configure subscriber-mgmt sla-profile egress qos policer cbs

configure subscriber-mgmt sla-profile ingress qos policer cbs

Description

This command is used to configure the policer’s CIR leaky bucket’s exceed threshold. The CIR bucket’s exceed threshold represents the committed burst tolerance allowed by the policer. If the policer’s forwarding rate is equal to or less than the policer's defined CIR, the CIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the forwarding rate increases beyond the profiling rate, the amount of data allowed to be in-profile above the rate is capped by the threshold.

The policer’s **cbs** size defined in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command returns the policer to its default CBS size.

Parameters

size

Specifies the size parameter and is expressed as an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly define whether size represents bytes or kilobytes.

Values 0 to 2683435456

bytes

Specifies the size parameter the size parameter in bytes. When **bytes** is defined, the value given for size is interpreted as the queue's MBS value given in bytes.

kilobytes

Specifies the size parameter in kilobytes. When **kilobytes** is defined, the value is interpreted as the queue's MBS value given in kilobytes.

Default kilobyte

Full Context

configure service ies interface sap egress queue-override queue cbs

configure service vpls sap egress queue-override queue cbs

configure service vpls sap ingress queue-override queue cbs

configure service ies interface sap ingress queue-override queue cbs

Description

This command overrides specific attributes of the specified queue's CBS parameters.

It is permissible, and possibly desirable, to oversubscribe the total CBS reserved buffers for a given access port egress buffer pool. Oversubscription may be desirable due to the potential large number of service queues and the economy of statistical multiplexing the individual queue's CBS settings into the defined reserved total.

When oversubscribing the reserved total, it is possible for a queue depth to be lower than its CBS setting and still not receive a buffer from the buffer pool for an ingress frame. As more queues are using their CBS buffers and the total in use exceeds the defined reserved total, essentially the buffers are being removed from the shared portion of the pool without the shared in use average and total counts being decremented. This can affect the operation of the high and low priority RED slopes on the pool, causing them to miscalculate when to start randomly drop packets.

If the CBS value is larger than the MBS value, an error will occur, preventing the CBS change.

The **no** form of this command returns the CBS size to the default value.

Parameters

size-in-kbytes

Specifies the size parameter is an integer expression of the number of kilobytes reserved for the queue. If a value of 10 kbytes is desired, enter the value 10. A value of 0 specifies that no reserved buffers are required by the queue (a minimal reserved size can still be applied for scheduling purposes).

configure card fp ingress access queue-group policer-override policer cbs

configure card fp ingress network queue-group policer-override policer cbs

Description

This command configures the policer's CIR leaky bucket's exceed threshold. The CIR bucket's exceed threshold represents the committed burst tolerance allowed by the policer. If the policer's forwarding rate is equal to or less than the policer's defined CIR, the CIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the forwarding rate increases beyond the profiling rate, the amount of data allowed to be in-profile above the rate is capped by the threshold.

The policer's **cbs** size defined in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command returns the policer to its default CBS size.

Parameters

size

Specifies that the *size* parameter is required when specifying **cbs** and is expressed as an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **bytes** and **kilobytes** keywords are mutually exclusive and are used to explicitly define whether *size* represents bytes or kilobytes.

Values 0 to 2683435456

bytes

When **bytes** is defined, the value given for size is interpreted as the queue's CBS value specified in bytes.

kilobytes

When **kilobytes** is defined, the value is interpreted as the queue's CBS value given in kilobytes.

Default **kilobyte**

default

Specifying the keyword **default** sets the CBS to its default value.

configure qos sap-ingress dynamic-policer cbs

configure qos sap-egress policer cbs

configure qos sap-ingress policer cbs

configure qos sap-egress dynamic-policer cbs

Description

This command configures the policer's CIR leaky bucket's exceed threshold. The CIR bucket's exceed threshold represents the committed burst tolerance allowed by the policer. If the policer's forwarding rate is equal to or less than the policer's defined CIR, the CIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the forwarding rate increases beyond the profiling rate, the amount of data allowed to be in-profile above the rate is capped by the threshold.

The policer's **cbs** size defined in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command returns the policer to its default CBS size.

By default, the CBS is 16 Mbytes when CIR equals max or is greater than or equal to the FP capacity (this overrides an explicit configured CBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max CIR capped to 3968 kbytes, with a minimum of 256 bytes.

Parameters

size [bytes | kilobytes]

Specifies an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly define whether size represents bytes or kilobytes.

Values 0 to 2683435456, **default**

Context

[Tree] (config>qos>sap-ingress>queue cbs)

[Tree] (config>qos>sap-egress>queue cbs)

Full Context

configure qos sap-ingress queue cbs

configure qos sap-egress queue cbs

Description

This command provides a mechanism to override the default reserved buffers for the queue. It is permissible, and possibly desirable, to oversubscribe the total CBS reserved buffers for a given access port egress buffer pool. Oversubscription may be desirable due to the potentially large number of service queues and the economy of statistical multiplexing the individual queue's CBS settings into the defined reserved total.

When oversubscribing the reserved total, it is possible for a queue depth to be lower than its CBS setting and still not receive a buffer from the buffer pool for an ingress frame. As more queues are using their CBS buffers and the total in use exceeds the defined reserved total, essentially the buffers are being removed from the shared portion of the pool without the shared in use average and total counts being decremented. This can affect the operation of the high- and low-priority RED slopes on the pool, causing them to miscalculate when to start randomly dropping packets.

If the CBS value is larger than the MBS value, the CBS is capped to the value of the MBS or the minimum CBS value. If the MBS and CBS values are configured to be equal (or nearly equal), this will result in the CBS being slightly higher than the value configured.

The **no** form of this command returns the CBS size to the default value.

Default

cbs default

Parameters

size-in-kbytes

The size parameter is an integer expression of the number of kilobytes reserved for the queue. If a value of 10 kbytes is desired, enter the value 10. A value of 0 specifies that no reserved buffers are required by the queue (a minimal reserved size can still be applied for scheduling purposes) The CBS maximum value used is constrained by the pool size in which the queue exists.

Values 0 to 1048576 or default

Minimum configurable non-zero value: 6 kbytes on an FP2, 7680 bytes on an FP3, and 16 kbytes on an FP4

Minimum non-zero default value: maximum of 10 ms of CIR, or 6 kbytes on an FP2, 7680 bytes on an FP3, and 16 kbytes on an FP4

Syntax

cbs *percent*

no cbs

Context

[Tree] (config>qos>network-queue>queue cbs)

Full Context

configure qos network-queue queue cbs

Description

The Committed Burst Size (**cbs**) command specifies the relative number of reserved buffers for a specific ingress network FP forwarding class queue or egress network port forwarding class queue. The value is entered as a percentage.

The CBS for a queue is used to determine whether it has exhausted its reserved buffers while enqueuing packets. When the queue has exceeded the number of buffers considered in reserve for this queue, it must contend with other queues for the available shared buffer space within the buffer pool. Access to this shared pool space is controlled through Random Early Detection (RED) slope application.

Two RED slopes are maintained in each buffer pool. A high-priority slope is used by in-profile packets. A low-priority slope is used by out-of-profile packets. At egress, there are two additional RED slopes maintained in each buffer pool: the highplus slope is used by inplus-profile packets, and the exceed slope is used by exceed-profile packets. All network control and management packets are considered in-profile. Assured packets are handled by their in-profile and out-of-profile markings. All best-effort packets are considered out-of-profile. Premium queues should be configured such that the CBS percent is sufficient to prevent shared buffering of packets. This is generally taken care of by the CIR scheduling of premium

queues and the overall small amount of traffic on the class. Premium queues in a properly designed system will drain before all others, limiting their buffer utilization.

The RED slopes will detect congestion conditions and work to discard packets and slow down random TCP session flows through the queue. The RED slope definitions can be defined, modified, or disabled through the slope policy assigned to the FP for the network ingress buffer pool or assigned to the network port for network egress buffer pools.

The resultant CBS size can be larger than the MBS. This will result in a portion of the CBS for the queue to be unused and should be avoided.

The **no** form of this command returns the CBS size for the queue to the default for the forwarding class.

Default

The cbs forwarding class defaults are listed in the Table 20: CBS Forwarding Class Defaults.

Table 20: CBS Forwarding Class Defaults

Forwarding Class	Forwarding Class Label	Default CBS
Network-Control	nc	3
High-1	h1	3
Expedited	ef	1
High-2	h2	1
Low-1	l1	3
Assured	af	1
Low-2	l2	3
Best-Effort	be	1

Parameters

percent

The percent of buffers reserved from the total buffer pool space, expressed as a decimal integer. If 10 Mbytes is the total buffer space in the buffer pool, a value of 10 would reserve 1 Mbyte (10%) of buffer space for the forwarding class queue. The value 0 specifies that no reserved buffers are required by the queue (a minimal reserved size can be applied for scheduling purposes).

For policers, the size parameter is an integer expression of the number of kilobytes for the policer CBS.

Values 0 to 1048576 or **default**

Minimum configurable non-zero value: 6 kbytes on an FP2, 7680 bytes on an FP3, and 16 kbytes on an FP4

Minimum non-zero default value: maximum of 10 ms of CIR or 6 kbytes on an FP2, 7680 bytes on an FP3, and 16 kbytes on an FP4

Platforms

All

cbs

Syntax

cbs *percent*

no cbs

Context

[Tree] (config>qos>shared-queue>queue cbs)

Full Context

configure qos shared-queue queue cbs

Description

The Committed Burst Size (**cbs)** command specifies the relative amount of reserved buffers for a specific ingress shared queue. The value is entered as a percentage.

The CBS for a queue is used to determine whether it has exhausted its reserved buffers while enqueuing packets. When the queue has exceeded the amount of buffers considered in reserve for this queue, it must contend with other queues for the available shared buffer space within the buffer pool.

The resultant CBS size can be larger than the MBS. This will result in a portion of the CBS for the queue being unused and should be avoided.

Default

The queue CBS defaults are listed in Table 21: Queue CBS Default Values.

Table 21: Queue CBS Default Values

Queue	Default CBS
1	1
2	3
3	10
4	3
5	10
6	10
7	3
8	3
9	1
10	1
11	1

Queue	Default CBS
12	1
13	1
14	1
15	1
16	1

Parameters

percent

The percent of buffers reserved from the total buffer pool space, expressed as a decimal integer. The value 0 specifies that no reserved buffers are required by the queue (a minimal reserved size can be applied for scheduling purposes).

Values 0 to 100

Platforms

All

cbs

Syntax

cbs *cbs*

no cbs

Context

[Tree] (config>sys>security>cpm-queue>queue cbs)

Full Context

configure system security cpm-queue queue cbs

Description

This command specifies the amount of buffer that can be drawn from the reserved buffer portion of the queue's buffer pool.

Parameters

cbs

Specifies the committed burst size in kbytes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

7.29 cc-error

cc-error

Syntax

[**no**] **cc-error**

Context

ccm-hold-time

Syntax

ccm-hold-time {**down** *down-timeout*] [**up** *up-timeout*}

no ccm-hold-time

Context

[Tree] (config>eth-tunnel ccm-hold-time)

Full Context

configure eth-tunnel ccm-hold-time

Description

This command allows a sub second CCM enabled MEP to delay a transition to a failed state if a configured remote CCM peer has timed out. The MEP will remain in the UP state for 3.5 times CCM interval + down-delay.

The **no** form of this command removes the additional delay

Parameters

down *down-timeout*

Specifies the time, in centiseconds, used for the hold-timer for associated Continuity Check (CC) Session down event dampening. This guards against reporting excessive member operational state transitions.

This is implemented by not advertising subsequent transitions of the CC state to the Ethernet Tunnel Group until the configured timer has expired.

Values 0 to 1000

Default 0

up *up-timeout*

Specifies the time, in deciseconds, used for the hold-timer for associated Continuity Check (CC) Session up event dampening. This guards against reporting excessive member operational state transitions.

This is implemented by not advertising subsequent transitions of the CC state to the Ethernet Tunnel Group until the configured timer has expired.

Values 0 to 5000

Default 20

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-hold-time

Syntax

ccm-hold-time down *timer*

configure eth-cfm domain association ccm-hold-time

Description

This command allows a sub second CCM enabled MEP to delay a transition to a failed state if a configured remote CCM peer has timed out. The MEP remains in the UP state for 3.5 times CCM interval + down-delay.

The **no** form of this command removes the additional delay.

Default

no ccm-hold-time

Parameters

down *timer*

Specifies the amount of time to delay, in centiseconds.

Values 0 to 1000

Default 0

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-hold-time

Syntax

ccm-hold-time [**down** *down-timeout*] [**up** *up-timeout*]

no ccm-hold-time

Context

[Tree] (config>eth-ring ccm-hold-time)

Full Context

configure eth-ring ccm-hold-time

Description

This command configures eth-ring dampening timers. See the **down** and **up** commands for more information.

The **no** form of the command sets the up and down timers to the default values.

Parameters

down-timeout

Specifies the down timeout, in centiseconds.

Values 0 to 5000

up-timeout

Specifies the hold-time for reporting the recovery, in deciseconds.

Values 0 to 5000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

7.32 ccm-interval

ccm-interval

Syntax

ccm-interval *interval*

no ccm-interval

Context

[Tree] (config>eth-cfm>domain>assoc ccm-interval)

Full Context

configure eth-cfm domain association ccm-interval

Description

This command configures the CCM transmission interval for all MEPs in the association.

The **no** form of this command reverts to the default value.

Default

no ccm-interval

Parameters

interval

Specifies the interval between CCM transmissions to be used by all MEPs in the MA.

Values 10 milliseconds, 100 milliseconds, 1 second, 10 seconds, 60 seconds, 600 seconds

Default 10 (seconds)

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>router>if>eth-cfm>mep ccm-tlv-ignore)

[Tree] (config>lag>eth-cfm>mep ccm-tlv-ignore)

Full Context

configure port ethernet eth-cfm mep ccm-tlv-ignore

configure router interface eth-cfm mep ccm-tlv-ignore

configure lag eth-cfm mep ccm-tlv-ignore

Description

This command allows the receiving MEP to ignore the specified TLVs in CCM PDU. Ignored TLVs will be reported as absent and will have no impact on the MEP state machine.

The **no** form of this command means the receiving MEP will process all recognized TLVs in the CCM PDU.

Default

no ccm-tlv-ignore

Parameters

interface-status

Ignores the interface status TLV on reception.

port-status

Ignores the port status TLV on reception.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

7.36 ccrt-replay

ccrt-replay

Syntax

ccrt-replay

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>gx ccrt-replay)

[Tree] (config>subscr-mgmt>diam-appl-plcy>gy ccrt-replay)

Full Context

configure subscriber-mgmt diameter-application-policy gx ccrt-replay

configure subscriber-mgmt diameter-application-policy gy ccrt-replay

Description

Commands in this context configure CCR-T replay. CCR-T replay is enabled with a **no shutdown** of this context. If a communication failure between client and server occurs, CCR-T replay enables the retransmission of CCR-T messages for a Gx or Gy session at a configured intervals until a valid response (CCA-t) is received or until the configured **max-lifetime** period expires, whichever comes first.

In Gx, replaying CCR-T messages ensures that the Gx session is cleared on the PCRF side in cases where the peering session to the PCRF was not available at the time that the initial and the first retransmitted CCR-T was sent.

In Gy, replaying CCR-T messages ensures that the final credit control usage reporting is not lost for billing by the OCS.

The subscriber host or session that triggered the Gx or Gy session that is in CCR-T replay mode is deleted from the system at the time that the initial CCR-T is sent. All resources associated with the subscriber host

or session, such as queues, DHCP lease states, and PPPoE session states are released. The orphaned Gx and Gy sessions in replay mode are left in the system.

7.37 cd

cd

Syntax

cd [*file-url*]

Context

[Tree] (file cd)

Full Context

file cd

Description

This command displays or changes the current working directory in the local file system.

Parameters

file-url

Specifies the file URL.

Values

local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login*:*pswd@remote-locn/*][*file-path*]
	up to 247 characters
	directory length up to 199 characters
remote-locn	[*hostname* | *ipv4-address* | [*ipv6-address*]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*]
	x:x:x:x:x:x:d.d.d.d[*-interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D

	interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

If no *file-url* is entered, the current working directory is displayed.

..

signifies the parent directory. This can be used in place of an actual directory name in a *directory-url*.

directory-url

Specifies the destination directory.

7.38 ce-address

ce-address

Syntax

ce-address *ip-address*

no ce-address

Context

[Tree] (config>service>ipipe>spoke-sdp ce-address)

[Tree] (config>service>ipipe>sap ce-address)

Full Context

configure service ipipe spoke-sdp ce-address

configure service ipipe sap ce-address

Description

This command specifies the IP address of the CE device associated with an Ipipe SAP or spoke SDP. In the case of a SAP, it is the address of the CE device directly attached to the SAP. For a spoke SDP, it is the address of the CE device reachable through that spoke SDP (for example, attached to the SAP on the remote node). The address must be a host address (no subnet addresses are accepted) as there must be only one CE device attached to an Ipipe SAP. The CE address specified at one end of an Ipipe will be used in processing ARP messages at the other endpoint, as the router acts as a proxy for ARP messages.

On a 7450 ESS, this command specifies the IP address of the CE device associated with an Ipipe SAP. In the case of a SAP, it is the address of the CE device directly attached to the SAP. The address must be a host address (no subnet addresses are accepted) as there must be only one CE device attached to an

Ipipe SAP. The CE address specified at one end of an Ipipe will be used in processing ARP messages at the other endpoint, as the router acts as a proxy for ARP messages.

Parameters

ip-address

Specifies the IP address of the CE device associated with an Ipipe SAP.

Platforms

All

7.39 ce-address-discovery

ce-address-discovery

Syntax

ce-address-discovery [**keep**]

ce-address-discovery ipv6 [**keep**]

no ce-address-discovery

Context

[Tree] (config>service>ipipe ce-address-discovery)

Full Context

configure service ipipe ce-address-discovery

Description

This command specifies whether the service will automatically discover the CE IP addresses.

When enabled, the addresses will be automatically discovered on SAPs that support address discovery, and on the spoke SDPs. When enabled, addresses configuration on the Ipipe SAP and spoke SDPs will not be allowed.

If disabled, CE IP addresses must be manually configured for the SAPs to become operationally up.

Default

no ce-address-discovery

Parameters

ipv6

The **ipv6** keyword enables IPv6 CE address discovery support on the Ipipe so that both IPv4 and IPv6 address discovery are supported. If the **ipv6** keyword is not included, then only IPv4 address discovery is supported and IPv6 packets are dropped.

keep

The keep keyword is only applicable to eth-legacy-fault-notification. This option maintains the CE address discovered even when the SAP on which the address was learned fails. The ARP entry will not be maintained if the SAP is administratively shutdown, the **clear service id** *svc-id* {**arp** | **neighbor**} is used to remove the ARP entry or the node reboots.

Description

This command configures the imported certificate filename for the certificate automatic update.

The **no** form of this command removes the *cert-file-name* from the configuration.

Parameters

cert-file-name

Specifies the filename of the certificate, up to 95 characters in length.

Platforms

All

7.42 cert-file

cert-file

Syntax

cert-file *filename*

no cert-file

Context

[Tree] (config>system>security>pki>ca-profile cert-file)

Full Context

configure system security pki ca-profile cert-file

Description

This command specifies the filename of a file in cf3:\system-pki\cert as the CA's certificate of the ca-profile.

Notes:

- The system will perform following checks against configured cert-file when a **no shutdown** command is issued:
  - Configured cert-file must be a DER formatted X.509v3 certificate file.
  - All non-optional fields defined in section 4.1 of RFC5280 must exist and conform to the RFC 5280 defined format.
  - Check the version field to see if its value is 0x2.
  - Check The Validity field to see that if the certificate is still in validity period.
  - X509 basic constraints extension must exists, and CA Boolean must be True.
  - If Key Usage extension exists, then at least keyCertSign and cRLSign should be asserted.
  - If the certificate is not a self-signing certificate, then system will try to look for issuer's CA's certificate to verify if this certificate is signed by issuer's CA; but if there is no such CA-profile configured, then system will just proceed with a warning message.
  - If the certificate is not a self-signing certificate, then system will try to look for issuer's CA's CRL to verify that it has not been revoked; but if there is no such CA-profile configured or there is no such CRL, then system will just proceed with a warning message.

  If any of above checks fails, then the **no shutdown** command will fail.
- Changing or removing of **cert-file** is only allowed when the **ca-profile** is in a **shutdown** state.

The **no** form of this command removes the filename from the configuration.

Parameters

filename

Specifies a local CF card file URL.

Platforms

All

7.44 cert-request

cert-request

Syntax

cert-request ca *ca-profile-name* **current-key** *key-filename* **current-cert** *cert-filename* [**hash-alg** *hash-algorithm*] **newkey** *key-filename* **subject-dn** *subject-dn* [**domain-name** *domain-names*] [**ip-addr** *ip-address* | *ipv6-address*] **save-as** *save-path-of-result-cert*

Context

[Tree] (admin>certificate>cmpv2 cert-request)

Full Context

admin certificate cmpv2 cert-request

Description

This command requests an additional certificate after the system has obtained the initial certificate from the CA.

The request is authenticated by a signature signed by the current-key, along with the current-cert. The hash algorithm used for signature is depends on the key type:

- DSA key: SHA1
- RSA key: MD5/SHA1/SHA224 | SHA256 | SHA384 | SHA512, by default is SHA1

In some cases, the CA may not return a certificate immediately, due to reasons such as **request processing need manual intervention**. In such cases, the **admin certificate cmpv2 poll** command can be used to poll the status of the request.

Parameters

ca *ca-profile-name*

Specifies a ca-profile name which includes CMP server information up to 32 characters.

current-key *key-filename*

Specifies corresponding certificate issued by the CA up to 95 characters.

current-cert *cert-filename*

Specifies the file name of an imported certificate that is attached to the certificate request up to 95 characters.

newkey *key-filename*

Specifies the file name of the imported key up to 95 characters.

hash-alg *hash-algorithm*

Specifies the hash algorithm for RSA key.

Values md5,sha1,sha224,sha256,sha384,sha512

subject-dn *dn*

Specifies the subject of the requesting certificate up to 256 characters.

Values attr1=val1,attr2=val2 where: attrN={C | ST | O | OU | CN}

save-as *save-path-of-result-cert*

Specifies the save full path name of saving the result certificate, up to 200 characters.

domain-name *domain-names*

Specifies FQDNs for SubjectAltName of the requesting certificate, separated by commas, up to 512 characters.

ip-addr *ip-address* | *ipv6-address*

Specifies an IPv4 or IPv6 address for SubjectAltName of the requesting certificate.

configure system security pki certificate-display-format

Description

This command specifies the display format used for the Certificates and Certificate Revocation Lists.

Default

certificate-display-format ascii

Parameters

ascii

Specifies the ASCII format to use for the Certificates and Certificate Revocation Lists.

utf8

Specifies the UTF8 format to use for the Certificates and Certificate Revocation Lists.

Platforms

All

7.49 certificate-expiration-warning

certificate-expiration-warning

Syntax

certificate-expiration-warning *hours* [**repeat** *repeat-hours*]

no certificate-expiration-warning

Context

[Tree] (config>system>security>pki certificate-expiration-warning)

Full Context

configure system security pki certificate-expiration-warning

Description

With this command configured, the system issues two types of warnings related to certificate expiration:

- **BeforeExp —** A warning message issued before certificate expire
- **AfterExp —** A warning message issued when certificate expire

This command specifies when system will issue **BeforeExp** message before a certificate expires. For example, with c**ertificate-expiration-warning 5**, the system will issue a **BeforeExp** message 5 hours before a certificate expires. An optional **repeat** <*repeat-hour*> parameter will enable the system to repeat the **BeforeExp** message every hour until the certificate expires.

If the user only wants **AfterExp**, then **certificate-expiration-warning 0** can be used to achieve this.

BeforeExp and **AfterExp** warnings can be cleared in following cases:

- The certificate is reloaded by the **admin certificate reload** command. In this case, if the reloaded file is not expired, then **AfterExp** is cleared. And, if the reloaded file is outside of configured warning window, then the **BeforeExp** is also cleared.
- When the **ca-profile/ipsec-gw/ipsec-tunnel/cert-profile** is shutdown, then **BeforeExp** and **AfterExp** of corresponding certificates are cleared.
- When **no certificate-expiration-warning** command is configured, then all existing **BeforeExp** and **AfterExp** are cleared.
- Users may change the configuration of the **certificate-expiration-warning** so that certain certificates are no longer in the warning window. **BeforeExp** of corresponding certificates are cleared.
- If the system time changes so that the new time causes the certificates to no longer be in the warning window, then **BeforeExp** is cleared. If the new time causes an expired certificate to come non-expired, then **AfterExp** is cleared.

Default

no certificate-expiration-warning

Parameters

hours

Specifies the amount of time before a certificate expires when system issues BeforeExp.

Values 0 to 8760

repeat-hours

Specifies the time the system will repeat BeforeExp every repeat-hour.

Values 0 to 8760

7.52 cflash-cap-alarm

cflash-cap-alarm

Syntax

cflash-cap-alarm *cflash-id* **rising-threshold** *threshold* [**falling-threshold** *threshold*] **interval** *seconds* [*rmon-event-type*] [**startup-alarm** *alarm-type*]

no cflash-cap-alarm *cflash-id*

Context

[Tree] (config>system>thresholds cflash-cap-alarm)

Full Context

configure system thresholds cflash-cap-alarm

Description

This command enables capacity monitoring of the compact flash specified in this command. The severity level is alarm. Both a rising and falling threshold can be specified.

The **no** form of this command removes the configured compact flash threshold alarm.

Parameters

cflash-id

Specifies the name of the cflash device to be monitored.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rising-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated **startup-alarm** is equal to **rising** or **either**.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal to the **falling-threshold** value.

The threshold value represents units of 512 bytes.

Values -2147483648 to 2147483647

Default 0

falling-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated **startup-alarm** is equal to **falling** or **either**.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal to the **rising-threshold** value.

The threshold value represents units of 512 bytes.

Values -2147483648 to 2147483647

Default 0

seconds

Specifies the polling period, in seconds, over which the data is sampled and compared with the rising and falling thresholds.

Values 1 to 2147483647

rmon-event-type

Specifies the type of notification action to be taken when this event occurs.

Values log — An entry is made in the RMON-MIB log table for each event occurrence. This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations, which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

alarm-type

Specifies the alarm that may be sent when this alarm is first created

If the first sample is greater than or equal to the rising threshold value and **startup-alarm** is equal to **rising** or **either**, a single rising threshold crossing event is generated.

If the first sample is less than or equal to the falling threshold value and **startup-alarm** is equal to **falling** or **either**, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Configuration example

```
cflash-cap-alarm cf1-A: rising-threshold 50000000 falling-
threshold 49999900
interval 120 rmon-event-type both start-alarm rising
```

Platforms

cflash-cap-alarm-pct

Syntax

cflash-cap-alarm-pct *cflash-id* **rising-threshold** *percentage* [**falling-threshold** *percentage*] **interval** *seconds* [**rmon-event-type** *event-type*] [**startup-alarm** *alarm-type*]

no cflash-cap-alarm-pct *cflash-id*

Context

[Tree] (config>system>thresholds cflash-cap-alarm-pct)

Full Context

configure system thresholds cflash-cap-alarm-pct

Description

This command enables capacity monitoring of the compact flash specified in this command. The usage is monitored as a percentage of the capacity of the compact flash. The severity level is alarm. Both a rising and falling threshold can be specified.

The **no** form of this command removes the configured compact flash threshold alarm.

Parameters

cflash-id

Specifies the name of the cflash device to be monitored.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rising-threshold ***percentage***

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated **startup-alarm** is equal to **rising** or **either**.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal to the **falling-threshold** value.

The threshold value is the percentage of used space versus capacity for the specified compact flash.

Values 0 to 100

Default 0

falling-threshold ***percentage***

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated **startup-alarm** is equal to **falling** or **either**.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal to the **rising-threshold** value.

The threshold value is the percentage of used space versus capacity for the specified compact flash.

Values 0 to 100

Default 0

seconds

Specifies the polling period, in seconds, over which the data is sampled and compared with the rising and falling thresholds.

Values 1 to 2147483647

event-type

Specifies the type of notification action to be taken when this event occurs.

Values log — An entry is made in the RMON-MIB log table for each event occurrence. This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations, which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

alarm-type

Specifies the alarm that may be sent when this alarm is first created.

If the first sample is greater than or equal to the rising threshold value and **startup-alarm** is equal to **rising** or **either**, a single rising threshold crossing event is generated.

If the first sample is less than or equal to the falling threshold value and **startup-alarm** is equal to **falling** or **either**, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Configuration example

```
cflash-cap-alarm-pct cf1-A: rising-threshold 70 falling-
threshold 60 interval 120 rmon-event-type both start-alarm
 rising
```

no cflash-cap-warn *cflash-id*

Context

[Tree] (config>system>thresholds cflash-cap-warn)

Full Context

configure system thresholds cflash-cap-warn

Description

This command enables capacity monitoring of the compact flash specified in this command.

The severity level is warning. Both a rising and falling threshold can be specified. The **no** form of this command removes the configured compact flash threshold warning.

Parameters

cflash-id

Specifies that the cflash-id specifies the name of the cflash device to be monitored.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rising-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated **startup-alarm** is equal to **rising** or **either**.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal to the **falling-threshold** value.

The threshold value represents units of 512 bytes.

Values -2147483648 to 2147483647

Default 0

falling-threshold ***threshold***

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated **startup-alarm** is equal to **falling** or **either**.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal to the **rising-threshold** value.

The threshold value represents units of 512 bytes.

Values -2147483648 to 2147483647

Default 0

seconds

Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

Values 1 to 2147483647

rmon-event-type

Specifies the type of notification action to be taken when this event occurs.

Values log — An entry is made in the RMON-MIB log table for each event occurrence. This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations, which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and a SR OS logger event are generated.

none — No action is taken.

Default both

alarm-type

Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and **startup-alarm** is equal to **rising** or **either**, a single rising threshold crossing event is generated.

If the first sample is less than or equal to the falling threshold value and **startup-alarm** is equal to **falling** or **either**, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Configuration example

```
cflash-cap-warn cf1-B: rising-threshold 2000000 falling-threshold 1999900
interval 240 rmon-event-type trap start-alarm either
```

configure service epipe sap cflowd

Description

This command enables cflowd to collect traffic flow samples through a service interface (SAP) for analysis. When cflowd is enabled on an Ethernet service SAP, the Ethernet traffic can be sampled and processed by the system's cflowd engine and exported to IPFIX collectors with the l2-ip template enabled.

cflowd is used for network planning and traffic engineering, capacity planning, security, application and user profiling, performance monitoring, usage-based billing, and SLA measurement. When cflowd is enabled at the SAP level, all packets forwarded by the interface are subjected to analysis according to the cflowd configuration.

For L2 services, only ingress sampling is supported.

7.58 cfm-mac-advertisement

cfm-mac-advertisement

Syntax

[**no**] **cfm-mac-advertisement**

Context

[Tree] (config>service>vpls>bgp-evpn cfm-mac-advertisement)

Full Context

configure service vpls bgp-evpn cfm-mac-advertisement

Description

This command enables the advertisement and withdrawal, as appropriate, of the IEEE MAC address associated with the MP (MEP and MIP) created on a SAP, Spoke or Mesh, in an EVPN service.

The up-date occurs each time an MP is added or deleted, or an IEEE MAC address is changed for an MP on a SAP, Spoke or Mesh within the service. The size of the update depends on the number of MPs in the service affected by the modification.

Only enable this functionality, as required, for services that require a resident MAC address to properly forward unicast traffic and that do not perform layer two MAC learning as part of the data plane.

Local MP IEEE MAC addresses are not stored in the local FDB and, as such, cannot be advertised through a control plane to a peer without this command.

The **no** version of the command disables the functionality and withdraws all previously advertised MP IEEE MAC addresses.

7.59 cfm-opcode

cfm-opcode

Syntax

cfm-opcode {**lt** | **gt** | **eq**} *opcode*

cfm-opcode range *start end*

no cfm-opcode

Context

[Tree] (config>system>security>mgmt-access-filter>mac-filter>entry>match cfm-opcode)

Full Context

configure system security management-access-filter mac-filter entry match cfm-opcode

Description

This command specifies the type of opcode checking to be performed.

If the cfm-opcode match condition is configured then a check must be made to see if the Ethertype is either IEEE802.1ag or Y1731. If the Ethertype does not match then the packet is not CFM and no match to the cfm-opcode is attempted.

The CFM (ieee802.1ag or Y1731) opcode can be assigned as a range with a start and an end number or with a (less than lt, greater than gt, or equal to eq) operator.

If no range with a start and an end or operator (lt, gt, eq) followed by an opcode with the value between 0 and 255 is defined then the command is invalid.

Table 22: Opcode Values lists the opcode values.

Table 22: Opcode Values

CFM PDU or Organization	Acronym	Configurable Numeric Value (Range)

7.63 change-reporting-action

change-reporting-action

Syntax

change-reporting-action *reporting-action*

no change-reporting-action

Context

[Tree] (config>subscr-mgmt>gtp>peer-profile change-reporting-action)

Full Context

configure subscriber-mgmt gtp peer-profile change-reporting-action

Description

This command specifies the value of the change reporting action IE sends to the peer in applicable messages. The peer needs to indicate support first using the appropriate flag in the indication IE.

This is overridden by AAA, if AAA explicitly request notification changes for either ECGI, TAI or both. If AAA does not request any notification changes or only the generic location change, the configured value is used.

The **no** form of this command indicates that the IE is not sent, unless specified by AAA.

Default

no change-reporting-action

Parameters

reporting-action

Specifies the reporting action value as per TS 29.274.

Values 0 to 255, cgi-sai, rai, tai, ecgi, cgi-sai-rai, tai-ecgi

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

7.64 channel

channel

Syntax

channel *ip-address* [*ip-address*] [**create**]

no channel *ip-address* [*ip-address*]

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle channel)

Full Context

configure mcast-management multicast-info-policy bundle channel

Description

This command defines explicit channels or channel ranges that are associated with the containing bundle. A channel or channel range is defined by their destination IP addresses. A channel may be defined using either IPv4 or IPv6 addresses. If a channel range is being defined, both the start and ending addresses must be the same type.

A specific channel may only be defined within a single channel or channel range within the multicast information policy. A defined channel range cannot overlap with an existing channel range.

If a channel range is to be shortened, extended, split or moved to another bundle, it must first be removed from its existing bundle.

Each specified channel range creates a containing context for any override parameters for the channel range. By default, no override parameters exist.

The **no** form of this command removes the specified multicast channel from the containing bundle.

Parameters

ip-address

Specifies the starting and ending destination IP addresses for a channel range. If only the start channel *ip-address* parameter is given, the channel ranges comprises of a single multicast channel.

If both the starting and ending address are specified, all addresses within the range including the specified address are part of the channel range.

IPv4 or IPv6 addresses may be defined. All specified addresses must be valid multicast destination addresses. The starting IP address must be numerically lower than the ending IP address.

Values Any valid IP multicast destination address

create

This keyword is required if creating a new multicast channel range when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the specified channel range already exists.

channel *start-address end-address* **bw** *bandwidth* [**class** *class*] [**type** *type*] [**source** *prefix*|*prefix-length*]

no channel *start-address end-address* [**source** *prefix*|*prefix-length*]

Context

[Tree] (config>router>mcac>policy>bundle channel)

Full Context

configure router mcac policy bundle channel

Description

This command creates a multicast channel within the bundle where it is configured. A join for a particular multicast channel can be accepted if:

1. Mandatory channels:

   A sufficient bandwidth exists on the interface according to the policy settings for the interface. There is always sufficient BW available on the bundle level because mandatory channels get BW pre-reserved.

2. Optional channels:

   A sufficient BW exists on both interface and bundle level.

A channel definition can be either IPv4 (*start-address, end-address, source-address* are IPv4 addresses) or IPv6. A single bundle can have either IPv4 or IPv6 or IPv6 and IPv4 channel definitions. A single policy can mix any of those bundles.

Overlapping channels are not allowed. Two channels overlap if they contain same groups and the same source address prefix (or both do not specify source address prefix). Two channels with same groups and different source prefixes (including one of the channels having no source configured or one of the channels having more specific prefix than the other) do not overlap and are treated as separate channels.

When joining a group from multiple sources, MCAC accounts for that only once when no source address is specified or a prefix for channel covers both sources. Channel BW should be adjusted accordingly or source-aware channel definition should be used if that is not desired.

If a bundle is removed, the channels associated are also removed and every multicast group that was previously policed (because it was in the bundle that contained the policy) becomes free of constraints.

When a new bundle is added to a MCAC policy, the bundle's established groups on a given interfaces are accounted by the policy. Even if this action results in exceeding the bundle's constrain, no active multicast groups are removed. When a leave message is received for an existing optional channel, then the multicast stream is pruned and subsequent new joins may be denied in accordance with the policy. It is possible that momentarily there may be insufficient bandwidth, even for mandatory channels, in this bundle.

Parameters

start-address

Specifies the beginning multicast IP address that identifies a multicast stream (BTV channel). Both addresses have to be either IPv4 or IPv6.

Values This must be a valid IPv4 or IPv6 multicast group address

end-address

Specifies the ending multicast IP address that identifies a multicast stream (BTV channel). Both addresses have to be either IPv4 or IPv6.

Values This must be a valid IPv4 or IPv6 multicast group address

prefix/prefix-length

Specifies the source of the multicast IP stream. This must be a valid IPv4 or IPv6 multicast source address prefix.

Values address-prefix/prefix-length

address-prefix is valid IPv4/IPv6 multicast source IP address prefix (local scope excluded)

prefix-length [0 to 32] for IPv4 [0 to 128] for IPv6

bandwidth

Specifies the bandwidth required by this channel in kb/s. If this bandwidth is configured for a mandatory channel then this bandwidth is reserved by subtracting the amount from the total available bandwidth for all potential egress interfaces and the bundle.

If this bandwidth is configured as an optional channel then this bandwidth must be available for both the bundle and the egress interface requesting the channel to be added. Once the channel has been added the available bandwidth for the bundle and the interface must be reduced by the configured bandwidth of channel.

Values 10 to 10000000 kb/s

class

Provides deeper classification of channels used in the algorithm when LAG ports change state.

Values high, low

Default low

type

Specifies the channel to be either mandatory or optional.

mandatory — When the **mandatory** keyword is specified, then the bandwidth is reserved by subtracting it from the total available for all the potential egress interfaces and the bundle.

optional — When the **optional** keyword is specified then the bandwidth must be available on both the bundle and the egress interface that requests the channel to be added. Once the channel has been added the available bandwidth for the bundle and the interface must be reduced by the configured bandwidth of channel.

Values mandatory, optional

Default optional

7.65 channel-group

channel-group

Syntax

[**no**] **channel-group** *channel-group-id*

Context

[Tree] (config>port>tdm>e1 channel-group)

[Tree] (config>port>tdm>ds1 channel-group)

Full Context

configure port tdm e1 channel-group

configure port tdm ds1 channel-group

Description

This command creates DS0 channel groups in a channelized DS1 or E1 circuit. Channel groups cannot be further subdivided.

The **no** form of this command deletes the specified DS1 or E1 channel.

Parameters

channel-group-id

Identifies the channel-group ID number.

Values DS1: 1 to 24 E1: 1 to 32

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

7.66 channelized

channelized

Syntax

channelized {**ds1** | **e1**}

no channelized

Context

[Tree] (config>port>tdm>ds3 channelized)

Full Context

configure port tdm ds3 channelized

Description

This command specifies that the associated DS-3 is a channelized DS-3 with DS-1/E-1 sub-channels. Depending on the MDA type, the DS-3 parameters must be disabled if clear channel is the default (for example, on m12-ds3 MDAs). Clear channel is a channel that uses out-of-band signaling, not in-band signaling, so the channel's entire bit rate is available. Channelization must be explicitly specified. The no

form specifies the associated DS-3 is a clear channel circuit and cannot contain sub-channel DS-1s/E-1s. The sub-channels must be deleted first before the **no** command is executed.

Default

no channelized.

Parameters

ds1

Specifies that the channel is DS-1.

e1

Specifies that the channel is E-1.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

Context

[Tree] (config>app-assure>group>policy>app-profile characteristic)

Full Context

configure application-assurance group policy app-profile characteristic

Description

This command assigns one of the existing values of an existing application service option characteristic to the application profile.

The **no** form of this command removes the characteristic from the application profile.

Parameters

characteristic-name

Specifies the name of an existing ASO characteristic.

value-name

Specifies the name for the application profile characteristic up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

characteristic

Syntax

characteristic *characteristic-name*

Context

[Tree] (config>app-assure>group>aqp>entry>action characteristic)

Full Context

configure application-assurance group app-qos-policy entry action characteristic

Description

This command enables the system to use the value of the characteristic name specified in the app-qos-policy url-filter action for the configurable ICAP x-header name provisioned in the url-filter policy. The ICAP server can then use this value to decide which url-filter policy to apply instead of applying a filter policy based on the subscriber name.

Parameters

characteristic-name

Specifies the name of the characteristic.

characteristic

Syntax

characteristic *characteristic-name* **{eq | neq}** *value-name*

no characteristic *characteristic-name*

Context

[Tree] (config>app-assure>group>policy>aqp>entry>match characteristic)

configure application-assurance group policy app-qos-policy entry match characteristic

Description

This command adds an existing characteristic and its value to the match criteria used by this AQP entry.

The **no** form of this command removes the characteristic from match criteria for this AQP entry.

Parameters

eq

Specifies that the value configured and the value in the flow are equal.

neq

Specifies that the value configured differs from the value in the flow.

characteristic-name

Specifies the name of the existing ASO characteristic, up to 32 characters in length.

value-name

Specifies the name of an existing value for the characteristic, up to 32 characters in length.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>app-assure>group>statistics>aa-sub charging-group)

Full Context

configure application-assurance group statistics aa-sub charging-group

Description

This command configures aa-sub accounting statistics for export of charging groups of a given AA ISA group/partition.

The **no** form of this command removes the parameters from the configuration.

Parameters

charging-group-name

Specifies the name of the charging group. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

export-using *export-method*

Specifies that the method of stats export to be used.

Values accounting-policy, radius-accounting-policy

no-export

Allows the operator to enable the referred to a charging group to be selected (via Diameter) for Gx-usage monitoring. Gx usage monitoring is enabled automatically (and this command is not shown) if the **export-using** parameter is selected for the respective charging group.

Usage monitoring must be enabled at the group:partition level (**config>app-assure>group>statistics>aa-sub>usage-monitoring**) as well in order to allow any application/application group/charging group usage monitoring.

configure mcast-management chassis-level

Description

Commands in this context configure multicast plane bandwidth parameters. The chassis-level CLI node contains the multicast plane replication limit for each switch fabric multicast plane.

The chassis-level node always exists and contains the configuration command to define the total replication rates for primary and secondary associated ingress paths for each switch fabric multicast plane.

Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

7.74 chassis-mode

chassis-mode

Syntax

chassis-mode *chassis-mode* [**force**]

Context

[Tree] (config>system chassis-mode)

Full Context

configure system chassis-mode

Description

This command is retained for historic reasons, and was used to control the set of features and scaling available based on the variants of IOMs present in the node. As of release 15.0, the set of supported IOMs no longer requires this differentiation using this command. The command still exists but the mode is fixed at **chassis mode d**.

Default

chassis-mode d

Parameters

chassis-mode

Specifies the chassis modes:

d: This mode corresponds to scaling and feature set associated with iom3-xp.

force

Forces an upgrade from a lesser scaling and feature set to a greater one.

Platforms

7450 ESS, 7750 SR-7/12

Full Context

configure router rip check-zero

configure router ripng check-zero

configure router ripng group check-zero

configure router ripng group neighbor check-zero

configure router rip group neighbor check-zero

configure router rip group check-zero

Description

This command enables checking for zero values in fields specified to be zero by the RIPv1 and RIPv2 specifications.

The **check-zero enable** command enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages.

The **check-zero disable** command disables this check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to

the specified neighbor interface). The most specific value is used. In particular if no value is set (**no check-zero**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command removes the **check-zero** command from the configuration.

Parameters

enable

Specifies to reject RIP messages which do not have zero in the RIPv1 and RIPv2 mandatory fields.

disable

Specifies allows receipt of RIP messages which do not have the mandatory zero fields reset.

Full Context

configure oam-pm session ip twamp-light loss-events chli-event

configure oam-pm session ethernet slm loss-events chli-event

configure oam-pm session ethernet lmm loss-events chli-event

Description

This command sets the consecutive high loss interval (CHLI) threshold to be monitored and the associated thresholds using the counter of the specified direction. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default

no chli-event forward

no chli-event backward

no chli-event aggregate

Parameters

forward

Specifies the threshold is applied to the forward direction count.

backward

Specifies the threshold is applied to the backward direction count.

aggregate

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold

Specifies the numerical value compared to the CHLI counter that is the rising threshold that determines when the event is to be generated, when the percentage of loss value is reached.

Values 1 to 864000

clear-threshold

Specifies an optional numerical value compared to the CHLI counter used for stateful behavior that allows the operator to configure a value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

A value of zero means that the CHLI counter must be 0.

[Tree] (config>system>security>ssh>server-cipher-list cipher)

Full Context

configure system security ssh client-cipher-list cipher

configure system security ssh server-cipher-list cipher

Description

This command configures a cipher. Client-ciphers are used when the SR OS is acting as an SSH client. Server-ciphers are used when the SR OS is acting as an SSH server.

The **no** form of this command removes the index and cipher name from the configuration.

Default

no cipher *index*

Parameters

index

Specifies the index of the cipher in the list.

Values 1 to 255

cipher-name

Specifies the algorithm used when performing encryption or decryption.

Values Client ciphers: 3des-cbc, aes128-cbc, aes192-cbc, aes256-cbc, aes128-ctr, aes192-ctr, aes256-ctr.

Server ciphers: 3des-cbc, aes128-cbc, aes192-cbc, aes256-cbc, aes128-ctr, aes192-ctr, aes256-ctr.

The following table lists the default ciphers used for SSHv2.

Table 23: SSHv2 Default Ciphers

Cipher index value	Cipher name
190	aes256-ctr
192	aes192-ctr
194	aes128-ctr
200	aes128-cbc
205	3des-cbc
225	aes192-cbc
230	aes256-cbc

[Tree] (config>system>security>tls>client-cipher-list cipher)

Full Context

configure system security tls server-cipher-list cipher

configure system security tls client-cipher-list cipher

Description

This command configures the cipher suite to be negotiated by the server and client.

Parameters

index

Specifies the index number. The index number provides the location of the cipher in the negotiation list, with the lower index numbers being higher in the negotiation list and the higher index numbers being at the bottom of the list.

Values 1 to 255

cipher-suite-code

Specifies the cipher suite code.

Values tls-rsa-with-null-md5
tls-rsa-with-null-sha
tls-rsa-with-null-sha256
tls-rsa-with-3des-ede-cbc-sha
tls-rsa-with-aes128-cbc-sha
tls-rsa-with-aes256-cbc-sha
tls-rsa-with-aes128-cbc-sha256

no cipher-list

Context

[Tree] (config>system>security>tls>client-tls-profile cipher-list)

Full Context

configure system security tls client-tls-profile cipher-list

Description

This command assigns the cipher list to be used by the TLS client profile for negotiation in the client Hello message.

Parameters

name

Specifies the name of the cipher list.

Platforms

All

cipher-list

Syntax

cipher-list *name*

no cipher-list

Context

[Tree] (config>system>security>tls>server-tls-profile cipher-list)

Full Context

configure system security tls server-tls-profile cipher-list

Description

This command assigns a cipher list to be used by the TLS server profile. This cipher list is used to find matching ciphers with the cipher list that is received from the client.

The **no** form of the command removes the cipher list.

Parameters

name

Specifies the name of the cipher list, up to 32 characters in length.

Platforms

All

7.82 cipher-suite

cipher-suite

Syntax

cipher-suite *cipher-suite*

no cipher-suite

Context

[Tree] (config>macsec>connectivity-association cipher-suite)

Full Context

configure macsec connectivity-association cipher-suite

Description

This command configures encryption of data path PDUs. When all parties in the Connectivity Association (CA) have the SAK, they use the above algorithm in conjunction with the SAK to encrypt the data path PDUs.

The XPN 64 bit (extended packet number) can be used for higher rate ports such as 10 GigE to minimize the window rollover and renegotiation of the SAK.

The **no** form of this command disables encryption of data path PDUs.

Default

cipher-suite gcm-aes-128

Parameters

cypher-suite

Specifies the algorithm.

Values gcm-aes-128 — algorithm is used for control plain encryption

gcm-aes-256 — algorithm is used for control plain encryption

gcm-aes-xpn-128 — algorithm with extended packet number is used for control plain encryption

gcm-aes-xpn-256 — algorithm with extended packet number is used for control plain encryption

cir

Syntax

cir *congested-cir*

no cir

Context

[Tree] (config>app-assure>group>policer>congestion-override cir)

Full Context

configure application-assurance group policer congestion-override cir

Description

This command provides a mechanism to configure the CIR for the congestion override policer. It is recommended that the CIR is configured larger than twice the maximum MTU for the traffic handled by the policer to allow for some burstiness of the traffic. The CIR is configurable for dual-bucket bandwidth policers only.

The **no** form of this command resets the CIR value to its default.

Default

cir 0

Parameters

congested-cir

Specifies an integer value defining size, in kilobytes, for the CIR of the policer.

Values 0 to 100000000

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

cir

Syntax

cir *cir-rate*

no cir

Context

7.84 cir-non-profiling

cir-non-profiling

Syntax

[**no**] **cir-non-profiling**

Context

[Tree] (config>qos>sap-ingress>queue cir-non-profiling)

Full Context

configure qos sap-ingress queue cir-non-profiling

Description

This command prevents the modification of the profile of a packet depending on the queue rate compared to its configured CIR. The CIR continues to be used to affect the scheduling priority of a queue. The **cir-non-profiling** command and the **queue police** command are mutually exclusive.

The **cir-non-profiling** command is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

The **cir-non-profiling** command should not be configured under a SAP ingress QoS policy queue associated with a LAG which spans FP4-based and FP2- or FP3-based hardware as the resulting operation could be different depending on which hardware type the traffic ingresses.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification circuit-id

configure subscriber-mgmt local-user-db ppp host host-identification circuit-id

Description

This command specifies the circuit ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the circuit ID is matched against DHCP Option 82.

Note:
This command is only used when **circuit-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the circuit ID from the configuration.

Parameters

ascii-string

Specifies the circuit ID from the Option 82, up to 127 characters.

hex-string

Specifies the circuit ID in hexadecimal format from the Option 82.

Values 0x0 to 0xFFFFFFFF (maximum 254 hex nibbles)

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option circuit-id

configure service ies interface dhcp option circuit-id

configure service vpls sap dhcp option circuit-id

Description

When enabled, the router sends an ASCII-encoded tuple in the **circuit-id** sub-option of the DHCP packet. This ASCII-tuple consists of the access-node-identifier, service-id, and SAP-ID, separated by "|". If no keyword is configured, then the circuit-id sub-option will not be part of the information option (Option 82). When the command is configured without any parameters, it equals to circuit-id ascii-tuple.

To send a tuple in the circuit ID, the **action replace** command must be configured in the same context.

If disabled, the **circuit-id** sub-option of the DHCP packet is left empty.

The **no** form of this command specifies to leave the circuit-id option of the packet empty.

Default

circuit-id ascii-tuple

Parameters

ascii-tuple

Specifies that the ASCII-encoded concatenated tuple consisting of the access-node-identifier, service-id, and interface-name is used.

ifindex

Specifies that the interface index is used. The If Index of a router interface can be displayed using the command **show>router>if>detail**.

sap-id

Specifies that the SAP identifier is used.

vlan-ascii-tuple

Specifies that the format will include VLAN-id and dot1p bits in addition to what is included in ascii-tuple already. The format is supported on dot1q and qinq ports only. Thus, when the Option 82 bits are stripped, dot1p bits are copied to the Ethernet header of an outgoing packet.

hex-string

Specifies the hex value of this option.

Values 0x0 to 0xFFFFFFFF...(up to 64 hex nibbles)

Context

[Tree] (config>router>ldp class-forwarding)

Full Context

configure router ldp class-forwarding

Description

This command enables class-based forwarding for packets that belong to one of the eight forwarding classes (be, l2, af, l1, h2, ef, h1, and nc). For the LER role, class-based forwarding is performed in conjunction with ECMP. At LER, this function applies to packets whose prefixes resolve to an LDP FEC. This LDP FEC resolves to a set of IGP shortcuts (RSVP-TE LSPs). At LSR, this function applies to labeled LDP packets whose FEC resolves to an IGP shortcut. Refer to "Class-based Forwarding of LDP Prefix Packets over IGP Shortcuts" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR MPLS Guide* for detailed information on this capability.

The **no** form of this command disables class-based forwarding.

Default

no class-forwarding

Parameters

cbf-mode lsr

Enables class-forwarding at LSR and disables any previously enabled mode.

cbf-mode ler

Enables class-forwarding at LER and disables any previously enabled mode.

cbf-mode lsr-and-ler

Enables class-forwarding at both LSR and LER, and disables any previously enabled mode.

class-forwarding

Syntax

[**no**] **class-forwarding**

Context

[Tree] (config>router class-forwarding)

Full Context

configure router class-forwarding

Description

This command enables class-based forwarding (CBF) over IGP shortcuts. When the **class-forwarding** command is enabled, the following types of packets are forwarded based on their forwarding class:

- packets of BGP prefixes
- CPM originated packets for the families (IPv4 only, IPv6 only, or both IPv4 and IPv6) which have been enabled over IGP shortcuts using the **igp-shortcut** CLI context in one or more IGP instances

The SR OS CBF implementation supports spraying of packets over a maximum of four forwarding sets of ECMP LSPs. The user must define a class-forwarding policy object in MPLS to configure the mapping of FCs to the forwarding sets. Then, the user assigns the CBF policy name and set ID to each MPLS LSP that is used in IGP shortcuts.

When a BGP IPv4 or IPv6 prefix is resolved, the FC of the packet is used to look up the forwarding set ID. Then, a modulo operation is performed on the tunnel next-hops of this set ID only, to spray packets of this FC. The data path concurrently implements CBF and ECMP within the tunnels of each set ID.

CPM-originated packets on the router, including control plane and OAM packets, are forwarded over a single LSP from the set of LSPs that the packet's FC is mapped to, as per the CBF configuration.

Note:
Weighted ECMP, at the transport tunnel level of BGP prefixes over IGP shortcuts and the CBF feature on a per BGP next-hop basis are mutually exclusive.

Default

no class-forwarding

Syntax

class-forwarding [**default-lsp** *lsp-name*]

no class-forwarding

Context

[Tree] (config>service>sdp class-forwarding)

Full Context

configure service sdp class-forwarding

Description

This command enables the forwarding of a service packet over the SDP based on the class of service of the packet. Specifically, the packet is forwarded on the RSVP LSP or static LSP whose forwarding class matches that of the packet. The user maps the system forwarding classes to LSPs using the **config>service>sdp>class-forwarding>fc** command. If there is no LSP that matches the packet's forwarding class, the default LSP is used. If the packet is a VPLS multicast/broadcast packet and the user did not explicitly specify the LSP to use under the **config>service>sdp>class-forwarding>multicast-lsp** context, then the default LSP is used.

VLL service packets are forwarded based on their forwarding class only if shared queuing is enabled on the ingress SAP. Shared queuing must be enabled on the VLL ingress SAP if class-forwarding is enabled on the SDP the service is bound to. Otherwise, the VLL packets will be forwarded to the LSP which is the result of hashing the VLL service ID. Since there are eight entries in the ECMP table for an SDP, one LSP ID for each forwarding class, the resulting load balancing of VLL service ID is weighted by the number of times an LSP appears on that table. For instance, if there are eight LSPs, the result of the hashing will be similar to when class based forwarding is disabled on the SDP. If there are fewer LSPs, then the LSPs which were mapped to more than one forwarding class, including the default LSP, will have proportionally more VLL services forwarding to them.

Class-based forwarding is not supported on a spoke SDP used for termination on an IES or VPRN service. All packets are forwarded over the default LSP.

The **no** form of the command deletes the configuration and the SDP reverts back to forwarding service packets based on the hash algorithm used for LAG and ECMP.

Default

no class-forwarding

Parameters

default-lsp *lsp-name*

Specifies the default LSP for the SDP. This LSP name must exist and must have been associated with this SDP using the *lsp-name* configured in the **config>service>sdp>lsp** context. The default LSP is used to forward packets when there is no available LSP which matches the packet's forwarding class. This could be because the LSP associated with the packet's forwarding class is down, or that the user did not configure a mapping of the packet's forwarding class to an LSP using the **config>service>sdp>class-forwarding>fc** command. The default LSP is also used to forward VPLS service multicast/broadcast packets in the absence of a user configuration indicating an explicit association to one of the SDP LSPs.

Note:
When the default LSP is down, the SDP is also brought down. The user will not be able to enter the class-forwarding node if the default LSP was not previously specified. In other words, the class-forwarding for this SDP will remain shutdown.

[Tree] (config>router>ospf>segm-rtng class-forwarding)

Full Context

configure router isis segment-routing class-forwarding

configure router ospf segment-routing class-forwarding

Description

This command enables Class Based Forwarding with ECMP for SR-ISIS or SR-OSPF resolved to RSVP-TE LSPs as IGP shortcuts. For CBF+ECMP to be effective, a class forwarding policy must be defined. In addition, FC to set associations and RSVP-TE LSPs to set associations must be defined.

The **no** form of this command disables Class Based Forwarding with ECMP for SR-ISIS or SR-OSPF resolved to RSVP-TE LSPs as IGP shortcuts.

Default

no class-forwarding

Platforms

All

7.91 class-forwarding-policy

class-forwarding-policy

Syntax

class-forwarding-policy *policy-name*

Full Context

configure router mpls class-forwarding-policy

Description

This command configures the class-based forwarding (CBF) policy used in the CBF feature of an LDP FEC or a BGP prefix over IGP shortcuts.

Parameters

policy-name

Specifies the name of the class forwarding policy, up to 32 characters.

Platforms

All

7.92 class-pool

class-pool

Syntax

[**no**] **class-pool** *alt-class-pool-id*

Context

[Tree] (config>qos>hs-port-pool-policy>alt-port-class-pools class-pool)

Full Context

configure qos hs-port-pool-policy alt-port-class-pools class-pool

Description

Commands in this context configure a class pool's parent mid-pool, dynamic port bandwidth weight, explicit percentage of mid-pool size, or a slope policy. Six alternate port-class pools always exist (one for each of the six scheduling classes) and do not need to be created.

The **no** form of the command restores the default **parent-mid-pool** association to **mid-pool none**, restores the default allocation **port-bw-weight 1** setting (**explicit-percent** disabled), and restores the default slope policy to the specified class-pool.

Parameters

alt-class-pool-id

Specifies the class pool ID.

Values 1 to 6

Platforms

7750 SR-7/12/12e

class-pool

Syntax

Full Context

configure router mpls lsp secondary class-type

configure router mpls lsp class-type

configure router mpls lsp-template class-type

configure router mpls lsp primary class-type

Description

This command configures the Diff-Serv Class Type (CT) for an LSP, the LSP primary path, or the LSP secondary path. The path level configuration overrides the LSP level configuration. However, only one CT per LSP path will be allowed as per RFC 4124.

The signaled CT of a dynamic bypass is always be CT0 regardless of the CT of the primary LSP path. The setup and hold priorities must be set to default values, that is, 7 and 0 respectively. This assumes that the operator configured a couple of TE classes, one which combines CT0 and a priority of 7 and the other which combines CT0 and a priority of 0. If not, the bypass LSP will not be signaled and will go into the down state.

The operator cannot configure the CT, setup priority, and hold priority of a manual bypass. They are always signaled with CT0 and the default setup and holding priorities.

The signaled CT and setup priority of a detour LSP must match those of the primary LSP path it is associated with.

If the operator changes the CT of an LSP or of an LSP path, or changes the setup and holding priorities of an LSP path, the path will be torn down and retried.

An LSP which does not have the CT explicitly configured will behave like a CT0 LSP when Diff-Serv is enabled.

If the operator configured a combination of a CT and a setup priority and/or a combination of a CT and a holding priority for an LSP path that are not supported by the user-defined TE classes, the LSP path will be kept in a down state and an error code will be displayed in the show command output for the LSP path.

The **no** form of this command reverts to the default value.

Default

class-type 0

Parameters

ct-number

Specifies the Diff-Serv Class Type number.

Values 0 to 7

Platforms

All

7.94 class-type-bw

class-type-bw

Syntax

class-type-bw ct0 *%-link-bandwidth* **ct1***%-link-bandwidth* **ct2***%-link-bandwidth* **ct3***%-link-bandwidth* **ct4***%-link-bandwidth* **ct5***%-link-bandwidth* **ct6***%-link-bandwidth* **ct7***%-link-bandwidth*

no class-type-bw

Context

[Tree] (config>router>rsvp>diffserv-te class-type-bw)

[Tree] (config>router>rsvp>interface class-type-bw)

Full Context

configure router rsvp diffserv-te class-type-bw

configure router rsvp interface class-type-bw

Description

This command configures the percentage of RSVP interface bandwidth each CT shares, for example, the Bandwidth Constraint (BC).

The absolute value of the CT share of the interface bandwidth is derived as the percentage of the bandwidth advertised by IGP in the Maximum Reservable Link Bandwidth TE parameter, for example, the link bandwidth multiplied by the RSVP interface **subscription** *percentage* parameter.

Note:
This configuration also exists at RSVP interface level and the interface specific configured value overrides the global configured value. The BC value can be changed at any time.

The RSVP interface **subscription** *percentage* parameter is configured in the **config>router>rsvp>interface** context.

The operator can specify the Bandwidth Constraint (BC) for a CT which is not used in any of the TE class definition but that does not get used by any LSP originating or transiting this node.

When Diff-Serv is disabled on the node, this model degenerates into a single default CT internally with eight preemption priorities and a non-configurable BC equal to the Maximum Reservable Link Bandwidth. This would behave exactly like CT0 with eight preemption priorities and BC= Maximum Reservable Link Bandwidth if Diff-Serv was enabled.

The **no** form of this command reverts to the default value.

Parameters

ct0 (ct1/ct2/ —ct7) %*link-bandwidth*

The Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

Values 0 to 100 %

Default 0

[Tree] (config>router>nat>inside>deterministic classic-lsn-max-subscriber-limit)

[Tree] (config>service>vprn>nat>inside>deterministic classic-lsn-max-subscriber-limit)

Full Context

configure router nat inside deterministic classic-lsn-max-subscriber-limit

configure service vprn nat inside deterministic classic-lsn-max-subscriber-limit

Description

This command affects ingress hashing of the subscribers for deterministic NAT. It will also affect hashing of the subscribers for non-deterministic NAT if the both types of NAT are configured simultaneously. The hashing will ensure that traffic load is distributed over multiple MS-ISAs in the system. For deterministic LSN44, (32 – n) bits of the source IP address will be considered for hashing, where 2^n= classic-lsn-max-subscriber-limit.

The scope of this command is the inside routing instance. This command must match the largest subscriber limit of all pools that are referenced by nat-policies configured within the corresponding inside routing instance.

This parameter must be configured before any prefix is configured and can be modified only if there are no prefixes configured under the deterministic NAT CLI hierarchy.

If non-deterministic NAT is not used simultaneously with deterministic NAT within a routing context, then hashing for non-deterministic NAT will be performed based on the subscriber.

Default

no classic-lsn-max-subscriber-limit

Parameters

max

The power of 2 (2^n) number that must match the largest subscriber limit number in a deterministic pool referenced from this inside routing instance. The range for this command is the same as the subscriber-limit command under the pool hierarchy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

classic-lsn-max-subscriber-limit

Syntax

classic-lsn-max-subscriber-limit *max*

no classic-lsn-max-subscriber-limit

Context

[Tree] (config>router>nat>inside classic-lsn-max-subscriber-limit)

[Tree] (config>service>vprn>nat>inside classic-lsn-max-subscriber-limit)

Full Context

configure router nat inside classic-lsn-max-subscriber-limit

configure service vprn nat inside classic-lsn-max-subscriber-limit

Description

This command sets the granularity of traffic distribution in the upstream direction across the MS-ISA within the scope of an inside routing context. Traffic distribution mechanism is based on the source IPv4 addresses/prefixes. More granular distribution is based on the IPv4 address, while distribution based on the IPv4 prefix (determined by prefix length) will be less granular. The granularity will further decrease with shorter prefix length.

For example, a prefix length of 32 will distribute individual /32 IPv4 addresses over multiple MS-ISAs in an ISA group. This will ensure better traffic load balancing at the expense of forwarding table utilization on the outside (public side) where each /32 is installed in the forwarding table. On the contrary, shorter prefixes will ensure better utilization of the forwarding table on the outside, at the expense of coarser spread of IP addresses over multiple MS-ISAs.

This command affects all flavors of LSN44 within the inside routing contexts, although its primary use is intended for deterministic NAT and dnat-only.

The length of the prefix that is used for distribution purposes is (32-n), where 2^n= classic-lsn-max-subscriber-limit. For example, if traffic distribution is based on the IPv4 address (prefix length = 32), then n must be 0. From here, it follows that classic-lsn-max-subscriber-limit must be set to 1:

Prefix length = 32 -> 32-n = 32 -> n=0 -> 2^0= 1 = *classic-lsn-max-subscriber-limit classic-lsn-max-subscriber-limit* = 1

The implicit method given by this command uses power of 2 calculations to provide prefix length for traffic distribution purposes. This roundabout approach to determine the prefix-length has roots in deterministic NAT where this command was originally introduced.

Even though deterministic NAT and dnat-only have very little in common, the method (and CLI syntax) for calculating the prefix length using the classic-lsn-max-subscriber-limit parameter for traffic distribution purposes is shared between the two. In dnat-only, this parameter is important from an operational perspective since it affects traffic load balancing over MS-ISA and the size of the routing table.

This command must be configured before any prefix is configured and can be modified only if there are no prefixes configured under the deterministic NAT.

Parameters

max

The power of 2 (2^n) value which in deterministic NAT must match the largest subscriber-limit value in any deterministic pool referenced from this inside routing instance.

In **dnat-only**, this value can be set to any value from the allowed range.

In both cases, this value will determine the prefix-length (17-32) that will directly influence load distribution between the MS-ISAs and the size of the routing table.

Values 1,2,4,8 to 32768

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure system security cli-script authorization cron cli-user

Description

This command configures the user context under which various types of CLI scripts should execute in order to authorize the script commands. TACACS+ and RADIUS users and authorization are not permitted for **cli-script** authorization.

The **no** form of this command configures scripts to execute with no restrictions and without performing authorization.

Default

no cli-user

Parameters

user-name

The name of a user in the local node database. TACACS+ or RADIUS users can not be used. The user configuration should reference a valid local profile for authorization.

Platforms

All

7.113 client

client

Syntax

client *client-index* [**create**]

no client *client-index*

Context

[Tree] (config>ipsec>client-db client)

Full Context

configure ipsec client-db client

Description

This command creates a new IPsec client entry in the client-db or enters the configuration context of an existing client entry.

There may be multiple client entries defined in the same client-db. If there are multiple entries that match the new tunnel request, then the system will select the entry that has smallest client-index.

The **no** form of this command reverts to the default.

Parameters

client-index

Specifies the ID of the client entry.

Values 1 to 8000

create

Keyword used to create the security policy instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

client

Syntax

client all

client *ip-address*

no client

Context

[Tree] (debug>system>grpc client)

Full Context

debug system grpc client

Description

This command enables debug output for all clients for a particular client.

The **no** form of this command deactivates debugging for all clients.

Parameters

all

Specifies that debugging will occur for all clients.

ip-address

Specifies the IPv4 or IPv6 address of the client.

Platforms

All

client

Syntax

client

Context

[Tree] (config>system>security>ssh>key-re-exchange client)

Full Context

configure system security ssh key-re-exchange client

Description

Commands in this context enable the key re-exchange for SR OS as an SSH client.

configure service vprn subscriber-interface local-address-assignment client-application

configure service ies subscriber-interface group-interface local-address-assignment client-application

configure service ies subscriber-interface local-address-assignment client-application

Description

This command enables local DHCP Server pool management for PPPoXv4 clients.

A pool of IP addresses can be shared between IPoE clients that rely on DHCP protocol (lease renewal process) and PPPoX clients where address allocation is not dependent on DHCP messaging but instead an IP address allocation within the pool is tied to the PPPoX session.

The **no** form of this command disables Local Address Assignment for any protocol.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

client-application

Syntax

client-application [**ppp-slaac**] [**ipoe-wan**] [**ipoe-slaac**]

no client-application

Context

[Tree] (config>service>vprn>sub-if>grp-if>lcl-addr-assign>ipv6 client-application)

Full Context

configure service vprn subscriber-interface group-interface local-address-assignment ipv6 client-application

Description

This command defines the client application that uses the local address server to perform address assignment. This feature is relies on RADIUS or local-user-database to return a pool name. The pool name is matched again the pools defined in the local-dhcp6-server configuration. The name of the local-dhcp6-server must also be provisioned.

The **no** form of this command reverts to the default.

Parameters

ppp-slaac

Indicates using the local DHCPv6 prefix pool to assign SLAAC prefixes for hosts. The pool name where the prefixes are used for SLAAC prefix assignment are obtained from RADIUS or local-user-database during the authentication process. The RADIUS attribute Alc-slaac-ipv6-pool is used to indicate the SLAAC pool name for PPPoE hosts.

ipoe-wan

Indicates using the local DHCPv6 pool for IA_NA address assignment and a static pre-defined prefixes for IA_PD. Both the IA_NA pool name and the IA_PD static framed-prefix are either obtained from RADIUS or LUDB during authentication. With RADIUS, it must return both IA_NA Framed-IPv6-Pool and IA_PD Delegated-IPv6-Prefix after a successful authentication. With LUDB, it must have ipv6-wan-address-pool and ipv6-delegated-prefix populated. This feature is specific to this use case and is not required for other combinations of DHCPv6 assignments such as IA_NA and IA_PD address assignment through RADIUS or LUDB.

ipoe-slaac

Indicates using the local DHCPv6 prefix pool to assign SLAAC prefixes for hosts. The pool name where the prefixes are used for SLAAC prefix assignment are obtained from RADIUS or local-user-database during the authentication process. The RADIUS attribute Alc-slaac-ipv6-pool is used to indicate the SLAAC pool name for PPPoE hosts.

configure service ies subscriber-interface group-interface ipv6 dhcp6 relay client-applications

configure service vprn subscriber-interface group-interface dhcp client-applications

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay client-applications

Description

This command enables DHCP relay and proxy-server for the configured client types.

The **no** form of this command reverts to the default.

Default

dhcp

Parameters

dhcp

Enables IPoE clients to use the DHCP relay or proxy-server.

ppp

Enables PPPoE clients to use the DHCP relay or proxy-server that PPPoE attempts to request an IP address for a PPPoE client from the DHCP server assigned to PPPoE node.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

7.116 client-cert-subject-key-id

client-cert-subject-key-id

Syntax

[**no**] **client-cert-subject-key-id**

Context

[Tree] (config>ipsec>rad-auth-plcy>include client-cert-subject-key-id)

Full Context

configure ipsec radius-authentication-policy include-radius-attribute client-cert-subject-key-id

Description

This command enables the inclusion of the Subject Key Identifier of the peer's certificate in the RADIUS Access-Request packet as VSA: Alc-Subject-Key-Identifier. Refer to the *7750 SR and VSR RADIUS Attributes Reference Guide* for more information.

Default

no client-cert-subject-key-id

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

client-cipher-list

Syntax

client-cipher-list

Context

[Tree] (config>system>security>ssh client-cipher-list)

Full Context

configure system security ssh client-cipher-list

Description

Commands in this context configure a list of allowed ciphers by the SSH client.

Platforms

All

client-cipher-list

Syntax

client-cipher-list *name* [**create**]

no client-cipher-list *name*

Context

[Tree] (config>system>security>tls client-cipher-list)

Full Context

configure system security tls client-cipher-list

Description

This command creates a cipher list that the client sends to the server in the client Hello message. It is a list of ciphers that are supported and preferred by the SR OS to be used in the TLS session. The server matches this list against the server cipher list. The most preferred cipher found in both lists is chosen.

Parameters

name

Specifies the name of the client cipher list, up to 32 characters in length.

create

Keyword used to create the client cipher list.

Platforms

All

7.118 client-db

client-db

Syntax

client-db *db-name* [**create**]

no client-db *db-name*

Context

[Tree] (config>ipsec client-db)

Full Context

configure ipsec client-db

Description

This command creates a new IPsec client-db or enters the configuration context of an existing client-db.

An IPsec client-db can be used for IKEv2 dynamic LAN-to-LAN tunnel authentication and authorization. When a new tunnel request is received, the system will match the request to the client entries configured in client-db and use credentials returned by the matched client entry for authentication. If authentication

succeeds, the system could also use the IPsec configuration parameters (such as **private-service-id**) returned by the matched entry to set up the tunnel.

The configured client-db is referenced under the ipsec-gw configuration context using the **client-db** command.

The **no** form of this command removes the *db-name* from the configuration.

Parameters

db-name

Specifies the name of this IPsec client up to 32 characters.

create

Keyword used to create the security policy instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

client-db

Syntax

client-db *name*

client-db *name* **fallback**

client-db *name* **no-fallback**

no client-db

Context

[Tree] (config>service>vprn>if>sap>ipsec-gw client-db)

[Tree] (config>service>ies>if>sap>ipsec-gw client-db)

Full Context

configure service vprn interface sap ipsec-gw client-db

configure service ies interface sap ipsec-gw client-db

Description

This command enables the use of an IPsec client database. The system uses the specified client database to authenticate IKEv2 dynamic LAN-to-LAN tunnel.

Default

no client-db

Parameters

name

Specifies the name of the client database.

fallback

Specifies whether or not this IPsec gateway falls back to the default authentication policy when the IPsec tunnel authentication request fails to match any clients in the IPsec database.

no-fallback

Specifies that if the client database lookup fails to return a matched result, the system will fail the tunnel setup.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

client-db

Syntax

[**no**] **no client-db** *db-name*

Context

[Tree] (debug>ipsec client-db)

Full Context

debug ipsec client-db

Description

This command enables debugging for the specified IPsec client-db.

Parameters

db-name

Specifies the IPsec client database name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

7.119 client-down-delay

client-down-delay

Syntax

client-down-delay *client-down-delay*

no client-down-delay

Context

[Tree] (config>system>satellite>eth-sat client-down-delay)

Full Context

configure system satellite eth-sat client-down-delay

Description

This command sets the delay between the last available uplink becoming unavailable and the disabling of associated Ethernet satellite client ports.

The **no** form of this command disables the delay and reverts to the current behavior.

Default

no client-down-delay

Parameters

client-down-delay

Sets the number of seconds to wait between the last available uplink becoming unavailable and the disabling of associated ethernet satellite client ports.

Values 0 to 1800

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

7.120 client-group-list

client-group-list

Syntax

client-group-list *name* [**create**]

no client-group-list *name*

Context

[Tree] (config>system>security>tls client-group-list)

Full Context

configure system security tls client-group-list

Description

This command configures a list of group suite codes that the client sends in a client Hello message.

The **no** form of this command removes the client group list.

Parameters

name

Specifies the name of the client group list, up to 32 characters.

create

Keyword used to create the client group list.

Platforms

All

7.121 client-id

client-id

Syntax

client-id {**mac-pppoe-session-id**}

no client-id

Context

[Tree] (config>service>vprn>sub-if>grp-if>pppoe>dhcp-client client-id)

[Tree] (config>service>ies>sub-if>grp-if>pppoe>dhcp-client client-id)

Full Context

configure service vprn subscriber-interface group-interface pppoe dhcp-client client-id

configure service ies subscriber-interface group-interface pppoe dhcp-client client-id

Description

This command inserts a DHCP client identifier option 61 in DHCP client messages for PPPoE sessions that obtain IPv4 addresses from a third party DHCP server. By default, a DHCP client identifier option 61 is not included.

The **no** form of this command reverts to the default.

Default

no client-id

Parameters

mac-pppoe-session-id

Specifies that the DHCP client identifier option 61 contains a type value with type set to zero (1 octet) and value set to the PPPoE client MAC address (6 octets) and the PPPoE session ID (2 octets). For example:

Opt 61 (hex) = 00 00 10 94 A0 45 E5 00 01

where:

00 = type

00 10 94 A0 45 E5 = PPPoE client MAC address

00 01 = PPPoE session ID

configure system security pki est-profile client-tls-profile

Description

This command configures the TLS client profile to be assigned to applications for encryption. The profile creates the TLS connection to the EST server.

The **no** form of this command removes the name from the configuration.

Default

no client-tls-profile

Parameters

name

Specifies the name of the client TLS profile, up to 32 characters

Platforms

All

client-tls-profile

Syntax

client-tls-profile *name* [**create**]

no client-tls-profile *name*

Context

[Tree] (config system security tls client-tls-profile)

Full Context

configure system security tls client-tls-profile

Description

This command configures the TLS client profile to be assigned to applications for encryption.

Parameters

name

Specifies the name of the client TLS profile, up to 32 characters in length.

create

Keyword used to create the client TLS profile.

Platforms

All

client-tls-profile

Syntax

client-tls-profile *name*

no client-tls-profile

Context

[Tree] (config system management-interface remote-management client-tls-profile)

Full Context

configure system management-interface remote-management client-tls-profile

Description

This command configures the TLS client profile used for encryption by all remote managers. This command and **allow-unsecure-connection** are mutually exclusive.

If this command is also configured for a specific manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command causes the profile configuration not to be used.

Parameters

name

Specifies the name of the client TLS profile, up to 32 characters.

Platforms

All

client-tls-profile

Syntax

client-tls-profile *name*

no client-tls-profile

Context

[Tree] (config system management-interface remote-management manager client-tls-profile)

Full Context

configure system management-interface remote-management manager client-tls-profile

Description

This command configures the TLS client profile used for encryption by this remote manager. This command and **allow-unsecure-connection** are mutually exclusive.

This command takes precedence over the same command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command causes the profile configuration to be inherited from the global context (**config**>**system**>**management-interface**>**remote-management**).

Parameters

name

Specifies the name of the client TLS profile, up to 32 characters.

Platforms

All

7.133 clli-code

clli-code

Syntax

clli-code *clli-code*

no clli-code

Context

[Tree] (config>system clli-code)

Full Context

configure system clli-code

Description

This command creates a Common Language Location Identifier (CLLI) code string for the SR-series router. A CLLI code is an 11-character standardized geographic identifier that uniquely identifies geographic locations and certain functional categories of equipment unique to the telecommunications industry.

No CLLI validity checks other than truncating or padding the string to eleven characters are performed.

Only one CLLI code can be configured, if multiple CLLI codes are configured the last one entered overwrites the previous entry.

The **no** form of the command removes the CLLI code.

Default

no clli-code

Parameters

clli-code

Specifies the 11 character string CLLI code. Any printable, seven bit ASCII characters can be used within the string. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. If more than 11 characters are entered, the string is truncated. If less than 11 characters are entered the string is padded with spaces.

Platforms

7.134 clock-offset

clock-offset

Syntax

clock-offset *seconds*

no clock-offset

Context

[Tree] (config>oam-pm>session>meas-interval clock-offset)

Full Context

configure oam-pm session meas-interval clock-offset

Description

This command allows measurement intervals with a boundary-type of clock aligned to be offset from the default time of day clock. The configured offset must be smaller than the size of the measurement interval. As an example, an offset of 120 (seconds) shifts the start times of the measurement intervals by two minutes from their default alignments with respect to the time of day clock.

The **no** form of this command sets the offset to 0.

Default

clock-offset 0

Parameters

seconds

Specifies the number of seconds to offset a clock-alignment measurement interval from its default.

Values 0 to 86399

Default 0

Platforms

All

7.135 clock-source

clock-source

Syntax

clock-source {**loop-timed** | **node-timed**}

Context

[Tree] (config>port>sonet-sdh clock-source)

Full Context

configure port sonet-sdh clock-source

Description

This command configures the clock to be used for transmission of data out towards the line. The options are to use the locally recovered clock from the line's receive data stream or the node central reference.

When changing the clock source for a port on an OC-48 MDA, a brief transmit interruption can occur on all ports of that MDA. Note that all SONET/SDH MDAs support loop timing.

The **node-timed** parameter in this command is supported by TDM satellite.

Parameters

loop-timed

The link recovers the clock from the received data stream.

node-timed

The link uses the internal clock when transmitting data.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

clock-source

Syntax

clock-source {**loop-timed** | **node-timed** | **adaptive** | **differential**}

Context

[Tree] (config>port>tdm>e1 clock-source)

[Tree] (config>port>tdm>e3 clock-source)

[Tree] (config>port>tdm>ds3 clock-source)

Full Context

configure port tdm e1 clock-source

configure port tdm ds1 clock-source

configure port tdm e3 clock-source

configure port tdm ds3 clock-source

Description

This command configures the clock to be used for transmission of data out towards the line. The options are to use the locally recovered clock from the line's receive data stream, the node central reference, or an adaptively recovered clock using the received packets.

The following tables show MDAs that support loop timing at DS3/E3 and DS1/E1 channelization options.

TDM DS3/E3	LoopTimed	Default
Channelized OC-12	No	node-timed
Channelized OC-3	No	node-timed
Channelized DS3/E3	No	node-timed
Channelized ASAP OC-12	Yes	node-timed
Channelized ASAP OC-3	Yes	node-timed
Channelized ASAP DS3/E3	Yes	node-timed
CES OC-3	Yes	node-timed

TDM DS1/E1	LoopTimed	Default
Channelized OC-12	Yes	loop-timed
Channelized OC-3	Yes	loop-timed
Channelized DS3/E3	Yes	loop-timed
Channelized ASAP OC-12	Yes	loop-timed
Channelized ASAP OC-3	Yes	loop-timed
Channelized ASAP DS3/E3	Yes	loop-timed
CES OC-3	Yes	loop-timed

Parameters

loop-timed

The link recovers the clock from the received data stream.

node-timed

The link uses the internal clock when transmitting data.

adaptive

The clock is adaptively recovered from the rate at which data is received and not from the physical layer. Adaptive timing is only supported on ds1 and e1 channels.

differential

The clock is recovered from differential RTP timestamp header. Differential timing is only supported on ds1 and e1 channels.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

7.136 clock-type

clock-type

Syntax

clock-type boundary

clock-type ordinary {**master** | **slave**}

Context

[Tree] (config>system>ptp clock-type)

Full Context

configure system ptp clock-type

Description

This command configures the type of clock. The clock type can only be changed when PTP is shutdown.

The clock type cannot be changed to ordinary timeTransmitter if the PTP reference is **no shutdown**. In addition, the clock type cannot be changed to ordinary timeTransmitter if there are peers configured. The clock type is restricted based on the profile. See the **profile** command description for the details of the restrictions.

When enabling a PTP with clock-type boundary, at least one reference into the central frequency clock must be enabled using the **configure system sync-if-timing [bits |ref1 |ref2 | ptp| synce]** command.

Default

clock-type ordinary slave

Parameters

boundary

Specifies that the system is a boundary clock, which may be anywhere in the PTP clock hierarchy. It can obtain timing from a timeTransmitter clock, and provide timing to multiple timeReceiver clocks concurrently.

ordinary master

Specifies that the system is a grandmaster clock in the PTP hierarchy. The system provides timing to multiple timeReceiver clocks in the network.

ordinary slave

Specifies that the system is always a timeReceiver clock in the PTP hierarchy. The system derives its timing from one or more timeTransmitter clocks in the network.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

7.138 cluster

cluster

Syntax

cluster *cluster-id*

no cluster

Context

[Tree] (config>subscr-mgmt>bgp-prng-plcy cluster)

Full Context

configure subscriber-mgmt bgp-peering-policy cluster

Description

This command configures the cluster ID for a route reflector server.

Route reflectors are used to reduce the number of IBGP sessions required within an AS. Normally, all BGP speakers within an AS must have a BGP peering with every other BGP speaker in an AS. A route reflector and its clients form a cluster. Peers that are not part of the cluster are considered to be non-clients.

When a route reflector receives a route, first it must select the best path from all the paths received. If the route was received from a non-client peer, then the route reflector sends the route to all clients in the cluster. If the route came from a client peer, the route reflector sends the route to all non-client peers and to all client peers except the originator.

For redundancy, a cluster can have multiple route reflectors.

Confederations can also be used to remove the full IBGP mesh requirement within an AS.

The **no** form of this command deletes the cluster ID and effectively disables the Route Reflection for the given group.

Parameters

cluster-id

Specifies the route reflector cluster ID is expressed in dot decimal notation.

Values Any 32 bit number in dot decimal notation. (0.0.0.1 to 255.255.255.255)

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

For redundancy, a cluster can have multiple route reflectors.

Confederations can also be used to remove the full IBGP mesh requirement within an AS.

The **no** form of this command deletes the cluster ID and effectively disables the Route Reflection for the given group.

Default

no cluster — No cluster ID is defined.

Parameters

cluster-id

The route reflector cluster ID is expressed in dot decimal notation.

Values Any 32 bit number in dot decimal notation. (0.0.0.1 to 255.255.255.255)

Platforms

All

cluster

Syntax

cluster *cluster-id* **orr-location** *location-id* [**allow-local-fallback**]]

Context

[Tree] (config>router>bgp cluster)

Full Context

configure router bgp cluster

Description

This command configures the cluster ID for a route reflector server ID and implicitly configures the associated BGP sessions as route reflector clients of the BGP instance. If an ORR location ID is specified with the cluster ID, the clients in that cluster receive routes optimal for that specific location; refer to *draft-ietf-idr-bgp-optimal-route-reflection* for more information.

Route reflectors are used to reduce the number of IBGP sessions required within an AS. Normally, all BGP speakers within an AS must have a BGP peering with every other BGP speaker in an AS. A route reflector and its clients form a cluster. Peers that are not part of the cluster are considered to be non-clients.

When a route reflector receives best path from a non-client peer, it sends the route to all clients. When the route reflector receives a best path from a client peer it sends the route to all non-client and all client peers except the originator.

With optimal route reflection, the best path advertised to a client takes location ID into account, which means that if the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs will be calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF/OSPFv3, IS-IS, or BGP-LS information in the TE DB.

Default

no cluster

Parameters

ip-address

Specifies the route reflector cluster ID is expressed in dot decimal notation.

Values Any 32 bit number in dot decimal notation. (0.0.0.1 to 255.255.255.255)

orr-location location-id

Specifies the optimal route reflection location index for this set of route reflector clients.

Values 1 to 255

allow-local-fallback

Controls the behavior when there are no BGP routes to advertise to the RR clients that are reachable from the perspective of their ORR location. If this option is configured, the RR is allowed (in this circumstance only), to advertise the best reachable BGP path from its own topology location. If this option is not configured and this situation applies, then no route is advertised to the clients.

Full Context

configure router bgp group neighbor cluster

configure router bgp group cluster

Description

This command configures the cluster ID for a route reflector server ID and implicitly configures the associated BGP sessions as route reflector clients of the BGP instance. If an ORR location ID is specified with the cluster ID, the clients in that cluster receive routes optimal for that specific location; see *draft-ietf-idr-bgp-optimal-route-reflection* for more information.

Route reflectors are used to reduce the number of IBGP sessions required within an AS. Normally, all BGP speakers within an AS must have a BGP peering with every other BGP speaker in an AS. A route reflector and its clients form a cluster. Peers that are not part of the cluster are considered to be non-clients.

When a route reflector receives best path from a non-client peer, it sends the route to all clients. When the route reflector receives a best path from a client peer it sends the route to all non-client and all client peers except the originator.

With optimal route reflection, the best path advertised to a client takes location ID into account, which means that if the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs

will be calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF/OSPFv3, IS-IS, or BGP-LS information in the TE DB.

The **no** form of this command deletes the cluster ID and effectively disables route reflection for the group.

Default

no cluster

Parameters

ip-address

Specifies the route reflector cluster ID is expressed in dot decimal notation.

Values Any 32 bit number in dot decimal notation. (0.0.0.1 to 255.255.255.255)

orr-location location-id

Specifies the optimal route reflection location index for this set of route reflector clients.

Values 1 to 255

allow-local-fallback

Controls the behavior when there are no BGP routes to advertise to the RR clients that are reachable from the perspective of their ORR location. If this option is configured, the RR is allowed (in this circumstance only), to advertise the best reachable BGP path from its own topology location. If this option is not configured and this situation applies, then no route is advertised to the clients.

7.139 cluster-id

cluster-id

Syntax

cluster-id *ip-address/mask* [*ip-address/mask*]

cluster-id none

no cluster-id

Context

[Tree] (config>router>policy-options>policy-statement>entry>from cluster-id)

Full Context

configure router policy-options policy-statement entry from cluster-id

Description

This command enables BGP routes to be matched based on the IP addresses encoded in the CLUSTER_LIST attribute.

The first i*p-address/mask pair* is matched against the most recently added cluster ID. Each subsequent *ip-address/mask* pair is tested against the next most recent cluster ID.

For example, to match all routes reflected by the RR with cluster ID 1.1.1.1 and then any other RR before reaching the router where the policy is applied, use the command **cluster-id 0.0.0.0/0 1.1.1.1/32**.

Note:
The command matches routes with two or more cluster IDs; the third and older cluster IDs are not evaluated and are automatically considered matching.

The **cluster-id none** form of this command only matches BGP routes without any CLUSTER_LIST attribute.

A non-BGP route does not match a policy entry if it contains the **cluster-id** command.

Default

no cluster-id

Parameters

ip-address

Specifies the 32-bit cluster ID in dotted decimal notation.

Values a.b.c.d

mask

Specifies a bit mask to apply to the *ip-address* parameter.

Values 0 to 32 (0 is only allowed if the *ip-address* is 0.0.0.0)

none

Specifies that only BGP routes without a CLUSTER_LIST attribute should be matched.

Full Context

configure port ethernet eth-cfm mep collect-lmm-stats

configure router interface eth-cfm mep collect-lmm-stats

configure lag eth-cfm mep collect-lmm-stats

Description

This command enables the collection of statistics on the facility MEPs. This command is an object under the Facility MEP. This is at a different level of the hierarchy than collection of lmm statistics for service SAPs and MPLS SDP Bindings. The show mep command can be used to determine is the Facility MEP is collecting stats.

The **no** form of this command disables and deletes the counters for this SAP, Binding or facility.

Default

no collect-lmm-stats

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vpls sap eth-cfm collect-lmm-stats

configure service epipe sap eth-cfm collect-lmm-stats

configure service vpls mesh-sdp eth-cfm collect-lmm-stats

Description

This command enables the collection of statistics on the SAP or MPLS SDP binding on which the ETH-LMM test is configured. The collection of LMM statistics must be enabled if a MEP is launching or responding to ETH-LMM packets. If LMM statistics collection is not enabled, the counters in the LMM and LMR PDU do not represent accurate measurements and all measurements should be ignored. The **show sap-using eth-cfm collect-lmm-stats** command and the **show sdp-using eth-cfm collect-lmm-stats command** can be used to display entities that are collecting stats.

The **no** form of this command disables and deletes the counters for this SAP or MPLS SDP binding.

collector

Syntax

collector router *router-instance* **ip** *ip-address* [**create**]

no collector router *router-instance* **ip** *ip-address*

Context

[Tree] (config>service>ipfix>export-policy collector)

Full Context

configure service ipfix ipfix-export-policy collector

Description

This command defines an external collector node that will collect IPFIX records sent by 7750 SR node. The IPFIX records will be streamed to the collector node using UDP transport. Traffic is originated from a random ephemeral UDP port to the destination port 4739. Up to two collector nodes can be defined for redundancy purposes.

UDP streams are stateless due to the significant volume of transactions. However they do contain 32bit sequence numbers such that packet loss can be identified.

Multiple IPFIX records are sent in a single UDP packet. UDP packet transmission is triggered when the packet size containing IPFIX records exceeds the configured MTU value or the internal timer which is set to 250ms, whichever occurs first.

Parameters

router *router-instance*

Router instance from which the collector node is reachable.

Values

<router-name> | <service-id>

router-name: "Base"

service-id: 1 to 2147483647

ip ip-address

IPv4 address of the external collector node to which IPFIX records will be sent.

create

Keyword used to create the collector instance.

Platforms

All

no collector service-name *service-name* **ip** *ip-address*

Context

[Tree] (config>service>nat>syslog>syslog-export-policy collector)

Full Context

configure service nat syslog syslog-export-policy collector

Description

This command defines an external collector node that collects syslog records. The syslog records are streamed to the collector node using UDP transport. Traffic is originated from a random ephemeral UDP port to the destination port 514. Up to two collector nodes can be defined for redundancy purposes.

Stateless UDP streams are used as transport due to the significant volume of transactions. However, they do contain 32-bit sequence numbers so packet loss can be identified. The sequence numbers are generated per BB-ISA per collector, and within each stream they are monotonically increased by 1. Overlapping sequence numbers between BB-ISAs can be differentiated by the MDA ID field carried in the syslog message.

Multiple syslog records are sent in a single UDP packet. UDP packet transmission is triggered when the packet size containing syslog records exceeds the configured MTU value or the configurable timer, whichever occurs first.

The **no** form of the command removes the parameters from the configuration.

Parameters

router-name

Specifies the router instances from which the collector node is reachable.

ip-address

Specifies the IPv4 address of the external collector node to which the syslog records are sent.

service-name

Specifies the service name from which the collector node is reachable.

create

Keyword used to create the collector instance.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

collector

Syntax

collector *ip-address*[:*port*] [**version** *version*]

no collector *ip-address*[:*port*]

Context

[Tree] (config>cflowd collector)

Full Context

configure cflowd collector

Description

This command defines a flow data collector for cflowd data. The IP address and version of the flow collector must be specified. The UDP port number is an optional parameter. If it is not set, the default of 2055 is used for all collector versions. To connect to an IPFIX (version 10) collector using the IPFIX default port, specify port 4739 when defining the collector. A maximum of eight collectors can be configured.

The **no** form of this command removes the flow collector definition from the config and stops the export of data to the collector. The collector needs to be shut down to be deleted.

Parameters

ip-address

Specifies the address of a remote cflowd collector host to receive the exported cflowd data.

Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x-[interface]

port

Specifies the UDP port number on the remote cflowd collector host to receive the exported cflowd data.

Values 1 to 65535

Default 2055

version

Specifies the version of the flow data collector.

Values 5, 8, 9, 10

Default 5

Platforms

All

Syntax

collector *collector-id* [**create**]

no collector *collector-id*

Context

[Tree] (config>app-assure>group>cflowd>direct-export collector)

Full Context

configure application-assurance group cflowd direct-export collector

Description

This command configures the Cflowd direct export collector.

The system uses the collectors when the Cflowd admin state shuts down and then re-enabled (**no shutdown** state). The system re-assigns the collectors to the groups or AA-ISAs or when a Cflowd collector ID is created. The collector IDs are used when a new group is added later.

When a collector ID is removed, the groups (AA-ISAs) that are assigned to this collector are removed and assigned to another available collector. The affected ISAs reset their collector statistics as they change to the new collector.

In addition, a Cflowd collector assignment to a group or AA-ISA is done only in the following conditions:

- the admin state is in a **no shutdown** state for the AA group or the AA group Cflowd
- a collector is available under the AA group with at least one address in a **no shutdown** admin state

If an AA group or AA-ISA is assigned a collector, shutting down, or the group unassigns the group from the cflowd collector.

The **no** form of this command removes the collector ID from the configuration.

Parameters

collector-id

Specifies the Cflowd direct export collector ID.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Syntax

combined-max-sessions *number-of-sessions*

no combined-max-sessions

Context

[Tree] (config>system>security>cli-session-group combined-max-sessions)

[Tree] (config>system>security>profile combined-max-sessions)

Full Context

configure system security cli-session-group combined-max-sessions

configure system security profile combined-max-sessions

Description

This command is used to limit the number of combined SSH/TELNET based sessions available to all users that are part of a specific profile, or to all users of all profiles that are part of the same **cli-session-group**.

The **no** form of this command disables the command and the profile or group limit is not applied to the number of combined sessions.

Default

no combined-max-sessions

Parameters

number-of-sessions

Specifies the maximum number of allowed combined SSH/TELNET based sessions.

Values 0 to 50

Platforms

command-accounting-during-load

Syntax

[**no**] **command-accounting-during-load**

Context

[Tree] (config>system>security>management-interface>md-cli command-accounting-during-load)

Full Context

configure system security management-interface md-cli command-accounting-during-load

Description

This command controls command accounting performed on the contents of a file loaded using the MD-CLI **load** or **rollback** command.

When enabled, all commands in the loaded file are logged, which may decrease the system response time with large files.

When disabled, command accounting is not performed during a load or rollback operation, which may increase the system response time by reducing the number of command accounting messages, especially when remote AAA servers are used.

The **load** or **rollback** command itself is always logged.

The **no** form of this command disables command accounting during a load or rollback operation.

Default

command-accounting-during-load

commit

Syntax

commit

Context

[Tree] (config>app-assure>group>policy commit)

Full Context

configure application-assurance group policy commit

Description

This command commits changes made during the current editing session. None of the policy changes done will take effect until commit command is issued. If the changes can be successfully committed, no errors detected during the commit during cross-reference verification against exiting application assurance configuration, the editing session will also be closed.

The newly committed policy takes effect immediately for all new flows, existing flows will transition onto the new policy shortly after the commit.

Default

commit

Platforms

All

commit

Syntax

commit [**confirmed** *timeout*] [**comment** *comment*]

commit no-checkpoint [**confirmed** *timeout*]

Context

[Tree] (candidate commit)

Full Context

candidate commit

Description

This command applies the changes in the candidate configuration to the active running configuration. The candidate changes will take operational effect.

If a commit operation is successful then all of the candidate changes will take operational effect and the candidate is cleared. If there is an error in the processing of the commit, or a 'commit confirmed' is not confirmed and an auto-revert occurs, then the router will return to a configuration state with none of the candidate changes applied. The operator can then continue editing the candidate and try a commit later.

By default, the SR OS will automatically create a new rollback checkpoint after a commit operation. The rollback checkpoint will contain the new configuration changes made by the commit. An optional **no-checkpoint** keyword can be used to avoid the auto-creation of a rollback checkpoint after a commit.

A commit operation is blocked if a rollback revert is currently being processed.

Parameters

confirmed

specifies that the commit operation (if successful) should be automatically reverted (undone) at the end of the timeout period unless the operator issues the confirm command before the timeout period expires. A rollback checkpoint is created after the commit operation (if successful) and will remain available whether the commit is auto-reverted or not. The contents of the candidate will remain visible (candidate view) and changes to the candidate are blocked until the timeout is completed or the **candidate confirm** command is executed. If the timeout expires and an auto-revert occurs, then the original candidate config will be available in edit-cfg mode.

Standard line-by-line non-transactional configuration commands (including via SNMP) are not blocked during the countdown period and any changes made to the configuration during the countdown period will be rolled back if the timeout expires. The confirmed option is useful when changes are being made that could impact management reachability to the router.

A rollback revert is blocked during the countdown period until the commit has been confirmed.

timeout

Specifies the auto-revert timeout period, in minutes.

Values 1 to 168

no-checkpoint

Specifies to avoid the automatic creation of a rollback checkpoint for a successful commit.

comment *comment*

Adds a comment up to 255 characters to the automatic rollback checkpoint.

no community *community-name* [**hash** | **hash2** | **custom**]

Context

[Tree] (config>service>vprn>snmp community)

Full Context

configure service vprn snmp community

Description

This command sets the SNMP community name(s) to be used with the associated VPRN instance. These VPRN community names are used to associate SNMP v1/v2c requests with a particular vprn context and to return a reply that contains VPRN-specific data or limit SNMP access to data in a specific VPRN instance.

VPRN snmp communities configured with an access permission of 'r' are automatically associated with the default access group "snmp-vprn-ro" and the "vprn-view" view (read only). VPRN snmp communities configured with an access permission of 'rw' are automatically associated with the default access group "snmp-vprn" and the "vprn-view" view (read/write).

The community in an SNMP v1/v2 request determines the SNMP context (i.e., the vprn# for accessing SNMP tables) and not the VPRN of the incoming interface on which the request was received. When an SNMP request arrives on VPRN 5 interface "ringo" with a destination IP address equal to the "ringo" interface, but the community in the SNMP request is the community configured against VPRN 101, then the SNMP request will be processed using the VPRN 101 context. (the response will contain information about VPRN 101). It is recommended to avoid using a simple series of vprn snmp-community values that are similar to each other (for example, avoid my-vprncomm-1, my-vprn-comm-2, etc).

The **no** form of this command removes the SNMP community name from the given VPRN context.

Parameters

community-name

Specifies the SNMP v1/v2c community name. This is a secret/confidential key used to access SNMP and specify a context (base vs vprn1 vs vprn2).

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

version *SNMP-version*

Specifies the SNMP version.

Values v1, v2c, both

access-permissions

Specifies the access rights to MIB objects.

Values **r** — Grants only read access to MIB objects. Creates an association of the community-name with the **snmp-vprn-ro** access group.**rw** — Grants read and write access to MIB objects. Creates an association of the community-name with the **snmp-vprn** access group.

list-name

Configures the **community** to reference a specific **src-access-list** (created under **configure system security snmp**), which will be used to validate the source IP address of all received SNMP requests that use this **community**. Multiple **community** (vprn or base router) and **usm-community** instances can reference the same **src-access-list**.

Context

[Tree] (config>service>vprn>static-route-entry community)

Full Context

configure service vprn static-route-entry community

Description

This command associates a list of up to 12 BGP communities (any mix of standard, extended, and large communities) with the static route. These communities can be matched in route policies and are automatically added to BGP routes that are created from the static route.

The communities specified at this level of the static route causes communities configured under the next-hop, black-hole, and indirect contexts of the static route to be ignored.

The **no** form of this command removes the association.

Default

no community

Parameters

comm-id

Specifies a BGP community value, up to 72 characters.

Values [*as-num:comm-val* | *well-known-comm* | *ext-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **llgr-stale** | **no-llgr** | **blackhole**
- *ext-comm* — the extended community, defined as one of the following:
  - {*target* | *origin*}:*ip-address*:*comm-val*
  - {*target* | *origin*}:*asnum*:*ext-comm-val*
  - {*target* | *origin*}:*ext-asnum*:*comm-val*

Context

[Tree] (config>router>ldp>session-params>peer community)

[Tree] (config>router>ldp>targeted-session>peer-template community)

Full Context

configure router ldp session-parameters peer community

configure router ldp targeted-session peer-template community

Description

This command configures a community name associated with a targeted session to a specified peer. The community is a local configuration for a targeted session. FECs received over a session of a given community are taken to belong to that community, and are redistributed over sessions of the same community.

The SR OS router uses the following rules for community:

- If both the session parameters for a specified peer and targeted peer template that is applied to session have the default configuration then no community applies.

- If the session parameters for a peer have the default configuration, but targeted session peer template has an explicit configuration for community, then the targeted peer template configuration will be used.
- If the session parameters have an explicit configuration for community, and the targeted session peer template has the default configuration, then the session parameter configuration applies.
- If both session parameters and targeted peer template have an explicit configuration for community, then the session parameter configuration is used.

The **no** form of this command removes the community from the session to the peer. FEC subsequently received over the session are treated as having no community.

Default

no community

Parameters

community-name

Specifies the string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

Context

[Tree] (config>system>security>snmp community)

Full Context

configure system security snmp community

Description

This command creates SNMP community strings for SNMPv1 and SNMPv2c access. This command is used in combination with the predefined access groups and views. To create custom access groups and views and associate them with SNMPv1 or SNMPv2c access use the **usm-community** command.

When configured, community implies a security model for SNMPv1 and SNMPv2c only.

For SNMPv3 security, the **access group** command must be configured.

The **no** form of the command removes the specified community string.

Parameters

community-string

Configures the SNMPv1 and/or SNMPv2c community string.

Values community-string — Specifies the community string. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

hash-key — Up to 33 characters

hash2-key — Up to 96 characters

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

access-permissions

Configures the access permissions for objects in the MIB.

r — Grants only read access to objects in the MIB, except security objects, using the internal "snmp-ro" access group and the "no-security" snmp view.

rw — Grants read and write access to all objects in the MIB, using the internal "snmp-rw" access group and the "no-security" snmp view.

rwa — Grants read and write access to all objects in the MIB, including security, using the internal snmp-rwa access group and the iso snmp view.

mgmt — Assigns a unique SNMP community string for SNMP access via the management router instance. This community uses the internal snmp-mgmt access group and the mgmt snmp view.

vpls-mgmt — Assigns a unique SNMP community string for SNMP access via the vpls-management router instance. This community uses the internal snmp-vpls-mgmt access group and mgmt-view snmp view.

version {v1 | v2c | both}

Configures the scope of the community string to be for SNMPv1, SNMPv2c, or both SNMPv1 and SNMPv2c access.

Default both

list-name

Configures the **community** to reference a specific **src-access-list**, which will be used to validate the source IP address of all received SNMP requests that use this community. Multiple community, usm-community, or VPRN SNMP community instances can reference the same src-access-list.

Platforms

community

Syntax

[**no**] **community** *name*

Context

[Tree] (config>router>policy-options community)

Full Context

configure router policy-options community

Description

This command creates a route policy community list or expression to use in route policy entries. A community list is an unordered set of community values (members). In general a route matches a community list if it has any of the member values. A community expression is a set of community values that are arranged in a logical expression using operators such as AND, OR, and NOT. A route matches a community expression if it satisfies the logic of the expression.

For additional information, see the **expression** and **members** commands in the **config**> **router**>**policy-options**>**community** context.

The **no** form of this command deletes the community list or the provided community ID.

Default

no community

Parameters

name

Specifies the community list name. Allowed values are any string up to 64 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

[Tree] (config>router>policy-options>policy-statement>default-action community)

Full Context

configure router policy-options policy-statement entry action community

configure router policy-options policy-statement default-action community

Description

This command adds or removes a BGP community list to or from routes matching the route policy statement entry.

If no community list is specified, the community path attribute is not changed.

The community list changes the community path attribute according to the **add** and **remove** keywords.

The **no** form of this command disables the action to edit the community path attribute for the route policy entry.

Default

no community

Parameters

name

Specifies up to 28 names.

add

The specified community list is added to any existing list of communities.

remove

The specified community list is removed from the existing list of communities.

replace

The specified community list replaces any existing community attribute. name — The community list name. Allowed values are any string up to 64 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or "start@variable@".

Platforms

All

community

Syntax

community *comm-name*

community expression *expression*

no community

Context

[Tree] (config>router>policy-options>policy-statement>entry>from community)

Full Context

configure router policy-options policy-statement entry from community

Description

This command adds or removes a BGP community list to or from routes matching the route policy statement entry.

If no community list is specified, the community path attribute is not changed.

The community list changes the community path attribute according to the **add** and **remove** keywords.

The **no** form of this command disables the action to edit the community path attribute for the route policy entry.

Default

no community

Parameters

comm-name

Specifies up to 28 names.

expression

Applies parameters to routes matching the entry.

Values expression is one of the following up to 900 characters:

<expression> {AND| OR} <expression>

[NOT] (<expression>)

[NOT] "["<comm-name>"]

Platforms

All

7.161 community-count

community-count

Syntax

community-count *count* [**equal** | **or-higher** | **or-lower**] [**standard** | **extended** | **large**]

no community-count

Context

[Tree] (config>router>policy-options>policy-statement>entry>from community-count)

Full Context

configure router policy-options policy-statement entry from community-count

Description

This command matches BGP routes based on community length (that is, the number of community members in the COMMUNITY, EXTENDED_COMMUNITY, or LARGE_COMMUNITY the attributes).

If no comparison qualifiers are present (**equal**, **or-higher**, **or-lower**), then **equal** is the implied default.

Without the optional **standard**, **extended**, or **large** keyword, the community length applies to the total number of communities, of all types. If some keywords are present, then only the types specified are counted against the limit.

A non-BGP route does not match a policy entry if it contains the **community-count** command.

Default

no community-count

Parameters

count

Specifies the number of community members.

Values 0 to 1024, or a parameter, up to 32 characters, name delimited by a starting and ending at-sign (@) character

equal

Specifies that matched routes should have the same number of AS path elements as the value specified.

or-higher

Specifies that matched routes should have the same or a greater number of community members as the value specified.

or-lower

Specifies that matched routes should have the same or a lower number of community members as the value specified.

standard

Specifies that only communities in the COMMUNITY attribute should be counted.

extended

Specifies that only communities in the EXTENDED_COMMUNITY attribute should be counted.

large

Specifies that only communities in the LARGE_COMMUNITY attribute should be counted.

Platforms

All

7.162 compare

compare

Syntax

compare *source1* **to** *source2*

Context

[Tree] (admin compare)

Full Context

admin compare

Description

This command displays the differences between rollback checkpoints and the active operational configuration, with source1 as the base/first file to which source2 is compared.

A compare operation does not check authorization of each line of output. Permission to execute the compare operation from the admin branch of CLI (authorization for the **admin rollback compare** or **admin compare** command itself) should only be given to users who are allowed to view the entire configuration, similar to permissions for **admin display-config**.

Default

The defaults for source1 and source2 are context aware and differ based on the branch in which the command is executed. In general, the default for source1 matches the context from which the command is issued.

- In the admin node: No defaults. source1 and source2 must be specified.
- In the admin>rollback node:

  source1 default = active-cfg, source2 default = latest-rb

  compare: equivalent to "compare active-cfg to latest-rb”

  compare to source2: equivalent to "compare active-cfg to source2”

- In a config>*xx* node:

  compare to source2: equivalent to "compare active-cfg to source2”

Parameters

source1, source2

Specifies comparison information.

Values **active-cfg** — The current operational configuration that is active in the node.

latest-rb — The most recent rollback checkpoint (the checkpoint file at the configured rollback-location with "*.rb” as the suffix).

rescue — The rescue configuration (at the configured rescue-location).

checkpoint-id — An ID indicating a specific rollback checkpoint. A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback-location) with "*.rb.1” as the suffix, 2 for file "*.rb.2”, and so on.

Platforms

All

compare

Syntax

compare [**to** *checkpoint2*]

compare *checkpoint1* **to** *checkpoint2*

Context

[Tree] (admin>rollback compare)

Full Context

admin rollback compare

Description

This command can be used in any branch under configure, but not with configure itself. The command syntax, parameter names, and default values are context aware and will differ based on the branch in which the command is executed.

This command displays the differences between rollback checkpoints and the active operational configuration, with checkpoint1 as the base/first file to which checkpoint2 is compared. This command displays the comparison for the configuration context where it is entered and all branches below that context level.

A compare operation does not check authorization of each line of output. Permission to execute the compare operation from the admin branch of CLI (authorization for the **admin rollback compare** or **admin compare** command itself) should only be given to users who are allowed to view the entire configuration, similar to permissions for **admin display-config**.

Default

The defaults for checkpoint1 and checkpoint2 are context-aware and differ based on the branch in which the command is executed. In general, the default for checkpoint1 matches the context from which the command is issued.

- In the admin node: No defaults. checkpoint1 and checkpoint2 must be specified.
- In the admin>rollback node:

  checkpoint1 default = active-cfg, checkpoint2 default = latest-rb

  compare: equivalent to "compare active-cfg to latest-rb”

  compare to checkpoint2: equivalent to "compare active-cfg to checkpoint2”
- In a config>*xx* node:

  compare to checkpoint2: equivalent to "compare active-cfg to checkpoint2”

Parameters

checkpoint1, checkpoint2

Specifies comparison information.

Values **active-cfg** — The current operational configuration that is active in the node.

latest-rb — The most recent rollback checkpoint (the checkpoint file at the configured rollback-location with "*.rb” as the suffix).

rescue — The rescue configuration (at the configured rescue-location).

checkpoint-id — An ID indicating a specific rollback checkpoint.
A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback-location) with "*.rb.1” as the suffix, 2 for file "*.rb.2”, and so on.

7.163 compare-origin-validation-state

compare-origin-validation-state

Syntax

[**no**] **compare-origin-validation-state**

Context

[Tree] (config>service>vprn>bgp>best-path-selection compare-origin-validation-state)

Full Context

configure service vprn bgp best-path-selection compare-origin-validation-state

Description

This command enables the comparison of origin validation states during the BGP decision process. When this command is configured, a new step is inserted in the BGP decision process after the removal of invalid routes and before the comparison of Local Preference. This step compares the origin validation state so a BGP route with a "Valid" state is preferred over a BGP route with a "Not-Found" state. A BGP route with a "Not-Found" state is preferred over a BGP route with an "Invalid" state assuming that these routes are considered "usable".

This comparison only applies to BGP routes learned from VPRN BGP peers. It does not apply to any comparison involving BGP-VPN routes that have been imported into the VPRN.

The **no** form of this command causes the new step to be skipped during the BGP decision process.

Default

no compare-origin-validation-state

Platforms

All

compare-origin-validation-state

Syntax

[**no**] **compare-origin-validation-state**

Context

[Tree] (config>router>bgp>best-path-selection compare-origin-validation-state)

Full Context

configure router bgp best-path-selection compare-origin-validation-state

Description

When this command is configured, a new step is inserted in the BGP decision process after removal of invalid routes and before the comparison of Local Preference. The new step compares the RPKI origin validation state so that a BGP route with a 'Valid' state is preferred over a BGP route with a 'Not-Found' state, and a BGP route with a 'Not-Found' state is preferred over a BGP route with an 'Invalid' state assuming that these routes are considered 'usable'.

The new step is skipped when **no compare-origin-validation-state** is configured.

Default

no compare-origin-validation-state

Platforms

All

7.164 compatibility

compatibility

Syntax

compatibility *mode*

Context

[Tree] (config>port>dwdm>coherent compatibility)

Full Context

configure port dwdm coherent compatibility

Description

This command configures the optical mode and rate of operation.

Parameters

mode

Specifies the optical mode.

Values

long-haul - The port operates in the native long-haul mode.

long-haul-non-diff - The port operates in the native long-haul mode using non-differential encoding.

metro - The port operates in the native metro regional mode.

access - The port operates in the native access mode (80km reach).

interop - The port operates in the third party interop mode.

interop2 - The port operates in the third party interop mode with alternate differential encoding.

interop3 - The port operates in the CFP2-DCO Rev A0 Staircase FEC interop mode.

oif-400g-zr - The port operates in compliance with the OIF 400G ZR implementation agreement (IA). This parameter is only supported for use with 400G ZR and 400G ZR+ pluggable transceiver modules.

open-zrp-ofec1 - The port operates in compliance with the OpenZR + multi-source agreement (MSA) (100GHz spacing). This parameter is only supported for use with 400G ZR and 400G ZR+ pluggable transceiver modules.

open-zrp-ofec2 - The port operates in compliance with the OpenZR+ MSA (75 GHz spacing). This parameter is only supported for use with 400G ZR and 400G ZR+ pluggable transceiver modules.

7.165 compatible-rfc1583

compatible-rfc1583

Syntax

[**no**] **compatible-rfc1583**

Context

[Tree] (config>service>vprn>ospf compatible-rfc1583)

Full Context

configure service vprn ospf compatible-rfc1583

Description

This command enables OSPF summary and external route calculations in compliance with RFC 1583 and earlier RFCs.

RFC 1583 and earlier RFCs use a different method to calculate summary and external route costs. To avoid routing loops, all routers in an OSPF domain should perform the same calculation method.

Although it would be favorable to require all routers to run a more current compliance level, this command allows the router to use obsolete methods of calculation.

This command is not supported in OSPF3.

The **no** form of this command enables the post-RFC1583 method of summary and external route calculation.

Default

compatible-rfc1583 — RFC 1583 compliance is enabled.

no confederation *confed-as-num* **members** *as-number* [*as-number*]

no confederation

Context

[Tree] (config>service>vprn confederation)

Full Context

configure service vprn confederation

Description

This command configures the VPRN BGP instance to participate in a BGP confederation. BGP confederations can be used to reduce the number of IBGP sessions required within an AS.

When a VPRN BGP instance is part of a confederation, it can form confederation-EBGP sessions with CE router peers in a different sub-autonomous systems of the same confederation as well as regular EBGP sessions with CE router peers outside the confederation. A VPRN BGP instance that is part of a confederation cannot import or export its routes to the base router instance (as VPN-IP routes).

The **no** form of this command deletes the specified member AS from the confederation. When members are not specified in the no statement, the entire list is removed and confederations is disabled. When the last member of the list is removed, confederations is disabled.

Default

no confederation

Parameters

confed-as-num

The confederation AS number defined as a decimal value.

Values 1 to 4294967295

members *as-number*

The AS number(s) that are members of the confederation, each expressed as a decimal integer. Configure up to 15 members per confed-as-num.

Values 1 to 4294967295

Platforms

All

confederation

Syntax

confederation *confed-as-num* [**members** *as-number* [*as-number*]]

no confederation

Context

[Tree] (config>router confederation)

Full Context

configure router confederation

Description

This command creates confederation autonomous systems within an AS.

This technique is used to reduce the number of IBGP sessions required within an AS. Route reflection is another technique that is commonly deployed to reduce the number of IBGP sessions.

The **no** form of this command deletes the specified member AS from the confederation.

When no members are specified in the **no** statement, the entire list is removed and **confederation** is disabled.

When the last member of the list is removed, **confederation** is disabled.

Default

no confederation - no confederations are defined.

Parameters

confed-as-num

Specifies the confederation AS number expressed as a decimal integer.

Values 1 to 65535

as-number

Specifies the AS number of members that are part of the confederation, expressed as a decimal integer. Up to 15 members per *confed-as-num* can be configured.

Values 1 to 65535

Platforms

7.172 config-backup

config-backup

Syntax

config-backup *count*

no config-backup

Context

[Tree] (config>system config-backup)

Full Context

configure system config-backup

Description

This command configures the maximum number of backup versions maintained for configuration files and BOF.

For example, assume the **config-backup** *count* is set to 5 and the configuration file is called *xyz.cfg.* When the configuration is saved, the file *xyz.cfg* is saved with a 1 extension. Each configuration save increments the numeric extension until the maximum count is reached.

xyz.cfg xyz.cfg.1 xyz.cfg.2 xyz.cfg.3 xyz.cfg.4 xyz.cfg.5

Each classic CLI persistent index file is updated at the same time as the associated configuration file. When the index file is updated, then the save is performed to *xyz.cfg* and the index file is created as *xyz.ndx*. Synchronization between the active and standby CPM is performed for all configurations and their associated persistent index files.

The **no** form of the command returns the configuration to the default value.

Default

config-backup 50

Parameters

count

Specifies the maximum number of backup revisions.

Values 1 to 200

Platforms

All

7.173 configuration-mode

configuration-mode

Syntax

configuration-mode {**classic** | **mixed** | **model-driven**}

Context

[Tree] (config>system>management-interface configuration-mode)

Full Context

configure system management-interface configuration-mode

Description

This command controls which management interfaces are used for editing and changing the configuration of the router.

Any management interface can be used in any configuration mode (to gather state information or perform operations, for example), but only specific management interfaces (CLI, NETCONF, and so on) are allowed to edit the configuration of the router in different modes. For example, only classic CLI and SNMP can be used to edit the configuration when in classic mode.

Default

configuration-mode model-driven

Parameters

classic

Enables editing of router configuration via classic CLI and SNMP management interfaces, but not using model-driven interfaces.

model-driven

Enables editing of router configuration via model-driven management interfaces (NETCONF with 'Nokia' YANG models, MD-CLI or gRPC), but not using classic interfaces.

mixed

Enables editing of router configuration using a mix of classic CLI and/or model-driven management interfaces (with some restrictions and limitations).

7.176 cong-priority-threshold

cong-priority-threshold

Syntax

cong-priority-threshold *preference-level*

no cong-priority-threshold

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle cong-priority-threshold)

Full Context

configure mcast-management multicast-info-policy bundle cong-priority-threshold

Description

This command defines the preference level threshold where records change from low congestion priority to high congestion priority. Congestion priority is used by the ingress multicast path queues to map packets entering the queue to either the low drop-tail or the MBS drop-tail threshold. If congestion occurs on the queue, the queue depth increases. As the queue depth increases beyond the low drop-tail, packets with low priority congestion priority are discarded. This leaves room in the queue for packets with high congestion priority until the queue reaches the MBS threshold.

The default congestion priority threshold is 4. This means that multicast channels with a preference level of 0 to 3 are treated as having low congestion priority and channels with preference level of 4 to 7 are treated as having a high congestion priority. The **cong-priority-threshold** command can be used to change the default threshold. Any multicast channel with a preference equal to or higher than the configured threshold is treated with high congestion priority.

The **cong-priority-threshold** value is also used by the multicast CAC manager to derive the class of a channel matched by the multicast information policy. Channels with a preference less than the configured threshold are treated as low class and channels with a preference equal to or greater than the threshold is treated as high class.

Changing the **cong-priority-threshold** value causes all channels congestion priority to be reevaluated. Both the ingress multicast path managers and multicast CAC managers must be updated.

The **no** form of this command restores the default congestion priority preference threshold value.

Default

cong-priority-threshold 4

Parameters

preference-level

Specifies the **cong-priority-threshold** where records change from low congestion priority to high congestion priority.

Values 0 to 7

Platforms
7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

configure service vprn subscriber-interface group-interface bonding-parameters connection

Description

This command configures a node where per-connection parameters can be defined. The ID is used as a connection identifier for bonding whenever differentiation between connections is required.

The **no** form of this command removes the connection configuration from this bonding context, which can only be done when bonding is administratively disabled.

Parameters

connection-id

Specifies the connection ID to be assigned to connections matching the node's parameters.

Values 1,2

connection

Syntax

connection *connection-id*

connection use-incoming

Context

[Tree] (config>service>vprn>sub-if>grp-if>bonding-parameters>mcast connection)

[Tree] (config>service>ies>sub-if>grp-if>bonding-parameters>mcast connection)

Full Context

configure service vprn subscriber-interface group-interface bonding-parameters mcast connection

configure service ies subscriber-interface group-interface bonding-parameters mcast connection

Description

This command configures the connection that should be used for sending out multicast traffic in a bonding context. Traffic can either be forced to use one *connection-id* or follow the connection where the setup message (IGMP/MLD) was received first (**use-incoming**).

The **no** form of this command removes the connection configuration from this bonding context, which can only be done when bonding is administratively disabled.

Default

connection use-incoming

Parameters

connection-id

Specifies the connection ID.

Values 1, 2

connection

Syntax

connection

Context

[Tree] (config>bmp>station connection)

Full Context

configure bmp station connection

Description

Commands in this context configure connection parameters for the BMP monitoring station.

Platforms

All

7.182 connection-profile-vlan

connection-profile-vlan

Syntax

connection-profile-vlan *conn-prof-id* [**create**]

no connection-profile-vlan *conn-prof-id*

Context

[Tree] (config connection-profile-vlan)

Full Context

configure connection-profile-vlan

Description

Commands in this context configure the VLAN ranges that will be associated with a service SAP.

Each connection-profile-vlan must be explicitly configured.

Parameters

conn-prof-id

Specifies the connection-profile identifier. This value will be configured in the service along with the SAP when the user associates a VLAN bundle to a single SAP. For example, a SAP defined in a dot1q port 1/1/1 that matches all the VLANs defined in the connection-profile-vlan 1 will be created as '**sap 1/1/1:cp-1 create**'.

Values 1 to 8000

Platforms

All

7.183 connection-timeout

connection-timeout

Syntax

connection-timeout *seconds*

no connection-timeout

Context

[Tree] (config>system>management-interface>remote-management connection-timeout)

Full Context

configure system management-interface remote-management connection-timeout

Description

This command configures the amount of time that all remote managers cannot be reached before they are considered to be down.

If this command is also configured for a specific manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command reverts to the default.

Default

connection-timeout 60

Parameters

seconds

Specifies the connection timeout in seconds.

Values 1 to 3600

Platforms

All

connection-timeout

Syntax

connection-timeout *seconds*

no connection-timeout

Context

[Tree] (config>system>management-interface>remote-management>manager connection-timeout)

Full Context

configure system management-interface remote-management manager connection-timeout

Description

This command configures the amount of time that this remote manager cannot be reached before it is considered to be down.

This command takes precedence over the same command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command reverts to the default.

Default

connection-timeout 60

Parameters

seconds

Specifies the connection timeout in seconds.

Values 1 to 3600

Platforms

All

7.184 connection-timer

connection-timer

Syntax

connection-timer *seconds*

no connection-timer

Context

[Tree] (config>aaa>diam>node>peer connection-timer)

[Tree] (config>aaa>diam>node connection-timer)

Full Context

configure aaa diameter node peer connection-timer

configure aaa diameter node connection-timer

Description

This command configures the Diameter node connection timer that defines the time the systems waits before attempting to reconnect to a peer after the connection was lost.

The **no** form of this command reverts to the default.

Default

connection-timer 30

Parameters

seconds

Specifies the Diameter node connection timer.

Values 1 to 1000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

7.185 connectivity-association

connectivity-association

Syntax

connectivity-association *ca-name* [**create**]

no connectivity-association *ca-name*

Context

[Tree] (config>macsec connectivity-association)

Full Context

configure macsec connectivity-association

Description

This command configures a connectivity association. MACsec connectivity associations are applied to a port dot1x configuration to enable MACsec on that port.

The **no** form of this command removes the connectivity association.

Parameters

ca-name

The name of the connectivity association, a string up to 32 characters long.

create

Mandatory while creating an entry.

Platforms

All

7.186 connectivity-verification

connectivity-verification

Syntax

connectivity-verification [**count** *nr-of-attempts*] [**timeout** *timeout-seconds*] [**retry-time** *retry-seconds*]

no connectivity-verification

Context

[Tree] (config>subscr-mgmt>vrgw>brg>brg-profile connectivity-verification)

Full Context

configure subscriber-mgmt vrgw brg brg-profile connectivity-verification

Description

This command configures the BRG connectivity verification. The system uses ICMP Echo request messages for connectivity verification.

When the last host associated with a BRG is removed, a ping mechanism is used to verify if the BRG is still active. This command specifies the parameters used in this mechanism.

The **no** form of this command disables the BRG ping mechanism and removes the BRG without verification. Any configured hold time still applies.

Default

connectivity-verification count 3 timeout 30 retry-time 900

Parameters

nr-of-attempts

Specifies the number of connectivity verification attempts this system makes before a BRG is considered down.

Values 1 to 5

timeout-seconds

Specifies the time, in seconds, after which an unanswered ping is considered failed.

Values 5 to 60

retry-seconds

Specifies the time, in seconds, that the system waits while it considers a BRG down before it starts a new connectivity verification cycle. If a ping succeeds, the mechanism will be retried after this time.

Values 300 to 3600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

7.189 consider-system-ip-in-gep

consider-system-ip-in-gep

Syntax

[**no**] **consider-system-ip-in-gep**

Context

[Tree] (config>router>ldp consider-system-ip-in-gep)

Full Context

configure router ldp consider-system-ip-in-gep

Description

When this command is enabled, the system interprets the presence or absence of the system IP and its associated action in the applied Global Export Policies in the same way as for other interfaces' IP addresses. In that case:

- if the system IP is not present, its FEC will not be exported or it will be withdrawn if it has been exported
- if the system IP is present with "accept", its FEC will be exported
- if the system IP is present with "deny", its FEC will not be exported or it will be withdrawn if it had been exported

Enabling or disabling this command leads to the applied Global Export Policies being reevaluated.

The **no** form of this command causes the system to not interpret the presence or absence of the system IP in applied Global Export Policies, and the FEC for the system IP is exported (default behavior).

Default

no consider-system-ip-in-gep

Full Context

bof console-speed

Description

This command configures the console port baud rate.

When this command is issued while editing the BOF file used for the most recent boot, both the BOF file and the active configuration are changed immediately.

The **no** form of this command reverts to the default value.

Default

console-speed 115200

Parameters

baud-rate

Specifies the console port baud rate, expressed as a decimal integer.

Values 9600, 19200, 38400, 57600, 115200

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s, 7950 XRS, VSR

7.192 constellation

constellation

Syntax

constellation gps [**galileo**]

Context

[Tree] (config>port>gnss constellation)

Full Context

configure port gnss constellation

Description

This command configures the GNSS systems used by the GNSS receiver on platforms containing one or more embedded GNSS receivers.

The GNSS receiver uses GPS by default. GPS must always be enabled when the GNSS receiver is used, and the GNSS receiver can be configured to use additional GNSS systems simultaneously.

Default

gps

Parameters

gps

Enables the use of the American GPS GNSS system. This keyword is always required when using the GNSS receiver.

galileo

Enables the use of the European Galileo GNSS system. This keyword is only supported on 7750 SR FP5 GNSS platforms.

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se

configure service customer contact

Description

This command configures contact information for a customer.

Include any customer-related contact information such as a technician's name or account contract name.

The **no** form of this command removes the contact information from the customer ID.

Default

no contact

Parameters

contact-information

Specifies customer contact information entered as an ASCII character string up to 80 characters in length. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Any printable, seven bit ASCII characters may be used within the string.

Platforms

Full Context

configure service cpipe spoke-sdp control-channel-status

configure service vpls spoke-sdp control-channel-status

configure service epipe spoke-sdp control-channel-status

Description

This command enables the configuration of static pseudowire status signaling on a spoke SDP for which signaling for its SDP is set to OFF.

A control-channel-status **no shutdown** is allowed only if all of the following are true:

- SDP signaling is off.
- The control-word is enabled (the control-word is disabled by default)
- The service type is Epipe, Apipe, VPLS, Cpipe, or IES/VPRN
- Mate SDP signaling is off (in vc-switched services)
- The pw-path-id is configured for this spoke SDP.

The **no** form of this command removes control channel status signaling from a spoke SDP. It can only be removed if control channel status is shut down.

Default

no control-channel-status

Platforms

control-tag

Syntax

control-tag *qtag*[*.qtag*]

no control-tag

Context

[Tree] (config>eth-tunnel>path control-tag)

Full Context

configure eth-tunnel path control-tag

Description

This command specifies the VLAN-ID to be used for Ethernet CFM and G.8031 control plane exchanges. If the operator wants to replace an existing control-tag, the parent path needs to be in shutdown state, then deleted and recreated before a new control-tag can be specified.

The **no** form of this command is used just to indicate that a control-tag is not configured. The procedure described above, based on 'no path' command must be used to un-configure/change the control-tag assigned to the path.

Default

no control-tag

Parameters

qtag[.qtag]

Specifies the value of the VLAN ID to be used for the control tag.

Values 0 to 4094, untagged option is not supported, *

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service epipe bgp-evpn mpls control-word

Description

This command enables the transmission and reception of the **control-word**. As defined in RFC7432, the use of the control-word helps avoid frame disordering.

It is enabled or disabled for all EVPN-MPLS destinations at the same time.

Default

no control-word

Platforms

All

control-word

Syntax

[**no**] **control-word**

Context

[Tree] (config>service>sdp>binding>pw-port control-word)

Full Context

configure service sdp binding pw-port control-word

Description

This command enables the setting of the control word bit in the label message. Control words are used to distinguish a PW payload (Ethernet) from an IP payload (identified by the first nibble past the bottom MPLS label, either 4 or 6) carried over an MPLS network.

Based on the payload type, the transit MPLS node can make an appropriate load balancing decision. Load balancing can rely on the MPLS labels, or rely on additional fields that are available only in IP header (source and destination IP addresses and ports).

The presence of a control word indicates that the header following the last MPLS label in the frame is not an IP header.

The **no** form of this command disables setting the control word bit in the label message.

Default

no control-word

Platforms

All

[Tree] (config>service>cpipe>spoke-sdp control-word)

Full Context

configure service ipipe spoke-sdp control-word

configure service epipe spoke-sdp control-word

configure service cpipe spoke-sdp control-word

Description

The control word command provides the option to add a control word as part of the packet encapsulation for pseudowire types for which the control word is optional. These are Ethernet pseudowires (Epipe).

For the 7750 SR only, ATM N:1 cell mode pseudowires (apipe vc-types atm-vcc and atm-vpc) and VT pseudowire (apipe vc-type atm-cell).

The configuration for the two directions of the pseudowire must match because the control word negotiation procedures described in Section 6.2 of RFC 4447 are not supported. The C-bit in the pseudowire FEC sent in the label mapping message is set to 1 when the control word is enabled. Otherwise, it is set to 0.

The service will only come up if the same C-bit value is signaled in both directions. If a spoke-sdp is configured to use the control word but the node receives a label mapping message with a C-bit clear, the node releases the label with the an "Illegal C-bit" status code as per Section 6.1 of RFC 4447. As soon as the user also enabled the control the remote peer, the remote peer will withdraw its original label and will send a label mapping with the C-bit set to 1 and the VLL service will be up in both nodes. The control word must be enabled to allow MPLS-TP OAM to be used on a static spoke-sdp in a Apipe, Epipe and Cpipe service.

Platforms

[Tree] (config>service>vpls>mesh-sdp control-word)

Full Context

configure service vpls spoke-sdp control-word

configure service vpls mesh-sdp control-word

Description

This command enables the use of the control word on pseudowire packets in VPLS and enables the use of the control word individually on each mesh SDP or spoke-SDP. By default, the control word is disabled. When the control word is enabled, all VPLS packets, including the BPDU frames, are encapsulated with the control word when sent over the pseudowire. The T-LDP control plane behavior is the same as in the implementation of control word for VLL services. The configuration for the two directions of the Ethernet pseudowire should match. The **no** form of this command reverts the mesh SDP or spoke-SDP to the default behavior of not using the control word. The control word must be enabled to use MPLS-TP OAM on a static spoke-sdp terminating in a VPLS.

configure service vprn redundant-interface spoke-sdp control-word

configure service vprn interface spoke-sdp control-word

Description

This command enables the PW control word on spoke SDPs terminated on an IES or VPRN interface. The control word must be enabled to allow MPLS-TP OAM on the spoke SDP

It is only valid for MPLS-TP spoke SDPs when used with IES and VPRN services.

The no form of this command disables the control work on spoke SDPs.

Default

no control-word

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

- configure service vprn redundant-interface spoke-sdp control-word

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vprn interface spoke-sdp control-word

control-word

Syntax

[**no**] **control-word**

Context

[Tree] (config>mirror>mirror-dest>spoke-sdp control-word)

Full Context

configure mirror mirror-dest remote-source spoke-sdp control-word

configure mirror mirror-dest spoke-sdp control-word

Description

This command enables the PW control word on spoke SDPs that are part of a mirror-destination.

The control word must be enabled to allow MPLS-TP OAM on a spoke SDP.

It is only valid for spoke SDPs that are part of a mirror service of type **ether**.

The **no** form of this command disables the control word.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure mirror mirror-dest remote-source spoke-sdp control-word

control-word

Syntax

control-word

Context

[Tree] (config>test-oam>build-packet>header control-word)

Full Context

configure test-oam build-packet header control-word

Description

This command creates a control-word header for inclusion in a build packet instance.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

7.201 controlword

controlword

Syntax

[**no**] **controlword**

Context

[Tree] (config>service>pw-template controlword)

Full Context

configure service pw-template controlword

Description

This command enables the use of the control word on pseudowire packets in VPLS and VPWS and enables the use of the control word individually on each mesh-sdp or spoke-sdp. By default, the control word is disabled. When the control word is enabled, all VPLS/VPWS packets, including the BPDU frames, are encapsulated with the control word when sent over the pseudowire. The T-LDP control plane behavior is the same as in the implementation of control word for VLL services. The configuration for the two directions of the Ethernet pseudowire should match.

The **no** form of the command reverts the mesh SDP or spoke-sdp to the default behavior of not using the control word.

Default

no controlword

convert-file

Syntax

convert-file *filename* **to** *output-file-name* **format** {**secure** | **legacy**} [**force**]

Context

[Tree] (admin>certificate convert-file)

Full Context

admin certificate convert-file

Description

This command converts imported certificates and keys in the cf3:/system-pki directory between secure and legacy format.

Parameters

filename

Specifies an existing filename, up to 95 characters.

output-file-name

Specifies the output file name, up to 95 characters. If the output filename already exists, and the **force** keyword is not selected, the system prompts to proceed or abort.

format

Specifies the target format.

Values secure — Specifies the enhanced secure format

legacy — Specifies the legacy format

force

Forces the conversion even if there is an existing file with the same output filename.

7.204 cookie

cookie

Syntax

cookie [*cookie1*] [*cookie2*]

no cookie

Context

[Tree] (config>service>epipe>spoke-sdp>ingress>l2tpv3 cookie)

[Tree] (config>service>epipe>spoke-sdp>egress>l2tpv3 cookie)

Full Context

configure service epipe spoke-sdp ingress l2tpv3 cookie

configure service epipe spoke-sdp egress l2tpv3 cookie

Description

This command configures the RX/TX cookie for L2TPv3 spoke SDPs for Epipe services. The RX cookie must match the configured TX cookie on a far-end node, while the TX cookie must match the configured RX cookie on a far-end node. If a mismatch is detected between the configured (far-end binding cookie) to what is received by the local IP address of the SDP a flag is set and must be manually cleared by an operator.

The purpose of the cookie is to provide validation against misconfiguration of service endpoints, and to ensure that the right service egress is being used.

One egress cookie and up to two ingress cookies may be configured per spoke SDP binding. One or two cookies can be configured for matching ingress packets from the far-end node, in order to support cookie rollover without dropping packets. When a cookie is not configured, SR OS assumes a value of 00:00:00:00:00:00:00:00.

A cookie is not mandatory. An operator may delete an egress cookie or either or both ingress cookies.

Default

no cookie1 cookie2

Parameters

cookie1

Specifies the first cookie, in the form of a 64-bit colon-separated hex value.

cookie2

Specifies the second cookie, in the form of a 64-bit colon-separated hex value.

Platforms

All

cookie

Syntax

cookie *cookie1-value* [*cookie2-value*]

Full Context

configure mirror mirror-dest remote-source spoke-sdp ingress l2tpv3 cookie

configure mirror mirror-dest spoke-sdp ingress l2tpv3 cookie

configure mirror mirror-dest spoke-sdp egress l2tpv3 cookie

Description

This command configures the RX/TX cookie for L2TPv3 spoke SDPs for the mirror destination. The command can configure L2TPv3 a single cookie for the egress spoke SDP or one or two cookies for the remote source ingress spoke SDP.

The purpose of the cookie is to provide validation against misconfiguration of service endpoints, and to ensure that the right service egress is being used.

When a cookie is not configured, SR OS assumes a value of 00:00:00:00:00:00:00:00. A cookie is not mandatory. An operator may delete the egress cookie or either or both ingress cookies.

Parameters

cookie1-value

Specifies a 64-bit colon separated hex value.

Values xx-xx-xx-xx-xx-xx-xx-xx or xx:xx:xx:xx:xx:xx:xx:xx

cookie2-value

Specifies a second 64-bit colon separated hex value.

Values xx-xx-xx-xx-xx-xx-xx-xx or xx:xx:xx:xx:xx:xx:xx:xx

configure router l2tp l2tpv3 cookie-length

configure service vprn l2tp l2tpv3 cookie-length

configure service vprn l2tp group l2tpv3 cookie-length

Description

This command configures the length of the optional cookie field.

The **no** form of this command returns the **cookie-length** to a default of **none**.

Default

no cookie-length

Parameters

4

Specifies the cookie length as 4 bytes.

8

Specifies the cookie length as 8 bytes.

default

When specified within the **config>service>vprn>l2tp>group>l2tpv3** context, this is referencing to the **cookie-length** configuration within the **config>service>vprn>l2tp>l2tpv3** context.

7.206 cooling-profile

cooling-profile

Syntax

cooling-profile {default | aggressive}

no cooling-profile

Context

[Tree] (config system fan-control cooling-profile)

Full Context

configure system fan-control cooling-profile

Description

This command configures the cooling profile used to determine the fan speed.

Nokia recommends that the default setting be used unless aggressive cooling is explicitly required.

The **no** form of this command sets the cooling profile back to the default value.

Default

no cooling-profile

Parameters

default

Specifies the fan speed operates at its default speed.

aggressive

Sets the control point optics temperature to 65 C, which requires a higher fan speed.

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

7.207 coordinates

coordinates

Syntax

coordinates *coordinates*

no coordinates

Context

[Tree] (config>system coordinates)

Full Context

configure system coordinates

Description

This command creates a text string that identifies the system coordinates for the device location. For example, the command **coordinates** "*37.390 -122.0550*" is read as latitude 37.390 north and longitude 122.0550 west.

Only one set of coordinates can be configured. If multiple coordinates are configured, the last one entered overwrites the previous entry.

The **no** form of the command reverts to the default value.

Parameters

coordinates

Specifies the coordinates describing the device location character string. The string may be up to 80 characters long. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. If the coordinates are subsequently used by an algorithm that locates the exact position of this node then the string must match the requirements of the algorithm.

configure service mrp copy

Description

This command copies existing MRP policy list entries for a specific policy name to another policy name. The **copy** command is a configuration level maintenance tool used to create a new MRP policy using an existing MRP policy.

An error will occur if the destination policy name exists.

Parameters

source-name

Identifies the source MRP policy from which the copy command will attempt to copy. The MRP policy with this name must exist for the command to be successful.

dest-name

Identifies the destination MRP policy to which the copy command will attempt to copy. If the MRP policy with dest-name exist within the system an error message is generated.

Context

[Tree] (file copy)

Full Context

file copy

Description

This command copies a file or all files in a directory from a source URL to a destination URL. At least one of the specified URLs should be a local URL. The optional wildcard (*) can be used to copy multiple files that share a common (partial) prefix and/or (partial) suffix.

When a file is copied to a destination with the same file name, the original file is overwritten by the new file specified in the operation. The following prompt appears if the destination file already exists:

"Overwrite destination file (y/n)?”

For example:

To copy a file named `srcfile` in a directory called `test` on cf2 in slot B to a file called `destfile` in a directory called production on cf1 in slot A, the syntax is:

```
sr1>file cf2:\ # copy cf2-B/test/srcfile cf1-A/production/destfile
```

To FTP a file named `121201.cfg` in directory `mydir` stored on cf1 in slot A to a network FTP server with IP address 192.0.2.79 in a directory called `backup` with a destination file name of `121201.cfg`, the FTP syntax is:

```
copy cf1-A/mydir/121201.cfg 192.0.2.79/backup/121201.cfg
```

Parameters

source-file-url

Specifies the location of the source file or directory to be copied.

Values

local-url	[*cflash-id*/][*file-path*] up to 200 characters, including cflash-id directory length 99 chars max each
remote-url	[{ftp:// | tftp:// | http:// | https://}*login*:*pswd*@*remote-locn*/][*file-path*] up to 247 characters directory length up to 199 characters
remote-locn	[*hostname* | *ipv4-address* | [*ipv6-address*]]
ipv4-address	*a.b.c.d*

ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*] *x:x:x:x:x:x:d.d.d.d*[*-interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

dest-file-url

Specifies the destination of the copied file or directory.

force

Specifies to force an immediate copy of the specified file(s). Executes the command without displaying a user prompt message. This command also automatically accepts HTTP redirects unless overridden by the **no-redirect** parameter.

profile

Specifies the TLS client profile configured under **config**>**system**>**security**>**tls**>**client-tls-profile** to use.

proxy-url

Specifies the URL of an HTTP proxy. For example, http://proxy.mydomain.com:8000. This URL must be an HTTP URL and not an HTTPS URL.

no-redirect

Specifies to automatically refuse any HTTP redirects without prompting the user.

Syntax

copy [*line*]

Context

[Tree] (candidate copy)

Full Context

candidate copy

Description

This command copies the selected CLI node (which includes all sub-branches) into a temporary buffer that can be used for a subsequent insert. The contents of the temporary buffer are deleted when the operator exits the candidate edit mode.

Parameters

line

Specifies which line to copy.

Values line, offset, **first**, **edit-point**, **last**

line — absolute line number

offset — relative line number to the current edit point. Prefixed with '+' or '-'.

first — keyword to indicate the first line

edit-point — keyword to indicate the current edit point

last — keyword to indicate the last line that is not 'exit'

Platforms

7.216 cpe-check

cpe-check

Syntax

cpe-check *cpe-ip-address*

no cpe-check [*cpe-ip-address*]

Context

[Tree] (config>service>vprn>static-route-entry>next-hop cpe-check)

[Tree] (config>service>vprn>static-route-entry>indirect cpe-check)

Full Context

configure service vprn static-route-entry next-hop cpe-check

configure service vprn static-route-entry indirect cpe-check

Description

This command enables CPE-check and specifies the IP address of the target CPE device.

This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. The target-ip-address cannot be in the same subnet as the static route subnet itself to avoid possible circular references. This option is mutually exclusive with BFD support on a given static route.

Note:
A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a **drop-count** of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.

The **no** form of this command disables the **cpe-check** option.

Default

no cpe-check

Parameters

cpe-ip-address

Specifies the IP address of the CPE device.

Platforms

All

cpe-check

configure saa test type cpe-ping

oam cpe-ping

Description

This ping utility determines the IP connectivity to a CPE within a specified VPLS service.

Parameters

service-id

Specifies the service ID of the service to diagnose or manage.

Values

service-id: 1 to 2147483647

svc-name: 64 characters maximum

destination *ip-address*

Specifies the IP address to be used as the destination for performing an OAM ping operations.

Values a.b.c.d

source *ip-address*

Specifies an unused IP address in the same network that is associated with the VPLS or PBB Epipe.

Values a.b.c.d

ieee-address

Specifies the source MAC address that is sent to the CPE. If not specified or set to 0, the MAC address configured for the CPM or CFM is used. This parameter is not applicable to CPE ping on Epipes.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

All zeros and multicast is not allowed.

fc-name

Specifies the forwarding class of the MPLS echo request encapsulation.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation for VPLS and the ARP packet for PBB Epipe and Epipe VLLs.

Default out

vc-label-ttl

Specifies the TTL value in the VC label for the OAM MAC request, expressed as a decimal integer.

Values 1 to 255

Default 255

send-count

Specifies the number of messages to send to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

Values 1 to 100

Default 1

return-control

Specifies the MAC OAM reply to a data plane MAC OAM request be sent using the control plane instead of the data plane. This parameter is only valid for VPLS services.

interval

Specifies the *interval* parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the *interval* is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

7.218 cpipe

cpipe

Syntax

cpipe *service-id* [**customer** *customer-id*] [**vpn** *vpn-id*] [**vc-type** {**satop-e1** | **satop-t1** | [**vc-switching**] | **cesopsn** | **cesopsn-cas**}] [**vc-switching**] [**test**] [**create**] [**name** *name*]

no cpipe *service-id*

Context

[Tree] (config>service cpipe)

Full Context

configure service cpipe

Description

This command configures a Circuit Emulation Services instance.

When creating a service, you must enter the **customer** keyword and specify a *customer-id* to associate the service with a customer. The *customer-id* must already exist, having been created using the **customer** command in the **service** context. After a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

After a service is created, the use of the **customer** *customer-id* parameter is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified results in an error.

By default, no services exist until they are explicitly created with this command.

The **no** form of this command deletes the service instance with the specified *service-id*. The service cannot be deleted until the service has been shutdown.

Parameters

service-id

The unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: Specifies an existing service name up to 64 characters in length.

customer-id

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

vpn vpn-id

Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN ID. If this parameter is not specified, the VPN ID uses the same service ID number.

Values 1 to 2147483647

Default null (0)

vc-type

The vc-type defines the type of unstructured or structured circuit emulation service to be configured.

Values **satop-e1**: Unstructured E1 circuit emulation service.

satop-t1: Unstructured DS1 circuit emulation service.

cesopsn: Basic structured N*64 kb/s circuit emulation service.

cesopsn-cas: Structured N*64 kb/s circuit emulation service with signaling.

Default satop-e1

vc-switching

Specifies if the pseudowire switching signaling is used for the spoke SDPs configured in this service.

test

Specifies a unique test service type for the service context which contains only a SAP configuration. The test service can be used to test the throughput and performance of a path for MPLS-TP PWs. This parameter applies to the 7450 ESS and 7750 SR only.

create

Keyword used to create the service. The **create** keyword requirement can be enabled/disabled in the **environment**>**create** context.

name name

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Values *name*: up to 64 characters

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

7.219 cpm-filter

cpm-filter

Syntax

cpm-filter

Context

[Tree] (config>system>security cpm-filter)

Full Context

configure system security cpm-filter

Description

Commands in this context configure a CPM filter. A CPM filter is a hardware filter done by the P chip on the CPM and CFM that applies to all the traffic going to the CPM CPU. It can be used to drop, accept packets, as well as allocate dedicated hardware queues for the traffic.

The **no** form of this command disables the CPM filter.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

7.220 cpm-http-redirect

7.222 cpr-window-size

cpr-window-size

Syntax
cpr-window-size *window-size*

Context
[Tree] (config>port>dwdm>coherent cpr-window-size)

Full Context
configure port dwdm coherent cpr-window-size

Description
This command configures the window size used for carrier phase recovery.

Default

32

Parameters

window-size

Indicates the number of symbols used for carrier phase recovery algorithm of the receiver. When this parameter is changed, the link bounces because the receiver needs to be reconfigured.

Values 2, 4, 8, 16, 32, 64

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

cpu-alarm

Syntax

cpu-alarm high-threshold *high-percentage* **low-threshold** *low-percentage*

no cpu-alarm

Context

[Tree] (config>li>x-interfaces>x3>alarms cpu-alarm)

Full Context

configure li x-interfaces x3 alarms cpu-alarm

Description

This command configures the thresholds for raising the CPU alarm. The low threshold value must be configured with a smaller value than the high threshold.

The **no** form of this command reverts to the default values.

Parameters

high-percentage

Specifies the high threshold value, as a percentage.

Values 1 to 100

Default 100

low-percentage

Specifies the low threshold value, as a percentage.

Values	0 to 99
Default	0

Platforms
7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure service ies interface sap cpu-protection

configure service vpls sap cpu-protection

configure service ies subscriber-interface group-interface sap cpu-protection

configure service ies interface spoke-sdp cpu-protection

configure service vprn interface sap cpu-protection

configure service vprn interface spoke-sdp cpu-protection

configure service vprn subscriber-interface group-interface sap cpu-protection

Description

This command assigns an existing CPU protection policy to the SAP or interface. The CPU protection policies are configured in the **config**>**sys**>**security**>**cpuprotection**>**policy** *cpu-protection-policy-id* context.

If no CPU-protection policy is assigned to a SAP, then a default policy is used to limit the overall-rate according to the default policy. The default policy is policy number 254 for access interfaces, 255 for network interfaces and no policy for video interfaces.

The **no** form of this command removes the association of the CPU protection policy from the associated SAP or interface configuration and reverts to the default policy values.

Default

cpu-protection 254 (for access interfaces)

cpu-protection 255 (for network interfaces)

The configuration of no cpu-protection returns the msap-policy to the default policies as shown above.

Parameters

mac-monitoring

Enables per SAP + source MAC address rate limiting using the per-source-rate from the associated cpu-protection policy.

ip-src-monitoring

Enables per SAP + IP source address rate limiting for certain protocol packets using the per-source-rate and include-protocols from the associated cpu-protection policy. The ip-src-monitoring is useful in subscriber management architectures that have routers between the subscriber and the BNG (router). In Layer 3 aggregation scenarios all packets from all subscribers behind the same aggregation router arrives with the same source MAC address and as such the mac-monitoring functionality can not differentiate traffic from different subscribers.

eth-cfm-monitoring

Enables the Ethernet Connectivity Fault Management cpu-protection extensions on the associated SAP, SDP, or template.

aggregate

applies the rate limit to the sum of the per-peer packet rates.

car

(Committed Access Rate (CAR) causes Eth-CFM packets to be ignored when enforcing the overall-rate.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

- configure service ies interface spoke-sdp cpu-protection
- configure service vpls sap cpu-protection
- configure service vprn interface spoke-sdp cpu-protection
- configure service vprn interface sap cpu-protection
- configure service ies interface sap cpu-protection

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s

configure service ipipe sap cpu-protection

configure service vpls sap cpu-protection

configure service epipe spoke-sdp cpu-protection

configure service epipe sap cpu-protection

configure service template vpls-sap-template cpu-protection

Description

Use this command to apply a specific CPU protection policy to the associated SAP, SDP or template. If the mac-monitoring keyword is given then per-MAC-rate limiting should be performed, using the per-source-rate from the associated CPU protection policy.

The CPU protection policies are configured in the **config>sys>security>cpu-protection>policy** *cpu-protection-policy-id* context.

If no CPU protection policy is assigned to a SAP, then a default policy is used to limit the overall-rate according to the default policy. The default policy is policy number 254 for access interfaces, 255 for network interfaces and no policy for video interfaces.

The **no** form of this command reverts to the default values.

Default

cpu-protection 254 (for access interfaces)

cpu-protection 255 (for network interfaces)

Parameters

mac-monitoring

Enables per SAP + source MAC address rate limiting using the per-source-rate from the associated cpu-protection policy.

eth-cfm-monitoring

Enables the Ethernet Connectivity Fault Management cpu-protection extensions on the associated SAP/SDP/template.

aggregate

applies the rate limit to the sum of the per-peer packet rates.

car

(Committed Access Rate) Ignores Eth-CFM packets when enforcing overall-rate.

configure router interface cpu-protection

configure service ies video-interface cpu-protection

configure service vprn interface cpu-protection

configure service vprn network-interface cpu-protection

configure service ies interface cpu-protection

configure service vprn video-interface cpu-protection

Description

This command assigns an existing CPU protection policy to the associated interface. For these interface types, the per-source rate limit is not applicable.

The CPU protection policies are configured in the **config>sys>security>cpu-protection>policy** *cpu-protection-policy-id* context.

If no CPU-protection policy is assigned to an interface, then the default policy is used to limit the overall-rate. The default policy is policy number 254 for access interfaces, 255 for network interfaces and no policy for video interfaces.

The **no** form of this command reverts to the default values.

Default

cpu-protection 254 (for access interfaces)

cpu-protection 255 (for network interfaces)

no cpu-protection (for video interfaces)

Parameters

policy-id

Specifies an existing CPU protection policy.

Values 1 to 255

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

no cpu-protection

Context

[Tree] (config>subscr-mgmt>msap-policy cpu-protection)

Full Context

configure subscriber-mgmt msap-policy cpu-protection

Description

Use this command to apply a specific CPU protection policy to the associated MSAP policy. The specified CPU protection policy is automatically applied to any MSAPs that are create using the MSAP policy.

If no CPU protection policy is assigned to a SAP, then a default policy is used to limit the overall-rate according to the default policy. The default policy is policy number 254 for access interfaces, 255 for network interfaces and no policy for video interfaces.

The **no** form of this command reverts to the default values.

Default

cpu-protection 254 (for access interfaces)

cpu-protection 255 (for network interfaces)

The configuration of no cpu-protection returns the msap-policy to the default policies as shown above.

Parameters

policy-id

Specifies an existing CPU protection policy.

Values 1 to 255

mac-monitoring

Enables per SAP + source MAC address rate limiting using the per-source-rate from the associated cpu-protection policy.

ip-src-monitoring

Enables per SAP + IP source address rate limiting for certain protocol packets using the per-source-rate and included-protocols from the associated cpu-protection policy. The ip-src-monitoring is useful in subscriber management architectures that have routers between the subscriber and the BNG (router). In Layer 3 aggregation scenarios all packets from all subscribers behind the same aggregation router arrives with the same source MAC address and as such the mac-monitoring functionality can not differentiate traffic from different subscribers.

configure subscriber-mgmt sap-template cpu-protection

Description

This command assigns an existing CPU protection policy to the SAP or interface.

CPU protection policies are configured in the **config>sys>security>cpu-protection** context.

Default

cpu-protection 254

Parameters

policy-id

Specifies an existing CPU protection policy is assigned to the SAP or interface.

Values 1 to 255

ip-src-monitoring

Specifies to enable IP source monitoring.

mac-monitoring

Specifies to enable MAC monitoring.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s

7.225 crc

crc

Syntax

crc {**16** | **32**}

Context

[Tree] (config>port>sonet-sdh>path crc)

Full Context

configure port sonet-sdh path crc

Description

A 16 bit CRC can only be configured on an OC-3 channel, all other channel speeds must use a 32 bit CRC except for the paths configured with encap-type atm at OC3 speed.

Default

crc 16 for OC-3, DS-1, DS-3 crc 32 for OC-12, OC-48, ATM-OC12/3, AT-MOC-3, and so on

Note:
The CRC default is 32 when the encap-type is set to ATM and also, the default cannot be changed when the encap-type is set to ATM.

Parameters

16

Use 16 bit checksum for the associated port/channel.

32

Use 32 bit checksum for the associated port/channel.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

crc

Syntax

crc {**16** | **32**}

Context

[Tree] (config>port>tdm>e3 crc)

[Tree] (config>port>tdm>ds3 crc)

Full Context

configure port tdm e3 crc

configure port tdm ds3 crc

Description

This command configures the precision of the cyclic redundancy check (CRC).

Default

crc 16 for non-ATM E-3 and DS-3 channel/ports.

crc 32 for ATM E-3 and DS-3 channels/ports. The default cannot be changed.

Parameters

16

Uses 16 bit checksum for the associated port/channel.

32

Uses 32 bit checksum for the associated port/channel.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

7.226 crc-monitor

crc-monitor

Syntax

crc-monitor

Context

[Tree] (config>router>policy-options>policy-statement>entry>action create-mpls-tunnel)

Full Context

configure router policy-options policy-statement entry action create-mpls-tunnel

Description

This command enables the creation of an MPLS tunnel to the BGP next-hop. It is supported for the following address families:

- vpn-ipv4
- vpn-ipv6
- evpn

- label-ipv4
- label-ipv6
- ipv4
- ipv6

The **no** form of the command disables the creation of an MPLS tunnel.

Default

no create-mpls-tunnel

Platforms

All

7.229 create-subscription

create-subscription

Syntax

[**no**] **create-subscription**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization create-subscription)

Full Context

configure system security profile netconf base-op-authorization create-subscription

Description

This command enables the NETCONF create-subscription operation in the default user profile.

The **base-op-authorization create-subscription** configuration is not pre-emptive, which means that it is checked only at the time of the initial subscription. Configuration changes to the **base-op-authorization** do not cancel any in-progress subscriptions and operators who successfully subscribed continue to receive messages.

The **no** form of this command disables the operation.

Default

no create-subscription

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

configure aaa isa-radius-policy acct-include-attributes credit-control-quota

Description

This command includes any unconsumed volume quota in the Alc-Credit-Control-Quota attribute.

The **no** form of this command excludes the Alc-Credit-Control-Quota attribute.

Default

no credit-control-quota

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

7.234 credit-control-server

credit-control-server

Syntax

credit-control-server radius

no credit-control-server

Context

[Tree] (config>subscr-mgmt>credit-control-policy credit-control-server)

Full Context

configure subscriber-mgmt credit-control-policy credit-control-server

Description

This command configures the credit control server to use. In case of RADIUS, the servers defined in the authentication policy are used. For Diameter, the peers defined in the specified Diameter policy are used.

The **no** form of this command reverts to the default.

Default

credit-control-server radius

Parameters

radius

Specifies to use the RADIUS authentication servers defined in the RADIUS authentication policy in the group interface to report credit usage and obtain new credit.

diameter *policy-name*

Specifies to use the diameter peers specified in the diameter policy to report credit usage and obtain new credit.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure subscriber-mgmt category-map credit-exhaust-threshold

Description

This command specifies the credit exhaust threshold considered to act.

The **no** form of this command reverts the configured value to the default.

Default

credit-exhaust-threshold 100

Parameters

threshold-percentage

Specifies the percentage to use for the credit exhaust threshold.

Values 50 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

7.236 credit-mcs-interval

credit-mcs-interval

Syntax

credit-mcs-interval *interval*

no credit-mcs-interval

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>gx credit-mcs-interval)

Full Context

configure subscriber-mgmt diameter-application-policy gx credit-mcs-interval

Description

This command configures the usage monitoring between the redundant chassis that is synchronized periodically per Gx session, from the active Gx session to the standby Gx session.

The **no** form of this command reverts to the default value.

Default

credit-mcs-interval 10

Parameters

interval

Specifies the interval time, in minutes, between synchronization moments for syncing volume to the multi-chassis redundant chassis in case of Gx usage monitoring on a CCI that belongs to a multi-chassis redundant host.

Values 5 to 60

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

7.237 credit-type

credit-type

Syntax

credit-type {**volume** | **time**}

no credit-type

Context

[Tree] (config>subscr-mgmt>cat-map credit-type)

Full Context

configure subscriber-mgmt category-map credit-type

Description

This command specifies whether volume or time based accounting is performed.

The **no** form of this command reverts to the default.

Default

credit-type volume

Parameters

volume

Specifies volume-based accounting.

time

Specifies time-based accounting.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

7.238 credit-type-override

credit-type-override

Syntax

credit-type-override {**volume** | **time**}

no credit-type-override

Context

[Tree] (config>subscr-mgmt>cat-map>category credit-type-override)

Full Context

configure subscriber-mgmt category-map category credit-type-override

Description

This command overrides the **credit-type** configured in the **config>subscr-mgmt>cat-map** context for the given category.

The **no** form of this command reverts to the default.

Parameters

volume

If different than the value specified in the **credit-type** command, the value overrides the credit-type.

time

If different than the value specified in the **credit-type** command, the value overrides the credit-type.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

7.239 credits

credits

Syntax

credits [**lowercase** *credits*] [**uppercase** *credits*] [**numeric** *credits*] [**special-character** *credits*]

no credits

Context

[Tree] (config>system>security>password>complexity-rules credits)

Full Context

configure system security password complexity-rules credits

Description

The maximum credits given for usage of the different character classes in the local passwords.

The **no** form of this command resets to default.

Default

no credits

Parameters

credits

Specifies the number of credits that can be used for each characters class.

Values 0 to 10

7.241 critical-event

critical-event

Syntax

[**no**] **critical-event**

Context

[Tree] (config>port>ethernet>efm-oam>link-mon>local-sf-action>info-notification critical-event)

Full Context

configure port ethernet efm-oam link-monitoring local-sf-action info-notification critical-event

Description

This command sets the critical event Flag field in the Information OAMPDU when the local signal failure (sf-threshold) threshold is reached. This is maintained in all subsequent Information OAM PDUs until the situation is cleared.

Interactions: The signal failure threshold triggers these actions.

Default

no critical-event

Platforms

All

critical-event

Syntax

critical-event local-port-action {**log-only** | **out-of-service**}

Context

[Tree] (config>port>ethernet>efm-oam>peer-rdi-rx critical-event)

Full Context

configure port ethernet efm-oam peer-rdi-rx critical-event

Description

This command defines how to react to the reception of a critical event Flag field set in the informational OAMPDU.

Default

critical-event local-port-action out-of-service

Parameters

local-port-action

Defines whether or not the local port will be affected when a critical event is received from a peer.

log-only

Keyword that prevents the port from being affected when the local peer receives a critical event. The critical event will be logged but the port will remain operational.

out-of-service

Keyword that causes the port to enter a non-operation down state with a port state of link up. The error is logged upon reception of critical event. The port is not available to service data but continues to carry Link OAM traffic to ensure the link is monitored.

Platforms

All

7.242 crl-expiration-warning

crl-expiration-warning

Syntax

crl-expiration-warning *hours* [**repeat** *repeat-hours*]

no crl-expiration-warning

Context

[Tree] (config>system>security>pki crl-expiration-warning)

Full Context

configure system security pki crl-expiration-warning

Description

This command specifies when the systems issues a **BeforeExp** message before a CRL expires. For example, with **certificate-expiration-warning 5**, the system issues a **BeforeExp** message 5 hours before a CRL expires. An optional **repeat** *repeat-hour* parameter enables the system to repeat the **BeforeExp** message every hour until the CRL expires.

If the user only wants **AfterExp**, then **certificate-expiration-warning 0** can be used to achieve this.

BeforeExp and **AfterExp** warnings can be cleared in following cases:

- The CRL is reloaded by the **admin certificate reload** command. In this case, if the reloaded file is not expired, then **AfterExp** is cleared. And, if the reloaded file is outside of configured warning window, then the **BeforeExp** is also cleared.
- When the **ca-profile** is shutdown, then **BeforeExp** and **AfterExp** of corresponding certificates are cleared.
- When **no crl-expiration-warning** command is configured, then all existing **BeforeExp** and **AfterExp** are cleared.
- Users may change the configuration of the **crl-expiration-warning** so that certain CRL are no longer in the warning window. **BeforeExp** of corresponding CRL are cleared.
- If the system time changes so that the new time causes the CRL to no longer be in the warning window, then **BeforeExp** is cleared. If the new time causes an expired CRL to come non-expired, then **AfterExp** is cleared.

Default

no crl-expiration-warning

Parameters

hours

Specifies the amount of time before a CRL expires when system issues **BeforeExp**

Values 0 to 8760

repeat-hour

Specifies that the system repeats **BeforeExp** every repeat-hour

Values 0 to 8760

Platforms

All

7.243 crl-file

crl-file

Syntax

crl-file *filename*

no crl-file

Context

[Tree] (config>system>security>pki>ca-profile crl-file)

Full Context

configure system security pki ca-profile crl-file

Description

This command specifies the name of a file in cf3:\system-pki\crl as the Certification Revoke List file of the **ca-profile**.

Notes:

- The system performs following checks against configured crl-file when a **no shutdown** command is issued:
  - A valid cert-file of the ca-profile must be already configured.
  - Configured crl-file must be a DER formatted CRLv2 file.
  - All non-optional fields defined in section 5.1 of RFC5280 must exist and conform to the RFC5280 defined format.
  - Check the version field to see if its value is 0x1.
  - Delta CRL Indicator must not exist (delta CRL is not supported).
  - CRL's signature must be verified by using the cert-file of ca-profile.

  If any of above checks fail, the **no shutdown** command fails.
- Changing or removing the **crl-file** is only allowed when the **ca-profile** is in a **shutdown** state.

The **no** form of this command removes the filename from the configuration.

Parameters

filename

Specifies the name of CRL file stored in cf3:\system-pki\crl.

Platforms

All

7.244 crl-update

crl-update

Syntax

crl-update ca *ca-profile-name*

Context

[Tree] (admin>certificate crl-update)

Full Context

admin certificate crl-update

Description

This command manually triggers the Certificate Revocation List file (CRL) update for the specified ca-profile.

Using this command requires shutting down the **auto-crl-update**.

Parameters

ca-profile-name

Specifies the name of the Certificate Authority profile.

Platforms

All

7.245 crl-urls

crl-urls

Syntax

crl-urls

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update crl-urls)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls

Description

Commands in this context configure **crl-urls** parameters. The system allows up to eight URL entries to be configured and tries each URL in order and stop when a qualified CRL is successfully downloaded. A qualified CRL is a valid CRL signed by the CA and is more recent than the existing CRL.

If none of the configured URLs returns a qualified CRL, then:

- If the schedule-type is next-update-based, system will wait for configure retry-interval before it start from beginning of the list again.
- If the schedule-type is periodic, then system will wait till next periodic update time.

If the user wants to manually stop the download, shutting down of auto-crl-retrieval could be used to achieve this.

Platforms

All

7.246 cron

cron

Syntax

cron

Context

[Tree] (config>system cron)

Full Context

configure system cron

Description

This command creates the context to create scripts, script parameters and schedules which support the Service Assurance Agent (SAA) functions.

CRON features are saved to the configuration file on both primary and backup control modules. If a control module switchover occurs, CRON events are restored when the new configuration is loaded. If a control module switchover occurs during the execution of a cron script, the failover behavior will be determined by the contents of the script.

Platforms

All

csnp-interval

Syntax

csnp-interval *seconds*

no csnp-interval

Context

[Tree] (config>service>vprn>isis>if csnp-interval)

Full Context

configure service vprn isis interface csnp-interval

Description

This command configures the time interval, in seconds, to send complete sequence number (CSN) PDUs from the interface. IS-IS must send CSN PDUs periodically.

The **no** form of this command reverts to the default value.

Default

csnp-interval 10 — CSN PDUs are sent every 10 seconds for LAN interfaces.

csnp-interval 5 — CSN PDUs are sent every 5 seconds for point-to-point interfaces.

Parameters

seconds

The time interval, in seconds between successive CSN PDUs sent from this interface expressed as a decimal integer.

Values 1 to 65535

Platforms

All

csnp-interval

Syntax

csnp-interval *seconds*

no csnp-interval

Context

[Tree] (config>router>isis>interface csnp-interval)

Full Context

configure router isis interface csnp-interval

Description

This command configures the time interval, in seconds, to send complete sequence number (CSN) PDUs from the interface. IS-IS must send CSN PDUs periodically.

The **no** form of this command reverts to the default value.

Default

csnp-interval 10 — CSN PDUs are sent every 10 seconds for LAN interfaces.

csnp-interval 5 — CSN PDUs are sent every 5 seconds for point-to-point interfaces.

Parameters

seconds

Specifies the time interval, in seconds, between successive CSN PDUs sent from this interface expressed as a decimal integer.

Values 1 to 65535

The **no** form of the command disables debugging.

Platforms

All

cspf

Syntax

cspf [*ip-address*]

no cspf

Context

[Tree] (debug>router>ospf cspf)

Full Context

debug router ospf cspf

Description

This command enables debugging for an OSPF constraint-based shortest path first (CSPF).

Parameters

ip-address

Specifies the IP address for the range used for CSPF.

Platforms

All

7.252 cspf-on-loose-hop

cspf-on-loose-hop

Syntax

[**no**] **cspf-on-loose-hop**

Context

[Tree] (config>router>mpls cspf-on-loose-hop)

Full Context

configure router mpls cspf-on-loose-hop

Description

This command enables the option to do CSPF calculations until the next loose hop or the final destination of LSP on LSR. On receiving a PATH message on LSR and processing of all local hops in the received ERO, if the next hop is loose, then the LSR node will first do a CSPF calculation until the next loose hop. On successful completion of CSPF calculation, ERO in PATH message is modified to include newly calculated intermediate hops and propagate it forward to the next hop. This allows setting up inter-area LSPs based on ERO expansion method.

Note:
The LSP may fail to set up if this option is enabled on an LSR that is not an area border router and receives a PATH message without proper next loose hop in ERO. The 'cspf-on-loose-hop' configuration is allowed to change dynamically and applied to new LSP setup after change.

Default

no cspf-on-loose-hop

Platforms

All

7.253 cumulative-factor

cumulative-factor

Syntax

[**no**] **cumulative-factor** *cumulative-factor*

Context

[Tree] (config>service>vpls>mac-move>primary-ports cumulative-factor)

[Tree] (config>service>template>vpls-template>mac-move>primary-ports cumulative-factor)

[Tree] (config>service>vpls>mac-move>secondary-ports cumulative-factor)

Full Context

configure service vpls mac-move primary-ports cumulative-factor

configure service template vpls-template mac-move secondary-ports cumulative-factor

configure service template vpls-template mac-move primary-ports cumulative-factor

configure service vpls mac-move secondary-ports cumulative-factor

Description

This command defines a factor defining how many mac-relearn measurement periods can be used to measure mac-relearn rate. The rate must be exceeded during the defined number of consecutive periods before the corresponding port is blocked by the mac-move feature. The cumulative-factor of primary ports must be higher than cumulative-factor of secondary ports.

Default

cumulative-factor 2 — secondary ports

cumulative-factor 3 — primary ports

Parameters

factor

Specifies the factor defining the number of mac-relearn measurement periods can be used to measure mac-relearn rate

no custom-option *protocol option-number*

Context

[Tree] (config>subscr-mgmt>ppp-policy>options custom-option)

Full Context

configure subscriber-mgmt ppp-policy ppp-options custom-option

Description

This command provides the ability to configure custom PPP options.

Note:
Standard options such as the DNS name is returned from DHCP or RADIUS and be converted to PPP automatically. Compression is not supported.

The **no** form of this command removes the custom options from the configuration.

Parameters

protocol

Specifies a protocol for the custom option.

Values lcp, ipcp, ipv6cp

option-number

Assigns an identifying number for the custom option.

Values 0 to 255

ip-address

Specifies the IP address in the a.b.c.d format.

ascii-string

Specifies an ASCII format string for the custom option up to 127 characters.

hex-string

Specifies a hex value for the custom option.

Values [0x0 to 0xFFFFFF (up to 254 hex nibbles)

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

custom-option

Syntax

custom-option *option-number* **address** [*ip-address*]

custom-option *option-number* **hex** *hex-string*

custom-option *option-number* **string** *ascii-string*

no custom-option *option-number*

Context

[Tree] (config>subscr-mgmt>vrgw>brg>brg-profile>dhcp-pool>options custom-option)

Full Context

configure subscriber-mgmt vrgw brg brg-profile dhcp-pool options custom-option

Description

This command configures DHCP options.

Parameters

option-number

Specifies the number of this DHCP option.

ip-address

Specifies the IP address of this option. Up to 4 addresses can be assigned.

hex-string

Specifies the hex value of this option.

Values 0x0 to 0xFFFFFFFF (maximum 254 hex nibbles)

ascii-string

Specifies an ASCII value of this option.

Values 127 characters maximum

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

7.257 custom-protocol

custom-protocol

Syntax

custom-protocol *custom-protocol-id* **ip-protocol-num** *protocol-id* [**create**]

custom-protocol *custom-protocol-id*

no custom-protocol *custom-protocol-id*

Context

[Tree] (config>app-assure>group>policy custom-protocol)

Full Context

configure application-assurance group policy custom-protocol

Description

This command creates and enters configuration context for custom protocols. Custom protocols allow the creation of TCP and UDP-based custom protocols (based on the *ip-protocol-num* option) that employ pattern-match at offset in protocol signature definition.

Operator-configurable custom-protocols are evaluated ahead of any Nokia-provided protocol signature in order of **custom-protocol-id** (the lower ID is matched first in case of flow matching multiple custom-protocols) within the context the protocol is defined.

Custom protocols must be created before they can be used in application definition but do not have to be enabled. To reference a custom protocol in application definition, or any other CLI configuration one must use protocol name that is a concatenation of "custom_" and <custom-protocol-id>, (for example custom_01, custom_02 ... custom_10, and so on). This concatenation is also used when reporting custom protocol statistics.

Parameters

custom-protocol-id

Specifies the index into the protocol list that defines a custom protocol for application assurance.

Values 1 to 10

protocol-id

Specifies the IP protocol to match against for the custom protocol.

Values 6, 17, Protocol numbers accepted in DHB, keywords: tcp, udp

create

Mandatory keyword used when creating custom protocol. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

7.258 custom-record

custom-record

Syntax

[**no**] **custom-record**

Context

[Tree] (config>subscr-mgmt>acct-plcy custom-record)

Full Context

configure subscriber-mgmt radius-accounting-policy custom-record

Description

Commands in this context configure the layout and setting for a custom accounting record associated with this accounting policy.

The **no** form of this command reverts the configured values to the defaults.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

The **no** form of this command reverts the configured values to the defaults.

Platforms

All

7.259 custom-x-header

custom-x-header

Syntax

custom-x-header *x-header-name*

no custom-x-header

Context

[Tree] (config>app-assure>group>url-filter>icap custom-x-header)

Full Context

configure application-assurance group url-filter icap custom-x-header

Description

This command configures the url-filter ICAP policy to include a new x-header field; the content of the x-header is populated based on AQP url-filter action which can optionally specify the ASO characteristic value to include in the x-header.

Default

no custom-x-header

Parameters

x-header-name

Specifies the name of the x-header added to the ICAP request.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

7.260 customer

customer

Syntax

customer *customer-id* [**create**] [**name** *name*]

no customer *customer-id*

Context

[Tree] (config>service customer)

Full Context

configure service customer

Description

This command creates a customer ID and customer context used to associate information with a particular customer. Services can later be associated with this customer at the service level.

Each *customer-id* must be unique. The **create** keyword must follow each new **customer** *customer-id* entry.

Enter an existing **customer** *customer-id* (without the *create* keyword) to edit the customer's parameters.

An optional customer **name** can be specified and is tied to the **customer-name** in the customer context (setting either **customer-name** or **name** will cause the other to change as well).

The **no** form of this command removes a *customer-id* and all associated information. Before removing a *customer-id*, all references to that customer in all services must be deleted or changed to a different customer ID.

Default

customer 1 always exists on the system and cannot be deleted.

Parameters

customer-id

Specifies the ID number to be associated with the customer, expressed as an integer.

Values *customer-id*: 1 to 2147483647

customer-name: 64 characters maximum

create

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

name name

This parameter configures an optional customer name, up to 64 characters in length, which adds a name identifier to a given customer to then use that customer name in configuration references as well as display and use customer names in show commands throughout the system. This helps the service provider/administrator to identify and manage services within the SR OS platforms.

All services are required to assign a customer ID to initially create a customer. However, either the customer ID or the customer name can be used to identify and reference a given customer once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *customer-id* as the name.

Values *name*: 64 characters maximum

Platforms

All

7.261 customer-id-range

customer-id-range

Syntax

customer-id-range start *customer-id* **end** *customer-id*

no customer-id-range

Context

[Tree] (config>service>md-auto-id customer-id-range)

Full Context

configure service md-auto-id customer-id-range

Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to customers that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A customer created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

Default

no customer-id-range

Parameters

start ***customer-id***

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

Values 2 to 2147483647

end ***customer-id***

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

Values 2 to 2147483647

8 d Commands

8.1 d-path-length-ignore

d-path-length-ignore

Syntax

[**no**] **d-path-length-ignore**

Context

[Tree] (config>router>bgp>path-selection d-path-length-ignore)

[Tree] (config>service>vprn d-path-length-ignore)

[Tree] (config>service>vprn>bgp>path-selection d-path-length-ignore)

Full Context

configure router bgp best-path-selection d-path-length-ignore

configure service vprn d-path-length-ignore

configure service vprn bgp best-path-selection d-path-length-ignore

Description

This command enables and disables the ability of the router to ignore D-PATH domain segment length during best-path selection. At the base router level (or **vprn**>**bgp** level for PE-CE routers), this command allows BGP to ignore the D-PATH domain segment length for best-path selection purposes. The D-PATH length is ignored when comparing two VPN routes or two IFL routes within the same RD. However, these VPN/IFL routes are processed in Main-BGP instance.

At the VPRN router level, this command allows the VPRN RTM to ignore the D-PATH domain segment length for best path selection purposes (for routes in VPRN). The user can control whether the D-PATH length is considered when two VPN routes with different RDs are compared.

Best-path selection for EVPN-IFF routes against other owners (for example, EVPN-IFL or IPVPN) still relies on RTM preference. When EVPN-IFF RTM preference matches the RTM preference of another BGP owner, the existing RTM selection applies and D-PATH is not considered, irrespective of the **d-path-length-ignore** configuration.

The **no** form of this command disables the ability to ignore the D-PATH domain segment length.

Default

no d-path-length-ignore

Platforms

8.2 dack-timeout

dack-timeout

Syntax

dack-timeout *dack-timeout*

no dack-timeout

Context

[Tree] (config>app-assure>group>tcp-optimizer dack-timeout)

Full Context

configure application-assurance group tcp-optimizer dack-timeout

Description

This command configures a delayed ACK (DACK) timeout for the TCP optimizer. By entering this command a default of 200 ms timeout is enabled for delayed acknowledgment. This value is not configurable.

The **no** form of this command disables the delayed acknowledgment timeout.

Default

no dack-timeout

Parameters

dack-timeout

Specifies the delayed acknowledgment timeout in ms.

Default 200

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.3 dad-disable

dad-disable

Syntax

[**no**] **dad-disable**

Context

[Tree] (config>service>ies>if>ipv6 dad-disable)

[Tree] (config>service>vprn>if>ipv6 dad-disable)

[Tree] (config>router>if>ipv6 dad-disable)

Full Context

configure service ies interface ipv6 dad-disable

configure service vprn interface ipv6 dad-disable

configure router interface ipv6 dad-disable

Description

This command disables duplicate address detection (DAD) on the interface. When **dad-disable** is configured on the interface, the router does not perform a DAD check and all IPv6 addresses on the interface immediately enter a preferred state without checking for uniqueness on the interface. This command is useful when an interface enters a looped state during troubleshooting and becomes operationally disabled when the loop is detected; a manual intervention is required to clear the DAD violation.

The **no** form of this command enables duplicate address detection (DAD) on the interface.

Default

no dad-disable

Platforms

All

[Tree] (config>service>vprn>bgp damp-peer-oscillations)

Full Context

configure service vprn bgp group neighbor damp-peer-oscillations

configure service vprn bgp group damp-peer-oscillations

configure service vprn bgp damp-peer-oscillations

Description

This command controls how long a BGP peer session remains in the idle-state after some type of error causes the session to reset. In the idle state, BGP does not initiate or respond to attempts to establish a new session. Repeated errors that occur a short while after each session reset cause longer and longer hold times in the idle state. This command supports the DampPeerOscillations FSM behavior described in section 8.1 of RFC 4271, *A Border Gateway Protocol 4 (BGP-4).*

The default behavior, which applies when no damp-peer-oscillations is configured, is to immediately transition out of the idle-state after every reset.

Default

no damp-peer-oscillations

Parameters

initial-wait

Specifies the amount of time, in minutes, that a session remains in the idle-state after it has been stable for a while.

Values 0 to 2048

Default 0

second-wait

Specifies the period of time, in minutes, that is doubled after each repeated session failure that occurs within a relatively short span of time.

Values 0 to 2048

Default 5

max-wait

Specifies the maximum amount of time, in minutes, that a session remains in the idle-state after it has experienced repeated instability.

Values 0 to 2048

Default 60

minutes

Specifies the interval of time, in minutes after a session reset, during which the session must be error-free in to reset the penalty counter and return to idle-hold-time to initial-wait.

Values 0 to 2048

Default 30

8.6 dampening

dampening

Syntax

dampening

Context

[Tree] (config>port>ethernet dampening)

Full Context

configure port ethernet dampening

Description

Commands in this context configure exponential port dampening for an Ethernet port.

Exponential Port Dampening (EPD) reduces the number of physical link transitions reported to upper layer protocols, potentially reducing upper layer protocol churn caused by a faulty link. Penalties are added against a port whenever the port's physical link state transitions from a link up state to a link down state. When the penalties exceed a configurable threshold, port-up and port-down transitions are no longer advertised to upper layers and the port's operational state will remain down until the penalty amount drops below a configurable reuse threshold. Each transition of link up state to link down state increments the accumulated penalty value by 1000. The accumulated penalties for a port are reduced at an exponential decay rate according to a configurable half-life parameter.

8.9 data-delay-interval

data-delay-interval

Syntax

data-delay-interval *seconds*

no data-delay-interval

Context

[Tree] (config>service>vpls>provider-tunnel>selective data-delay-interval)

[Tree] (config>service>vpls>provider-tunnel>inclusive data-delay-interval)

Full Context

configure service vpls provider-tunnel selective data-delay-interval

configure service vpls provider-tunnel inclusive data-delay-interval

Description

This command configures the I-PMSI or S-PMSI data delay timer.

When used in I-PMSI trees, this delay timer allows time for the RSVP control plane to signal and bring up the S2L sub-LSP to each destination PE participating in the VPLS or B-VPLS service. The delay timer starts as soon as the P2MP LSP instance becomes operationally up under the inclusive node, for example, as soon as the first S2L sub-LSP is up. This occurs after configuring the following commands:

- **MD-CLI**

```
configure service vpls provider-tunnel inclusive admin-state enable
```

- **classic CLI**

```
configure service vpls provider-tunnel inclusive no shutdown
```

In general, it is started when the P2MP LSP instance transitions from the operationally down state to the up state.

For a mLDP P2MP LSP, the delay timer is started as soon as the P2MP FEC corresponding to the I-PMSI is resolved and installed at the root node. The user must factor in the value configured in the data-delay-interval at the root node any delay configured in IGP-LDP sync timer on interfaces over the network.

```
configure router interface ldp-sync-timer
```

This is because the mLDP P2MP LSP may move to a different interface at the expiry of this timer since the routing upstream of the LDP Label Mapping message may change when this timer expires and the interface metric is restored.

At the expiry of this timer, the VPLS or B-VPLS begins forwarding of BUM packets over the P2MP LSP instance even if not all the S2L paths are up.

When used for EVPN S-PMSI trees, the data delay interval determines the time the router takes to switch over the traffic from the Ingress Replication binds to the wildcard S-PMSI or from the wildcard S-PMSI to the S-PMSI, after the S-PMSI is created. This time should account for the time it takes for BGP to propagate the S-PMSI A-D route to the downstream PEs and the time it takes the downstream PEs to join the tree all the way up to the root.

The **no** form of this command reinstates the default value for this delay timer.

Parameters

seconds

Specifies the delay time value in seconds

Values 3 to 180

8.11 data-threshold

data-threshold

Syntax

data-threshold {*c-grp-ip-addr/mask* | *c-grp-ip-addr netmask*} *s-pmsi-threshold* [**pe-threshold-add** *pe-threshold-add*] [**pe-threshold-delete** *pe-threshold-delete*]

data-threshold *c-grp-ipv6-addr/prefix-length s-pmsi-threshold* [**pe-threshold-add** *pe-threshold-add*] [**pe-threshold-delete** *pe-threshold-delete*]

no data-threshold {*c-grp-ip-addr/mask* | *c-grp-ip-addr netmask*}

no data-threshold *c-grp-ipv6-addr/prefix-length*

Context

[Tree] (config>service>vpls>provider-tunnel>selective data-threshold)

[Tree] (config>service>vprn>mvpn>pt>selective data-threshold)

Full Context

configure service vpls provider-tunnel selective data-threshold

configure service vprn mvpn provider-tunnel selective data-threshold

Description

When used along with MVPN, this command specifies the data rate threshold that triggers the switch from the inclusive provider tunnel to the selective provider tunnel for (C-S, C-G) within the group range. Optionally, PE thresholds to create or delete ng-MVPN S-PMSI may also be specified. Omitting the PE thresholds, preserves the currently set value (or defaults if never set). Multiple statements (one per a unique group) are allowed in the configuration.

This command is not applicable to multi-stream S-PMSI.

This command for S-PMSI trees can also be used in EVPN services. The **data-threshold** command options are used in the same way as in MVPN when applied to EVPN, in particular the rate and PE thresholds.

The **no** form of this command removes the values from the configuration.

Default

no data-threshold

Parameters

group-address/mask

Specifies a multicast group address and netmask length.

c-grp-ip-addr/mask* | *c-grp-ip-addr netmask

Specifies an IPv4 multicast group address and netmask length or network mask.

c-grp-ipv6-addr/prefix-length

Specifies an IPv6 multicast group address and prefix length.

s-pmsi-threshold

Specifies the rate, in kb/s. If the rate for a (C-S, C-G)) within the specified group range exceeds the threshold, traffic for the (C-S, C-G) is switched to the selective provider tunnel. Threshold 0 is supported. When threshold 0 is configured, the (C-S, C-G) switches to S-PMSI as soon as it is learned in the MVPN and without traffic flowing for that (C-S, C-G).

s-pmsi-threshold-add

Specifies the number of receiver PEs for creating S-PMSI. When the number of receiver PEs for a specified multicast group configuration is non-zero and below the threshold and BW threshold is satisfied, S-PMSI is created.

s-pmsi-threshold-delete

Specifies the number of receiver PEs for deleting S-PMSI. When the number of receiver PEs for a specified multicast group configuration is above the threshold, S-PMSI is deleted and the multicast group is moved to I-PMSI or a wildcard S-PMSI. It is recommended that the delete threshold be significantly larger than the add threshold, to avoid re-signaling of S-PMSI as the receiver PE count fluctuates.

Values

c-grp-ip-addr	: multicast group address a.b.c.d
mask	[4 to 32]
netmask	: a.b.c.d (network bits all 1 and host bits all 0)
s-pmsi-threshold	: [0 to 4294967294] (threshold in kb/s)
c-grp-ipv6-addr	: multicast ipv6-address x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x [0 to FFFF]H
	d [0 to 255]D

	prefix-length [1 to 128]
pe-threshold-add	: [1 to 65535], if never specified, 65535 is used (add threshold always met)
pe-threshold-delete	: [2 to 65535], if never specified, 65535 is used (delete threshold never met)

Platforms

All

data-threshold

Syntax

data-threshold {*c-grp-ip-addr/mask* | *c-grp-ip-addr netmask*} *s-pmsi-threshold* [**pe-threshold-add** *pe-threshold-add*] [**pe-threshold-delete** *pe-threshold-delete*]

data-threshold *c-grp-ipv6-addr/prefix-length s-pmsi-threshold* [**pe-threshold-add** *pe-threshold-add*] [**pe-threshold-delete** *pe-threshold-delete*]

no data-threshold {*c-grp-ip-addr/mask* | *c-grp-ip-addr netmask*}

no data-threshold *c-grp-ipv6-addr/prefix-length*

Context

[Tree] (config>router>gtm>provider-tunnel>selective data-threshold)

Full Context

configure router gtm provider-tunnel selective data-threshold

Description

This command specifies the data rate threshold that triggers the switch from the inclusive provider tunnel to the selective provider tunnel for (C-S, C-G) within the group range. Optionally, PBR thresholds for creating or deleting NG-MVPN S-PMSI may also be specified. Omitting the PBR thresholds preserves currently set values (or defaults if never set). Multiple statements (one per a unique group) are allowed in the configuration.

This command is not applicable to multi-stream S-PMSIs.

The **no** form of this command removes the values from the configuration.

Default

no data-threshold

Parameters

c-grp-ip-addr/mask* | *c-grp-ip-addr netmask

Specifies an IPv4 multicast group address and netmask length or network mask.

Values mask: 4 to 32

c-grp-ipv6-addr/prefix-length

Specifies an IPv6 multicast group address and prefix length.

s-pmsi-threshold

Specifies the rate, in kb/s. If the rate for a (C-S, C-G) within the specified group range exceeds the threshold, traffic for the (C-S, C-G) is switched to the selective provider tunnel.

s-pmsi-threshold-add

Specifies the number of receiver PBRs for creating S-PMSI. When the number of receiver PBRs for a specified multicast group configuration is non-zero and below the threshold and BW threshold is satisfied, S-PMSI is created.

s-pmsi-threshold-delete

Specifies the number of receiver PBRs for deleting S-PMSI. When the number of receiver PBRs for a specified multicast group configuration is above the threshold, S-PMSI is deleted and the multicast group is moved to I-PMSI or a wildcard S-PMSI. It is recommended that the delete threshold be significantly larger than the add threshold to avoid re-signaling of S-PMSI as the receiver PBR count fluctuates.

Values

c-grp-ip-addr	multicast group address a.b.c.d
mask	4 to 32
netmask	a.b.c.d (network bits all 1 and host bits all 0)
s-pmsi-threshold	1 to 4294967294 (threshold in kb/s)
c-grp-ipv6-addr	multicast ipv6-address x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x [0 to FFFF]H d [0 to 255]D prefix-length [1 to 128]
pe-threshold-add	1 to 65535 Default: 65535 (delete threshold always met)
pe-threshold-delete	2 to 65535 Default: 65535:(delete threshold always met)

database-export [**identifier** *id*] [**bgp-ls-identifier** *bgp-ls-id*]

no database-export

Context

[Tree] (config>router>isis database-export)

Full Context

configure router isis database-export

Description

This command enables the population of the extended TE Database (TE-DB) with the link-state information from a given IGP instance.

The extended TE-DB is used as a central point for importing all link-state information, link, node, and prefix, from IGP instances on the router or the vSROS controller of the NSP and to exporting it to BGP-LS on the router and to Java-VM proxy on the vSROS controller. This information includes the IGP, TE, and the SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.

The **no** form of this command disables database exportation.

Parameters

identifier

This parameter is used to uniquely identify the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. This parameter defaults to the IGP instance ID assigned by SR OS. However, given that the concept of instance ID defined in IS-IS (RFC 6822) is unique within a routing domain while the one specified for OSPF is local subnet significant (RFC 6549), the user can remove any overlap by configuring the new **identifier** value to be unique within a given IGP domain when this router sends the IGP link-state information using BGP-LS.

id

Specifies an entry ID to export.

Values 0 to 18446744073709551615

bgp-ls-identifier

This parameter is used, along with the Autonomous System Number (ASN) to correlate the BGP-LS NLRI advertisements of multiples BGP-LS speakers of the same IGP domain. If an NRC-P network domain has multiple IGP domains, BGP-LS speakers within each IGP domain must be configured with the same unique {bgp-ls-identifier, asn} tuple.

The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain.

Note that if this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** option is not strictly required because enabling the extended TE-DB populates this information automatically. It is, however, recommended to enable it to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.

bgp-ls-id

Specifies a BGP LS ID to export.

Values 0 to 4294967295

Platforms

All

Description

This command enables the population of the extended TE Database (TE-DB) with the link-state information from a given IGP instance.

The extended TE-DB is used as a central point for importing all link-state information, link, node, and prefix, from IGP instances on the router or the vSROS controller of the NSP and to exporting it to BGP-LS on the router and to Java-VM proxy on the vSROS controller. This information includes the IGP, TE, and the SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.

The **no** form of this command disables database exportation.

Default

no database-export

Parameters

identifier

Identifies the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. This parameter defaults to the IGP instance ID assigned by SR OS. The concept of instance ID specified for OSPF is local subnet significant (RFC 6549). The user can remove router specific overlap by configuring the new **identifier** value to be unique within a given IGP domain when this router sends the IGP link-state information using BGP-LS.

id

Specifies an entry ID to export.

Values 0 to 18446744073709551615

bgp-ls-identifier

This parameter is used, along with the Autonomous System Number (ASN), to correlate the BGP-LS NLRI advertisements of multiples BGP-LS speakers of the same IGP domain. If an NRC-P network domain has multiple IGP domains, BGP-LS speakers within each IGP domain must be configured with the same unique {bgp-ls-identifier, asn} tuple.

The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain.

Note that if this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** option is not strictly required because enabling the extended TE-DB populates this information automatically. It is, however, recommended to enable it to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.

configure application-assurance datapath-cpu-low-wmark

Description

This command configures the system-wide low watermark threshold as a percentage of the per-ISA datapath core CPU utilization, where an alarm will be raised by the agent. CPU usage is the average usage across all datapath cores.

Default

datapath-cpu-low-wmark 90

Parameters

low-watermark

Specifies the low watermark for datapath CPU usage alarms.

Values 1 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.22 day-of-month

day-of-month

Syntax

day-of-month {*day-number* [..*day-number*] **all**}

no day-of-month

Context

[Tree] (config>system>cron>sched day-of-month)

Full Context

configure system cron schedule day-of-month

Description

This command specifies which days of the month that the schedule will occur. Multiple days of the month can be specified. When multiple days are configured, each of them will cause the schedule to trigger. If a day-of-month is configured without configuring month, weekday, hour, and minute, the event will not execute.

Using the **weekday** command as well as the **day-of-month** command will cause the script to run twice. For example, consider that today is Monday January 1. If Tuesday January 5 is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified day-of-month from the list.

Default

no day-of-month

Parameters

day-number

Specifies the positive integers specify the day of the month counting from the first of the month. The negative integers specify the day of the month counting from the last day of the month. For example, configuring **day-of-month -5, 5** in a month that has 31 days will specify the schedule to occur on the 27th and 5th of that month.

Integer values must map to a valid day for the month in question. For example, February 30 is not a valid date.

Values 1 to 31, -31 to -1 (maximum 62 day-numbers)

all

Specifies all days of the month.

8.25 dbw-down-threshold

dbw-down-threshold

Syntax

dbw-down-threshold *percent-change* [**bw** *absolute-change*]

no dbw-down-threshold

Context

[Tree] (config>router>rsvp>interface dbw-down-threshold)

Full Context

configure router rsvp interface dbw-down-threshold

Description

This command sets the minimum change (in percent of the latest advertised value) above which an decrease in MRLB (IS-IS TE sub-TLV 10) or MRB (OSPF TE sub-TLV 7) triggers an IGP-TE update. This configuration only applies to a change in MRLB or MRB caused by dark bandwidth. Other events affecting MRLB/MRB (such as the change of the subscription factor or the loss of link in a LAG over which the RSVP interface is defined) trigger an immediate TE update, regardless of the importance of the impact.

Optionally, the threshold can also be expressed as an absolute value. In this case, the evaluation of the change is made using the percent change and the absolute change. An IGP-TE update is sent if both thresholds are crossed. Changing this parameter in the course of dark bandwidth accounting does not affect the accounting cycle.

By default, the multiplier inherits the global value, unless it is specifically set using this command. The **no** form of this command sets this parameter to inherit the value of the corresponding global parameter.

Parameters

percent-change

Specifies the minimum decrease in MRLB/MRB, expressed in percent.

Values 0 to 100

absolute-change

Specifies the minimum decrease in MRLB/MRB, expressed in Mb/s.

Values 0 to 1000000

[**no**] **de-1-out-profile**

Context

[Tree] (config qos sap-ingress fc de-1-out-profile)

Full Context

configure qos sap-ingress fc de-1-out-profile

Description

This command, when enabled on a parent forwarding class, applies a color profile mode to the packets stored in the queue associated with this forwarding class. The queue associated with the parent forwarding class must be of type **profile-mode**.

When this QoS policy is applied to the ingress of a Frame Relay VLL SAP, the system will treat the received FR frames with DE bit set as out-of-profile, regardless of their previous marking as the result of

the default classification or on a match with an IP filter. It also adjusts the CIR of the ingress SAP queue to consider out-of-profile frames that were sent while the SAP queue was in the "< CIR" state of the bucket. This makes sure that the CIR of the SAP is achieved.

All received DE = 0 frames that are classified into this parent forwarding class or any of its subclasses have their profile unchanged by enabling this option. That is, the DE = 0 frame profile could be undetermined (default), in-profile, or out-of-profile as per previous classification. The DE = 0 frames that have a profile of undetermined will be evaluated by the system CIR marking algorithm and will be marked appropriately.

The **priority** option, if used, has no effect. All FR VLL DE = 1 frames have their priority automatically set to low while DE = 0 frames have their priority set to high. Furthermore, DE = 1 frames have the drop-preference bit set in the internal header. The internal settings of the priority bit and of the drop-preference bit of the frame is independent of the use of the profile mode.

All other capabilities of the Fpipe service are maintained. This includes remarking of the DE bit on egress SAP, and FR PW control word on egress network port for the packets that were classified into "out-of-profile" at ingress SAP.

This **de-1-out-profile** keyword has an effect when applied to the ingress of a SAP that is part of an Fpipe service. It can also be used on the ingress of an Epipe or VPLS SAP.

The **no** form of this command disables the color profile mode of operation on all SAPs to which this ingress QoS policy is applied.

Default

no de-1-out-profile

Platforms

All

8.30 de-mark

de-mark

Syntax

de-mark [**force** *de-value*]

no demark

Context

[Tree] (config>qos>sap-egress>fc de-mark)

Full Context

configure qos sap-egress fc de-mark

Description

This command is used to explicitly define the marking of the DE bit for **fc** *fc-name* according to the inplus-profile/in-profile or out-of-profile/exceed-profile status of the packet (*fc-name* may be used to identify the dot1p-value).

If no DE value is present, the default values are used for the marking of the DE bit; for example, 0 for inplus-profile or in-profile packets, 1 for out-of-profile or exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the DE bit for both the BVID and ITAG.

If this command is not used, the DE bit should be preserved if an ingress TAG exist; otherwise, set to zero.

If the DE value is included in the command line, this value is to be used for all the packets of this forwarding class regardless of their profile status.

The commands **de-mark-inner** and **de-mark-outer** take precedence over the **de-mark** command if both are specified in the same policy.

Parameters

de-value

Specifies the DE marking value.

Values 0 or 1

Platforms

All

de-mark

Syntax

de-mark [**force** *de-value*]

no de-mark

Context

[Tree] (config>qos>network>egress>fc de-mark)

Full Context

configure qos network egress fc de-mark

Description

This command is used to explicitly define the marking of the DE bit for **fc** *fc-name* according to the inplus-profile or in-profile and out-of-profile or exceed-profile status of the packet (*fc-name* may be used to identify the dot1p value).

Parameters

de-value

Specifies that this value is to be used for all the packets of this forwarding class regardless of their profile status.

If no DE value is present, the default values are used for the marking of the DE bit; that is, 0 for inplus-profile and in-profile packets, 1 for out-of-profile and exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

In the PBB case, use the following rules for a network port (B-SDP):

- the outer VID follows the rules for regular SDP
- for packets originating from a local I-VPLS/PBB-Epipe, this command dictates the marking of the DE bit for both the outer (link level) BVID and ITAG; if the command is not used, the DE bit is set to zero.
- for transit packets (B-SAP/B-SDP to B-SDP), the related ITAG bits are preserved, the same as for BVID.

Values 0, 1

Platforms

All

8.31 de-mark-inner

de-mark-inner

Syntax

de-mark-inner [**force** *de-value*]

no de-mark-inner

Context

[Tree] (config>qos>sap-egress>fc de-mark-inner)

Full Context

configure qos sap-egress fc de-mark-inner

Description

This command is used to explicitly define the marking of the DE bit in the inner VLAN tag for **fc** *fc-name* on a QinQ SAP, according to the in- and out-of-profile status of the packet.

If no DE value is present, the default values are used for the marking of the DE bit; for example, 0 for inplus-profile or in-profile packets, 1 for out-of-profile or exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

If the DE value is included in the command line, this value is used for all the inner tags of packets of this forwarding class, regardless of their profile status.

This command takes precedence over the **de-mark** command if both are specified in the same policy and over the default action.

The configuration of **qinq-mark-top-only** under the SAP egress takes precedence over the use of the **de-mark-inner** in the policy. That is, the inner VLAN tag is not remarked when **qinq-mark-top-only** is configured (the marking used for the inner VLAN tag is based on the current default, which is governed by the marking of the packet received at the ingress to the system).

If no de-mark commands are used, the DE bit is preserved if an ingress inner tag exists; otherwise, set to 0.

Remarking the inner DE bit is not supported based on the profile result of egress policing.

Parameters

de-value

Specifies the DE marking value.

Values 0 or 1

Platforms

All

8.32 de-mark-outer

de-mark-outer

Syntax

de-mark-outer [**force** *de-value*]

no de-mark-outer

Context

[Tree] (config>qos>sap-egress>fc de-mark-outer)

Full Context

configure qos sap-egress fc de-mark-outer

Description

This command is used to explicitly define the marking of the DE bit in the outer or single VLAN tag on a qinq or dot1q SAP, respectively, according to the in, out, or exceed-profile status of the packet.

If no DE value is present, the default values are used for the marking of the DE bit; for example, 0 for inplus-profile/in-profile packets, 1 for out-of-profile/exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

If the DE value is included in the command line, this value is used for all the outer or single tags of packets of this forwarding class, regardless of their profile status.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the DE bit for both the BVID and ITAG.

This command takes precedence over the **de-mark** command if both are specified in the same policy and over the default action.

If no de-mark commands are used, the DE bit is preserved if an ingress outer or single tag exists; otherwise, set to 0.

Parameters

de-value

Specifies the DE marking value.

Values 0 or 1

[Tree] (config>router>pcep>pce dead-timer)

[Tree] (config>router>pcep>pcc dead-timer)

Full Context

configure router pcep pce dead-timer

configure router pcep pcc dead-timer

Description

This command configures the PCEP session dead timer value, which is the amount of time a PCEP speaker (PCC or PCE) will wait after the receipt of the last PCEP message before declaring its peer down.

The keep-alive mechanism is asymmetric, meaning that each PCEP speaker can propose a different dead timer value to its peer to use to detect session timeout.

The **no** form of the command returns the dead timer to the default value.

Default

dead-timer 120

Parameters

seconds

the dead timer value, in seconds

Values 1 to 255

Platforms

debug-output

Syntax

[**no**] **debug-output**

Context

[Tree] (config>call-trace>trace-profile debug-output)

Full Context

configure call-trace trace-profile debug-output

Description

This command enables output to the debug log. Traced messages are decoded as text and sent to debug logging. This allows for real-time debugging but is not recommended on live systems because of the decode overhead.

This command disables logging to the compact flash. The **debug-output** and **live-output** commands are mutually exclusive.

The **no** form of this command disables output to the debug log.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.38 debug-save

debug-save

Syntax

debug-save [*file-url*]

Context

[Tree] (admin debug-save)

Full Context

admin debug-save

Description

This command saves existing debug configuration (configuration done under the debug branch of CLI). Debug configurations are not saved by the **admin save** command and not preserved across a node reboot or CPM switchover. The **debug-save** command makes the debug configuration available for the operator to execute after a reboot by using the **exec** command or after a CPM switchover by using the **switchover-exec** command, if desired.

Parameters

file-url

Specifies the file URL location to save the debug configuration. If no file-url is specified then the debug configuration is saved at the same location as the standard configuration file (**bof>primary-config**/**bof>secondary-config**/**bof>tertiary-config**) with the same file name as the standard configuration file but with a .dbg suffix.

Note:
IPv6-address applies only to 7750 SR and 7950 XRS.

Values

file url	local-url | remote-url: 255 chars max
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id *file-path* 199 chars max
remote-url	[{ftp:// | tftp://}*login*:*pswd*@*remote-locn*/][*file-path*]
	255 chars max
	directory length 99 chars max each
remote-locn	{hostname | ipv4-address | [ipv6-address]}

decrypt-key

Syntax

decrypt-key *key* | *hash-key* | *hash2-key* [**hash** | **hash2** | **custom**]

no decrypt-key

Context

[Tree] (config>app-assure>group>url-list decrypt-key)

Full Context

configure application-assurance group url-list decrypt-key

Description

In case the file is encrypted this command is used to configure the decryption key used to read the file.

The **no** form of this command removes the url-list object.

Default

no decrypt-key

Parameters

key* | *hash-key* | *hash2-key

Specifies the Application-Assurance url-list decryption key.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

8.41 def-instance-sharing

def-instance-sharing

Syntax

def-instance-sharing {**per-sap** | **per-session**}

Context

[Tree] (config>subscr-mgmt>sla-prof def-instance-sharing)

Full Context

configure subscriber-mgmt sla-profile def-instance-sharing

Description

This command configures the default SPI sharing method for IPoE or PPPoE sessions from the same subscriber, having the same SLA profile associated, that are active on the same SAP. SPI sharing can be per-SAP or a dedicated SPI per-session.

Default

def-instance-sharing per-sap

Parameters

per-sap

Specifies that IPoE or PPP sessions from the same subscriber, having the same SLA profile associated, and active on the same SAP share an SPI.

per-session

Specifies that IPoE or PPP sessions from the same subscriber, having the same SLA profile associated, and active on the same SAP obtain a dedicated SPI per session.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt def-inter-dest-id

configure subscriber-mgmt msap-policy sub-sla-mgmt def-inter-dest-id

configure service ies subscriber-interface group-interface sap sub-sla-mgmt def-inter-dest-id

Description

This command specifies a default destination string for all subscribers associated with the SAP. The command also accepts the **use-top-q** flag that automatically derives the string based on the top most delineating Dot1Q tag from the SAP's encapsulation.

The **no** form of this command removes the default subscriber identification string from the configuration.

Parameters

string

A RADIUS VSA (Alc-Int-Dest-Id-Str, type 28) obtained during the subscriber authentication phase contains the destination string name that is matched against the string defined under the Vport. In this fashion the subscriber host is associated with the corresponding Vport.

Alternatively, the destination string can be defined in LUDB.

use-top-q

This is applicable only to Ethernet ports.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

def-inter-dest-id

Syntax

def-inter-dest-id {**string** *string* | **use-top-q**}

no def-inter-dest-id

Context

[Tree] (config>service>vpls>sap>sub-sla-mgmt def-inter-dest-id)

Full Context

configure service vpls sap sub-sla-mgmt def-inter-dest-id

Description

This command specifies a default destination string for all subscribers associated with the SAP. The command also accepts the **use-top-q** flag that automatically derives the string based on the top most delineating Dot1Q tag from the SAP's encapsulation.

The **no** form of this command removes the default subscriber identification string from the configuration.

no def-sub-id

Default

no def-inter-dest-id

Parameters

use-top-q

Specifies to derive the string based on the top most delineating Dot1Q tag from the SAP's encapsulation

string *string*

Specifies the subscriber identification applicable for a subscriber host.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>router>bgp>group def-recv-evpn-encap)

Full Context

configure router bgp group neighbor def-recv-evpn-encap

configure router bgp group def-recv-evpn-encap

Description

This command defines how the BGP will treat a received EVPN route without RC5512 BGP encapsulation extended community. If no encapsulation is received, BGP will validate the route as MPLS or VXLAN depending on how this command is configured.

Default

no def-recv-evpn-encap

Parameters

mpls

Specifies that **mpls** is the default encapsulation value in the case where no RFC5512 extended community is received in the incoming BGP-EVPN route.

vxlan

Specifies that **vxlan** is the default encapsulation value.

Platforms

configure service vpls sap sub-sla-mgmt def-sub-id

configure subscriber-mgmt msap-policy sub-sla-mgmt def-sub-id

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt def-sub-id

Description

This command specifies the explicit default sub-id for dynamic subscriber hosts (including ARP hosts) in case that the sub-id string is not supplied through RADIUS or LUDB.

The sub-id is assigned to a new subscriber host in the following order of priority:

- RADIUS
- LUDB
- Explicit default – The **def-sub-id** command is used to explicitly set the *sub-id* name of the host as one of the following:
  - The SAP ID to which the new host is associated
  - An explicit string
  - An auto-generated string consisting of the concatenated subscriber identification fields defined under the **subscr-mgmt**>**auto-sub-id-key** node. The fields are taken in the order in which they are configured and are separated by a '|'character. The subscriber host identification fields are separately defined for IPoE and PPPoE host types.
- Implicit default – If the sub-id string is not returned via RADIUS or LUDB and there is no def-sub-id configured, the *sub-id* name is generated as a random 10 character encoded string based on the auto-sub-id-keys. This 10 characters encoded string is unique per chassis as well as in dual-homed environment. It is generated based on auto-sub-id-keys. If auto-sub-id-keys are not explicitly configured, the default ones are:
  - mac, sap-id, or session-id for PPP type hosts
  - mac or sap-id for IPoE type hosts.

This command does not apply to static subscribers.

The **no** form of this command reverts to the default.

Parameters

use-sap-id

Specifies the sub-id name-id on which the original request for host creation arrived (DHCP Discover, or PADI or ARP Request).

sub-id

Explicitly configured sub-id name up to 32 characters.

use-auto-id

Specifies the concatenated string of auto-sub-id-keys separated by a "| " character.

Default no def-sub-id

Implicit default If the *sub-id string* is not supplied through RADIUS, LUDB, or **def-sub-id** configuration, then a random 10 character encoded sub-id name is generated. This random sub-id name is based on the subscriber identification keys defined under the **subscr-mgmt**>**auto-sub-id-key** node. In case that the auto-sub-id-keys are not defined explicitly, the default ones are:

- mac, sap-id, or session-id for PPPoE type hosts
- mac or sap-id for IPoE type hosts

configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sub-id

configure service ies subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sub-id

Description

This command configures the default subscriber ID. The default is used if no other source (like RADIUS) provides a subscriber identification string.

Parameters

sub-id

Specifies the default subscriber identification up to 32 characters.

use-auto-id

Specifies that the auto-generated subscriber identification string, is used as the default subscriber identification string.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.46 def-sub-profile

def-sub-profile

Syntax

def-sub-profile *default-subscriber-profile-name*

Context

[Tree] (config subscr-mgmt msap-policy sub-sla-mgmt def-sub-profile)

Full Context

configure subscriber-mgmt msap-policy sub-sla-mgmt def-sub-profile

Description

This command specifies a default subscriber profile for an MSAP.

A subscriber profile defines the aggregate QoS for all hosts within a subscriber context. This is done through the definition of the egress and ingress scheduler policies that govern the aggregate SLA for subscriber using the subscriber profile.

The **no** form of this command removes the default SLA profile from the SAP configuration.

Parameters

default-sub-profile

Specifies a default subscriber profile for this SAP up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sub-profile

configure service ies interface sap sub-sla-mgmt def-sub-profile

Description

This command specifies a default subscriber profile for this SAP. The subscriber profile must be defined prior to associating the profile with a SAP in the **config>subscr-mgmt>sub-profile** context.

A subscriber profile defines the aggregate QoS for all hosts within a subscriber context. This is done through the definition of the egress and ingress scheduler policies that govern the aggregate SLA for subscriber using the subscriber profile. Subscriber profiles also allow for specific SLA profile definitions when the default definitions from the subscriber identification policy must be overridden.

The **no** form of this command removes the default SLA profile from the SAP configuration.

Parameters

default-sub-profile

Specifies a default subscriber profile for this SAP. The subscriber profile must be defined prior to associating the profile with a SAP in the **config>subscr-mgmt>sub-profile** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.47 default

default

Syntax

[**no**] **default**

Context

[Tree] (config>log>accounting-policy default)

Full Context

configure log accounting-policy default

Description

This command configures the default accounting policy to be used with all SAPs that do not have an accounting policy.

If no access accounting policy is defined on a SAP, accounting records are produced in accordance with the default access policy. If no default access policy is created, then no accounting records will be collected other than the records for the accounting policies that are explicitly configured.

If no network accounting policy is defined on a network port, accounting records will be produced in accordance with the default network policy. If no network default policy is created, then no accounting records will be collected other than the records for the accounting policies explicitly configured.

Only one access accounting policy ID can be designated as the default access policy. Likewise, only one network accounting policy ID can be designated as the default network accounting policy.

The record name must be specified prior to assigning an accounting policy as default.

If a policy is configured as the default policy, then a **no default** command must be issued before a new default policy can be configured.

The **no** form of this command removes the default policy designation from the policy ID. The accounting policy will be removed from all SAPs or network ports that do not have this policy explicitly defined.

configure subscriber-mgmt isa-filter default-action

configure subscriber-mgmt isa-filter ipv6 default-action

Description

This command specifies what should happen to packets that do not match any of the configured entries.

The **no** form of this command reverts to the default value.

Default

default-action drop

Parameters

drop

Specifies that packets matching the filter entry are dropped.

forward

Specifies that packets matching the filter entry are forwarded.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

default-action

Syntax

default-action {**block** | **allow**}

Context

[Tree] (config>service>mrp>mrp-policy default-action)

Full Context

configure service mrp mrp-policy default-action

Description

This command specifies the action to be applied to the MMRP attributes (Group B-MACs) whose ISIDs do not match the specified criteria in all of the entries of the mrp-policy.

When multiple **default-action** commands are entered, the last command will overwrite the previous command.

Default

default-action allow

Parameters

block

Specifies that all MMRP attributes will not be declared or registered unless there is a specific mrp-policy entry which causes them to be allowed on this SAP or SDP.

allow

Specifies that all MMRP attributes will be declared and registered unless there is a specific mrp-policy entry which causes them to be blocked on this SAP or SDP.

Platforms

All

default-action

Syntax

default-action {**drop** | **forward**}

no default-action

Context

[Tree] (config>service>vprn>log>filter default-action)

Full Context

configure service vprn log filter default-action

Description

The default action specifies the action that is applied to events when no action is specified in the event filter entries or when an event does not match the specified criteria.

When multiple **default-action** commands are entered, the last command overwrites the previous command.

The **no** form of this command reverts the default action to the default value (forward).

Default

default-action forward — The events which are not explicitly dropped by an event filter match are forwarded.

Parameters

drop

The events which are not explicitly forwarded by an event filter match are dropped.

forward

The events which are not explicitly dropped by an event filter match are forwarded.

Platforms

All

default-action

Syntax

default-action {**permit** | **deny**} [**event-log** *event-log-name*]

Description

This command configures the default action to take when the ICAP server is unreachable.

Default

no default-action

Parameters

allow

Allows all requests.

block-all

Blocks all requests.

block-http-redirect *http-redirect-name*

Blocks and redirects requests.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-action

Syntax

default-action {**dnat** | **forward**} [**ip-address** *ip-address*]

Context

[Tree] (config>service>nat>nat-classifier default-action)

Full Context

configure service nat nat-classifier default-action

Description

This command specifies the default action to take for packets in this nat-classifier. The default-action will apply to packet that do not match any configured criteria within nat-classifier. The **no** form of this command equals action forward.

Default

default-action forward

Parameters

dnat

Performs the DNAT function. The destination IP address of the packet traversing the router in the direction from inside to outside is replaced by the configured IP address. Destination

port is not translated. In the opposite direction (from outside to inside), the source address in the returning packet is restored to the original value.

forward

The forward action will ensure that the packet is transparently passed through the nat-classifier.

ip-address *ip-address*

The destination IP address that will replace the original IP address in the packet traveling from inside to outside.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-action

Syntax

default-action {**accept** | **discard**}

Context

[Tree] (config>router>mcac>policy default-action)

Full Context

configure router mcac policy default-action

Description

This command specifies the action to be applied to multicast streams (channels) when the streams do not match any of the multicast addresses defined in the MCAC policy.

When multiple default-action commands are entered, the last command will overwrite the previous command.

Default

default-action discard

Parameters

accept

Specifies multicast streams (channels) not defined in the MCAC policy will be accepted.

discard

Specifies multicast streams (channels) not defined in the MCAC policy will be dropped.

Platforms

All

default-action

Syntax

default-action fc *fc-name* **profile** {**in** | **out**}

Context

[Tree] (config>qos>network>ingress default-action)

Full Context

configure qos network ingress default-action

Description

This command defines or edits the default action to be taken for packets that have an undefined DSCP or MPLS EXP bit set. The **default-action** command specifies the forwarding class to which such packets are assigned.

Multiple default-action commands will overwrite each previous default-action command.

Default

default-action fc be profile out

Parameters

fc-name

Specifies the forwarding class name. All packets with DSCP value or MPLS EXP or dot1p bits that are not defined will be placed in this forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out}

All packets that are assigned to this forwarding class will be considered in-profile or out-of-profile based on this command. In case of congestion, the in-profile packets are preferentially queued over the out-of-profile packets.

Values in, out

Platforms

configure filter ip-filter default-action

configure filter mac-filter default-action

configure filter ipv6-filter default-action

Description

This command defines the default action to be applied to packets not matching any entry in this ACL filter policy or to packets for that match a PBF/PBR filter entry for which the PBF/PBR target is down and **pbr-down-action-override** per-entry is set to **filter-default-action**.

Default

default-action drop

Parameters

drop

Specifies the default action is to drop a packet.

forward

Specifies the default action is to forward a packet.

Platforms

All

default-action

Syntax

default-action {**drop** | **forward**}

no default-action

Context

[Tree] (config>log>filter default-action)

Full Context

configure log filter default-action

Description

The default action specifies the action that is applied to events when no action is specified in the event filter entries or when an event does not match the specified criteria.

When multiple **default-action** commands are entered, the last command overwrites the previous command.

The **no** form of this command reverts the default action to the default value (forward).

Default

default-action forward

Parameters

drop

The events which are not explicitly forwarded by an event filter match are dropped.

forward

The events which are not explicitly dropped by an event filter match are forwarded.

Platforms

All

default-action

Syntax

default-action {**permit** | **deny** | **deny-host-unreachable**}

Context

[Tree] (config>system>security>mgmt-access-filter>ipv6-filter default-action)

[Tree] (config>system>security>mgmt-access-filter>ip-filter default-action)

[Tree] (config>system>security>mgmt-access-filter>mac-filter default-action)

Full Context

configure system security management-access-filter ipv6-filter default-action

configure system security management-access-filter ip-filter default-action

configure system security management-access-filter mac-filter default-action

Description

This command creates the default action for management access in the absence of a specific management access filter match.

The **default-action** is applied to a packet that does not satisfy any match criteria in any of the management access filters. Whenever management access filters are configured, the **default-action** must be defined.

Parameters

permit

Specifies that packets not matching the configured selection criteria in any of the filter entries will be permitted.

deny

Specifies that packets not matching the selection criteria be denied and that an ICMP host unreachable message will not be issued.

deny-host-unreachable

Specifies that packets not matching the selection criteria be denied access and that an ICMP host unreachable message will be issued.

The **deny-host-unreachable** only applies to ip-filter and ipv6filter.

Platforms

All

default-action

Syntax

default-action {**accept** | **drop**}

Context

[Tree] (config>system>security>cpm-filter default-action)

Full Context

configure system security cpm-filter default-action

Description

This command specifies the action to take on the traffic when there are no filter entry matches. If there are no filter entries defined, the packets received are either dropped or forwarded based on that default action.

Default

default-action accept

Parameters

accept

Specifies that packets matching the filter entry are forwarded.

drop

Specifies that packets matching the filter entry are dropped.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

default-action

Syntax

default-action {**deny-all** | **permit-all** | **none** | **read-only-all**}

Context

[Tree] (config>system>security>profile default-action)

Full Context

configure system security profile default-action

Description

This command specifies the default action to be applied when no match conditions are met.

Parameters

deny-all

Sets the default of the profile to deny access to all commands.

permit-all

Sets the default of the profile to permit access to all commands.

Note:
In classic CLI but not in MD-CLI the **permit-all** parameter does not change access to **security** commands. Specific entries must be created in a command authorization profile in order to give access to **security** commands. The system populated "administrative" profile contains rules to access **security** commands.

none

Sets the default of the profile to no-action. This option is useful to assign multiple profiles to a user.

read-only-all

Sets the default of the profile to allow read-only access to all commands.

Platforms

All

default-action

Syntax

default-action {**accept** | **next-entry** | **next-policy** | **drop** | **reject**}

no default-action

Context

[Tree] (config>router>policy-options>policy-statement default-action)

Full Context

configure router policy-options policy-statement default-action

Description

Commands in this context configure actions to apply to routes that do not match any entries of a route policy statement.

The **no** form of this command deletes the **default-action** context for the policy statement.

Default

no default-action

Parameters

accept

Specifies that routes not matched by any entry should be allowed or accepted. This parameter provides a context for modifying route properties.

next-entry

Specifies that routes not matched by any entry should be evaluated by the next sequential entry in the policy chain, after route properties are possibly modified by the default action of the current policy.

next-policy

Specifies that routes not matched by any entry should be evaluated by the next sequential policy in the policy chain, after route properties are possibly modified by the default action of the current policy.

drop

Specifies that routes not matched by any entry should be disallowed or rejected. This parameter provides a context for modifying route properties.

reject

Specifies that routes not matched by any entry should be disallowed or rejected. This parameter does not provide a context for modifying route properties.

no default-action

Context

[Tree] (config>app-assure>group>url-filter>web-service default-action)

[Tree] (config>app-assure>group>url-filter>icap default-action)

[Tree] (config>app-assure>group>url-filter>local-filtering default-action)

Full Context

configure application-assurance group url-filter web-service default-action

configure application-assurance group url-filter icap default-action

configure application-assurance group url-filter local-filtering default-action

Description

This command configures a default action for the URL filter. The default action takes effect when the URL filter cannot be used. This may happen in the following scenarios.

- In the case of a local URL list, when the URL list is shutdown or the file is not loaded due to an error.
- In the case of ICAP or web filtering, when all TCP connections are busy or down.

The **no** form of this command removes the **default-action** for the URL filter.

Default

no default-action

Parameters

allow

Specifies to allows traffic.

block-all

Specifies to block traffic.

block-http-redirect ***http-redirect-name***

Specifies to block traffic and redirect the user to an information page, which can be different than the page the user is redirected to when the site they attempted to access was found in the URL filter; this page is configured using the **config**>**aa**>**group**>**url-filter**>**http-redirect** command.

Platforms

8.50 default-authentication-server-policy

default-authentication-server-policy

Syntax

default-authentication-server-policy *policy-name*

no default-authentication-server-policy

Context

[Tree] (config>router>radius-proxy>server default-authentication-server-policy)

[Tree] (config>service>vprn>radius-proxy>server default-authentication-server-policy)

Full Context

configure router radius-proxy server default-authentication-server-policy

configure service vprn radius-proxy server default-authentication-server-policy

Description

This command specifies the default radius-server-policy for RADIUS authentication. This policy is used when there is no specific match based on username.

The **no** form of this command removes the policy name from the configuration.

Parameters

policy-name

Specifies the name of the default RADIUS server policy associated with this RADIUS proxy server for authentication purposes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

default-category-map

Syntax

default-category-map *category-map-name*

no default-category-map

Context

[Tree] (config>subscr-mgmt>credit-control-policy default-category-map)

Full Context

configure subscriber-mgmt credit-control-policy default-category-map

Description

This command configures the default category map.

The **no** form of this command reverts to the default.

Parameters

category-map-name

Specifies the category map name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.53 default-charging-group

default-charging-group

Syntax

default-charging-group *charging-group-name*

no default-charging-group

Context

[Tree] (config>app-assure>group>policy default-charging-group)

Full Context

configure application-assurance group policy default-charging-group

Description

This command associates a charging group to any applications or app-groups that are not explicitly assigned to a charging group, for an application assurance policy.

The **no** form of this command deletes the default charging group from the configuration.

Default

no default-charging-group

Parameters

charging-group-name

A string of up to 32 characters uniquely identifying an existing charging group in the system.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.54 default-credit

default-credit

Syntax

default-credit volume *credits* [**bytes** | **kilobytes** | **megabytes** | **gigabytes**]

default-credit time *seconds*

no default-credit

Context

[Tree] (config>subscr-mgmt>cat-map>category default-credit)

Full Context

configure subscriber-mgmt category-map category default-credit

Description

This command configures the default credit values for RADIUS credit control and Diameter Gy application credit control.

For RADIUS credit control, this command configures the default time or volume credit for this category. The default credit is used during initial setup when no quota is received from the RADIUS server.

For Diameter Gy credit control, this command specifies the interim credit assigned to this category (rating group) when Extended Failure Handling (EFH) is enabled. This command is ignored when EFH is disabled.

The **no** form of this command reverts to the default.

Parameters

volume *credits* [bytes | kilobytes | megabytes | gigabytes]

Specifies the default value for the volume credit and the unit in which the default value is expressed.

Values 1 to 4294967295 (minimum 1 byte)

time *seconds*

Specifies the default value for the time credit, in seconds.

Values 1 to 4294967295 (minimum 1 second)

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

no default-dnat-ip-address

Context

[Tree] (config>service>nat>nat-classifier default-dnat-ip-address)

Full Context

configure service nat nat-classifier default-dnat-ip-address

Description

This command configures the IP address to substitute for the destination IP address of the packets

Default

no default-dnat-ip-address

Parameters

ip-address

Specifies the default DNAP IP address.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.56 default-dns

default-dns

Syntax

default-dns *ip-address* [**secondary** *ip-address*]

no default-dns

Context

[Tree] (config>service>vprn>sub-if default-dns)

[Tree] (config>service>ies>sub-if default-dns)

Full Context

configure service vprn subscriber-interface default-dns

configure service ies subscriber-interface default-dns

Description

This command configures last resort IP DNS addresses that can be used for name resolution by IPoE hosts (IA_NA, IA_PD and SLAAC) and PPPoE hosts (IA_NA, IA_PD and SLAAC).

The **no** form of this command reverts to the default.

Parameters

ip-address

Specifies the IP address of the primary DNS server.

secondary ip-address

Specifies the IP address of the secondary DNS server (optional).

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

default-dns

Syntax

default-dns *ipv6-address* [**secondary** *ipv6-address*]

no default-dns

Context

[Tree] (config>service>vprn>sub-if>ipv6 default-dns)

[Tree] (config>service>ies>sub-if>ipv6 default-dns)

Full Context

configure service vprn subscriber-interface ipv6 default-dns

configure service ies subscriber-interface ipv6 default-dns

Description

This command configures last resort IPv6 DNS addresses that can be used for name resolution by IPoEv6 hosts (IA_NA, IA_PD and SLAAC) and PPPoEv6 hosts (IA_NA, IA_PD and SLAAC).

The **no** form of this command reverts to the default.

Parameters

ipv6-address

Specifies the IPv6 address of the primary DNS server.

secondary ipv6-address

Specifies the IPv6 address of the secondary DNS server (optional).

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.57 default-domain

default-domain

Syntax

default-domain *dns-name*

no default-domain

Context

[Tree] (config>service>vprn>dns default-domain)

Full Context

configure service vprn dns default-domain

Description

This command configures the DNS domain name to be added in DNS retries when a DNS query is not replied or an empty DNS reply is received.

The **no** form of this command prevents DNS retries when the DNS query is not replied or an empty DNS reply is received.

Parameters

dns-name

Specifies the name of the default domain, up to 255 characters. Allowed values for characters are alphabetical (A-Z), numeric (0-9), the minus sign (-), and the period (.). For example, "3gpp-network.org”.

Platforms

All

default-domain

Syntax

default-domain

Context

[Tree] (config>eth-cfm default-domain)

Full Context

configure eth-cfm default-domain

Description

Commands in this context configure MIP creation parameters per index (**bridge-identifier** *bridge-id* **vlan** *vlan-id*) if the MIP creation statement exists as part of the service connection. The mip creation statement must be present on the connection before any configuration can occur for a MIP under this context. The determining factor for MIP creation is based on the authoritative properties of the **eth-cfm domain**

association configuration. The individual indexes in this table are used for MIP creation only when the association context is not authoritative; this includes the lack of association for a matching index.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.58 default-fc

default-fc

Syntax

default-fc *fc-name*

no default-fc

Context

[Tree] (config>qos>sap-ingress default-fc)

Full Context

configure qos sap-ingress default-fc

Description

This command configures the default forwarding class for the policy. If an ingress packet does not match a higher priority (more explicit) classification command, the default forwarding class or subclass if associated with the packet. Unless overridden by an explicit forwarding class classification rule, all packets received on an ingress SAP using this ingress QoS policy are classified to the default forwarding class. Optionally, the default ingress enqueuing priority for the traffic can be overridden as well.

The default forwarding class is best effort (be). The **default-fc** settings are displayed in the **show configuration** and **save** output regardless of inclusion of the **detail** keyword.

Default

default-fc "be”

Parameters

fc-name

Specify the forwarding class name for the queue. The value specified for *fc-name* must be one of the predefined forwarding classes in the system.

The subclass-name parameter is optional and used with the fc-name parameter to define a preexisting subclass. The fc-name and subclass-name parameters must be separated by a period (dot). If subclass-name does not exist in the context of fc -name, an error will occur. If subclass-name is removed using the **no fc** *fc-name.subclass-name* **force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

Values fc: *class*[.*subclass*]

class: be, l2, af, l1, h2, ef, h1, nc

subclass: 29 characters max

Full Context

configure service vprn l2tp group tunnel ppp default-group-interface

configure router l2tp group tunnel ppp default-group-interface

configure service vprn l2tp group ppp default-group-interface

configure router l2tp group ppp default-group-interface

Description

This command configures the group interface where the PPP sessions are established when the authentication server does not specify the group interface.

The **no** form of this command removes the interface name or service ID from the configuration.

Parameters

ip-int-name

Specifies an IP interface name, up to 32 characters.

service-id service-id

Specifies an existing service identification number.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **default-group-interface** *ip-int-name* **service-name** *svc-name* variant can be used in all configuration modes.

Values {*id* | *svc-name*}

id:	1 to 2147483647
svc-name:	up to 64 characters (*svc-name* is an alias for input only. The *svc-name* gets replaced with an id automatically by SR OS in the configuration).

service-name svc-name

Specifies an existing service name up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.61 default-gtp-tunnel-endpoint-limit

default-gtp-tunnel-endpoint-limit

Syntax

default-gtp-tunnel-endpoint-limit direction *direction* [**create**]

no default-gtp-tunnel-endpoint-limit direction *direction*

Context

[Tree] (config>app-assure>group>statistics>tca>gtp-filter default-gtp-tunnel-endpoint-limit)

Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter default-gtp-tunnel-endpoint-limit

Description

This command configures a TCA for the counter capturing drops because the GTP endpoint limits create requests exceeding the configured allowed limit (set by the **default-tunnel-endpoint-limit** command). A default-gtp-tunnel-endpoint-limit drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**). The **create** keyword is mandatory when creating a TCA.

Parameters

direction

Specifies the traffic direction.

Values from-sub

create

Keyword used to create the TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.62 default-host

default-host

Syntax

no default-host *ipv4-prefix/mask* | *ipv6-prefix/prefix-length*

Context

[Tree] (config>service>ies>sub-if>grp-if>sap default-host)

[Tree] (config>service>vprn>sub-if>grp-if>sap default-host)

Full Context

configure service ies subscriber-interface group-interface sap default-host

configure service vprn subscriber-interface group-interface sap default-host

Description

This command configures the default-host. More than one default host can be configured per SAP.

The **no** form of this command removes the values from the configuration.

Parameters

ipv4prefix/prefix-length

Specifies an IPv4 prefix and prefix length.

Values

ipv4-prefix a.b.c.d (host bits must be 0

prefix-length 0 to 32

ipv6-prefix/prefix-length

Specifies an IPv6 prefix and prefix length.

Values

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

prefix-length - [0 to 128]

next-hop

Assigns the next hop IP address.

Platforms

8.63 default-instance

default-instance

Syntax

[**no**] **default-instance**

Context

[Tree] (config>service>vprn>isis>if default-instance)

Full Context

configure service vprn isis interface default-instance

Description

This command enables a non-MI capable router to establish an adjacency and operate with an SR OS in a non-zero instance. If the router does not receive IID-TLVs, it establishes an adjacency in a single instance. Instead of establishing an adjacency in the standard instance 0, the router establishes an adjacency in the configured non-zero instance. The router then operates in the configured non-zero instance so that it appears to be in the standard instance 0 to its neighbor. This feature is supported on point-to-point interfaces, broadcast interfaces are not supported.

The **no** form of this command disables the functionality so that the router can only establish adjacencies in the standard instance 0.

Default

no default-instance

Platforms

All

default-instance

Syntax

[**no**] **default-instance**

Context

[Tree] (config>router>isis>interface default-instance)

Full Context

configure router isis interface default-instance

Description

This command enables a non-MI capable router to establish an adjacency and operate with a router in a non-zero instance. If the router does not receive IID-TLVs, it will establish an adjacency in a single instance. Instead of establishing an adjacency in the standard instance 0, the router will establish an adjacency in the configured non-zero instance. The router will then operate in the configured non-zero instance so that it appears to be in the standard instance 0 to its neighbor. This feature is supported on point-to-point interfaces, broadcast interfaces are not supported.

This feature must be configured on the router connected to non-MI capable routers and on all other SR OS routers in the area, so that they receive non-MI LSPs in the correct instance and not in the base instance.

The **no** form of this command disables the functionality so that the router can only establish adjacencies in the standard instance 0.

[Tree] (config>router>bgp>group>neighbor default-label-preference)

Full Context

configure router bgp default-label-preference

configure router bgp group default-label-preference

configure router bgp group neighbor default-label-preference

Description

This command specifies a route-table preference value to use for EBGP or IBGP routes carrying labeled-unicast prefixes and received from peers covered by the context of the command. Route-table preference comes into play when the route-table has multiple routes for the same IP prefix. In this case the route with the numerically lowest preference value is usually the route that is activated and installed into the IP FIB. By default all BGP routes have a route-table preference value of 170.

This command overrides the preference value assigned by the **label-preference** command; that other command does not distinguish between EBGP and IBGP routes. Overriding happens even when the default-label-preference value is inherited from a higher level of configuration and competes with an explicitly configured label-preference value at a lower level of configuration in the BGP hierarchy.

Note:
The preference value assigned by the **default-label-preference** command can always be overwritten by a route policy entry that accepts the route with a **preference** command in the action.

The **no** form of the command lets BGP route-table preference for labeled-unicast routes to be controlled by other means.

Default

no default-label-preference

Parameters

ebgp label preference

Specifies the EBGP default preference label value.

Values 0 to 255

ibgp label preference

Specifies the IBGP default preference label value.

Values 0 to 255

Description

This command configures the metric used by the area border router (ABR) for the default route into a stub area.

The default metric should only be configured on an ABR of a stub area.

An ABR generates a default route if the area is a **stub** area.

The **no** form of this command reverts to the default value.

Default

default-metric 1

Parameters

metric

Specifies the metric expressed as a decimal integer for the default route cost to be advertised into the stub area.

Values 1 to 16777214

Platforms

All

8.69 default-msap-policy

default-msap-policy

Syntax

default-msap-policy *policy-name*

no default-msap-policy

Context

[Tree] (config>service>vpls>sap default-msap-policy)

Full Context

configure service vpls sap default-msap-policy

Description

This command specifies the default managed SAP policy to use to create MSAPs when the response from the RADIUS server does not specify a managed SAP policy.

The *policy-name* parameter is only valid for a SAP with the keywords **capture-sap** specified in the SAP's configuration. The **capture-sap** keyword in the SAP configuration captures the SAP where triggering packets is sent to the CPM. Non-triggering packets captured by the capture SAP is dropped.

The managed SAP policy must already be defined in the **config>subscr-mgmt>msap-policy** context.

The **no** form of this command removes the policy-name from the configuration.

Parameters

policy-name

Specifies an existing default managed SAP policy.

Platforms

All

8.70 default-pap-password

default-pap-password

Syntax

default-pap-password *password* [**hash** | **hash2** | **custom**]

no default-pap-password

Context

[Tree] (config>subscr-mgmt>ppp-policy default-pap-password)

Full Context

configure subscriber-mgmt ppp-policy default-pap-password

Description

This command configures the default PAP password for RADIUS authentication when the Password-Length=0 in the PAP Authenticate-Request.

RADIUS authentication cannot be initiated when the Password-Length=0 in the PAP Authenticate-Request and no default-pap-password is configured. The PPP session terminates in this case.

Parameters

password

Specifies a default PAP password up to 64 characters.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

Full Context

configure router mpls lsp-template default-path

Description

A default path binding must be provided before the LSP template can be used for signaling LSP. The LSP template must be shutdown to modify default-path binding.

Parameters

path-name

Configures the default path binding

Platforms

All

8.72 default-peer

default-peer

Syntax

[**no**] **default-peer**

Context

[Tree] (config>aaa>diam>node>peer default-peer)

Full Context

configure aaa diameter node peer default-peer

Description

This command designates a peer as a default peer. Traffic that is destined to realms that are not associated with locally configured peers, is sent to the default-peer. In effect, the default peer becomes a default route for Diameter realms.

This command is mandatory in multi-chassis redundancy where the inter-chassis peer is designated as default peer. Then, the SR with no open connections towards agents or servers, forwards all traffic to the inter-peer which maintains, as part of MCS, open connections with agents and servers.

The **no** form of this command reverts to the default.

Default

no default-peer

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

default-peer

Syntax

default-peer

no default-peer

Context

[Tree] (config>service>vprn>msdp>group>peer default-peer)

[Tree] (config>service>vprn>msdp>peer default-peer)

Full Context

configure service vprn msdp group peer default-peer

configure service vprn msdp peer default-peer

Description

Using the default peer mechanism, a peer can be selected as the default Multicast Source Discovery Protocol (MSDP) peer. As a result, all source-active messages from the peer will be accepted without the usual peer-reverse-path-forwarding (RPF) check.

The MSDP peer-RPF check is different from the normal multicast RPF checks. The peer-RPF check is used to stop source-active messages from looping. A router validates source-active messages originated from other routers in a deterministic fashion.

A set of rules is applied in order to validate received source-active messages, and the first rule that applies determines the peer-RPF neighbor. All source-active messages from other routers are rejected. The rules applied to source-active messages originating at Router S received at Router R from Router N are as follows:

- If Router N and router S are one and the same, then the message is originated by a direct peer-RPF neighbor and will be accepted.
- If Router N is a configured peer, or a member of the Router R mesh group then its source-active messages are accepted.
- If Router N is the Border Gateway Protocol (BGP) next hop of the active multicast RPF route toward Router S then Router N is the peer-RPF neighbor and its source-active messages are accepted.
- If Router N is an external BGP peer of Router R and the last autonomous system (AS) number in the BGP AS-path to Router S is the same as Router N's AS number, then Router N is the peer-RPF neighbor, and its source-active messages are accepted.
- If Router N uses the same next hop as the next hop to Router S, then Router N is the peer-RPF neighbor, and its source-active messages are accepted.
- If Router N fits none of the above rules, then Router N is not a peer-RPF neighbor, and its source-active messages are rejected.

Default

no default-peer

8.74 default-preference

default-preference

Syntax

default-preference [**ebgp** *ebgp preference*] [**ibgp** *ibgp preference*]

no default-preference

Context

[Tree] (config>router>bgp>group default-preference)

[Tree] (config>router>bgp default-preference)

[Tree] (config>router>bgp>group>neighbor default-preference)

Full Context

configure router bgp group default-preference

configure router bgp default-preference

configure router bgp group neighbor default-preference

Description

This command specifies a route-table preference value to use for EBGP or IBGP routes carrying unlabeled prefixes and received from peers covered by the context of the command. Route-table preference comes into play when the route-table has multiple routes for the same IP prefix. In this case, the route with the numerically lowest preference value is usually the route that is activated and installed into the IP FIB. By default all BGP routes have a route-table preference value of 170.

This command overrides the preference value assigned by the **preference** command; that other command does not distinguish between EBGP and IBGP routes. Overriding happens even when the default-preference value is inherited from a higher level of configuration and competes with an explicitly configured preference value at a lower level of configuration in the BGP hierarchy.

Note:
The preference value assigned by the **default-preference** command can always be overwritten by a route policy entry that accepts the route with a **preference** command in the action.

The **no** form of the command lets BGP route-table preference to be controlled by other means.

Default

no default-preference

Parameters

ebgp preference

Specifies the EBGP default preference value.

Values 0 to 255

ibgp preference

Specifies the IBGP default preference value.

Values 0 to 255

Platforms

All

8.75 default-priority

default-priority

Syntax

default-priority {**high** | **low**}

no default-priority

Context

[Tree] (config>qos>sap-ingress default-priority)

Full Context

configure qos sap-ingress default-priority

Description

This command configures the default enqueuing priority for all packets received on an ingress SAP using this policy. To change the default priority for the policy, the **fc-name** must be defined whether it is being changed or not.

Default

default-priority low

Parameters

high

Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low

Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

configure service vpls bgp-evpn mpls default-route-tag

configure service vpls bgp-evpn vxlan default-route-tag

configure service epipe bgp-evpn segment-routing-v6 default-route-tag

Description

This command configures a route tag that EVPN and IP-VPN use when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP EVPN instance is enabled, the command cannot be changed. Additionally, EVPN services can add tags to routes with **proxy-arp/nd>evpn-route-tag** or the route table tag (added using the import policy). Only one tag is passed from EVPN to the BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.

The following are examples of the conflict priority handling:

- If a service is configured with both **default-route-tag** *X* and **proxy-arp>evpn-route-tag** *Y*, EVPN uses route tag *Y* when sending EVPN proxy-arp routes to the BGP RIB for advertisement.
- If a given IP-prefix route is tagged in the route-table with tag *A* and the R-VPLS, in which the route is advertised, uses *B* as the **default-route-tag**, then EVPN keeps tag *A* when sending the route to the BGP RIB.

The **default-route-tag** configuration is only supported on EVPN and IP-VPN service routes. The route tag for ES and AD per-ES routes is always zero.

The **no** form of this command removes the **default-route-tag** (that is, it sets the route tag to zero).

Default

no default-route-tag

Parameters

tag

Specifies the route tag.

Values 1 to 255

Platforms

configure subscriber-mgmt ppp-policy default-user-name

Description

This command configures the default username for authentication when not provided in PAP/CHAP authentication (no Name field in CHAP Response message or Peer-Id-Length=0 in PAP Authenticate-Request).

The PPP session terminates when no username is provided in PAP/CHAP authentication and no default-user-name is configured.

Parameters

ppp-username

Specifies a default username up to 253 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.90 default-value

default-value

Syntax

default-value *value-name*

no default-value

Context

[Tree] (config>app-assure>group>policy>aso>char default-value)

Full Context

configure application-assurance group policy app-service-options characteristic default-value

Description

This command assigns one of the characteristic values as default.

When a default value is specified, app-profile entries that do not explicitly include this characteristic inherit the default value and use it as part of the AQP match criteria based on that app-profile.

A default-value is required for each characteristic. This is evaluated at commit time.

The **no** form of this command removes the default value for the characteristic.

Parameters

value-name

Specifies the name of an existing characteristic value.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.91 defaults

defaults

Syntax

defaults

Context

[Tree] (config>router>dhcp6>server defaults)

Full Context

configure router dhcp6 local-dhcp-server defaults

Description

Commands in this context configure server default timer and option parameters. These can be overridden on a per-pool and per-prefix basis.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

defaults

Syntax

defaults

Context

[Tree] (config>subscr-mgmt>gtp>apn-policy>apn defaults)

Full Context

configure subscriber-mgmt gtp apn-policy apn defaults

Description

Commands in this context configure default parameters for the GTP connection that can be used when the parameters are not returned in authentication.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.92 delay

delay

Syntax

delay

Context

[Tree] (config>router>if>if-attribute delay)

Full Context

configure router interface if-attribute delay

Description

Commands in this context configure or apply delay interface attributes such as static delay.

Platforms

All

delay

Syntax

delay *interval*

Context

[Tree] (config>system>management-interface>cli>md-cli>environment>progress-indicator delay)

Full Context

configure system management-interface cli md-cli environment progress-indicator delay

Description

This command sets the delay before the progress indicator is displayed in the MD-CLI.

Default

delay 500

Parameters

interval

Specifies the delay interval, in milliseconds.

Values 1 to 10000

Platforms

All

delay

Syntax

delay *delay-measurement-type*

Context

[Tree] (config>test-oam>link-meas>template delay)

Full Context

configure test-oam link-measurement measurement-template delay

Description

This command configures the type of delay measurement statistic used in both the sample window and aggregate sample window.

The **no** form of this command reverts to the default value.

Default

delay min

Parameters

delay-measurement-type

Specifies the type of delay measurement that is used for comparison and reporting.

Values **min** — Keyword to take the minimum of a series of measurements for comparison and reporting.

max — Keyword to take the maximum of a series of measurements for comparison and reporting.

avg — Keyword to compute the average of a series of measurements for comparison and reporting.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.93 delay-event

delay-event

Syntax

delay-event {**forward** | **backward** | **round-trip**} **lowest-bin** *bin-number* **threshold***raise-threshold* [**clear** *clear-threshold*]

no delay-event {**forward** | **backward** | **round-trip**}

Context

[Tree] (config>oam-pm>bin-group>bin-type delay-event)

Full Context

configure oam-pm bin-group bin-type delay-event

Description

This command sets the bin number, the threshold and the direction that is monitored to determine if a delay metric threshold crossing event has occurred or has cleared. It requires a bin number, a rising threshold value and a direction. If the *clear-threshold* value is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and without regard to any previous window. When a raise threshold is reached, the log event is generated. Each unique threshold can only be raised once for the threshold within measurement interval. If the optional clear threshold is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is not raised until a measurement interval completes, and the clear threshold has not been exceeded. A clear event is raised under that

condition. In general, alarms are generated when there is a state change. The thresholds configured are applied to the count in specified bin and all higher number bins.

The **no** form of this command removes thresholding for this delay metric. The complete command must be configured in order to remove the specific threshold.

Parameters

forward

Specifies the threshold is applied to the forward direction bin.

backward

Specifies the threshold is applied to the backward direction bin.

round-trip

Specifies the threshold is applied to the roundtrip direction bin.

bin-number

Specifies the number of the bin that the threshold is applied to. This bin and all higher bins are monitored to determine if the sum total results in these bins have reached or crossed the configured threshold.

Values 0 to 9

raise-threshold

Specifies the rising numerical value in the range that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional numerical value in the range threshold used to indicate stateful behavior that allows the operator to configure a lower value than the rising threshold that determines when the clear event should be generated. Clear is generated when the end of measurement interval count is less than or equal to the configured value. If this option is not configured the behavior is stateless. Zero means no results can exist in the lower bin or any higher.

Values 0 to 863999

Default Clear threshold disabled

Platforms

All

8.94 delay-event-exclusion

delay-event-exclusion

Syntax

delay-event-exclusion {**forward** | **backward** | **round-trip**} **lowest-bin** *bin-number*

no delay-event-exclusion {**forward** | **backward** | **round-trip**}

Context

[Tree] (config>oam-pm>bin-group>bin-type delay-event-exclusion)

Full Context

configure oam-pm bin-group bin-type delay-event-exclusion

Description

This optional command allows results from probes that map to the specified bin and higher bins to be excluded from the TCA count. The TCA count is used to determine if a threshold has been reached by the event monitoring function. Individual counters are incremented in the bin, but the counts in the specified bin and higher bins are not included in the TCA threshold computation. A **delay-event** must be configured in the same direction, and the **lowest-bin** configured as part of the **delay-event-exclusion** command must be higher than the lowest bin specified by the corresponding **delay-event** command.

The bin group allows this optional command to be added, modified, or deleted while tests are actively referencing the bin group. The bin group does not need to be shut down during **delay-event-exclusion** configuration. If the values are modified while the active tests are executing, all configured TCAs for the specified direction within the bin group enters a pending (p) state until the start of the next measurement interval. Any existing stateful TCAs that were raised are cleared without creating a log event, and no further processing for the affected TCAs occur in the active window. Depending on timing, the pending state may continue past the adjacent measurement interval until the start of the following measurement interval.

The **no** form of this command does not exclude any values from the configured TCA threshold.

Default

no delay-event-exclusion forward

no delay-event-exclusion backward

no delay-event-exclusion round-trip

Parameters

forward

Specifies the forward direction bin.

backward

Specifies the backward direction bin.

round-trip

Specifies the round-trip direction bin.

bin-number

Specifies the number of the lowest bin that the exclusion is applied to. This bin and all higher bins are excluded from the **delay-event** (TCA) count. If no bin numbers are configured, this command is ignored.

Values 1 to 9

Platforms

All

8.95 delay-events

delay-events

Syntax

[**no**] **delay-events**

Context

[Tree] (config>oam-pm>session>measurement-interval>event-mon delay-events)

Full Context

configure oam-pm session measurement-interval event-mon delay-events

Description

This enables the monitoring of all configured delay events. Adding this functionality starts the monitoring of the configured delay events at the start of the next measurement interval. If the function is removed using the **no** command, all monitoring of configured delay events, logging, and recording of new events for that session are suspended. Any existing events at the time of the shut down are maintained until the active measurement window in which the removal was performed has completed. The state of this monitoring function can be changed without having to shutdown all the tests in the session.

The **no** form of this command disables the monitoring of all configured delay events.

8.96 delay-selection

delay-selection

Syntax

delay-selection {static | dynamic | static-preferred | dynamic-preferred}

no delay-selection

Context

[Tree] (config>router>if>if-attr>delay delay-selection)

Full Context

configure router interface if-attribute delay delay-selection

Description

This command selects the delay source to be advertised by the IGP for this interface.

The **no** form of this command reverts to the default value.

Default

delay-selection static-preferred

Parameters

static

Keyword to use only statically configured delay and ignore dynamic delay measurements generated by **link-measurement**.

dynamic

Keyword to use only dynamic delay measurements generated by **link-measurement** and ignore statically configured delay.

static-preferred

Keyword to prefer the configured static delay over the dynamic delay. If static delay is not configured, the delay reported using **link-measurement** is used.

dynamic-preferred

Keyword to prefer the dynamic reported delay over the statically configured delay. If no dynamic delay has been reported using **link-measurement**, the statically configured delay is used.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.97 delay-start-time

delay-start-time

Syntax

delay-start-time *delay*

no delay-start-time

Context

[Tree] (config>subscr-mgmt>acct-plcy delay-start-time)

Full Context

configure subscriber-mgmt radius-accounting-policy delay-start-time

Description

It is recommended to only use this command when **session-accounting** is used. By default, a dual stack subscriber generates a RADIUS accounting interim message for each new host update (IPv4, IPv6 WAN, and IPv6 PD). This command delays the trigger of a RADIUS accounting start message and allows all hosts to connect first. When the delay timer expires, a single RADIUS accounting start message containing all the host currently connected to the BNG is sent to the server. Subsequent host connections will trigger interim-updates if host-update is enabled on session-accounting. For all other accounting modes, this command will delay the trigger of an accounting start when a host connects.

The **no** form of this command reverts to the default.

Default

no delay-start-time

Parameters

delay

Specifies the accounting start delay, in seconds.

Values 1 to 10

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.98 delay-template

delay-template

Syntax

delay-template *delay-template-name*

no delay-template

Context

[Tree] (config>oam-pm>session>ethernet>dmm delay-template)

Full Context

configure oam-pm session ethernet dmm delay-template

Description

This command specifies a reference to a **config>oam-pm>streaming delay-template** for the Ethernet DMM test. It is possible to include a delay template reference that is not configured under **config>oam-**

pm>streaming. In this case, the streaming of the results is not in effect. Refer to the **config>oam-pm>streaming delay-template** command for session to template interaction behaviors.

The **no** form of this command deletes the delay template from the test.

Default

no delay-template

Parameters

delay-template-name

Specifies the delay template name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

delay-template

Syntax

delay-template *delay-template-name*

no delay-template

Context

[Tree] (config>oam-pm>session>ip>twamp-light delay-template)

Full Context

configure oam-pm session ip twamp-light delay-template

Description

This command specifies a reference to a **config>oam-pm>streaming delay-template** for the IP TWAMP LIGHT test. It is possible to include a delay template reference that is not configured under **config>oam-pm>streaming**. In this case, streaming of results are not in effect. Refer to the **config>oam-pm>streaming delay-template** command for session to template interaction behaviors.

The **no** form of this command deletes the delay template from the test.

Default

no delay-template

Parameters

delay-template-name

Specifies the delay template name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

delay-template

Syntax

delay-template *delay-template-name*

no delay-template

Context

[Tree] (config>oam-pm>session>mpls>dm delay-template)

Full Context

configure oam-pm session mpls dm delay-template

Description

This command specifies a reference to a **config>oam-pm>streaming delay-template** for the MPLS DM test. It is possible to include a delay template reference that is not configured under **config>oam-pm>streaming**. In this case, streaming of results are not in effect. Refer to the **config>oam-pm>streaming delay-template** command for session to template interaction behaviors.

The **no** form of this command deletes the delay template from the test.

Default

no delay-template

Parameters

delay-template-name

Specifies the delay template name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

delay-template

Syntax

delay-template *template-name* [**create**]

no delay-template *template-name*

Context

[Tree] (config>oam-pm>streaming delay-template)

Full Context

configure oam-pm streaming delay-template

Description

This command specifies a template for streaming delay metrics that can be referenced under the **oam-pm>session** technology delay style test.

The **delay-template** must be configured under the technology delay test **oam-pm>session** to allow the delay specific test to stream results using the configured template attributes.

The **no** form of this command deletes the specified delay template.

Parameters

template-name

Specifies the template name, up to 64 characters.

create

Creates the template.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.99 delegated-ipv6-prefix

delegated-ipv6-prefix

Syntax

[**no**] **delegated-ipv6-prefix**

Context

[Tree] (config>subscr-mgmt>acct-plcy>include-radius-attribute delegated-ipv6-prefix)

Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute delegated-ipv6-prefix

Description

This command enables the generation of the **delegated-ipv6-prefix** RADIUS attribute.

The **no** form of this command disables the generation of the **delegated-ipv6-prefix** RADIUS attribute.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.100 delegated-prefix-length

delegated-prefix-length

Syntax

delegated-prefix-length [**minimum** *prefix-length*] [**maximum** *prefix-length*]

no delegated-prefix-length

Context

[Tree] (config>router>dhcp6>server>pool delegated-prefix-length)

[Tree] (config>service>vprn>dhcp6>server>pool delegated-prefix-length)

Full Context

configure router dhcp6 local-dhcp-server pool delegated-prefix-length

configure service vprn dhcp6 local-dhcp-server pool delegated-prefix-length

Description

This command configures the delegated prefix length that is used if the DHCPv6 client does not specify a prefix length hint.

The DHCPv6 client prefix length hint is limited by the range specified by the **minimum** and **maximum** parameters. If the hint is smaller than the minimum, the allocated prefix length is equal to the minimum length. If the hint is larger than the maximum, the allocated prefix length is equal to the maximum length.

The **no** form of this command reverts to the default.

Default

delegated-prefix-length 64 minimum 48 maximum 64

Parameters

prefix-length

Specifies the minimum or maximum allowed prefix length, in bits.

Values 48 to 127

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

delegated-prefix-length

Syntax

delegated-prefix-length *bits*

delegated-prefix-length variable

no delegated-prefix-length

Context

[Tree] (config>service>vprn>sub-if>ipv6 delegated-prefix-length)

[Tree] (config>service>ies>sub-if>ipv6 delegated-prefix-length)

Full Context

configure service vprn subscriber-interface ipv6 delegated-prefix-length

configure service ies subscriber-interface ipv6 delegated-prefix-length

Description

This command configures the subscriber interface level setting for delegated prefix length. The delegated prefix length for a subscriber- interface can be either set to a fixed value that is explicitly configured under the subscriber interface CLI hierarchy or a variable value that can be obtained from various sources. This command can be changed only when no IPv6 prefixes are configured under the **subscriber-interface** context.

The **no** form of this command reverts to the default.

Default

no delegated-prefix-length (the delegated prefix length is 64)

Parameters

bits

Specifies the delegated prefix length in bits. This value is applicable to the entire subscriber interface. In case that the delegated prefix length is also supplied via other means (LUDB, RADIUS or DHCP Server), such supplied value must match the value configured under the **subscriber-interface** context. Otherwise, the prefix instantiation in the router fails.

Values 48 to 64

variable

Specifies that the delegated prefix value can be of any length between 48 to 64. The value itself can vary between the prefixes and is provided at the time of prefix instantiation. The order of priority for the source of the delegated prefix length is:

- LUDB
- RADIUS
- DHCPv6 server

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.101 delete

delete

Syntax

delete *file-url* [**force**] [**no-redirect**] [**client-tls-profile** *profile*] [**proxy** *proxy-url*]

Context

[Tree] (file delete)

Full Context

file delete

Description

This command deletes the specified file.

The optional wildcard (*) can be used to delete multiple files that share a common (partial) prefix and/or (partial) suffix. When the wildcard is entered, the following prompt displays for each file that matches the wildcard:

"Delete file <filename> (y/n)?”

Parameters

file-url

Specifies the file name to delete.

Values

local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each
remote-url	[{ftp:// | tftp:// | http:// | https://}*login*:*pswd*@*remote-locn*/][*file-path*] up to 247 characters directory length up to 99 characters each
remote-locn	[hostname | ipv4-address | [ipv6-address]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*] *x:x:x:x:x:x:d.d.d.d*[-*interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

force

Forces an immediate deletion of the specified file(s). The command **file delete * force** deletes all the wildcard matching files without displaying a user prompt message. This command also automatically accepts HTTP redirects unless overridden by the **no-redirect** parameter.

profile

Specifies the TLS client profile configured under **config>system>security>tls>client-tls-profile** to use.

proxy-url

Specifies the URL of an HTTP proxy. For example, http://proxy.mydomain.com:8000. This URL must be an HTTP URL and not an HTTPS URL.

no-redirect

Specifies to automatically refuse any HTTP redirects without prompting the user.

Platforms

All

delete

Syntax

delete [*line*]

Context

[Tree] (candidate delete)

Full Context

candidate delete

Description

This command deletes the selected CLI node (which includes all sub-branches). The deleted lines are also copied into a temporary buffer that can be used for a subsequent insert.

Parameters

line

Indicates which line to delete.

Values line, offset, **first**, **edit-point**, **last**

line	absolute line number
offset	relative line number to current edit point. Prefixed with '+' or '-'
first	keyword - first line

edit-point	keyword - current edit point
last	keyword - last line that is not 'exit'

Platforms

All

delete

Syntax

delete [{*checkpoint-id* | **rescue** | **latest-rb**}]

Context

[Tree] (admin>rollback delete)

Full Context

admin rollback delete

Description

This command deletes a rollback checkpoint and causes the suffixes to be adjusted (decremented) for all checkpoints older that the one that was deleted (to close the hole in the list of checkpoint files and create room to create another checkpoint).

If **config redundancy rollback-sync** is enabled, a rollback delete will also delete the equivalent checkpoint on the standby CF and shuffle the suffixes on the standby CF.

It is not advised to manually delete a rollback checkpoint (for example, using a **file delete** command). If a rollback checkpoint file is manually deleted without using the **admin rollback delete** command then the suffixes of the checkpoint files are not shuffled, nor is the equivalent checkpoint file deleted from the standby CF. This manual deletion creates a hole in the checkpoint file list until enough new checkpoints have been created to roll the hole off the end of the list.

Parameters

checkpoint-id

An ID indicating a specific rollback checkpoint. A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback location) with *.rb.1 as the suffix, 2 for file *.rb.2, and so on.

Values 1 to 9

latest-rb

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

rescue

Deletes the rescue checkpoint. No checkpoint suffix numbers are changed.

Platforms

All

8.102 delete-config

delete-config

Syntax

[**no**] **delete-config**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization delete-config)

Full Context

configure system security profile netconf base-op-authorization delete-config

Description

This command enables the NETCONF delete-config operation.

The **no** form of this command disables the operation.

Default

no delete-config

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

Platforms

[Tree] (config>subscr-mgmt>wlan-gw>ue-query>state delete-pending)

Full Context

configure subscriber-mgmt wlan-gw ue-query state delete-pending

Description

This command enables matching on UEs that are in a delete-pending state.

The **no** form of this command disables matching on UEs in a delete pending-state, unless all state matching is disabled.

Default

no delete-pending

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.104 delivery-service

delivery-service

Syntax

delivery-service *service-id*

delivery-service name *service-name*

no delivery-service

Context

[Tree] (config>service>vprn>if>sap>ip-tunnel delivery-service)

[Tree] (config>service>ies>if>sap>ip-tunnel delivery-service)

Full Context

configure service vprn interface sap ip-tunnel delivery-service

configure service ies interface sap ip-tunnel delivery-service

Description

This command sets the delivery service for GRE encapsulated packets associated with a particular GRE tunnel. This is the IES or VPRN service where the GRE encapsulated packets are injected and terminated. The delivery service may be the same service that owns the private tunnel SAP associated with the GRE tunnel. The GRE tunnel does not come up until a valid delivery service is configured.

The **no** form of this command deletes the delivery-service from the GRE tunnel configuration.

Parameters

service-id

Identifies the service used to originate and terminate the GRE encapsulated packets belonging to the GRE tunnel.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **delivery-service name** *service-name* variant can be used in all configuration modes.

Values {*id* | *svc-name*}

id: 1 to 2147483647

svc-name: up to 64 characters (*svc-name* is an alias for input only. The *svc-name* gets replaced with an id automatically by SR OS in the configuration).

service-name

Identifies the service used to originate and terminate the GRE encapsulated packets belonging to the GRE tunnel.

Values 1 to 64 characters

Platforms

All

8.105 delta-consumed-agg-rate

delta-consumed-agg-rate

Syntax

delta-consumed-agg-rate percent *percent-of-delta-consumed-agg-rate*

no delta-consumed-agg-rate

Context

[Tree] (config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance delta-consumed-agg-rate)

Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance delta-consumed-agg-rate

Description

This command configures the percentage of the delta (from the beginning to the end of the current H-QoS below CIR or above CIR pass) of the aggregate rate consumed by its other members that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. This command is only applicable

when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **delta-consumed-agg-rate percent** to its default value.

Default

delta-consumed-agg-rate 20.00

Parameters

percent-of-delta-consumed-agg-rate

Specifies the percentage of the delta (over the current H-QoS below CIR or above CIR pass) consumed aggregate rate that can be given to a queue.

Values 0.00 to 100.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.106 delta-consumed-higher-tier-rate

delta-consumed-higher-tier-rate

Syntax

delta-consumed-higher-tier-rate percent *percent-of-delta-consumed-high-tier-rate*

no delta-consumed-higher-tier-rate

Context

[Tree] (config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance delta-consumed-higher-tier-rate)

Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance delta-consumed-higher-tier-rate

Description

This command configures the percentage of the delta (from the beginning to the end of the current H-QoS below CIR or above CIR pass) of the higher tier rate consumed by its other members that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. Higher tier refers to the Vport aggregate rate and port scheduler level, group, and maximum rates.

This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **delta-consumed-higher-tier-rate percent** to its default value.

Default

delta-consumed-higher-tier-rate 5.00

Parameters

percent-of-delta-consumed-high-tier-rate

Specifies the percentage of the delta (over the current H-QoS below CIR or above CIR pass) consumed higher tier rate that can be given to a queue.

Values 0.00 to 100.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.107 delta-in-use-limit

delta-in-use-limit

Syntax

delta-in-use-limit *limit*

no delta-in-use-limit

Context

[Tree] (config>vrrp>policy delta-in-use-limit)

Full Context

configure vrrp policy delta-in-use-limit

Description

This command sets a lower limit on the virtual router in-use priority that can be derived from the delta priority control events.

Each *vrrp-priority-id* places limits on the delta priority control events to define the in-use priority of the virtual router instance. Setting this limit prevents the sum of the delta priority events from lowering the in-use priority value of the associated virtual router instances below the configured value.

The limit has no effect on explicit priority control events. Explicit priority control events are controlled by setting the in-use priority to any value between 1 and 254.

Only non-owner virtual router instances can be associated with VRRP priority control policies and their priority control events.

Once the total sum of all delta events is calculated and subtracted from the base **priority** of the virtual router instance, the result is compared to the **delta-in-use-limit** value. If the result is less than the limit, the **delta-in-use-limit** value is used as the virtual router in-use priority value. If an explicit priority control event overrides the delta priority control events, the **delta-in-use-limit** has no effect.

Setting the limit to a higher value than the default of 1 limits the effect of the delta priority control events on the virtual router instance base **priority** value. This allows for multiple priority control events while minimizing the overall effect on the in-use priority.

Changing the *in-use-priority-limit* causes an immediate re-evaluation of the in-use priority values for all virtual router instances associated with this *vrrp-policy-id* based on the current sum of all active delta control policy events.

The **no** form of the command reverts to the default value.

Default

delta-in-use-limit 1 — Specifies the lower limit of 1 for the in-use priority, as modified, by delta priority control events.

Parameters

limit

Specifies the lower limit of the in-use priority base, as modified by priority control policies. The *in-use-priority-limit* has the same range as the non-owner virtual router instance base-priority parameter. If the result of the total delta priority control events minus the virtual router instances base-priority, is less than the *in-use-priority-limit*, the *in-use-priority-limit* value is used as the virtual router instances in-use priority value.

Setting the *in-use-priority-limit* to a value equal to or larger than the virtual router instance *base-priority* prevents the delta priority control events from having any effect on the virtual router instance in-use priority value.

Values 1 to 254

Platforms

All

8.108 dent-threshold

dent-threshold

Syntax

dent-threshold *threshold*

no dent-threshold

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>hd dent-threshold)

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>sd dent-threshold)

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>pip dent-threshold)

Full Context

configure mcast-management multicast-info-policy video-policy video-interface hd dent-threshold

configure mcast-management multicast-info-policy video-policy video-interface sd dent-threshold

configure mcast-management multicast-info-policy video-policy video-interface pip dent-threshold

Description

This command sets the threshold value below which the FCC server will dent/drop unicast data sent to the FCC client during a fast channel change. Within the RTP extension header, the packet priority (PRI) (2 bits) and the fine-grained priority (FPRI) (3 bits) indicate the "importance" of the frame as to how essential it is to the video stream.

This parameter is only applicable if the FCC server mode is **dent**.

The **no** form of the command returns the parameter to the default value.

Default

dent-threshold 16 (only B frames are dropped)

Parameters

threshold

Specifies the threshold value is used by the FCC server to compare with the concatenation of the PRI and FPRI to determine whether to send the packet to the FCC client. If the PRI and FPRI expressed as a decimal integer is greater than or equal to the threshold value, the packet will be sent.

Values 1 to 31

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

8.109 deny-list

deny-list

Syntax

[no] deny-list *deny-list-name*

Context

[Tree] (config>app-assure>group>url-filter>local-filtering deny-list)

Full Context

configure application-assurance group url-filter local-filtering deny-list

Description

This command adds a **deny-list** URL list to the local URL filter policy.

The **no** form of this command removes the URL list object.

Default

no deny-list

Parameters

deny-list-name

Specifies the URL list name.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.110 depleted-event

depleted-event

Syntax

[**no**] **depleted-event**

Context

[Tree] (config>service>vprn>dhcp6>server>pool>prefix>thresholds>minimum-free depleted-event)

[Tree] (config>router>dhcp6>server>pool>prefix>thresholds>minimum-free depleted-event)

Full Context

configure service vprn dhcp6 local-dhcp-server pool prefix thresholds minimum-free depleted-event

configure router dhcp6 local-dhcp-server pool prefix thresholds minimum-free depleted-event

Description

This command enables the system to send out a warning when the prefix with a configured length is no longer available in the provisioned prefix.

For example:

```
prefix 2001:0:0:ffe0::/50 pd wan-host create
   thresholds
       minimum-free prefix-length 64
           depleted-event
```

With the above configuration, the system will send out a warning when there is no available /64 that can be allocated out of 2001:0:0:ffe0::/50.

The **no** form of this command disables the warnings.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

depleted-event

Syntax

[**no**] **depleted-event**

Context

[Tree] (config>service>vprn>dhcp6>server>pool>thresholds>minimum-free depleted-event)

[Tree] (config>router>dhcp6>server>pool>thresholds>minimum-free depleted-event)

Full Context

configure service vprn dhcp6 local-dhcp-server pool thresholds minimum-free depleted-event

configure router dhcp6 local-dhcp-server pool thresholds minimum-free depleted-event

Description

This command enables the system to send out warnings when the prefix with the configured length is no longer available in the pool.

The **no** form of this command disables the warnings.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.111 derived-id

derived-id

Syntax

derived-id *derived-id-string*

no derived-id

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident derived-id)

[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>host-ident derived-id)

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification derived-id

configure subscriber-mgmt local-user-db ppp host host-identification derived-id

Description

This command configures an ASCII string that uniquely identifies a host and is derived by a Python script from packet content available during a DHCP transaction or PPPoE session establishment.

Note:
This command is only used when **derived-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the derived-id from the configuration.

Parameters

derived-id-string

Specifies the host ID to be derived by a python script from DHCP or PPPoE packets, up to 255 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.112 description

description

Syntax

description *tiny-description-string*

no description

Context

[Tree] (config>ipsec>static-sa description)

Full Context

configure ipsec static-sa description

Description

This command configures a text description that is stored in the configuration file. The text string is associated with a configuration context to identify the content in the configuration file.

The **no** form of this command removes the string from the configuration.

Parameters

tiny-description-string

Specifies the description character string. Allowed values are any string, up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms

All

Description

This command configures a text description that is stored in the configuration file. The text string is associated with a configuration context to identify the content in the configuration file.

The **no** form of this command removes the string from the configuration.

Default

no description

Parameters

short-description-string

Specifies the description entered as a character string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Description

This command configures a text description that is stored in the configuration file. The text string is associated with a configuration context to identify the content in the configuration file.

The **no** form of this command removes the string from the configuration.

Parameters

short-description-string

Specifies the description character string. Allowed values are any string, up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Description

This command configures a text description that is stored in the configuration file. The text string is associated with a configuration context to identify the content in the configuration file.

The **no** form of this command removes the string from the configuration.

Default

No description is associated with the configuration context.

Parameters

short-description-string

Specifies the description character string. Allowed values are any string, up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

This command specifies a description of a S-BFD reflector.

Parameters

description-string

Specifies the S-BFD reflector description.

Platforms

All

description

Syntax

description *description-string*

no description

Context

[Tree] (config>system>alarm-contact-input description)

Full Context

configure system alarm-contact-input description

Description

This command configures a text description of an alarm contact input pin. The description is stored in the CLI configuration file. It indicates the usage or attribute of the pin, and helps the user to identify the purpose of the pin. The description is included in the log event when the pin changes state.

The **no** form of this command reverts the description string to the default.

Parameters

description-string

Specifies a printable character string, up to 80 characters.

Default "Pin *x*", where *x* is the alarm contact input pin number.

Platforms

7750 SR-a

Syntax

dest-global-id *dest-global-id*

no dest-global-id

Context

[Tree] (config>router>mpls>lsp dest-global-id)

Full Context

configure router mpls lsp dest-global-id

Description

This optional command configures the MPLS-TP Global ID of the far end node of the MPLS-TP LSP. This command is only allowed for MPLS-TP LSPs. Global ID values of 0 indicate that the local node's configured global ID is used. If the local global-id is 0, then the dest-global-id must also be 0. The dest-global-id cannot be changed if an LSP is in use by an SDP.

Default

dest-global-id 0

Parameters

dest-global-id

Specifies the destination global ID.

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure service vprn sap ipsec-tunnel dest-ip

configure service vprn interface sap ip-tunnel dest-ip

configure service ies interface sap ip-tunnel dest-ip

Description

This command configures a private IPv4 or IPv6 address of the remote tunnel endpoint. A tunnel can have up to 16 **dest-ip** commands. At least one **dest-ip** address is required in the configuration of a tunnel. A tunnel does not come up operationally unless all **dest-ip** addresses are reachable (part of a local subnet).

Unnumbered interfaces are not supported.

The **no** form of this command deletes the destination IP of the tunnel.

Parameters

ip-address

Specifies the private IPv4 or IPv6 address of the remote IP tunnel endpoint. If this remote IP address is not within the subnet of the IP interface associated with the tunnel then the tunnel will not come up.

Values

<ip-address>	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x - [0 to FFFF]H
		d - [0 to 255]D

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.117 dest-ip-addr

dest-ip-addr

Syntax

dest-ip-addr *ip-addr***ess**

no dest-ip-addr

Context

[Tree] (config>mcast-mgmt>mcast-rprt-dest dest-ip-addr)

Full Context

configure mcast-management mcast-reporting-dest dest-ip-addr

Description

This command specifies the IP address of the external node to which IGMP events are exported. The destination IP address can only be reachable from the global routing table (no vrf access).

The **no** form of this command removes the destination address from the configuration.

Parameters

ip-addr

Specifies the IP address of the multicast reporting destination.

Platforms

All

8.118 dest-mac

dest-mac

Syntax

dest-mac {**nearest-bridge** | **nearest-non-tpmr** | **nearest-customer**}

Context

[Tree] (config>port>ethernet>lldp dest-mac)

Full Context

configure port ethernet lldp dest-mac

Description

This command configures destination MAC address parameters.

Default

dest-mac nearest-bridge

Parameters

nearest-bridge

Specifies to use the nearest bridge.

nearest-non-tpmr

Specifies to use the nearest non-Two-Port MAC Relay (TPMR).

nearest-customer

Specifies to use the nearest customer.

Platforms

All

dest-mac

Syntax

dest-mac *ieee-address*

no dest-mac

Context

[Tree] (config>oam-pm>session>ethernet dest-mac)

Full Context

configure oam-pm session ethernet dest-mac

Description

This command defines the destination MAC address of the peer MEP and sets the destination MAC address in the layer two header to match. This must be a unicast address.

The **no** form of this command removes session parameter.

Parameters

ieee-address

Specifies the Layer 2 unicast MAC address of the destination MEP.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

All

8.119 dest-mac-address

dest-mac-address

Syntax

dest-mac-address *mac-address* [**create**]

no dest-mac-address *mac-address*

Context

[Tree] (config>macsec>mac-policy dest-mac-address)

Full Context

configure macsec mac-policy dest-mac-address

Description

This command specifies the destination MAC address.

The **no** form of this command removes the MAC address.

Parameters

mac-address

Specifies the value of the MAC address policy.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

create

Mandatory to create the configuration.

Platforms

All

8.120 dest-mac-rewrite

dest-mac-rewrite

Syntax

dest-mac-rewrite *ieee-address*

no dest-mac-rewrite

Context

[Tree] (config>service>vpls>sap>egress dest-mac-rewrite)

Full Context

configure service vpls sap egress dest-mac-rewrite

Description

This commands enables the overwriting of a destination MAC address to an operator-configured value for all unicast packets egressing the specified SAP. The command is intended to be deployed with L2 PBF SAP redirect when a remote end of the SAP interface is an L3 interface with a MAC address different from the MAC address of the non-PBF-ed L3 interface. See Filter Policy in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more details.

The **no** form disables the option.

Default

no dest-mac-rewrite

Parameters

ieee-address

Specifies the MAC address

Values 1xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Cannot be all zeros

Platforms

dest-realm-learning

Syntax

[**no**] **dest-realm-learning**

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>gy dest-realm-learning)

[Tree] (config>subscr-mgmt>diam-appl-plcy>gx dest-realm-learning)

Full Context

configure subscriber-mgmt diameter-application-policy gy dest-realm-learning

configure subscriber-mgmt diameter-application-policy gx dest-realm-learning

Description

This command configures destination realm learning that is used in outgoing Gx and Gy Credit Control Request (CCR) messages. Destination realm is a mandatory configuration parameter.

The configured destination realm is always used in the initial CCR-I message. The consecutive request message of a Gx or Gy session can use the destination realm as learned from replies within a DIAMETER session (if learning is enabled), or they can ignore the realm from the reply and always use the configured destination realm in Gx and Gy request messages (learning is disabled).

The **no** form of this command ignores the realm from the reply.

Default

dest-realm-learning

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dest-tunnel-number

Syntax

dest-tunnel-number *dest-tunnel-number*

no dest-tunnel-number

Context

[Tree] (config>router>mpls>lsp dest-tunnel-number)

Full Context

configure router mpls lsp dest-tunnel-number

Description

This optional command configures the MPLS-TP tunnel number of the LSP at the far end node of the MPLS-TP LSP. This command is only allowed for MPLS-TP LSPs. If it is not entered, then the system will take the dest-tunnel-number to be the same as the src-tunnel-num for the LSP.

Default

The default value is the configured *src-tunnel-num*.

Parameters

dest-tunnel-number

Specifies the destination tunnel number.

Values 1 to 61440

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.123 dest-udp-port

dest-udp-port

Syntax

dest-udp-port *udp-port-number*

no dest-udp-port

Context

[Tree] (config>oam-pm>session>ip dest-udp-port)

Full Context

configure oam-pm session ip dest-udp-port

Description

This command defines the destination UDP port on outbound TWAMP Light packets sent from the session controller. The destination UDP port must match the UDP port value configured on the TWAMP Light reflector that is responding to this specific TWAMP Light test.

The **no** form of this command removes the destination UDP port setting.

Parameters

udp-port-number

Specifies the UDP source port.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

dest-udp-port

Syntax

dest-udp-port *port-number*

Context

[Tree] (config>test-oam>link-meas>template>twl dest-udp-port)

Full Context

configure test-oam link-measurement measurement-template twamp-light dest-udp-port

Description

This command configures the destination UDP port used by the link measurement tests.

Default

dest-udp-port 862

Parameters

port-number

Specifies the destination UDP port copied into the UDP header of each Echo request packet launched for each link measurement test belonging to the specified template.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.124 destination

destination

Syntax

destination *ip-address*

no destination

Context

[Tree] (config>oam-pm>session>ip destination)

Full Context

configure oam-pm session ip destination

Description

This command defines the destination IP address that is assigned to the TWAMP Light packets. The destination address must be included in the prefix list on the session reflector within the configured context in order to allow the reflector to process the inbound TWAMP Light packets.

The **no** form of this command removes the destination parameters.

Parameters

ip-address

Specifies the IP address of the IP peer to which the packet is directed.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

destination

Syntax

destination *ip-address* [**create**]

no destination *ip-address*

Context

[Tree] (config>filter>redirect-policy destination)

Full Context

configure filter redirect-policy destination

Description

This command defines a destination in a redirect policy. More than one destination can be configured. Whether a destination IPv4/IPv6 address will receive redirected packets depends on the effective priority value after evaluation.

The most preferred destination is programmed in hardware as action forward next-hop. If all destinations are down (as determined by the supported tests), action forward is programmed in hardware. All destinations within a given policy must be either IPv4 or (exclusive) IPv6. The redirect policy with IPv4 destinations configured can only be used by IPv4 filter policies. The redirect policy with IPv6 destinations configured can only be used by IPv6 filter policies.

Default

no destination

Parameters

ip-address

Specifies the IPv4 address (in dotted decimal notation) or IPv6 address to send the redirected traffic to.

Values IPv4 address: ip-address: a.b.c.d

IPv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

Platforms

All

destination

Syntax

destination memory *num-entries*

destination syslog *syslog-id*

no destination

Context

[Tree] (config>filter>log destination)

Full Context

configure filter log destination

Description

This command configures the destination for filter log entries for the filter log ID.

Filter logs can be sent to either memory (**memory**) or to an existing Syslog server definition (**syslog**).

If the filter log destination is **memory**, the maximum number of entries in the log must be specified.

The **no** form of the command deletes the filter log association.

Default

destination memory 1000

Parameters

memory *num-entries*

Specifies the destination of the filter log ID is a memory log. The *num-entries* value is the maximum number of entries in the filter log expressed as a decimal integer.

Values 10 to 50000

syslog *syslog-id*

Specifies the destination of the filter log ID is a Syslog server. The *syslog-id* parameter is the number of the Syslog server definition.

Values 1 to 10

Platforms

All

destination

Syntax

destination {*ip-address* | *fqdn*} **port** *port* [**create**]

no destination {*ip-address* | *fqdn*} **port** *port*

Context

[Tree] (config>system>grpc-tunnel>destination-group destination)

[Tree] (config>system>telemetry>destination-group destination)

Full Context

configure system grpc-tunnel destination-group destination

configure system telemetry destination-group destination

Description

This command configures a destination IP address and port for a specific destination within a destination group. Up to two destinations can be defined within a destination group. Each destination is an IPv4 address, an IPv6 address, or the Fully Qualified Domain Name (FQDN).

The **no** form of this command removes the destination from the destination group.

Parameters

ip-address

Specifies the IPv4 address (in dotted decimal notation) or IPv6 address.

Values IPv4 address: ip-address: a.b.c.d

IPv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

fqdn

Specifies the FQDN.

port

Specifies the TCP destination port number.

Values 1 to 65535

create

Keyword used to create a destination.

Platforms

All

destination

Syntax

destination *ip-address*

no destination

Context

[Tree] (config>router>if>if-attr>delay>dyn>twamp>ipv4 destination)

Full Context

configure router interface if-attribute delay dynamic twamp-light ipv4 destination

Description

This command configures the unicast IPv4 destination address for the TWAMP Light test packet. When this command is not configured, the destination IPv4 address is auto-assigned for interfaces configured with a prefix length of 30 and 31. All other interface prefix lengths and unnumbered interfaces are unable to auto- assign the destination IPv4 address. If the interface does not use a prefix length of 30 or 31, the destination must be configured.

Deleting a configured destination removes the specified address and causes the source address to be auto-assigned for prefix length of 30 and 31.

Configuration modifications are allowed without administratively disabling the IPv4 protocol.

The **no** form of this command removes the IPv4 address from the configuration.

Default

no destination

Parameters

ip-address

Specifies the IPv4 destination address.

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

destination

Syntax

destination *ipv6-address*

no destination

Context

[Tree] (config>router>if>if-attr>delay>dyn>twamp>ipv6 destination)

Full Context

configure router interface if-attribute delay dynamic twamp-light ipv6 destination

Description

This command configures the IPv6 destination address of the TWAMP Light test packet. When this command is not configured, no destination address is present and an error is raised to prevent the transmission of the test packet.

The IPv6 protocol can be enabled without addressing. However, the test does not transmit packets.

The link local address must be in the form fe80::/60 in accordance with RFC 4291, *IP Version 6 Addressing Architecture*.

The **no** form of this command removes the IPv6 address from the configuration.

Default

no destination

Parameters

ipv6-address

Specifies the TWAMP Light IPv6 destination address

Values		
	ipv6-address:	x:x:x:x:x:x:x:x
		x - [0 to FFFF]H
		unicast and link local IPv6 address only

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.125 destination-address

destination-address

Syntax

[**no**] **destination-address** *ip-address*

Context

[Tree] (config>filter>gre-tun-tmp>ipv4 destination-address)

Full Context

configure filter gre-tunnel-template ipv4 destination-address

Description

This command defines one or more destinations for the GRE IP header used to encapsulate the matching IPv4/IPv6 packet.

Traffic matching the associated IPv4 or IPv6 filter are hashed across all available destination address. If no destination address is available, then matching traffic follows the configured **pbr-down-action-override** action, if configured.

The **no** form of this command removes the specified destination IP address configuration from the associated GRE tunnel template.

Parameters

ip-address

Specifies up to 16 IPv4 addresses to be used as the destination address.

Platforms

All

destination-address

Syntax

destination-address *ip-address*

no destination-address

Context

[Tree] (config>service>ies>if>ping-template destination-address)

[Tree] (config>service>vprn>if>ping-template destination-address)

Full Context

configure service ies interface ping-template destination-address

configure service vprn interface ping-template destination-address

Description

This command configures the address to where the ICMP echo requests are directed to test connectivity. The source of the ICMP echo request is the primary IPv4 address of the interface under which the ping-template is configured. The destination address must be on the same subnet as the source IP address. A configuration warning message displays if the primary IPv4 address and the destination are not on the same subnet, `INFO: PIP #2092 Ping template misconfiguration - destination-address and primary IP address should fall in the same subnet`. Unnumbered interfaces and loopback addresses are not supported.

The **config>service>ies|vprn>interface>ping-template** must be in the no shutdown state to remove or change the **destination-address** *ip-address*.

The **no** form of this command removes the destination address from the configuration.

Parameters

ip-address

Specifies the destination address to where the ICMP echo requests are directed to test connectivity, in a.b.c.d format.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure system telemetry persistent-subscriptions subscription destination-group

Description

This command assigns an existing destination group to the specified persistent subscription. The assigned **destination-group** must already exist before the configured persistent subscription can be activated.

The **no** form of this command removes the destination group name from the persistent subscription.

Parameters

name

Specifies the destination group name, up to 32 characters.

Platforms

All

8.129 destination-ip

destination-ip

Syntax

[**no**] **destination-ip**

Context

[Tree] (config>service>nat>syslog>syslog-export-policy>include destination-ip)

Full Context

configure service nat syslog syslog-export-policy include destination-ip

Description

This command includes the destination IP address in the flow log. The **destination-ip** is significant in Destination Based NAT (DNAT) where the foreign IP address is translated. A foreign IP address is the original IP address toward the destination node and in DNAT it is replaced by the **destination-ip**. More clearly, on the inside (private side), the IP address of the destination node is referred to as foreign IP (original destination IP), and once this address is translated by DNAT, it is referred to as destination IP (translated destination IP) on the outside (public side).

The **no** form of the command disables the feature.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>service>vprn>nat>inside destination-prefix)

[Tree] (config>router>nat>inside destination-prefix)

Full Context

configure service vprn nat inside destination-prefix

configure router nat inside destination-prefix

Description

This command configures a destination prefix. An (internal) static route will be created for this prefix. All traffic that hits this route will be subject to NAT. The system will not allow a destination-prefix to be configured if the configured nat-policy refers to an IP pool that resides in the same service (as this would result in a routing loop).

Parameters

ip-prefix

Specifies the IP prefix; host bits must be zero (0).

Values a.b.c.d

length

Specifies the prefix length.

Values 0 to 32

nat-policy-name

Specifies the NAT policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

destination-prefix

Syntax

[**no**] **destination-prefix**

Context

[Tree] (config>cflowd>collector>aggregation destination-prefix)

Full Context

configure cflowd collector aggregation destination-prefix

Description

This command specifies that the aggregation data is based on destination prefix information.

The **no** form removes this type of aggregation from the collector configuration.

Description

This command specify the detail level of PPP packet debug output.

The **no** form of this command disables debugging.

Parameters

low | medium | high

Specifies the detail level of PPP packet debug output.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

detail-level

Syntax

detail-level {**low** | **medium** | **high**}

no detail-level

Context

[Tree] (debug>router>radius detail-level)

Full Context

debug router radius detail-level

Description

This command specifies the output detail level of command **debug router radius**.

Default

detail-level medium

Parameters

low

Specifies that the output includes packet type, server address, length, radius-server-policy name.

medium

Specifies all output in low level including the RADIUS attributes in the packet.

high

Specifies all output in medium level including the hex packet dump.

Platforms

All

detail-level

Syntax

detail-level *detail-level*

Context

[Tree] (debug>router>wpp detail-level)

[Tree] (debug>router>wpp>packet detail-level)

[Tree] (debug>router>wpp>portal>packet detail-level)

Full Context

debug router wpp detail-level

debug router wpp packet detail-level

debug router wpp portal packet detail-level

Description

This command specifies the detail level of WPP packet debugging.

Parameters

detail-level

specifies the detail level of WPP packet debugging.

Values high — Specifies a high detail level for WPP packet debugging
low — Specifies a low detail for WPP packet debugging

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

detail-level

Syntax

detail-level {**low** | **medium** | **high**}

Context

[Tree] (debug>subscr-mgmt>vrgw>brg>pppoe-client>brg-id detail-level)

Full Context

debug subscriber-mgmt vrgw brg pppoe-client brg-id detail-level

Description

This command specifies the amount of detail present in debugging the specified PPPoE client.

Default

detail-level high

Parameters

low

Specifies a low level of detail during debugging.

medium

Specifies a medium level of detail during debugging.

high

Specifies a high level of detail during debugging.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

detail-level

Syntax

detail-level {**low** | **medium** | **high**}

no detail-level

Context

[Tree] (debug>service>id>igmp-snooping detail-level)

Full Context

debug service id igmp-snooping detail-level

Description

This command enables and configures the IGMP tracing detail level.

The **no** form of this command disables the IGMP tracing detail level.

Platforms

All

detail-level

Syntax

detail-level {**low** | **medium** | **high**}

no detail-level

Context

[Tree] (debug>service>id>mld detail-level)

Full Context

debug service id mld-snooping detail-level

Description

This command enables and configures the MLD tracing detail level.

The **no** form of this command disables the MLD tracing detail level.

Platforms

All

detail-level

Syntax

detail-level {**low** | **medium** | **high**}

no detail-level

Context

[Tree] (debug>service>id>dhcp detail-level)

Full Context

debug service id dhcp detail-level

Description

This command configures the DHCP tracing detail level.

The **no** form of the command disables debugging.

Parameters

low

Displays a low detail level for DHCP debugging.

medium

Displays a medium detail level for DHCP debugging.

high

Displays a high detail level for DHCP debugging.

Platforms

All

detail-level

Syntax

detail-level *detail-level*

Context

[Tree] (debug>router>pcp>pcp-server>packet detail-level)

Full Context

debug router pcp pcp-server packet detail-level

Description

This command configures the packet debugging level of detail.

Parameters

detail-level

Specifies the detail level.

Values low, high

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.133 detailed-acct-attributes

detailed-acct-attributes

Syntax

[**no**] **detailed-acct-attributes**

Context

[Tree] (config>subscr-mgmt>acct-plcy>include detailed-acct-attributes)

Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute detailed-acct-attributes

Description

This command enables detailed reporting of per queue and per policer octet and packet counters using RADIUS VSAs. Enabled by default. It can be enabled simultaneously with aggregate counters (std-acct-attributes).

The **no** form of this command excludes the detailed counter VSAs from the RADIUS accounting messages.

Default

detailed-acct-attributes

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.134 detect

detect

Syntax

detect num-moves *num-moves* **window** *minutes* [**trusted-mac-move-factor** *factor*]

Context

[Tree] (config>service>vpls>bgp-evpn>mac-duplication detect)

Full Context

configure service vpls bgp-evpn mac-duplication detect

Description

This command modifies the behavior of the **mac-duplication** command, which is always enabled by default. It monitors the number of moves of a MAC address for a period of time (window).

Default

detect num-moves 5 window 3 trusted-mac-move-factor 1

Parameters

num-moves

Identifies the number of MAC moves in a VPLS service. The counter is incremented when a specified MAC is locally relearned in the FDB or flushed from the FDB due to the reception of a better remote EVPN route for that MAC.

Values 3 to 10

Default 5

minutes

Specifies the length of the window in minutes.

Values 1 to 15

Default 3

factor

Specifies the multiplying value used to calculate a MAC duplication event. The *num-moves* value is multiplied by this value to determine the number of moves needed to declare a trusted MAC as duplicate.

For example, if *num-moves*=5 and *factor*=3, five moves within the window is enough to declare a non-trusted MAC as duplicate. However, 15 moves are needed to declare a trusted MAC as duplicate.

By default, the value of *factor* is 1, which means the factor for a trusted MAC is the same as for a non-trusted MAC. This provides a backwards compatible solution upon upgrade of the node.

Values 1 to 10

Default 1

Platforms

All

8.135 detect-seen-ip

detect-seen-ip

Syntax

[**no**] **detect-seen-ip**

Context

[Tree] (config>app-assure>group>transit-ip-policy detect-seen-ip)

Full Context

configure application-assurance group transit-ip-policy detect-seen-ip

Description

This command enables the detection of transit subscribers based on the IP address.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.136 detection-time

detection-time

Syntax

detection-time *seconds*

no detection-time

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>protocol>dynamic-parameters detection-time)

Full Context

configure system security dist-cpu-protection policy protocol dynamic-parameters detection-time

Description

When a dynamic enforcing policer is instantiated, it remains allocated until at least a contiguous conforming period of detection-time passes.

Default

detection-time 30

Parameters

seconds

Specifies the detection time.

Values 1 to 128000

Platforms

All

detection-time

Syntax

detection-time *seconds*

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>static-policer detection-time)

Full Context

configure system security dist-cpu-protection policy static-policer detection-time

Description

When a policer is declared as in an "exceed” state, it remains as exceeding until a contiguous conforming period of **detection-time** passes. The **detection-time** only starts after the exceed-action hold-down is complete. If the policer detects another exceed during the detection count down then a hold-down is once again triggered before the policer re-enters the detection time (that is, the countdown timer starts again at the configured value). During the hold-down (and the detection-time), the policer is considered as in an "exceed” state.

Default

detection-time 30

Parameters

seconds

Specifies the detection time.

Values 1 to 128000

Platforms

8.138 deterministic-med

deterministic-med

Syntax

[**no**] **deterministic-med**

Context

[Tree] (config>service>vprn>bgp>best-path-selection deterministic-med)

Full Context

configure service vprn bgp best-path-selection deterministic-med

Description

This command controls how the BGP decision process compares routes on the basis of MED. When **deterministic-med** is configured, BGP groups paths that are equal up to the MED comparison step based on neighbor AS, and then compares the best path from each group to arrive at the overall best path. This change to the BGP decision process makes best path selection completely deterministic in all cases. Without **deterministic-med**, the overall best path selection is sometimes dependent on the order of the route arrival because of the rule that MED cannot be compared in routes from different neighbor AS.

Default

no deterministic-med

Platforms

All

deterministic-med

Syntax

[**no**] **deterministic-med**

Context

[Tree] (config>router>bgp>best-path-selection deterministic-med)

8.140 device

device

Syntax
device *ieee-address* [**create**]
no device *ieee-address*

Context
[Tree] (config>system>bluetooth device)

Full Context
configure system bluetooth device

Description

This command is used to add and remove devices from the Bluetooth allowlist or to enter the context to configure the MAC. The router only accepts pairing requests with devices that are in the allowlist. The devices are identified through their IEEE 802 MAC addresses. Up to six devices can be defined in the allowlist.

The **create** keyword must be used to add a new device.

The **no** form of this command removes the indicated device from the allowlist.

Parameters

ieee-address

Specifies the MAC address of the external Bluetooth device.

Values 6-byte unicast MAC address (*xx:xx:xx:xx:xx:xx* or *xx-xx-xx-xx-xx-xx*)

Platforms

7750 SR-1, 7750 SR-s

8.141 device-label

device-label

Syntax

device-label *name*

no device-label

Context

[Tree] (config>system>management-interface>remote-management device-label)

Full Context

configure system management-interface remote-management device-label

Description

This command configures the metadata label that is supplied to all remote managers. This label can be used to group devices (network-nodes) that serve a common purpose or role.

If this command is also configured for a specific remote manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command causes an empty string to be used.

Parameters

name

Specifies the device-label name, up to 64 characters.

Platforms

All

device-label

Syntax

device-label *name*

no device-label

Context

[Tree] (config>system>management-interface>remote-management>manager device-label)

Full Context

configure system management-interface remote-management manager device-label

Description

This command configures the metadata label that is supplied to this remote manager. This label can be used to group devices (network-nodes) with a common purpose/role.

This command takes precedence over the same command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command causes the device-label name to be inherited from the global context (**config**>**system**>**management-interface**>**remote-management)**.

Parameters

name

Specifies the device-label name, up to 64 characters.

Platforms

All

8.142 device-name

device-name

Syntax

device-name *name*

no device-name

Context

[Tree] (config>system>management-interface>remote-management device-name)

Full Context

configure system management-interface remote-management device-name

Description

This command configures a device name that is supplied to all remote managers. This name identifies the specified SR OS node in the network.

If this command is also configured for a specific manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command causes the system to use the default device name (system-name).

Default

system-name

Parameters

name

Specifies the device name, up to 64 characters.

Platforms

All

device-name

Syntax

device-name *name*

no device-name

Context

[Tree] (config>system>management-interface>remote-management>manager device-name)

Full Context

configure system management-interface remote-management manager device-name

Description

This command configures a device name that is supplied to the specific manager. This name identifies the specified SR OS node in the network.

This command takes precedence over the same command configured in the global context **(config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command causes the device name to be inherited from the global context (**config**>**system**>**management-interface**>**remote-management)**.

Default

system-name

Parameters

name

Specifies the device name, up to 64 characters.

8.143 df-bit-lac

df-bit-lac

Syntax

df-bit-lac {**always** | **never**}

no df-bit-lac

Context

[Tree] (config>router>l2tp df-bit-lac)

[Tree] (config>service>vprn>l2tp df-bit-lac)

Full Context

configure router l2tp df-bit-lac

configure service vprn l2tp df-bit-lac

Description

By default, the LAC df-bit-lac is always set and sends all L2TP packets with the DF bit set to 1. The DF bit is configurable to allow downstream routers to fragment the L2TP packets. The LAC itself will not fragment L2TP packets. L2TP packets that have a larger MTU size than what the LAC egress ports allows are dropped.

The **no** form of this command reverts to the default.

Default

df-bit-lac always

Parameters

always

Specifies that the LAC sends all L2TP packets with the DF bit set to 1.

never

Specifies that the LAC sends all L2TP packets with the DF bit set to 0.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

df-bit-lac

Syntax

df-bit-lac {**always** | **never** | **default**}

no df-bit-lac

Context

[Tree] (config>router>l2tp>group>tunnel df-bit-lac)

[Tree] (config>router>l2tp>group df-bit-lac)

[Tree] (config>service>vprn>l2tp>group df-bit-lac)

[Tree] (config>service>vprn>l2tp>group>tunnel df-bit-lac)

Full Context

configure router l2tp group tunnel df-bit-lac

configure router l2tp group df-bit-lac

configure service vprn l2tp group df-bit-lac

configure service vprn l2tp group tunnel df-bit-lac

Description

By default, the LAC df-bit-lac is set to default and sends all L2TP packets with the DF bit set to 1. The DF bit is configurable to allow downstream routers to fragment the L2TP packets. The LAC will not fragment L2TP packets. L2TP packets that have a larger MTU size than what the LAC egress ports allows are dropped. The configuration of the df-bit can be overridden at different levels: l2tp, tunnel, and group. The configuration at the tunnel level overrides the configuration on both the group and l2tp levels. The configuration at the group level overrides the configuration on l2tp.

The **no** form of this command reverts to the default.

Default

df-bit-lac default

Parameters

always

Specifies that the LAC sends all L2TP packets with the DF bit set to 1.

never

Specifies that the LAC sends all L2TP packets with the DF bit set to 0.

default

Follows the DF-bit configuration specified on upper levels.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.144 dh-group

dh-group

Syntax

dh-group {**1** | **2** | **5** | **14** | **15** | **19** | **20** | **21**}

Context

[Tree] (config>ipsec>ike-transform dh-group)

Full Context

configure ipsec ike-transform dh-group

Description

This command specifies the Diffie-Hellman group to be used in this IKE transform instance.

Default

dh-group 2 (1024-bit — More Modular Exponential (MODP))

Parameters

dh-group {1 | 2 | 5 | 14 | 15 | 19 | 20 | 21}

Specifies which Diffie-Hellman group to use for calculating session keys. More bits provide a higher level of security, but require more processing. Three groups are supported with IKE-v1:

Group 1: 768 bits

Group 2: 1024 bits

Group 5: 1536 bits

Group 14: 2048 bits

Group 15: 3072 bits

Group 19: P-256 ECC Curve, 256 bits

Group 20: P-384 ECC Curve, 384 bits

Group 21: P-512 ECC Curve, 512 bits

dhcp

Syntax

[**no**] **dhcp** [**interface** *ip-int-name*]

[**no**] **dhcp mac** *ieee-address*

[**no**] **dhcp sap** *sap-id*

Context

[Tree] (debug>router>ip dhcp)

Full Context

debug router ip dhcp

Description

This command enables DHCP debugging.

The **no** form of this command disables debugging.

Parameters

ip-int-name

Specifies the name of the IP interface, up to 32 characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

sap-id

Specifies the physical port identifier portion of the SAP definition.

Platforms

All

dhcp

Syntax

dhcp *type* **direction** {**ingress** | **egress**} **script** *script*

no dhcp *type* **direction** {**ingress** | **egress**}

Context

[Tree] (config>python>py-policy dhcp)

Full Context

configure python python-policy dhcp

Description

This command specifies the Python script for the specified DHCPv4 packet type in the specified direction.

Multiple **dhcp** command configurations are allowed in the same Python policy.

The **no** form of this command reverts to the default.

Parameters

type

Specifies the message type of the event.

Values discover, offer, request, decline, ack, nak, release, inform, force-renew, lease-query, lease-unassigned, lease-unknown, lease-active

direction {ingress | egress}

Specifies whether the packet is being received by the system or being sent by the system.

script *script*

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

[Tree] (config>service>ies>if>sap>ipsec-gateway dhcp)

Full Context

configure service vprn interface sap ipsec-gateway dhcp

configure service ies interface sap ipsec-gateway dhcp

Description

Commands in this context configure DHCPv4-based address assignment for IKEv2 remote-access tunnels.

The system acts as a DHCPv4 client on behalf of the IPsec client, and also a relay agent to relay DHCPv4 packets to the DHCPv4 server.

DHCPv4 DORA(Discovery/Offer/Request/Ack) exchange happens during IKEv2 remote-access tunnel setup. The system also supports standard renew.

In order to use this feature, the **relay-proxy** must be enabled on the corresponding interface (either the private interface or the interface that has the gi-address as the interface address).

Default

no dhcp

dhcp

Syntax

bof autoconfigure ipv4 dhcp

Description

This command configures the IPv4 DHCP client for OOB management. The OOB management IPv4 can be set using a DHCP server offer.

The **no** form of this command disables IPv4 DHCP OOB management.

Default

no dhcp

Parameters

include-user-class

Specifies to include Option 77 user class data in the offer.

client-id

Specifies to include the client ID for IPv4 Option 61 for auto-discovery. The identifier is opaque and is in string format. By default, this is the chassis serial number.

timeout

Specifies the DHCP offer timeout, in seconds.

Values 1 to 65535

Default 30

ascii-string

Specifies the string format for this option, up to 127 characters.

hex-string

Specifies the hexadecimal format for this option, up to 254 hex nibbles.

Values 0x0 to 0xFFFFFFFF

Platforms

7450 ESS-7, 7750 SR-1, 7750 SR-7, 7750 SR-1e, 7750 SR-2e, 7750 SR-s

bof autoconfigure ipv6 dhcp

Description

This command configures the IPv6 DHCP client for out-of-band (OOB) management. The OOB management IPv6 can be set using a DHCP server offer.

The **no** form of this command disables IPv6 DHCP client OOB management.

Default

no dhcp

Parameters

include-user-class

Specifies to include Option 15 user class data in the offer.

client-id

Specifies to include the client ID for IPv6 DHCP Option 1 for auto-discovery. The identifier is opaque and is in string format. By default, this is the chassis serial number.

seconds

Specifies the DHCP client ID timeout, in seconds.

Values 1 to 65535

duid-type

Specifies the type code of the server DUID.

Values duid-link-local, duid-enterprise

ascii-string

Specifies the string format for this option, up to 124 characters.

hex-string

Specifies the hexadecimal format for this option, up to 248 hex nibbles.

Values 0x0 to 0xFFFFFFFF

timeout

Specifies the DHCP offer timeout, in seconds.

Values 1 to 65535

configure system security cpu-protection ip-src-monitoring included-protocols dhcp

Description

This command includes the extracted IPv4 DHCP packets for ip-src-monitoring. IPv4 DHCP packets will be subject to the per-source-rate of CPU protection policies.

Default

dhcp (Note this is different from the other protocols)

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

8.146 dhcp-client

dhcp-client

Syntax

[**no**] **dhcp-client**

Context

[Tree] (debug>router>l2tp>assignment-id>packet dhcp-client)

[Tree] (debug>router>l2tp>peer>packet dhcp-client)

[Tree] (debug>router>l2tp>group>packet dhcp-client)

[Tree] (debug>router>l2tp>packet dhcp-client)

Full Context

debug router l2tp assignment-id packet dhcp-client

debug router l2tp peer packet dhcp-client

debug router l2tp group packet dhcp-client

debug router l2tp packet dhcp-client

Description

This command enables debugging for DHCP client packet.

The **no** form of this command disables debugging for DHCP client packet.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp-client

Syntax

dhcp-client [**terminate-only**]

no dhcp-client

Context

[Tree] (debug>service>id>ppp>event dhcp-client)

Full Context

debug service id ppp event dhcp-client

Description

This command enable PPP event debug for DHCP client.

The **no** form of this command disables PPP event debugging for the DHCP client.

Parameters

terminate-only

Enables debug for local terminated PPP session.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp-client

Syntax

[**no**] **dhcp-client**

Context

[Tree] (debug>service>id>ppp>packet dhcp-client)

Full Context

debug service id ppp packet dhcp-client

Description

This command enables debugging for specific DHCP client packets.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp-client

Syntax

dhcp-client

Context

[Tree] (config>service>vprn>sub-if>grp-if>pppoe dhcp-client)

[Tree] (config>service>ies>sub-if>grp-if>pppoe dhcp-client)

Full Context

configure service vprn subscriber-interface group-interface pppoe dhcp-client

configure service ies subscriber-interface group-interface pppoe dhcp-client

Description

Commands in this context configure the PPPoE-to-DHCP options.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.147 dhcp-filter

dhcp-filter

Syntax

dhcp-filter *filter-id* [**create**]

no dhcp-filter

Context

[Tree] (config>filter dhcp-filter)

Full Context

configure filter dhcp-filter

Description

Commands in this context create and configure the specified DHCP filter policy.

Parameters

filter-id

Specifies the DHCP filter policy ID expressed as a decimal integer.

Values 1 to 65535

create

Keyword required to create the configuration context.

Platforms

All

8.148 dhcp-leasetime-threshold

dhcp-leasetime-threshold

Syntax

dhcp-leasetime-threshold [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

no dhcp-leasetime-threshold

Context

[Tree] (config>system>persistence>options dhcp-leasetime-threshold)

Full Context

configure system persistence options dhcp-leasetime-threshold

Description

This command configures Dynamic Data Persistence (DDP) compact flash access optimization for DHCP leases.

The DHCP lease-time threshold controls the eligibility of a DHCP lease for persistency updates when no data other than the lease expiry time is to be updated. When the offered lease time of the DHCP lease is less than the configured threshold, the lease is flagged to skip persistency updates and will be installed with its full lease time upon a persistency recovery after a reboot.

The **dhcp-leasetime-threshold** command controls persistency updates for DHCPv4 and DHCPv6 leases for a DHCP relay or proxy and DHCPv4 leases for DHCP snooping (enabled with **subscriber-mgmt**) and a DHCP server (enabled with **dhcp-server**).

The **no** form of the command disables the DHCP lease time threshold.

Default

no dhcp-leasetime-threshold

Parameters

days

Specifies the threshold in days.

Values 0 to 7305

hours

Specifies the threshold in hours.

Values 0 to 23

minutes

Specifies the threshold in minutes.

Values 0 to 59

seconds

Specifies the threshold in seconds.

Values 0 to 59

Platforms

All

dhcp-leasetime-threshold

Syntax

dhcp-leasetime-threshold [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

no dhcp-leasetime-threshold

Context

[Tree] (config>redundancy>multi-chassis>options>sub-mgmt dhcp-leasetime-threshold)

Full Context

configure redundancy multi-chassis options sub-mgmt dhcp-leasetime-threshold

Description

This command configures the DHCP lease time threshold to be eligible for MCS synchronization.

DHCP leases for the **sub-mgmt** MCS applications are eligible to skip synchronization if the committed lease time is less than the active threshold on a multi-chassis peer. The active threshold is the minimum value of the thresholds configured on the nodes at each end of a multi-chassis peer. The threshold is inactive when it is unconfigured on at least one end of the multi-chassis peer.

The **no** form of the command disables the DHCP lease time threshold.

Default

no dhcp-leasetime-threshold

No threshold is active and all **sub-mgmt** DHCP leases are synchronized.

Parameters

days

Specifies the threshold in days.

Values 0 to 1

hours

Specifies the threshold in hours.

Values 0 to 23

minutes

Specifies the threshold in minutes.

Values 0 to 59

seconds

Specifies the threshold in seconds.

Values 0 to 59

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.149 dhcp-options

dhcp-options

Syntax

[**no**] **dhcp-options**

Context

[Tree] (config>subscr-mgmt>auth-plcy>include-radius-attribute dhcp-options)

Full Context

configure subscriber-mgmt authentication-policy include-radius-attribute dhcp-options

Description

This command enables insertion of RADIUS VSA containing all DHCP options from DHCP discover (or DHCP request) message. The VSA contains all DHCP options in a form of the string. If required (the total length of all DHCP options exceeds 255B), multiple VSAs are included.

The **no** form of this command reverts to the default.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp-options

Syntax

[**no**] **dhcp-options**

Context

[Tree] (config>aaa>isa-radius-plcy>acct-include-attributes dhcp-options)

[Tree] (config>aaa>isa-radius-plcy>auth-include-attributes dhcp-options)

Full Context

configure aaa isa-radius-policy acct-include-attributes dhcp-options

configure aaa isa-radius-policy auth-include-attributes dhcp-options

Description

This command enables insertion of RADIUS VSA containing all dhcp-options from dhcp-discover (or dhcp-request) message. The VSA contains all dhcp-options in a form of the string. If required (the total length of all dhcp-options exceeds 255B), multiple VSAs are included.

Default

no dhcp-options

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.150 dhcp-pool

dhcp-pool

Syntax

dhcp-pool

Context

[Tree] (config>subscr-mgmt>vrgw>brg>brg-profile dhcp-pool)

Full Context

configure subscriber-mgmt vrgw brg brg-profile dhcp-pool

Description

Commands in this context configure per-subscriber IPv4 address pool parameters to be used for address allocation. Pools for different subscribers can overlap. Specific pool parameters can be overridden by RADIUS.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.151 dhcp-python-policy

dhcp-python-policy

Syntax

dhcp-python-policy *policy-name*

no dhcp-python-policy

Context

[Tree] (config>service>vpls>sap dhcp-python-policy)

Full Context

configure service vpls sap dhcp-python-policy

Description

This command specifies the name of the Python policy. The Python policy is created in the **config>python>python-policy** *name* context.

The **no** form of this command reverts to the default.

Parameters

policy-name

Specifies a Python policy name, up to 32 characters.

Platforms

All

8.152 dhcp-server

dhcp-server

Syntax

dhcp-server

Context

[Tree] (config>system>persistence dhcp-server)

Full Context

configure system persistence dhcp-server

Description

This command configures DHCP server persistence parameters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.153 dhcp-triggered

dhcp-triggered

Syntax

[**no**] **dhcp-triggered**

Context

[Tree] (config>subscr-mgmt>wlan-gw>ue-query>state dhcp-triggered)

Full Context

configure subscriber-mgmt wlan-gw ue-query state dhcp-triggered

Description

This command enables matching on UEs currently in a DHCP-triggered state. This query only filters UEs that are currently authenticating due to a DHCP, DHCPv6, or RS trigger, not RADIUS-authenticated UEs in an ESM, DSM, or portal state that were originally authenticated due to a DHCP, DHCPv6, or RS trigger.

The **no** form of this command disables matching on UEs in a DHCP-triggered state, unless all state matching is disabled.

Default

no dhcp-triggered

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.154 dhcp-user-db

dhcp-user-db

Syntax

dhcp-user-db *local-user-db-name*

no dhcp-user-db

Context

[Tree] (config>service>vpls>sap dhcp-user-db)

Full Context

configure service vpls sap dhcp-user-db

Description

This command enabled access to LUDB for DHCPv4 hosts under the capture SAP. The name of this local user database must match the name of local user database configured under the **config>service>vprn/ies>sub-if>group-if>dhcp** context.

Parameters

local-user-db

Specifies the name of the local user database name up to 32 characters.

Platforms

All

8.155 dhcp-vendor-class-id

dhcp-vendor-class-id

Syntax

[**no**] **dhcp-vendor-class-id**

Context

[Tree] (config>subscr-mgmt>auth-plcy>include-radius-attribute dhcp-vendor-class-id)

[Tree] (config>subscr-mgmt>acct-plcy>include-radius-attribute dhcp-vendor-class-id)

Full Context

configure subscriber-mgmt authentication-policy include-radius-attribute dhcp-vendor-class-id

configure subscriber-mgmt radius-accounting-policy include-radius-attribute dhcp-vendor-class-id

Description

This command includes the [26-6527-36] Alc-DHCP-Vendor-Class-Id attribute in authentication or RADIUS accounting messages. The content of the DHCP Vendor-Class-Identifier option (60) is mapped in this attribute.

The **no** form of this command reverts to the default.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp-vendor-class-id

Syntax

[**no**] **dhcp-vendor-class-id**

Context

[Tree] (config>aaa>isa-radius-plcy>acct-include-attributes dhcp-vendor-class-id)

[Tree] (config>aaa>isa-radius-plcy>auth-include-attributes dhcp-vendor-class-id)

Full Context

configure aaa isa-radius-policy acct-include-attributes dhcp-vendor-class-id

configure aaa isa-radius-policy auth-include-attributes dhcp-vendor-class-id

Description

This command includes the "[26-6527-36] Alc-DHCP-Vendor-Class-Id" attribute in authentication or RADIUS accounting messages. The content of the DHCP Vendor-Class-Identifier option (60) is mapped in this attribute.

Default

no dhcp-vendor-class-id

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**no**] **dhcp6 sap** *sap-id*

Context

[Tree] (debug>router>ip dhcp6)

Full Context

debug router ip dhcp6

Description

This command enables DHCPv6 debugging with optional interface, SAP, and client-identifier match criteria to filter the debug output.

The **no** form of this command disables debugging.

Parameters

ip-int-name

Specifies the name of an existing IP interface, up to 32 characters. Up to four DHCPv6 interface match criteria can be specified per routing instance.

client-identifier

Specifies a client identifier option match criteria.

duid duid-hex-string

Specifies a hexadecimal value for an opaque match on the client DUID in the client identifier option. When the actual length of the client DUID is longer than the length of the specified hex-string, only the left most octets are matched. Up to four DHCPv6 client-identifier match criteria can be specified per routing instance.

Values 0x0 to 0xFFFFFFFF (maximum 260 hex nibbles)

mask mask-hex-string

Specifies an optional substring match criteria. When a mask is specified, both hex-string lengths must be equal.

Values 0x0 to 0xFFFFFFFF (maximum 260 hex nibbles)

link-layer-address lla-hex-string

Specifies a hexadecimal value for a link layer address field match of a type 1 (DUID-LLT) or type 3 (DUID-LL) client DUID in the client identifier option. When the actual length of the link layer address field is longer than the length of the specified hex-string, only the left most octets are matched. Up to four DHCPv6 client-identifier match criteria can be specified per routing instance.

Values 0x0 to 0xFFFFFFFF (maximum 252 hex nibbles)

sap-id

Specifies an existing SAP identifier. Up to four DHCPv6 SAP match criteria can be specified per routing instance.

Platforms

All

dhcp6

Syntax

dhcp6 *type* **direction** {**ingress** | **egress**} **script** *script*

no dhcp6 *type* **direction** {**ingress** | **egress**}

Context

[Tree] (config>python>py-policy dhcp6)

Full Context

configure python python-policy dhcp6

Description

This command specifies the Python script for the specified DHCPv6 packet type in the specified direction.

Multiple **dhcps** command configurations are allowed in the same Python policy.

The **no** form of this command reverts to the default.

Parameters

type

Specifies the message type of the event.

Values solicit, advertise, request, confirm, renew, rebind, reply, release, decline, reconfigure, info-request, relay-forward, relay-reply

direction {ingress | egress}

Specifies whether the event is incoming or outgoing.

script

Specifies the name of the Python script, up to 32 characters, that will be used to handle the specified message.

Platforms

All

Full Context

configure service ies subscriber-interface group-interface wlan-gw ranges dhcp6

configure service vprn subscriber-interface group-interface wlan-gw ranges dhcp6

Description

Commands in this context create DHCPv6 configuration for WLAN-GW ISA subscribers.

dhcp6

Syntax

[**no**] **dhcp6**

Context

[Tree] (config>service>vprn>if>sap>ipsec-gateway dhcp6)

[Tree] (config>service>ies>if>sap>ipsec-gateway dhcp6)

Full Context

configure service vprn interface sap ipsec-gateway dhcp6

configure service ies interface sap ipsec-gateway dhcp6

Description

Commands in this context configure DHCPv6-based address assignment for IKEv2 remote-access tunnels.

The system acts as a DHCPv6 client on behalf of the IPsec client, and also acts as a relay agent to relay DHCPv6 packets to the DHCPv6 server.

DHCPv6 exchange happens during IKEv2 remote-access tunnel setup. The system also supports standard renew.

Default

no dhcp6

8.157 dhcp6-address

dhcp6-address

Syntax

dhcp6-address *ipv6-address*

no dhcp6-address

Context

[Tree] (config>subscr-mgmt>wlan-gw>ue-query dhcp6-address)

Full Context

configure subscriber-mgmt wlan-gw ue-query dhcp6-address

Description

This command enables matching on UEs with the specified DHCPv6 IA-NA address.

The **no** form of this command disables matching on the IA-NA address.

Default

no dhcp6-address

Parameters

ipv6-address

Specifies the IA-NA address.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.158 dhcp6-filter

dhcp6-filter

Syntax

dhcp6-filter *filter-id* [**create**]

no dhcp6-filter

Context

[Tree] (config>filter dhcp6-filter)

Full Context

configure filter dhcp6-filter

Description

Commands in this context create and configure the specified DHCPv6 filter policy.

The **no** form of this command reverts to the default.

Parameters

filter-id

Specifies the DHCPv6 filter policy ID expressed as a decimal integer.

Values 1 to 65535

create

Keyword required to create the configuration context.

Platforms

All

8.159 dhcp6-options

dhcp6-options

Syntax

[**no**] **dhcp6-options**

Context

[Tree] (config>subscr-mgmt>auth-plcy>include dhcp6-options)

Full Context

configure subscriber-mgmt authentication-policy include-radius-attribute dhcp6-options

Description

This command copies DHCPv6 options from received DHCPv6 messages on ingress access and pass them to the RADIUS server in Accept-Request. The messages is carried in the RADIUS VSA Alc-ToServer-Dhcp6-Options.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp6-options

Syntax

[**no**] **dhcp6-options**

Context

[Tree] (config>aaa>isa-radius-plcy>acct-include-attributes dhcp6-options)

Full Context

configure aaa isa-radius-policy acct-include-attributes dhcp6-options

Description

If a DHCPv6 stack is active for a UE, this attribute defines if options received in the last DHCPv6 message should be reflected.

Default

no dhcp6-options

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

dhcp6-options

Syntax

[**no**] **dhcp6-options**

Context

[Tree] (config>aaa>isa-radius-plcy>auth-include-attributes dhcp6-options)

Full Context

configure aaa isa-radius-policy auth-include-attributes dhcp6-options

Description

If authentication was triggered by DHCPv6, this knob defines if options received in that DHCPv6 message should be reflected in the radius Access-Request.

Default

no dhcp6-options

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.160 dhcp6-python-policy

dhcp6-python-policy

Syntax

dhcp6-python-policy *policy-name*

no dhcp6-python-policy

Context

[Tree] (config>service>vpls>sap dhcp6-python-policy)

Full Context

configure service vpls sap dhcp6-python-policy

Description

This command specified the Python policy for DHCPv6 packets sent/received on the capture SAP.

The **no** form of this command removes the policy name from the configuration.

Parameters

policy name

Specifies an existing Python policy name, up to 256 characters.

Platforms

All

8.161 dhcp6-relay

dhcp6-relay

Syntax

[**no**] **dhcp6-relay**

Context

[Tree] (config>service>ies>if>ipv6 dhcp6-relay)

[Tree] (config>service>vprn>if>ipv6 dhcp6-relay)

Full Context

configure service ies interface ipv6 dhcp6-relay

configure service vprn interface ipv6 dhcp6-relay

Description

Commands in this context configure DHCPv6 relay parameters for the interface.

The **no** form of this command disables DHCPv6 relay.

Platforms

All

8.162 dhcp6-server

dhcp6-server

Syntax

[**no**] **dhcp6-server**

Context

[Tree] (config>service>vprn>if>ipv6 dhcp6-server)

[Tree] (config>service>ies>if>ipv6 dhcp6-server)

Full Context

configure service vprn interface ipv6 dhcp6-server

configure service ies interface ipv6 dhcp6-server

Description

Commands in this context configure DHCPv6 server parameters for the interface.

The **no** form of this command disables the DHCP6 server.

Platforms

All

8.163 dhcp6-user-db

dhcp6-user-db

Syntax

dhcp6-user-db *local-user-db*

no dhcp6-user-db

Context

[Tree] (config>service>vpls>sap dhcp6-user-db)

Full Context

configure service vpls sap dhcp6-user-db

Description

This command enabled access to LUDB for DHCPv6 hosts under the capture SAP. The name of this LUDB must match the name of the LUDB configured under the **config>service>vprn/ies>sub-if>grp-if>dhcp** hierarchy.

The **no** form of this command reverts to the default.

Parameters

local-user-db

Specifies the name of the local-user-database, up to 32 characters.

Platforms

All

8.164 dhcpv4

dhcpv4

Syntax

dhcpv4

Context

[Tree] (config>service>vprn>subscriber-mgmt dhcpv4)

[Tree] (config>router>subscriber-mgmt dhcpv4)

Full Context

configure service vprn subscriber-mgmt dhcpv4

configure router subscriber-mgmt dhcpv4

Description

Commands in this context configure DHCPv4 parameters that apply to this routing instance.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.165 dhcpv4-nat

Syntax

dhcpv4-nat

Context

[Tree] (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client dhcpv4-nat)

[Tree] (config>service>ies>sub-if>wlan-gw>pool-manager>dhcp6-client dhcpv4-nat)

Full Context

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client dhcpv4-nat

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client dhcpv4-nat

Description

This node enables address pools for DHCPv4 NAT inside addresses. This configuration is only available in wholesale interfaces.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.166 dhcpv6-client

dhcpv6-client

Syntax

dhcpv6-client

Context

[Tree] (config>service>vprn>sub-if>wlan-gw>pool-manager dhcpv6-client)

[Tree] (config>service>ies>sub-if>wlan-gw>pool-manager dhcpv6-client)

Full Context

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client

Description

This command configures the DHCPv6 client for the pool manager.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.167 diameter

diameter

Syntax

diameter *type* **direction** {**ingress** | **egress**} **script** *script*

no diameter *type* **direction** {**ingress** | **egress**}

Context

[Tree] (config>python>py-policy diameter)

Full Context

configure python python-policy diameter

Description

This command specifies the Python script to use for the specified Diameter message type in the specified direction.

Multiple diameter command configurations are allowed in the same Python policy.

The **no** form of this command reverts to the default.

Parameters

type

Specifies the message type.

Message type	Application	Direction
aaa – AA Answer	Nasreq	ingress
aar – AA Request	Nasreq	egress
asa – Abort Session Answer	Gx, Gy	egress
asr – Abort Session Request	Gx, Gy	ingress
cca – Credit Control Answer	Gx, Gy	ingress
ccr – Credit Control Request	Gx, Gy	egress
cea – Capabilities Exchange Answer	Base	ingress
cer – Capabilities Exchange Request	Base	egress
dpa – Disconnect Peer Answer	Base	ingress/egress
dpr – Disconnect Peer Request	Base	ingress/egress
dwa – Device Watchdog Answer	Base	ingress/egress

dwr – Device Watchdog Request	Base	ingress/egress
raa – Re-Authentication Answer	Gx, Gy	egress
rar – Re-Authentication Request	Gx, Gy	ingress

direction {ingress | egress}

Specifies if the message is incoming or outgoing.

script

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

Platforms

8.172 diffserv-te

diffserv-te

Syntax

diffserv-te [**mam** | **rdm**]

no diffserv-te

Context

[Tree] (config>router>rsvp diffserv-te)

Full Context

configure router rsvp diffserv-te

Description

This command enabled Diff-Serv TE on the node.

When this command is enabled, IS-IS and OSPF will start advertising available bandwidth for each TE class configured under the diffserv-te node. This command will only have effect if the operator has already enabled TE at the IS-IS and/or OSPF routing protocol levels:

config>router>isis>traffic-engineering

and/or:

config>router>ospf>traffic-engineering

IGP will advertise for each RSVP interface in the system the available bandwidth in each TE class in the unreserved bandwidth TE parameter for that class. In addition, IGP will continue to advertise the existing Maximum Reservable Link Bandwidth TE parameter to mean the maximum bandwidth that can be booked on a given interface by all classes. The value advertised is adjusted with the link **subscription** *percentage* factor configured in the **config>router>rsvp>interface** context.

The user configures the following parameters for the operation of Diff-Serv:

- Definition of TE classes, TE Class = {Class Type (CT), LSP priority}.
- Mapping of the system forwarding classes to the Diff-Serv Class Type (CT).
- Configuration of the percentage of RSVP interface bandwidth each CT shares, that is, the Bandwidth Constraint (BC).

When Diff-Serv TE is enabled, the system will automatically enable the Max Allocation Model (MAM) Admission Control Policy. MAM represents the bandwidth constraint model for the admission control of an LSP reservation to a link. This is the only Admission Control Policy supported in this release.

Each CT shares a percentage of the Maximum Reservable Link Bandwidth through the user-configured Bandwidth Constraint (BC) for this CT. The Maximum Reservable Link Bandwidth is the link bandwidth multiplied by the RSVP interface subscription factor.

The sum of all BC values across all CTs will not exceed the Maximum Reservable Link Bandwidth. In other words, the following rule is enforced:

SUM (BCc) =< Max-Reservable-Bandwidth, 0 <= c <= 7

An LSP of class-type CTc, setup priority p, holding priority h (h=<p), and bandwidth B is admitted into a link if the following condition is satisfied:

B <= Unreserved Bandwidth for TE-Class[i]

where TE-Class [i] maps to < CTc , p > in the definition of the TE classes on the node. The bandwidth reservation is effected at the holding priority, that is, in TE-class [j] = <CTc, h>. Thus, the reserved bandwidth for CTc and the unreserved bandwidth for the TE classes using CTc are updated as follows:

Reserved(CTc) = Reserved(CTc) + B

Unreserved TE-Class [j] = BCc - SUM (Reserved(CTc,q)) for 0<= q <= h

Unreserved TE-Class [i] = BCc - SUM (Reserved(CTc,q)) for 0<= q <= p

The same is done to update the unreserved bandwidth for any other TE class making use of the same CTc. These new values are advertised to the rest of the network at the next IGP-TE flooding.

The Russian Doll Model (RDM) LSP admission control policy allows bandwidth sharing across Class Types. It provides a hierarchical model by which the reserved bandwidth of a CT is the sum of the reserved bandwidths of the numerically equal and higher CTs.

The RDM model is defined using the following equations:

SUM (Reserved (CTc)) <= BCb,

where the SUM is across all values of c in the range b <= c <= (MaxCT - 1), and BCb is the bandwidth constraint of CTb.

BC0= Max-Reservable-Bandwidth, so that

SUM (Reserved(CTc)) <= Max-Reservable-Bandwidth,

where the SUM is across all values of c in the range 0 <= c <= (MaxCT - 1).

When Diff-Serv is disabled on the node, this model degenerates into a single default CT internally with eight preemption priorities and a non-configurable BC equal to the Maximum Reservable Link Bandwidth. This would behave exactly like CT0 with eight preemption priorities and BC= Maximum Reservable Link Bandwidth if Diff-Serv was enabled.

The enabling or disabling of Diff-Serv TE on the system requires the RSVP and MPLS protocol be shutdown.

The **no** form of this command reverts to the default value.

Default

no diffserv-te

Parameters

mam

Defines the default admission control policy for Diff-Serv LSPs.

rdm

Defines Russian doll model for the admission control policy of Diff-Serv LSPs.

Platforms

8.173 digest-type

digest-type

Syntax

digest-type {**default** | **none** | **md5** | **sha1**}

no digest-type

Context

[Tree] (config>service>vprn>l2tp>l2tpv3 digest-type)

[Tree] (config>service>vprn>l2tp>group>l2tpv3 digest-type)

Full Context

configure service vprn l2tp l2tpv3 digest-type

configure service vprn l2tp group l2tpv3 digest-type

Description

This command configures the hashing algorithm used to calculate the message digest.

The **no** form of this command returns the **digest-type** to **none**.

Default

no digest-type

Parameters

none

Specifies that no digest should be used.

md5

Specifies that the MD5 algorithm should be used.

sha1

Specifies that the SHA1 algorithm should be used.

default

When specified within the **config>service>vprn>l2tp>group>l2tpv3** context, this is referencing to the **digest-type** configuration within the **config>service>vprn>l2tp>l2tpv3** context.

Context

[Tree] (config>port>transceiver digital-coherent-optics)

Full Context

configure port transceiver digital-coherent-optics

Description

This command specifies if a digital coherent optics module is used for this port.

The **no** form of this command specifies that the optical module used in this port is not a digital coherent optics module.

Default

no digital-coherent-optics

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.175 dir

dir

Syntax

dir [*file-url*] [**sort-order** { **d** | **n** | **s**}] [**reverse**]

Context

[Tree] (file dir)

Full Context

file dir

Description

This command displays a list of files and subdirectories in a directory.

Parameters

file-url

Specifies the path or directory name.

Use the *file-url* with the optional wildcard (*) to reduce the number of files to list.

sort-order {d | n | s}

Specifies the sort order.

Values d — date

n — name

s — size

reverse

Reverses the sort order.

Default Lists all files in the current working directory.

local-url	[*cflash-id*/][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each
remote-url	[{ftp:// | tftp://}*login*:*pswd@remote-locn*/][*file-path*]
	up to 247 characters
	directory length up to 99 characters each
remote-locn	[hostname | ipv4-address | [ipv6-address]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

8.177 direction-bit

direction-bit

Syntax

[**no**] **direction-bit**

Context

[Tree] (config>mirror>mirror-dest>encap>layer-3-encap direction-bit)

Full Context

configure mirror mirror-dest encap layer-3-encap direction-bit

Description

This command is used to steal one bit from the intercept-id in the LI-Shim and use it to indicate the direction of traffic flow for an LI session. Using a direction bit may be used by a LI Mediation Gateway to distinguish between the two directions of traffic flow for an LI session when both directions share a common mirror-dest, intercept-id and session-id. If the direction bit is enabled then the Mirror Header Version (2 bit mhv) in the LI-Shim will be set to binary 01, and the next bit after the mhv is set to 0 for ingress traffic and 1 for egress traffic.

For NAT based LI, ingress means the traffic is arriving at the node from the subscriber host (applies to the 7450 ESS and 7750 SR).

No changes are allowed to the **direction-bit** configuration once a gateway is configured.

Platforms

All

direction-bit

Syntax

[**no**] **direction-bit**

Context

[Tree] (config>li>mirror-dest-template>layer-3-encap direction-bit)

Full Context

configure li mirror-dest-template layer-3-encap direction-bit

Description

This command enables and disables the use of one bit from the interception ID field in the LI-Shim header to be used to indicate the direction of mirrored traffic flow for an LI session. An LI Mediation Gateway can use a direction bit to distinguish between the two directions of traffic flow for an LI session when both directions share a common mirror destination, interception ID, and session ID. If the direction bit is enabled, the Mirror Header Version (2-bit MHV) in the LI-Shim header will be set to binary 01, and the next bit after the MHV is set to 0 for ingress traffic and 1 for egress traffic.

For NAT-based LI, ingress traffic arrives at the node from the subscriber host. No changes are allowed to the direction bit configuration after a gateway is configured.

The **no** form of this command disables the use of the bit as a direction indicator.

8.180 disable-aging

disable-aging

Syntax

[**no**] **disable-aging**

Context

[Tree] (config>service>vpls disable-aging)

[Tree] (config>service>vpls>sap disable-aging)

[Tree] (config>service>vpls>vxlan disable-aging)

[Tree] (config>service>vpls>spoke-sdp disable-aging)

[Tree] (config>service>template>vpls-template disable-aging)

Full Context

configure service vpls disable-aging

configure service vpls sap disable-aging

configure service vpls vxlan disable-aging

configure service vpls spoke-sdp disable-aging

configure service template vpls-template disable-aging

Description

This command disables MAC address aging across a VPLS service, on a VPLS service SAP or spoke-SDP, or VXLAN instance with static binds. Learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (aging time). In each VPLS service instance, there are independent

aging timers for local learned MAC and remote learned MAC entries in the VPLS forwarding database (FDB).

The **disable-aging** command turns off aging for local and remote learned MAC addresses. When **no disable-aging** is specified for a VPLS, aging can be disabled for specific SAPs, spoke-SDPs, and VXLAN instances (or any combination) by entering the **disable-aging** command at the appropriate level.

When the **disable-aging command** is entered at the VPLS level, the aging state of individual SAPs or SDPs or VXLAN instance is ignored.

The **no** form of this command enables aging on the VPLS service.

Default

no disable-aging

Except for VXLAN instances, where the **disable-aging** is the default mode

Platforms

All

[Tree] (config>service>vprn>bgp disable-communities)

Full Context

configure service vprn bgp group neighbor disable-communities

configure service vprn bgp group disable-communities

configure service vprn bgp disable-communities

Description

This command configures BGP to disable sending standard, extended, or large communities to specific peers.

By default, all communities that are attached to a BGP route (any address family) are not stripped from the route when it is advertised to any type of peer: IBGP, EBGP or confed-EBGP.

Default

no disable-communities

Parameters

standard

Specifies that standard 4-byte communities should be removed.

extended

Specifies that 8-byte extended communities (of all types) should be removed.

large

Specifies that 12-byte large communities should be removed.

Platforms

All

8.185 disable-explicit-null

disable-explicit-null

Syntax

[**no**] **disable-explicit-null**

Context

[Tree] (config>router>bgp>label-allocation>label-ipv6 disable-explicit-null)

Full Context

configure router bgp label-allocation label-ipv6 disable-explicit-null

Description

This command controls the allocation and use of explicit null MPLS labels with labeled-unicast ipv6 routes.

When this command is enabled (**no disable-explicit-null**), the following behaviors apply:

- during the times when the router is required to act as the BGP next-hop of a label-unicast IPv6 route that it is advertising, it sets the BGP label value to IPv6 explicit null (value 2), forcing a POP behavior for received packets.
- received label-unicast IPv6 routes never create tunnels in TTM that can be used to resolve other BGP routes (with an IPv6 next-hop).
- a received label-unicast IPv6 route can be resolved by a label-ipv4 BGP tunnel that is transported over a stacked tunnel (SR-TE LSP or LDPoRSVP LSP)

When this command is disabled (**disable-explicit-null**), the following behaviors apply:

- during those times when the router is required to act as the BGP next-hop of a label-unicast IPv6 route that it is advertising, it sets the BGP label value to a proper value in the dynamic label range and programs a POP or SWAP operation for that label, depending on the origin of the route and various import policy actions that could apply to the route
- received label-unicast IPv6 routes that have a prefix length of 128 bits are automatically installed in TTM so that they can be used to resolve other (non-labeled-unicast) BGP routes (with an IPv6 next-hop)

- a received label-unicast ipv6 route cannot be resolved by a label-ipv4 BGP tunnel that is transported over a stacked tunnel (SR-TE LSP or LDPoRSVP LSP)
- the label-ipv6 routes used for ECMP towards an IPv6 destination cannot be a mix of routes with regular label values and routes with special (IPv6 explicit null) label values

Changes in the operational status do not cause the BGP sessions of the base router to reset.

disable-ldp-sync

Syntax

[**no**] **disable-ldp-sync**

Context

[Tree] (config>router>isis disable-ldp-sync)

Full Context

configure router isis disable-ldp-sync

Description

This command disables the IGP-LDP synchronization feature on all interfaces participating in the OSPF or IS-IS routing protocol. When this command is executed, IGP immediately advertises the actual value of the link cost for all interfaces which have the IGP-LDP synchronization enabled if the currently advertised cost is different. It will then disable IGP-LDP synchronization for all interfaces. This command does not delete the interface configuration. The **no** form of this command has to be entered to re-enable IGP-LDP synchronization for this routing protocol.

The **no** form of this command restores the default settings and re-enables IGP-LDP synchronization on all interfaces participating in the OSPF or IS-IS routing protocol and for which the ldp-sync-timer is configured.

Default

no disable-ldp-sync

Platforms

Full Context

configure service template vpls-template disable-learning

configure service vpls spoke-sdp disable-learning

configure service vpls sap disable-learning

configure service vpls vxlan disable-learning

configure service vpls disable-learning

Description

This command disables learning of new MAC addresses in the VPLS forwarding database (FDB) for the service instance, SAP instance, spoke-SDP instance, or VXLAN instance.

When **disable-learning** is enabled, new source MAC addresses are not entered in the VPLS service forwarding database. This applies for both local and remote MAC addresses.

When **no disable-learning** is specified for a VPLS on a 7450 ESS, it is possible to disable learning for specific SAPs and/or spoke SDPs by entering the **disable-learning command at the appropriate level.**

When **disable-learning** is disabled, new source MAC addresses are learned and entered into the VPLS forwarding database.

This parameter is mainly used in conjunction with the **discard-unknown** command.

The **no** form of this command enables learning of MAC addresses.

Default

no disable-learning

Normal MAC learning is enabled. The default mode for VXLAN instances is **disable-learning**.

Platforms

All

- configure service vpls spoke-sdp disable-learning

disable-learning

Syntax

[**no**] **disable-learning**

Context

[Tree] (config>service>pw-template disable-learning)

Full Context

configure service pw-template disable-learning

Description

This command enables learning of new MAC addresses.

This parameter is mainly used in conjunction with the **discard-unknown** command.

The **no** form of this command enables learning of MAC addresses.

Default

no disable-learning (Normal MAC learning is enabled)

Platforms

All

8.190 disable-route-table-install

disable-route-table-install

Syntax

[**no**] **disable-route-table-install**

Context

[Tree] (config>router>bgp disable-route-table-install)

Full Context

configure router bgp disable-route-table-install

Description

This command disables the installation of all IPv4, label-ipv4, IPv6 and label-ipv6 routes into the route table and tunnel table associated with the BGP instance.

Configuring this command prevents the advertisement of all IPv4, label-ipv4, IPv6 and label-ipv6 routes if there is a change of the BGP next-hop to one of the router's own addresses. Typically, this is only useful on a router that is a control-plane route reflector (not in the datapath).

The **no** form of the command enables the installation of all IPv4, label-ipv4, IPv6 and label-ipv6 routes into the route table and tunnel table associated with the BGP instance.

Default

no disable-route-table-install

Platforms

All

disable-route-table-install

Syntax

[**no**] **disable-route-table-install**

Context

[Tree] (config>router>policy-options>policy-statement>entry>action disable-route-table-install)

[Tree] (config>router>policy-options>policy-statement>default-action disable-route-table-install)

Full Context

configure router policy-options policy-statement entry action disable-route-table-install

configure router policy-options policy-statement default-action disable-route-table-install

Description

This command specifies that BGP routes (IPv4, IPv6, label-ipv4, label-ipv6) matching the policy entry (or, depending on the context, the policy's default-action) should not be installed in the route table, tunnel table (in the case of label-ipv4 routes), or IP FIB table.

This policy action has an effect only in BGP peer import policies. This policy action does not prevent the matched routes from contributing toward aggregate routes and does not prevent the matched routes from being advertised, even if next-hop-self has been applied. This means that incorrect use of this feature can blackhole traffic.

Marking label-ipv4 routes with this action does not prevent label-swap (ILM) entries from being programmed when such routes are re-advertised with a new BGP next-hop and label.

The **no** form of this command provides the default behavior of installing routes that are selected as the best path, ECMP path or backup path, depending on the circumstances.

Default

no disable-route-table-install

disable-shcv

Syntax

[**no**] **disable-shcv** [**alarm**] [**hold-time** *seconds*]

Context

[Tree] (config>subscr-mgmt>ancp>policy>port-dwn disable-shcv)

Full Context

configure subscriber-mgmt ancp ancp-policy port-down disable-shcv

Description

When this command is configured, the node suspends SHCV for the hosts defined with this ANCP policy until the access node sends a port-up message. When the **hold-time** parameter is used, the node suspends SHCV for the period of time defined. If the **hold-time** parameter is not defined the node will suspend SHCV until a port-up message is received.

If the optional alarm flag is used, the node sends a SHCV alarm before suspending.

The **no** form of this command reverts to the default.

Parameters

alarm

Specifies that the node sends an alarm before suspending SHCV.

seconds

Specifies the time that the node suspends SHCV.

Values 0 to 7200

configure lag bfd disable-soft-reset-extension

Description

This command disables the automatic extension of BFD timers during an IOM/IMM soft-reset. Normally, BFD session timers are automatically extended during a soft-reset operation on the IOMs and IMMs to avoid BFD sessions timing out and causing protocol events. However, in some cases this behavior is not desired as it could delay fast re-route transitions if the timers are in place. The **disable-soft-reset-extension** command controls this behavior.

Default

no disable-soft-reset-extension

Platforms

All

8.196 disable-stickiness

disable-stickiness

Syntax

[**no**] **disable-stickiness**

Context

[Tree] (config>aaa>radius-srv-plcy>servers disable-stickiness)

Full Context

configure aaa radius-server-policy servers disable-stickiness

Description

This command disables a subscriber RADIUS accounting session from sticking with a single server under normal working conditions. If a direct algorithm is used, all subscriber RADIUS sessions will go directly to the server with the lowest configured index. If a failure occurs, a new in-service server with the next lowest index is used. When the original server recovers, if stickiness is not disabled, all existing sessions will continue to use the new server. This command disables stickiness, and as a result, the recovered original RADIUS server will again service every subscriber. If a round-robin algorithm is used and stickiness is not disabled, an accounting session for a particular subscriber (or host, depending on the accounting mode) will stay with the same server. This command removes the stickiness and all subscriber accounting messages will go through the list of servers in a round-robin manner.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.197 disable-targeted-session

disable-targeted-session

Syntax

[**no**] **disable-targeted-session**

Context

[Tree] (config>router>ldp>targ-session disable-targeted-session)

Full Context

configure router ldp targeted-session disable-targeted-session

Description

This command disables support for SDP triggered automatic generated targeted sessions. Targeted sessions are LDP sessions between non-directly connected peers. The discovery messages for an indirect LDP session are addressed to the specified peer and not to the multicast address.

The **no** form of this command enables the set up of any targeted sessions.

Default

no disable-targeted-session

Platforms

All

8.198 disallow-igp

disallow-igp

Syntax

[**no**] **disallow-igp**

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop disallow-igp)

Full Context

configure router static-route-entry indirect tunnel-next-hop disallow-igp

Description

This optional command determines if the associated static route can be resolved via an IGP next-hop in the RTM if no tunnel next-hops are found in TTM.

When configured, the associated static route will not be resolved to an available IGP route in the RTM.

The **no** form of this command returns the behavior to the default, which allows the static route to be resolved via an IGP route in the RTM if no tunnel next-hop can be found in the TTM.

Default

no disallow-igp

Platforms

All

8.199 discard

discard

Syntax

discard [**now**]

Context

[Tree] (candidate discard)

Full Context

candidate discard

Description

This command deletes the entire contents of the candidate configuration and exits the edit-cfg mode. Undo cannot be used to recover a candidate that has been discarded with **candidate discard**.

Parameters

now

Avoids a confirmation prompt for the discard.

Platforms

All

8.200 discard-changes

discard-changes

Syntax

[**no**] **discard-changes**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization discard-changes)

Full Context

configure system security profile netconf base-op-authorization discard-changes

Description

This command enables the NETCONF discard-changes operation.

The **no** form of this command disables the operation.

Default

no discard-changes

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

Platforms
All

8.201 discard-rx-pause-frames

discard-rx-pause-frames

Syntax
[**no**] **discard-rx-pause-frames**

Context
[Tree] (config>port>ethernet discard-rx-pause-frames)

Full Context
configure port ethernet discard-rx-pause-frames

Description
This command discards received pause frames. Pause frames are used for local link flow control.

The **no** form of this command processes pause frames upon reception and the transmit side of the receiving port pauses in its transmissions.

Default
no discard-rx-pause-frames

Platforms
All

8.202 discard-unknown

discard-unknown

Syntax
[**no**] **discard-unknown**

Context
[Tree] (config>service>vpls discard-unknown)

[Tree] (config>service>template>vpls-template discard-unknown)

Full Context

configure service vpls discard-unknown

configure service template vpls-template discard-unknown

Description

By default, packets with unknown destination MAC addresses are flooded. If **discard-unknown** is enabled at the VPLS level, packets with unknown destination MAC address will be dropped instead (even when configured FDB size limits for VPLS or SAP are not yet reached).

The **no** form of this command allows flooding of packets with unknown destination MAC addresses in the VPLS.

Default

no discard-unknown

Platforms

All

[Tree] (config>service>vpls>vxlan discard-unknown-source)

[Tree] (config>service>vpls>spoke-sdp discard-unknown-source)

[Tree] (config>service>template>vpls-template discard-unknown-source)

Full Context

configure service template vpls-sap-template discard-unknown-source

configure service vpls sap discard-unknown-source

configure service vpls vxlan discard-unknown-source

configure service vpls spoke-sdp discard-unknown-source

configure service template vpls-template discard-unknown-source

Description

When this command is enabled, packets received on a SAP, a spoke-SDP, or a static VXLAN instance with an unknown source MAC address will be dropped only if the maximum number of MAC addresses for that SAP or spoke-SDP (see **max-nbr-mac-addr** [**config>service>vpls>sap max-nbr-mac-addr**, **config>service>vpls>spoke-sdp max-nbr-mac-addr**]) has been reached. If **max-nbr-mac-addr** has not been set for the SAP or spoke-SDP, enabling **discard-unknown-source** has no effect.

When disabled, the packets are forwarded based on the destination MAC addresses.

The **no** form of this command causes packets with an unknown source MAC addresses to be forwarded by destination MAC addresses in VPLS.

Default

no discard-unknown-source

Platforms

All

- configure service template vpls-sap-template discard-unknown-source
- configure service template vpls-template discard-unknown-source
- configure service vpls spoke-sdp discard-unknown-source
- configure service vpls sap discard-unknown-source

8.204 disconnect

disconnect

Syntax

disconnect [**address** *ip-address* | **session-id** *session-id* | **username** *user-name* | {**console** | **bluetooth** | **telnet** | **ftp** | **ssh** | **netconf** | **grpc**}]

Context

[Tree] (admin disconnect)

Full Context

admin disconnect

Description

This command disconnects a user from a session.

Issuing the **disconnect** command without any parameters will disconnect the session in which the command was executed.

If any of the session type options (for example, **console, bluetooth, telnet, FTP, SSH**) are specified, then only the respective sessions are affected.

If no session type options are specified, then all sessions from the IP address or from the specified user are disconnected.

Any task that the user is executing is terminated. FTP files accessed by the user will not be removed.

A major severity security log event is created specifying what was terminated and by whom.

Parameters

ip-address

Specifies the IP address to disconnect, specified in dotted decimal notation.

Note:
IPv6 is supported on the 7750 SR and 7950 XRS.

Values

ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

session-id

The model-driven session ID. Can be obtained using the **show system management-interface datastore-locks** [**detail**] command.

user-name

Specifies the name of the user. The name can be up to 32 characters.

console

Disconnects the console session.

bluetooth

Disconnects the bluetooth session.

telnet

Disconnects the Telnet session.

ftp

Disconnects the FTP session.

ssh

Disconnects the SSH session.

netconf

Disconnects the NETCONF session.

grpc

Disconnects the GRPC session.

Full Context

debug subscriber-mgmt vrgw brg pppoe-client brg-id discovery

Description

This command, limits debugging only to the specified messages in the discovery phase.

Parameters

padi

Limits debugging only to padi messages.

pado

Limits debugging only to pado messages.

padr

Limits debugging only to padr messages.

pads

Limits debugging only to pads messages.

padt

Limits debugging only to padt messages.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

discovery

Syntax

discovery

Context

[Tree] (config>port>ethernet>efm-oam discovery)

Full Context

configure port ethernet efm-oam discovery

Description

This is the top level of the hierarchy containing various discovery parameters that allow the operator to control certain aspects of the negotiation process as well as what action to take when there is a mismatch in peer capabilities.

Platforms

All

8.207 discovery-interval

discovery-interval

Syntax

discovery-interval *interval-secs* [**boot** *interval-secs*]

no discovery-interval

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ipsec discovery-interval)

Full Context

configure redundancy multi-chassis peer mc-ipsec discovery-interval

Description

This command specifies the time interval of tunnel-group stays in the Discovery state. Interval-1 is used as discovery-interval when a new tunnel-group is added to multi-chassis redundancy (mp-ipsec); interval-2 is used as discovery-interval when the system boots up, it is optional, when it is not specified, the interval-1 will be used.

Default

discovery-interval 300 boot 300

Parameters

interval-secs

Specifies the maximum duration, in seconds, of the discovery interval during which a newly activated multi- chassis IPsec tunnel-group will remain dormant while trying to contact its redundant peer. Groups held dormant in this manner will neither pass traffic nor negotiate security keys. This interval ends when either the redundant peer is contacted and a master election occurs, or when the maximum duration expires.

Values 1 to 1800

boot *interval-secs*

Specifies the maximum duration of an interval immediately following system startup. When the normal discovery interval for a group would expire while the post-boot discovery interval is still active, then the group's discovery interval is extended until the post-boot discovery interval expires. This allows an extension to the normal discovery stage of groups following a chassis reboot, to account for the larger variance in routing.

Values 1 to 1800

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

discovery-interval

Syntax

discovery-interval *seconds*

Context

[Tree] (config>test-oam>link-meas>template>twl>ipv6-dest-disc discovery-interval)

Full Context

configure test-oam link-measurement measurement-template twamp-light ipv6-destination-discovery discovery-interval

Description

This command configures the frequency at which IPv6 peer discovery packets are transmitted when the discovery-timer is active.

The **no** form of the command reverts to the default value.

Default

discovery-interval 10

Parameters

seconds

Specifies transmission frequency of the discovery packet.

Values 1 to 10

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.208 discovery-timer

discovery-timer

Syntax

discovery-timer *seconds*

Context

[Tree] (config>test-oam>link-meas>template>twl>ipv6-dest-disc discovery-timer)

Full Context

configure test-oam link-measurement measurement-template twamp-light ipv6-destination-discovery discovery-timer

Description

This command configures the amount of time to transmit peer discovery packets at the **discovery-interval**. The timer starts when the IPv6 protocols is enabled under the **config**>**router**>**if**>**if-attribute**>**delay**>**dynamic**> **twamp-light**>**ipv6** context. At the expiration of the **discovery-interval** or when a peer is discovered, the probe interval changes to the value configured for the **update-interval**.

The **no** form of the command reverts to the default value.

Default

discovery-interval 60

Parameters

seconds

Specifies transmission frequency of the discovery packet.

Values 1 to 1800

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.209 discriminator

discriminator

Syntax

discriminator *discriminator*

no discriminator

Context

[Tree] (config>bfd>seamless-bfd>reflector discriminator)

Full Context

configure bfd seamless-bfd reflector discriminator

Description

This command specifies the S-BFD discriminator.

The **no** form of this command removes the discriminator.

Parameters

discriminator

Specifies the discriminator value.

Values 524288 to 526335

Platforms

All

discriminator

Syntax

discriminator *discriminator*

no discriminator

Context

[Tree] (config>router>bfd>seamless-bfd>peer discriminator)

Full Context

configure router bfd seamless-bfd peer discriminator

Description

This command specifies the seamless BFD reflector discriminator for the remote peer node in the mapping table used by seamless BFD sessions initiated on the router.

The **no** form of this command removes the discriminator.

Parameters

discriminator

Specifies the discriminator of the remote node.

Values 1 to 4294967295

Platforms

All

8.210 disjointness-reference

disjointness-reference

Syntax

[no] disjointness-reference

Context

[Tree] (config>router>pcep>pcc>pce-assoc>div disjointness-reference)

Full Context

configure router pcep pcc pce-associations diversity disjointness-reference

Description

This command configures the value conveyed in the P-flag of the DISJOINTNESS-CONFIGURATION TLV. When enabled, it indicates that this LSP path is the reference path for the disjoint set of paths. The PCE must first compute the path of this LSP and then apply the requested disjointness type to compute the path of all other paths in the same diversity association ID.

The **no** form of this command sets the P-flag to false.

Default

P-flag to false

Platforms

All

8.211 disjointness-type

disjointness-type

Syntax

disjointness-type {**loose** | **strict**}

no disjointness-type

Context

[Tree] (config>router>pcep>pcc>pce-assoc>div disjointness-type)

Full Context

configure router pcep pcc pce-associations diversity disjointness-type

Description

This command configures the disjointness type for the association group.

The **no** form of this command reverts to the default value.

Default

disjointness-type loose

Parameters

loose

Keyword to specify the loose disjointness type.

strict

Keyword to specify the strict disjointness type.

Platforms

All

8.212 dispersion

dispersion

Syntax

dispersion *dispersion*

Context

[Tree] (config>port>dwdm>coherent dispersion)

Full Context

configure port dwdm coherent dispersion

Description

This command configures the residual chromatic dispersion to be compensated when the coherent receiver is operating in manual dispersion control mode.

Default

0

Parameters

dispersion

Specifies the dispersion compensation.

Values -50000 to 50000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.213 display

display

Syntax

display type {*type*} *url-string* **format** {*format*} [**password** [*32 chars max*]]

Context

[Tree] (admin>certificate display)

Full Context

admin certificate display

Description

This command displays the content of an input file in plain text.

Note:
When displaying the key file content, only the key size and type are displayed.

The following list summarizes the formats supported by this command:

- System
  - system format
  - PKCS #12
  - PKCS #7 PEM encoded
  - PKCS #7 DER encoded
  - RFC4945
- Certificate Request
  - PKCS #10
- Key
  - system format
  - PKCS #12
- CRL
  - system format
  - PKCS #7 PEM encoded
  - PKCS #7 DER encoded
  - RFC4945

Parameters

url-string

Specifies the local CF card url of the input file.

Values

url-string	<local-url> [up to 99 characters]
local-url	<cflash-id>/<file-path>
cflash-id	cf1: | cf2: | cf3:

type

Specifies the type of input file.

Values cert, key, crl, cert-request

format

Specifies the format of input file.

Values pkcs10, pkcs12, pkcs7-der, pkcs7-pem, pem, der

password

Specifies the password to decrypt the input file in case that it is an encrypted PKCS#12 file, up to 99 characters.

Platforms

All

8.214 display-config

display-config

Syntax

display-config [**detail** | **index**]

Context

[Tree] (admin display-config)

Full Context

admin display-config

Description

This command displays the system's running configuration.

By default, only non-default settings are displayed.

Specifying the **detail** option displays all default and non-default configuration parameters.

Parameters

detail

Displays default and non-default configuration parameters.

index

Displays only persistent-indices.

Platforms

All

8.215 display-key

display-key

Syntax

display-key type {**ike** | **esp**} **gateway name** *name* **dynamic-tunnel** *ip-address*: *port*

display-key type {**ike** | **esp**} **tunnel** *ipsec-tunnel-name*

Context

[Tree] (admin>ipsec display-key)

Full Context

admin ipsec display-key

Description

This command displays existing IKE-SA or CHILD-SA keys..

Note:
This command does not work if **config>ipsec>no show-ipsec-keys** or **no max-history-{esp|ike}-key-records** is configured under corresponding **ipsec-gw** or **ipsec-tunnel**.

Parameters

name

The name, up to 32 characters.

ip-address

The IP address of the remote client.

Values

<ip-address>	ip-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x
		x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

port

The port of the remote client.

Values 0 to 65535

ipsec-tunnel-name

The IPsec tunnel name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following outputs are examples of the **admin ipsec display-key** command.

[Tree] (config>subscr-mgmt>msap-policy dist-cpu-protection)

Full Context

configure service vprn subscriber-interface group-interface sap dist-cpu-protection

configure subscriber-mgmt msap-policy dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to an MSAP policy. The DCP policy is automatically assigned to MSAPs created with this policy. A non-existent DCP policy can be assigned to an **msap-policy** because an MSAP policy is similar to a template that is applied in the MSAP creation. The DCP policy is validated at the time that the MSAP is created, and the MSAP creation is blocked (and an appropriate log event created) if the DCP policy does not exist.

Note:
For other types of objects (for example, normal non-MSAP SAPs and network interfaces) the DCP policy must exist before it can be assigned to the SAP.

The **no** form of this command removes the policy name from the configuration.

If no dist-cpu-protection policy is assigned to an MSAP policy, then the default access DCP policy (_default-access-policy) is used.

If no DCP functionality is required on the MSAP policy, then an empty DCP policy can be created and explicitly assigned to the MSAP policy.

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>subscr-mgmt>sap-template dist-cpu-protection)

Full Context

configure subscriber-mgmt sap-template dist-cpu-protection

Description

This command assigns a DCP policy to a SAP template. The policy is automatically assigned to SAPs that are autocreated with this SAP template. The **dist-cpu-protection** policy must exit before it is assigned to a SAP template.

The **no** form of this command removes the policy name from the configuration.

If a DCP policy is not assigned to an SAP template, the default access DCP policy (_defaultaccess-policy) is used.

If no DCP functionality is required on the autocreated SAPs, an empty DCP policy can be created and explicitly assigned to the SAP template.

Default

no dist-cpu-protection

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dist-cpu-protection

Syntax

no dist-cpu-protection

Context

[Tree] (config>service>epipe>sap dist-cpu-protection)

[Tree] (config>service>cpipe>sap dist-cpu-protection)

[Tree] (config>service>ipipe>sap dist-cpu-protection)

Full Context

configure service epipe sap dist-cpu-protection

configure service cpipe sap dist-cpu-protection

configure service ipipe sap dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid existing DCP policy can be assigned to a SAP or a network interface (this rule does not apply to templates, such as an **msap-policy** template).

If no dist-cpu-protection policy is assigned to a SAP, then the default access DCP policy (_default-access-policy) is used.

If no DCP functionality is required on the SAP, then an empty DCP policy can be created and explicitly assigned to the SAP.

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

All

- configure service ipipe sap dist-cpu-protection
- configure service epipe sap dist-cpu-protection

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service cpipe sap dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>service>ies>if>sap dist-cpu-protection)

[Tree] (config>service>ies>sub-if>grp-if>sap dist-cpu-protection)

Full Context

configure service ies interface sap dist-cpu-protection

configure service ies subscriber-interface group-interface sap dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid DCP policy can be assigned to a SAP or a network interface. This rule does not apply to templates such as an msap-policy.

Default

If no dist-cpu-protection policy is assigned to an SAP, then the default access DCP policy (default-access-policy) is used. If no DCP functionality is required on the SAP, then an empty DCP policy can be created and explicitly assigned to the SAP policy.

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

All

- configure service ies interface sap dist-cpu-protection

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface sap dist-cpu-protection

dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>service>vprn>nw-if dist-cpu-protection)

Full Context

configure service vprn network-interface dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the network interface. Only a valid created DCP policy can be assigned to a network interface (this rule does not apply to templates such as an msap-policy).

Default

If no dist-cpu-protection policy is assigned to the VPRN network interface, then the default network DCP policy (_default-network-policy) is used.

If no DCP functionality is required on the VPRN network interface then an empty DCP policy can be created and explicitly assigned to the VPRN network interface.

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

All

dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>service>vprn>if>sap dist-cpu-protection)

Full Context

configure service vprn interface sap dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid created DCP policy can be assigned to a SAP or a network interface (This rule does not apply to templates such as an msap-policy).

Default

If no dist-cpu-protection policy is assigned to an SAP policy, then the default access DCP policy (default-access-policy) is used. If no DCP functionality is required on the SAP policy, then an empty DCP policy can be created and explicitly assigned to the SAP policy.

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

All

dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>router>if dist-cpu-protection)

Full Context

configure router interface dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid created DCP policy can be assigned to a SAP or a network interface (note that this rule does not apply to templates such as an msap-policy).

If the user does not assign a DCP policy to a router interface, the system uses the default network DCP policy.

Default

no dist-cpu-protection

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

All

dist-cpu-protection

Syntax

dist-cpu-protection

Context

configure system security dist-cpu-protection

Description

Commands in this context configure the Distributed CPU Protection (DCP) feature.

Platforms

All

8.217 dist-lag-rate-shared

dist-lag-rate-shared

Syntax

[**no**] **dist-lag-rate-shared**

Context

[Tree] (config>qos>port-scheduler-policy dist-lag-rate-shared)

Full Context

configure qos port-scheduler-policy dist-lag-rate-shared

Description

This command enables sharing of rates when the port on which this port-scheduler-policy is configured is part of a LAG configured in **distribute** mode.

When enabled, the absolute rate values configured as part of the max-rate, PIR/CIR group rates and PIR/CIR level rates are shared across the member ports of the LAG when configured in **distribute** mode.

This command does not have any effect when the port on which this **port-scheduler-policy** is configured is part of a LAG in **link** or **port-fair** mode. Similarly, when rates are configured as a **percent-rate**, this parameter is ignored.

Platforms

All

8.218 distinguisher

distinguisher

Syntax

distinguisher *id*

no distinguisher

Context

[Tree] (conf>router>segment-routing>sr-policies>policy distinguisher)

Full Context

configure router segment-routing sr-policies static-policy distinguisher

Description

This command associates a distinguisher value with a statically defined segment routing policy. This is a mandatory parameter and configuration command for non-local segment routing policies (for which the **head-end** parameter is set to a value other than "local”). Every non-local segment routing policy must have a unique distinguisher value. When a non-local static segment routing policy is imported into BGP and originated as a BGP route, the configured distinguisher value is copied into the NLRI of the route.

The **no** form of this command removes the distinguisher association.

Default

no distinguisher

Parameters

id

Specifies the distinguisher ID.

Values 1 to 4294967295

Platforms

All

distinguisher

Syntax

distinguisher *distinguisher-id*

no distinguisher

Context

[Tree] (config>router>policy-options>policy-statement>entry>from distinguisher)

Full Context

configure router policy-options policy-statement entry from distinguisher

Description

This command configures an SR Policy distinguisher as a route policy match criterion. This match criterion is only used in import policies.

The **no** form of this command removes the distinguisher ID match criterion from the configuration.

Parameters

distinguisher-id

Specifies the SR policy distinguisher ID.

Values 0 to 4294967295

Platforms

All

8.219 distributed-sub-mgmt

distributed-sub-mgmt

Syntax

distributed-sub-mgmt

Context

[Tree] (config>service>vprn>wlan-gw distributed-sub-mgmt)

Full Context

configure service vprn wlan-gw distributed-sub-mgmt

Description

Commands in this context configure Distributed Subscriber Management (DSM) for soft GRE group interface and for ranges of IEEE 802.1q VLAN tags in soft GRE group interfaces.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

distributed-sub-mgmt

Full Context

configure router wlan-gw distributed-sub-mgmt

configure subscriber-mgmt wlan-gw distributed-sub-mgmt

configure service vprn wlan-gw distributed-sub-mgmt

Description

Commands in this context configure profiles, templates and policies that can be applied to DSM subscribers.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

distributed-sub-mgmt

Syntax

[**no**] **distributed-sub-mgmt**

Context

[Tree] (config>isa>wlan-gw-group distributed-sub-mgmt)

Full Context

configure isa wlan-gw-group distributed-sub-mgmt

Description

This command configures the WLAN gateway distributed subscriber management.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

distributed-sub-mgmt

Syntax

distributed-sub-mgmt

Context

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range distributed-sub-mgmt)

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range distributed-sub-mgmt)

Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt

Description

Commands in this context configure distributed-sub-mgmt configuration per vlan-range. This also includes vlan-range default, which makes this configuration applicable to the **wlan-gw group-interface**.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.220 diversity

diversity

Syntax

[no] diversity *association-name*

Context

[Tree] (config>router>pcep>pcc>pce-assoc diversity)

Full Context

configure router pcep pcc pce-associations diversity

Description

This command creates a named diversity association from which the parameters for the specified diversity association are configured.

The **no** form of the command deletes the specified diversity association.

Parameters

association-name

Specifies the name of the diversity association, up to 32 characters.

Platforms

All

diversity

Syntax

[no] diversity *diversity-assoc-name*

Context

[Tree] (config>router>mpls>lsp-template>pce-assoc diversity)

[Tree] (config>router>mpls>lsp>pce-assoc diversity)

Full Context

configure router mpls lsp-template pce-associations diversity

configure router mpls lsp pce-associations diversity

Description

This command binds the LSP to a named diversity association. The diversity association must exist under the PCC. Up to five diversity associations can be configured per LSP.

The **no** form of the command removes the LSP binding from the specified diversity association.

Parameters

diversity-assoc-name

Specifies the name of an existing diversity association, up to 32 characters.

Platforms

All

8.221 diversity-type

diversity-type

Syntax

diversity-type {**link** | **node** | **srlg-link** | **srlg-node**}

no diversity-type

Context

[Tree] (config>router>pcep>pcc>pce-assoc>div diversity-type)

Full Context

configure router pcep pcc pce-associations diversity diversity-type

Description

This command configures the diversity type for the association group. This command is mandatory. If the command is not configured, the system does not validate the association configuration.

The **no** form of the command reverts to the default value.

Default

no diversity-type

Parameters

link

Keyword to specify the link diversity type.

node

Keyword to specify the node diversity type.

srlg-link

Keyword to specify the SRLG-link diversity type.

srlg-node

Keyword to specify the SRLG-node diversity type.

Platforms

All

8.222 divert

divert

Syntax

[**no**] **divert**

Context

[Tree] (config>app-assure>group>policy>app-profile divert)

Full Context

configure application-assurance group policy app-profile divert

Description

This command enables the redirection of traffic to AA ISA for the system-wide forwarding classes diverted to application assurance (**divert-fc**) for AA subscribers using this application profile.

The **no** form of this command stops redirect of traffic to AA ISAs for the AA subscribers using this application profile.

Default

no divert

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.223 divert-fc

divert-fc

Syntax

[**no**] **divert-fc** *fc-name*

Context

[Tree] (config>isa>aa-grp divert-fc)

Full Context

configure isa application-assurance-group divert-fc

Description

This command selects a forwarding class in the system to be diverted to an application assurance engine for this application assurance group. Only traffic to/from subscribers with application assurance enabled is diverted.

To divert multiple forwarding classes, the command needs to be executed multiple times specifying each forwarding class to be diverted at a time.

The **no** form of this command stops diverting of the traffic to an application assurance engine for this application assurance group.

Parameters

fc-name

Creates a class instance of the forwarding class fc-name.

Values be, l2, af, l1, h2, ef, h1, nc

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.224 dm

dm

Syntax

dm [**test-id** *test-id*] [**create**]

no dm

Context

[Tree] (config>oam-pm>session>mpls dm)

Full Context

configure oam-pm session mpls dm

Description

This command assigns an identifier to the DM test and creates the individual test.

The **no** form of this command removes the DM test function from the OAM-PM session.

Parameters

test-id

Specifies the value of the 26-bit test identifier sent as session identifier in the DM PDU.

Values 0 to 67108863

create

Creates the DM test. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.225 dmm

dmm

Syntax

dmm [**test-id** *test-id*] [**create**]

no dmm

Context

[Tree] (config>oam-pm>session>ethernet dmm)

Full Context

configure oam-pm session ethernet dmm

Description

This command defines the test ID to be assigned to the delay test and creates the container to allow the individual test parameters to be configured.

The **no** form of this command removes the DMM test function from the PM Session.

Parameters

test-id

Specifies the value to be placed in the 4-byte test ID field of an ETH-DMM PDU.

Values 0 to 2147483647

create

Creates the test.

Platforms

All

8.226 dmr-prefix

dmr-prefix

Syntax

dmr-prefix *dmr-prefix*

no dmr-prefix

Context

[Tree] (config>service>nat>map-domain dmr-prefix)

Full Context

configure service nat map-domain dmr-prefix

Description

This command configures the IPv6 prefix of the BR (dmr-prefix), which is used as a default MAP rule (route) in the CEs. Each MAP domain in the VSR has a unique dmr-prefix.

Parameters

dmr-prefix

Specifies the IPv6 prefix associated with a MAP domain in the BR. The prefix represents a dmr-rule in the CE.

Values <*ipv6-prefix/prefix-length*> :

ipv6-prefix: *x:x:x:x:x:x:x:x* (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

prefix-length: [0 to 96]

Platforms

VSR

8.227 dnat

dnat

Syntax

[no] **dnat**

Context

[Tree] (config>service>nat>nat-policy dnat)

Full Context

configure service nat nat-policy dnat

Description

This command defines context for destination NAT (DNAT) specific configuration under the nat-policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.228 dnat-only

dnat-only

Syntax

dnat-only router *router-instance* **nat-group** *nat-group-id*

no dnat-only

Context

[Tree] (config>service>nat>nat-policy>dnat dnat-only)

Full Context

configure service nat nat-policy dnat dnat-only

Description

This command configures outside routing context and nat-group in which DNAT translation shout take place. This command is mutually exclusive with the pool command in nat-policy. When DNAT-only is enabled, no source and port NAT (SNAPT) is performed. In other words, only the destination IP address (going from inside to outside) is translated while the source IP address and port are not translated.

Parameters

router *router-instance*

Specifies the routing context on the outside (public side).

nat-group *nat-group-id*

Specifies the NAT group IP.

Values 1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

dnat-only

Syntax

dnat-only

Context

[Tree] (config>router>nat>outside dnat-only)

[Tree] (config>service>vprn>nat>inside dnat-only)

[Tree] (config>router>nat>inside dnat-only)

[Tree] (config>service>vprn>nat>outside dnat-only)

Full Context

configure router nat outside dnat-only

configure service vprn nat inside dnat-only

configure router nat inside dnat-only

configure service vprn nat outside dnat-only

Description

Commands in this context configure the dnat-only parameters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.229 dns

dns

Syntax

[**no**] **dns**

Context

[Tree] (config>service>vprn dns)

Full Context

configure service vprn dns

Description

Commands in this context configure domain name servers.

The **no** form of this command disables DNS for this service.

Platforms

All

dns

Syntax

dns target-addr *dns-name* **name-server** *ip-address* [**source** *ip-address*] [**count** *send-count*] [**timeout** *timeout*] [**interval** *interval*] [**record-type** {**ipv4-a-record** | **ipv6-aaaa-record**}] [**router-instance** *router-instance*]

Context

[Tree] (config>saa>test>type dns)

[Tree] (oam dns)

Full Context

configure saa test type dns

oam dns

Description

This command performs DNS name resolution. If **ipv4-a-record** is specified, DNS target addresses are queried for A records only. If **ipv6-aaaa-record** is specified, AAAA records are queried first, and if a successful response is not received, the DNS server is queried for A records (applies to the 7750 SR and 7950 XRS).

Parameters

dns-name

Specifies the DNS domain name, up to 255 characters.

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message response corresponding to the outstanding message request.

Values 1 to 10

Default 1

ip-address

Specifies the IP address of the primary DNS server.

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: 0 to FFFF]H

d: [0 to 255]D

record-type

Specifies a record type (applies to the 7750 SR and 7950 XRS only).

Values **ipv4-a-record —** A record-specific mapping of a host name to an IPv4 address.

ipv6-aaaa-record — A record-specific mapping to the Internet class that stores a single IPv6 address.

send-count

Specifies the number of messages to send. The **send-count** parameter overrides the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

Values 1 to 100

Default 1

timeout

Specifies the time, in seconds, to override the default *timeout* value and is the amount of time that the router waits for a message response after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded.

Values 1 to 120

Default 5

router-instance

Specifies the preferred method to enter a service name or routing instance from which to launch the DNS query. This value is stored as the service name. This is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

Values

router-name	Base	Specifies a base routing instance
	management	Specifies a management routing instance
	_Base_and_ management	Specifies a base routing instance and a management routing instance: if no response is received from the base, a management routing instance is used.
vprn-svc-name		Specifies a service name, up to 64 characters

Default _Base_and_management

bof dns-domain

Description

This command configures the domain name used when performing DNS address resolution. This is a required parameter if DNS address resolution is required. Only a single domain name can be configured. If multiple domain statements are configured, the last one encountered is used.

The **no** form of this command removes the domain name from the configuration.

Default

no dns-domain

Parameters

dns-name

Specifies the DNS domain name, up to 178 characters.

Platforms

All

8.231 dns-ip-cache

dns-ip-cache

Syntax

dns-ip-cache *dns-ip-cache-name* [**create**]

no dns-ip-cache *dns-ip-cache-name*

Context

[Tree] (config>app-assure>group dns-ip-cache)

Full Context

configure application-assurance group dns-ip-cache

Description

This command configures a DNS IP cache used to snoop DNS requests generated by subscribers to populate a cache of IP addresses matching a specified list of domain names. In the context of URL content charging strengthening, it is also mandatory to specify a list of trusted DNS servers to populate the DNS IP cache.

Parameters

dns-ip-cache-name

Specifies the Application Assurance DNS IP cache name, up to 32 characters.

create

Specifies a keyword used to create the DNS IP cache.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service vprn router-advertisement interface dns-options

configure service vprn router-advertisement dns-options

configure service ies subscriber-interface group-interface ipv6 router-advertisements dns-options

Description

Commands in this context configure DNS information for Stateless Address Auto-Configuration (SLAAC) hosts.

When specified at the router-advertisement level in the routing context, this command allows configuration of service-wide parameters. These can then be inherited at the interface level by specifying the **config>service>vprn>router-advert>if>dns-options>include-dns** command.

The **no** form of this command disables configuration of DNS information for Stateless Address Auto-Configuration (SLAAC) hosts.

do-not-fragment

Syntax

[**no**] **do-not-fragment**

Context

[Tree] (config>oam-pm>session>ip do-not-fragment)

Full Context

configure oam-pm session ip do-not-fragment

Description

This command configures the Do Not Fragment (DF) bit in the IPv4 header of the TWAMP Light test packet in order to prevent packet fragmentation. This is only applicable to IPv4. IPv6 does not include the bit as part of the specification. This parameter is ignored but not blocked when the address is IPv6.

The **no** form of this command allows packet fragmentation.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

8.237 dod-label-distribution

dod-label-distribution

Syntax

[**no**] **dod-label-distribution**

Context

[Tree] (config>router>ldp>session-params>peer dod-label-distribution)

Full Context

configure router ldp session-parameters peer dod-label-distribution

Description

This command enables the use of the LDP Downstream-on-Demand (DoD) label distribution procedures.

When this option is enabled, LDP will set the A-bit in the Label Initialization message when the LDP session to the peer is established. When both peers set the A-bit, they will both use the DoD label distribution method over the LDP session (RFC 5036).

This feature can only be enabled on a link-level LDP session and therefore will apply to prefix labels only, not service labels.

As soon as the link LDP session comes up, the router will send a label request to its DoD peer for the FEC prefix corresponding to the peer's LSR-id. The DoD peer LSR-id is found in the basic Hello discovery messages the peer used to establish the Hello adjacency with the router.

Similarly if the router and the directly attached DoD peer entered into extended discovery and established a targeted LDP session, the router will immediately send a label request for the FEC prefix corresponding to the peer's LSR-id found in the extended discovery messages.

However, the router will not advertise any <FEC, label> bindings, including the FEC of its own LSR-id, unless the DoD peer requested it using a Label Request Message.

When the DoD peer sends a label request for any FEC prefix, the router will reply with a <FEC, label> binding for that prefix if the FEC was already activated on the router. If not, the router replies with a notification message containing the status code of "no route." The router will not attempt in the latter case to send a label request to the next-hop for the FEC prefix when the LDP session to this next-hop uses the DoD label distribution mode. Hence the reference to single-hop LDP DoD procedures.

As soon as the link LDP session comes up, the router will send a label request to its DoD peer for the FEC prefix corresponding to the peer's LSR-id. The DoD peer LSR-id is found in the basic Hello discovery messages the peer used to establish the Hello adjacency with the router.

Similarly if the router and the directly attached DoD peer entered into extended discovery and established a targeted LDP session, the router immediately sends a label request for the FEC prefix corresponding to the peer's LSR-id found in the extended discovery messages. Peer address has to be the peer LSR-ID address.

The **no** form of this command disables the DoD label distribution with an LDP neighbor.

Default

no dod-label-distribution

configure service nat firewall-policy domain

Description

This command specifies a router and domain to which the firewall policy will be applied. All associated traffic must be part of the prefixes specified by this domain.

The **no** form of the command removes the domain association from the firewall policy.

Default

no domain

Parameters

domain-name

Specifies the name of the firewall domain in the specified router instance. 32 characters maximum.

router-name

Specifies the name of the router instance to use.

Values *router-name* | *vprn-svc-id*

router-name — "Base", "management"

vprn-svc-id — 1 to 2147483647

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

domain

Syntax

domain *md-index* [**format** *md-name-format*] [**name** *md-name*] **level** *level* [**admin-name** *admin-name*]

domain *md-index*

no domain *md-index*

Context

[Tree] (config>eth-cfm domain)

Full Context

configure eth-cfm domain

Description

This command configures Connectivity Fault Management (CFM) Maintenance Domain (MD) parameters.

The **no** form of this command removes the MD index parameters from the configuration.

Parameters

md-index

Specifies the MD index value.

Values 1 to 4294967295

md-name-format

Specifies a value that represents the type (format).

Values

dns — Specifies the DNS name format.

mac — X:X:X:X:X:X-u

X — 0 to FF (hexadecimal)

u — 0 to 65535 (decimal)

none — Specifies a Y.1731 domain format and the only format allowed to execute Y.1731 specific functions.

string — Specifies an ASCII string.

Default string

md-name

Specifies a generic MD name, up to 43 characters.

level

Specifies the integer identifying the MD level. Higher numbers correspond to higher maintenance domains, those with the greatest physical reach, with the highest values for customer CFM packets. Lower numbers correspond to lower maintenance domains, those with more limited physical reach, with the lowest values for single bridges or physical links.

Values 0 to 7

admin-name

Specifies a creation time required parameter that allows the operator to assign a name value to the domain container. This is used for information and migration purposes. This value cannot be modified without destroying the domain. If no *admin-name* exists, the configured *md-index* value is converted into a character string to become the *admin-name* reference. When upgrading from a release that does not include the **admin-name** configuration option, the *md-index* is converted into a character string. After an *admin-name* value is assigned, it cannot be modified.

Context

[Tree] (config>system>ptp domain)

Full Context

configure system ptp domain

Description

This command configures the PTP domain.

Note:
Some profiles may require a domain number in a restricted range. The operator must ensure that the value aligns with the expected range for the profile.

The domain cannot be changed unless PTP is shutdown. If the PTP profile setting is changed, the domain is changed to the default domain for the new PTP profile.

The **no** form of this command reverts to the default configuration. The default value is dependent upon the configured profile, as detailed below.

Default

domain 0 — profile ieee1588-2008

domain 4 — profile g8265dot1-2010

domain 24 — profile g8275dot1-2014

domain 44 — profile g8275dot2-2016

Parameters

domain

Specifies the PTP domain.

Values 0 to 255 for ieee1588-2008

0 to 255 for g8265dot1-2010

24 to 43 for g8275dot1-2014

0 to 255 for g8275dot2-2016

configure service vprn bgp-ipvpn segment-routing-v6 domain-id

configure service vprn bgp-ipvpn mpls domain-id

configure service vprn bgp-evpn segment-routing-v6 domain-id

Description

This command specifies the domain ID that identifies the network from which a BGP route was received before that route is exported to a different neighbor. The domain ID is part of a domain, represented as *domain-id*:*isf_safi_type* in the D-PATH attribute, as described in *draft-ietf-bess-evpn-ipvpn-interworking*. The D-PATH attribute is modified by gateway routers, where a gateway is defined as a PE where a VPRN is instantiated, and that VPRN advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances).

In the following example, consider that a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N:

Seg Len=1 / 65000:1:128

If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows:

Seg Len=2 / 65000:2:70 / 65000:1:128

That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.

The D-PATH attribute is used on gateways to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).

The **no** form of this command removes the configured domain ID.

Default

no domain-id

Parameters

global-field:local-field

Specifies the domain ID.

Values	*4byte-GlobalAdminValue:2byte-LocalAdminValue*	
	4byte-GlobalAdminValue:	0 to 4294967295
	2byte-LocalAdminValue	0 to 65535

8.241 dot1p

dot1p

Syntax

dot1p *dot1p-priority* [**fc** *fc-name*] [**priority** {**low** | **high**}]

no dot1p *dot1p-priority*

Context

[Tree] (config>qos>sap-ingress dot1p)

Full Context

configure qos sap-ingress dot1p

Description

This command explicitly sets the forwarding class or subclass or enqueuing priority when a packet is marked with a *dot1p-priority* specified. Adding a dot1p rule on the policy forces packets that match the *dot1p-priority* specified to override the forwarding class and enqueuing priority based on the parameters included in the dot1p rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueuing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

The *dot1p-priority* is derived from the most significant three bits in the IEEE 802.1q or IEEE 802.1p header. The three dot1p bits define 8 Class-of-Service (CoS) values commonly used to map packets to per-hop QoS behavior.

The **no** form of this command removes the explicit dot1p classification rule from the SAP ingress policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

Parameters

dot1p-priority

This value is a required parameter that specifies the unique IEEE 802.1p value that will match the dot1p rule. If the command is executed multiple times with the same *dot1p-value*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of eight dot1p rules are allowed on a single policy.

Values 0 to 7

fc *fc-name*

Specifies the value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the fc-name is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

priority

This parameter overrides the default enqueuing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueuing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueuing priority is inherited based on previous rule matches.

Default Inherits the priority defined by the default-priority statement.

high

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP

queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

configure qos sap-ingress mac-criteria entry match dot1p

Description

The IEEE 802.1p value to be used as the match criterion.

Use the **no** form of this command to remove the dot1p value as the match criterion.

Default

no dot1p

Parameters

dot1p-value

Specifies the IEEE 802.1p value in decimal.

Values 0 to 7

dot1pmask

This 3-bit mask can be configured using the following formats:

Format Style	Format Syntax	Example
Decimal	D	4
Hexadecimal	0xH	0x4

Format Style	Format Syntax	Example
Binary	0bBBB	0b100

To select a range from 4 up to 7, specify *p-value* of 4 and a *mask* of 0b100 for value and mask.

Values 0 to 7 (decimal hex or binary)

Default 7

Syntax

dot1p *dot1p-value* [**fc** *fc-name*] [**profile** {**in** | **out** | **use-de** | **exceed** | **inplus**}]

no dot1p *dot1p-value*

Context

[Tree] (config>qos>sap-egress dot1p)

Full Context

configure qos sap-egress dot1p

Description

This command defines a specific dot1p value that must be matched to perform the associated reclassification actions. If an egress packet on the SAP matches the specified dot1p value, the forwarding class or profile may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The dot1p priority is derived from the most significant three bits in the IEEE 802.1q or IEEE 802.1p header. The three dot1p bits define 8 Class-of-Service (CoS) values commonly used to map packets to per-hop QoS behavior.

The reclassification actions from a dot1p reclassification rule may be overridden by a DSCP, IP precedence, or IP flow matching event.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping decisions. If a DSCP, IP precedence, IPv6 criteria, or IP criteria match occurs after the dot1p match, the new forwarding class may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new FC, the FC from the dot1p match will be used.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion behavior. If a DSCP, IP precedence, IPv6 criteria, or IP criteria match occurs after the dot1p match, the

new profile may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new profile, the profile from the dot1p match will be used.

The **no** form of this command removes the reclassification rule from the SAP egress QoS policy.

Parameters

dot1p-value

This value is a required parameter that specifies the unique IEEE 802.1p value that will match the dot1p rule. If the command is executed multiple times with the same *dot1p-value*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of eight dot1p rules are allowed on a single policy.

Values 0 to 7

fc *fc-name*

Specifies the value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the FC name is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

profile {in | out | use-de | exceed | inplus}

Specifies the profile reclassification action is optional. When specified, packets matching the dot1p value will be explicitly reclassified to the profile specified regardless of the ingress profiling decision. The explicit profile reclassification may be overwritten by a DSCP, IP precedence, IPv6 criteria, or IP criteria reclassification match. To remove the profile reclassification action for the specified dotp1 value, the **dot1p** command must be re-executed without the profile reclassification action defined.

Values **in** — Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out — Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

use-de — Specifies that the DE bit is used to determine the profile of the packet (in-profile is used when DE = 0 and out-of-profile is used when DE = 1).

exceed — Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus — Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

Syntax

dot1p {*dot1p-value* | **in-profile** *dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*]}

no dot1p

Context

[Tree] (config>qos>sap-egress>fc dot1p)

Full Context

configure qos sap-egress fc dot1p

Description

This command explicitly defines the egress IEEE 802.1p (dot1p) bits marking for *fc-name*. When the marking is set, all packets of *fc-name* that have either an IEEE 802.1q or IEEE 802.1p encapsulation use the explicitly defined *dot1p-value*. If the egress packets for *fc-name* are not IEEE 802.1q or IEEE 802.1p encapsulated, the dot1p command has no effect.

The optional **in-profile** *dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*] parameters added to the existing **dot1p** command adds the capability to mark on an egress SAP the in, out, and exceed-profile status via a certain dot1p combination, similarly with the DE options. All inplus-profile traffic is marked with the same value as in-profile traffic.

When the **in-profile** keyword is added, the **out-profile** keyword must be specified; however, **exceed-profile** is optional. If the optional **exceed-profile** *dot1p-value* is not included, any exceed-profile traffic will be marked with the same dot1p value as configured for the out-of-profile traffic.

The command with the additional structure may be used on the SAP when the internal in, out, and exceed-profile status needs to be communicated to an access network or customer device that does not support the DE bit.

When these commands are used, the DE bit or the equivalent field is left unchanged by the egress processing if a tag exists. If a new tag is added, the related DE bit is set to 0.

When the previous command (**dot1p** *dot1p-value*) is used without the new structure, it means that the dot1p value is used for the entire forwarding class, as it did before. The two versions of the command are mutually exclusive.

The in-profile or out-of-profile/exceed-profile status may be indicated via the DE bit setting if the **de-mark** command is used. The DE value used for exceed-profile is the same as that used for out-of-profile.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the dot1p bits for both the BVID and ITAG.

The commands **dot1p-inner** and **dot1p-outer** take precedence over the **dot1p** command if both are specified in the same policy.

The **no** form of this command sets the IEEE 802.1p or IEEE 802.1q priority bits to 0.

Default

no dot1p

Parameters

in-profile *dot1p-value*

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

Values 0 to 7

out-profile *dot1p-value*

Specifies the 802.1p value to set for out-profile frames in this forwarding class.

Values 0 to 7

exceed-profile *dot1p-value*

Specifies the 802.1p value to set for exceed-profile frames in this forwarding class.

Values 0 to 7

Context

[Tree] (config>qos>network>ingress dot1p)

Full Context

configure qos network ingress dot1p

Description

This command explicitly sets the forwarding class or enqueuing priority and profile of the packet when a packet is marked with a *dot1p-priority* specified. Adding a dot1p rule on the policy forces packets that match the *dot1p-priority* specified to override and be assigned to the forwarding class and enqueuing priority and profile of the packet, based on the parameters included in the dot1p rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueuing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

The *dot1p-priority* is derived from the most significant three bits in the IEEE 802.1q or IEEE 802.1p header. The three dot1p bits define 8 Class-of-Service (CoS) values commonly used to map packets to per-hop Quality of Service (QoS) behavior.

The **no** form of this command removes the explicit dot1p classification rule from the policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

Parameters

dot1p-priority

This value is a required parameter that specifies the unique IEEE 802.1p value that will match the dot1p rule. If the command is executed multiple times with the same *dot1p-value*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of eight dot1p rules are allowed on a single policy.

Values 0 to 7

fc-name

Specifies the value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out | use-de}

All packets that are assigned to this forwarding class will be considered in-profile or out-of-profile based on this command or will use the DE bit to determine the profile of the packets (in-profile is used when DE = 0 and out-of-profile is used when DE = 1). In case of congestion, the in-profile packets are preferentially queued over the out-of-profile packets.

Platforms

All

dot1p

Syntax

dot1p *dot1p-priority*

no dot1p

Context

[Tree] (config>qos>network>egress>fc dot1p)

Full Context

configure qos network egress fc dot1p

Description

This command is used whenever the dot1p bits are set to a common value regardless of the internal profile of the packets. Although it is not mandatory, this command should be used in combination with the **de-mark** command to enable the marking of the DE bit according to the internal profile of the packet.

This command acts as a shortcut for configuring the two existing commands with the same dot1p priority.

The **dot1p** *dot1p-priority* command is saved in the configuration as **dot1p-in-profile** *dot1p-priority* and **dot1p-out-profile** *dot1p-priority*. The inplus-profile traffic is marked with the same value as in-profile traffic. The exceed-profile traffic is marked with the same value as out-of-profile traffic.

Platforms

Syntax

dot1p *dot1p-value* [*dot1p-mask*]

no dot1p

Context

[Tree] (config>filter>mac-filter>entry>match dot1p)

Full Context

configure filter mac-filter entry match dot1p

Description

Configures an IEEE 802.1p value or range to be used as a MAC filter match criterion.

When a frame is missing the 802.1p bits, specifying an dot1p match criterion will fail for the frame and result in a non-match for the MAC filter entry.

The **no** form of the command removes the criterion from the match entry.

Egress **dot1p** value matching will only match if the customer payload contains the 802.1p bits. For example, if a packet ingresses on a null encapsulated SAP and the customer packet is IEEE 802.1Q or 802.1p tagged, the 802.1p bits will be present for a match evaluation. On the other hand, if a customer tagged frame is received on a dot1p encapsulated SAP, the tag will be stripped on ingress and there will be no 802.1p bits for a MAC filter match evaluation; in this case, any filter entry with a dot1p match criterion specified will fail.

Default

no dot1p

Parameters

dot1p-value

Specifies the IEEE 802.1p value in decimal.

Values 0 to 7

dot1p-mask

Specifies a 3-bit mask that can be configured using the decimal integer, hexadecimal or binary format.

Format Style	Format Syntax	Example
Decimal	D	4
Hexadecimal	0xH	0x4
Binary	0bBBB	0b100

To select a range from 4 up to 7 specify *dot1p-value* of 4 and a *dot1p-mask* of 0b100 for value and mask.

Default 7 (decimal)

Values 1 to 7 (decimal)

dot1p-inner

Syntax

dot1p-inner *dot1p-value*

dot1p-inner in-profile*dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*]

no dot1p-inner

Context

[Tree] (config>qos>sap-egress>fc dot1p-inner)

Full Context

configure qos sap-egress fc dot1p-inner

Description

This command explicitly configures the egress inner VLAN tag IEEE 802.1p (dot1p) bits marking for the forwarding class name. When the marking is set, all packets of the forwarding class name that have either an inner IEEE 802.1q or IEEE 802.1p encapsulation on a QinQ SAP will use the explicitly defined *dot1p-value*. If the egress packets for the forwarding class are not IEEE 802.1q or IEEE 802.1p QinQ encapsulated, this command has no effect.

The optional **in-profile** *dot1p-value*, **out-profile** *dot1p-value*, and **exceed-profile** *dot1p-value* parameters on the **dot1p-inner** command add the capability to mark the in-profile and out-of-profile status on an egress QinQ SAP. The command with the additional parameters may be used on the SAP when the internal in-profile, out-of-profile, and exceed-profile status needs to be communicated to an access network or customer device that does not support the DE bit. When the in-profile keyword is added, the rest of the structure must be specified. All inplus-profile traffic is marked with the same value as in-profile traffic.

When these commands are used, the DE bit or the equivalent field is left unchanged by the egress processing if an inner tag exists. If a new inner tag is added, the related DE bit is set to 0. The inplus/in, out, or exceed-profile status may be indicated using the DE bit setting if the **de-mark** or **de-mark-inner** command is used.

The two versions of the command (with and without parameters) are mutually exclusive.

This command takes precedence over the **configure qos sap-ingress dot1p** command if both are specified in the same policy, and over the default action where the marking is taken from a packet received at ingress.

The configuration of **qinq-mark-top-only** under the SAP egress takes precedence over the use of the **dot1p-inner** command in the policy; that is, the inner VLAN tag is not remarked when **qinq-mark-top-only** is configured. The marking used for the inner VLAN tag is based on the current default, which is governed by the marking of the packet received at the ingress to the system.

The **no** form of this command sets the inner IEEE 802.1p or IEEE 802.1q priority bits to 0.

Default

no dot1p-inner

Parameters

dot1p-value

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

Values 0 to 7

in-profile *dot1p-value*

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

Values 0 to 7

out-profile *dot1p-value*

Specifies the 802.1p value to set for out-of-profile frames in this forwarding class.

Values 0 to 7

exceed-profile *dot1p-value*

no dot1p-outer

Context

[Tree] (config>qos>sap-egress>fc dot1p-outer)

Full Context

configure qos sap-egress fc dot1p-outer

Description

This command explicitly defines the egress outer or single VLAN tag IEEE 802.1p (dot1p) bits marking for *fc-name*. When the marking is set, all packets of fc-name that have either an outer or single IEEE 802.1q or IEEE 802.1p encapsulation on a qinq or a dot1p SAP, respectively, will use the explicitly defined *dot1p-value*. If the egress packets for *fc-name* are not IEEE 802.1q or IEEE 802.1p encapsulated, this command has no effect.

The optional **in-profile** *dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*] parameters on the dot1p-outer command add the capability to mark the in, out, and exceed-profile status on an egress qinq or dot1p SAP. The command with the additional parameters may be used on the SAP when the internal in, out, and exceed-profile status needs to be communicated to an access network or customer device that does not support the DE bit.

When the **in-profile** keyword is added, the **out-profile** keyword must be specified; however, **exceed-profile** is optional. If the optional **exceed-profile** *dot1p-value* is not included, any exceed-profile traffic will be marked with the same dot1p value as configured for the out-of-profile traffic. All inplus-profile traffic is marked with the same value as in-profile traffic.

When these commands are used, the DE bit or the equivalent field is left unchanged by the egress processing if a single or outer tag exists. If a new tag is added, the related DE bit is set to 0. The in, out, or exceed-profile status may be indicated via the setting of the DE bit setting if the **de-mark(-outer)** command is used. The DE value used for inplus is the same as that used for in-profile and the one used for exceed-profile is the same as that used for out of profile.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the dot1p bits for both the BVID and ITAG.

The two versions of the command (with and without parameters) are mutually exclusive.

This command takes precedence over the **dot1p** command if both are specified in the same policy, and over the default action where the marking is taken from a packet received at ingress.

The **no** form of the command sets the IEEE 802.1p or IEEE 802.1q priority bits to 0.

Default

no dot1p-outer

Parameters

dot1p-value

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

Values 0 to 7

in-profile *dot1p-value*

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

Values 0 to 7

configure service ies redundant-interface hold-time down

configure service vprn subscriber-interface hold-time down

configure router interface hold-time down

Description

This command causes a delay in the activation of the associated IP interface by the specified number of seconds. The delay is invoked whenever the system attempts to bring the associated IP interface up, unless the **init-only** option is configured. If the **init-only** option is configured, the delay is only applied when the IP interface is first configured or after a system reboot.

The **no** form of this command removes the command from the active configuration and removes the delay in activating the associated IP interface. If the configuration is removed during a delay period, the currently running delay will continue until it completes.

Default

no down ip

Parameters

seconds

The time delay, in seconds, to make the interface operational.

Values 1 to 1200

init-only

Specifies that the **down** delay is only applied when the interface is configured or after a reboot.

Values 1 to 1200

down-on-peer-tldp-pw-status-faults

no down-on-peer-tldp-pw-status-faults

Context

[Tree] (config>service>epipe>pw-port down-on-peer-tldp-pw-status-faults)

Full Context

configure service epipe pw-port down-on-peer-tldp-pw-status-faults

Description

This command enables the PW port configured on an Epipe to go locally operationally down if any of the following status bits are received on a mate spoke-SDP across an FPE:

- 0x00000001 - Pseudowire Not Forwarding
- 0x00000002 - Local Attachment Circuit (ingress) Receive Fault
- 0x00000004 - Local Attachment Circuit (egress) Transmit Fault
- 0x00000008 - Local PSN-facing PW (ingress) Receive Fault

- 0x00000010 - Local PSN-facing PW (egress) Transmit Fault

The **no** form of the command specifies that the mate PW status fault bits are not taken into account in the operational state of the PW port.

Default

no down-on-peer-tldp-pw-status-faults

Platforms

All

8.253 down-threshold

down-threshold

Syntax

down-threshold *percent-change* [**bw** *absolute-change*]

Context

[Tree] (config>router>rsvp>dbw-accounting down-threshold)

Full Context

configure router rsvp dbw-accounting down-threshold

Description

This command sets the minimum change (in percent of the latest advertised value) above which a decrease in Maximum Reservable Link Bandwidth (MRLB) (IS-IS TE sub-TLV 10) or Maximum Reservable Bandwidth (MRB) (OSPF TE sub-TLV 7) triggers an IGP-TE update. This configuration only applies to a change in MRLB or MRB caused by dark bandwidth. Other events affecting MRLB/MRB (such as the change of the subscription factor or the loss of link in a LAG over which the RSVP interface is defined) trigger an immediate TE update, regardless of the importance of the impact.

Optionally, the threshold can also be expressed as an absolute value. In this case, the evaluation of the change is made using the percent change and the absolute change. An IGP-TE update is sent if both of these thresholds are crossed. Changing this parameter in the course of dark bandwidth accounting does not affect the accounting cycle.

Default

down-threshold 0

Parameters

percent-change

Specifies the minimum decrease in MRLB/MRB, expressed in percent.

Values 0 to 100

absolute-change

Specifies the minimum decrease in MRLB/MRB, expressed in Mb/s.

Values 0 to 1000000

Platforms

8.254 down-timeout

down-timeout

Syntax

[**no**] **down-timeout**

Context

[Tree] (config>aaa>radius-srv-plcy>servers>health-check down-timeout)

Full Context

configure aaa radius-server-policy servers health-check down-timeout

Description

This command determines the interval to wait for a RADIUS reply message from the RADIUS server before a RADIUS server is declared out-of-service. By default, the value of the down-timeout is the number of retries multiplied by the timeout interval. Each host will use the configured timeout and retry value under the AAA RADIUS server policy.

timeout refers to the waiting period before the next retry attempt.

retry refers the number of times the host will attempt to contact the RADIUS server.

If a RADIUS server is declared out-of-service, the host pending retry attempts will move on to the next RADIUS server.

The **no** form of this command reverts to the default.

Parameters

minutes

Specifies the timer to wait, in minutes, before declaring the RADIUS server that is down.

Values 1 to 5

seconds

Specifies the timer to wait, in seconds, before declaring the RADIUS server that is down.

Values 1 to 59

8.256 downlink

downlink

Syntax
downlink aggregate-rate
downlink arbiter *arbiter-name*
downlink policer *policer-id*
downlink queue *queue-id*
downlink scheduler *scheduler-name*
no downlink

Context

[Tree] (config>subscr-mgmt>gtp>apn-policy>apn>ambr-qos-mapping downlink)

Full Context

configure subscriber-mgmt gtp apn-policy apn ambr-qos-mapping downlink

Description

When enabled, the downlink rate in the APN-AMBR IE in an incoming GTP message is interpreted as a rate override for the specified egress QoS object. For queues and policers, the PIR is overridden.

This override uses standard SR OS QoS overrides. Therefore, a subsequent Gx/RADIUS-based override removes this override.

The **no** form of this command disables the override mechanism.

Default

no downlink

Parameters

aggregate-rate

Specifies the aggregate rate.

arbiter-name

Specifies the name of the arbiter to be overridden, up to 32 characters.

policer-id

Specifies the ID of the policer to be overridden.

Values 1 to 63

queue-id

Specifies the ID of the queue to be overridden.

Values 1 to 8

scheduler-name

Specifies the name of the scheduler to be overridden, up to 32 characters.

Platforms

Context

[Tree] (config>subscr-mgmt>sla-prof>pfcp>seq downlink-mbr-gbr)

Full Context

configure subscriber-mgmt sla-profile pfcp-mappings session-qer downlink-mbr-gbr

Description

This command configures the downlink MBR/GBR to QoS override mapping.

The **no** form of the command disables the downlink MBR/GBR mapping.

Default

no downlink-mbr-gbr

Parameters

aggregate-rate

Maps the MBR/GBR to a rate override for the aggregate rate.

arbiter-name

Specifies the arbiter target of the MBR/GBR override. The arbiter name can be up to 32 characters.

policer-id

Specifies the policer ID target of the MBR/GBR override.

Values 1 to 63

queue-id

Specifies the queue ID target of the MBR/GBR override.

Values 1 to 8

scheduler-name

Specifies the scheduler name target of the MBR/GBR override. The scheduler name can be up to 32 characters.

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.258 download-interval

download-interval

Syntax

download-interval *minutes*

no download-interval

Context

[Tree] (config>aaa>route-downloader download-interval)

Full Context

configure aaa route-downloader download-interval

Description

This command sets the time interval, in minutes, that the system waits for between two consecutive runs of the route-download process. The time is counted from the start-time of the run, thus, if an route-download process is still ongoing by the time the timer expires, the process will restart from count=1.

The **no** form of this command reverts to the default value.

Default

download-interval 720

Parameters

minutes

Specifies the time interval, in minutes, between the start of the last route downloader run and the start of the next route downloader run.

Values 1 to 1440

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.259 downstream-ip-filter

downstream-ip-filter

Syntax

downstream-ip-filter *filter-id*

no downstream-ip-filter

Context

[Tree] (config>service>vprn>nat>inside downstream-ip-filter)

Full Context

configure service vprn nat inside downstream-ip-filter

Description

This command assigns an IPv4 filter policy to the downstream NAT interface. This filter is applied to downstream traffic after the NAT function is applied but before it enters the inside VPRN instance.

The **no** form of the command removes the filter from the configuration.

Default

no downstream-ip-filter

Parameters

filter-id

Specifies an existing IPv4 filter policy. Values can be expressed either as a decimal integer or as an ASCII string of up to 64 characters.

Values 1 to 65535, or ASCII string of up to 64 characters

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

downstream-ip-filter

Syntax

downstream-ip-filter *filter-id*

no downstream-ip-filter

Context

[Tree] (config>service>vprn>nat>outside downstream-ip-filter)

[Tree] (config>router>nat>outside downstream-ip-filter)

Full Context

configure service vprn nat outside downstream-ip-filter

configure router nat outside downstream-ip-filter

Description

This command specifies a filter to apply to the downstream traffic after routing in the outside virtual router instance and before the NAT function; it is useful for traffic that bypasses the egress filters applied in the inside virtual router instance, such as DS-Lite traffic.

The **no** form of the command removes the filter from the configuration.

Default

no downstream-ip-filter

Parameters

filter-id

Specifies a filter up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.260 downstream-ipv6-filter

downstream-ipv6-filter

Syntax

downstream-ipv6-filter *filter-id*

no downstream-ipv6-filter

Context

[Tree] (config>router>nat>outside downstream-ipv6-filter)

[Tree] (config>service>vprn>nat>outside downstream-ipv6-filter)

Full Context

configure router nat outside downstream-ipv6-filter

configure service vprn nat outside downstream-ipv6-filter

Description

This command configures the ipv6-filter for downstream traffic. This filter is applied to downstream traffic after it leaves the outside virtual router instance but before the NAT function is applied. This is useful for shared v6 filters that apply to all v6 DSM hosts.

The **no** form of the command removes the filter from the configuration.

Default

no downstream-ipv6-filter

Parameters

filter-id

Specifies an IPv6 filter up to 64 characters in length.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.261 downstream-map-tlv

downstream-map-tlv

Syntax

downstream-map-tlv *downstream-map-tlv*

no downstream-map-tlv

Context

[Tree] (config>saa>test>type-multi-line>lsp-trace>sr-policy downstream-map-tlv)

Full Context

configure saa test type-multi-line lsp-trace sr-policy downstream-map-tlv

Description

This command configures the downstream mapping TLV that provides a mechanism for the sender and responder nodes to exchange and validate interface and label stack information for each downstream hop in the path of the LDP FEC an RSVP LSP, or a BGP IPv4 or IPv6 label route.

The following downstream mapping TLVs are supported: the original Downstream Mapping (DSMAP) TLV defined in RFC 4379 (obsoleted by RFC 8029) and the Downstream Detailed Mapping (DDMAP) TLV defined in RFC 6424.

The **no** form of this command removes the configuration.

Parameters

downstream-map-tlv

Specifies which format of the downstream mapping TLV to use in the LSP trace packet. The DSMAP TLV is the original format in RFC 4379 (obsoleted by RFC 8029). The DDMAP is the new enhanced format specified in RFC 6424. The user can also choose not to include the downstream mapping TLV by entering the value **none**. When **lsp-trace** is used on a MPLS-TP LSP (static option), it can only be executed if the control-channel is set to none. In addition, the DSMAP/DDMAP TLV is only included in the echo request

message if the egress interface is either a numbered IP interface or an unnumbered IP interface. The TLV is not included if the egress interface is of type **unnumbered-mpls-tp**.

Values ddmap: Sends a detailed downstream mapping TLV.

dsmap: Sends a downstream mapping TLV.

none: No mapping TLV is sent.

Default Inherited from global configuration of downstream mapping TLV in option **mpls-echo-request-downstream-map {dsmap | ddmap}**.

Platforms

All

8.262 dpd

dpd

Syntax

dpd [**interval** *interval*] [**max-retries** *max-retries*] [**reply-only**]

no dpd

Context

[Tree] (config>ipsec>ike-policy dpd)

Full Context

configure ipsec ike-policy dpd

Description

This command controls the dead peer detection mechanism.

The **no** form of this command removes the parameters from the configuration.

Default

no dpd

Parameters

interval

Specifies the DPD interval, in seconds. Since more time is necessary to determine if there is incoming traffic, the actual time needed to bring down the tunnel is larger than the DPD interval multiplied by max-retries.

Values 10 to 300

Default 30

max-retries

Specifies the maximum number of retries before the tunnel is removed.

Values 2 to 5

Default 3

reply-only

Specifies whether to initiate a DPD request if there is an incoming ESP or IKE packet. Issuing the command without the reply-only keyword does not initiate a DPD request if there is an incoming ESP packet.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.263 dr-activation-timer

dr-activation-timer

Syntax

dr-activation-timer *seconds*

Context

[Tree] (config>service>vpls>bind>evpn-mcast-gateway dr-activation-timer)

Full Context

configure service vpls allow-ip-int-bind evpn-mcast-gateway dr-activation-timer

Description

This command configures the designated router (DR) activation timer for the EVPN gateway.

After the DR activation timer expires, each provider edge router (PE) runs the MEG or PEG DR election. The timer allows the PE to collect Inclusive Multicast Ethernet Tag routes from other MEG/PEG gateways and avoid running the DR election multiple times. The DR triggers the MEG/PEG first-hop and last-hop router actions on the router.

Default

dr-activation-timer 3

Parameters

seconds

Specifies DR election wait time, in seconds.

Values 0 to 100

Platforms

All

8.264 drain

drain

Syntax

[**no**] **drain**

Context

[Tree] (config>service>vprn>dhcp>server>pool>subnet drain)

Full Context

configure service vprn dhcp local-dhcp-server pool subnet drain

Description

This command means no new leases can be assigned from this subnet and existing leases are cleaned up upon renew/rebind.

The **no** form of this command means the subnet is active and new leases can be assigned from it.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

drain

Syntax

[**no**] **drain**

Context

[Tree] (config>service>vprn>nat>outside>pool>address-range drain)

Full Context

configure router nat outside pool address-range drain

configure service vprn nat outside pool address-range drain

Description

This command starts or stops draining this NAT address range. When an address-range is being drained, it will not be used to serve new hosts. Existing hosts, however, will still be able to use the address that was assigned to them even if it is being drained. An address-range can only be deleted if the parent pool is shut down or if the range itself is effectively drained (hosts are no longer using the addresses).

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.265 drop

drop

Syntax

[**no**] **drop**

Context

[Tree] (config>app-assure>group>policy>aqp>entry>action drop)

Full Context

configure application-assurance group policy app-qos-policy entry action drop

Description

This command configures the drop action on flows matching this AQP entry. When enabled, all flow traffic matching this AQP entry will be dropped. When drop action is part of a set of multiple actions to be applied to a single flow as result of one or more AQP entry match, drop action will be performed first and no other action will be invoked on that flow.

The **no** form of this command disables the drop action on flows matching this AQP entry.

Default

no drop

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

drop

Syntax

drop

drop packet-length {**lt** | **gt** | **eq**} *packet-length-value*

drop packet-length range *packet-length-value packet-length-value*

drop pattern expression *expression* **mask** *mask* **offset-type** *offset-type* **offset-value** *offset-value*

drop ttl {**lt** | **gt** | **eq**} *ttl-value*

drop ttl range *ttl-value ttl-value*

Context

[Tree] (config>filter>ip-filter>entry>action drop)

Full Context

configure filter ip-filter entry action drop

Description

This command configures the drop action for the traffic that matches this filter entry.

Traffic can, also, be dropped based on *pkt-length*, *packet-length range*, *ttl*, *ttl range*, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, and not the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

Parameters

packet-length

Specifies drop packets matching both the filter entry match criteria and the *packet-length value* defined in the **drop** action statement. Packets matching the filter entry match criteria and not matching the *packet-length* value, as defined in the **drop** action statement, are implicitly forwarded with no further match in the following filter entries.

Values lt — Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies "equal to”.

packet-length-value

Specifies the packet length value for the rate limit action.

Values 0 to 65535

range

Specifies an inclusive range. When **range** is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

expression

Specifies the hexadecimal pattern to match; up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

mask

Specifies the mask for the pattern expression, up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

offset-type

Specifies the starting point reference for the offset-value of this pattern.

Values layer-3, layer-4, data, dns-qtype

offset-value

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

Values 0 to 255

ttl-value

Specifies drop packets matching both the filter entry match criteria and the TTL value defined in the drop action statement. Packets matching the filter entry match criteria and not matching the TTL value, as defined in the drop action statement, are implicitly forwarded with no further match in the following filter entries.

Values 0 to 255

drop payload-length {**lt** | **gt** | **eq**} *payload-length-value*

drop payload-length range *payload-length-value payload-length-value*

Context

[Tree] (config>filter>ipv6-filter>entry>action drop)

Full Context

configure filter ipv6-filter entry action drop

Description

This command configures the drop action for the traffic that matches this filter entry.

Traffic can, also, be dropped based on *payload-length*, *payload-length range*, *hop-limit*, *hop-limit range*, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria

Parameters

hop-limit

Specifies the hop-limit value for the drop action.

Values lt — Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

eq — Specifies "equal to”.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

hop-limit-value

Specifies the hop-limit value for the drop action.

Values 0 to 255

range

Specifies an inclusive range. When the **range** parameter is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

expression

Specifies the hexadecimal pattern to match; up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

mask

Specifies the mask for the pattern expression, up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

offset-type

Specifies the starting point reference for the offset-value of this pattern.

Values layer-3, layer-4, data, dns-qtype

offset-value

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

Values 0 to 255

payload-length

Specifies drop packets matching both the filter entry match criteria and the payload-length-value defined in the drop action statement. Packets matching the filter entry match criteria and not matching the payload-length-value, as defined in the drop action statement, are implicitly forwarded with no further match in the following filter entries.

Values lt — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies "equal to".

payload-length-value

Specifies the payload length value for the drop action.

Values 0 to 65535

Default

drop-count 3

Parameters

count

Specifies the count value.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

drop-count

Syntax

drop-count *count*

no drop-count

Context

[Tree] (config>vrrp>policy>priority-event>host-unreachable drop-count)

Full Context

configure vrrp policy priority-event host-unreachable drop-count

Description

This command configures the number of consecutively sent ICMP echo request messages that must fail before the host unreachable priority control event is set.

The **drop-count** command is used to define the number of consecutive message send attempts that must fail for the **host-unreachable** priority event to enter the set state. Each unsuccessful attempt increments the event's consecutive message drop counter. With each successful attempt, the event's consecutive message drop counter resets to zero.

If the event's consecutive message drop counter reaches the **drop-count** value, the **host-unreachable** priority event enters the set state.

The event's **hold-set** value defines how long the event must stay in the set state even when a successful message attempt clears the consecutive drop counter. The event is not cleared until the consecutive drop counter is less than the **drop-count** value and the **hold-set** timer has a value of zero (expired).

The **no** form of the command reverts to the default value.

Default

drop-count 3 — 3 consecutive ICMP echo request failures are required before the host unreachable priority control event is set.

Parameters

count

The number of ICMP echo request message attempts that must fail for the event to enter the set state. It also defines the threshold so a lower consecutive number of failures can clear the event state.

debug subscriber-mgmt vrgw brg pppoe-client brg-id dropped-only

Description

This command specifies that only packets that are dropped by the vRGW will be shown in debugging.

Default

dropped-only

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

8.273 ds1

ds1

Syntax

[**no**] **ds1** *ds1-id*

Context

[Tree] (config>port>tdm ds1)

Full Context

configure port tdm ds1

Description

Commands in this context configure digital signal level 1 (DS-1) frame parameters. The T-Carrier system was the first successful system that supported digitized voice transmission. The original transmission rate (1.544 Mb/s) in the T-1 (DS-1) line is commonly used by Internet service providers (ISPs) to connect to the Internet.

North America uses the T-Carrier system while Europe uses the E-Carrier system of transmission, using multiples of the DS- system. Digital signals are carried inside the carrier systems.

T-1 transmits DS-1-formatted data at 1.544 Mb/s through the network. The corresponding European carrier is E-1 with a data rate of 2.048 Mb/s. E-1 and T-1 (DS-1) can be interconnected for international use.

The **no** form of this command disables DS-1 capabilities.

Parameters

ds1-id

Identifies the DS-1 channel being created.

Values DS1: 1 to 28, ds1-sonet-sdh-index

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

8.274 ds3

ds3

Syntax

[**no**] **ds3** [*sonet-sdh-index*]

Context

[Tree] (config>port>tdm ds3)

Full Context

configure port tdm ds3

Description

Commands in this context configure DS-3 parameters. DS-3 lines provide a speed of 44.736 Mb/s and is also frequently used by service providers. DS-3 lines carry 28 DS-1 signals and a 44.736 Mb/s data rate.

A DS-3 connection typically supports data rates of about 43 Mb/s. A T-3 line actually consists of 672 individual channels, each supporting 64 kb/s. T-3 lines are used mainly by Service Providers to connect to the Internet backbone and for the backbone itself.

Depending on the MDA type, the DS-3 parameters must be disabled if clear channel is enabled by default (for example, on the m12-ds3 MDA). Clear channel is a channel that uses out-of-band signaling, not in-band signaling, so the channel's entire bit rate is available. Channelization must be explicitly specified. Note that if DS-3 nodes are provisioned on a channelized SONET/SDH MDA you must provision the parent STS-1 SONET/STM0 SDH path first.

North America uses the T-Carrier system while Europe uses the E-Carrier system of transmission, using multiples of the DS system. Digital signals are carried inside the carrier systems.

The **no** form of this command disables DS-3 capabilities.

Parameters

sonet-sdh-index

Specifies the components making up the specified SONET/SDH Path. Depending on the type of SONET/SDH port the *sonet-sdh-index* must specify more path indexes to specify the payload location of the path. The *sonet-sdh-index* differs for SONET and SDH ports.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

8.275 dsap

dsap

Syntax

dsap *dsap-value* [*dsap-mask*]

no dsap

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match dsap)

Full Context

configure qos sap-ingress mac-criteria entry match dsap

Description

Configures an Ethernet 802.2 LLC DSAP value or range for an ingress SAP QoS policy match criterion.

This is a 1-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

Use the **no** form of this command to remove the dsap value as the match criterion.

Default

no dsap

Parameters

dsap-value

The 8-bit dsap match criteria value in hexadecimal.

Values 0x00 to 0xFF (hex)

dsap-mask

This is optional and can be used when specifying a range of dsap values to use as the match criteria.

This 8-bit mask can be configured using the following formats:

Format Style	Format Syntax	Example
Decimal	DDD	240
Hexadecimal	0xHH	0xF0
Binary	0bBBBBBBBB	0b11110000

Values 0x00 to 0xFF (hex)

Default FF

Platforms

Syntax

dsap *dsap-value* [*dsap-mask*]

no dsap

Context

[Tree] (config>filter>mac-filter>entry>match dsap)

Full Context

configure filter mac-filter entry match dsap

Description

Configures an Ethernet 802.2 LLC DSAP value or range for a MAC filter match criterion.

This is a one-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria.

Use the **no** form of the command to remove the dsap value as the match criterion.

Default

no dsap

Parameters

dsap-value

Specifies the 8-bit dsap match criteria value which can be expressed in decimal integer, hexadecimal or binary format.

Values 0 to 255

dsap-mask

Specifies an optional parameter that may be used when specifying a range of dsap values to use as the match criteria.

This 8 bit mask can be configured using the decimal integer, hexadecimal or binary formats described in the following table.

Format Style	Format Syntax	Example
Decimal	DDD	240

Format Style	Format Syntax	Example
Hexadecimal	0xHH	0xF0
Binary	0bBBBBBBBB	0b11110000

Default 255 (exact match)
0x00 to 0xFF

Values 0 to 255

no dscp *dscp-name*

Context

[Tree] (config>router>sgt-qos dscp)

[Tree] (config>service>vprn>sgt-qos dscp)

Full Context

configure router sgt-qos dscp

configure service vprn sgt-qos dscp

Description

This command creates a mapping between the DiffServ Code Point (DSCP) of the self-generated traffic and the forwarding class.

Self-generated traffic that matches the specified DSCP will be assigned to the corresponding forwarding class. Multiple commands can be entered to define the association of some or all 64 DSCPs to the forwarding class.

All DSCP names that define a DSCP value must be explicitly defined.

The **no** form of this command removes the DSCP-to-forwarding class association.

Parameters

dscp-name

Specifies the name of the DSCP to be associated with the forwarding class. DiffServ code point can only be specified by its name and only an existing DiffServ code point can be specified. The software provides names for the well-known code points.

Values be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

fc *fc-name*

Specifies the forwarding class name. All packets with a DSCP value or MPLS EXP bit that are not defined will be placed in this forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

Platforms

All

dscp

Syntax

dscp *dscp-name*

no dscp

Context

[Tree] (config>service>vprn>if>sap>ip-tunnel dscp)

Full Context

configure service vprn interface sap ip-tunnel dscp

Description

This command sets the DSCP code-point in the outer IP header of GRE encapsulated packets associated with a particular GRE tunnel. The default, set using the **no** form of this command, is to copy the DSCP value from the inner IP header (after remarking by the private tunnel SAP egress qos policy) to the outer IP header.

Default

no dscp

Parameters

dscp

Specifies the DSCP code-point to be used.

Values be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, cp35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

dscp

Syntax

dscp in-profile *dscp-name* **out-profile** *dscp-name*

no dscp

Context

[Tree] (config>app-assure>group>policy>aqp>entry>action>remark dscp)

Full Context

configure application-assurance group policy app-qos-policy entry action remark dscp

Description

Commands in this context configure DSCP remark action or actions on flows matching this AQP entry. When enabled, all packets for all flows matching this AQP entry will be remarked to the configured DSCP name.

DSCP remark can only be applied when the entry remarks forwarding class or forwarding class and priority. In-profile and out-of profile of a given packet for DSCP remark is assessed after all AQP policing and priority remarking actions took place.

The **no** form of this command stops DSCP remarking action on flows matching this AQP entry.

Default

no dscp

Parameters

in-profile *dscp-name*

Specifies the DSCP name to use to remark in-profile flows that match this policy.

out-profile *dscp-name*

Specifies the DSCP name to use to remark out-of-profile flows that match this policy.

Values be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, cp35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

no dscp

Context

[Tree] (config>oam-pm>session>mpls dscp)

Full Context

configure oam-pm session mpls dscp

Description

This command can be used to explicitly configure the DSCP value that is carried in the DM PDU. This value is not used on the launch point or the reflector to influence the QoS behavior on the network elements. The frame itself has no IP information because it uses the General Associated Channel Header (G-Ach). The fc and profile values are used to influence QoS behavior on the launch point and the responder.

The **no** form of this command reverts the dscp carried in the DM PDU to default.

Default

dscp be

Parameters

dscp-name

Specifies the Diffserv code point name.

Values be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5,nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41,af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

Full Context

configure qos sap-ingress dscp

Description

This command explicitly sets the forwarding class or subclass or enqueuing priority when a packet is marked with the DiffServ Code Point (DSCP) value contained in the *dscp-name*. A list of up to eight dscp-names can be entered on a single command. The lists of dscp-names within the configuration are managed by the system to ensure that each list does not exceed eight names. Entering more than eight dscp-names with the same parameters (**fc**, **priority**) will result in multiple lists being created. Conversely, multiple lists with the same parameters (fc, priority) are merged and the lists repacked to a maximum of eight per list if DSCP names are removed or the parameters changed so the multiple lists use the same parameters. Also, if a subset of a list is entered with different parameters, then a new list will be created for the subset. When the list is stored in the configuration, the DSCP names are sorted by their DSCP value in ascending numerical order; consequently, the order in the configuration may not be exactly what the user entered.

Adding a DSCP rule on the policy forces packets that match the DSCP value specified to override the forwarding class and enqueuing priority based on the parameters included in the DSCP rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueuing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

The DSCP value (referred to here by *dscp-name*) is derived from the most significant six bits in the IPv4 header ToS byte field (DSCP bits) or the Traffic Class field from the IPv6 header. If the packet does not have an IP header, DSCP-based matching is not performed. The six DSCP bits define 64 DSCP values used to map packets to per-hop Quality of Service (QoS) behavior. The most significant three bits in the IP header ToS byte field are also commonly used in a more traditional manner to specify an IP precedence value, causing an overlap between the precedence space and the DSCP space. Both IP precedence and DSCP classification rules are supported.

DSCP rules have a higher match priority than IP precedence rules and where a *dscp-name* DSCP value overlaps an *ip-prec-value*, the DSCP rule takes precedence.

The **no** form of this command removes the specified the *dscp-names* from the explicit DSCP classification rule in the SAP ingress policy. As *dscp-names* are removed, the system repacks the lists of *dscp-names* with the same parameters (up to eight per list). As the **no** command does not have any additional parameters, it is possible to remove multiple *dscp-names* from multiple DSCP statements having different parameters with one command. If a *dscp-name* specified in a **no** command does not exist in any DSCP statement, then the command is aborted at that point with an error message displayed; any DSCP names in the list before the failed entry will be processed as normal but the processing will stop at the failed entry so that the remainder of the list is not processed.

Removing the *dscp-name* from the policy immediately removes the DSCP name on all ingress SAPs using the policy.

Parameters

dscp-name

The DSCP name is a required parameter that specifies the unique IP header ToS byte DSCP bits value that will match the DSCP rule. If the command is executed multiple times with the same *dscp-name*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of 64 DSCP rules are allowed on a single policy and a maximum of eight *dscp-names* can be specified in a single statement.

The specified name must exist as a *dscp-name*. SR OS software provides names for the well-known code points; these can be shown using the **show qos dscp-table** command.

fc *fc-name*

The value given for *fc-name* must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a preexisting subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (.). If *subclass-name* does not exist in the context of *fc-name*, an error will occur. If *subclass-name* is removed using the **no fc** *fc-name.subclass-name* **force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

Values

fc: *class*[.*subclass*]

class: be, l2, af, l1, h2, ef, h1, nc

subclass: 29 characters max

Default Inherit (when **fc** *fc-name* is not defined, the rule preserves the previous forwarding class of the packet).

priority

This parameter overrides the default enqueuing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueuing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueuing priority is inherited based on previous rule matches.

Default Inherits the priority defined by the default-priority statement.

high

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when

the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

Context

[Tree] (config>qos>sap-egress dscp)

Full Context

configure qos sap-egress dscp

Description

This command defines IP Differentiated Services Code Point (DSCP) names that must be matched to perform the associated reclassification actions. The specified name must exist as a DSCP name. SR OS software provides names for the well-known code points. A list of up to eight DSCP names can be entered on a single command. The lists of DSCP names within the configuration are managed by the system to ensure that each list does not exceed eight names. Entering more than eight DSCP names with the same parameters (**fc** and **profile**) results in multiple lists being created. Conversely, multiple lists with the same parameters (**fc** and **profile**) are merged and the lists repacked to a maximum of eight per list if DSCP names are removed or the parameters changed so the multiple lists use the same parameters. Also, if a subset of a list is entered with different parameters, a new list is created for the subset. When the list is stored in the configuration, the DSCP names are sorted by their DSCP value in ascending numerical order; consequently, the order in the configuration may not be exactly what the user entered.

If an egress packet on the SAP matches an IP DSCP value corresponding to a specified DSCP name, the forwarding class, profile egress queue accounting behavior may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions. Matching a DSCP-based reclassification rule will override all IP precedence-based reclassification rule actions.

The IP DSCP bits used to match against DSCP reclassification rules come from the Type of Service (ToS) field within the IPv4 header or the traffic class field from the IPv6 header. If the packet does not have an IP header, DSCP-based matching is not performed.

The reclassification actions from a DSCP reclassification rule may be overridden by an IP flow match event.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping

decisions. If an IP criteria match occurs after the DSCP match, the new forwarding class may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new fc, the fc from the dscp match will be used.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion behavior. If an IP criteria match occurs after the DSCP match, the new profile may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new profile, the profile from the DSCP match will be used.

The **no** form of this command removes the specified the *dscp-names* from the reclassification rule in the SAP egress QoS policy. As *dscp-names* are removed, the system repacks the lists of *dscp-names* with the same parameters (up to 8 per list). As the **no** command does not have any additional parameters, it is possible to remove multiple *dscp-names* from multiple DSCP statements having different parameters with one command. If a *dscp-name* specified in a **no** command does not exist in any DSCP statement, the command is aborted at that point with an error message displayed. Any *dscp-names* in the list before the failed entry will be processed as normal but the processing will stop at the failed entry so that the remainder of the list is not processed.

Parameters

dscp-name

The *dscp-name* parameter is required when defining a DSCP reclassification rule. The specified name must exist as a DSCP name. A maximum of eight DSCP names can be specified in a single statement. SR OS software provides names for the well-known code points, which can be shown using the **show qos dscp-table** command.

***fc-name*:**

The **fc** reclassification action is optional. When specified, packets matching the IP DSCP value corresponding to a specified *dscp-name* will be explicitly reclassified to the forwarding class specified as *fc-name* regardless of the ingress classification decision. The explicit forwarding class reclassification may be overwritten by an IP criteria reclassification match. The **fc** name defined must be one of the eight forwarding classes supported by the system. To remove the forwarding class reclassification action for the specified DSCP value, the **dscp** command must be re-executed without the **fc** reclassification action defined.

Values be, l1, af, l2, h1, ef, h2 or nc

counter-id

Specifies the counter ID.

profile

The profile reclassification action is optional. When specified, packets matching the IP DSCP value corresponding to a specified *dscp-name* will be explicitly reclassified to the specified profile regardless of the ingress profiling decision. The explicit profile reclassification may be overwritten by an IPv6 criteria or IP criteria reclassification match. To remove the profile reclassification action for the specified *dscp-name*, the **dscp** command must be re-executed without the profile reclassification action defined.

in

Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out

Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

exceed

Specifies that when **exceed** is specified, any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus

Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

Platforms

Full Context

configure qos sap-egress fc dscp

Description

This command configures a DSCP to be used for remarking packets from the specified FC. If the optional **exceed-profile**, **in-profile**, or **out-profile** keyword is specified, the command will remark different DSCP depending on whether the packet was classified to be exceed, in-profile, or out-of-profile ingress to the node. All inplus-profile traffic is marked with the same value as in-profile traffic.

Default

no dscp

Parameters

dscp-name

Specifies a DSCP name that has been previously mapped to a value using the **dscp-name** command. The DSCP can only be specified by its name.

Values be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, c p35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

exceed-profile *dscp-name*

This optional parameter specifies the DSCP name to be used to remark the traffic that is exceed-profile. If not specified, this defaults to the same value configured for **out-profile** parameter.

in-profile *dscp-name*

Specifies the DSCP name to be used to remark the traffic that is in-profile.

out-profile *dscp-name*

Specifies the DSCP name to be used to remark the traffic that is out-of-profile.

Context

[Tree] (config>qos>network>ingress dscp)

Full Context

configure qos network ingress dscp

Description

This command creates a mapping between the DiffServ Code Point (DSCP) of the network ingress traffic and the forwarding class.

Ingress traffic that matches the specified DSCP will be assigned to the corresponding forwarding class. Multiple commands can be entered to define the association of some or all 64 DiffServ code points to the forwarding class. For undefined code points, packets are assigned to the forwarding class specified under the **default-action** command.

The **no** form of this command removes the DiffServ code point-to-forwarding class association. The **default-action** then applies to that code point value.

Parameters

dscp-name

The name of the DiffServ code point to be associated with the forwarding class. DiffServ code point can only be specified by its name and only an existing DiffServ code point can be specified. The software provides names for the well-known code points.

The system-defined names available are as follows. The system-defined names must be referenced as all lowercase, exactly as shown in the first column in Table 27: Default DSCP Names to DSCP Value Mapping and Table 28: Default Class Selector Code Points to DSCP Value Mapping.

Additional names-to-code point value associations can be added using the '**dscp-name** *dscp-name dscp-value*' command.

The actual mapping is being done on the *dscp-value*, not the *dscp-name* that references the *dscp-value*. If a second *dscp-name* that references the same *dscp-value* is mapped within the policy, an error will occur. The second name will not be accepted until the first name is removed.

Table 27: Default DSCP Names to DSCP Value Mapping

DSCP Name	DSCP Value Decimal	DSCP Value Hexadecimal	DSCP Value Binary
nc1	48	0x30	0b110000
nc2	56	0x38	0b111000
ef	46	0x2e	0b101110
af41	34	0x22	0b100010
af42	36	0x24	0b100100
af43	38	0x26	0b100110
af31	26	0x1a	0b011010
af32	28	0x1c	0b011100
af33	30	0x1d	0b011110
af21	18	0x12	0b010010
af22	20	0x14	0b010100
af23	22	0x16	0b010110
af11	10	0x0a	0b001010
af12	12	0x0c	0b001100
af13	14	0x0e	0b001110
default	0	0x00	0b000000

Table 28: Default Class Selector Code Points to DSCP Value Mapping

DSCP Name	DSCP Value Decimal	DSCP Value Hexadecimal	DSCP Value Binary
cs7	56	0x38	0b111000
cs6	48	0X30	0b110000

DSCP Name	DSCP Value Decimal	DSCP Value Hexadecimal	DSCP Value Binary
cs5	40	0x28	0b101000
cs4	32	0x20	0b100000
cs3	24	0x18	0b011000
cs2	16	0x10	0b010000
cs1	08	0x8	0b001000

fc-name

Enter this required parameter to specify the *fc-name* with which the code point will be associated.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out}

Enter this required parameter to indicate whether the DiffServ code point value is the in-profile or out-of-profile value. For every DSCP value defined, the profile must be indicated. If a DSCP value is not mapped, the default-action forwarding class and profile state will be used for that value.

DSCP values mapping to forwarding classes Expedited (ef), High-1 (h1) and Network-Control (nc) can only be set to in-profile.

DSCP values mapping to forwarding class "be" can only be set to out-of-profile.

Full Context

configure qos network egress dscp

Description

This command configures an IP Differentiated Services Code Point (DSCP) value that must be matched to perform the associated reclassification actions. If an egress packet on an IES/VPRN interface spoke SDP, on a CSC network interface in a VPRN, or on a network interface that the network QoS policy is applied to, matches the specified IP DSCP value, the forwarding class and profile may be overridden.

By default, the forwarding class and profile of the packet are derived from ingress classification and profiling functions. Matching a DHCP-based reclassification rule will override all IP precedence-based reclassification rule actions.

The IP DSCP bits used to match against DSCP reclassification rules come from the Type of Service (ToS) field within the IPv4 header or the Traffic Class field from the IPv6 header. If the packet does not have an IP header, DSCP-based matching is not performed.

The configuration of egress DSCP classification and the configuration of an egress IP criteria or IPv6 criteria entry statement within a network QoS policy are mutually exclusive.

The IP precedence- and DSCP-based reclassification are supported on a network interface, on a CSC network interface in a VPRN, and on a PW used in an IES or VPRN spoke interface. The CLI will block the application of a network QoS policy with the egress reclassification commands to the spoke SDP part of a Layer 2 service.

Conversely, the CLI will not allow the user to add the egress reclassification commands to a network QoS policy if the policy is being used by a Layer 2 spoke SDP.

The egress reclassification commands will only take effect if the redirection of the spoke SDP or CSC interface to use an egress port queue group succeeds. For example, the following CLI command would be successful:

config>**service**>**vprn**>**if**>**spoke-sdp**>**egress**> **qos** *network-policy-id* **port-redirect-group** *queue-group-name* **instance** *instance-id*

config>**service**>**ies**>**if**>**spoke-sdp>egress**> **qos** *network-policy-id* **port-redirect-group** *queue-group-name* **instance** *instance-id*

config>service>vprn>nw-if>qos *network-policy-id* **port-redirect-group** *queue-group-name* **instance** *instance-id*

If the redirection command fails, the PW will use the network QoS policy assigned to the network IP interface, however any reclassification in the network QoS policy applied to the network interface will be ignored.

The **no** form of this command removes the egress reclassification rule.

Parameters

dscp-name

be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

fc fc-name

be, l2, af, l1, h2, ef, h1, nc

***profile* {*in* | *out* | *exceed* | *inplus*}**

The profile reclassification action is mandatory. When specified, packets matching the DSCP value will be explicitly reclassified to the profile specified regardless of the ingress profiling decision. To remove the profile reclassification action for the specified DSCP value, the **no dscp** command must be executed.

in - Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out - Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

exceed - Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus - Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

Context

[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match dscp)

[Tree] (cfg>sys>sec>cpm>ip-filter>entry>match dscp)

Full Context

configure system security cpm-filter ipv6-filter entry match dscp

configure system security cpm-filter ip-filter entry match dscp

Description

This command configures a DiffServ Code Point (DSCP) name to be used as an IP filter match criterion.

The **no** form of this command removes the DSCP match criterion.

Default

no dscp

Parameters

dscp-name

Configures a dscp name that has been previously mapped to a value using the **dscp-name** command. The DiffServ code point may only be specified by its name.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

dscp

Syntax

dscp *dscp-name*

no dscp

Context

[Tree] (config>test-oam>icmp>ping-template dscp)

Full Context

configure test-oam icmp ping-template dscp

Description

This command specifies the DSCP to be carried in the IP header. This value is not exposed to egress QoS policies. This command uses well-known DSCP names.

The **no** form of this command reverts to the default value.

Default

dscp nc1

Parameters

dscp-name

Specifies the DSCP name, up to 32 characters.

Values be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, cp35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

Platforms

dscp

Syntax

dscp *dscp-name*

Context

[Tree] (config>test-oam>link-meas>template>twl dscp)

Full Context

configure test-oam link-measurement measurement-template twamp-light dscp

Description

This command configures the DSCP to be copied into the IP header of each TWAMP Light echo request packet launched for the test.

Default

dscp nc1

Parameters

dscp-name

Specifies the DSCP code point to be used.

Values be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

Platforms

8.277 dscp-in-profile

dscp-in-profile

Syntax

dscp-in-profile *dscp-name*

no dscp-in-profile

Context

[Tree] (config qos network egress fc dscp-in-profile)

Full Context

configure qos network egress fc dscp-in-profile

Description

This command specifies the in-profile DSCP name for the forwarding class. The corresponding DSCP value will be used for all IP packets that require marking at egress on this forwarding class queue, and that are in-profile. The inplus-profile traffic is marked with the same value as in-profile traffic.

When multiple DSCP names are associated with the forwarding class at network egress, the last name entered will overwrite the previous value.

The **no** form of this command resets the configuration to the factory default in-profile DSCP name setting for *policy-id* 1.

Parameters

dscp-name

Specifies the system- or user-defined, case-sensitive *dscp-name.*

Values Any defined system- or user-defined *dscp-name*

Platforms

All

8.278 dscp-out-profile

dscp-out-profile

Syntax

dscp-out-profile *dscp-name*

no dscp-out-profile

Context

[Tree] (config qos network egress fc dscp-out-profile)

Full Context

configure qos network egress fc dscp-out-profile

Description

This command specifies the out-of-profile DSCP name for the forwarding class. The corresponding DSCP value will be used for all IP packets requiring marking the egress on this forwarding class queue that are out-of-profile. The exceed-profile traffic is marked with the same value as out-of-profile traffic.

When multiple DSCP names are associated with the forwarding class at network egress, the last name entered will overwrite the previous value.

The **no** form of this command resets the configuration to the factory default out-of-profile DSCP name setting for *policy-id* 1.

Default

Policy-id 1:	Factory setting
Policy-id 2 to 65535:	Policy-id setting

Parameters

dscp-name

Specifies the system- or user-defined, case-sensitive *dscp-name.*

Values Any defined system- or user-defined *dscp-name*

Platforms

All

8.279 dslite-lsn-sub

dslite-lsn-sub

Syntax

[**no**] **dslite-lsn-sub router** *router-instance* **b4** *ipv6-prefix*

Context

[Tree] (config>li>li-source>nat dslite-lsn-sub)

Full Context

configure li li-source nat dslite-lsn-sub

Description

This command configures the Dual-Stack Lite LSN subscriber source.

The **no** form of this command removes the value from the configuration.

Parameters

router-instance

Specifies the router instance the pool belongs to, either by router name or service ID.

Values *router-name*: "Base" or "management"

Default Base

ipv6-prefix

Specifies the IPv6 address.

Values

ipv6-prefix:	<prefix>/<length>
prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x to [0 to FFFF]H
	d to [0 to 255]D
<length>	[0 to 128]

Platforms

8.280 dslite-max-subscriber-limit

dslite-max-subscriber-limit

Syntax

dslite-max-subscriber-limit *max*

no dslite-max-subscriber-limit

Context

[Tree] (config>router>nat>inside>dslite dslite-max-subscriber-limit)

[Tree] (config>service>vprn>nat>inside dslite-max-subscriber-limit)

Full Context

configure router nat inside dslite dslite-max-subscriber-limit

configure service vprn nat inside dslite-max-subscriber-limit

Description

This command sets the value for the number of high order bits of the source IPv6 address that will be considered as DS-Lite subscriber. The remaining bits of the source IPv6 address will be masked off, effectively aggregation all IPv6 source addresses under the configured prefix length into a single DS-Lite subscriber. Source IPv4 addresses/ports of the traffic carried within the DS-Lite subscriber will be translated into a single outside IPv4 address and the corresponding deterministic port-block (port-blocks can be extended).

The range of values for subscriber-prefix-length in non-deterministic DS-Lite is limited from 32 to 64 (a prefix will be considered as a DS-Lite subscriber) or it can be set to a value of 128 (the source IPv6 address is considered as a DS-Lite subscriber).

In cases where deterministic DS-Lite is enabled in a giver inside routing context, the range of values of the subscriber-prefix-length depends on the value of dslite-max-subscriber-limit parameter as follows:

subscriber-prefix-length – n = [32..64,128]

where n = log2(dslite-max-subscriber-limit)

[or in an alternate form: dslite-max-subscriber-limit = 2^n.]

In other words the largest prefix length for the deterministic DS-Lite subscriber will be 32+n, where n = log2(dslite-max-subscriber-limit). The subscriber prefix length can extend up to 64 bits. Beyond 64 bits for the subscriber prefix length, there only one value is allowed: 128. In the case n must be 0, which means that the mapping between B4 elements (or IPv6 address) and the IPv4 outside addresses is in 1:1 ratio (no sharing of outside IPv4 addresses).

This parameter can be changed only when there are no deterministic prefixes configured in the same routing context.

Default

128

Parameters

max

In non-deterministic DS-Lite this value can be 32 to 64,128, assuming that the deterministic DS-Lite is not concurrently enabled in the same inside routing context.

In case that deterministic DS-Lite is enabled, this value can be within the range [(32+n)..64,128] where n = log2(dslite-max-subscriber-limit). The value of 128 is allowed only when n=0 (each subscriber is mapped to a single outside IPv4 IP address).

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt dsm-ip-filter

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt dsm-ip-filter

Description

This command configures an IP filter that is distributed on ISA cards.

This command specifies the IP filter applied to all UEs corresponding to default vlan-range (such as a group-interface) or the specified vlan-range. The IP filter can be created in the **config>subscr-mgmt>isa-filter** context, and can contain up to 1024 match entries. The IP filter can be overridden per UE from RADIUS via access-accept or COA.

The **no** form of this command reverts to the default.

Parameters

dsm-ip-filter-name

Specifies the identifier of the distributed-sub-mgmt IP filter.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

8.283 dsm-subscriber

dsm-subscriber

Syntax

[**no**] **dsm-subscriber mac** *mac-address*

Context

[Tree] (config>li>li-source>wlan-gw dsm-subscriber)

Full Context

configure li li-source wlan-gw dsm-subscriber

Description

This command configures the DSM UE source.

Parameters

mac-address

Specifies the MAC address.

Values mac-addr: xx:xx:xx:xx:xx:xx **example:** 00:0c:f1:99:85:b8
or XX:XX:XX:XX:XX:XX **example:** 00-0C-F1-99-85-B8

configure router mpls lsp transit-path reverse-path mip dsmap

configure router mpls lsp transit-path forward-path mip dsmap

configure router mpls lsp protect-tp-path mep dsmap

Description

This command is used to configure the values to use in the DSMAP TLV sent by a node in an LSP Trace echo request for a static MPLS-TP LSP. A node sending a DSMAP TLV will include the in-if-num and out-if-num values. Additionally, it will include the out-label for the LSP in the Label TLV for the DSMAP in the echo request message.

The **no** form of this command equals to a value 0 (this means no interface validation will be performed).

Default

no dsmap

Parameters

if-num

This is a 32-bit value corresponding to the expected ingress interface if-num used by an MPLS-TP LSP for the next hop downstream.

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries entry match dst-ip

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries entry match dst-ip

Description

This command configures the destination IP match condition.

The **no** form of this command reverts to the default.

Parameters

ip-address/mask

Specifies the IPv4 address and mask.

Values

ip-address	a.b.c.d
mask	0 to 32

netmask

Specifies the mask, expressed as a dotted quad.

Values a.b.c.d

ipv6-address

Specifies the IPv6 address (applies only to the 7750 SR).

Values

ipv6-address	x:x:x:x:x:x:x:x (where x is [0 to FFFF]H)
	:x:x:x:x:x:d.d.d.d (where d is [0 to 255]D)

prefix-length

Specifies the prefix length (applies only to the 7750 SR).

Values 1 to 128

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>subscr-mgmt>http-rdr-plcy>fwd-entries dst-ip)

Full Context

configure subscriber-mgmt http-redirect-policy forward-entries dst-ip

Description

This command configures traffic flow to be forwarded via match in the redirect policy.

Parameters

ip-address

Specifies the IPv4 or IPv6 address to match the destination address in the IP header of the traffic received from the subscriber.

prefix-length

Specifies the length of the prefix specified by the ip-address.

Values 1 to 128 for IPv6
1 to 32 for IPv4

ip-protocol

Specifies the protocol to match the IP protocol in the IP header of the traffic received from the subscriber.

Values tcp, udp

port-number

Specifies the port to match the destination port in the HTTP request.

Values 1 to 65535

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

dst-ip

Syntax

dst-ip {**eq** | **neq**} *ip-address*

[Tree] (config>app-assure>group>policy>aqp>entry>match dst-ip)

Full Context

configure application-assurance group policy app-qos-policy entry match dst-ip

Description

This command specifies a destination IP address to use as match criteria.

Default

no dst-ip

Parameters

eq

Specifies that a successful match occurs when the flow matches the specified address or prefix.

neq

Specifies that a successful match occurs when the flow does not match the specified address or prefix.

ip-address

Specifies a valid unicast address.

Values

ipv4-address	a.b.c.d[/mask]
	mask - [1..32]
ipv6-address	x:x:x:x:x:x:x:x/prefix-length
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
	prefix-length [1..128]

ip-prefix-list-name

Specifies the name of an IP prefix list, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure li li-filter li-ip-filter entry match dst-ip

Description

This command configures destination IP address LI filter match criterion.

The **no** form of this command removes any configured destination IP address. The match criterion is ignored.

Parameters

ip-address

Specifies any address specified as dotted quad.

Values a.b.c.d

mask

Specifies eight 16-bit hexadecimal pieces representing bit match criteria.

Values 1 to 32

ipv4-address-mask

Specifies a mask expressed in dotted quad notation.

Values 0.0.0.0 to 255.255.255.255

Platforms

All

dst-ip

Syntax

dst-ip {*ipv6-address*/*prefix-length* | *ipv6-address ipv6-address-mask*}

no dst-ip

Context

[Tree] (config>li>li-filter>li-ipv6-filter>entry>match dst-ip)

Full Context

configure li li-filter li-ipv6-filter entry match dst-ip

Description

This command configures destination IPv6 address LI filter match criterion.

The **no** form of this command removes any configured destination IPv6 address. The match criterion is ignored.

Parameters

ipv6-address

Specifies any IPv6 address entered as:.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

prefix-length

Specifies the prefix length.

Values 1 to 128

ipv6-address-mask

Specifies any IPv6 address mask expressed as:

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

[Tree] (config>qos>sap-ingress>ip-criteria>entry>match dst-ip)

Full Context

configure qos sap-egress ip-criteria entry match dst-ip

configure qos sap-ingress ip-criteria entry match dst-ip

Description

This command configures a destination address range to be used as a SAP QoS policy match criterion.

To match on the IPv4 destination address, specify the address and its associated mask, e.g., 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the destination IPv4 address match criterion.

Default

no dst-ip

Parameters

ip-address

Specifies the destination IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

prefix-list-name

Specifies the IPv4 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms

All

dst-ip

Syntax

dst-ip {*ipv6-address/prefix-length* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *ipv6-prefix-list-name*}

no dst-ip

Context

Full Context

configure qos sap-ingress ipv6-criteria entry match dst-ip

configure qos sap-egress ipv6-criteria entry match dst-ip

Description

This command configures a destination address range to be used as a SAP QoS policy match criterion.

To match on the IPv6 destination address, specify the address and its associated mask, e.g. 2001:db8:1000::/64.

The **no** form of this command removes the destination IPv6 address match criterion.

Default

no dst-ip

Parameters

ipv6-address

Specifies the IPv6 address for the IP match criterion in hexadecimal digits (applies to the 7750 SR and 7950 XRS).

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

prefix-length

Specifies the IPv6 prefix length for the IPv6 address expressed as a decimal integer (applies to the 7750 SR and 7950 XRS).

Values 1 to 128

ipv6-address-mask

Specifies the IPv6 address mask.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

ipv6-prefix-list-name

Specifies the IPv6 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms

Full Context

configure qos network egress ipv6-criteria entry match dst-ip

configure qos network egress ip-criteria entry match dst-ip

Description

This command configures a destination address range to be used as a network QoS policy match criterion.

To match on the destination address, specify the address and its associated mask, for example, when specifying an IPv4 address, 10.1.0.0/16 or 10.1.0.0 255.255.0.0 can be used.

The **no** form of this command removes the destination IP address match criterion.

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ipv6-address

Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

d: [0 to 255]D

mask

Specifies the length of the IPv6 address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

Platforms

All

dst-ip

Syntax

dst-ip {*ip-address/mask* | *ip-address ipv4-address-mask* | **ip-prefix-list** *ip-prefix-list-name*}

dst-ip {*ipv6-address/mask* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *ipv6-prefix-list-name*}

configure qos network ingress ip-criteria entry match dst-ip

Description

This command configures a destination address range to be used as a network QoS policy match criterion.

To match on the destination address, specify the address and its associated mask, for example, when specifying an IPv4 address, 10.1.0.0/16 or 10.1.0.0 255.255.0.0 can be used.

The **no** form of this command removes the destination IP address match criterion.

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-list-name

Specifies an IPv4 prefix list which contains IPv4 address prefixes to be matched. IP prefix lists are only supported at a network ingress.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

mask

Specifies the length of the IPv6 address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

ipv6-prefix-list-name

Specifies an IPv6 prefix list which contains IPv6 address prefixes to be matched. IPv6 prefix lists are only supported at a network ingress.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms

All

dst-ip

Syntax

IPv4:

dst-ip {*ip-address/mask* | *ip-address ipv4-address-mask* | **ip-prefix-list** *prefix-list-name*}

IPv6:

dst-ip {*ipv6-address/prefix-length* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *prefix-list-name*}

Full Context

configure filter ipv6-filter entry match dst-ip

configure filter ip-exception entry match dst-ip

configure filter ip-filter entry match dst-ip

configure filter ipv6-exception entry match dst-ip

Description

This command configures a destination address range to be used as a filter policy match criterion.

To match on the destination address, specify the address and its associated mask, e.g., 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the destination IPv4 or IPv6 address match criterion.

Default

no dst-ip

Parameters

ip-address

Specifies the destination IPv4 address in dotted decimal notation.

Values a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-listor ipv6-prefix-list prefix-list-name

Specifies to use a list of IP prefixes referred to by *prefix-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0..FFFF]H
d: [0..255]D

prefix-length

Specifies the IPv6 prefix length for the *ipv6-address* as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0..FFFF]H
d: [0..255]D

configure system security cpm-filter ip-filter entry match dst-ip

Description

This command configures a destination IP address range to be used as an IP filter match criterion.

To match on the destination IP address, specify the address and its associated mask, for example, 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 may also be used.

The **no** form of this command removes the destination IP address match criterion.

Default

no dst-ip

Parameters

ip-address

Specifies the IP address for the IP match criterion in dotted decimal notation.

Values 0.0.0.0 **to** 255.255.255.255

ip-prefix-list

Creates a list of IPv4 prefixes for match criteria in IPv4 ACL and CPM filter policies.

ip-prefix-list-name

A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

mask

Specifies the subnet mask length expressed as a decimal integer.

Values 1 to 32

netmask

Specifies the dotted quad equivalent of the mask length.

Values 0.0.0.0 to 255.255.255.255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

dst-ip

Syntax

dst-ip [*ipv6-address /prefix-length*] [**ipv6-prefix-list** *ipv6-prefix-list-name*]

no dst-ip

Context

[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match dst-ip)

Full Context

configure system security cpm-filter ipv6-filter entry match dst-ip

Description

This command configures a destination IPv6 address range to be used as an IPv6 filter match criterion.

To match on the destination IPv6 address, specify the address.

The **no** form of this command removes the destination IP address match criterion.

This command only applies to the 7750 SR and 7950 XRS.

Default

no dst-ip

Parameters

ipv6-address/prefix-length

Specifies the IPv6 address for the IPv6 match criterion in dotted decimal notation. An IPv6 IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:0:217A.

Values

x:x:x:x:x:x:x:x (eight 16-bit pieces)		
x:x:x:x:x:x:d.d.d.d		
	x:	[0 to .FFFF]H
	d:	[0 to 255]D
prefix-length:	1 to 128	

ipv6-prefix-list

Creates a list of IPv4 prefixes for match criteria in IPv4 ACL and CPM filter policies.

ipv6-prefix-list-name

Specifies a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms

dst-mac

Syntax

dst-mac *ieee-address* [*ieee-address-mask*]

no dst-mac

Context

[Tree] (config>li>li-filter>li-mac-filter>entry>match dst-mac)

Full Context

configure li li-filter li-mac-filter entry match dst-mac

Description

This command configures a destination MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the destination mac address as the match criterion.

Parameters

ieee-address

Specifies the 48-bit IEEE mac address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

Specifies a 48-bit mask that can be configured using:

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure so that all packets with a destination MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFF000000

Default **0xFFFFFFFFFFFF** (exact match)

Values 0x00000000000000 — 0xFFFFFFFFFFFF

Platforms

All

Syntax

dst-mac *ieee-address* [*ieee-address-mask*]

no dst-mac

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match dst-mac)

Full Context

configure qos sap-ingress mac-criteria entry match dst-mac

Description

Configures a destination MAC address or range to be used as a Service Ingress QoS policy match criterion.

The **no** form of this command removes the destination MAC address as the match criterion.

Default

no dst-mac

Parameters

ieee-address

The MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

A 48-bit mask to match a range of MAC address values.

This 48-bit mask can be configured using the following formats:

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0xFFFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

All packets with a source MAC OUI value of 00-03-FA, subject to a match condition, should be specified as: 0003FA000000 0x0FFFFF000000

Values 0x00000000000000 to 0xFFFFFFFFFFFF (hex)

Default 0xFFFFFFFFFFFF

Platforms

All

Syntax

dst-mac *ieee-address* [*ieee-address-mask*]

no dst-mac

Context

[Tree] (config>filter>mac-filter>entry>match dst-mac)

Full Context

configure filter mac-filter entry match dst-mac

Description

Configures a destination MAC address or range to be used as a MAC filter match criterion.

The **no** form of the command removes the destination mac address as the match criterion.

Default

no dst-mac

Parameters

ieee-address

Specifies the MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit. Note that both upper and lower case are supported.

ieee-address-mask

Specifies a 48-bit mask to match a range of MAC address values.

To configure so that all packets with a destination MAC OUI value of 00:03:FA are subject to a match condition then the entry should be specified as: 00:03:FA:00:00:00 FF:FF:FF:00:00:00.

Default ff:ff:ff:ff:ff:ff (exact match)

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH

where H is a hexadecimal digit. to 0xFFFFFFFFFFFF

Note that both upper and lower case are supported.

Full Context

configure subscriber-mgmt isa-filter entry match dst-port

configure subscriber-mgmt isa-filter ipv6 entry match dst-port

Description

This command specifies that the packet's UDP/TCP dst-port must match a specific value. This command is not valid in a match context that is not specific to UDP or TCP.

The **no** form of this command removes matching of the layer-4 port.

Parameters

operator

Specifies that the only supported value is eq (equal to). The destination port value must be equal to the *port-number* value.

port-number

Specifies the number of the port to match.

Values 0 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dst-port

Syntax

dst-port *tcp-port*

no dst-port

Context

[Tree] (config>subscr-mgmt>http-rdr-plcy dst-port)

Full Context

configure subscriber-mgmt http-redirect-policy dst-port

Description

This command specifies the port to match the destination port in the HTTP request.

HTTP traffic that does not match this port, is not redirected.

The **no** form of this command reverts to the default.

Default

dst-port 80

Parameters

tcp-port

Specifies the TCP port.

Values 1 to 65535

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

dst-port

Syntax

dst-port {**eq** | **neq**} *port-num*

configure application-assurance group policy app-qos-policy entry match dst-port

Description

This command specifies a destination TCP/UDP port, destination port list, or destination range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

Default

no dst-port

Parameters

eq

Specifies that a successful match occurs when the flow matches the specified port.

neq

Specifies that a successful match occurs when the flow does not match the specified port.

port-num

Specifies the destination port number.

Values 0 to 65535

start-port-num end-port-num

Specifies the start or end destination port number.

Values 0 to 65535

port-list-name

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

dst-port

Syntax

configure application-assurance group session-filter entry match dst-port

Description

This command specifies a destination TCP/UDP port, destination port list, or destination range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

Default

no dst-port

Parameters

eq

Specifies that a successful match occurs when the flow matches the specified port.

gt

Specifies all port numbers greater than the port-number match.

lt

Specifies all port numbers less than the port-number match.

port-num

Specifies the destination port number.

Values 0 to 65535

start-port-num end-port-num

Specifies the start or end destination port number.

Values 0 to 65535

port-list-name

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure li li-filter li-ipv6-filter entry match dst-port

configure li li-filter li-ip-filter entry match dst-port

Description

This command configures a destination TCP or UDP port number or port range for an IP LI filter match criterion. Note that an entry containing Layer 4 match criteria will not match non-initial (second, third, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the destination port match criterion.

Parameters

lt

Specifies all port numbers less than *dst-port-number* match.

gt

Specifies all port numbers greater than *dst-port-number* match.

eq

Specifies that *dst-port-number* must be an exact match.

dst-port-number

Specifies an inclusive range of port numbers to be used as a match criteria. The destination port numbers *start-port* and *end-port* are expressed as decimal integers.

Values [0..65535]D
[0x0..0xFFFF]H
[0b0..0b1111111111111111]B

configure qos network ingress ipv6-criteria entry match dst-port

configure qos network ingress ip-criteria entry match dst-port

configure qos network egress ipv6-criteria entry match dst-port

configure qos network egress ip-criteria entry match dst-port

Description

This command configures a destination TCP or UDP port number, port range, or a port list for a network QoS policy match criterion.

The **no** form of this command removes the destination port match criterion.

Parameters

lt

Keyword used to specify TCP or UDP port numbers to match that are less than the destination port value.

gt

Keyword used to specify TCP or UDP port numbers to match that are greater than the destination port value.

eq

Keyword used to specify TCP or UDP port numbers to match that are equal to the destination port value.

dst-port-number

Specifies the TCP or UDP port numbers to match, specified as less than (lt), greater than (gt), or equal to (eq) the destination port value, specified as a decimal integer.

Values 1 to 65535

port-list-name

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

start

Specifies the starting range of TCP or UDP port values to match.

Values 1 to 65535

end

Specifies the end range of TCP or UDP port values to match.

Values 1 to 65535

Platforms

All

dst-port

Syntax

dst-port {**lt** | **gt** | **eq**} *dst-port-number*

dst-port port-list *port-list-name*

dst-port range *dst-port-number dst-port-number*

no dst-port

Full Context

configure filter ipv6-exception entry match dst-port

configure filter ip-exception entry match dst-port

configure filter ipv6-filter entry match dst-port

configure filter ip-filter entry match dst-port

Description

This command configures a destination TCP, UDP, or SCTP port number or port range for an IP filter or IP exception match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing the "**dst-port eq** 0" match criterion, may match non-initial fragments when the destination port value is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the destination port match criterion.

Default

no dst-port

Parameters

lt

Specifies that all port numbers less than the *dst-port-number* match.

gt

Specifies that all port numbers greater than the *dst-port-number* match.

eq

Specifies that the *dst-port-number* must be an exact match.

dst-port-number

Specifies the destination port number to be used as a match criteria expressed as a decimal integer, as well as in hexadecimal or binary format. The following value is for decimal integer format only.

Values 0 to 65535

port-list-name

Specifies to use a list of ports referred to by *port-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

dst-port-number dst-port-number

Specifies inclusive port range between two *dst-port-number* values.

Platforms

VSR

- configure filter ip-exception entry match dst-port

configure system security management-access-filter ipv6-filter entry dst-port

configure system security management-access-filter ip-filter entry dst-port

Description

This command configures a destination TCP or UDP port number or port range for a management access filter match criterion.

The **no** form of this command removes the destination port match criterion.

Parameters

value

Specifies the destination TCP or UDP port number as match criteria.

Values 1 **to** 65535 (decimal)

mask

Specifies the mask used to specify a range of destination port numbers as the match criterion.

This 16 bit mask can be configured using the formats described in Table 29: Format Styles to Configure Mask:

Table 29: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDD	63488
Hexadecimal	0xHHHH	0xF800
Binary	0bBBBBBBBBBBBBBBB	0b1111100000000000

To select a range from 1024 up to 2047, specify 1024 0xFC00 for value and mask.

Default **65535** (exact match)

Values 1 to 65535 (decimal)

Full Context

configure system security cpm-filter ip-filter entry match dst-port

configure system security cpm-filter ipv6-filter entry match dst-port

Description

This command specifies the TCP/UDP port or port name to match the destination-port of the packet.

Note:
An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the destination port match criterion.

Default

no dst-port

Parameters

tcp/udp port-number

Specifies the destination port number to be used as a match criteria expressed as a decimal integer.

Values 0 to 65535 (accepted in decimal hex or binary)

port-list-name

Specifies the port list name to be used as a match criteria for the destination port.

mask

Specifies the 16 bit mask to be applied when matching the destination port.

Values [0x0000 to 0xFFFF] | [0 to 65535] | [0b0000000000000000 to 0b1111111111111111]

8.294 dst-zone

dst-zone

Syntax

[**no**] **dst-zone** {*std-zone-name* | *non-std-zone-name*}

Context

[Tree] (config>system>time dst-zone)

Full Context

configure system time dst-zone

Description

This command configures the start and end dates and offset for summer time or daylight savings time to override system defaults or for user defined time zones.

When configured, the time is adjusted by adding the configured offset when summer time starts and subtracting the configured offset when summer time ends.

If the time zone configured is listed in the Time Zones section, then the starting and ending parameters and offset do not need to be configured with this command unless it is necessary to override the system defaults. The command returns an error if the start and ending dates and times are not available either the Time Zones section on or entered as optional parameters in this command.

Up to five summer time zones may be configured, for example, for five successive years or for five different time zones. Configuring a sixth entry will return an error message. If no summer (daylight savings) time is supplied, it is assumed no summer time adjustment is required.

The **no** form of the command removes a configured summer (daylight savings) time entry.

Parameters

std-zone-name

Specifies the standard time zone name. The standard name must be a system-defined zone in the Time Zones section. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining **start-date**, **end-date** and **offset** parameters need to be provided unless it is necessary to override the system defaults for the time zone.

Values ADT, NDT, AKDT, CDT, CEST, EDT, EEST, MDT, NZDT, PDT, WEST

non-std-zone-name

Specifies the non-standard time zone name. Create a user-defined name created using the zone. The name can be a maximum of 5 characters in length.

dup-detect anti-spoof-mac *mac-address* **window** *minutes* **num-moves** *count* **hold-down** [*minutes* | **max**] [**static-black-hole**]

Context

[Tree] (config>service>vpls>proxy-nd dup-detect)

[Tree] (config>service>vpls>proxy-arp dup-detect)

Full Context

configure service vpls proxy-nd dup-detect

configure service vpls proxy-arp dup-detect

Description

This command enables a mechanism that detects duplicate IPs and ARP/ND spoofing attacks. Attempts (relevant to dynamic and EVPN entry types) to add the same IP (different MAC) are monitored for **window** <*minutes*>. When <*count*> is reached within that **window**, the proxy-ARP/ND entry for the suspected IP is marked as duplicate. An alarm is also triggered. This condition is cleared when **hold-down** time expires (max does not expire) or a **clear** command is issued.

If the **anti-spoof-mac** is configured, the proxy-ARP/ND offending entry's MAC is replaced with this <*mac-address*> and advertised in an unsolicited GARP/NA for local SAP/SDP-bindings, and in EVPN to remote PEs. This mechanism assumes that the same **anti-spoof-mac** is configured in all the PEs for the same service and that traffic with destination **anti-spoof-mac** received on SAPs/SDP-bindings will be dropped. An ingress **mac-filter** may be configured to drop traffic to the **anti-spoof-mac**.

The **anti-spoof-mac** can also be combined with the **static-black-hole** option. To use a black-hole MAC entry for the **anti-spoof-mac** function in a proxy-ARP/ND service, the following must be configured:

- **static-black-hole** option for the **anti-spoof-mac**
- a static black-hole MAC using the same MAC address used for the **anti-spoof-mac: static-mac mac** <*mac-address*> **create black-hole** command.

When both **anti-spoof-mac** and **static-black-hole** commands are configured, the MAC is advertised in EVPN as Static. Locally, the MAC will be shown in the FDB as CStatic and associated with a black-hole.

The combination of the **anti-spoof-mac** and the **static-black-hole** options ensures that any frame arriving in the system with MAC DA=**anti-spoof-mac** will be discarded, regardless of the ingress endpoint type (SAP/SDP-binding or EVPN) and without the need for a filter.

If the user wants to redirect the traffic with MAC DA=**anti-spoof-mac** instead of discarding it, redirect filters should be configured on SAPs/SDP-bindings instead of the **static-black-hole** option.

If the **static-black-hole** option is not configured for the **anti-spoof-mac**, the behavior is as follows:

- The **anti-spoof-mac** is not programmed in the FDB.
- Any attempt to add a Static MAC (or any other MAC) with the **anti-spoof-mac** value will be rejected by the system.
- A mac-filter is needed to discard traffic with MAC DA=**anti-spoof-mac**.

Any changes to the configuration of **anti-spoof-mac** require proxy-arp or proxy-nd to first be shut down. Refer to "ARP/ND Snooping and Proxy Support" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Layer 2 Services and EVPN Guide: VLL, VPLS, PBB, and EVPN* for more information.

Default

dup-detect window 3 num-moves 5 hold-down 9

Parameters

window *minutes*

Specifies the window size in minutes.

Values 1 to 15

Default 3

count

Specifies the number of moves required so that an entry is declared duplicate.

Values 3 to 10

Default 5

hold-down *minutes*

Specifies the hold-down time for a duplicate entry.

Values 2 to 60

Default 9

hold-down max

Specifies permanent hold-down time for a duplicate entry.

mac-address

Specifies the optional anti-spoof-mac to use.

configure port ethernet efm-oam peer-rdi-rx dying-gasp

Description

This command defines how to react to the reception of a dying gasp Flag field set in the informational OAMPDU.

Default

dying-gasp local-port-action out-of-service

Parameters

local-port-action

Defines whether or not the local port will be affected when a dying gasp event is received from a peer.

log-only

Keyword that prevents the port from being affected when the local peer receives a dying gasp. The dying gasp will be logged but the port will remain operational.

out-of-service

Keyword that causes the port to enter a non-operation down state with a port state of link up. The error will be logged upon reception of dying gasp. The port will not be available to service data but will continue to carry Link OAM traffic to ensure the link is monitored.

Full Context

configure port ethernet efm-oam dying-gasp-tx-on-reset

configure system ethernet efm-oam dying-gasp-tx-on-reset

Description

This command enables generation of the Information OAM PDU off-cycle when the soft reset notification is received by the EFM application. The local port state remains under the control of the Soft Reset application and does not change based on this EFM function. If the port is operationally up then the local node will continue to consider the port as available for service data and forwarding. If the upstream node requires notification to route around the local node undergoing the soft reset, notification must be sent to those nodes. This is a disruptive function.

This command is disabled by default at the system level and enabled by default at the port level. The combination of the system-level and port-level configuration determines if the dying gasp on soft reset function is active on individual ports. Both the system-level and port-level commands must be enabled in order to support generation of the Information OAM PDU for soft reset. If either is disabled, dying gasp is not active on those ports. This functionality must be enabled prior to the soft reset.

When both **grace-tx-enable** and **dying-gasp-tx-on-reset** are active on the same port, **grace-tx-enable** takes precedence when a soft reset is invoked if the Peer Vendor OUI being received is 00:16:4d (ALU) or the configured **config>port>ethernet>efm-oam grace-vendor-oui** value. The **grace-tx-enable** command should not be configured if the Nokia Vendor Specific Grace TLV is not supported on the remote peer, including Nokia 7750 SR equipment prior to release 11.0 R4.

Default

Context

[Tree] (config>service>vpls>proxy-arp dynamic)

[Tree] (config>service>vpls>proxy-nd dynamic)

Full Context

configure service vpls proxy-arp dynamic

configure service vpls proxy-nd dynamic

Description

This command creates a dynamic IP that can be associated to a MAC list. The configured dynamic IP is only converted to a dynamic entry when the resolve process for the IP has passed successfully.

A summary of the IP resolution process is as follows:

- A resolve message is sent for the configured IP as soon as the dynamic IP is configured. The message is sent with a configurable frequency of 1 to 60 minutes (using the **resolve** command); the default value is 5 minutes. The actual resolve interval is a "tittered" value of the configured interval.
- The resolve message is an ARP-request or NS message flooded to all the non-EVPN endpoints in the service, irrespective of the status of the **unknown-arp-request-flood-evpn** or **unknown-ns-flood-evpn** commands. The router sends resolve messages at the configured frequency until a dynamic entry for the IP is created in the proxy-ARP or proxy-ND table. The IP entry is created only if all of the following conditions are true.
  - An ARP, GARP, or NA message is received for the configured IP.
  - The associated MAC exists in the configured MAC list for the IP.

    If the MAC list is empty or not configured, the router does not create an entry for the IP.
- After a dynamic entry is created in the proxy-ARP or proxy-ND table, the IP->MAC entry is advertised in the EVPN.

The **no** form of the command deletes the dynamic IP and the associated proxy-ARP or proxy-ND entry, if it exists.

Parameters

ip-address

Specifies the IPv4 or IPv6 address.

Values ip-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

Syntax

[**no**] **dynamic-cost**

Context

[Tree] (config>lag dynamic-cost)

Full Context

configure lag dynamic-cost

Description

This command enables OSPF or ISIS costing of a Link Aggregation Group (LAG) based on the available aggregated, operational bandwidth.

The path cost is dynamically calculated based on the interface bandwidth. OSPF path cost can be changed through the interface metric or the reference bandwidth.

If dynamic cost is configured, then costing is applied based on the total number of links configured and the cost advertised is inversely proportional to the number of links available at the time. This is provided that the number of links that are up exceeds the configured LAG threshold value at which time the configured threshold action determines if, and at what cost, this LAG will be advertised.

For example: Assume a physical link in OSPF has a cost associated with it of 100, and the LAG consists of four physical links. The cost associated with the logical link is 25. If one link fails then the cost would automatically be adjusted to 33.

If dynamic cost is not configured and OSPF autocost is configured, then costing is applied based on the total number of links configured. This cost will remain static provided the number of links that are up exceeds the configured LAG threshold value at which time the configured threshold action determines if and at what cost this LAG will be advertised.

If dynamic-cost is configured and OSPF autocost is not configured, the cost is determined by the cost configured on the OSPF metric provided the number of links available exceeds the configured LAG threshold value at which time the configured threshold action determines if this LAG will be advertised.

If neither dynamic-cost nor OSPF autocost are configured, the cost advertised is determined by the cost configured on the OSPF metric provided the number of links available exceeds the configured LAG threshold value at which time the configured threshold action determines if this LAG will be advertised.

The **no** form of this command removes dynamic costing from the LAG.

Default

no dynamic-cost

Platforms

[Tree] (config>service>vprn>bgp-ipvpn>mpls dynamic-egress-label-limit)

[Tree] (config>service>epipe>bgp-evpn>mpls dynamic-egress-label-limit)

Full Context

configure service vprn bgp-evpn mpls dynamic-egress-label-limit

configure service vpls bgp-evpn mpls dynamic-egress-label-limit

configure service vprn bgp-ipvpn mpls dynamic-egress-label-limit

configure service epipe bgp-evpn mpls dynamic-egress-label-limit

Description

This command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table.

For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed.

For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES.

The **no** form of this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.

Default

no dynamic-egress-label-limit

Platforms

All

8.309 dynamic-enforcement-policer-pool

dynamic-enforcement-policer-pool

Syntax

[**no**] **dynamic-enforcement-policer-pool** *number-of-policers*

Context

[Tree] (config>card>fp>ingress>dist-cpu-protection dynamic-enforcement-policer-pool)

Full Context

configure card fp ingress dist-cpu-protection dynamic-enforcement-policer-pool

Description

This command reserves a set of policers for use as dynamic enforcement policers for the Distributed CPU Protection (DCP) feature. Policers are allocated from this pool and instantiated as per-object-per-

protocol dynamic enforcement policers after a local monitor is triggered for an object (such as a SAP or Network Interface). Any change to this configured value automatically clears the high water mark, timestamp, and failed allocation counts as seen under "show card x fp y dist-cpu-protection" and in the tmnxFpDcpDynEnfrcPlcrStatTable in the TIMETRA-CHASSIS-MIB. Decreasing this value to below the currently used/allocated number causes all dynamic policers to be returned to the free pool (and traffic returns to the local monitors).

Default

no dynamic-enforcement-policer-pool

Parameters

number-of-policers

specifies the number of policers to be reserved.

Values 1000 to 32000

8.312 dynamic-mbs

dynamic-mbs

Syntax

[**no**] **dynamic-mbs**

Context

[Tree] (config>qos>qgrps>egr>qgrp>queue dynamic-mbs)

Full Context

configure qos queue-group-templates egress queue-group queue dynamic-mbs

Description

This command enables support for dynamically modifying the MBS size of a queue using HQoS in order to maintain the maximum latency for traffic in the queue based on the queue's configured MBS and the ratio of its operational PIR to its administrative PIR. As the HQoS algorithm updates the operational PIR, by reducing or increasing it, the MBS of the queue is adjusted accordingly.

The configuration of dynamic MBS and the configuration of queue depth monitoring (**monitor-queue-depth** command) are mutually exclusive. Queue depth monitoring is an override on the queue where the queue group is applied.

The **no** form of this command disables dynamic MBS resizing.

Default

no dynamic-mbs

Platforms

8.313 dynamic-nd-populate

dynamic-nd-populate

Syntax

[**no**] **dynamic-nd-populate**

Context

[Tree] (config>service>vpls>proxy-nd dynamic-nd-populate)

Full Context

configure service vpls proxy-nd dynamic-nd-populate

Description

This command enables the addition of dynamic entries to the proxy-ND table. The command is disabled by default. When executed, the system will populate proxy-ND entries from snooped Neighbor Advertisement (NA) messages on SAPs/SDP-bindings, in addition to the entries coming from EVPN (if the EVPN is enabled). These entries will be shown as dynamic, as opposed to EVPN entries or static entries.

When disabled, dynamic-ND entries will be flushed from the proxy-ND table. Enabling **dynamic-nd-populate** is only recommended in networks with a consistent configuration of this command in all the PEs.

Default

no dynamic-nd-populate

Description

This command enables debugging for dynamic MLDP.

The **no** form of this command disables dynamic MLDP debugging.

Parameters

detail

Debugs detailed dynamic MLDP information.

Platforms

All

8.324 dynsvc-password

dynsvc-password

Syntax

dynsvc-password *password* [**hash** | **hash2**]

no dynsvc-password

Context

[Tree] (config>system>security>password dynsvc-password)

Full Context

configure system security password dynsvc-password

Description

Note:
See also the description for the **enable-dynamic-services-config** command.

This command allows a user with admin permissions to configure a system wide password which enables a user to enter a special dynamic services configuration mode.

The minimum length of the password is determined by the **minimum-length** command. The complexity requirements for the password are determined by the **complexity** command.

The **no** form of this command removes the dynsvc password from the configuration.

Parameters

password

Configures the password which enables a user to enter a special dynamic services configuration mode. The maximum length can be up to 20 characters if unhashed, 32 characters if hashed, 54 characters if the **hash2** keyword is specified.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

9.2 e1

e1

Syntax

e1 [*e1-id*]

Context

[Tree] (config>port>tdm e1)

Full Context

configure port tdm e1

Description

Commands in this context configure E-1 parameters. E-1 is a basic time division multiplexing scheme used to carry digital circuits. It is also a standard WAN digital communication format designed to operate over copper facilities at a rate of 2.048 Mb/s.

North America uses the T-Carrier system while Europe uses the E-Carrier system of transmission, using multiples of the DS system. Digital signals are carried inside the carrier systems.

The **no** form of this command disables E-1 capabilities.

Parameters

e1-id

Specifies the E-1 channel being created.

Values E1: 1 to 21, e1-sonet-sdh-index

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

9.3 e3

e3

Syntax

[**no**] **e3** [*sonet-sdh-index*]

Context

[Tree] (config>port>tdm e3)

Full Context

configure port tdm e3

Description

Commands in this context configure E-3 parameters. E-3 lines provide a speed of 44.736 Mb/s and is also frequently used by service providers. E-3 lines carry 16 E-1 signals with a data rate of 34.368 Mb/s.

An E-3 connection typically supports data rates of about 43 Mb/s. An E-3 line actually consists of 672 individual channels, each supporting 64 kb/s. E-3 lines are used mainly by Service Providers to connect to the Internet backbone and for the backbone itself.

Depending on the MDA type, the E-3 parameters must be disabled if clear channel is enabled by default (for example, on the m12-ds3e3 MDA). Clear channel is a channel that uses out-of-band signaling, not in-band signaling, so the channel's entire bit rate is available. Channelization must be explicitly specified. Note that if E-3 nodes are provisioned on the channelized SONET/SDH MDA you must provision the parent STS-1 SONET/STM0 SDH path first.

North America uses the T-Carrier system while Europe uses the E-Carrier system of transmission, using multiples of the DS system. Digital signals are carried inside the carrier systems.

The **no** form of this command disables E-3 capabilities.

Parameters

sonet-sdh-index

Specifies the components making up the specified SONET/SDH Path. Depending on the type of SONET/SDH port the *sonet-sdh-index* must specify more path indexes to specify the payload location of the path. The *sonet-sdh-index* differs for SONET and SDH ports.

eapol-destination-address

Syntax

eapol-destination-address *mac*

no eapol-destination-address

Context

[Tree] (config>port>ethernet>dot1x>macsec>sub-port eapol-destination-address)

Full Context

configure port ethernet dot1x macsec sub-port eapol-destination-address

Description

The EAPoL destination MAC address uses a destination multicast MAC address of 01:80:C2:00:00:03. Some networks cannot tunnel this packet over the network and consume these packets, causing the MKA session to fail. This command can change the destination MAC of the EAPoL to the unicast address of the MACsec peer, and as such, the EAPoL and MKA signaling will be unicasted between two peers.

The **no** form of this command returns the value to the default.

Default

no eapol-destination-address

Parameters

mac

Specifies the desired destination MAC address to be used by the EAPOL MKA packets of this sub-port.

Values aa:bb:cc:dd:ee:ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers.

Full Context

configure service vprn bgp best-path-selection ebgp-ibgp-equal

Description

This command instructs the BGP decision process to ignore the difference between EBGP and IBGP routes in selecting the best path and eligible multipaths (if multipath and ECMP are enabled). The result is a form of EIBGP load-balancing in a multipath scenario.

The operator can apply the behavior selectively to only certain types of routes by specifying one or more address family names in the command.

The **no** form of this command configures the router in the BGP decision process to prefer an EBGP learned route over an IBGP learned route.

Default

no ebgp-ibgp-equal

Parameters

ipv4

Specifies that the command should be applied to unlabeled unicast IPv4 routes.

ipv6

Specifies that the command should be applied to unlabeled unicast IPv6 routes.

label-ipv4

Specifies that the command should be applied to labeled IPv4 routes.

label-ipv6

Specifies that the command should be applied to labeled IPv6 routes.

Platforms

Context

[Tree] (config>router>bgp>best-path-selection ebgp-ibgp-equal)

Full Context

configure router bgp best-path-selection ebgp-ibgp-equal

Description

This command instructs the BGP decision process to ignore the difference between EBGP and IBGP routes in selecting the best path and eligible multipaths (if multipath and ECMP are enabled). The result is a form of EIBGP load balancing in a multipath scenario.

The behavior can be applied selectively to only certain types of routes by specifying one or more address family names in the command. If no families are specified, this command applies to IPv4, IPv6, label-IPv4, label-IPv6, VPN-IPv4, VPN-IPv6, and EVPN routes.

The **no** form of this command configures the router in the BGP decision process to prefer an EBGP learned route over an IBGP learned route.

Default

no ebgp-ibgp-equal

Parameters

ipv4

Specifies that the command should be applied to unlabeled unicast IPv4 routes.

ipv6

Specifies that the command should be applied to unlabeled unicast IPv6 routes.

label-ipv4

Specifies that the command should be applied to labeled unicast IPv4 routes.

label-ipv6

Specifies that the command should be applied to labeled unicast IPv6 routes.

vpn-ipv4

Specifies that the command should be applied to IPv4 VPN routes.

vpn-ipv6

Specifies that the command should be applied to IPv6 VPN routes.

evpn

Specifies that the command should be applied to EVPN routes.

configure service epipe bgp-evpn segment-routing-v6 ecmp

configure service epipe bgp-evpn vxlan ecmp

configure service epipe bgp-evpn mpls ecmp

Description

When configured in a VPLS service, this command controls the number of paths that are allowed to reach a specified MAC address when that MAC in the FDB is associated to a remote all-active multi-homed ES.

The configuration of two or more ECMP paths to a specified MAC enables the aliasing function described in RFC 7432.

When used in an Epipe service, this command controls the number of paths that are allowed to reach a specified remote Ethernet tag that is associated to an ES destination.

Default

ecmp 1

Parameters

max-ecmp-routes

Specifies the number of paths allowed to the same multi-homed MAC address or Ethernet tag.

Values 1 to 32

Platforms

Full Context

configure service vprn bgp-evpn mpls auto-bind-tunnel ecmp

configure service vprn bgp-ipvpn mpls auto-bind-tunnel ecmp

Description

This command configures the maximum number of tunnels that may be used as ECMP next-hops for the VPRN. This value overrides any values that are configured using the **config**>**service**>**vprn**>**ecmp** command.

The **no** form of this command removes the configured overriding value, and the value configured using the **config**>**service**>**vprn**>**ecmp** command is used.

Default

ecmp 1

Parameters

max-ecmp-routes

Specifies the maximum number of tunnels that may be used as ECMP next-hops for the VPRN.

Values 1 to 32

Default 1

Platforms

All

ecmp

Syntax

ecmp *max-ecmp-routes*

no ecmp

Context

[Tree] (config>router ecmp)

Full Context

configure router ecmp

Description

This command enables ECMP and configures the number of routes for path sharing; for example, the value 2 means two equal cost routes are used for cost sharing.

ECMP can be used only for routes with the same preference and same protocol.

If available ECMP routes at the best preference exceed the maximum ECMP routes allowed, the system selects using the following criteria:

1. The system selects the lowest next hop router ID.
2. If the next hop goes to the same neighbor, the system selects the next hop with the lowest interface index.

The **no** form of this command disables ECMP path sharing. If ECMP is disabled and multiple routes are available at the best preference and equal cost, the route with the lowest next-hop IP address is used.

Default

no ecmp

Parameters

max-ecmp-routes

Specifies the maximum number of equal cost routes allowed on this routing table instance, expressed as a decimal integer. Setting ECMP *max-ecmp-routes* to 1 yields the same result as entering **no ecmp**.

Values 1 to 64

Platforms

All

ecmp

Syntax

ecmp *max-ecmp-routes*

no ecmp

Context

[Tree] (config>service>vprn ecmp)

Full Context

configure service vprn ecmp

Description

This command enables equal-cost multipath (ECMP) and configures the number of routes for path sharing. For example, the value of 2 means that 2 equal cost routes are used for cost sharing.

ECMP groups form when the system routes to the same destination with equal cost values. Routing table entries can be entered manually (as static routes), or they can be formed when neighbors are discovered and routing table information is exchanged by routing protocols. The system can balance traffic across the groups with equal costs.

ECMP can only be used for routes learned with the same preference and same protocol.

If available ECMP routes at the best preference exceed the maximum ECMP routes allowed, the system selects using the following criteria:

1. The system selects the lowest next hop router ID.
2. If the next hop goes to the same neighbor, the system selects the next hop with the lowest interface index.

The **no** form of this command disables ECMP path sharing. If ECMP is disabled and multiple routes are available at the best preference and equal cost, the newly updated route is used.

Default

no ecmp

Parameters

max-ecmp-routes

Specifies the maximum number of routes for path sharing.

Values 1 to 64

9.15 ecmp-opt-threshold

ecmp-opt-threshold

Syntax

ecmp-opt-threshold *preference-level*

no ecmp-opt-threshold

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle ecmp-opt-threshold)

Full Context

configure mcast-management multicast-info-policy bundle ecmp-opt-threshold

Description

This command defines the preference level threshold where multicast ECMP path management can dynamically optimize channels based on topology or bandwidth events. If the channels preference is

equal to or less than the ecmp-opt-threshold, ECMP can move the channel between ECMP paths when bandwidth distribution events happen. Channels with a preference level higher than the threshold are moved during these events.

The default ECMP optimization limit threshold is 7. This means that multicast channels with a preference level of 0 to 7 (all channels) are allowed to move between ECMP paths. The ecmp-opt-threshold command can be used to change the default threshold.

Changing the threshold causes all channels ECMP optimization eligibility to be reevaluated.

The **no** form of this command restores the default ECMP optimization preference threshold value.

Default

ecmp-opt-threshold 7

Parameters

preference-level

The preference-level parameter is required when specifying the ecmp-opt-threshold. An integer value from 0 to 7 must be specified.

Values 0 to 7

Platforms

All

9.16 ecmp-unequal-cost

ecmp-unequal-cost

Syntax

[**no**] **ecmp-unequal-cost**

Context

[Tree] (config>service>vprn ecmp-unequal-cost)

Full Context

configure service vprn ecmp-unequal-cost

Description

This command relaxes the constraint that ECMP multipaths must have the same IGP cost to reach the BGP next-hop. When VPN routes for the same IP prefix are imported into a VPRN service, they are eligible to be used as multipaths. The resulting route is programmed as an ECMP IP route.

The BGP best path selection algorithm is the basis for choosing the set of imported VPN routes that can be combined to form an ECMP route. Normally (unless an **ignore-nh-metric** command is configured), the BGP decision process gives higher preference to VPN routes with a lower next-hop cost if other,

more significant criteria, are tied. In these circumstances, a VPN route cannot be an eligible multipath if it does not have the same next-hop cost as the best VPN route. Configuring this command removes this restriction and allows the multipaths to have different (meaning lower) next-hop costs than the best route. This broadens the applicability of multipath and can result in better load balancing in the network.

This command applies only to the following types of routes imported by a VPRN.

- vpn-ipv4
- vpn-ipv6
- mcast-vpn-ipv4
- mcast-vpn-ipv6

The **no** form of this command restores the default behavior that requires next-hop costs of multipaths to be equal, unless the next-hop cost is completely removed from the BGP decision process.

Default

ecmp-unequal-cost

9.17 ect-algorithm

ect-algorithm

Syntax

ect-algorithm fid-range *fid-range* {**low-path-id**| **high-path-id**}

Context

[Tree] (config>service>vpls>spb>level ect-algorithm)

Full Context

configure service vpls spb level ect-algorithm

Description

This command configures the ect-algorithm associated with a FID. Names are:

- low-path-id
- high-path-id

The algorithm for low-path-id chooses the path with the lowest metric and uses the sum of each Bridge-ID to break-ties (in this case preferring the lowest bridge identifiers).

The algorithm for high-path-id choose the path with the lowest metric and the sum of each Bridge-ID (after each one is modified by the algorithm mask) to break-ties (in this case preferring the highest bridge identifiers).

A Forwarding Identifier (FID) is an abstraction of the IEEE 802.1 SPB Base VID and represents the VLAN (B-VPLS) in IS-IS LSPs. B-VPLS services with the same FID share B-MACs and I-SIDs. (the SAP encapsulation VLAN tag may be set to the same value as the FID or to any other valid VLAN tag). One or more FIDs can be associated with an ECT-algorithm by using the FID range. User B-VPLS services may share the same FID as the control B-VPLS or use independent FIDs where each FID has an assigned ect-algorithm. B-VPLS services with i-vpls services must have an independent FID. B-VPLS services with only PBB Epipes may share FIDs with other B-VPLS services including the control B-VPLS service.

The ect-algorithm is associated with the FID and can only be changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID must be independent from the FID assigned to other services.

Default

ect-algorithm fid-range 1-4095 low-path-id

Parameters

name

low-path-id, high-path-id.

fid-range

Range of Forwarding Identifier values.

Values 1 to 4095

Full Context

configure service template vpls-sap-template stp edge-port

configure service vpls spoke-sdp stp edge-port

configure service vpls sap stp edge-port

Description

This command configures the SAP or SDP as an edge or non-edge port. If **auto-edge** is enabled for the SAP, this value will be used only as the initial value.

Note:
The function of the **edge-port** command is similar to the **rapid-start** command. It tells RSTP that it is on the edge of the network (for example, there are no other bridges connected to that port) and, as a consequence, it can immediately transition to a forwarding state if the port becomes available.

RSTP, however, can detect that the actual situation is different from what **edge-port** may indicate.

Initially, the value of the SAP or spoke-SDP parameter is set to edge-port. This value will change if:

- A BPDU is received on that port. This means that after all there is another bridge connected to this port. Then the edge-port becomes disabled.
- If auto-edge is configured and no BPDU is received within a certain period of time, RSTP concludes that it is on an edge and enables the edge-port.

The **no** form of this command returns the edge port setting to the default value.

Default

no edge-port

Platforms

All

edit

Syntax

edit [**exclusive**]

Context

[Tree] (candidate edit)

Full Context

candidate edit

Description

This command enables the edit-cfg mode where changes can be made to the candidate configuration and sets the edit-point to the end of the candidate. In edit-cfg mode the CLI prompt contains **edit-cfg** near the root of the prompt. Commands in the **candidate** CLI branch, except **candidate edit**, are available only when in edit-cfg mode.

Parameters

exclusive

Allows a user to exclusively create a candidate configuration by blocking other users (and other sessions of the same user) from entering edit-cfg mode. Exclusive edit-cfg mode can only be entered if the candidate configuration is empty and no user is in edit-cfg mode. Once a user is in exclusive edit-cfg mode no other users/sessions are allowed in edit-cfg mode. The user must either commit or discard the exclusive candidate before leaving exclusive edit-cfg mode. If the CLI session times out while a user is in exclusive edit-cfg mode then the contents of the candidate are discarded. The **admin disconnect** command

can be used to force a user to disconnect (and to clear the contents of the candidate) if they have the candidate locked.

9.21 efm

efm

Syntax

efm *port-id* **local-loopback** {**start** | **stop**}

efm *port-id* **remote-loopback** {**start** | **stop**}

Context

[Tree] (oam efm)

Full Context

oam efm

Description

This command enables Ethernet in the First Mile (EFM) OAM tests loopback tests on the specified port. The EFM OAM remote loopback OAMPDU is sent to the peering device to trigger remote loopback.

When EFM OAM is disabled or shutdown on a port, the dying gasp flag for the OAMPDU is set for the OAMPDUs sent to the peer. This speeds up the peer loss detection time.

Parameters

port-id

Specifies the port ID.

Note:
On the 7950 XRS, The XMA ID takes the place of the MDA.

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

local-loopback {start | stop}

Specifies whether to start or stop local loopback tests on the specified port.

remote-loopback {start | stop}

Specifies whether to start or stop remote Ethernet in the First Mile (EFM) OAM loopback tests on the specified port. The EFM OAM remote loopback OAMPDU is sent to the peering device to trigger remote loopback.

For EFM OAM tunneling to function properly, EFM OAM tunneling should be configured for VLL services or a VPLS service with two SAPs only.

9.24 egr-percentage-of-rate

egr-percentage-of-rate

Syntax

egr-percentage-of-rate *egr-rate-percentage*

no egr-percentage-of-rate

Context

[Tree] (config>port>modify-buffer-allocation-rate egr-percentage-of-rate)

Full Context

configure port modify-buffer-allocation-rate egr-percentage-of-rate

Description

The **egr-percentage-of-rate** command increases or decreases the active bandwidth associated with the egress port that affects the amount of egress buffer space managed by the port. Changing a ports active bandwidth using the **egr-percentage-of-rate** command is an effective means of artificially lowering the buffers managed by one egress port and giving them to other egress ports on the same MDA.

The **egr-percentage-of-rate** command accepts a percentage value that increases or decreases the active bandwidth based on the defined percentage. A value of 50% causes the active bandwidth to be reduced by 50%. A value of 150% causes the active bandwidth to be increased by 50%. Values from 1 to 1000 percent are supported.

A value of 100 (the default value) is equivalent to executing the **no egr-percentage-of-rate** command and restores the egress active rate to the normal value.

The **no** form of this command removes any artificial increase or decrease of the egress active bandwidth used for egress buffer space allocation to the port. The **no egr-percentage-of-rate** command sets the egress rate percentage to 100%.

Parameters

egr-rate-percentage

The *egr-rate-percentage* parameter is required and specifies the percentage value used to modify the current egress active bandwidth of the port. This does not actually change the bandwidth available on the port in any way. The defined *egr-rate-percentage* parameter is multiplied by the egress active bandwidth of the port. A value of 150 results in an increase of 50% (1.5 x Rate).

Values 1 to 1000

Default 100 (no change to active rate)

9.26 egr-weight

egr-weight

Syntax

egr-weight access *access-weight* **network** *network-weight*

no egr-weight

Context

[Tree] (config>port>hybrid-buffer-allocation egr-weight)

Full Context

configure port hybrid-buffer-allocation egr-weight

Description

This command configures the sharing of the egress buffers allocated to a hybrid port among the access and network contexts. By default, it is split equally between network and access.

The **no** form of this command reverts to the default values for the egress access and network weights.

Parameters

access-weight

Specifies the access weight as an integer.

Values 0 to 100

Default 50

network-weight

Specifies the network weight as an integer.

Values 0 to 100

Default 50

configure mirror mirror-dest spoke-sdp egress

Description

Commands in this context configure spoke SDP egress parameters.

Platforms

All

egress

Syntax

[**no**] **egress**

Context

[Tree] (config>mirror>mirror-dest>sap egress)

Full Context

configure mirror mirror-dest sap egress

Description

This command enables access to the context to associate an egress SAP Quality of Service (QoS) policy with a mirror destination SAP.

If no QoS policy is defined, the system default SAP egress QoS policy is used for egress processing.

Platforms

All

egress

Syntax

egress

Context

[Tree] (config>qos>network egress)

Full Context

configure qos network egress

Description

This command is used to enter the CLI node that creates or edits egress policy entries that specify the forwarding class queues to be instantiated when this policy is applied to the network port.

The forwarding class and profile state mapping to in- and out-of-profile DiffServ Code Points (DSCPs), dot1p, and MPLS EXP bits mapping for all labeled packets are also defined in this context.

All service packets are aggregated into DiffServ-based egress queues on the network interface. The service packets are transported either with IP GRE encapsulation or over a MPLS LSP. The exception is with the IES service. In this case, the actual customer IP header has the DSCP field mapped.

All out-of-profile service packets are marked with the corresponding out-of-profile DSCP, dot1p, or the EXP bit value at network egress. All the in-profile service ingress packets are marked with the corresponding in-profile DSCP, dot1p, or EXP bit value based on the forwarding class to which they belong. The exceed-profile traffic is marked with the same value as out-of-profile traffic and the inplus-profile traffic is marked with the same value as in-profile traffic.

Platforms

All

egress

Syntax

egress

Context

[Tree] (config>qos>queue-group-templates egress)

Full Context

configure qos queue-group-templates egress

Description

Commands in this context configure QoS egress queue groups. Egress queue group templates can be applied to egress Ethernet ports to create an egress queue group.

Platforms

All

egress

Syntax

egress

Context

[Tree] (config>router>if egress)

Full Context

configure router interface egress

Description

This command enables access to the context to configure egress network filter policies for the IP interface. If an egress filter is not defined, no filtering is performed.

Platforms

All

egress

Syntax

egress

Context

[Tree] (config>service>cust>multi-service-site egress)

9.28 egress-counter-map

egress-counter-map

Syntax

egress-counter-map policer *policer-id* **traffic-type** {**unicast** | **multicast** | **broadcast**} [**create**]

egress-counter-map queue *queue-id* **traffic-type** {**unicast** | **multicast** | **broadcast**} [**create**]

no egress-counter-map policer *policer-id*

no egress-counter-map queue *queue-id*

Context

[Tree] (config>sflow egress-counter-map)

Full Context

configure sflow egress-counter-map

Description

This command configures the egress counter map for sFlow. The map must be configured so sFlow agent understands how to interpret data collected against SAP queues and policers. Multiple queues and policers can be mapped to the same **traffic-type** using separate line entries.

The **no** form of this command deletes a SAP policy queue/policer from the map.

Parameters

policer-id

Specifies the policer ID in a SAP egress QoS policy. If the SAP policy does not have a policer with the specified ID, the map entry will be ignored for this SAP.

Values 1 to 8

queue-id

Specifies the queue ID in a SAP egress QoS policy. If the SAP policy does not have a queue with the specified ID, the map entry will be ignored for this SAP.

Values 1 to 8

Platforms

7750 SR, 7750 SR-s, 7950 XRS

9.29 egress-engineering

egress-engineering

Syntax

egress-engineering

no egress-engineering

Context

[Tree] (config>router>bgp>group egress-engineering)

[Tree] (config>router>bgp>group>neighbor egress-engineering)

Full Context

configure router bgp group egress-engineering

configure router bgp group neighbor egress-engineering

Description

Commands in this context configure egress engineering on a specific neighbor or all neighbors in a BGP group.

If egress engineering is not configured in the neighbor context, the configuration is inherited from the group context.

The **no** form of this command removes the egress engineering configuration.

Default

no egress-engineering

Platforms

All

9.30 egress-fc

egress-fc

Syntax

egress-fc *fc-name*

no egress-fc

Context

[Tree] (config>qos>sap-ingress>fc egress-fc)

Full Context

configure qos sap-ingress fc egress-fc

Description

This command configures the forwarding class to be used by the egress QoS processing. It overrides the forwarding class determined by ingress classification but not the QoS Policy Propagation via BGP.

The forwarding class or forwarding subclass can be overridden.

The new egress forwarding class is applicable to both SAP egress and network egress.

Default

no egress-fc

Parameters

fc-name

Specifies the forwarding class name to be used by the egress QoS processing.

Values be, l2, af, l1, h2, ef, h1, nc

Platforms

All

9.31 egress-ip-filter-entries

egress-ip-filter-entries

Syntax

[**no**] **egress-ip-filter-entries**

Context

[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl egress-ip-filter-entries)

Full Context

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries

Description

Commands in this context configure the egress IP filter parameters.

The **no** form of this command reverts to the default.

Default

egress-ip-filter-entries

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

9.32 egress-ipv6-filter-entries

egress-ipv6-filter-entries

Syntax

[**no**] **egress-ipv6-filter-entries**

Context

[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl egress-ipv6-filter-entries)

Full Context

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries

Description

Commands in this context configure the egress IPv6 filter parameters.

The **no** form of this command reverts to the default.

Default

egress-ipv6-filter-entries

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

9.33 egress-pbr

egress-pbr

Syntax

egress-pbr {**default-load-balancing** | **l4-load-balancing**}

no egress-pbr

Context

[Tree] (config>filter>ip-filter>entry egress-pbr)

[Tree] (config>filter>ipv6-filter>entry egress-pbr)

Full Context

configure filter ip-filter entry egress-pbr

configure filter ipv6-filter entry egress-pbr

Description

This command specifies that the configured PBR action is applicable to egress processing. The command should only be enabled in ACL policies used by residential subscribers. Enabling **egress-pbr** on filters not deployed for residential subscribers is not blocked but may lead to unexpected behavior and should be avoided.

The **no** form of this command removes the **egress-pbr** designation of the filter entry's action.

Default

no egress-pbr

Parameters

default-load-balancing

Sets load-balancing to the default (hash based on SA/DA of the packet).

l4-load-balancing

Includes TCP/UDP port (if available) in the hash.

Platforms

All

9.34 egress-peer-engineering

egress-peer-engineering

Syntax

egress-peer-engineering

no egress-peer-engineering

Context

[Tree] (config>router>bgp egress-peer-engineering)

Full Context

configure router bgp egress-peer-engineering

Description

Commands in this context configure EPE parameters in BGP.

The **no** form of this command removes the EPE parameters from the BGP context.

Default

no egress-peer-engineering

Platforms

All

9.35 egress-peer-engineering-label-unicast

egress-peer-engineering-label-unicast

Syntax

[**no**] **egress-peer-engineering-label-unicast**

Context

[Tree] (config>router>bgp>group egress-peer-engineering-label-unicast)

[Tree] (config>router>bgp>group>neighbor egress-peer-engineering-label-unicast)

Full Context

configure router bgp group egress-peer-engineering-label-unicast

configure router bgp group neighbor egress-peer-engineering-label-unicast

Description

This command enables the generation of a label-unicast route for each /32 or /128 prefix that corresponds to the BGP neighbor or group address in the scope of the command. These routes can be advertised to other routers to recursively resolve unlabeled BGP routes for AS external destinations. They support the Egress Peer Engineering (EPE) use case.

The **no** form of this command disables the generation of EPE label-unicast routes.

Default

no egress-peer-engineering-label-unicast

Platforms

All

9.36 egress-policer

egress-policer

Syntax

egress-policer [*policer-name*]

no egress-policer

Context

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dsm egress-policer)

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dsm egress-policer)

Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt egress-policer

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt egress-policer

Description

This command specifies the egress policer applied to all UEs corresponding to default vlan-range (such as, group-interface) or the specified vlan-range. The policer can be created in the **config>subscr-mgmt>isa-policer** context. The egress policer can be overridden per UE from RADIUS via access-accept or COA.

The **no** form of this command reverts to the default.

Parameters

policer-name

Specifies the identifier of the distributed-sub-mgmt policer for egress traffic up to 256 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

9.37 egress-port-queue-overrides

egress-port-queue-overrides

Syntax

egress-port-queue-overrides

Context

[Tree] (config>port>ethernet>network egress-port-queue-overrides)

Full Context

configure port ethernet network egress-port-queue-overrides

Description

Commands in this context configure Ethernet network egress port queue override parameters.

Platforms

All

9.38 egress-rate

egress-rate

Syntax

egress-rate *sub-rate*

no egress-rate

Context

[Tree] (config>port>ethernet egress-rate)

Full Context

configure port ethernet egress-rate

Description

This command configures the rate of traffic leaving the network. The configured *sub-rate* uses packet-based accounting. An event log is generated each time the egress rate is modified unless the port is part of a LAG.

The **no** form of this command returns the value to the default.

Default

no egress-rate

Parameters

sub-rate

Specifies the egress rate in kb/s.

Values 1 to 100000000

Platforms

All

9.39 egress-rate-modify

egress-rate-modify

Syntax

egress-rate-modify agg-rate-limit

egress-rate-modify scheduler *scheduler-name*

no egress-rate-modify

Context

[Tree] (config>subscr-mgmt>trk-plcy egress-rate-modify)

Full Context

configure subscriber-mgmt host-tracking-policy egress-rate-modify

Description

This command specifies the egress-rate modification that is to be applied.

The **no** form of this command reverts to the default value.

Parameters

agg-rate-limit

Specifies to use the egress rate limit.

scheduler-name

Specifies the scheduler name up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

egress-rate-modify

Syntax

egress-rate-modify [**agg-rate-limit** | **scheduler** *scheduler-name*]

no egress-rate-modify

Context

[Tree] (config>subscr-mgmt>igmp-policy egress-rate-modify)

Full Context

configure subscriber-mgmt igmp-policy egress-rate-modify

Description

This command is used to apply HQoS Adjustment to a subscriber. HQoS Adjustment is needed when multicast traffic flow for the subscriber is dissociated from subscriber host queues. Multicast redirection is typical such case although it can be applied in direct IPoE subscriber per-sap replication mode.

The channel bandwidth definition policy is defined in the mcac policy under the **config>router>mcac>policy** context. The policy is applied under the redirected interface or under the group-interface.

In order for HQoS Adjustment to take effect, sub-mcac-policy must be in a no shutdown mode and applied under the sub-profile even if mcac is not deployed.

The **no** form of this command reverts to the default value.

Parameters

agg-rate-limit

Specifies the aggregate14 rate modification to be applied. The subscriber's bandwidth is capped via the **agg-rate-limit** command in the sub-profile or with a Change of Authorization (CoA) request. This bandwidth cap is dynamically adjusted according to the multicast channel definition and channel association with the host via IGMP.

scheduler-name

Specifies the schedule name. The subscriber's bandwidth is capped via the scheduling-policy in the sub-profile or with a Change of Authorization (CoA) request. HQoS Adjustment will modify the rate of the scheduler defined in the scheduling policy or configured via CoA.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

egress-rate-modify

Syntax

egress-rate-modify agg-rate-limit

egress-rate-modify scheduler *scheduler-name*

no egress-rate-modify

Context

[Tree] (config>subscr-mgmt>mld-policy egress-rate-modify)

Full Context

configure subscriber-mgmt mld-policy egress-rate-modify

Description

This command configures the egress rate modification.

The **no** form of this command removes the values from the configuration.

Parameters

agg-rate-limit

Specifies that the maximum total rate for all subscriber egress queues for each subscriber associated with the policy.

scheduler-name

Specifies the scheduler to be applied for egress rate modification.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

egress-rate-modify

Syntax

[**no**] **egress-rate-modify**

Context

[Tree] (config>port>ethernet>access>egress>vport egress-rate-modify)

Full Context

configure port ethernet access egress vport egress-rate-modify

Description

This command applies HQoS Adjustment to a Vport. HQoS Adjustment refers to the dynamic adjustment of the rate limit at an QoS enforcement point within a Nokia router when the multicast traffic stream is disjointed from the unicast traffic stream. This QoS enforcement point within the router represents the physical point further down in the access part of the network where the two streams join each other and potentially can cause congestion.

An example would be a PON port which is shared amongst subscriber's multicast traffic (single copy of each channel) and subscriber's unicast traffic. The bandwidth control point for this PON port resides in the upstream Nokia BNG node in the form of a Vport. In the case where the multicast delivery method of the BNG utilizes redirection, the multicast traffic in the BNG will flow outside of the subscriber or the Vport context and thus will bypass any bandwidth enforcement in the Nokia router. To correct this, a Vport bandwidth adjustment is necessary in the router that will account for the multicast bandwidth consumption that is bypassing Vport in the router but is present in the PON port whose bandwidth is controlled by Vport.

An estimate of the multicast bandwidth consumption on the PON port can be made at the Vport level based on the IGMP messages sourced from the subscribers behind the PON port. This process is called HQoS Adjustment.

A multicast channel bandwidth is subtracted from or added to the Vport rate limit according to the received IGMP Join/Leave messages and the channel bandwidth definition policy associated with the Vport (indirectly through a group-interface). Since the multicast traffic on the PON port is shared amongst subscribers behind this PON port, only the first IGMP Join or the last IGMP Leave per multicast channel is tracked for the purpose of the Vport bandwidth modification.

The Vport rate that will be affected by this functionality depends on the configuration:

- In case the **agg-rate** within the Vport is configured, its value will be modified based on the IGMP activity associated with the subscriber under this Vport.
- In case the port-scheduler-policy within the Vport is referenced, the max-rate defined in the corresponding port-scheduler-policy will be modified based on the IGMP activity associated with the subscriber under this Vport.

The channel bandwidth definition policy is defined in the mcac policy in the **config>router>mcac>policy** context. The policy is applied under the group-interface or in case of redirection under the redirected-interface.

The rates in effect can be displayed with the following two commands:

```
show port 1/1/5 vport name
qos scheduler-hierarchy port port-id vport vport-name
```

The configuration of a scheduler policy under a Vport, which is only applicable to Ethernet interfaces, is mutually exclusive with the configuration of the **egress-rate-modify** parameter.

Context: HQoS Adjustment for Vport is disabled.

Platforms

9.40 egress-scheduler-override

egress-scheduler-override

Syntax

egress-scheduler-override [**create**]

no egress-scheduler-override

Context

[Tree] (config>port>tdm>ds3 egress-scheduler-override)

[Tree] (config>port>tdm>e1>channel-group egress-scheduler-override)

[Tree] (config>port>ethernet egress-scheduler-override)

[Tree] (config>port>sonet-sdh>path egress-scheduler-override)

[Tree] (config>port>tdm>e3 egress-scheduler-override)

[Tree] (config>port>tdm>ds1>channel-group egress-scheduler-override)

Full Context

configure port tdm ds3 egress-scheduler-override

configure port tdm e1 channel-group egress-scheduler-override

configure port ethernet egress-scheduler-override

configure port sonet-sdh path egress-scheduler-override

configure port tdm e3 egress-scheduler-override

configure port tdm ds1 channel-group egress-scheduler-override

Description

This command applies egress scheduler overrides. When a port scheduler is associated with an egress port, it is possible to override the following parameters:

- The **max-rate** allowed for the scheduler.
- The maximum **rate** for each priority level 8 through 1.
- The CIR associated with each priority level 8 through 1.

See the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for command syntax and usage for the **port-scheduler-policy** command.

The **no** form of this command removes all override parameters from the egress port or channel scheduler context. Once removed, the port scheduler reverts all rate parameters back to the parameters defined on the port-scheduler-policy associated with the port.

Parameters

create

Mandatory while creating an entry.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure port tdm e1 channel-group egress-scheduler-override

9.41 egress-scheduler-policy

egress-scheduler-policy

Syntax

egress-scheduler-policy *port-sched-plcy*

no egress-scheduler-policy

Context

[Tree] (config>port-policy egress-scheduler-policy)

Full Context

configure port-policy egress-scheduler-policy

Description

This command references a port scheduler policy that is defined under the **config>qos>port-scheduler-policy>** hierarchy. Port schedulers are instantiated on carrier IOMs towards all ISAs that are part of the lns-group.

The no form of the command removes the port scheduler policy from the configuration.

Default

no egress-scheduler-policy

Parameters

port-sched-plcy

Specifies the egress scheduler policy, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

egress-scheduler-policy

Syntax

egress-scheduler-policy *port-scheduler-policy-name*

configure port ethernet egress-scheduler-policy

configure port tdm ds3 egress-scheduler-policy

configure port tdm e3 egress-scheduler-policy

configure port tdm ds1 channel-group egress-scheduler-policy

Description

This command enables the provisioning of an existing port-scheduler-policy to a port or channel.

The egress-scheduler-override node allows for the definition of the scheduler overrides for a specific port or channel.

When a port scheduler is active on a port or channel, all queues and intermediate service schedulers on the port are subject to receiving bandwidth from the scheduler. Any policers, queues, or schedulers with port-parent associations are mapped to the appropriate port priority levels based on the port-

parent command parameters. Any policers, queues, or schedulers that do not have a port-parent or valid intermediate scheduler parent defined are treated as orphaned and are handled based on the port scheduler policies default or explicit orphan behavior.

The port scheduler maximum rate and priority level rate parameters may be overridden to allow unique values separate from the port-scheduler-policy-name attached to the port or channel. Use the **egress-scheduler-override** command to specify the port or channel specific scheduling parameters.

The **no** form of this command removes a port scheduler policy from an egress port or channel. Once the scheduler policy is removed, all orphaned policers, queues, and schedulers revert to a free running state governed only by the local queue or scheduler parameters. This includes any queues or schedulers with a port-parent association.

Parameters

port-scheduler-policy-name

Specifies an existing port-scheduler-policy configured in the **config>qos** context. The name can be up to 32 characters.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure port tdm e1 channel-group egress-scheduler-policy
- configure port tdm e3 egress-scheduler-policy

egress-statistics

Syntax

[**no**] **egress-statistics**

Context

[Tree] (config>router>mpls>lsp egress-statistics)

[Tree] (config>router>mpls>lsp-template egress-statistics)

Full Context

configure router mpls lsp egress-statistics

configure router mpls lsp-template egress-statistics

Description

This command configures statistics in the egress data path of an originating LSP at a head-end node. The user must execute the no shutdown for this command to effectively enable statistics.

Note:
SR-TE LSP egress statistics are not supported on VSR.

The same set of counters is updated for packets forwarded over any path of the RSVP-TE LSP and over the lifetime of the LSP. In steady state, the counters are updated for packets forwarded over the active path of the LSP. The active path can be the primary path, one of the secondary paths, the FRR detour path, or the FRR bypass path when the head-end node is also the PLR.

For SR-TE LSPs, egress statistics are collected independently for each path (primary, backup standby or not), and are preserved on switchover (except for non-standby).

LSP egress statistics are collected if the head-end node is also the Penultimate-Popping Hop (PHP) node for a single-hop LSP using an implicit null egress label.

RSVP-TE LSP statistics are not collected on a dynamic or a static bypass tunnel itself.

Statistics collection on two labels of the stack is possible. Please refer to **config>system>ip>mpls>label-stack-statistics-count**.

The **no** form of this command disables the statistics in the egress data path and removes the accounting policy association from the LSP.

Default

no egress-statistics

configure service vprn bgp eibgp-loadbalance

Description

This command enables eiBGP load sharing so routes with both MP-BGP and IPv4 next-hops can be used simultaneously.

In order for this command to be effective, the **ecmp** and **multipath** commands for the associated VPRN instance must also be configured to allow for multiple routes to the same destination.

The **no** form of this command used at the global level reverts to default values.

Default

no eibgp-loadbalance

Platforms

All

9.45 elevation-mask-angle

elevation-mask-angle

Syntax

elevation-mask-angle *degrees*

Context

[Tree] (config>port>gnss elevation-mask-angle)

Full Context

configure port gnss elevation-mask-angle

Description

This command configures the elevation mask angle, which provides a method of filtering satellites used by the system. This command is supported on platforms that have one or more embedded GNSS receivers.

Satellites with low elevation may provide degraded accuracy because of the long signal path through the atmosphere. Signals from satellites below the configured minimum satellite elevation are not used.

Note:
Nokia recommends not to configure an elevation mask angle below 10°.

Default

10

Parameters

degrees

Specifies the elevation mask angle in degrees from the horizon.

Values 0 to 89

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se

Context

[Tree] (config>filter>ipv6-filter embed-filter)

[Tree] (config>filter>ip-filter embed-filter)

Full Context

configure filter ipv6-filter embed-filter

configure filter ip-filter embed-filter

Description

This command embeds a previously defined IPv4, IPv6, or MAC embedded filter policy or Hybrid OpenFlow switch instance into this exclusive, template, or system filter policy at the specified offset value. Rules derived from the BGP FlowSpec can also be embedded into template filter policies only.

The **embed-filter open-flow** *ofs-name* form of this command enables OpenFlow (OF) in GRT either by embedding the specified OpenFlow switch (OFS) instance with **switch-defined-cookie** disabled, or by embedding rules with sros-cookie:type "grt-cookie", value 0, from the specified OFS instance with **switch-defined-cookie** enabled. The embedding filter can only be deployed in GRT context or be unassigned.

The **embed-filter open-flow** *ofs-name* **system** form of this command enables OF in system filters by embedding rules with sros-cookie:type "system-cookie", value 0, from the specified OFS instance with **switch-defined-cookie** enabled. The embedding filter can only be of scope **system**.

The **embed-filter open-flow** *ofs-name* **service** {*service-id* | *service-name*} form of this command enables OF in VPRN/VPLS filters by embedding rules with sros-cookie:type "service-cookie", value **service-id**, from the specified OFS instance with **switch-defined-cookie** enabled—per service rules. The embedding filter can only be deployed in the specified VPRN/VPLS service. A single VPLS service can only support OF rules per SAP or per service.

The **embed-filter open-flow** *ofs-name* **sap** *sap-id* form of this command enables OF in VPLS SAP filters by embedding rules with sros-cookie:type "service-cookie", value *service-id* and flow match conditions specifying the sap-id from the specified OFS instance with **switch-defined-cookie** enabled—per SAP OF rules. The embedding filter must be of type exclusive and can only be deployed on the specified SAP in the context of the specified VPLS service. A single VPLS service can only support OF rules per SAP or per service.

The **no embed-filter open-flow** *ofs-name* form of this command removes the OF embedding for the GRT context.

The **embed-filter flowspec** form of this command enables the embedding of rules derived from BGP FlowSpec routes into the filter policy that is being configured. The optional **group** parameter specifies that only FlowSpec routes tagged with an interface-set extended community containing this group ID should be selected for embedding. The optional **router** parameter specifies the routing instance source of the BGP FlowSpec routes; if the parameter is not specified, the routing instance is derived automatically from the context in which the filter policy is applied.

The **no embed-filter flowspec** form of this command removes the FlowSpec filter embedding from this filter policy.

The **no embed-filter** *filter-id* form of this command removes the embedding from this filter policy.

See the description of embedded filter policies in this guide for further operational details.

Parameters

ip-filter-id

Specifies a previously defined IPv4 policy for embedding in this filter.

ipv6-filter-id

Specifies a previously defined IPv6 policy for embedding in this filter.

offset

Specifies that an embedded filter entry X will have an entry X + offset in the embedding filter.

Values 0 to 2097151

Default 0

active

Specifies that embedded filter entries are to be included in this embedding filter policy and activated on applicable line cards—default if no keyword is specified and omitted from **info** command output (but not **info detail**), or when saving the configuration.

inactive

Specifies that no embedded filter policy entries are to be included in this embedding filter policy. The embedding is configured but will not do anything.

flowspec

This keyword indicates that rules derived from BGP FlowSpec routes should be embedded into (or removed from, in case of the **no** form) the filter.

group-id

Specifies that only FlowSpec routes with an interface-set extended community with this value of *group-id* should be selected for embedding.

Values 0 to 16383

router-instance

Specifies a router instance.

vprn-service-name

Specifies the VPRN service name used for embedding FlowSpec rules.

open-flow

Indicates that rules derived from OpenFlow should be embedded into (or removed from, in case of the **no** form) the filter.

ofs-name

Specifies the name of the currently configured Hybrid OpenFlow Switch (OFS) instance.

Not including the **system**, **service** or **sap** parameters will specify OF in a GRT instance context by default. This allows embedding of OF rules into filters deployed in GRT instances from OFS with **switch-defined-cookie** disabled, or embedding rules from OFS with **switch-defined-cookie** enabled, when the FlowTable cookie encodes sros-cookie:type "grt-cookie”.

system

Used for OF control of system filters. Allows embedding of OF rules into system filters from OFS with **switch-defined-cookie** enabled. Only the rules with cookie value encoding "system-cookie" are embedded.

service-id

Specifies an existing VPRN or VPLS service ID that the embedding filter can be used for.

service-name — Specifies an existing VPRN or VPLS service name that the embedding filter can be used for.

Values 1 to 2147483647

service-name

Specifies an existing VPRN or VPLS service name up to 64 characters that the embedding filter can be used for.

sap-id

Used for OF control of VPLS services when a PortID and VLAN ID match is required. Allows embedding of OF rules with a PortID and VLAN ID match into exclusive VPLS SAP filters. Only the rules with cookie value encoding the VPLS service, and flow table match encoding the specified SAP, are embedded into the filter. The embedding filter can only be deployed in the context of the specified SAP.

sap-id — Specifies an existing SAP that the embedding filter can be used for.

embedded-rp

Syntax

[**no**] **embedded-rp**

Context

[Tree] (config>router>pim>rp>ipv6 embedded-rp)

Full Context

configure router pim rp ipv6 embedded-rp

Description

Commands in this context configure embedded RP parameters.

Embedded RP is required to support IPv6 inter-domain multicast because there is no MSDP equivalent in IPv6.

The detailed protocol specification is defined in RFC 3956, *Embedding the Rendezvous Point (RP) Address in an IPv6 Multicast Address*. This RFC describes a multicast address allocation policy in which the address of the RP is encoded in the IPv6 multicast group address, and specifies a PIM-SM group-to-RP mapping to use the encoding, leveraging, and extending unicast-prefix-based addressing. This mechanism not only provides a simple solution for IPv6 inter-domain ASM but can be used as a simple solution for IPv6 intra-domain ASM with scoped multicast addresses as well. It can also be used as an automatic RP discovery mechanism in those deployment scenarios that would have previously used the Bootstrap Router protocol (BSR).

The **no** form of this command disables embedded RP.

9.50 enable-admin

enable-admin

Syntax

enable-admin

Context

[Tree] (enable-admin)

Full Context

enable-admin

Description

See the description for the **admin-password** command. If the **admin-password** is configured in the **config>system>security>password** context, then any user can enter a special administrative mode by entering the **enable-admin** command.

enable-admin is in the default profile. By default, all users are given access to this command.

Once the **enable-admin** command is entered, the user is prompted for a password. If the password matches, the user is given unrestricted access to all the commands.

The minimum length of the password is determined by the **minimum-length** command. The complexity requirements for the password are determined by the **complexity** command.

The following shows a password configuration example:

```
A:ALA-1>config>system>security# info
----------------------------------------------
...
            password
                aging 365
                minimum-length 8
                attempts 5 time 5 lockout 20
                admin-password "rUYUz9XMo6I" hash
            exit
...
----------------------------------------------
A:ALA-1>config>system>security#
```

There are two ways to verify that a user is in the enable-admin mode:

- show users — administrator can know which users are in this mode
- Enter the **enable-admin** command again at the root prompt and an error message will be returned.

```
*A:node-1# show users
```

[**no**] **enable-asm-mdt**

Context

[Tree] (config>service>vprn>mvpn>pt>selective enable-asm-mdt)

Full Context

configure service vprn mvpn provider-tunnel selective enable-asm-mdt

Description

This command enables Data MDT with PIM-ASM mode on the receiver PE node. PIM-ASM or PIM-SSM operation mode is derived based on the locally configured SSM range on the node.

If asm-mode is disabled using this command, then PIM-SSM mode is enabled for all groups, independent of the configured SSM range on the node.

Platforms

Full Context

configure service vprn mvpn provider-tunnel inclusive rsvp enable-bfd-root

Description

This command enables unidirectional multi-point BFD session on a sender (Root) PE node for upstream fast failure detection over RSVP-TE P2MP LSP.

Parameters

transmit-interval

Sets the transmit interval, in milliseconds.

Values 10 to 100000

Default 100

multiplier

Sets the multiplier for the BFD session.

Values 3 to 20

Default 3

Platforms

All

enable-bfd-root

Syntax

enable-bfd-root *transmit-interval* [**multiplier** *multiplier*]

no enable-bfd-root

Context

[Tree] (configure>service>vprn>mvpn>pt>inclusive>p2mp-sr enable-bfd-root)

Full Context

configure service vprn mvpn provider-tunnel inclusive p2mp-sr enable-bfd-root

Description

This command enables a unidirectional multi-point BFD session on a sender (Root) PE node for upstream fast failure detection over P2MP SR tree LSP. The node uses the multiplier and the transmit interval parameters to calculate the detection time, which is the period of time without receiving BFD packets after which the session failure is determined.

Default

no enable-bfd-root

Parameters

transmit-interval

Sets the transmit interval, in milliseconds.

Values 10 to 100000

Default 300

multiplier

Sets the multiplier for the transmit interval of the BFD session.

Values 3 to 20

Default 3

enable-dscp-prec-remarking

Syntax

[**no**] **enable-dscp-prec-remarking**

Context

[Tree] (config>qos>sap-egress>policer enable-dscp-prec-remarking)

Full Context

configure qos sap-egress policer enable-dscp-prec-remarking

Description

This command enables DSCP/precedence remarking based on the profile state of a packet being forwarded by a SAP or subscriber egress policer. The DSCP/precedence can be remarked to a value independent of, or separately based on, the packet's profile, if the packet has an exceed, in-profile, or out-of-profile state.

Default

no enable-dscp-prec-remarking

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

9.58 enable-dynamic-services-config

enable-dynamic-services-config

Syntax

[**no**] **enable-dynamic-services-config**

Context

[Tree] (enable-dynamic-services-config)

Full Context

enable-dynamic-services-config

Description

Note:
See also the description for the **dynsvc-password** command.

If the dynsvc-password is configured in the **config>system>security>password** context, then any user can enter a special dynamic services configuration mode by entering the **enable-dynamic-services-config** command.

The **enable-dynamic-services-config** command is not in the default profile. To give access to this command, the user must belong to the administrative profile or a new profile should be created.

Once the **enable-dynamic-services-config** command is entered, the user is prompted for a password. If the password matches, the user is given access to the dynamic services configuration. Access to static configuration is in this case prohibited.

To verify that a user is in the **enable-dynamic-services-config** mode, use the **show users** command. Users in the **enable-dynamic-services-config** mode lists the letter "D" next to the user's CLI session.

The **no** form of this command disables the dynamic services configuration mode for this user.

9.60 enable-fc-collection

enable-fc-collection

Syntax

[**no**] **enable-fc-collection**

Context

[Tree] (config>oam-pm>session>ethernet>lmm enable-fc-collection)

Full Context

configure oam-pm session ethernet lmm enable-fc-collection

Description

This command enables the ETH-LMM test within the OAM-PM session to collect per-FC counters. This command must be used in combination with the **collect-lmm-fc-stats** command for the entity over which the source MEP is defined. The **config**>**oam-pm**>**session**>**ethernet**>**priority** value must match the numerical value that represents the FC name (7 = NC, 6 = H1, 5 = EF, 4 = H2, 3 = L1, 2 = AF, 1 = L2, 0 = BE).

The OAM-PM infrastructure does not validate that the proper counting mode has been configured on the entity that is linked to the source MEP, and does not validate that the FC and priority have been configured. The **show**>**eth-cfm**>**collect-lmm-fc-stats** command may be used to display the entities and the FCs on those entities that have established individual FC counters.

Sessions that launch from the same source MEP must use the same counting model; either **collect-lmm-fc-stats** for individual counters for the defined FCs, or **collect-lmm-stats** for a single all-encompassing counter.

Individual OAM-PM sessions must be configured if multiple Ethernet LMM tests are required for different FCs. Cross-session validation occurs to ensure that a source MEP does not include multiple tests that are using the same priority.

The **no** form of this command removes all previously defined FCs and stops counting for those FCs.

[Tree] (config>service>vprn>bgp>group enable-origin-validation)

Full Context

configure service vprn bgp group neighbor enable-origin-validation

configure service vprn bgp group enable-origin-validation

Description

When this command is added to the configuration of a group or neighbor, it causes every inbound IPv4, IPv6, and label-IPv4 route from that peer to be marked with one of the following origin validation states:

- Valid (0)
- Not-Found (1)
- Invalid (2)

By default (when no family parameter is present in the command) or when all the family options are specified, all unicast IPv4 (AFI1/SAFI1), label-IPv4 (AFI1/SAFI4), and unicast IPv6 (AFI2/SAFI1) routes are evaluated to determine their origin validation states. When only a subset of the family options are present, then only the corresponding address family routes are evaluated.

This command applies to all types of VPRN BGP peers, generally, it should only be applied to EBGP peers and groups that contain only EBGP peers.

The **no** form of this command disables the inspection of received routes from the peer to determine origin validation state.

Default

no enable-origin-validation

Parameters

ipv4

Enables origin validation processing for unlabeled unicast IPv4 routes.

ipv6

Enables origin validation processing for unlabeled unicast IPv6 routes.

label-ipv4

Enables origin validation processing for labeled IPv4 routes.

Platforms

All

Full Context

configure router bgp group enable-origin-validation

configure router bgp group neighbor enable-origin-validation

Description

When the **enable-origin-validation** command is added to the configuration of a group or neighbor, it causes every inbound IPv4 or IPv6 route from that peer to be marked with one of the following origin validation states:

- Valid (0)
- Not-Found (1)
- Invalid (2)

By default (when neither the ipv4 or ipv6 option is present in the command) or when both the ipv4 and ipv6 options are specified, all unicast IPv4 (AFI1/SAFI1), label-IPv4 (AFI1/SAFI4), unicast IPv6 (AFI2/SAFI1), and label-IPv6 (AFI2/SAFI4) routes are evaluated to determine their origin validation states. When only the ipv4 or ipv6 option is present, only the corresponding address family routes (unlabeled and labeled) are evaluated.

The **enable-origin-validation** command applies to all types of BGP peers, but as a general rule, it should only be applied to EBGP peers and groups that contain only EBGP peers.

Default

no enable-origin-validation

Parameters

ipv4

Enables origin validation processing for unlabeled unicast IPv4 routes.

ipv6

Enables origin validation processing for unlabeled unicast IPv6 routes.

label-ipv4

Enables origin validation processing for labeled IPv4 routes.

label-ipv6

Enables origin validation processing for labeled IPv6 routes.

[Tree] (config>router>bgp>group>neighbor enable-peer-tracking)

Full Context

configure router bgp enable-peer-tracking

configure router bgp group enable-peer-tracking

configure router bgp group neighbor enable-peer-tracking

Description

This command enables BGP peer tracking. BGP peer tracking allows a BGP peer to be dropped immediately if the route used to resolve the BGP peer address is removed from the IP routing table and there is no alternative available. The BGP peer will not wait for the holdtimer to expire; therefore, the BGP re-convergence process is accelerated.

The **no** form of this command disables peer tracking.

Default

no enable-peer-tracking

Platforms

All

9.71 enable-rr-vpn-forwarding

enable-rr-vpn-forwarding

Syntax

[**no**] **enable-rr-vpn-forwarding**

Context

[Tree] (config>router>bgp enable-rr-vpn-forwarding)

Full Context

configure router bgp enable-rr-vpn-forwarding

Description

When this command is configured all received VPN-IP routes, regardless of route target, are imported into the dummy VRF, where the BGP next-hops are resolved. The **label-route-transport-tunnel** under **config>router>bgp>next-hop-resolution** determines what types of tunnels are eligible to resolve the next-hops. If a received VPN-IP route from IBGP peer X is resolved and selected as best so that it can be re-advertised to an IBGP peer Y, and the BGP next-hop is modified towards peer Y (by using the next-hop-self command in Y's group or neighbor context or by using a next-hop action in an export policy applied to Y) then BGP allocates a new VPRN service label value for the route, signals that new label value to Y and programs the IOM to do the corresponding label swap operation. The supported combinations of X and Y are outlined below:

- from X (client) to Y (client)
- from X (client) to Y (non-client)
- from X (non-client) to Y (client)

The **no** form of this command causes the re-advertisement of a VPN-IP route between one IBGP peer and another IBGP peer does not cause a new VPRN service label value to be signaled and programmed even if the BGP next-hop is changed through group/neighbor configuration or policy.

Nokia recommends leaving this command disabled for scaling and convergence reasons.

enable-subconfed-vpn-forwarding

Syntax

[**no**] **enable-subconfed-vpn-forwarding**

Context

[Tree] (config>router>bgp enable-subconfed-vpn-forwarding)

Full Context

configure router bgp enable-subconfed-vpn-forwarding

Description

This command configures BGP to keep VPN-IPv4 and VPN-IPv6 routes within a subconfederation and allow a **next-hop-self** command to create label swap forwarding entries.

When this is enabled, the base router BGP instance retains all received VPN-IPv4 and VPN-IPv6 routes, even those with route targets not matching any VRF import policy of any locally configured VPRN. In addition, when this leaf is enabled and base router BGP is configured to apply a **next-hop-self** command to a peer of any type (EBGP, IBGP, or confed-EBGP), the VPN-IPv4 and VPN-IPv6 routes are advertised to the peer with a new BGP label and next-hop, and a label-swap forwarding entry is programmed.The preceding behaviors are applied when the **enable-inter-as-vpn** or the **enable-rr-vpn-forwarding** commands, both under the **configure router bgp** context, are also enabled in the same BGP instance and regardless of whether the base router has a confederation configuration.

The **no** form of this command disables subconfederation VPN forwarding.

configure service vpls sap egress encap-defined-qos

Description

This command creates a new QoS sub-context in B-VPLS SAP egress context. The user can define encapsulation groups, referred to as encap-group, based on the ISID value in the packet's encapsulation and assign a QoS policy and a scheduler policy or aggregate rate limit to the group.

Platforms

All

9.77 encap-group

encap-group

Syntax

encap-group *group-name* [**type** *group-type*] [**qos-per-member**] [**create**]

no encap-group *group-name*

Context

[Tree] (config>service>vpls>sap>egress>encap-defined-qos encap-group)

Full Context

configure service vpls sap egress encap-defined-qos encap-group

Description

This command defines an encapsulation group which consists of a group of ISID values. All packets forwarded on the egress of a B-VPLS SAP which payload header matches one of the ISID value in the encap-group will use the same QoS policy instance and scheduler policy or aggregate rate limit instance.

The user adds or removes members to the encap-group one at a time or as a range of contiguous values using the member command. However, when the qos-per-member option is enabled, members must be added or removed one at a time. These members are also referred to as ISID contexts.

The user can configure one or more encap-groups in the egress context of the same B-SAP, therefore defining different ISID values and applying each a different SAP egress QoS policy, and optionally a different scheduler policy/**agg-rate**. ISID values are unique within the context of a B-SAP. The same ISID value cannot be re-used in another encap-group under the same B-SAP but can be re-used in an encap-group under a different B-SAP. Finally, if the user adds to an encap-group an ISID value which is already a member of this encap-group, the command causes no effect. The same if the user attempts to remove an ISID value which is not a member of this encap-group.

Once a group is created, the user will assign a SAP egress QoS policy, and optionally a scheduler policy or aggregate rate limit, using the following commands:

config>service>vpls>sap>egress>encap-defined-qos>encap-group>qos *sap-egress-policy-id*

config>service>vpls>sap>egress>encap-defined-qos>encap-group>scheduler-policy *scheduler-policy-name*

config>service>vpls>sap>egress>encap-defined-qos>encap-group>agg-rate *kilobits-per-second*

A SAP egress QoS policy must first be assigned to the created encap group before the user can add members to this group. Conversely, the user cannot perform the **no qos** command until all members are deleted from the encap-group.

An explicit or the default SAP egress QoS policy continues to be applied to the entire B-SAP but this will serve to create the set of egress queues which are used to store and forward a packet which does not match any of the defined ISID values in any of the encap-groups for this SAP.

Only the queue definition and fc-to-queue mapping from the encap-group SAP egress QoS policy is applied to the ISID members. All other parameters configurable in a SAP egress QoS policy must be inherited from egress QoS policy applied to the B-SAP.

Furthermore, any other CLI option configured in the egress context of the B-SAP continues to apply to packets matching a member of any encap-group defined in this B-SAP.

The keyword **qos-per-member** allows the user to specify that a separate queue set instance and scheduler/**agg-rate** instance will be created for each ISID value in the encap-group. By default, shared instances will be created for the entire encap-group.

When the B-SAP is configured on a LAG port, the ISID queue instances defined by all the encap-groups applied to the egress context of the SAP will be replicated on each member link of the LAG. The set of scheduler/**agg-rate** instances will be replicated per link or per IOM or XMA depending if the adapt-qos option is set to link/port-fair mode or distribute mode. This is the same behavior as that applied to the entire B-SAP in the current implementation.

The **no** form of this command deletes the encap-group.

Parameters

group-name

Specifies the name of the encap-group and can be up to 32 ASCII characters in length

type

Specifies the type of the encapsulation ID used by this encap-group

Values isid

qos-per-member

Specifies that a separate queue set instance and scheduler/**agg-rate** instance will be created for each ISID value in the encap-group

Full Context

configure port ethernet dot1x macsec sub-port encap-match

Description

This command defines the sub-set of traffic on this port affected by this MACsec sub-port.

In order to establish an end-to-end communication between the remote MACsec peers encrypting VLAN-tagged traffic, the MKA packets have to be able to travel over the network following the same path as the encrypted traffic. MKA packets are generated with specific tags depending on the traffic match criteria configured, as shown in Table 30: MKA Packet Generation .

The **no** form of this command removes all traffic sub-set definitions from the MACsec sub-port.

Table 30: MKA Packet Generation

Configuration	Config Example (<s-tag>.<c-tag>)	MKA Packet Generation	Traffic pattern match/behavior
PORT all-encap	Config>port>ethernet>dot1x>macsec Sub-port 10 encap-match all-encap ca-name 10	untagged MKA packet	Matches all traffic on the port, including untagged, single-tag, double-tag. This is the Release 15.0 default behavior.
Untagged	Config>port>ethernet>dot1x>macsec Sub-port 1 encap-match untagged ca-name 2	untagged MKA packet	Matches only untagged traffic on the port
802.1Q single S-TAG (specific S-TAG)	Config>port>ethernet>dot1x>macsec Sub-port 2 encap-match dot1q 1 ca-name 3	MKA packet generated with S-TAG=1	Matches only single-tag traffic on port with tag ID of 1
802.1Q single S-TAG (any S-TAG)	Config>port>ethernet>dot1x>macsec Sub-port 3 encap-match dot1q * ca-name 4	untagged MKA packet	Matches any single-tag traffic on port
802.1ad double tag (both tag have specific TAGs)	Config>port>ethernet>dot1x>macsec Sub-port 4 encap-match qinq 1.1 ca-name 5	MKA packet generated with S-tag=1 and C-TAG=1	Matches only double-tag traffic on port with service tag of 1 and customer tag of 1
802.1ad double tag (specific S-TAG, any C-TAG)	Config>port>ethernet>dot1x>macsec Sub-port 6 encap-match qinq 1.* ca-name 7	MKA packet generated with S-TAG=1	Matches only double-tag traffic on port with service tag of 1 and customer tag of any
802.1ad double tag (any S-TAG, any C-TAG	Config>port>ethernet>dot1x>macsec Sub-port 7 encap-match double-tag *.* ca-name 8	untagged MKA packet	Matches any double-tag traffic on port

Default

encap-match all-encap

Parameters

all-encap

Specifies that all traffic patterns are matched including untagged, single-tag or double-tag, and all will be encrypted.

untagged

Specifies that only untagged traffic are matched and encrypted.

single-tag

Specifies that only dot1q traffic are matched. Either all single tag traffic can be matched, by using *, or a specific dot1q tag can be matched.

double-tag

Specifies that only qinq traffic are matched. The service tag can be specifically matched or a wild card match (*.*) can be used.

encap-value

Specifies the type and value of the packet encapsulation to match for this MACsec sub-port.

Type	Parameter
all-encap	—
untagged	—
dot1q	[*| s] (s = 0..4094)
qinq	[*.*| s.*| s.c] (s and c = 0..4094)

where:

- S = service tag
- C = customer tag

Full Context

configure subscriber-mgmt sub-profile egress encap-offset

Description

This command enables the adjustment of the queue and subscriber aggregate rate based on the last mile Ethernet or ATM encapsulation.

The data path computes the adjusted frame size real-time for each serviced packet from a queue by adding the actual packet size to the fixed offset provided by CPM for this queue and variable AAL5 padding.

When this command is enabled, the fixed packet offset is derived from the encapsulation type value signaled in the Access-loop-encapsulation sub-TLV in the Vendor-Specific PPPoE Tags or DHCP Relay Options as per RFC 4679. If the user specifies an encapsulation type with the command, this value is used as the default value for all hosts of this subscriber until a host session signaled a valid value. The signaled value is applied to this host only and the remaining hosts of this subscriber continue to use the user entered default type value if configured, or no offset is applied. However, hosts of the same subscriber using the same SLA profile and which are on the same SAP will share the same instance of FC queues. In this case, the last valid encapsulation value signaled by a host of that same instance of the SAP egress QoS policy will override any previous signaled or configured value.

If the user manually applied a constant byte offset to each packet serviced by the queue by configuring the packet-byte-offset, it will have no effect on the net offset computed for the packet. This net offset is stored in the subscriber host table.

The procedures for handling signaling changes or configuration changes affecting the subscriber profile are as follows:

The avg-frame-size parameter in the subscriber profile is ignored.

If the user specifies an encapsulation type with the command, this value is used as the default value for all hosts of this subscriber until a host session signaled a valid value. The signaled value is applied to this host and other hosts of the same subscriber sharing the same SLA profile and which are on the same SAP. The remaining hosts of this subscriber continue to use the user entered default type value if configured, or no offset is applied.

If the user enables/disables the encap-offset option, or changes the parameter value of the encap-offset option, CPM immediately triggers a re-evaluation of subscribers hosts using the corresponding subscriber profile and an update the IOM with the new fixed offset value.

If a subscriber has a static host or an ARP host, the subscriber host continues to use the user-configured default encapsulation type value or the last valid encapsulation value signaled in the PPPoE tags or DHCP relay options by other hosts of the same subscriber which use the same SLA profile instance. If none was signaled or configured, then no rate adjustment is applied.

When the encap-offset option is configured in the subscriber profile, the subscriber host queue rates, that is, CLI and operational PIR and CIR as well as queue bucket updates, the queue statistics, that is, forwarded, dropped, and HQoS offered counters use the last-mile frame-over-the-wire format. The scheduler policy CLI and operational rates also use LM-FoW format. The port scheduler max-rate and the priority level rates and weights, if a Weighted Scheduler Group is used, are always entered in CLI and

interpreted as local port frame-over-the-wire rates. The same is true for an agg-rate-limit applied to a Vport. Finally the subscriber agg-rate-limit is entered in CLI as last-mile frame-over-the-wire rate. The system maintains a running average frame expansion ratio for each queue to convert queue rates between these two formats.

The **no** form of this command reverts to the default.

Parameters

type

The name of the default encapsulation used for all host queues of a subscriber in the absence of a valid value signaled in the PPPoE tags.

Values pppoa-llc, pppoa-null, pppoeoa-llc, pppoeoa-llc-fcs, pppoeoa-llc-tagged, pppoeoa-llc-tagged-fcs, pppoeoa-null, pppoeoa-null-fcs, pppoeoa-null-tagged, pppoeoa-null-tagged-fcs, ipoa-llc, ipoa-null, ipoeoa-llc, ipoeoa-llc-fcs, ipoeoa-llc-tagged, ipoeoa-llc-tagged-fcs, ipoeoa-null, ipoeoa-null-fcs, ipoeoa-null-tagged, ipoeoa-null-tagged-fcs, pppoe, pppoe-tagged, ipoe, ipoe-tagged

Full Context

configure subscriber-mgmt local-user-db ppp host access-loop-encapsulation encap-offset

Description

This command is applicable within the LAC/LNS context. It provides the last mile link encapsulation information that is needed for proper (shaping) rate calculations and interleaving delay in the last mile.

The encapsulation value will be taken from the following sources in the order of priority:

- Statically provisioned value in local user database (LUDB).
- RADIUS
- PPPoE tags on LAC or ICRQ message (RFC 5515) on LNS

In case that the encapsulation information is not provided by any of the existing means (LUDB, RADIUS, AVP signaling, PPPoE Tags), then by default pppoea-null encapsulation will be in effect.

The following values are supported encapsulation values on LNS in the 7750 SR.

encap-type:

pppoa-llc	LLC (NLPID) PPPoA encapsulation.
pppoa-null	VC-MUX PPPoA encapsulation.
pppoeoa-llc	LLC/SNAP based bridged Ethernet PPPoEoA encapsulation without FCS.
pppoeoa-llc-fcs	LLC/SNAP based bridged Ethernet PPPoEoA encapsulation with FCS.
pppoeoa-null	VC-MUX PPPoEoA encapsulation without FCS.
pppoeoa-null-fcs	VC-MUX PPPoEoA encapsulation with FCS.
pppoe	PPPoE encapsulation.
pppoe-tagged	Tagged PPPoE Encapsulation.

The values are not supported encapsulation values on LNS in the 7750 SR.

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification encap-tag-range

configure subscriber-mgmt local-user-db ppp host host-identification encap-tag-range

Description

This command specifies a range of encapsulation tags as the host identifications. The encapsulation tag is dot1q or qinq on Ethernet port.

For dot1q, the start/end-tag is single number, range from 0-4094; for QinQ, the start/end-tag format is x.y, x or y could be "*", which means ignore inner or outer tag.

Note:
This command is only used when **encap-tag-range** is configured as one of the **match-list** parameters.

The **no** form of this command removes the encapsulation tag range from the configuration.

Parameters

start-tag *start-tag*

Specifies the value of the start label in the range of SAPs allowed on this host.

Values	*start-tag*	dot1q	qtag1
		qinq	(qtag1.qtag2 | qtag1.* | *.qtag2)

end-tag *end-tag*

Specifies the value of the end label in the range of SAPs allowed on this host.

Values	*end-tag*	dot1q	qtag1
		qinq	(qtag1.qtag2 | qtag1.* | *.qtag2)

Description

This command configures the encoding applied to the HTTP header enrichment field.

The **no** form of this command removes the encoding.

Default

no encode

Parameters

type

Specifies whether the parameters are hashed with MD5, encrypted with RC4 or AES using the configured key, or if certificate-based encryption is used with RSA.

Values md5, rc4, certificate, cert-base64, rc4md5-base64, aes128, aes256, aes128cbc, aes256cbc

key

Specifies the key string, 64 characters maximum.

hash-key

Specifies the first hashed key.

hash-key2

Specifies the second hashed key.

hash

Specifies that the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies that the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

cert-profile-name

Specifies the name of the certificate profile to use. This profile must have already been created using the **certificate-profile** command.

bof encryption-key

Description

This command creates a key to be used by AES256 and SHA256 for configuration file encryption and hashing. This key is used for all configuration files (primary, secondary, and tertiary).

After creating or deleting a key, use the **admin save** command to save the configuration file with the current encryption key state.

The **no** form of this command deletes the encryption key.

Default

no encryption-key

Parameters

key

Specifies the encryption key.

If the **hash**, **hash2**, or **custom** parameter is not configured, the key is entered in plaintext and the key length must be between 8 and 32 characters. A plaintext key cannot contain embedded nulls or end with " hash", " hash2", or " custom".

If the **hash**, **hash2**, or **custom** parameter is configured, the key is hashed and the key length must be between 1 and 64 characters.

hash

Keyword to specify that the key is entered in an encrypted form.

hash2

Keyword to specify that the key is entered in a more complex encrypted form. The **hash2** encryption scheme is node-specific and the key cannot be transferred between nodes.

custom

Keyword to specify that the key uses custom encryption.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

encryption-key

Syntax

encryption-key *key* [**hash** | **hash2** | **custom**]

no encryption-key

Context

[Tree] (config>log encryption-key)

Full Context

configure log encryption-key

Description

This command specifies the encryption key used by AES-256-CTR for log file encryption. The encryption key is used for all local log files on the system.

The **no** form of this command deletes the encryption key.

Default

no encryption-key

Parameters

key

Specifies the encryption key.

If the **hash**, **hash2**, or **custom** parameter is not configured, the key is entered in plaintext and the key length must be between 8 and 32 characters. A plaintext key cannot contain embedded nulls or end with " hash", " hash2", or " custom".

If the **hash**, **hash2**, or **custom** parameter is configured, the key is hashed and the key length must be between 1 and 64 characters.

hash

Keyword to specify that the key is entered in an encrypted form.

hash2

Keyword to specify that the key is entered in a more complex encrypted form. The **hash2** encryption scheme is node-specific and the key cannot be transferred between nodes.

custom

Keyword to specify that the key uses custom encryption.

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>group-encryption encryption-keygroup)

Full Context

configure service vprn subscriber-interface group-interface wlan-gw group-encryption encryption-keygroup

configure service ies subscriber-interface group-interface wlan-gw group-encryption encryption-keygroup

Description

This command binds an encryption key-group to a WLAN-GW soft-GRE group interface. When configured in the inbound direction, received packets must be encrypted using one of the valid security-associations configured for the key-group. When configured in the outbound direction, L2oMPLSoGRE packets egressing the node use the "active-outbound-sa" associated with the key-group configured.

The **no** form of this command removes the encryption keygroup from the inbound or outbound group interface.

Parameters

keygroup-id

Specifies the ID number or name of the keygroup.

Values 1 to 127, *keygroup-name* up to 64 characters

direction

Applies the keygroup to the inbound or outbound direction of a service.

Values inbound | outbound

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

encryption-keygroup

Syntax

encryption-keygroup *keygroup-id* **direction** {**inbound** | **outbound**}

no encryption-keygroup direction {**inbound** | **outbound**}

Context

[Tree] (config>router>if>group-encryption encryption-keygroup)

Full Context

configure router interface group-encryption encryption-keygroup

Description

This command is used to bind a key group to a router interface for inbound or outbound packet processing. When configured in the outbound direction, packets egressing the router use the **active-outbound-sa** associated with the configured key group. When configured in the inbound direction, received packets must be encrypted using one of the valid security associations configured for the key group.

The **no** form of this command removes the key group from the router interface in the specified direction.

Default

no encryption-keygroup direction inbound

no encryption-keygroup direction outbound

Parameters

keygroup-id

The ID number of the key group being configured.

Values 1 to 127, *keygroup-name* (64 characters maximum)

inbound

Binds the key group in the inbound direction.

outbound

Binds the key group in the outbound direction.

Platforms

VSR

encryption-keygroup

Syntax

encryption-keygroup *keygroup-id* [**create**]

no encryption-keygroup *keygroup-id*

Context

[Tree] (config>grp-encryp encryption-keygroup)

Full Context

configure group-encryption encryption-keygroup

Description

This command is used to create a key group. Once the key group is created, use the command to enter the key group context or delete a key group.

The **no** form of the command removes the key group. Before using the **no** form, the key group association must be deleted from all services that are using this key group.

Parameters

keygroup-id

The number or name of the key group being referenced.

Values 1 to 15, or *keygroup-name* (up to 64 characters)

create

Creates a key group.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

encryption-keygroup

Syntax

encryption-keygroup *keygroup-id* **direction** {**inbound** | **outbound**}

no encryption-keygroup direction {**inbound** | **outbound**}

Context

[Tree] (config>service>sdp encryption-keygroup)

Full Context

configure service pw-template encryption-keygroup

configure service vprn encryption-keygroup

configure service sdp encryption-keygroup

Description

This command is used to bind a key group to an SDP, VPRN service, or PW template for inbound or outbound packet processing. When configured in the outbound direction, packets egressing the node

use the **active-outbound-sa** associated with the key group configured. When configured in the inbound direction, received packets must be encrypted using one of the valid security associations configured for the key group. Services using the SDP will be encrypted.

The encryption (enabled or disabled) configured on an SDP used to terminate a Layer 3 spoke SDP of a VPRN always overrides any VPRN-level configuration for encryption.

Encryption is enabled after the outbound direction is configured.

For PW template changes, the following **tools** command must be executed after the configuration changes are made: **tools**>**perform**>**service**>**eval-pw-template**>**allow-service-impact**. This command applies the changes to services that use the PW template.

The **no** form of the command removes the key group from the SDP or service in the specified direction (inbound or outbound).

Parameters

keygroup-id

Specifies the number of the key group being configured.

Values 1 to 15 or *keygroup-name* (up to 64 characters)

direction {inbound | outbound}

Specifies the direction of the service that the key group will be bound to.

Platforms

VSR

encryption-offset

Syntax

encryption-offset *encryption-offset*

no encryption-offset

Context

[Tree] (config>macsec>connectivity-association encryption-offset)

Full Context

configure macsec connectivity-association encryption-offset

Description

This command specifies the offset of the encryption in MACsec packet.

The encryption-offset is distributed by MKA (Key-server) to all parties.

It is signaled via MACsec capabilities. There are four basic settings for this. Table 31: MACsec Basic Settings breaks down the settings.

Table 31: MACsec Basic Settings

Setting	Description
0	MACsec is not implemented
1	Integrity without confidentiality
2	The following are supported: • Integrity without confidentiality • Integrity and confidentiality with a confidentiality offset of 0
3	The following are supported: • Integrity without confidentiality • Integrity and confidentiality with a confidentiality offset of 0, 30, or 50

Note:

1. SR OS supports setting (3) Integrity without confidentiality and Integrity and confidentiality with a confidentiality offset of 0, 30, or 50.

The **no** form of this command rejects all arriving traffic whether MACsec is secured or not.

Default

encryption-offset 0

Parameters

encryption-offset

Specifies the encryption.

Values 0 — encrypt the entire payload
30 — leave the IPv4 header in clear
50 — leave the IPv6 header in clear

Syntax

[**no**] **end** *function-value*

Context

[Tree] (config>router>segment-routing>srv6>inst>loc>func end)

Full Context

configure router segment-routing segment-routing-v6 base-routing-instance locator function end

Description

Commands in this context configure the value and attributes of SRv6 End SID function of a locator. The End SID function encodes the basic behavior of a prefix or a node SID.

The End SID function for each SRH mode must be statically allocated. The value is not automatically allocated by default.

The **no** form of this command removes the specified End function.

Parameters

function-value

Specifies an SRv6 End SID function value. Up to eight values can be configured per locator. Statically allocated functions of all SID types in a locator have their value upper range limited by parameter **locator function-length static-function max-entries**.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

9.91 end-dt2m

end-dt2m

end-dt2m [*function-value*]

no end-dt2m

Context

[Tree] (config>service>vpls>srv6>locator>function end-dt2m)

Full Context

configure service vpls segment-routing-v6 locator function end-dt2m

Description

This command configures the SRv6 End.DT2M behavior and function value that is associated to the SRv6 instance in the service. This means that decapsulation and table lookup for IPv6 prefixes occurs in the VPLS service.

The **no** form of this command removes the function behavior and value from the configuration.

Default

no end-dt2m

Parameters

function-value

Specifies the optional static function value that is associated to the function behavior. Statically allocated functions of all SID types in a locator have their value upper range limited by parameter **locator function-length static-function max-entries**. If not configured, the system allocates a value dynamically. Auto-allocated service function values have an upper range limited by the maximum service function length of 20-bits that is used in the datapath lookup for service functions.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Full Context

configure system security keychain direction uni receive entry end-time

Description

This command specifies the calendar date and time after which the key specified by the authentication key is no longer eligible to sign or authenticate the protocol stream.

Default

end-time forever

Parameters

date

Specifies the calendar date after which the key specified by the authentication key is no longer eligible to sign or authenticate the protocol stream in the YYYY/MM/DD format. When no year is specified the system assumes the current year.

hours-minutes

Specifies the time after which the key specified by the authentication key is no longer eligible to sign or authenticate the protocol stream in the hh:mm[:ss] format. Seconds are optional, and if not included, assumed to be 0.

UTC

Indicates that time is given with reference to Coordinated Universal Time in the input.

now

Specifies a time equal to the current system time.

forever

Specifies that the key is always active.

Platforms

All

9.101 end-x

end-x

Syntax

[**no**] **end-x** *function-value*

Context

[Tree] (config>router>segment-routing>srv6>inst>loc>func end-x)

Full Context

configure router segment-routing segment-routing-v6 base-routing-instance locator function end-x

Description

Commands in this context configure the attributes of the End.X SID function associated with a P2P interface. The End.X SID function encodes the behavior of an adjacency SID.

A static function value can be configured for each combination of SRH mode and protection type.

For a given interface, the static function value associated with the same combination of protection type and SRH mode overrides any corresponding automatically allocated function value (**end-x-auto-allocate** command configuration).

If more than one value is configured for an interface and combination of SRH mode and protection type, they are all advertised in IS-IS.

When used in remote TI-LFA repair tunnel programming, IS-IS uses rules to select one End.X value from the multiple values received in IS-IS link advertisements.

Values assigned to loopback and system interfaces are not advertised in IS-IS.

End.X SID functions for adjacencies over broadcast interfaces are always automatically allocated based on the configuration of the **end-x-auto-allocate** command.

The **no** form of this command removes the function value from the configuration.

Parameters

function-value

Specifies the SRv6 End.X function. Statically allocated functions of all SID types in a locator have their value upper range limited by parameter **locator function-length static-function max-entries**.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

9.102 end-x-auto-allocate

end-x-auto-allocate

Syntax

[**no**] **end-x-auto-allocate srh-mode** *srh-mode* **protection** *protection*

Context

[Tree] (config>router>segment-routing>srv6>inst>loc>func end-x-auto-allocate)

Full Context

configure router segment-routing segment-routing-v6 base-routing-instance locator function end-x-auto-allocate

Description

This command adds a list entry for the automatic allocation of the End.X SID function for all adjacencies over all network interfaces on the router (P2P and broadcast interfaces). Auto-allocated End.X SID function values have a range up to the maximum value of parameter **function-length** in a locator configuration.

A list entry is a combination of the protection type and the SRH mode. Any combinations in addition to the maximum number of entries supported by this command must be allocated statically for each P2P interface. The maximum number of entries in this list is two.

When no list entries are configured, no End.X function values are automatically allocated by default for a locator.

Note:
Any change to this list causes a reallocation of new function values to all interfaces on the router that results in flooding them to the network and triggers a new SPF in all routers.

The **no** form of this command removes a list entry.

Parameters

srh-mode

Specifies the SRH mode for the SID.

Values psp — Penultimate Segment Pop (PSP) of the SRH

usp — Ultimate Segment Pop (USP) of the SRH

psp-usd — Supports both PSP of the SRH and Ultimate Segment Decapsulation (USD) on the same SID

usp-usd — Supports both USP of the SRH and USD on the same SID

psp-usp-usd — Supports PSP and USP of the SRH with USD on the same SID

protection

Specifies if the adjacency SID is protected.

Values protected, unprotected

Full Context

configure service vprn l2tp group mlppp endpoint

configure subscriber-mgmt ppp-policy mlppp endpoint

configure router l2tp group mlppp endpoint

configure service vprn l2tp group tunnel mlppp endpoint

configure router l2tp group tunnel mlppp endpoint

Description

When configured under the l2tp hierarchy, this command is applicable to LNS.

Within the ppp-policy, this command is applicable only to LAC.

The endpoint, according to RFC 1990, represents the system transmitting the packet. It is used during MLPPPoX negotiation phase to distinguish this peer from all others.

In the case that the client rejects the endpoint option during LCP negotiation, the LAC and the LNS must be able to negotiate the LCP session without the endpoint option.

The **no** form of this command disables sending endpoint option in LCP negotiation.

Parameters

ip-address

Specifies the IPv4 address (class 2).

system-ip

Specifies to use the system IPv4 address (class 2).

ieee-address

Specifies the MAC address of the interface (class 3).

system-mac

Specifies to use the MAC address of the system (class 3).

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

endpoint

Syntax

endpoint *endpoint-name* [**create**]

no endpoint *endpoint-name*

Full Context

configure service vpls endpoint

Description

This command configures a service endpoint.

Parameters

endpoint-name

Specifies an endpoint name up to 32 characters in length

create

This keyword is mandatory while creating a service endpoint

Platforms

All

endpoint

Syntax

endpoint *ip-address*

no endpoint

Context

[Tree] (config>router>mpls>fwd-policies>fwd-policy endpoint)

Full Context

configure router mpls forwarding-policies forwarding-policy endpoint

Description

This command configures the endpoint address for an MPLS forwarding policy.

The policy allows the user to forward unlabeled packets over a set of user-defined direct (with option to push a label stack) or indirect next hops. Routes are bound to an endpoint policy when their next hop matches the endpoint address of the policy.

The **no** form of the command removes the endpoint from the MPLS forwarding policy.

Parameters

ip-address

Specifies the destination IPv4 or IPv6 address.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D

Context

[Tree] (config>mirror>mirror-dest>sdp endpoint)

[Tree] (config>mirror>mirror-dest endpoint)

[Tree] (config>mirror>mirror-dest>sap endpoint)

Full Context

configure mirror mirror-dest sdp endpoint

configure mirror mirror-dest endpoint

configure mirror mirror-dest sap endpoint

Description

This command configures a service end point. A mirror service supports two implicit endpoints managed internally by the system. The following applies to endpoint configurations.

Up to two named endpoints may be created per service mirror or LI service. The endpoint name is locally significant to the service mirror or LI service.

- Objects (SAPs or SDPs) may be created on the service mirror or LI with the following limitations:
  - two implicit endpoint objects (without explicit endpoints defined)
  - one implicit and multiple explicit object with the same endpoint name
  - multiple explicit objects each with one of two explicit endpoint names
- All objects become associated implicitly or indirectly with the implicit endpoints 'x' and 'y'.
- Objects may be created without an explicit endpoint defined.
- Objects may be created with an explicit endpoint defined.
- Objects without an explicit endpoint may have an explicit endpoint defined without deleting the object.
- Objects with an explicit endpoint defined may be dynamically moved to another explicit endpoint or may have the explicit endpoint removed.

Creating an object without an explicit endpoint:

- If an object on a mirror or LI service has no explicit endpoint name associated, the system attempts to associate the object with implicit endpoint 'x' or 'y'.
- The implicit endpoint cannot have an existing object association.
- If both 'x' and 'y' are available, 'x' is selected.
- If an 'x' or 'y' association cannot be created, the object cannot be created.

Creating an object with an explicit endpoint name:

- The endpoint name must exist on the mirror or LI service.
- If this is the first object associated with the endpoint name:
  - the object is associated with either implicit endpoint 'x' or 'y'
  - the implicit endpoint cannot have an existing object associated
  - if both 'x' and 'y' are available, 'x' is selected
  - if 'x' or 'y' is not available, the object cannot be created
  - the implicit endpoint is now associated with the named endpoint
  - f this is not the first object associated with the endpoint name:
  - the object is associated with the named endpoint's implicit association

Changing an object’s implicit endpoint to an explicit endpoint name

- If the explicit endpoint name is associated with an implicit endpoint, the object is moved to that implicit endpoint
- If the object is the first to be associated with the explicit endpoint name:

- the object is associated with either implicit endpoint 'x' or 'y'
- the implicit endpoint cannot have an existing object associated (except this one)
- if both 'x' and 'y' are available, 'x' is selected
- if 'x' or 'y' is not available, the object cannot be moved to the explicit endpoint
- if moved, the implicit endpoint is now associated with the named endpoint

Changing an object's explicit endpoint to another explicit endpoint name

- If the new explicit endpoint name is associated with an implicit endpoint, the object is moved to that implicit endpoint
- If the object is the first to be associated with the new explicit endpoint name:
  - the object is associated with either implicit endpoint 'x' or 'y'
  - the implicit endpoint cannot have an existing object associated (except this one)
  - if both 'x' and 'y' are available, 'x' is selected
  - if 'x' or 'y' is not available, the object cannot be moved to the new endpoint
  - if moved, the implicit endpoint is now associated with the named endpoint

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB sdp is allowed. The ICB sdp cannot be added to the endpoint if the SAP is not part of a MC-LAG instance. Conversely, a SAP which is not part of a MC-LAG instance cannot be added to an endpoint which already has an ICB sdp.

An explicitly named endpoint which does not have a SAP object can have a maximum of four SDPs which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

The user can only add a SAP configured on a MC-LAG instance to this endpoint. Conversely, the user will not be able to change the mirror service type away from mirror service without first deleting the MC-LAG SAP.

The **no** form of this command removes the association of a SAP or an SDP with an explicit endpoint name. When removing an objects explicit endpoint association:

- The system attempts to associate the object with implicit endpoint 'x' or 'y'.
- The implicit endpoint cannot have an existing object association (except this one).
- If both 'x' and 'y' are available, 'x' is selected.
- If an 'x' or 'y' association cannot be created, the explicit endpoint cannot be removed.

Parameters

endpoint-name

Specifies the endpoint name.

create

Mandatory keyword to create this entry.

Platforms

All

endpoint

Syntax

endpoint *ip-address*

no endpoint

Context

[Tree] (conf>router>segment-routing>sr-policies>policy endpoint)

Full Context

configure router segment-routing sr-policies static-policy endpoint

Description

This command associates an IPv4 or IPv6 endpoint address with a statically-defined segment routing policy. This association is mandatory when enabling an SR segment-routing policy.

The endpoint address 0.0.0.0 is a special value that matches all BGP next-hops. To use it, the BGP route must have a color-extended community with the color-only bits set to '01' or '10'.

The **no** form of this command removes the endpoint association.

Default

no endpoint

Parameters

ip-address

Specifies the endpoint IP address to be associated with the statically-defined segment-routing policy.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

Platforms

All

endpoint

Syntax

endpoint *ip-address*

no endpoint

Context

[Tree] (config>router>policy-options>policy-statement>entry>from endpoint)

Full Context

configure router policy-options policy-statement entry from endpoint

Description

This command configures an SR Policy endpoint address as a route policy match criterion. This match criterion is only used in import policies.

The **no** form of this command removes the endpoint IP match criterion from the configuration.

Parameters

ip-address

Specifies the IPv4 or IPv6 address.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x [-interface]
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D

Platforms

All

9.104 endstation-vid-group

endstation-vid-group

Syntax

endstation-vid-group *id* **vlan-id** *startvid-endvid*

no endstation-vid-group *id*

Context

[Tree] (config>service>vpls>mrp>mvrp endstation-vid-group)

Full Context

configure service vpls mrp mvrp endstation-vid-group

Description

This command specifies the range of VLAN IDs that are controlled by MVRP on the port associated with the parent SAP. When the command is present under a certain SAP, the MVRP will treat the associated virtual port as an end-station.

MVRP endstation behavior means that configuration of a new data SAP with the outer tag in the configured endstation-vid-group will generate down that virtual port a MVRP declaration for the new [outer] VLAN attribute. Also registration received for the VLAN attribute in the range will be accepted but not propagated in the rest of MVRP context.

VPLS-groups are not allowed under the associated Management VPLS (M-VPLS) when the endstation is configured under one SAP. VPLS-groups can be supported in the chassis using a different M-VPLS.

The **no** form of this command removes the specified group id.

Default

no endstation-vid-group

Parameters

id

Specifies the range index

Values 1 to 4094

startvid-endvid

Specifies the range of VLANs to be controlled by MVRP

Values 1 to 4094

Platforms

All

9.105 enforce-diffserv-lsp-fc

enforce-diffserv-lsp-fc

Syntax

[**no**] **enforce-diffserv-lsp-fc**

Context

[Tree] (config>service>sdp>class-forwarding enforce-diffserv-lsp-fc)

Full Context

configure service sdp class-forwarding enforce-diffserv-lsp-fc

Description

This command enables checking by RSVP that a Forwarding Class (FC) mapping to an LSP under the SDP configuration is compatible with the Diff-Serv Class Type (CT) configuration for this LSP.

When the user enables this option, the service manager inquires with RSVP if the FC is supported by the LSP. RSVP checks if the FC maps to the CT of the LSP, for example, the default class-type value or the class-type value entered at the LSP configuration level.

If RSVP did not validate the FC, then the service manager will return an error and the check has failed. In this case, packets matching this FC will be forwarded over the default LSP. Any addition of an LSP to an SDP that will not satisfy the FC check will also be rejected.

The service manager does not validate the default-lsp FC-to-CT mapping. Whether or not the FC is validated, the default-lsp will always end up being used in this case.

RSVP will not allow the user to change the CT of the LSP until no SDP with class-based forwarding enabled and the **enforce-diffserv-lsp-fc** option enabled is using this LSP. All other SDPs using this LSP are not concerned by this rule.

The SDP will continue to enforce the mapping of a single LSP per FC. However, when **enforce-diffserv-lsp-fc** enabled, RSVP will also enforce the use of a single CT per FC as per the user configured mapping in RSVP.

If class-forwarding is enabled but **enforce-diffserv-lsp-fc** is disabled, forwarding of the service packets will continue to be based on the user entered mapping of FC to LSP name without further validation as per the existing implementation. The CT of the LSP does not matter in this case.

If class-forwarding is not enabled on the SDP, forwarding of the service packets will continue to be based on the ECMP/LAG hash routine. The CT of the LSP does not matter in this case.

The **no** form of this command reverts to the default value which is to use the user entered mapping of FC to LSP name.

Full Context

configure service vprn bgp enforce-first-as

configure service vprn bgp group neighbor enforce-first-as

configure service vprn bgp group enforce-first-as

Description

When this command is configured so that it applies to an EBGP session, all routes (belonging to all address families) that are received from the EBGP peer are checked to ensure that the most recent autonomous system number (ASN) in the AS_PATH attribute of each route matches the configured **peer-as** of the session; if it does not match, then either the session is reset (if **update-fault-tolerance** is not enabled) or the session is left up but the route is treated as withdrawn (if **update-fault-tolerance** is enabled).

Enabling or disabling this command on a session that is already up does not flap the session. When **enforce-first-as** is enabled, previously received routes are not checked for compliance with the rule. Enforcement applies only to routes received after the command is enabled and stops when the command is disabled.

enforce-unique-if-index

Syntax

[**no**] **enforce-unique-if-index**

Context

[Tree] (config>system>ip enforce-unique-if-index)

Full Context

configure system ip enforce-unique-if-index

Description

This command enables the options to force the creation of IP interface indexes so that they are globally unique across all routing contexts. In addition, the command ensures that any interface created using SNMP also has a system-wide unique IP interface index.

If this command is issued but the system has previously existing interface indexes that conflict, the command will be rejected until all the conflicts are removed. Pre-existing persistency tables should also be removed before enabling this system option.

The **no** form of the command disables this option and returns the system to the default behavior.

Default

no enforce-unique-if-index

Platforms

All

9.110 enforcement

enforcement

Syntax

enforcement {**static** *policer-name* | **dynamic** {*mon-policer-name* | **local-mon-bypass**}}

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>protocol enforcement)

Full Context

configure system security dist-cpu-protection policy protocol enforcement

Description

This command configures the enforcement method for the protocol.

Default

enforcement dynamic local-mon-bypass

Parameters

static

Specifies that the protocol is always enforced using a **static-policer**. Multiple protocols can reference the same **static-policer**. Packets of protocols that are statically enforced bypass any local monitors.

policer name

Specifies which **static-policer** to use.

dynamic

Specifies that a specific enforcement policer for this protocol for this SAP/object is instantiated when the associated **local-monitoring-policer** is determined to be in a nonconforming state (at the end of a minimum monitoring time of 60 seconds to reduce thrashing).

mon-policer-name

Specifies which **local-monitoring-policer** to use.

local-mon-bypass

This parameter is used to not include packets from this protocol in the local monitoring function, and when the local-monitor "trips", do not instantiate a dynamic enforcement policer for this protocol.

Platforms

All

9.111 engineID

engineID

Syntax

[**no**] **engineID** *engine-id*

Context

[Tree] (config>system>snmp engineID)

Full Context

configure system snmp engineID

Description

This command sets the SNMP engine ID that uniquely identifies the SNMPv3 node.If unconfigured, the system uses an engine ID based on the information from the system backplane.If the SNMP engine ID is changed, the current configuration must be saved and a reboot must be executed. Otherwise, the previously configured SNMP communities and logger trap-target notify communities will not be valid for the new engine ID.

Note:
Changing the SNMP engine ID invalidates all SNMPv3 MD5 and SHA security digest keys, which may render the node unmanageable.

When replacing a chassis, configure the new router to use the same engine ID as the previous router. This preserves SNMPv3 security keys and allows management stations to use their existing authentication keys for the new router.

Ensure that the engine ID of each router is unique. A management domain can only maintain one instance of a specific engine ID.

The **no** form of the command configures the router to use the default value.

Parameters

engine-id

Specifies an identifier from 10 to 64 hexadecimal digits (5 to 32 octet number), uniquely identifying this SNMPv3 node. This string is used to access this node from a remote host with SNMPv3.

Platforms

All

9.112 enhanced-distribution

enhanced-distribution

Syntax

[**no**] **enhanced-distribution**

Context

[Tree] (config>cflowd enhanced-distribution)

Full Context

configure cflowd enhanced-distribution

Description

This command enables the inclusion of the ingress port ID into the hash algorithm used to distribute cflowd sample traffic to cflowd processes running on the 7950 XRS CPM. By including this new attribute, cflowd may see better distribution of flows across processing tasks if there is a limited number of IP interfaces on which sampling is performed, but those interfaces use LAGs with a large number of port members.

By enabling this option, the same flow may be captured multiple times if packets are received on multiple ingress ports.

This command is only applicable to cflowd running on a 7950 XRS platform.

The **no** form of this command removes the command from the configuration and disables the inclusion of the ingress port ID in the cflowd hash algorithm.

Default

no enhanced-distribution

Platforms

7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

enqueue-on-pir-zero

Syntax

[**no**] **enqueue-on-pir-zero**

Context

[Tree] (config>qos>adv-config-policy>child-control>bandwidth-distribution enqueue-on-pir-zero)

Full Context

configure qos adv-config-policy child-control bandwidth-distribution enqueue-on-pir-zero

Description

This command is used to enable queuing of new packets when H-QoS determines that a queue should stop forwarding (operational PIR set to zero). The default behavior is to allow the queue to continue to use the previously determined operational PIR and set the queue's MBS (Maximum Burst Size) to zero. This prevents new packets from being admitted to the queue until the PIR zero case terminates. The new behavior when **enqueue-on-pir-zero** is enabled is to set the operational PIR to zero and leave the queue's MBS set to the normal value.

This command overrides the **limit-pir-zero-drain** command.

The **no** form of this command reverts to default behavior.

9.114 enroll

enroll

Syntax

enroll est-profile *name* **key** *key-filename* **output** *output-cert-filename* [**hash-alg** *hash algorithm*] **subject-dn** *subject-dn* [**domain-name** *domain-names*] [**ip-addr** *ip-address* **|** *ipv6-address*] [**validate-cert-chain**] [**force**]

Context

[Tree] (admin>certificate>est enroll)

Full Context

admin certificate est enroll

Description

This command enrolls a new certificate with Certificate Authority (CA) by the EST protocol specified with the **est-profile** *name* parameter with a imported private key specified by the **key** *key-filename* parameter.

The **est-profile** *name* specifies the authentication between the system and EST server.

The **hash-alg** *hash-algorithm*, **subject-dn** *subject-dn*, **domain-name** *domain-names*, and **ip-addr** *ip-address* parameters are used to generate the Certificate Signing Request (CSR) in the EST request message. The **domain-name** *domain-names* and **ip-addr** *ip-address* parameters are used as subject alternative names.

If **validate-cert-chain** is specified, the system validates the certificate's chain of result certificate before importing it. The "certificate chain" is the chain of all the certificates from the result certificate to the issuing CA. The "result certificate" is the new certificate returned by EST server.

The result certificate is imported and saved with the filename specified by the **output** *output-cert-filename*. If **force** is specified, the system overwrites the existing file with same name as the *output-cert-filename*.

Parameters

name

Specifies EST profile name, up to 32 characters

key-filename

Specifies the filename of a key, up to 95 characters

output-cert-filename

Specifies the output certificate filename, up to 200 characters

hash-algorithm

Specifies the hash algorithm used in a certificate request.

Values sha1, sha224, sha256, sha384, sha512

subject-dn

Specifies the distinguish name, up to 256 characters, used as the subject in a certificate request, including:

- C-Country
- ST-State

- O-Organization name
- OU-Organization Unit name
- CN-common name

This parameter is formatted as a text string including any of the preceding attributes. The attribute and its value is linked by using "=", and "," is used to separate different attributes.

For example: C=US,ST=CA,O=ALU,CN=SR12

Values attr1=val1,attr2=val2

where: attrN={C | ST | O | OU | CN}, up to 256 characters

domain-names

Specifies domain names, up to 512 characters, separated by commas

ip-address

Specifies an IPv4 or IPv6 address string, up to 64 characters

validate-cert-chain

Specifies that the system validates the certificate's chain of result certificate before importing it

force

Specifies that the system overwrites the existing file with same *output-cert-filename*

Full Context

configure service vprn interface spoke-sdp entropy-label

configure service vprn entropy-label

Description

This command enables or disables the use of entropy labels for spoke SDPs on a VPRN.

If **entropy-label** is configured, the entropy label and ELI are inserted in packets for which at least one LSP in the stack for the far-end of the tunnel used by the service has advertised entropy-label-capability. If the tunnel is RSVP type, **entropy-label** can also be controlled under the **config>router>mpls** or **config>router>mpls>lsp** contexts.

The entropy label and the hash label features are mutually exclusive. The entropy label cannot be configured on a spoke SDP or service where the hash label feature has already been configured.

Default

no entropy-label

Platforms

All

entropy-label

Syntax

entropy-label

[**no**] **entropy-label**

Context

[Tree] (config>service>sdp>binding>pw-port entropy-label)

Full Context

configure service sdp binding pw-port entropy-label

Description

This command enables entropy label insertion on the PW port.

If this command is configured, the entropy label and ELI are inserted in packets for which at least one LSP in the stack for the far-end of the tunnel used by the service has advertised entropy label capability.

- If the tunnel is of type RSVP or SR-TE, the **entropy-label** must be enabled under the **config**>**router**>**mpls** or **config**>**router**>**mpls**>**lsp** contexts.
- If the tunnel is of type SR-ISIS, SR-OSPF or SR-TE, the **override-tunnel-elc** command must be configured under the **config**>**router**>**isis** or **config**>**router**>**ospf** contexts.
- If the tunnel is LDP, the entropy-level capability is configured under the **configure**>**router**>**ldp** context.

The entropy label is only applicable to PW ports bound to a static port, and not to ports using an FPE.

The **no** form of this command disables the entropy label insertion on the PW port.

Default

no entropy-label

Platforms

All

entropy-label

Syntax

entropy-label {**rsvp-te** | **sr-te**} {**force-disable** | **enable**}

Context

[Tree] (config>router>mpls entropy-label)

Full Context

configure router mpls entropy-label

Description

This command configures the use of entropy labels for MPLS.

The entropy label (EL) and entropy label indicator (ELI) require the insertion of two additional labels in the label stack. In some cases, this may result in an unsupported label stack depth or large changes in the label stack depth during the lifetime of an LSP (for example, due to switching from a primary path with ELC enabled to a secondary path for which the far end has not signaled ELC).

This command provides control at the head end of an RSVP LSP or SR-TE LSP as to whether an EL is inserted on an LSP by ignoring the ELC signaled from the far-end LER, and to control how the additional label stack depth is accounted for.

By default, regardless of the value set for entropy label capability at the egress node, the ingress LER considers the EL and ELI in the label stack while sending the information to the TTM and NHLFE. The application using the LSP does not insert an EL and ELI in the label stack unless the far-end signals ELC and the application is configured to insert an entropy label.

When **entropy-label** is set to **force-disable**, the ingress LER does not consider EL and ELC in the label stack when sending the information to the TTM and NHLFE. Therefore, the system marks the TTM and NHLFE as ELC not supported, and applications do not insert an EL or ELI.

The **entropy-label** command value changes at either the MPLS level or the LSP level. The new operational value does not take effect until the LSP is re-signaled. A **shutdown** and **no shutdown** of the LSP is required to enable the new value.

The user can use the **clear** command or bounce MPLS itself (**shutdown**/**no shutdown**) to force the new value to take effect for a large numbers of LSPs.

Default

entropy-label rsvp-te enable

Parameters

rsvp-te

Applies the **entropy-label** command to RSVP LSPs.

sr-te

Applies the **entropy-label** command applies to SR-TE LSPs.

force-disable

Specifies that the ingress LER will not consider the EL and ELI in the label stack while sending the information to the TTM and NHLFE. The system marks the TTM and NHLFE as ELC not supported, and applications do not insert an EL or ELI in the label stack.

enable

Specifies that the ingress LER will consider what is signaled from the egress node for ELC for marking the NHLFE, while the TTM is always marked. Although applications only insert the entropy label if the far end signals ELC, the additional two labels of the EL and ELI are always accounted for.

[Tree] (config>router>mpls>lsp entropy-label)

Full Context

configure router mpls lsp-template entropy-label

configure router mpls lsp entropy-label

Description

This command configures the use of entropy labels for an LSP.

The entropy label (EL) and entropy label indicator (ELI) require the insertion of two additional labels in the label stack. In some cases, this may result in an unsupported label stack depth or large changes in the label stack depth during the lifetime of an LSP (for example, due to switching from a primary path with ELC enabled to a secondary path for which the far end has not signaled ELC).

This command provides control at the head end of an RSVP LSP or SR-TE LSP over whether an entropy label is inserted on an LSP by overriding the ELC signaled from the far-end LER, and control over how the additional label stack depth is accounted for.

By default, the value of **entropy-labe**l is inherited from the MPLS level. The command under the LSP context provides a means to override the default MPLS behavior on a per-LSP basis. For auto-LSPs, it can only be configured in LSP templates of type one-hope-p2p and mesh-p2p.

Under the LSP context, when the value of **entropy-label** is set to **enable**, the ingress LER will take into consideration what is signaled from the egress node for ELC when marking the NHLFE as entropy-label-capable. Since the value of **entropy-label** is set to **enable** at the LSP level, the system will always mark it in the TTM as entropy-label-capable regardless of the signaled value, in order to ensure that the potential additional label stack depth is accounted for. In this scenario, the TTM and NHLFE can be out of synchronization based on what is configured at the egress node. That is, the application will always account for the entropy label and ELI in the label stack without taking into consideration the signaled value of ELC.

When **entropy-labe**l is set to **force-disable**, the ingress LER will not consider EL and ELI in the label stack while sending the information to the TTM and NHLFE, regardless of what the far end signals. Therefore, the system will mark the TTM and NHLFE as ELC not supported, and applications will not insert an EL or ELI.

When the value of **entropy-label** changes at either the MPLS level or the LSP level, the new operational value will not take effect until the LSP is re-signaled. A **shutdown** and **no shutdown** of the LSP is required to enable the new value.

The user can use the **clear** command or bounce MPLS itself (**shutdown** and **no shutdown**) to force the new value to take effect for a large numbers of LSPs.

Default

entropy-label inherit

Parameters

force-disable

Indicates that the ingress LER will not consider the entropy label and ELI in the label stack while sending the information to the TTM and NHLFE. The system will mark the TTM and NHLFE as ELC not supported, and applications will not insert an EL or ELI in the label stack.

enable

Indicates that the ingress LER will take into consideration what is signaled from the egress node for ELC for marking the NHLFE, while the TTM is always marked. Therefore, although applications will only insert the entropy label if the far end signals ELC, the additional two labels of the entropy label EL and ELI are always accounted for.

inherit

Indicates that the value of **entropy-label** is inherited from the setting in the MPLS context.

Platforms

All

entropy-label

Syntax

[**no**] **entropy-label**

Context

[Tree] (config>router entropy-label)

Full Context

configure router entropy-label

Description

If **entropy-label** is configured, the Entropy label and Entropy Label Indicator is inserted on packets for which at least one LSP in the stack for the far-end of the LDP or RSVP tunnel used by an IGP or BGP shortcut has advertised entropy-label-capability. If the tunnel is of type RSVP, then **entropy-label** must also have been enabled under **config>router>mpls** or **config>router>mpls>lsp**.

This configuration will result in other traffic that is forwarded over an LDP or RSVP LSP for which this router is the LER, and for which there is no explicit service endpoint on this router, to have the EL/ELI enabled, subject to the LSP far-end advertising entropy-label-capability. An example of such traffic includes packets arriving on a stitched LDP LSP forwarded over an RSVP LSP.

Default

no entropy-label

configure router isis segment-routing entropy-label

configure router ospf segment-routing entropy-label

Description

This command instructs the system to ignore any received IGP advertisements of entropy label capability relating to remote nodes in the network. It also prevents a user from configuring **override-tunnel-elc** for the IGP instance.

The **no** version of this command enables the processing of any received IGP advertisements of entropy label capability.

Default

entropy-label enable

Parameters

force-disable

Forces the system to ignore any received entropy label capability signaled in the IGP.

enable

Enables the system to process any received entropy label capability signaled in the IGP.

Platforms

All

9.117 entropy-label-capability

entropy-label-capability

Syntax

[**no**] **entropy-label-capability**

Context

[Tree] (config>router>rsvp entropy-label-capability)

[Tree] (config>router>ldp entropy-label-capability)

Full Context

configure router rsvp entropy-label-capability

configure router ldp entropy-label-capability

Description

This command enables or disables ELC for RSV.

If **entropy-label-capability** is configured, then the system will signal (using the procedures specified in RFC 6790) that it is capable of receiving and processing the entropy label and ELI on incoming packets of RSVP and LDP LSPs.

If **no entropy-label-capability** is configured, then the system will not signal ELC. If an ELI is exposed on a packet where the tunnel label is popped at the termination of that LSP, and an entropy label is not configured, then the packet will be dropped.

Default

no entropy-label-capability

Context

[Tree] (config>subscr-mgmt>ancp>static-map entry)

Full Context

configure subscriber-mgmt ancp ancp-static-map entry

Description

This command configures an ANCP name. When ANCP is configured to provide rate adaptation without the use of enhanced subscriber management, this command will define how to map an ANCP key (usually the circuit-id of the DSLAM port) to either a SAP and a scheduler name (when a Multi-Service Site (MSS) is not used) or a customer, site and scheduler name when MSS is used.

Different ANCP names may be used with the same SAPs or customer ID/MSS combinations to allow schedulers within the policy to be mapped to the ANCP names. An ANCP string and SAP combination may reference only one ancp-policy. An ANCP string and customer and site-name combination may reference a single ancp-policy.

The **no** form of this command reverts to the default.

Parameters

ancp-string

Specifies the ASCII representation of the DSLAM circuit-id name, up to 63 characters.

customer-id

Specifies the associated existing customer ID.

Values 1 to 2147483647

customer-site-name

Specifies the associated customer’s configured MSS name, up to 32 characters.

policy-name

Specifies an existing ANCP policy name, up to 32 characters.

sap-id

Specifies the physical port identifier portion of the SAP definition.

[Tree] (config>subscr-mgmt>sub-ident-pol>sla-profile-map entry)

Full Context

configure subscriber-mgmt sub-profile sla-profile-map entry

configure subscriber-mgmt sub-ident-policy sla-profile-map entry

Description

This command configures an SLA profile string. Each subscriber identification string can be provisioned into a subscriber mapping table providing an explicit mapping of the string to a specific subscriber profile. This allows certain subscribers to be directly mapped to the appropriate subscriber profile in the event that the default mappings are not desired for the subscriber.

An explicit mapping of a subscriber identification string to a subscriber profile cannot be defined with the subscriber profile name default. It is possible for the subscriber identification string to be entered in the mapping table without a defined subscriber profile which can result in the explicitly defined subscriber to be associated with the subscriber profile named default.

Explicitly mapping a subscriber identification string to a subscriber profile will cause an existing active subscriber associated with the string to be reassigned to the newly mapped subscriber profile. An explicit mapping overrides all default subscriber profile definitions.

Attempting to delete a subscriber profile that is currently defined as in an explicit subscriber identification string mapping will fail.

The system will fail the removal attempt of an explicit subscriber identification string mapping to a subscriber profile definition when an active subscriber is using the mapping and cannot be reassigned to a defined default non-provisioned subscriber profile.

The **no** form of this command reverts to the default.

Parameters

sla-profile-string

Identifies the SLA profile string, up to 32 characters.

sla-profile-name

Identifies the SLA profile name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>service>mrp>mrp-policy entry)

Full Context

configure service mrp mrp-policy entry

Description

This command creates or edits an mrp-policy entry. Multiple entries can be created using unique entry-id numbers within the policy. The implementation exits the policy on the first match found and executes the actions in accordance with the accompanying action command. For this reason, entries must be sequenced correctly from most to least explicit. An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword action for it to be considered complete. Entries without the action keyword will be considered incomplete and therefore will be rendered inactive.

The **no** form of this command removes the specified entry from the mrp-policy. Entries removed from the mrp-policy are immediately removed from all services where the policy is applied.

Parameters

entry-id

An entry-id uniquely identifies a match criteria and the corresponding action. It is recommended that multiple entries be given entry-ids in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

Values 1 to 65535

create

Keyword; required when first creating the configuration context. When the context is created, one can navigate into the context without the create keyword.

Platforms

All

entry

Syntax

entry *range-entry-id* [**create**]

no entry *range-entry-id*

Context

[Tree] (config>service>vpls>isid-policy entry)

Full Context

configure service vpls isid-policy entry

Description

This command creates or edits an ISID policy entry. Multiple entries can be created using unique entry-id numbers within the ISID policy.

entry-id — Specifies an entry-id uniquely identifies a ISID range and the corresponding actions. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

The following rules govern the usage of multiple entry statements:

- overlapping values are allowed:
  - isid from 301 to 310
  - isid from 305 to 315
  - isid 316
- the minimum and maximum values from overlapping ranges are considered and displayed. The above entries will be equivalent with "isid from 301 to 316” statement.
- there is no consistency check with the content of ISID statements from other entries. The entries will be evaluated in the order of their IDs and the first match will cause the implementation to execute the associated action for that entry.

no isid - removes all the previous statements under one entry.

no isid value | from value to higher-value - removes a specific ISID value or range. Must match a previously used positive statement: for example, if the command "isid 16 to 100” was used using "no isid 16 to 50”, it will not work but "no isid 16 to 100 will be successful.

Values 1 to 65535

Default

no entry

Parameters

range-entry-id

Specifies the ID of the ISID policy to be created or edited

Values 1 to 8191

create

Required when first creating the configuration context. Once the context is created, one can navigate into the context without the create keyword.

Platforms

All

entry

Syntax

entry *entry-id* [**name** *entry-name*]

no entry *entry-id*

Context

[Tree] (config>service>vprn>log>filter entry)

Full Context

configure service vprn log filter entry

Description

This command is used to create or edit an event filter entry. Multiple entries may be created using unique *entry-id* values. The SR OS implementation exits the filter on the first match found and executes the action in accordance with the action command.

Comparisons are performed in an ascending entry ID order. When entries are created, they should be arranged sequentially from the most explicit entry to the least explicit. Matching ceases when a packet matches an entry. The entry action is performed on the packet, either drop or forward. To be considered a match, the packet must meet all the conditions defined in the entry.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword action for it to be considered complete. Entries without the action keyword will be considered incomplete and are rendered inactive.

By default, no filter entries are defined. Entries must be explicitly configured.

The **no** form of this command removes the specified entry from the event filter. Entries removed from the event filter are immediately removed from all log-id's where the filter is applied.

Default

No event filter entries are defined. An entry must be explicitly configured.

Parameters

entry-id

The entry ID uniquely identifies a set of match criteria corresponding action within a filter. Entry ID values should be configured in staggered increments so you can insert a new entry in an existing policy without renumbering the existing entries.

Values 1 to 999

name entry-name

Configures an optional entry name for the event filter, up to 64 characters, that can be used to refer to the entry after it is created.

Platforms

All

entry

Syntax

entry *entry-id* [**create**]

no entry *entry-id*

Context

[Tree] (config>app-assure>group>policy>app-filter entry)

configure application-assurance group policy app-filter entry

Description

This command creates an application filter entry.

App filter entries are an ordered list, the lowest numerical entry that matches the flow defines the application for that flow.

An application filter entry or entries configures match attributes of an application.

The **no** form of this command deletes the specified application filter entry.

Parameters

entry-id

Specifies an integer that identifies an app-filter entry.

Values 1 to 65535

create

Keyword used to create the entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

entry

Syntax

entry *entry-id* [**create**]

no entry *entry-id*

Context

[Tree] (config>app-assure>group>policy>aqp entry)

Full Context

configure application-assurance group policy app-qos-policy entry

Description

This command creates an application QoS policy entry. A flow that matches multiple Application QoS policies (AQP) entries will have multiple AQP entries actions applied. When a conflict occurs for two or more actions, the action from the AQP entry with the lowest numerical value takes precedence.

The **no** form of this command deletes the specified application QoS policy entry.

Parameters

entry-id

An integer identifying the AQP entry.

Values 1 to 65535

create

Mandatory keyword creates the entry. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Syntax

entry *entry-id* [**create**]

no entry *entry-id*

Context

[Tree] (config>app-assure>group>sess-fltr entry)

Full Context

configure application-assurance group session-filter entry

Description

This command configures a particular Application-Assurance session filter match entry. Every session filter can have zero or more session filter match entries. An application filter entry or entries configures match attributes of an application.

The **no** form of this command deletes the specified entry.

Parameters

entry-id

Specifies an integer that identifies the entry.

Values 1 to 65535

create

Keyword used to create the entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

entry

Syntax

entry *entry-id* **direction** *direction* [**create**]

no entry *entry-id* **direction** *direction*

Context

[Tree] (config>app-assure>group>statistics>tca>gtp-fltr>msg entry)

Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter message-type entry

Description

This command configures a TCA for the counter capturing hits for the specified GTP filter entry. A GTP filter entry TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a default action TCA.

Parameters

entry-id

Specifies the GTP filter message-type entry identifier.

Values 1 to 255

direction

Specifies the traffic direction.

Values from-sub, to-sub

create

Keyword used to create the TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

entry

Syntax

entry *entry-id* **direction** *direction* [**create**]

no entry *entry-id* **direction** *direction*

Context

[Tree] (config>app-assure>group>statistics>tca>gtp-fltr>msg-gtpv2 entry)

Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter message-type-gtpv2 entry

Description

This command configures a TCA for the counter capturing hits for the specified GTPv2 message type filter entry. A GTP filter entry TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating an entry TCA.

Parameters

entry-id

Specifies the GTP filter message-type-gtpv2 entry identifier.

Values 516 to 770

direction

Specifies the traffic direction.

Values from-sub, to-sub

create

Keyword used to create the TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

entry

Syntax

entry *entry-id* **direction** *direction* [**create**]

no entry *entry-id* **direction** *direction*

Context

[Tree] (config>app-assure>group>statistics>tca>gtp-fltr>imsi-apn entry)

Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter imsi-apn entry

Description

This command configures a TCA for the counter capturing hits for the specified IMSI-APN filter entry. A GTP IMSI-APN filter entry TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating an entry TCA.

Parameters

entry-id

Specifies the identifier for the IMSI-APN filter entry.

Values 1031 to 2030

direction

Specifies the traffic direction.

Values from-sub, to-sub

create

Keyword used to create the TCA.

entry

Syntax

entry *entry-id* **direction** *direction* [**create**]

no entry *entry-id* **direction** *direction*

Context

[Tree] (config>app-assure>group>statistics>tca>sctp-fltr>ppid entry)

Full Context

configure application-assurance group statistics threshold-crossing-alert sctp-filter ppid entry

Description

This command configures a TCA for the counter capturing hits for the specified SCTP filter PPID entry. An SCTP filter entry TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a TCA.

Parameters

entry-id

Specifies the SCTP filter PPID entry identifier.

Values 1 to 255

direction

Specifies the traffic direction.

Values from-sub, to-sub

create

Keyword used to create the TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

entry

Syntax

entry *entry-id* **direction** *direction* [**create**]

no entry *entry-id* **direction** *direction*

Context

[Tree] (config>app-assure>group>statistics>tca>session-filter entry)

Full Context

configure application-assurance group statistics threshold-crossing-alert session-filter entry

Description

This command configures a TCA for the counter capturing hits for the specified session filter entry. A session filter entry TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a TCA.

Parameters

entry-id

Specifies the SCTP filter PPID entry identifier.

Values 1 to 65535

direction

Specifies the traffic direction.

Values from-sub, to-sub

create

Keyword used to create the TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

entry

Syntax

entry *entry-id* [**create**]

no entry *entry-id*

Context

[Tree] (config>app-assure>group>gtp>gtp-fltr>imsi-apn-fltr entry)

Full Context

configure application-assurance group gtp gtp-filter imsi-apn-filter entry

Description

This command configures an entry within the IMSI-APN filter to allow for IMSI-APN match and action configuration.

Parameters

entry-id

Specifies the index into the IMSI-APN list that defines a custom filtering action.

Values 1031 to 2030

create

Keyword used to create the entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

entry

Syntax

entry *entry-id* **value** *gtp-message-value* **action** {**permit** | **deny**}

no entry *entry-id*

Context

[Tree] (config>app-assure>group>gtp>gtp-fltr>msg entry)

Full Context

configure application-assurance group gtp gtp-filter message-type entry

Description

This command configures an entry for a specific GTPv1 message type value.

Parameters

entry-id

Specifies the index into the GTP message value list that defines a custom message-type action.

Values 1 to 255

gtp-message-value

Specifies the GTPv1 message type, either as a numeric value or as a string.

Values 1 to 255 or 256 characters {echo-request, echo-response, error-indication, g-pdu, supported-extension-headers-notification}

permit | deny

Specifies the action to take for packets that match this GTP filter message entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

entry

Syntax

entry *entry-id* **value** *gtpv2-message-value* **action** {**permit** | **deny**}

no entry *entry-id*

Context

Full Context

configure application-assurance group gtp gtp-filter message-type-gtpv2 entry

Description

This command configures an entry for a specific GTPv2 message type value.

Default

entry permit

Parameters

entry-id

Specifies the index into the GTP message value list that defines a custom message-type action.

Values 516 to 770

gtpv2-message-value

Specifies the GTPv2 message type, either as a numeric value or as a string.

Values 1 to 255 or 256 characters (such as: echo-request, echo-response, create-session-request, modify-bearer-request, change-notification-request, change-notification-response, modify-bearer-response, create-session-response, delete-session-request, delete-session-response, remote-ue-report-notification, remote-ue-report-acknowledge)

permit | deny

Specifies the action to take for packets that match this GTP filter message entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

entry

Syntax

entry *entry-id* **value** *ppid-value* **action** {**permit** | **deny**}

no entry *entry-id*

entry

Syntax

entry *entry-id* [**create**]

no entry *entry-id*

Context

[Tree] (config>service>nat>nat-classifier entry)

Full Context

configure service nat nat-classifier entry

Description

This command creates or edits a nat-classifier entry. Multiple entries can be created using unique entry-id numbers within the nat-classifier. Entries must be sequenced from most to least explicit. An entry may not have any match criteria defined, in which case all UDP traffic will be matched. In case that the action is not explicitly configured, a default-action will be applied.

The **no** form of the command removes the specified entry from the filter. Entries removed from the nat-classifier are immediately removed from all entities to which the nat-classifier is applied.

Parameters

entry-id

Specifies an entry-id that uniquely identifies a match criteria and the corresponding action. It is recommended that multiple entries be given entry-ids in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

Values 1 to 1000

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

entry

Syntax

[Tree] (config>li>li-filter>li-mac-filter entry)

Full Context

configure li li-filter li-ip-filter entry

configure li li-filter li-ipv6-filter entry

configure li li-filter li-mac-filter entry

Description

This command creates or edits a Lawful Interception filter entry. Multiple entries can be created using unique entry-id numbers within the filter.

An entry in an LI filter always has an implicit action of "forward”.

The **no** form of this command removes the specified entry from the filter. Entries removed from the filter are immediately removed from all services or network ports where the associated filter is applied.

LI filter entries can be used as li-source entries.

The entry numbers for LI filters serve purely as keys for managing the entries (deleting entries, and so on). The order of LI filter entries is not guaranteed to match the entry numbers and the software may reorder entries. Operators must use LI entries in a manner such that relative order of the LI entries amongst themselves is not important.

The **no** form of this command removes the LI entry ID from the configuration.

Parameters

li-entry-id

Identifies the Lawful Interception filter entry.

Values 1 to 65536

Platforms

All

entry

Syntax

entry *entry-id* [**create**]

no entry *entry-id*

configure qos sap-egress ip-criteria entry

configure qos sap-ingress mac-criteria entry

configure qos sap-ingress ipv6-criteria entry

configure qos sap-egress ipv6-criteria entry

configure qos sap-ingress ip-criteria entry

Description

This command is used to create or edit an IP, IPv6, or MAC criteria entry for the policy. Multiple entries can be created using unique *entry-id* numbers.

The list of flow criteria is evaluated in a top-down manner with the lowest entry ID at the top and the highest entry ID at the bottom. If the defined match criteria for an entry within the list matches the information in the egress packet, the system stops matching the packet against the list and performs the matching entries reclassification actions. If none of the entries match the packet, the IP flow reclassification list has no effect on the packet.

An entry is not populated in the list unless the action command is executed for the entry. An entry that is not populated in the list has no effect on egress packets. If the action command is executed without any explicit reclassification actions specified, the entry is populated in the list allowing packets matching the entry to exit the list, preventing them from matching entries lower in the list. Since this is the only flow reclassification entry that the packet matched and this entry explicitly states that no reclassification action is to be performed, the matching packet will not be reclassified.

The **no** form of this command removes the specified entry from the policy. Entries removed from the policy are immediately removed from all services where that policy is applied.

Parameters

entry-id

The *entry-id,* expressed as an integer, uniquely identifies a match criterion and the corresponding action. It is recommended that multiple entries be given *entry-ids* in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

An entry cannot have any match criteria defined (in which case, everything matches) but must have at least the keyword **action fc** *fc-name* for it to be considered complete. Entries without the action keyword will be considered incomplete and, therefore, will be rendered inactive.

Values 1 to 65535

create

Required parameter when creating a flow entry when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when

attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the flow entry already exists.

Platforms

All

entry

Syntax

entry *entry-id* [**create**]

no entry *entry-id*

Full Context

configure qos network egress ipv6-criteria entry

configure qos network ingress ip-criteria entry

configure qos network egress ip-criteria entry

configure qos network ingress ipv6-criteria entry

Description

This command is used to create or edit an IP or IPv6 criteria entry for the policy. Multiple entries can be created using unique entry numbers.

The list of flow criteria is evaluated in a top-down manner with the lowest entry ID at the top and the highest entry ID at the bottom. If the defined match criteria for an entry within the list matches the information in the packet, the system stops matching the packet against the list and performs the matching entries reclassification actions. If none of the entries match the packet, the IP flow reclassification list has no effect on the packet.

An entry is not populated in the list unless the action command is executed for the entry. An entry that is not populated in the list has no effect on ingress packets. If the **action** command is executed without any explicit reclassification actions specified, the entry is populated in the list allowing packets matching the entry to exit the list, preventing them from matching entries lower in the list. Since this is the only flow reclassification entry that the packet matched, and this entry explicitly states that no reclassification action is to be performed, the matching packet will not be reclassified.

The configuration of egress prec/DSCP classification and the configuration of an egress IP criteria or IPv6 criteria entry statement within a network QoS policy are mutually exclusive.

Network QoS policies containing egress **ip-criteria** or **ipv6-criteria entry** statements are only applicable to network interfaces. Configuration of **ip-criteria** or **ipv6-criteria entry** statements in a network egress

QoS policy and the application of the policy on any object other than a GRT network interface are mutually exclusive.

The **no** form of this command removes the specified entry from the policy. Entries removed from the policy are immediately removed from all services to which that policy is applied.

Parameters

entry-id

The entry identifier, expressed as an integer, uniquely identifies a match criterion and the corresponding action. It is recommended that multiple entries be given entry identifiers in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

An entry cannot have any match criteria defined (in which case, everything matches) but must have at least the keyword **action fc fc-name profile** *profile* for it to be considered complete. Entries without the action keyword will be considered incomplete and will be rendered inactive.

Values 1 to 65535

create

Required parameter when creating a flow entry when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled, and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the flow entry already exists.

no entry *entry-id*

Context

[Tree] (config>log>filter entry)

Full Context

configure log filter entry

Description

This command creates or edits an event filter entry. Multiple entries can be created using unique *entry-id* values. The SR OS implementation exits the filter on the first match found and executes the action in accordance with the **action** command.

Comparisons are performed in an ascending entry ID order. When entries are created, they should be arranged sequentially from the most explicit entry to the least explicit. Matching ceases when a packet matches an entry. The entry action is performed on the packet, either drop or forward. To be considered a match, the packet must meet all the conditions defined in the entry.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword action for it to be considered complete. Entries without the action keyword will be considered incomplete and are rendered inactive.

By default, no filter entries are defined. Entries must be explicitly configured.

The **no** form of this command removes the specified entry from the event filter. Entries removed from the event filter are immediately removed from all log-id's where the filter is applied.

Parameters

entry-id

The entry ID uniquely identifies a set of match criteria corresponding action within a filter. Entry ID values should be configured in staggered increments so you can insert a new entry in an existing policy without renumbering the existing entries.

Values 1 to 999

name entry-name

Configures an optional entry name for the event filter, up to 64 characters, that can be used to refer to the entry after it is created.

Platforms

All

entry

Syntax

[**no**] **entry** *entry-id*

Context

Full Context

configure system security management-access-filter ip-filter entry

configure system security management-access-filter mac-filter entry

configure system security management-access-filter ipv6-filter entry

Description

This command is used to create or edit a management access IP(v4), IPv6, or MAC filter entry. Multiple entries can be created with unique *entry-id* numbers. The OS exits the filter upon the first match found and executes the actions according to the respective action command. For this reason, entries must be sequenced correctly from most to least explicit.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword **action** defined to be considered complete. Entries without the **action** keyword are considered incomplete and inactive.

The **no** form of this command removes the specified entry from the management access filter.

Parameters

entry-id

Specifies an entry ID uniquely identifies a match criteria and the corresponding action. It is recommended that entries are numbered in staggered increments. This allows users to insert a new entry in an existing policy without having to renumber the existing entries.

Values 1 to 9999

Platforms

All

Syntax

[**no**] **entry** *entry-id*

Context

[Tree] (config>system>security>profile entry)

Full Context

configure system security profile entry

Description

This command is used to create a user profile entry.

More than one entry can be created with unique *entry-id* numbers. Exits when the first match is found and executes the actions according to the accompanying **action** command. Entries should be sequenced from most explicit to least explicit.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword **action** for it to be considered complete.

The **no** form of this command removes the specified entry from the user profile.

Parameters

entry-id

Specifies an entry-id that uniquely identifies a user profile command match criteria and a corresponding action. If more than one entry is configured, the *entry-ids* should be numbered in staggered increments to allow users to insert a new entry without requiring renumbering of the existing entries.

Values 1 to 9999

[Tree] (config>system>security>keychain>direction>uni>receive entry)

Full Context

configure system security keychain direction uni send entry

configure system security keychain direction bi entry

configure system security keychain direction uni receive entry

Description

This command defines a particular key in the keychain. Entries are defined by an entry ID. A keychain must have valid entries for the TCP Enhanced Authentication mechanism to work.

If the entry is the active entry for sending, then this causes a new active key to be selected (if one is available using the youngest key rule). If it is the only possible key to send, then the system rejects the command with an error indicating the configured key is the only available send key.

If the key is one of the eligible keys for receiving, it will be removed. If the key is the only possible eligible key, then the command is accepted, and an error indicating that this is the only eligible key will be generated.

The **no** form of this command removes the entry from the keychain.

Parameters

entry-id

Specifies an entry that represents a key configuration to be applied to a keychain.

Values 0 to 63, null-key

key

Specifies a key ID which is used along with *keychain-name* and **direction** to uniquely identify this particular key entry.

authentication-key

Specifies the *authentication-key* that is used by the encryption algorithm. The key is used to sign and authenticate a protocol packet.

The *authentication-key* can be any combination of letters or numbers.

Values A key must be 160 bits for algorithm hmac-sha-1-96 and must be 128 bits for algorithm aes-128-cmac-96. If the key given with the entry command amounts to less than this number of bits, then it is padded internally with zero bits up to the correct length.

algorithm

Specifies an enumerated integer that indicates the encryption algorithm to be used by the key defined in the keychain.

Values aes-128-cmac-96 — Specifies an algorithm based on the AES standard for TCP authentication.

aes-128-gcm-16 — Specifies an algorithm used for MCS.

hmac-sha-1-96 — Specifies an algorithm based on SHA-1 for RSVP-TE and TCP authentication.

message-digest — MD5 hash used for TCP authentication.

hmac-md5 — MD5 hash used for IS-IS and RSVP-TE.

password – Specifies a simple password authentication for OSPF, IS-IS, and RSVP-TE.

hmac-sha-1 — Specifies the sha-1 algorithm for OSPF, IS-IS, and RSVP-TE.

hmac-sha-256 — Specifies the sha-256 algorithm for OSPF and IS-IS.

hash-key* | *hash2-key* | *custom-key

Specifies the hash key. The key can be any combination of ASCII characters up to 33 for the *hash-key* and 96 characters for the *hash2-key* (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies a custom hash version is used while saving the configuration files.

Platforms

All

entry

Syntax

entry *entry-id* [**create**]

no entry *entry-id*

Context

[Tree] (config>system>security>tls>cert-profile entry)

Full Context

configure system security tls cert-profile entry

Description

This command configures an entry for the TLS certificate profile. A certificate profile may have up to eight entries. Currently, TLS uses the entry with the smallest ID number when responding to server requests.

The **no** form of the command deletes the specified entry.

Parameters

entry-id

Specifies the identification number of the TLS certificate profile entry.

Values 1 to 8

create

Keyword used to create the TLS certificate profile entry.

Platforms

All

entry

Syntax

entry *entry-id* **expression** *regular-expression*

no entry *entry-id*

Context

[Tree] (config>router>policy-options>as-path-group entry)

Full Context

configure router policy-options as-path-group entry

Description

This command creates the context to edit route policy entries within an autonomous system path group.

Multiple entries can be created using unique entries. The router exits the filter when the first match is found and executes the action specified. For this reason, entries must be sequenced correctly from most to least explicit.

An entry does not require matching criteria defined (in which case, everything matches) but must at least define an action in order to be considered complete. Entries without an action are considered incomplete and will be rendered inactive.

The **no** form of this command removes the specified entry from the autonomous system path group.

Parameters

entry-id

Specifies the entry ID expressed as a decimal integer. An *entry-id* uniquely identifies match criteria and the corresponding action. Nokia recommends that multiple entries be given

entry-ids in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

Values 1 to 128

regular-expression

Specifies the AS path group regular expression. Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

An AS path in a BGP route matches an AS path group, if the pattern of the path matches the concatenation of all regular expressions in the group. A regular expression incorporates terms and operators that use the terms. An individual AS number is an elementary term in the AS path regular expression. More complex terms can be built from elementary terms. The following are key operators supported by SR OS:

- .
- *
- ?
- {n}
- {m,n}
- {m, }

To reverse the match criteria when specifying a list of ranges or single values using square brackets, use the non-match operator (^) before the elements within the square brackets.

Platforms

entry

Syntax

entry *entry-id*

no entry

Context

[Tree] (config>router>policy-options>policy-statement entry)

Full Context

configure router policy-options policy-statement entry

Description

This command creates the context to edit route policy entries within the route policy statement.

Multiple entries can be created using unique entries. The router exits the filter when the first match is found and executes the action specified. For this reason, entries must be sequenced correctly from most to least explicit.

An entry does not require matching criteria defined (in which case, everything matches) but must have at least define an action in order to be considered complete. Entries without an action are considered incomplete and will be rendered inactive.

The **no** form of this command removes the specified entry from the route policy statement.

Parameters

entry-id

Specifies the entry ID expressed as a decimal integer. An *entry-id* uniquely identifies match criteria and the corresponding action. It is recommended that multiple entries be given *entry-ids* in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

Values 1 to 128

no entry *entry-id*

Context

[Tree] (config>app-assure>group>url-filter>web-service>classification-overrides entry)

Full Context

configure application-assurance group url-filter web-service classification-overrides entry

Description

This command creates a classification override, manually setting the category of a hostname.

The **no** form of this command removes the classification override entry.

Default

no entry

Parameters

entry-id

Specifies the classification of the override entry.

Values 1 to 65535

hostname

Specifies the hostname of the configured override category, up to 255 characters.

category

Specifies the override category, up to 256 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

9.121 epipe

epipe

Syntax

epipe *service-id* **customer** *customer-id* [**vpn** *vpn-id*] [**vc-switching**] [**create**] **name** [*name*]

epipe *service-id* [**test**] [**create**] [**name** *name*]

no epipe *service-id*

Context

[Tree] (config>service epipe)

Full Context

configure service epipe

Description

This command configures an Epipe service instance. This command is used to configure a point-to-point epipe service. An Epipe connects two endpoints defined as Service Access Points (SAPs). Both SAPs may be defined in one 7450 ESS, 7750 SR, or 7950 XRS or they may be defined in separate devices connected over the service provider network. When the endpoint SAPs are separated by the service provider network, the far end SAP is generalized into a Service Distribution Point (SDP). This SDP describes a destination and the encapsulation method used to reach it.

No MAC learning or filtering is provided on an Epipe.

When creating a service, you must enter the **customer** keyword and specify a *customer-id* to associate the service with a customer. The *customer-id* must already exist, having been created using the **customer** command in the **service** context. After a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

After a service is created, the use of the **customer** *customer-id* is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified will result in an error.

By default, no epipe services exist until they are explicitly created with this command.

The **no** form of this command deletes the epipe service instance with the specified *service-id*. The service cannot be deleted until the service has been shut down.

Cpipe services are enabled on the 7450 ESS.

Parameters

service-id

The unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every 7450 ESS, 7750 SR, or 7950 XRS on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: up to 64 characters

customer-id

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

vpn vpn-id

Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN ID. If this parameter is not specified, the VPN ID uses the same service ID number.

Values 1 to 2147483647

Default null (0)

vc-switching

Specifies if the pseudowire switching signaling is used for the spoke SDPs configured in this service.

test

Specifies a unique test service type for the service context which will contain only a SAP configuration. The test service can be used to test the throughput and performance of a path for MPLS-TP PWs. This parameter applies to the 7450 ESS and 7750 SR only.

create

Keyword used to create the service instance. The **create** keyword requirement can be enabled/disabled in the **environment**>**create** context.

name name

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Values *name*: up to 64 characters

Platforms

configure application-assurance group policy app-qos-policy entry action error-drop

Description

This command configures a drop action for error flows (bad IP checksums, tcp/udp port 0, and so on).

Default

no error-drop

Parameters

event-log-name

Specifies the event log name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

error-drop

Syntax

error-drop direction *direction* [**create**]

no error-drop direction *direction*

Context

[Tree] (config>app-assure>group>statistics>tca error-drop)

Full Context

configure application-assurance group statistics threshold-crossing-alert error-drop

Description

This command configures a TCA for the counter capturing error drops. An error drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating an error-drop TCA.

Parameters

direction

Specifies the traffic direction.

Values from-sub, to-sub

create

Keyword used to create the error drop TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

9.134 es-activation-timer

es-activation-timer

Syntax

es-activation-timer *seconds*

no es-activation-timer

Context

[Tree] (config>service>system>bgp-evpn>eth-seg es-activation-timer)

Full Context

configure service system bgp-evpn ethernet-segment es-activation-timer

Description

This command configures the Ethernet Segment activation timer for a specified Ethernet Segment. The **es-activation-timer** delays the activation of a specified **ethernet-segment** on a specified PE that has been elected as DF (Designated Forwarder). Only when the **es-activation-timer** has expired, the SAP/SDP-binding associated to an **ethernet-segment** can be activated (in case of single-active multi-homing) or added to the default-multicast-list (in case of all-active multi-homing).

If **no es-activation-timer** is configured, the system uses the value configured in the **config>redundancy>bgp-evpn-multi-homing>es-activation-timer** context, if configured. Otherwise the system uses a default value of 3 seconds.

Default

no es-activation-timer

Parameters

seconds

Specifies the number of seconds for the **es-activation-timer**.

Values 0 to 100

Default 3

Platforms

All

es-activation-timer

Syntax

es-activation-timer *seconds*

Context

[Tree] (config>redundancy>bgp-evpn-multi-homing es-activation-timer)

Full Context

configure redundancy bgp-evpn-multi-homing es-activation-timer

Description

This command configures the global Ethernet-Segment activation timer. The **es-activation-timer** delays the activation of a specified Ethernet-Segment on a specified PE that has been elected as DF (Designated Forwarder). Only when the **es-activation-timer** has expired, the SAP/SDP-binding associated to an Ethernet-Segment can be activated (in case of single-active multi-homing) or added to the default-multicast-list (in case of all-active multi-homing).

The **es-activation-timer** configured at the Ethernet-Segment level supersedes this global **es-activation-timer**.

Default

es-activation-timer 3

Parameters

seconds

Specifies the number of seconds for the **es-activation-timer**.

Values 0 to 100

Platforms

All

9.135 es-orig-ip

es-orig-ip

Syntax

es-orig-ip *ip-address*

no es-orig-ip

Context

[Tree] (config>service>system>bgp-evpn>eth-seg es-orig-ip)

Full Context

configure service system bgp-evpn ethernet-segment es-orig-ip

Description

This command modifies the Originating IP field advertised in the ES route for a given Ethernet Segment. By default, the Originating IP is the system-ip of the PE. However, this value can be changed to the IPv4 or IPv6 address configured with this command.

With the **es-orig-ip** configured, ES shutdown is required, for the following cases:

- When adding Local ES routes, the command changes how the ES routes are added to the candidate list; the configured IP address is added, instead of the system-ip.
- When advertising local ES routes, the configured IP address is used for the orig-ip of the route.

The **no** form of the command changes the originating IP address back to the system-ip.

Default

no es-orig-ip

Parameters

ip-address

Specifies an IPv4 or IPv6 address.

Values {*ip-address* | *ipv6-address*}

Platforms

All

9.136 esa

esa

Syntax

esa *esa-id* [**create**]

no esa *esa-id*

Context

[Tree] (config esa)

Full Context

configure esa

Description

This command configures or creates an ESA instance with an identifier.

The **no** form of this command removes the ESA from the system.

Parameters

esa-id

Specifies the ESA identifier.

Values 1 to 16

create

Mandatory keyword used when creating an ESA instance in the config context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

9.137 esa-vm

esa-vm

Syntax

[**no**] **esa-vm** [*esa-id*/*vm-id*]

Context

[Tree] (config>isa>tunnel-group esa-vm)

Full Context

configure isa tunnel-group esa-vm

Description

This command specifies the tunnel ESA VM for the tunnel group. The ISA and ESA VM cannot co-exist in the same tunnel group.

Parameters

esa-id

Specifies the ESA id

Values 1 to 16

vm-id

Specifies the VM id

Values 1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

esa-vm

Syntax

[**no**] **esa-vm** [*esa-id/vm-id*]

Context

[Tree] (config>isa>tunnel-mem-pool esa-vm)

Full Context

configure isa tunnel-member-pool esa-vm

Description

This command configures the tunnel ESA VM for the tunnel member pool. The ISA and ESA VM cannot coexist in the same tunnel member group.

The **no** form of this command removes the ESA VM from the tunnel member pool.

Parameters

esa-id

Specifies the ESA ID.

Values 1 to 16

vm-id

Specifies the VM ID.

Values 1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

esa-vm

Syntax

esa-vm *vapp-id* [**drain**]

no esa-vm *vapp-id*

Context

[Tree] (config>isa>lns-group esa-vm)

Full Context

configure isa lns-group esa-vm

Description

This command specifies the ISA and ESA VM to be used in the LNS group.

Parameters

vapp-id

Displays the ID of the configured ESA and ESA VM.

Values

vapp-id:	*esa-id*/*vm-id*	
	esa-id	1 to 16
	vm-id	1 to 4

drain

Specifies the draining of the ESA VM. The drain function gracefully redirects subscribers to other ESA VMs as it does not allow new subscribers to use the ESA VM. Eventually, the ESA VM will not service any subscriber and can be decommissioned gracefully.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

esa-vm

Syntax

[**no**] **esa-vm** *vapp-id*

Context

[Tree] (config>isa>wlan-group esa-vm)

Full Context

configure isa wlan-group esa-vm

Description

This command configures the ESA VM for the WLAN-GW group. It requires group redundancy to be configured in MDA mode.

Parameters

vapp-id

Specifies the ID of the ESA and ESA VM to configure.

Values

vapp-id:	*esa-id*/*vm-id*	
	esa-id	1 to 16
	vm-id	1 to 4

esa-vm

Syntax

[**no**] **esa-vm** *vapp-id*

Context

[Tree] (config>isa>nat-group esa-vm)

Full Context

configure isa nat-group esa-vm

Description

This command assigns an ESA-VM to a NAT group.

Parameters

vapp-id

Specifies the ESA and VM identifying a provisioned BB ISA.

Values

vapp-id:	*esa-id*/*vm-id*	
	esa-id	1 to 16
	vm-id	1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

esa-vm

Syntax

[**no**] **esa-vm** *vapp-id*

Context

[Tree] (config>isa>video-group esa-vm)

Full Context

configure isa video-group esa-vm

Description

This command assigns an ESA-VM to a video group.

The **no** form of this command removes the specified ESA-VM from the video group.

Default

no esa-vm

Parameters

vapp-id

Specifies the ESA and VM ID of the configured ESA-VM.

Values

vapp-id:	*esa-id*/*vm-id*	
	esa-id	1 to 16
	vm-id	1 to 4

Platforms

7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

9.138 esi

esi

Syntax

esi *value*

no esi

Context

[Tree] (config>service>system>bgp-evpn>eth-seg esi)

Full Context

configure service system bgp-evpn ethernet-segment esi

Description

This command configures the 10-byte Ethernet Segment identifier (ESI) associated to the Ethernet-Segment that will be signaled in the BGP-EVPN routes. The ESI value cannot be changed unless the Ethernet-Segment is shutdown. Reserved esi values (0 and MAX-ESI) are not allowed.

Default

no esi

Parameters

value

Specifies the 10-byte esi.

Values 00-11-22-33-44-55-66-77-88-99

Using any of these separators ('-',':')

Platforms

All

9.139 esm

esm

Syntax

[**no**] **esm**

Context

[Tree] (config>subscr-mgmt>wlan-gw>tunnel-query>ue-state esm)

Full Context

configure subscriber-mgmt wlan-gw tunnel-query ue-state esm

Description

This command enables matching on ESM UEs.

The **no** form of this command disables matching on DSM UEs, unless UE state matching is disabled altogether.

Default

no esm

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

esm

Syntax

[**no**] **esm**

Context

[Tree] (config>subscr-mgmt>wlan-gw>ue-query>state esm)

Full Context

configure subscriber-mgmt wlan-gw ue-query state esm

Description

This command enables matching on UEs in an ESM state.

The **no** form of this command disables matching on UEs in an ESM state, unless all state matching is disabled.

Default

no esm

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

9.140 esmc-tunnel

esmc-tunnel

Syntax

[**no**] **esmc-tunnel**

Context

[Tree] (config>port>ethernet>ssm esmc-tunnel)

Full Context

configure port ethernet ssm esmc-tunnel

Description

This command allows ESMC frames that are received into the Ethernet port to be tunneled in an Epipe or VPLS service. This is not recommended because it breaks the concepts inherent in Synchronous Ethernet, however it is required for compliance to MEF 6.1.1 EPL Option 2.

The **no** form of this command extracts the ESMC frames upon reception by the port. The ESMC frames are not tunneled through the service.

Default

no esmc-tunnel

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

9.141 esp-auth-algorithm

esp-auth-algorithm

Syntax

esp-auth-algorithm {**null** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** | **aes-xcbc** | **auth-encryption**}

no esp-auth-algorithm

Context

[Tree] (config>ipsec>transform esp-auth-algorithm)

Full Context

configure ipsec ipsec-transform esp-auth-algorithm

Description

This command specifies which hashing algorithm should be used for the authentication function Encapsulating Security Payload (ESP). Both ends of a manually configured tunnel must share the same configuration parameters for the IPsec tunnel to enter the operational state.

The **no** form of this command disables the authentication.

Default

esp-auth-algorithm sha1

Parameters

null

This is a very fast algorithm specified in RFC 2410, which provides no authentication.

md5

This parameter configures ESP to use the **hmac-md5** algorithm for authentication.

sha1

This parameter configures ESP to use the **hmac-sha1** algorithm for authentication.

sha256

This parameter configures ESP to use the **sha256** algorithm for authentication.

sha384

This parameter configures ESP to use the **sha384** algorithm for authentication.

sha512

This parameter configures ESP to use the **sha512** algorithm for authentication.

aes-xcbc

Specifies the **aes-xcbc** algorithm for authentication.

auth-encryption

This parameter must be configured when **esp-encryption-algorithm** is either **aes-gcm** or **aes-gmac**.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

esp-auth-algorithm

Syntax

esp-auth-algorithm {**sha256** | **sha512**}

no esp-auth-algorithm

Context

[Tree] (config>grp-encryp>encryp-keygrp esp-auth-algorithm)

Full Context

configure group-encryption encryption-keygroup esp-auth-algorithm

Description

This command specifies the hashing algorithm used to perform authentication on the Encapsulating Security Payload (ESP) within NGE packets for services configured using this key group. All SPI entries must be deleted before the **no** form of the command may be entered or the **esp-auth-algorithm** value changed from its current value.

The **no** form of the command reverts to the default value.

Default

esp-auth-algorithm sha256

Parameters

sha256

Configures the ESP to use the HMAC-SHA-256 algorithm for authentication.

sha512

Configures the ESP to use the HMAC-SHA-512 algorithm for authentication.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

9.142 esp-encryption-algorithm

esp-encryption-algorithm

Syntax

esp-encryption-algorithm {**null** | **des** | **3des** | **aes128** | **aes192** | **aes256**| **aes128-gcm8** | **aes128-gcm12** | **aes128-gcm16** | **aes192-gcm8** | **aes192-gcm12** | **aes192-gcm16** | **aes256-gcm8** | **aes256-gcm12** | **aes256-gcm16** | **null-aes128-gmac** | **null-aes192-gmac** | **null-aes256-gmac**}

no esp-encryption-algorithm

Context

[Tree] (config>ipsec>ipsec-transform esp-encryption-algorithm)

Full Context

configure ipsec ipsec-transform esp-encryption-algorithm

Description

This command specifies the encryption algorithm to use for the IPsec session. Encryption only applies to esp configurations. If encryption is not defined, esp will not be used.

For IPsec tunnels to come up, both ends need to be configured with the same encryption algorithm.

The **no** form of this command removes the specified encryption algorithm.

Note:
When **aes-gcm** or **aes-gmac** is configured:

- **esp-auth-algorithm** must be set to **auth-encryption**
- the system will not include the authentication algorithm in the ESP proposal of the SA payload
- **ipsec-transform** cannot be used for manual keying

Default

esp-encryption-algorithm aes128

Parameters

null

This parameter configures the high-speed null algorithm, which does nothing. This is the same as not having encryption turned on.

des

This parameter configures the 56-bit des algorithm for encryption. This is an older algorithm, with relatively weak security. Although slightly better than no encryption, it should only be used where a strong algorithm is not available on both ends at an acceptable performance level.

3des

This parameter configures the 3-des algorithm for encryption. This is a modified application of the des algorithm which uses multiple des operations to make things more secure.

aes128

This parameter configures the aes algorithm with a block size of 128 bits. This is the mandatory implementation size for aes. As of today, this is a very strong algorithm choice.

aes192

This parameter configures the aes algorithm with a block size of 192 bits. This is a stronger version of aes.

aes256

This parameter configures the aes algorithm with a block size of 256 bits. This is the strongest available version of aes.

aes128-gcm8

Configures ESP to use aes-gcm with a 128-bit key size and an 8-byte ICV for encryption and authentication.

aes128-gcm12

Configures ESP to use aes-gcm with a 128-bit key size and a 12-byte ICV for encryption and authentication.

aes128-gcm16

Configures ESP to use aes-gcm with a 128-bit key size and a 16-byte ICV for encryption and authentication.

aes192-gcm8

Configures ESP to use aes-gcm with a 192-bit key size and an 8-byte ICV for encryption and authentication.

aes192-gcm12

Configures ESP to use aes-gcm with a 192-bit key size and a 12-byte ICV for encryption and authentication.

aes192-gcm16

Configures ESP to use aes-gcm with a 192-bit key size and a 16-byte ICV for encryption and authentication.

aes256-gcm8

Configures ESP to use aes-gcm with a 256-bit key size and an 8-byte ICV for encryption and authentication.

aes256-gcm12

Configures ESP to use aes-gcm with a 256-bit key size and a 12-byte ICV for encryption and authentication.

aes128-gcm16

Configures ESP to use aes-gcm with a 256-bit key size and a 16-byte ICV for encryption and authentication.

null-aes128gmac

Configures ESP to use aes-gmac with a 128-bit key size for authentication only.

null-aes192gmac

Configures ESP to use aes-gmac with a 192-bit key size for authentication only.

null-aes256gmac

Configures ESP to use aes-gmac with a 256-bit key size for authentication only.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

esp-encryption-algorithm

Syntax

esp-encryption-algorithm {**aes128** | **aes256**}

no esp-encryption-algorithm

Context

[Tree] (config>grp-encryp>encryp-keygrp esp-encryption-algorithm)

Full Context

configure group-encryption encryption-keygroup esp-encryption-algorithm

Description

This command specifies the encryption algorithm used to perform encryption on the Encapsulating Security Payload (ESP) within NGE packets for services configured using this key group. All SPI entries must

be deleted before the **no** form of the command may be entered or the **esp-encryption-algorithm** value changed from its current value.

The **no** form of the command resets the parameter to the default value.

Default

esp-encryption-algorithm aes128

Parameters

aes128

Configures the AES algorithm with a block size of 128 bits—a very strong algorithm choice.

aes256

Configures the AES algorithm with a block size of 256 bits—the strongest available version of AES.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

9.143 esp-ext-hdr

esp-ext-hdr

Syntax

esp-ext-hdr {**true** | **false**}

no esp-ext-hdr

Context

[Tree] (config>filter>ipv6-filter>entry>match esp-ext-hdr)

Full Context

configure filter ipv6-filter entry match esp-ext-hdr

Description

This command enables match on existence of ESP Extension Header in the IPv6 filter policy.

The **no** form of this command ignores ESP Extension Header presence/absence in a packet when evaluating match criteria of a given filter policy entry.

Default

no esp-ext-hdr

Parameters

true

Matches a packet with an ESP Extension Header.

false

Matches a packet without an ESP Extension Header.

Platforms

All

9.144 ess-system-type

ess-system-type

Syntax

[**no**] **ess-system-type**

Context

[Tree] (bof ess-system-type)

Full Context

bof ess-system-type

Description

This command allows a new RoHS compliant 7750 SR-12 or 7750 SR-7 chassis to operate as an 7450 ESS-12 or 7450 ESS-7 system.

After entering this command, the system must be rebooted for the change to take effect.

If the RoHS compliant 7750 SR-12 or 7750 SR-7 chassis is operating as an 7450 ESS system, it can operate with either the 7750 SR or 7450 ESS CPM (subject to SR OS support) but both should always be the same type. See the SR OS release notes for information about the cards supported in 7750 SR and 7450 ESS.

In addition, the system can operate with supported 7450 ESS or 7750 SR IOMs, MDAs, and IMMs.

The **no** form of this command disables this mode of operation and returns the system to a 7750 SR chassis type operation on the next reboot.

Default

no ess-system-type

9.149 eth-cfm-linktrace

eth-cfm-linktrace

Syntax

eth-cfm-linktrace {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**ttl** *ttl-value*] [**fc** {*fc-name*} [**profile** {**in** | **out**}]] [**count** *send-count*] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (config>saa>test>type eth-cfm-linktrace)

Full Context

configure saa test type eth-cfm-linktrace

Description

This command configures a CFM linktrace test in SAA.

Parameters

mac-address

Specifies the Layer 2 unicast MAC address of the destination MEP.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

remote-mepid *mep-id*

Specifies the remote MEP ID as an alternative to the static *mac-address*. When the **remote-mepid** parameter is used in place of the *mac-address*, the domain and association information of the **source mep** for the test is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

ttl-value

Specifies the maximum number of hops traversed in the linktrace.

Values 1 to 255

Default 64

fc-name

Specifies the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

Values be, l2, af, l1, h2, ef, h1, nc

Default nc

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

Default in

send-count

Specifies the number of messages to send, expressed as a decimal integer. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must be expired before the next message request is sent.

Values 1 to 10

Default 1

timeout

Specifies the time, to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the

expiration of the time out, the test is marked complete and no more packets are processed for any of those request probes.

Values 1 to 10

Default 5

interval

Specifies the time, in seconds, to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

Values 1 to 10

Default 5

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

9.150 eth-cfm-loopback

eth-cfm-loopback

Syntax

eth-cfm-loopback {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**size** *data-size*] [**fc** {*fc-name*} [**profile** {**in** | **out**}]] [**count** *send-count*] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (config>saa>test>type eth-cfm-loopback)

Full Context

configure saa test type eth-cfm-loopback

Description

This command configures an Ethernet CFM loopback test in SAA.

Parameters

mac-address

Specifies the Layer 2 unicast MAC address of the destination MEP.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

remote-mepid *mep-id*

Specifies the remote MEP ID as an alternative to the static *mac-address*. When the **remote-mepid** parameter is used in place of the *mac-address*, the domain and association information of the **source mep** for the test is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

data-size

This is the size of the data portion of the data TLV. If 0 is specified, no data TLV is added to the packet.

Values 0 to 1500

Default 0

fc-name

Specifies the **fc** parameter that is used to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

Values be, l2, af, l1, h2, ef, h1, nc

Default nc

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

Default in

send-count

Specifies the number of messages to send, expressed as a decimal integer. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must be expired before the next message request is sent.

Values 1 to 100

Default 1

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of time out, the test is marked complete and no more packets are processed for any of those request probes.

Values 1 to 10

Default 5

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

Values 1 to 10

Default 5

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

9.151 eth-cfm-two-way-delay

eth-cfm-two-way-delay

Syntax

eth-cfm-two-way-delay {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**fc** {*fc-name*} [**profile** {**in** | **out**}]] [**count** *send-count*] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (config>saa>test>type eth-cfm-two-way-delay)

Full Context

configure saa test type eth-cfm-two-way-delay

Description

This command configures an Ethernet CFM two-way delay test in SAA.

Parameters

mac-address

Specifies the Layer 2 unicast MAC address of the destination MEP.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

remote-mepid *mep-id*

Specifies the remote MEP ID as an alternative to the static *mac-address*. When the **remote-mepid** parameter is used in place of the *mac-address*, the domain and association information of the **source mep** for the test is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

fc-name

Specifies the **fc** parameter that is used to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

Values be, l2, af, l1, h2, ef, h1, nc

Default nc

send-count

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. The message interval value must be expired before the next message request is sent.

Values 1 to 100

Default 1

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of time out, the test is marked complete and no more packets are processed for any of those request probes.

Values 1 to 10

Default 5

interval

Specifies the time, in seconds, expressed as a decimal integer. This parameter is used to configure the spacing between probes within a test run.

Values 0.1 to 0.9, 1 to 10

Default 5

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

9.152 eth-cfm-two-way-slm

eth-cfm-two-way-slm

Syntax

eth-cfm-two-way-slm {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**fc** {*fc-name*} [**profile** {**in** | **out**}]] [**count** *send-count*] [**size** *data-size*] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (config>saa>test>type eth-cfm-two-way-slm)

Full Context

configure saa test type eth-cfm-two-way-slm

Description

This command configures an Ethernet CFM two-way SLM test in SAA.

Parameters

mac-address

Specifies the Layer 2 unicast MAC address of the destination MEP.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

remote-mepid ***mep-id***

Specifies the remote MEP ID as an alternative to the static *mac-address*. When the **remote-mepid** parameter is used in place of the *mac-address*, the domain and association information of the **source mep** for the test is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

fc-name

Specifies the **fc** parameter that is to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

Values be, l2, af, l1, h2, ef, h1, nc

Default nc

profile {in | out}

The profile state of the MPLS echo request encapsulation.

Default in

send-count

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. The message interval value must be expired before the next message request is sent.

Values 1 to 1000

Default 1

data-size

Specifies the size of the data portion of the data TLV. If 0 is specified, no data TLV is added to the packet.

Values 0 to 1500

Default 0

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of those request probes.

Values 1 to 10

Default 5

interval

Specifies the time, in seconds, used to configure the spacing between probes within a test run.

Values 0.1 to 0.9, 1 to 10

Default 5

Platforms

9.155 eth-ring

eth-ring

Syntax

eth-ring *ring-id*

no eth-ring

Context

[Tree] (config>service>vpls eth-ring)

Full Context

configure service vpls eth-ring

Description

This command configures a VPLS SAP to be associated with an Ethernet ring. The SAP port ID is associated with the corresponding Ethernet ring path configured on the same port ID. The encapsulation type must be compatible with the Ethernet ring path encapsulation.

The **no** form of this command removes the Ethernet ring association from this SAP.

Default

no eth-ring

Parameters

ring-id

Specifies the ring ID.

Values 1 to 128

Platforms

All

eth-ring

Syntax

eth-ring *ring-index*

no eth-ring

Context

[Tree] (config eth-ring)

Full Context

configure eth-ring

Description

This command configures a G.8032 protected Ethernet ring. G.8032 Rings may be configured as major rings with two paths (a&b) or as sub-rings with two paths, or in the case of an interconnection node a single path.

The **no** form of this command deletes the Ethernet ring specified by the ring-id.

Default

no eth-ring

Parameters

ring-index

Specifies the ring ID.

Values 1 to 128

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

9.156 eth-sat

eth-sat

Syntax

eth-sat *sat-id* [**create**]

no eth-sat *sat-id*

Context

[Tree] (config>system>satellite eth-sat)

Full Context

configure system satellite eth-sat

Description

This command enables the specified Ethernet satellite configuration context.

The **no** form of the command deletes the specified Ethernet satellite.

Parameters

sat-id

Specifies the satellite ID for the associated Ethernet satellite.

Values 1 to 20

create

Creates a new Ethernet satellite context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-sat

Syntax

eth-sat *sat-id*

Context

[Tree] (admin>satellite eth-sat)

Full Context

admin satellite eth-sat

Description

This command can be used to perform administrative functions on the specified Ethernet-satellite chassis.

Parameters

sat-id

Specifies the Ethernet-satellite chassis.

Values 1 to 20

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

9.157 eth-tag

eth-tag

Syntax

eth-tag *tag-value*

no eth-tag

Context

[Tree] (config>service>epipe>bgp-evpn>local-attachment-circuit eth-tag)

[Tree] (config>service>epipe>bgp-evpn>remote-attachment-circuit eth-tag)

Full Context

configure service epipe bgp-evpn local-attachment-circuit eth-tag

configure service epipe bgp-evpn remote-attachment-circuit eth-tag

Description

This command configures the Ethernet tag value. When configured in the **local-attachment-circuit** context, the system uses the value in the advertised AD per-EVI route sent for the attachment circuit. When configured in the **remote-attachment-circuit** context the system compares that value with the eth-tag value of the imported AD per-EVI routes for the service. If there is a match, the system creates an EVPN destination for the Epipe.

Parameters

tag-value

Specifies the Ethernet tag value of the attachment circuit.

Values 1 to 16777215

Platforms

All

9.158 eth-test

eth-test

Syntax

eth-test {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**priority** *priority*] [**data-length** *data-length*]

Context

[Tree] (oam>eth-cfm eth-test)

Full Context

oam eth-cfm eth-test

Description

This command initiates an ETH-CFM test. The implementation supports a single ETH-TST PDU to check unidirectional reachability, launched from a source MEP and terminated on the remote MEP with no response PDU toward the source.

Parameters

mac-address

Specifies a unicast destination MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

remote-mepid *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

priority

Specifies the priority of the frame. The priority can be manipulated by QoS policies.

Values 0 to 7

Default 7

data-length

Specifies the size of the padding to be added to the frame.

Values	64 to 1500
Default	64

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

9.159 eth-test-enable

eth-test-enable

Syntax

[**no**] **eth-test-enable**

Context

[Tree] (config>eth-tunnel>path>eth-cfm>mep eth-test-enable)

Full Context

configure eth-tunnel path eth-cfm mep eth-test-enable

Description

This command enables eth-test functionality on MEP. For this test to work, operators need to configure ETH-test parameters on both sender and receiver nodes. The ETH-test is then performed using the following OAM commands:

oam eth-cfm eth-test *mac-address* **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**priority** *priority*] [**data-length** *data-length*]

A check is done for both the provisioning and test to ensure the MEP is an Y.1731 MEP (MEP provisioned with domain format none, association format icc-based). If not, the operation fails. An error message in the CLI and SNMP will indicate the problem.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-tunnel

Syntax

eth-tunnel *tunnel-id*

Context

[Tree] (config>service>vpls eth-tunnel)

Full Context

configure service vpls eth-tunnel

Description

This command associates a BVPLS SAP with the global Ethernet tunnel object specified by tunnel-id. Only one-to-one mapping between SAP and Ethernet tunnel is supported in the initial implementation. The global eth-tunnel tunnel-id with at least a member port must be configured in advance for the command to be successful. A SAP will be instantiated using the active path components (member port and control-tag) for VPLS forwarding. The last member port in the Ethernet tunnel cannot be deleted if there is a SAP configured on that eth-tunnel. This command is only available in the BVPLS context.

The **no** form of this command removes the sap from the Ethernet tunnel object.

Default

no sap is specified

Parameters

tunnel-id

Specifies the value of the Ethernet tunnel identifier to be used for the SAP.

Values 1 to 64

Platforms

All

eth-tunnel

9.163 ethernet-ctag

ethernet-ctag

Syntax

[**no**] **ethernet-ctag**

Context

[Tree] (config>qos>sap-egress ethernet-ctag)

Full Context

configure qos sap-egress ethernet-ctag

Description

This command specifies that the top customer tag should be used for egress reclassification based on dot1p criteria. This command applies to all dot1p criteria configured in a given SAP egress QoS policy.

The **no** form of this command means that a service delimiting tag will be used for egress reclassification based on dot1p criteria.

Default

no ethernet-ctag

Platforms

All

9.164 ethernet-header

ethernet-header

Syntax

ethernet-header [**da** *ieee-address*] [**sa** *ieee-address*] [**etype** *ethertype*]

no ethernet-header

Context

[Tree] (config>li>li-source>nat ethernet-header)

Full Context

configure li li-source nat ethernet-header

Description

This command configures the Ethernet header for the NAT sources.

The **no** form of this command removes the values from the configuration.

Parameters

da *ieee-address*

Specifies the destination MAC address field of the of the Ethernet encapsulation used for the NAT subscribers associated with this mirror source up to 30 characters.

sa *ieee-address*

Specifies the source MAC address field of the of the Ethernet encapsulation used for the NAT subscribers associated with this mirror source up to 30 characters.

ethertype

Specifies the ethertype of the ethernet encapsulation used for the NAT subscribers associated with this mirror source that have an intercept identifier.

Values 1536 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

9.165 ethernet-segment

ethernet-segment

Syntax

ethernet-segment *name* [**virtual**] [**create**]

no ethernet-segment *name*

Context

[Tree] (config>service>system>bgp-evpn ethernet-segment)

Full Context

configure service system bgp-evpn ethernet-segment

Description

This command configures an Ethernet Segment instance and its corresponding name. The configuration of the dot1q or qinq nodes is only allowed if the Ethernet Segment (ES) is created as **virtual**.

For a virtual ES, a port, LAG, or SDP must be created for the ES before configuring a VLAN or vc-id association.

When a port or LAG is added, the **type** and **encap-type** values are checked. If the **encap-type** is **dot1q**, then only the dot1q node can be configured; the qinq context is not allowed. In the same way, if the **encap-type** is **qinq**, then only the qinq node is allowed. A dot1q, qinq, or vc-id range is required for a virtual ES to be operationally active.

Parameters

name

Specifies the 32-character ES name.

virtual

This keyword specifies that the ES is virtual and is associated to logical interfaces, in addition to ports, LAGs, or SDPs.

create

Mandatory keyword for creating an ES.

Platforms

All

9.166 etype

etype

Syntax

etype *etype-value*

no etype

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match etype)

Full Context

configure qos sap-ingress mac-criteria entry match etype

Description

Configures an Ethernet type II value to be used as a service ingress QoS policy match criterion.

The Ethernet type field is a 2-byte field used to identify the protocol carried by the Ethernet frame. For e.g. 0800 is used to identify the IPv4 packets.

The Ethernet type field is used by the Ethernet version-II frames. IEEE 802.3 Ethernet frames do not use the type field. For IEEE 802.3 frames, use the dsap, ssap, or snap-pid fields as match criteria.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The no form of this command removes the previously entered etype field as the match criteria.

Default

no etype

Parameters

etype-value

The Ethernet type II frame Ethertype value to be used as a match criterion expressed in hexadecimal.

Values 0x0600 to 0xFFFF

Platforms

All

etype

Syntax

etype *0x0600..0xffff*

no etype

Context

[Tree] (config>filter>mac-filter>entry>match etype)

Full Context

configure filter mac-filter entry match etype

Description

Configures an Ethernet type II Ethertype value to be used as a MAC filter match criterion.

The Ethernet type field is a two-byte field used to identify the protocol carried by the Ethernet frame. For example, 0800 is used to identify the IPv4 packets.

The Ethernet type field is used by the Ethernet version-II frames. IEEE 802.3 Ethernet frames do not use the type field. For IEEE 802.3 frames, use the dsap, ssap or snap-pid fields as match criteria.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria.

The **no** form of the command removes the previously entered etype field as the match criteria.

Default

no etype

Parameters

0x0600..0xffff

Specifies the Ethernet type II frame Ethertype value to be used as a match criterion expressed in decimal integer or hexadecimal format.

Values 1536 to 65535 or 0x0600 to 0xFFFF

Platforms

All

etype

Syntax

etype *0x0600xx0xffff*

no etype

Context

[Tree] (config>system>security>mgmt-access-filter>mac-filter>entry>match etype)

Full Context

configure system security management-access-filter mac-filter entry match etype

Description

Configures an Ethernet type II Ethertype value to be used as a MAC filter match criterion.

The Ethernet type field is a two-byte field used to identify the protocol carried by the Ethernet frame. For example, 0800 is used to identify the IPv4 packets.

The Ethernet type field is used by the Ethernet version-II frames. IEEE 802.3 Ethernet frames do not use the type field. For IEEE 802.3 frames, use the dsap, ssap or snap-pid fields as match criteria.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria. Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for information about MAC Match Criteria Exclusivity Rules fields that are exclusive based on the frame format.

The **no** form of this command removes the previously entered etype field as the match criteria.

Default

no etype

Parameters

ethernet-type

Specifies the Ethernet type II frame Ethertype value to be used as a match criterion expressed in hexadecimal.

Values 0x0600 to 0xFFFF

event

Syntax

event *event-type* [**create**]

no event *event-type*

Context

[Tree] (config>card>mda event)

Full Context

configure card mda event

Description

This command allows the user to control the action to be taken when a specific hardware error event is raised against the target MDA.

If no event action has been created for a specific event type, then the hardware errors related to that event type are ignored by the management plane of the router.

The **no** form of this command clears any action defined for the event.

Parameters

event-type

Specifies the event type, up to 32 characters.

Values soft-error — Defines the action to be taken when soft errors are detected on the MDA

internal-frame-loss — System detected frame loss in the traffic transiting the MDA.

memory-error — Provides the user options to handle MDA memory error events on MDAs. This feature is supported on FP2- and FP3-based Ethernet MDAs and IMMs.

data-link-error — Provides the user options to handle datapath link errors on an MDA.

create

Keyword used to create an event.

event

Syntax

event *rmon-event-id* [*event-type*] [**description** *description-string*] [**owner** *owner-string*]

no event *rmon-event-id*

Context

[Tree] (config>system>thresholds>rmon event)

Full Context

configure system thresholds rmon event

Description

The event command configures an entry in the RMON-MIB event table. The event command controls the generation and notification of threshold crossing events configured with the alarm command. When a threshold crossing event is triggered, the **rmon>event** configuration optionally specifies if an entry in the RMON-MIB log table should be created to record the occurrence of the event. It may also specify that an SNMP notification (trap) should be generated for the event. The RMON-MIB defines two notifications for threshold crossing events: Rising Alarm and Falling Alarm.

Creating an event entry in the RMON-MIB log table does not create a corresponding entry in the SR OS event logs. However, when the **event-type** is set to trap, the generation of a Rising Alarm or Falling Alarm notification creates an entry in the SR OS event logs and that is distributed to all the SR OS log destinations that are configured: CONSOLE, session, memory, file, syslog, or SNMP trap destination.

The SR OS logger message includes a rising or falling threshold crossing event indicator, the sample type (absolute or delta), the sampled value, the threshold value, the RMON-alarm-id, the associated RMON-event-id and the sampled SNMP object identifier.

Use the **no** form of this command to remove an rmon-event-id from the configuration.

Parameters

rmon-event-id

Specifies an identifier for this event. Alarm ID values above 65400 are used for dynamic system threshold commands and should be avoided.

Values 1 to 65535

rmon-event-type

Specifies the type of notification action to be taken when this event occurs.

Values **log** — An entry is made in the RMON-MIB log table for each event occurrence.

This does **not** create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log

destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

description-string

Specifies a user configurable string that can be used to identify the purpose of this event. This is an optional parameter and can be up to 80 characters long. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

owner-string

Specifies the owner string; the owner identifies the creator of this alarm. It defaults to "TiMOS CLI". This parameter is defined primarily to allow entries that have been created in the RMON-MIB alarmTable by remote SNMP managers to be saved and reloaded in a CLI configuration file. The owner will not normally be configured by CLI users and can be up 80 characters long.

Default TiMOS CLI

Configuration example:

```
event 5 rmon-event-type both description "alarm testing" owner "TiMOS CLI"
```

Platforms

no event-control *application-id* [*event-name* | *event-number*]

Context

[Tree] (config>log event-control)

Full Context

configure log event-control

Description

This command is used to specify that a particular event or all events associated with an application is either generated or suppressed.

Events are generated by an application and contain an event number and description explaining the cause of the event. Each event has a default designation which directs it to be generated or suppressed.

Events are generated with a default severity level that can be modified by using the *severity-level* option.

Events that are suppressed by default are typically used for debugging purposes. Events are suppressed at the time the application requests the event's generation. No event log entry is generated regardless of the destination. While this feature can save processor resources, there may be a negative effect on the ability to troubleshoot problems if the logging entries are squelched. In reverse, indiscriminate application may cause excessive overhead.

The rate of event generation can be throttled by using the **throttle** parameter.

The **no** form of this command reverts the parameters to the default setting for events for the application or a specific event within the application. The severity, generate, suppress, and throttle options will also be reset to the initial values.

Default

Each event has a set of default settings. To display a list of all events and the current configuration use the **event-control** command.

Parameters

application-id

The application whose events are affected by this event control filter.

Values A valid application name. To display a list of valid application names, use the **show log applications** command. Some examples of valid applications are:

```
adp|application_assurance|aps|auto_prov|bfd|bgp|bier|
bmp|calltrace|cflowd|chassis|cpmhwfilter|cpmhwqueue
debug|dhcp|dhcps|diameter|dot1x|dynsvc|efm_oam|elmi|

tls|tree_sid|user|user_db|video|vrrp|vrtr|wlan_gw|wpp
```

event-name

To generate, suppress, or revert to default for a single event, enter the specific event short name up to 32 characters. If no event name is specified, the command applies to all events in the application. To display a list of all event short names use the **event-control** command.

event-number

To generate, suppress, or revert to default for a single event, enter the specific number. If no event number is specified, the command applies to all events in the application.

Values 0 to 4294967295

generate

Specifies that logger event is created when this event occurs. The generate keyword can be used with two optional parameters, *severity-level* and **throttle**.

Default generate

severity-level

An ASCII string representing the severity level to associate with the specified generated events

Default The system-assigned severity name

Values cleared, indeterminate, critical, major, minor, warning

throttle

Specifies whether or not events of this type will be throttled. By default, event throttling is on for most event types.

suppress

This keyword indicates that the specified events will not be logged. If the **suppress** keyword is not specified then the events are generated by default. For example on the 7750 SR, **event-control bgp suppress** will suppress all BGP events. If a log event is a raising event for a Facility Alarm, and the associated Facility Alarm is raised, then changing the log event to **suppress** clears the associated Facility Alarm.

Default generate

specific-throttle-rate *events-limit*

The log event throttling rate can be configured independently for each log event using this keyword. This specific-throttle-rate overrides the globally configured throttle rate (**config**>**log**>**throttle-rate**) for the specific log event.

Values 1 to 20000

interval *seconds*

Specifies the number of seconds that the specific throttling intervals lasts.

Values 1 to 1200

disable-specific-throttle

Specifies to disable the **specific-throttle-rate**.

repeat

Specifies that the log event should be repeated every minute until the underlying condition is cleared. Only supported for the following log events: BGP tBgpMaxNgPfxLmtThresholdReached and PORT tmnxEqPortEtherCrcAlarm (for **degrade** threshold only)

Platforms

All

9.169 event-damping

event-damping

Syntax

[**no**] **event-damping**

Context

[Tree] (config>log event-damping)

Full Context

configure log event-damping

Description

This command allows the user to set the event damping algorithm to suppress QoS or filter change events.

The **no** form of this command removes the event damping algorithm.

Note:
While this event damping is original behavior for some modules such as service manager, QoS, and filters, it can result in the NMS system database being out of sync because of missed change events. On the other hand, if the damping is disabled (**no event-damping**), it may take much longer to **exec** a large CLI configuration file after system bootup.

Platforms

All

9.170 event-handler

event-handler

Syntax

event-handler *event-handler*

no event-handler

Context

[Tree] (config>log>event-trigger>event>trigger-entry event-handler)

Full Context

configure log event-trigger event trigger-entry event-handler

Description

This command configures the event handler to be used for this trigger entry.

The **no** form of this command removes the event handler configuration.

Parameters

event-handler

Specifies the name of the event handler, up to 32 characters.

Platforms

All

event-handler

Syntax

event-handler

Context

[Tree] (config>system>security>cli-script>authorization event-handler)

Full Context

configure system security cli-script authorization event-handler

Description

Commands in this context configure authorization for the Event Handling System (EHS). EHS allows user-controlled programmatic exception handling by allowing a CLI script to be executed upon the detection of a log event.

Platforms

All

9.171 event-handling

event-handling

Syntax

event-handling

Context

[Tree] (config>log event-handling)

Full Context

configure log event-handling

Description

Commands in this context configure event handling within the Event Handler System (EHS).

event-log

Syntax

event-log *event-log-name* [**create**]

no event-log *event-log-name*

Context

[Tree] (config>app-assure>group event-log)

Full Context

configure application-assurance group event-log

Description

This command configures an event log.

Parameters

event-log-name

Specifies the name of the event log.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

event-log

Syntax

event-log *event-log-name* [**all**]

no event-log

Context

[Tree] (config>app-assure>group>tcp-validate event-log)

Full Context

configure application-assurance group tcp-validate event-log

Description

This command enables logging of traffic dropped by TCP validation.

The **no** form of this command disables logging of traffic dropped by TCP validation.

Default

no event-log

Parameters

event-log-name

Specifies the name of the event log up to 32 characters.

all

Logs all dropped traffic. Using the **all** option allows the operator to capture all discards made by the TCP validation policy, including those related to:

- packets that were received after an RST and discarded
- packets received before TCP session establishment (before SYN) and discarded

Without the **all** option, discards related to these cases are not captured in any event log.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

event-log

Syntax

event-log *event-log-name*

no event-log

Context

[Tree] (config>app-assure>group>gtp>gtp-filter event-log)

[Tree] (config>app-assure>group>gtp event-log)

Full Context

configure application-assurance group gtp gtp-filter event-log

configure application-assurance group gtp event-log

Description

This command allows AA to treat traffic on UDP port number 2152 as GTP-u. Without further specifying any other parameters within this GTP context, AA performs basic GTP-u header sanity checks and discards packets that are malformed. This GTP context allows the operator to configure various GTP filters (maximum of 128 GTP filters).

Default

no event-log

Parameters

event-log-name

Specifies the event log name to be used to log discards due to GTP-u basic header sanity checks.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

event-log

Syntax

event-log *event-log-name*

no event-log

Context

[Tree] (config>app-assure>group>sctp-filter event-log)

Full Context

configure application-assurance group sctp-filter event-log

Description

This command configures an event log for packets dropped by the SCTP filter.

Default

no event-log

Parameters

event-log-name

Specifies the event log name to be used.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

9.173 event-mon

event-mon

Syntax

event-mon

Context

[Tree] (config>oam-pm>session>measurement-interval event-mon)

Full Context

configure oam-pm session measurement-interval event-mon

Description

This command enables the different threshold events on a specific measurement interval. Only one measurement interval with a configured OAM PM session can have events enabled using the **no shutdown** command.

9.174 event-notification

event-notification

Syntax

[**no**] **event-notification**

Context

[Tree] (config>port>ethernet>efm-oam>link-mon>errored-frame-period event-notification)

[Tree] (config>port>ethernet>efm-oam>link-mon>errored-frame-seconds event-notification)

[Tree] (config>port>ethernet>efm-oam>link-mon>errored-frame event-notification)

Full Context

configure port ethernet efm-oam link-monitoring errored-frame-period event-notification

configure port ethernet efm-oam link-monitoring errored-frame-seconds event-notification

configure port ethernet efm-oam link-monitoring errored-frame event-notification

Description

Allows the frame error **sf-threshold** crossing events to transmit the Event Notification OAMPDU with the specific Link Event TLV information. The Event Notification OAM PDU will only be generated when the initial **sf-threshold** is reached. No subsequent notification will be sent until the event that triggered until the event is manually cleared. The burst parameter under the **local-sf-action** will determine the number

of Event Notification OAMPDUs to generate when the event occurs. The reception of the event notification will be processed regardless of this parameter.

The **no** version of this command will disable the transmission of the Event Notification OAMPDU for this event type.

Default

event-notification

Platforms

All

event-notification

Syntax

[**no**] **event-notification**

Context

[Tree] (config>port>ethernet>efm-oam>link-mon>errored-symbols event-notification)

Full Context

configure port ethernet efm-oam link-monitoring errored-symbols event-notification

Description

This command allows the symbol error event threshold crossing actions to transmit the Event Notification OAM PDU with the specific Link Event TLV information. The Event Notification OAM PDU will only be generated on the initial sf-threshold is reached. No subsequent notification will be sent until the event that triggered the notification clears, through manual intervention or a window where the configured sd-threshold is not reached. The burst parameter under the local-sf-action will determine the number of Event Notification OAM PDUs to generate when the event occurs. The reception of the event notification will be processed regardless of this parameter.

The **no** version of this command will disable the transmission of the Event Notification OAM PDU for this event type.

Default

event-notification

Platforms

All

event-notification

Syntax

event-notification local-port-action {**log-only** | **out-of-service**}

Context

[Tree] (config>port>ethernet>efm-oam>peer-rdi-rx event-notification)

Full Context

configure port ethernet efm-oam peer-rdi-rx event-notification

Description

This command defines how to react to the reception of event TLVs contained in the Event Notification OAMPDU. The event TLVs contained in the event notification OAMPDU will be analyzed to determine if the peer has crossed the error threshold for the window. The analysis does not consider any local signal degrades or signal failure threshold. The analysis is based solely on the information receive form the peer. The analysis is performed on all event TLVs contained in the Event Notification OAMPDU without regard for support of a specific error counters or local configuration of any thresholds. In the case of symbol errors only, a threshold below the error rate can be used to return the port to service.

Default

event-notification local-port-action log-only

Parameters

local-port-action

Defines whether or not the local port will be affected when the Event Notification OAM PDU is received from a peer based on the threshold computation for the included TLVs.

log-only

Keyword that prevents the port from being affected when the local peer receives an Event Notification OAM PDU. The event will be logged but the port will remain operational.

out-of-service

Keyword that causes the port to enter a non-operation down state with a port state of link up. The error will be logged upon reception of Event Notification. The port will not be available to service data but will continue to carry Link OAM traffic to ensure the link is monitored. All this assumes the error threshold exceeds the error rate in the TLV.

Platforms

All

9.175 event-notification-burst

event-notification-burst

Syntax

event-notification-burst *packets*

Context

[Tree] (config>port>ethernet>efm-oam>link-mon>local-sf-action event-notification-burst)

Full Context

configure port ethernet efm-oam link-monitoring local-sf-action event-notification-burst

Description

This command defines the number of the Event Notification OAM PDU to be send to the peer if the local signal failure threshold (sf-threshold) has been reached. The sending of the Event Notification OAMPDU is configured under the individual monitors.

Interactions: The **sf-thresh** threshold will trigger these actions.

Parameters

packets

Specifies the number of Event Notification OAM PDUs to send to a peer when the signal failure threshold has been reached.

Values 1 to 5

Platforms

All

9.176 event-trigger

event-trigger

Syntax

event-trigger

Context

Context

[Tree] (config>call-trace-trace-profile events)

Full Context

configure call-trace trace-profile events

Description

This command configures whether captured traces include events that occurred on the SR OS router, such as mobility and idle-timeout.

Default

events none

Parameters

none

Specifies that no events is traced.

public-only

Specifies that only events that are readable by everyone is traced.

all

Specifies that all events is traced, including events that are encrypted for use by customer support only. Encrypted events are not readable by end-users.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

events

Full Context

debug router bgp events

Description

This command logs all events changing the state of a BGP peer.

The **no** form of this command disables the debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms

All

events

Syntax

events [**station** *station-name*]

9.179 evi

evi

Syntax

evi *value*

no evi

Context

[Tree] (config>service>epipe>bgp-evpn evi)

[Tree] (config>service>vpls>bgp-evpn evi)

Full Context

configure service epipe bgp-evpn evi

configure service vpls bgp-evpn evi

Description

This command allows the configuration of a 2-byte EVPN instance (EVI) unique in the system. It is used for the service-carving algorithm for multi-homing and auto-deriving route target and route distinguishers.

If not specified, the value is zero and no route distinguisher or route targets are auto-derived from it. If the *evi* value is specified and no other **route-distinguisher** or **route-target** is configured in the service, the following rules apply:

- the route distinguisher is derived from <system_ip>:evi
- the route target is derived from <autonomous-system>:evi

If VSI import and export policies are configured, the route target must be configured in the policies and those values take preference over the auto-derived route targets. If **bgp-ad**>**vpls-id** and **bgp-evpn**>**evi** are both configured on the same service, the VPLS ID auto-derived route target or route distinguisher takes precedence over the values auto-derived from the EVI. The operational route target for a service is displayed in the **show service id bgp** command.

The **no** form of this command sets the EVI value back to zero.

Parameters

value

Specifies the EVPN instance.

Values 1 to 16777215

Platforms

All

evi

Syntax

evi *start* [**to** *to*]

no evi *start*

Context

[Tree] (config>service>system>bgp-evpn>eth-seg>service-carving>manual evi)

Full Context

configure service system bgp-evpn ethernet-segment service-carving manual evi

Description

This command configures the EVI ranges for which the PE is the primary Designated Forwarder, or uses the lowest preference algorithm.

Note:
Multiple individual EVI values and ranges are allowed.

There are two service-carving manual algorithms for DF election:

- manual non-preference

  A **preference** command is not configured for this algorithm. The primary PE for the configured EVIs is determined by the EVI range. The manual non-preference algorithm only supports two PEs in the Ethernet Segment

- manual preference-based

  If a **preference** command is configured, the algorithm uses the configured value to determine the DF election. For EVIs not defined in the range, the highest-preference algorithm is used. For configured EVIs, the lowest-preference algorithm is used.

The **no** form of this command removes the PE from the primary Designated Forwarder role for the range, or sets the preference algorithm back to highest preference.

Parameters

start

Specifies the initial EVI value of the range.

Values 1 to 65535

to

Specifies the end EVI value of the range. If not configured, only the individual start value is considered.

Values 1 to 16777215

Platforms

All

[Tree] (config>service>vprn>bgp-evpn>mpls evi)

Full Context

configure service vprn bgp-evpn segment-routing-v6 evi

configure service vprn bgp-evpn mpls evi

Description

This command configures a 2-byte EVPN instance (EVI) unique in the system.

The router uses the EVI to identify the BGP EVPN instance in a VPRN (for the EVPN-IFL model) or an R-VPLS (for the EVPN-IFF model) that is associated with the Layer 3 Ethernet Segment (ES), for the purpose of IP Aliasing. This configuration is required on the PEs attached to the ES as well as on the remote PEs that need to create ES destinations to the multihoming Layer 3 ES.

The **no** form of this command removes the EVI value.

Default

no evi

Parameters

value

Specifies the EVPN instance.

Values 1 to 16777215

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

configure service epipe bgp-evpn vxlan evi-three-byte-auto-rt

configure service vpls bgp-evpn vxlan evi-three-byte-auto-rt

Description

This command specifies that the BGP-EVPN instance import and export route target is auto-derived as described in RFC 8365 (Global-Administrator:A/Type/D-ID/Service-ID).

Where:

- Global Administrator — is the configured 2-octet AS Number. If the configured ASN exceeds the 2 byte limit, the low order 16-bit value will be taken.
- A=0 (for auto-derivation)
- Type=4 (EVI-based route target)
- D-ID= [1..2] — encodes the BGP instance. This allows the auto-derivation of different route targets in multi-instance services. The value is inherited from the corresponding BGP instance.
- Service ID= 3-octet EVI

The **no** form of this command disallows the derivation of the route target.

Default

no evi-three-byte-auto-rt

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

- configure service vpls bgp-evpn segment-routing-v6 evi-three-byte-auto-rt

no evpn *service-id*

Context

[Tree] (config>subscr-mgmt>isa-svc-chain evpn)

Full Context

configure subscriber-mgmt isa-service-chaining evpn

Description

This command configures the import mode for the service chaining EVPN service. The **import-mode** controls the EPVN route types that are imported by the EVPN system.

The **no** form of this command removes the configuration parameters.

Parameters

service-id

Specifies the service ID of the EVPN.

Values 1 to 2147483647

import-mode

Specifies the import mode of the EVPN.

Values bridged — The specified EVPN instance imports EVPN route type-2 and type-1 from the peer.

routed — The specified EVPN instance imports EVPN type-1, type-2 and type-5 routes from the peer. Also, the EVPN instance can be configured to export EVPN type-5 routes for NAT pools to the peer.

none — The specified EVPN instance does not import any EVPN routes from the peer but can be configured with NAT pools that are exported to the peer in EVPN type-5 routes.

create

Keyword used to create the EVPN service instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure router bgp group neighbor add-paths evpn

Description

This command configures the Add-Paths capability for EVPN routes.

The **no** form of this command disables Add-Paths support for EVPN routes. This causes sessions that are established using Add-Paths for EVPN to go down and come back up without the Add-Paths capability.

Default

no evpn

Parameters

send-limit

Specifies the maximum number of EVPN paths to send.

Values 1 to 16, none, multipaths

receive

Keyword used to allow multiple EVPN paths per prefix from a peer.

none

Keyword used to specify that the router does not negotiate to receive multiple unlabeled unicast routes per EVPN prefix.

All

evpn

Syntax

[**no**] **evpn**

Context

[Tree] (config>router>ldp>import-pmsi-routes evpn)

Full Context

configure router ldp import-pmsi-routes evpn

Description

This command specifies that the SR OS is to cache inter-as EVPN PMSI AD routes for option B.

The **no** form of this command disables caching of EVPN PMSI AD routes. The default is disabled, however when an upgrade from a software load that does not supports this command is performed, this command will be enabled after the upgrade.

This command is not enabled if the user is using an older configuration file.

Default

no evpn

Platforms

All

9.183 evpn-etree-leaf-label

evpn-etree-leaf-label

Syntax

evpn-etree-leaf-label [[*32..524256*]]

no evpn-etree-leaf-label

Context

[Tree] (config>service>system>bgp-evpn evpn-etree-leaf-label)

Full Context

configure service system bgp-evpn evpn-etree-leaf-label

Description

This command enables EVPN Ethernet-Tree (E-Tree) VPLS services on the router (not B-VPLS). It allocates an E-Tree leaf label for the Provider Edge (PE) device and configures the ILM entry.

The command ensures that in-flight traffic can perform an ILM entry lookup at any time, and avoid the discards during **shutdown** or **no shutdown** services (or at least reduce the timing window so that it does not occur during normal operation or configuration).

The E-Tree leaf label can optionally be statically configured with a value. The label value must be in the static label range of the system.

Note:
The **evpn-etree-leaf-label** command must be configured to execute **bgp-evpn mpls no shutdown**.

The **no** form of this command removes the value from the configuration.

Default

no evpn-etree-leaf-label

Parameters

32..524256

Specifies the E-Tree leaf label

Values 32 to 524256

9.187 evpn-nd-advertise

evpn-nd-advertise

Syntax

evpn-nd-advertise {**host** | **router** | **router-host**}

Context

[Tree] (config>service>vpls>proxy-nd evpn-nd-advertise)

Full Context

configure service vpls proxy-nd evpn-nd-advertise

Description

This command enables the advertisement of static or dynamic entries that are learned as host, router, or host and router, (only one option is possible in a specified service). It also determines the R flag (host or router) when sending Neighbor Advertisement (NA) messages for existing EVPN entries in the proxy-ND table.

The **router-host** command option is only possible when the ARP/ND extended community is advertised along with the MAC/IP routes. It determines that both host and router (dynamic and static) entries are advertised in MAC/IP routes, with an indication whether the entry is host or router in the R flag. These EVPN entries are installed as host or router entries depending on the R flag of the route, and NA messages for them are sent with the proper host or router indication.

To modify this command you must shutdown the proxy ND.

```
configure service vpls proxy-nd shutdown
```

Default

evpn-nd-advertise router

Parameters

host

Enables the advertisement of static or dynamic entries that are learned as host.

router

Enables the advertisement of static or dynamic entries that are learned as routers.

router-host

Enables the advertisement of static or dynamic entries that are learned as router or host.

9.189 evpn-route-tag

evpn-route-tag

Syntax

evpn-route-tag *tag*

no evpn-route-tag

Context

[Tree] (config>service>vpls>proxy-arp evpn-route-tag)

[Tree] (config>service>vpls>proxy-nd evpn-route-tag)

Full Context

configure service vpls proxy-arp evpn-route-tag

configure service vpls proxy-nd evpn-route-tag

Description

This command configures a local route tag that can be used on export policies to match MAC/IP routes generated by the proxy-ARP or proxy-ND module. For example, if a new active dynamic proxy-ARP entry is added to the proxy-ARP table and **evpn-route-tag** is 10, an export policy that matches on tag 10 and adds a site-of-origin community SOO-1, allows the router to advertise the MAC/IP route for the proxy-ARP entry with community SOO-1.

The **no** form of this command removes the route tag for the generated EVPN MAC/IP routes.

Parameters

tag

Specifies the route tag, in either decimal or hexadecimal form.

Values 1 to 255

Platforms

All

9.190 evpn-tunnel

evpn-tunnel

Syntax

evpn-tunnel [**ipv6-gateway-address** {**ip** | **mac**}] [**supplementary-broadcast-domain**]

no evpn-tunnel

Context

[Tree] (config>service>vprn>if>vpls evpn-tunnel)

Full Context

configure service vprn interface vpls evpn-tunnel

Description

This command sets the evpn-tunnel mode for the attached R-VPLS. When enabled for an IPv4 interface, no IPv4 address is required under the same interface. When enabled on an IPv6 interface, the **ipv6-gateway-address** parameter can be configured as **ip** or **mac**.

When configured as **evpn-tunnel ipv6-gateway-address ip** or simply **evpn-tunnel**, then:

- on transmission, the router populates the GW IP field of the route type 5 with a Link-Local-Address (LLA) if an explicit global IPv6 address is not configured. Otherwise, the configured IPv6 address is used.
- on reception of routes type 5 for IPv6 prefixes, only routes with non-zero GW IP are processed; the rest of the routes will be **treated-as-withdraw**.

When configured as **evpn-tunnel ipv6-gateway-address mac,** then:

- on transmission, the router sends routes type 5 with zero GW IP field, and a MAC extended community of the router, containing the VPRN interface MAC.
- on reception of IPv6 prefix routes, only routes with zero GW IP and non-zero router's MAC are processed; the rest of the routes will be **treated-as-withdraw**.

The **supplementary-broadcast-domain** option instructs the data path to exclude EVPN destinations in the Layer 3 lookup for packets coming from an RVPLS SAP and configures the entire set of VPRN as well as attached RVPLS services in OISM mode. Only one SBD RVPLS can exist in a given VPRN. In order to add or remove the **supplementary-broadcast-domain** option, the entire **evpn-tunnel** command must first be removed.

The configuration of **evpn-tunnel** without options is equivalent to the **ipv6-gateway-address ip** option.

The **no** form of this command disables the evpn-tunnel mode.

Default

no evpn-tunnel

Parameters

ipv6-gateway-address

Indicates whether the IPv6 Prefix route uses a GW IP or a GW MAC as gateway.

Values **ip, mac**

supplementary-broadcast-domain

Specifies to use the EVPN tunnel as a Supplementary Broadcast Domain (SBD). The SBD is used in EVPN OISM to advertise the SMET routes and receive the multicast traffic on egress PEs that are not attached to the source R-VPLS service.

evpn-type

Syntax

evpn-type *type*

no evpn-type

Context

[Tree] (config>router>policy-options>policy-statement>entry>from evpn-type)

Full Context

configure router policy-options policy-statement entry from evpn-type

Description

This command matches BGP routes based on the EVPN route type. The route types supported in SR OS are the following:

- Type 1 or Auto-Discovery Ethernet Tag route, including both the AD per-ES and AD per-EVI routes Type 2 or MAC/IP route
- Type 2 or MAC/IP route
- Type 3 or IMET route, including Multicast Ethernet Tag
- Type 4 or ES (Ethernet Segment) route Type 5 of IP-prefix route, including IPv4 and IPv6 prefixes
- Type 6 or Selective Multicast Ethernet Tag route, including IPv4 and IPv6 multicast groups
- Type 7 or Multicast Join Synch route, including IPv4 and IPv6 multicast group
- Type 8 or Multicast Leave Synch route, including IPv4 and IPv6 multicast groups

The **no** form of this command removes the **evpn-type** matching.

Parameters

name

Specifies the EVPN route type.

Values 1 to 8

Full Context

configure system security dist-cpu-protection policy static-policer exceed-action

configure system security dist-cpu-protection policy protocol dynamic-parameters exceed-action

Description

This command controls the action performed upon the extracted control packets when the configured policer rates are exceeded.

Default

exceed-action none

Parameters

discard

Discards packets that are nonconforming.

low-priority

Marks packets that are nonconforming as low-priority (for example, discard eligible or out-profile). If there is congestion in the control plane of the SR OS then unmarked (for example, green, hi-prio or in-profile) control packets are given preferential treatment.

hold-down *seconds*

When this optional parameter is specified, it causes the following "hold-down” behavior.

When the SR OS software detects that an enforcement policer has marked or discarded one or more packets (software may detect this some time after the packets are actually discarded), and an optional **hold-down** *seconds* value has been specified for the **exceed-action**, then the policer will be set into a "mark-all” or "drop-all” mode that cause the following:

- the policer state to be updated as normal
- all packets to be marked (if the action is "low-priority”) or dropped (action = discard) regardless of the results of the policing decisions/actions/state.

The **hold-down** is cleared after approximately the configured time in seconds after it was set. The **hold-down** *seconds* option should be selected for protocols that receive more than one packet in a complete handshake/negotiation (for example, DHCP, PPP). **hold-down** is not applicable to a local monitoring policer. The "detection-time” will only start after any **hold-down** is complete. During the **hold-down** (and the detection-time), the policer is considered as in an "exceed” state. The policer may re-enter the hold-down state if an exceed packet is detected during the detection-time countdown.

Configuring the **indefinite** parameter value will cause hold down to remain in place until the operator clears it manually using a tools command (**tools perform security dist-cpu-protection release-hold-down**) or removes the dist-cpu-protection policy from the object.

Configuring the **none** parameter value will disable hold down.

Values 1 to 10080, indefinite, none

9.202 exclude

exclude

Syntax

exclude

Context

[Tree] (config>service>vprn>isis>loopfree-alternates exclude)

Full Context

configure service vprn isis loopfree-alternates exclude

Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The user can exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

Note:
Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action of the **exclude** command, when not explicitly specified by the user in the prefix policy, is a "reject". Thus, regardless of whether the user has explicitly added the statement "default-action reject" to the prefix policy, a prefix that does not match any entry in the policy is accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

Default

no exclude

Full Context

configure service vprn ospf loopfree-alternates exclude

configure service vprn ospf3 loopfree-alternates exclude

Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The implementation already allows the user to exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

Note:
Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action of the **exclude** command, when not explicitly specified by the user in the prefix policy, is a "reject". Thus, regardless if the user did or did not explicitly add the statement "default-action reject" to the prefix policy, a prefix that did not match any entry in the policy will be accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

9.205 exclude-from-avg

exclude-from-avg

Syntax

exclude-from-avg {**forward** | **backward** | **round-trip**} **bins** *bin-numbers*

no exclude-from-avg (**forward** | **backward** | **round-trip**}

Context

[Tree] (config>oam-pm>bin-group>bin-type exclude-from-avg)

Full Context

configure oam-pm bin-group bin-type exclude-from-avg

Description

This optional command allows the results from probes that map to the specified bins within the bin type to be excluded from the average calculation. Individual counters are incremented in the bin, but the average is not affected by the value of the excluded delay metric for the individual probes in this bin. The bin group does not allow this command to be added, modified, or deleted when a test is actively referencing the bin group. Sessions that reference the bin group must have the bin group and tests shut down before changes can be made.

The **no** form of this command removes the exclusion, and all bins are included in the average calculation.

Default

no exclude-from-avg forward

no exclude-from-avg backward

no exclude-from-avg round-trip

Parameters

forward

Specifies the forward direction bin.

backward

Specifies the backward direction bin.

round-trip

Specifies the round-trip direction bin.

bin-numbers

Specifies the bin numbers to be excluded from the average calculation. The values typically represent, but are not restricted to, the highest and lowest configured bins in order to eliminate outlying results that are not representative of network performance.

A hyphen can be entered between bin numbers to include a continuous sequence of bins; for example, entering 7-9 would specify bins 7, 8, and 9. Commas can be entered between bin numbers to include separate or non-continuous bins; for example, entering 0,8,9 would specify bins 0, 8, and 9. Both hyphens and commas can be used in this manner in the same configuration; for example, entering 0,7-9 would include bins 0, 7, 8, and 9. All bin numbers specified as part of this command must be configured. If a specified bin does not exist, the command fails.

Values 0 to 9

Platforms

All

9.206 exclude-group

exclude-group

Syntax

[**no**] **exclude-group** *ip-admin-group-name*

Context

[Tree] (config>router>route-next-hop-policy>template exclude-group)

Full Context

configure router route-next-hop-policy template exclude-group

Description

This command configures the admin group constraint into the route next-hop policy template.

Each group is entered individually. The **include-group** statement instructs the LFA SPF selection algorithm to pick up a subset of LFA next-hops among the links that belong to one or more of the specified admin groups. A link that does not belong to at least one of the admin-groups is excluded. However, a link can still be selected if it belongs to one of the groups in an include-group statement but also belongs to other groups that are not part of any include-group statement in the route next-hop policy.

The **pref** option is used to provide a relative preference for the admin group to select. A lower preference value means that LFA SPF will first attempt to select an LFA backup next-hop that is a member of the corresponding admin group. If none is found, then the admin group with the next highest preference value is evaluated. If no preference is configured for a given admin group name, then it is supposed to be the least preferred, that is, numerically the highest preference value.

When evaluating multiple **include-group** statements within the same preference, any link that belongs to one or more of the included admin groups can be selected as an LFA next-hop. There is no relative preference based on how many of those included admin groups the link is a member of.

The **exclude-group** statement simply prunes all links belonging to the specified admin group before making the LFA backup next-hop selection for a prefix.

If the same group name is part of both include and exclude statements, the exclude statement will win. It other words, the exclude statement can be viewed as having an implicit preference value of zero (0).

The admin-group criteria are applied before running the LFA next-hop selection algorithm.

The **no** form deletes the admin group constraint from the route next-hop policy template.

Parameters

ip-admin-group-name

Specifies the name of the group, up to 32 characters.

Platforms

All

9.207 exclude-mac-policy

exclude-mac-policy

Syntax

exclude-mac-policy *mac-policy-id*

no exclude-mac-policy

Context

[Tree] (config>port>ethernet>dot1x>macsec exclude-mac-policy)

Full Context

configure port ethernet dot1x macsec exclude-mac-policy

Description

This command specifies the MAC policy to be excluded from MACsec encryption.

The **no** form of this command removes the policy from the MACsec and allows all destination MAC addresses.

Default

no exclude-mac-policy

Parameters

mac-policy-id

Specifies the MAC policy to exclude from the configuration.

Values 0 to 4294967295

Platforms

All

9.208 exclude-node

exclude-node

Syntax

exclude-node *ip-address*

no exclude-node

Context

[Tree] (config>router>mpls>lsp exclude-node)

Full Context

configure router mpls lsp exclude-node

Description

This command enables the option to include XRO object in the bypass LSP PATH message object. The exclude-node option is required for manual bypass LSP with XRO to FRR protect ABR node in a multi-vendor network deployment. This command must be configured on the PLR node that protects the ABR node. The ABR node IP address must be configured as exclude-node.

Default

no exclude-node

Platforms

All

9.209 exclude-prefix

exclude-prefix

Syntax

[**no**] **exclude-prefix** *ipv6-prefix/prefix-length*

Context

[Tree] (config>router>dhcp6>server>pool exclude-prefix)

[Tree] (config>service>vprn>dhcp6>server>pool exclude-prefix)

Full Context

configure router dhcp6 local-dhcp-server pool exclude-prefix

configure service vprn dhcp6 local-dhcp-server pool exclude-prefix

Description

This command defines a prefix that to be excluded from available prefix in the pool for DHCP6. The typical use case is to exclude the interface address.

- A held lease is deleted if it got excluded by an exclude prefix.
- An exclude range can never exclude only a part of an existing lease. If for example a /63 PD is assigned, an exclude of /64 which belongs to this /63 cannot be configured.
- A single exclude prefix can never exclude a whole include prefix.
- When applying or removing an exclude prefix, the threshold stats are adjusted to reflect the actual address space and its usage.

The **no** form of this command removes the prefix that is to be excluded from available prefix in the pool.

Parameters

ipv6-prefix/prefix-length

Specifies an IPv6 prefix and prefix length.

Values

ipv6-prefix	x:x:x:x:x:x:x:x	(eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d	
	x - [0 to FFFF]H	
	d - [0 to 255]D	
prefix-length	0 to 128	

Platforms

9.210 exclude-protocol

exclude-protocol

Syntax

[**no**] **exclude-protocol** {*protocol-name*}

Context

[Tree] (config>port>ethernet>dot1x>macsec exclude-protocol)

Full Context

configure port ethernet dot1x macsec exclude-protocol

Description

Specifies protocols whose packets are not secured using Media Access Control Security (MACsec) when MACsec is enabled on a port.

When this option is enabled in a connectivity association that is attached to an interface, MACsec is not enabled for all packets of the specified protocols that are sent and received on the link.

When this option is enabled on a port where MACsec is configured, packets of the specified protocols are sent and accepted in cleartext.

The **no** form of this command secures the packets of the specified protocol.

Default

no exclude-protocol

Parameters

protocol-name

Specifies the protocol name.

Values **cdp**, **lacp**, **lldp**, **eapol-start**, **efm-oam**, **eth-cfm**, **ptp**, **ubfd**

Platforms

All

9.211 exclude-tcp-retrans

exclude-tcp-retrans

Syntax

Context

[Tree] (config>app-assure>group>statistics>aa-sub exclude-tcp-retrans)

Full Context

configure application-assurance group statistics aa-sub exclude-tcp-retrans

Description

This command is to only to EPC. When enabled, TCP errors and retransmission packets are not counted for the purpose of CBC. This setting has no impact on app/app-group aggregate AA stats.

Default

no exclude-tcp-retrans

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

9.212 exclusive-lock-time

exclusive-lock-time

Syntax

exclusive-lock-time *seconds*

no exclusive-lock

Context

[Tree] (config>router>policy-options exclusive-lock-time)

Full Context

configure router policy-options exclusive-lock-time

Description

This command specifies the inactivity timer for the exclusive lock time for policy editing. When a session is idle for greater than this time, the lock is removed and the configuration changes is aborted.

Default

exclusive-lock-time 300

Parameters

seconds

Specifies the duration the session with exclusive lock may be inactive.

Values Values: 1 to 3600

Platforms

All

9.213 exec

exec

Syntax

exec [**-echo**] [**-syntax**] {*file-name* | *eof-marker-string*} [**-argument** [*256 chars max*] [[*256 chars max*]]

Context

[Tree] (exec)

Full Context

exec

Description

This command executes the contents of a text file as if they were CLI commands entered at the console.

exec commands do not have **no** versions.

Related Commands:

boot-bad-exec: Use this command to configure a URL for a CLI script to exec following a failed configuration boot.

boot-good-exec: Use this command to configure a URL for a CLI script to exec following a successful configuration boot.

stdin can be used as the source of commands for the **exec** command. When **stdin** is used as the **exec** command input, the command list is terminated with <Ctrl-C>, "EOF<Return>" or "*eof_string*<Return>".

If an error occurs entering an exec file sourced from stdin, all commands after the command returning the error will be silently ignored. The **exec** command will indicate the command error line number when the stdin input is terminated with an end-of-file input.

Example:

Assume the *test.cfg* file has the following commands:

echo $(1)

echo $(2)

echo $(3)

Enter the following command:

exec test.cfg –arguments 10 20 30

The output from this command will be:

```
10
20
30
```

Parameters

-echo

Echoes the contents of the **exec** file to the session screen as it executes.

Default echo disabled

-syntax

Performs a syntax check of the file without executing the commands. Syntax checking will be able to find invalid commands and keywords, but it will not be able to validate erroneous user- supplied parameters.

Default execute file commands

file-name

Specifies the text file with CLI commands to execute, up to 256 characters.

eof-marker-string

Specifies the ASCII printable string used to indicate the end of the exec file when stdin is used as the exec file source. <Ctrl-C> and "EOF” can always be used to terminate an exec file sourced from stdin up to 254 characters.

Default EOF

-argument

Specifies up to five arguments, each up to 256 characters.

exhausted-credit-service-level

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

9.216 exit

exit

Syntax

exit [**all**]

Context

[Tree] (exit)

Full Context

exit

Description

This command returns to the context from which the current level was entered. For example, to navigate to the current level on a context by context basis, then the **exit** command only moves the cursor back one level.

```
A:ALA-1# configure
A:ALA-1>config# router
A:ALA-1>config>router# ospf
A:ALA-1>config>router>ospf# exit
A:ALA-1>config>router# exit
A:ALA-1>config# exit
```

When navigating to the current level by entering a command string, the **exit** command returns the cursor to the context in which the command was initially entered.

```
A:ALA-1# configure router ospf
A:ALA-1>config>router>ospf# exit
A:ALA-1#
```

The **exit all** command moves the cursor all the way back to the root level.

```
A:ALA-1# configure
A:ALA-1>config# router
A:ALA-1>config>router# ospf
A:ALA-1>config>router>ospf# exit all
A:ALA-1#
```

Parameters

all

Exits back to the root CLI context.

Platforms

All

9.217 expected

expected

Syntax

expected auto-generated

expected bytes *byte-string* [*byte-string* (up to 64 bytes-strings max, 64 bytes max)]

expected string *identifier*

expected use-rx

Context

[Tree] (config>port>otu>pm-tti expected)

Full Context

configure port otu pm-tti expected

Description

This command allows the user to configure the expected RX trail trace identifier (TTI) for path monitoring (PM) in the ODU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes. This trace should match the far-end port's PM trace. When this trace does not match the received PM trace, the ODU-TIM alarm will be reported if enabled.

Default

Blank (all zeros)

Parameters

auto-generated

Sets the default.

identifier

Sets the PM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0. Up to 64 byte strings can be specified in a single statement.

byte-string

[byte1 byte2 to byte64]. Sets the PM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0.

use-rx

Copies the received pm-tti to the expected either as a string or a sequence of bytes depending on the received pm-tti data.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

expected

Syntax

expected *byte*

expected auto

Context

[Tree] (config>port>otu>psi-payload expected)

Full Context

configure port otu psi-payload expected

Description

This command allows the user to configure the expected received payload type value in byte 0 of the Payload structure identifier (PSI) of the OPU overhead. When this values does not match the received value, the OPU-PLM alarm will be reported if it is enabled.

Default

3 for 10GE-LAN/WAN or OC192 with OTU encapsulation; 5 for GFP framed 10GE-LAN with OTU encapsulation.

Parameters

auto

Sets the expected value to the standard value in the payload type field.

byte

Specifies the expected received payload type value in bytes.

Values [00 to FF] Hexadecimal notation

Default 00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Syntax

expected auto-generated

expected bytes *byte-string* [*byte-string*...(up to 64 byte-strings max, 64 bytes max)]

expected string *identifier*

expected use-rx

Context

[Tree] (config>port>otu>sm-tti expected)

Full Context

configure port otu sm-tti expected

Description

This command enables the user to configure the expected RX Trail Trace Identifier (TTI) for Section Monitoring (SM) in the OTU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes. This trace should match the expected far-end port's SM trace. When this trace does not match the received SM trace, the OTU-TIM alarm will be reported if enabled.

Default

Blank (all zeros)

Parameters

auto-generated

Sets the default.

identifier

Sets the PM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0. Up to 64 byte strings can be specified in a single statement.

byte-string

[byte1 byte2 to byte64]. Sets the PM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0.

use-rx

Copies the received pm-tti to the expected either as a string or a sequence of bytes depending on the received pm-tti data.

9.221 explicit-sf-path

explicit-sf-path

Syntax

explicit-sf-path {**primary** | **secondary**}

no explicit-sf-path

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>source-override explicit-sf-path)

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel explicit-sf-path)

Full Context

configure mcast-management multicast-info-policy bundle source-override explicit-sf-path

configure mcast-management multicast-info-policy bundle channel explicit-sf-path

Description

This command defines an explicit ingress switch fabric multicast path assigned to a multicast channel. When defined, the channel is setup with the explicit path as its inactive path. When an explicit path is not defined, all multicast channels are initialized on the secondary path and when they start to consume bandwidth, they are moved to the appropriate path based on the channel attributes and path limitations. Explicit path channels are not allowed to move from their defined path.

The **explicit-sf-path** command in the bundle context defines the initial path for all channels associated with the bundle unless the channel has an overriding **explicit-sw-path** defined in the channel context. The channel context may also be overridden by the **explicit-sf-path** command in the **source-override** context. The channel and **source-override explicit-sf-path** settings default to null (undefined) and have no effect unless explicitly set.

The **no** form of this command restores default path association behavior (dynamic or null depending on the context).

Parameters

primary

The **primary** and **secondary** keywords are mutually exclusive to one another. One keyword must be specified when executing the explicit-sf-path command. The **primary** keyword specifies that the primary ingress multicast path should be used as the explicit path for the channel.

secondary

The **primary** and **secondary** keywords are mutually exclusive to one another. One keyword must be specified when executing the explicit-sf-path command. The **secondary** keyword specifies that the secondary ingress multicast path should be used as the explicit path for the channel.

Override sequence — The channel setting overrides the bundle setting. The source-override setting overrides the channel and bundle settings.

Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

9.222 explicit-subscriber-map

explicit-subscriber-map

9.223 exponential-backoff

exponential-backoff

Syntax

[**no**] **exponential-backoff**

Context

[Tree] (config>system>login-control exponential-backoff)

Full Context

configure system login-control exponential-backoff

Description

This command enables the exponential-backoff of the login prompt. The exponential-backoff command is used to deter dictionary attacks, when a malicious user can gain access to the CLI by using a script to try **admin** with any conceivable password.

The **no** form of this command disables exponential-backoff.

Default

no exponential-backoff

Platforms

All

9.224 exponential-backoff-retry

exponential-backoff-retry

Syntax

exponential-backoff-retry

no exponential-backoff-retry

Context

[Tree] (config>router>mpls exponential-backoff-retry)

Full Context

configure router mpls exponential-backoff-retry

Description

This command enables the use of an exponential back-off timer when re-trying an LSP. When an LSP path establishment attempt fails, the path is put into retry procedures and a new attempt will be performed at the expiry of the user-configurable retry timer (config>router>mpls>lsp>retry-timer). By default, the retry time is constant for every attempt. The exponential back-off timer procedures will double the value of the user configured retry timer value at every failure of the attempt to adjust to the potential network congestion that caused the failure. An LSP establishment fails if no Resv message was received and the Path message retry timer expired or a PathErr message was received before the timer expired.

Platforms

All

9.225 export

export

Syntax

[**no**] **export**

Context

[Tree] (config>subscr-mgmt>isa-svc-chain>evpn export)

Full Context

configure subscriber-mgmt isa-service-chaining evpn export

Description

Commands in this context configure information related to the export of EVPN BGP routes related to service chaining.

The **no** form of this command disables exporting EVPN BGP routes related to service chaining

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

export

Syntax

export *policy* [*policy*]

no export

Context

[Tree] (config>subscr-mgmt>bgp-prng-plcy export)

Full Context

configure subscriber-mgmt bgp-peering-policy export

Description

This command specifies the export policies to be used to control routes advertised to BGP neighbors.

When multiple policy names are specified, the policies are evaluated in the order they are specified. A maximum of five (5) policy names can be configured. The first policy that matches is applied.

Note:
If a non-existent route policy is applied to a VPRN instance, the CLI generates a warning message. This message is only generated at an interactive CLI session and the route policy association is made. No warning message is generated when a non-existent route policy is applied to a VPRN instance in a configuration file or when SNMP is used.

The **no** form of this command removes all route policy names from the export list.

Default

no export — BGP advertises routes from other BGP routes but does not advertise any routes from other protocols unless directed by an export policy.

Parameters

policy

Specifies a route policy statement name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

export

Syntax

export *ip-prefix/length*

[Tree] (config>service>ies>sub-if>wlan-gw>redundancy export)

Full Context

configure service ies subscriber-interface wlan-gw redundancy export

Description

This command specifies an IPv4 route (prefix/length) per subscriber-interface to be exported (announced) to indicate liveness of the subscriber-interface on the WLAN-GW. This route is the one that is monitored in routing by the peer WLAN-GW to decide its state with respect.

The no form of this command reverts to the default.

Parameters

ip-prefix/length

Specifies the IP prefix and length.

Values ip-prefix:a.b.c.d

ip-prefix-length: 0 to 32

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

export

Syntax

export *plcy-or-long-expr* [*plcy-or-expr*]

no export

[Tree] (config>service>vprn>bgp>group>neighbor export)

Full Context

configure service vprn bgp export

configure service vprn bgp group export

configure service vprn bgp group neighbor export

Description

This command is used to specify route policies that control how outbound routes transmitted to certain peers are handled. Route policies are configured in the **config>router>policy-options** context.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in a peer-group) or neighbor level (only applies to the specified peer). The most specific level is used.

The **export** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

Only one of the 15 objects referenced by the **export** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **export** commands are issued, the last command entered overrides the previous command.

When an export policy is not specified, BGP-learned routes are advertised by default; non-BGP routes are not advertised.

The **no** form of this command removes the policy association.

Default

no export

Parameters

plcy-or-long-expr

Specifies the route policy name, up to 64 characters in length, or a policy logical expression, up to 255 characters in length.

plcy-or-expr

Specifies the route policy name, up to 64 characters in length, or a policy logical expression, up to 255 characters in length.

Syntax

[**no**] **export** *policy-name* [*policy-name* **...up to 5 max**]

Context

[Tree] (config>service>vprn>isis export)

Full Context

configure service vprn isis export

Description

This command configures export routing policies that determine the routes exported from the routing table to IS-IS.

If no export policy is defined, non IS-IS routes are not exported from the routing table manager to IS-IS.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered overrides the previous command. A maximum of five policy names can be specified.

If an **aggregate** command is also configured in the **config>router** context, then the aggregation is applied before the export policy is applied.

Routing policies are created in the **config>router>policy-options** context.

The **no** form of this command removes the specified *policy-name* or all policies from the configuration if no *policy-name* is specified.

Default

no export — No export policy name is specified.

Parameters

policy-name

The export policy name. Up to five *policy-name* arguments can be specified.

Platforms

All

export

Syntax

export *policy-name* [*policy-name* **...**(**up to 5 max**)]

no export

[Tree] (config>service>vprn>msdp>peer export)

Full Context

configure service vprn msdp group peer export

configure service vprn msdp group export

configure service vprn msdp export

configure service vprn msdp peer export

Description

This command specifies the policies to export source active state from the source active list into Multicast Source Discovery Protocol (MSDP).

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

The **no** form of this command removes all policies from the configuration.

Default

no export

Parameters

policy-name

Specifies the export policy name, up to 32 characters. Up to five policy-name arguments can be specified.

If you configure an export policy at the global level, each individual peer inherits the global policy. If you configure an export policy at the group level, each individual peer in a group inherits the group's policy. If you configure an export policy at the peer level, then policy only applies to the peer where it is configured.

All

export

Syntax

export {**unicast** | *ext-community*}

Context

[Tree] (config>service>vprn>mvpn>vrf-target export)

Full Context

configure service vprn mvpn vrf-target export

Description

This command specifies communities to be sent to peers.

Parameters

unicast

Specifies to use unicast vrf-target ext-community for the multicast VPN.

ext-comm

An extended BGP community in the **type**:**x**:**y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers.

Values target:{*ip-address*:*comm-val* | *2byte-asnumber:ext-comm-val* | 4byte-asnumber:comm-val}

ip-address:	a.b.c.d
comm-val:	0 to 65535

export

Syntax

export *ip-prefix/length*

no export

Context

[Tree] (config>service>vprn>nat>outside>pool>redundancy export)

Full Context

configure service vprn nat outside pool redundancy export

Description

This command installs the export route in the routing table for active NAT pools.

Once the export route is in the routing table, it can be advertised in the network via a routing protocol. NAT pools in the standby or disabled state will not advertise the export route.

A NAT pool becomes active when it becomes operationally UP, and there is no monitoring route (which is also the export route from the peer) present in the routing node (as received from the network). The pool will transition into standby state in case that the monitoring route (or export route from the peer) is already present in the routing table. In other words, the monitoring route is already advertised as an export route from the peering node with active NAT pool.

The export route can be advertised only from:

- The active lead pool.
- Active pool for which fate-sharing is disabled.

Default

no export

Parameters

ip-prefix/length

Specifies the IP prefix and length.

Syntax:

ip-prefix/length:	ip-prefix	a.b.c.d
	ip-prefix-length	0 to 32
Values	0, 4, 16	

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure router ldp export

Description

This command specifies the export route policies used to determine which routes are exported to LDP. Policies are configured in the **config>router>policy-options** context.

If no export policy is specified, non-LDP routes will not be exported from the routing table manager to LDP. LDP-learned routes will be exported to LDP neighbors. Present implementation of export policy (outbound filtering) can be used "only" to add FECs for label propagation. The export policy does not control propagation of FECs that an LSR receives from its neighbors.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of 5 policy names can be specified.

The **no** form of this command removes all policies from the configuration.

Default

no export — No export route policies specified.

Parameters

policy-name

Specifies up to five export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

The specified name(s) must already be defined.

Context

[Tree] (config>router>nat>outside>pool>redundancy export)

Full Context

configure router nat outside pool redundancy export

Description

This command configures the route to export to the peer. While the export prefix is configured and the value of the object tmnxNatPlLsnRedActive is equal to true, the system exports this prefix in the realm of the virtual router instance associated with this pool; to the NAT redundancy peer, the presence of this prefix is an indication that the Large Scale NAT function in this virtual router instance is active; hence, the export prefix of this system is the monitor prefix of the peer.

The export prefix must be different from the monitor prefix.

Default

no export

Parameters

ip-prefix/length

Specifies the IP address and length of the prefix to be exported.

Values

ip-prefix:	a.b.c.d
ip-prefix-length:	0 to 32

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service vprn subscriber-interface export-host-routes

configure service ies subscriber-interface export-host-routes

Description

This command controls the export of subscriber management host routes from a retail service to the corresponding forwarding wholesale VPRN service.

By default, subscriber management host routes are not exported.

The presence of retail subscriber management host routes in the wholesale VPRN service is required for downstream traffic forwarding in multi-chassis redundancy scenarios with a redundant interface and when the retail subscriber subnets are not leaked in the wholesale VPRN service (allow-unmatching-subnets or unnumbered retail subscriber interface).

This command fails if the subscriber interface is not associated with a forwarding wholesale service subscriber interface or if the subscriber interface is not configured to support address allocation outside the provisioned subnets (allow-unmatching-subnets or unnumbered subscriber interface).

The **no** form of this command reverts to the default.

export-inactive-bgp

Syntax

[**no**] **export-inactive-bgp**

Context

[Tree] (config>service>vprn export-inactive-bgp)

Full Context

configure service vprn export-inactive-bgp

Description

This command allows the preferred BGP route learned by a VPRN to be exported as the VPN route, even when if it is inactive in the route table because a preferred BGP VPRN route from another PE is present. This overrides the default state in which the VPRN cannot export an inactive BGP route.

For the BGP route to be exported, the VRF export policy must accept it.

This command applies to both MPLS VPN and SRv6 VPN routes. In SRv6 VPN routes the advertised instruction is an End.DT, while in MPLS VPN routes the advertised label is a per-next-hop label.

This "best-external” type of route advertisement is useful in active/standby multi-homing scenarios because it ensures that all PEs know about the backup path provided by the standby PE.

Default

no export-inactive-bgp

Platforms

All

9.232 export-inactive-bgp-enhanced

export-inactive-bgp-enhanced

Syntax

[**no**] **export-inactive-bgp-enhanced**

Context

[Tree] (config>service>vprn export-inactive-bgp-enhanced)

Full Context

configure service vprn export-inactive-bgp-enhanced

Description

This command configures the router to allow a BGP route that is inactive (because a better non-BGP route for the same prefix is present) to be exportable as a VPN-IP route.

A BGP route learned from a VPRN BGP peer is exportable as a VPN-IP route, only if it is the best route for the prefix and is installed in the route table of the VPRN. If the **export-inactive-bgp** command is enabled in the VPRN configuration, this rule is relaxed, and the best inactive VPRN BGP route is exportable as a VPN-IP route, provided that the active installed route for the prefix is an imported VPN-IP route.

The rule described in the preceding paragraph can be relaxed even further by enabling this command. When this command is enabled, the best inactive VPRN BGP route (best amongst all routes received from all CEs) is exportable as a VPN-IP route, regardless of the route type of the active installed route.

The configuration of this command overrides the **export-inactive-bgp** command. If this command is already enabled, do not enable the **export-inactive-bgp** command.

The **no** form of this command disables the router from allowing an inactive BGP route in the presence of a better non-BGP route to be exportable as a VPN-IP route.

[Tree] (config>service>vprn>ospf3 export-limit)

Full Context

configure service vprn ospf export-limit

configure service vprn grt-lookup export-limit

configure service vprn ospf3 export-limit

Description

This command limits the total number of routes exported from the VRF to the GRT. Configuring **export-limit 0** disables the maximum limit for routes exported from the VRF to the GRT.

The **no** form of this command sets the export-limit to a default of five (5).

Default

export-limit 5

Parameters

num-routes

Specifies the maximum number of routes that can be exported. Configuring a num-routes value in a range of 1 to 1000 limits the number of routes to the specified value.

Values 0 to 1000

Platforms

All

export-limit

Syntax

export-limit *number* [**log** *percentage*]

no export-limit

9.234 export-mode

export-mode

Syntax

export-mode {**automatic** | **manual**}

Context

[Tree] (config>cflowd export-mode)

Full Context

configure cflowd export-mode

Description

This command can be used to control how exports are generated by the cflowd process. The default behavior is for flow data to be exported automatically based on the active and inactive time-out values. The alternative mode is manual in which case flow data is only exported when the command "tools perform cflowd manual-export" is issued. The only exception is if the cflowd cache overflows, in which case the normal automatic export process is used.

Default

export-mode automatic

Parameters

automatic

cflowd flow data is automatically generated.

manual

cflowd flow data is exported only when manually triggered.

Platforms

All

9.235 export-override

export-override

Syntax

export-override *mode*

no export-override

Context

[Tree] (configure>app-assure>group>cflowd export-override)

Full Context

configure application-assurance group cflowd export-override

Description

This command configures the AA sub-type used in cflowd record export. The cflowd stats exported to the cflowd collector to look identical to when AA is on the type of system defined by the mode. The following cflowd export fields are affected:

1. cflowd export observation point (field 138), the mode will be derived from the export-override category that is selected.
2. cflowd export AA_Subscriber_Type (field 12) modified as configured, using existing field types.
3. cflowd interface name is used as the sub-ID field, optionally modified to use the **export-override** *mode* **prefix** as a global identifier.

All AA cflowd record types are affected by export-override. To change any of the export-override or prefix, cflowd must be shutdown first. When the **export-override** is set back to default (**no export-override**) the prefix is set back to the default.

The **no** form of this command removes the export override.

Default

no export-override

Parameters

mode

The type of system emulated by stats export.

Values mobile(mobile gateway mode, cflowd field 138 = 2)

Platforms

Context

[Tree] (config>router>ldp>session-params>peer export-prefixes)

Full Context

configure router ldp session-parameters peer export-prefixes

Description

This command specifies the export route policy used to determine which prefixes received from other LDP and T-LDP peers are re-distributed to this LDP peer via the LDP/T-LDP session to this peer. A prefix that is filtered out (deny) is not exported. A prefix that is filtered in (accept) will be exported.

If no export policy is specified, all FEC prefixes learned will be exported to this LDP peer. This policy is applied in addition to the global LDP policy and targeted session policy.

Policies are configured in the **config>router>policy-options** context. A maximum of five policy names can be specified. Peer address has to be the peer LSR-ID address.

The **no** form of this command removes the policy from the configuration.

Default

no export-prefixes - no export route policy is specified

Parameters

policy-name

Specifies up to five export-prefix route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string. The specified name(s) must already be defined.

Platforms

All

no export-tunnel-table

Context

[Tree] (config>router>ldp export-tunnel-table)

Full Context

configure router ldp export-tunnel-table

Description

This command enables exports BGP label route and SR tunnels from the TTM into LDP for the purpose of stitching an LDP FEC to a BGP or SR tunnel for the same destination prefix.

To enable route stitching between LDP and BGP, separately configure tunnel table route export policies in both protocols and enable the advertisement of RFC 8277, *Using BGP to Bind MPLS Labels to Address Prefixes*, formatted labeled routes for prefixes learned from LDP FECs.

The BGP route export policy instructs BGP to listen to LDP route entries in the CPM Tunnel Table. If a /32 LDP FEC prefix matches an entry in the export policy, BGP originates a BGP labeled route, stitches it to the LDP FEC, and re-distributes the BGP labeled route to its Interior Border Gateway Protocol (IBGP) neighbors.

Using the following commands to add LDP FEC prefixes with the **from protocol ldp** statement in the existing BGP export policy configuration at the global level, peer-group level, or peer level:

- **config>router>bgp>export** *policy-name*
- **config>router>bgp>group>export** *policy-name*
- **config>router>bgp>group>neighbor>export** *policy-name*

To indicate to BGP to evaluate the entries with the **from protocol ldp** statement in the export policy when applied to a specific BGP neighbor, use commands:

- **config>router>bgp>group>neighbor>family label-ipv4** and
- **config>router>bgp>group>neighbor>advertise-ldp-prefix**

Without the latter configuration, only core IPv4 routes learned from RTM are advertised as BGP labeled routes to the neighbor. No stitching of LDP FEC to the BGP labeled route will be performed for this neighbor even if the same prefix was learned from LDP.

The LDP tunnel table route export policy instructs LDP to listen to BGP route entries in the CPM Tunnel Table. If a /32 BGP labeled route matches a prefix entry in the export policy, LDP originates an LDP FEC for the prefix, stitches it to the BGP labeled route, and re-distributes the LDP FEC to its IBGP neighbors.

The user can add BGP labeled route prefixes with the **from protocol bgp** statement in the configuration of the LDP tunnel table export policy. The **from protocol** statement is applied only when the protocol value is **ldp**. Policy entries with protocol values of **rsvp**, **bgp**, or any value other than **ldp** are ignored at the time the policy is applied to LDP.

In the LDP-to-SR data path direction, LDP listens to SR tunnel entries in the TTM. The user can restrict the export of SR tunnels to LDP from a specific prefix list. The user can also restrict the export to a specific IGP instance by optionally specifying the instance ID in the "from protocol” statement. The statement has an effect only when the protocol value is **isis** or **bgp**. Policy entries with any other protocol value are ignored at the time the policy is applied. If the user configures multiple **from protocol** statements in the same policy or does not include the **from protocol** statement but adds a default action of accept, then LDP will follow the TTM selection rules to select a tunnel to which it will stitch the LDP ILM:

1. LDP selects the tunnel from the lowest TTM preference protocol.
2. If two or more of IS-IS or OSPF protocol instances and BGP protocol have the same preference, then LDP selects the protocol using the default TTM protocol preference.
3. Within the same IGP protocol, LDP selects the lowest instance ID.

If an LDP FEC primary next-hop cannot be resolved using an RTM route and a SR tunnel of type SR-ISIS to the same destination prefix matches a prefix entry in the export policy, LDP programs an LDP ILM and stitches it to the SR node-SID tunnel endpoint. LDP also originates an FEC for the prefix and re-distributes it to its LDP peers. When an LDP FEC is stitched to a SR tunnel, packets forwarded benefit from the protection of the LFA/remote LFA backup next-hop of the SR tunnel.

When resolving a FEC, LDP will prefer RTM over TTM when both resolutions are possible. That is, swapping the LDP ILM to a LDP NHLFE is preferred over stitching it to an SR tunnel endpoint.

Nokia recommends that the user should enable the bfd-enable option on the interfaces in LDP, IGP instance, and BGP contexts to speed up failure detection and activation of the SR LFA/remote-LFA backup next-hop or the BGP backup, depending on the stitching operation.

This feature is limited to IPv4 /32 prefixes in LDP, BGP and SR.

The **no** form of this command disables the export of BGP and SR tunnels to LDP.

Default

no export-tunnel-table

Parameters

policy-name

Specifies up to five export-tunnel-table route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string. The specified name(s) must already be defined.

Syntax

export-tunnel-table ldp

no export-tunnel-table

Context

[Tree] (config>router>isis>segment-routing export-tunnel-table)

Full Context

configure router isis segment-routing export-tunnel-table

Description

This command exports the LDP tunnels to an IGP instance for the purpose of stitching a SR tunnel to a LDP FEC for the same destination IPv4 /32 prefix.

In the SR-to-LDP data path direction, the SR mapping server provides a global policy for the prefixes corresponding to the LDP FECs the SR stitches to.

When this command is enabled in the segment-routing context of an IGP instance, IGP listens to LDP tunnel entries in the TTM. Whenever a LDP tunnel destination matches a prefix for which IGP received a prefix-SID sub-TLV from a mapping server, it instructs the SR module to program the SR ILM and to stitch it to the LDP tunnel endpoint. The LDP FEC can be resolved via a static route, a IS-IS instance, or an OSPF instance.

When an SR tunnel is stitched to a LDP FEC, packets forwarded will benefit from the protection of the LFA backup next-hop of the LDP FEC.

When resolving a node SID, IGP will prefer resolution of prefix SID received in a IP Reach TLV over a prefix SID received via the mapping server. That is, swapping the SR ILM to a SR NHLFE is preferred over stitching it to a LDP tunnel endpoint.

Nokia recommends that the user should enable the bfd-enable option on the interfaces in both LDP and IGP instance contexts to speed up the failure detection and the activation of the LFA/remote-LFA backup next-hop in either direction of the stitching.

This feature is limited to IPv4 /32 prefixes in both LDP and SR.

The **no** form of this command disables the exporting of LDP tunnels to the IGP instance.

Default

no export-tunnel-table

Parameters

ldp

Exports LDP tunnels from the tunnel table into an IGP instance.

Platforms

All

export-tunnel-table

Syntax

[**no**] **export-tunnel-table ldp**

Context

[Tree] (config>router>ospf>segm-rtng export-tunnel-table)

Full Context

configure router ospf segment-routing export-tunnel-table

Description

This command enables exporting, to an IGP instance, the LDP tunnels for the purpose of stitching a SR tunnel to a LDP FEC for the same destination IPv4 /32 prefix.

In the SR-to-LDP data path direction, the SR mapping server provides a global policy for the prefixes corresponding to the LDP FECs that the SR stitches to.

When this command is enabled in the segment-routing context of an IGP instance, IGP listens to LDP tunnel entries in the TTM. Whenever a LDP tunnel destination matches a prefix for which IGP received a prefix-SID sub-TLV from a mapping server, it instructs the SR module to program the SR ILM and to stitch it to the LDP tunnel endpoint. The LDP FEC can be resolved via a static route, a IS-IS instance, or an OSPF instance.

When an SR tunnel is stitched to a LDP FEC, packets forwarded will benefit from the protection of the LFA backup next hop of the LDP FEC.

When resolving a node SID, IGP will prefer resolution of prefix SID received in a IP Reach TLV over a prefix SID received via the mapping server. In other words, the swapping of the SR ILM to a SR NHLFE is preferred over stitching it to a LDP tunnel endpoint.

It is recommended to enable the **bfd-enable** option on the interfaces in both LDP and IGP instance contexts, to speed up the failure detection and the activation of the LFA/remote-LFA backup next hop in either direction of the stitching.

This feature is limited to IPv4 /32 prefixes in both LDP and SR.

The **no** form of this command disables the exporting of LDP tunnels to the IGP instance.

Full Context

configure application-assurance group policy app-filter entry expression

Description

This command configures string values to use in the application definition.

Parameters

expr-index

Specifies an index value which represents expression substrings.

Values 1 to 4

expr-type

Represents a type (and thereby the expression substring).

http-host — Matches the string against the HTTP Host field or TLS Server Name Indicator (SNI).

http-uri — Matches the string against the HTTP URI field.

http-referer — Matches the string against the HTTP Referer field.

http-user-agent — Matches the string against the HTTP User Agent field.

sip-ua — Matches the string against the SIP UA field.

sip-uri — Matches the string against the SIP URI field.

sip-mt — Matches the string against the SIP MT field.

citrix-app — Matches the string against the Citrix app field.

h323-product-id — Matches the string against the h323-product-id field.

tls-cert-subj-org-name — Matches the TLS Certificate Subject Organization Name substring.

tls-cert-subj-common-name — Matches the TLS Certificate Subject Common Name substring.

rtsp-host — Matches the Real Time Streaming Protocol (RTSP) substring host.

rtsp-uri — Matches the RTSP URI substring.

rtsp-ua — Matches the RTSP UA substring.

rtmp-page-host — Matches against the RTMP Page Host field

rtmp-page-uri — Matches against the RTMP Page URI field

rtmp-swf-host — Matches against the RTMP Swf Host field

rtmp-swf-uri — Matches against the RTMP Swf URI field

dns-domain-name — Matches the string against the DNS Name field.

eq

Specifies the equal to comparison operator to match the specified HTTP string.

neq

Specifies the not equal to comparison operator to match the specified HTTP string.

expr-string

Specifies an expression string, up to 64 characters, used to define a pattern match. Denotes a printable ASCII substring used as input to an application assurance filter match criteria object.

The following syntax is permitted within the substring to define the pattern match criteria:

^<substring>* - matches when <substring> is at the beginning of the object.

<substring> - matches when <substring> is at any place within the object.

*<substring>$ - matches when <substring> is at the end of the object.

^<substring>$ - matches when <substring> is the entire object.

* - matches zero to many of any character. A single wildcard as infix in the expression is allowed.

\. - matches any single character

\d - matches any single decimal digit [0-9]

\I - forces case sensitivity (by default, the expression match are case insensitive), the \I can be specified anywhere between

the leading [^*] and trailing [$*]

* - matches the asterisk character

Rules for <substring> characters:

<substring> must contain printable ASCII characters.

<substring> must not contain the "double quote” character or the " ” (space) character on its own.

<substring> match is case in sensitive by default.

<substring> must not include any regular expression meta-characters other than "*", "\I", "\.", "*" and "\d".

The "\” (slash) character is used as an ESCAPE sequence. The following ESCAPE sequences are permitted within the <substring>:

Character to match <substring> input

Hexadecimal Octet YY \xYY

A <substring> that uses the '\' (backslash) ESCAPE character which is not followed by a "\” or "\x” and a 2-digit hex octet is not valid.

Operational notes:

- When matching a TCP flow against HTTP-string based applications, the HTTP header fields are collected from the first HTTP request (for example a GET or a POST) for a given TCP flow. The collected strings are then evaluated against each HTTP flow created within the given TCP flow to determine whether a given HTTP flow matches the application. By not specifying a protocol, the HTTP expressions are matched against all protocols in the HTTP family. By specifying a specific HTTP protocol (for example, http_video) the expression match can be constrained to a subset of the HTTP protocols.

- To uniquely identify a SIP-based application a protocol match is not required in the app-filter entry with the SIP expression. The SIP expression match is performed against any protocol in the SIP family (such as sip and rtp_sip). By specifying a specific SIP protocol (like rtp_sip) the expression match can be constrained to a subset of the SIP protocols.

Context

[Tree] (config>app-assure>group>policy>custom-protocol expression)

Full Context

configure application-assurance group policy custom-protocol expression

Description

This command configures an expression string value for pattern-based custom protocols match. A flow matches a custom protocol if the specified string is found at an offset of a TCP/UDP of the first payload packet.

Options:

- client-to-server — A pattern will be matched against a flow from a TCP client.
- server-to-client — A pattern will be matched against a flow from a TCP server.
- any – A pattern will be matched against a TCP/UDP flow in any direction (towards or from AA subscriber)

The **no** form of this command deletes a specified string expression from the definition.

Parameters

expr-index

Specifies the expression substring index.

Values 1

expr-string

Denotes a printable ASCII string, up to 16 characters, used to define a custom protocol match. Rules for expr-string characters:

- Must contain printable ASCII characters.
- Must not contain the "double quote” character or the " ” (space) character on its own.
- Match is case sensitive.

- Must not include any regular expression meta-characters.

The "\" (slash) character is used as an ESCAPE sequence. The following ESCAPE sequences are permitted within the expr-string:

Character to match expr-string input

Hexadecimal Octet YY \xYY

An expr-string that uses the '\' (backslash) ESCAPE character which is not followed by a "\" or "\x" and a 2-digit hex octet is not valid.

offset *payload-octet-offset*

specifies the offset (in octets) into the protocol payload, where the expr-string match criteria will start.

Values 0 to 127

direction *direction*

Specifies the protocol direction to match against to resolve to a custom protocol.

Values client-to-server, server-to-client, any

Context

[Tree] (config>router>policy-options>as-path expression)

Full Context

configure router policy-options as-path expression

Description

This command configures a route policy AS path regular expression statement to use in the route policy entries.

An AS path in a BGP route matches an AS path regular expression, if the path matches the pattern of the regular expression. A regular expression incorporates terms and operators that use the terms. An individual AS number is an elementary term in the AS path regular expression. More complex terms can be built from elementary terms. The following are key operators supported by SR OS:

- .
- *
- ?
- {n}
- {m,n}
- {m, }

To reverse the match criteria when specifying a list of ranges or single values using square brackets, use the non-match operator (^) before the elements within the square brackets.

The **no** form of this command deletes the AS path regular expression statement.

Parameters

regular-expression

The AS path regular expression. Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at signs (@); for example, "@variable@”.

null

The AS path expressed as an empty regular expression string.

configure subscriber-mgmt diameter-application-policy gx features extended-bw

Description

This command specifies whether extended bandwidth AVPs are supported. Extended bandwidth AVPs are capable of supporting bandwidth values greater than (2^{32} - 1) b/s. The extended AVPs allow bitrates in kb/s and are as follows:

- Extended-GBR-DL (AVP code 2850)
- Extended-GBR-UL (AVP code 2851)
- Extended-Max-Requested-BW-DL (AVP code 554)
- Extended-Max-Requested-BW-UL (AVP code 555)
- Extended-APN-AMBR-DL (AVP code 2848)
- Extended-APN-AMBR-UL (AVP code 2849)

The **no** form of this command disables the extended bandwidth AVP support.

Default

no extended-bw

9.245 extended-lsa

extended-lsa

Syntax

extended-lsa {**sparse** | **only**}

no extended-lsa

Context

[Tree] (config>router>ospf3 extended-lsa)

Full Context

configure router ospf3 extended-lsa

Description

This command configures the use of extended LSA format in OSPFv3, as described in *draft-ietf-ospf-ospfv3-lsa-extend*.

Prior to this feature, SR OS used the fixed format LSA to carry the prefix and link information as described in RFC 5340, *OSPF for IPv6*. The fixed format is not extensible and the TLV format of the extended LSA must be used.

With this feature, the default mode of operation for OSPFv3 is referred to as **sparse** mode, meaning that the router will always advertise the fixed format for existing LSAs and will add the TLV-based extended

LSA only when it needs to advertise new sub-TLVs. This mode of operation is similar to the way OSPFv2 advertises the segment routing information. It sends the prefix in the original fixed-format prefix LSA and then follows with the extended prefix TLV which is sent in an extended prefix opaque LSA containing the prefix SID sub-TLV.

The **extended-lsa only** value enables the full extended LSA mode. This causes all existing and new LSAs to use the extended LSA format.

The OSPFv3 instance must first be shut down before the user can change the mode of operation since the protocol must flush all LSAs and re-establish all adjacencies.

The **no** form of this command at the OSPFv3 instance level reverts the OSPFv3 instance to the default **sparse** mode of operation.

Default

extended-lsa sparse

Parameters

sparse

Enables the sparse mode of operation in an OSPFv3 instance.

only

Enables the full extended LSA mode of operation in an OSPFv3 instance.

Platforms

All

extended-lsa

Syntax

extended-lsa {**inherit** | **only**}

no extended-lsa

Context

[Tree] (config>router>ospf3>area extended-lsa)

Full Context

configure router ospf3 area extended-lsa

Description

This command configures the use of extended LSA format in a OSPFv3 area as described in *draft-ietf-ospf-ospfv3-lsa-extend*.

By default, the area inherits the instance-level configuration. The latter defaults to the **sparse** mode of operation. The **extended-lsa only** value enables the full extended LSA mode, which causes all existing and new LSAs to use the extended LSA format.

The OSPFv3 instance must first be shut down before the user can change the mode of operation since the protocol must flush all LSAs and reestablish all adjacencies.

The **no** form of this command at the area level returns the area to the default mode of inheriting the mode from the OSPFv3 instance level.

Default

extended-lsa inherit

Parameters

inherit

Configures the area to inherit the mode of operation enabled at the OSPFv3 instance level.

only

Enables the full extended LSA mode of operation in an OSPFv3 area.

Full Context

configure service vprn bgp extended-nh-encoding

configure service vprn bgp group neighbor extended-nh-encoding

configure service vprn bgp group extended-nh-encoding

Description

This command configures BGP to advertise (at session OPEN) the capability to receive IPv4 or IPv4 routes with IPv4 or IPv6 next hops from the VPRN BGP peers included in the scope of the command. These peers should not send these routes unless they receive the capability. If the SR OS router receives an IPv4 route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed and causes either a session reset or treat as withdraw behavior depending on the error handling settings.

The **no** form of this command causes the sending of an extended NH encoding BGP capability to the associated BGP peers to be inherited from a higher configuration level or disabled (if configured at the BGP level).

Default

no extended-nh-encoding

Parameters

ipv4

Specifies that the command should be applied to unlabeled unicast IPv4 routes.

Platforms

All

extended-nh-encoding

Syntax

extended-nh-encoding [**label-ipv4**] [**vpn-ipv4**] [**ipv4**]

[Tree] (config>router>bgp>group extended-nh-encoding)

Full Context

configure router bgp extended-nh-encoding

configure router bgp group neighbor extended-nh-encoding

configure router bgp group extended-nh-encoding

Description

This command configures BGP to advertise (at session OPEN) the capability to receive label IPv4, VPN IPv4 routes, or IPv6 next hops from the peers. These peers should not send such routes unless they receive notification of this capability. If the SR OS router receives a label IPv4 or VPN IPv4 route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed and this will cause either session reset or **treat-as-withdraw** behavior depending on the error handling settings.

The **no** form of this command causes the sending of an extended NH encoding BGP capability to the associated BGP peers to be inherited from a higher configuration level or disabled (if configured at the BGP level).

Default

no extended-nh-encoding

Parameters

label-ipv4

Instructs BGP to advertise an extended NH encoding capability for NLRI AFI=1, NLRI SAFI=4, and next-hop AFI=2.

vpn-ipv4

Instructs BGP to advertise an extended NH encoding capability for NLRI AFI=1, NLRI SAFI=128, and next-hop AFI=2.

ipv4

Instructs BGP to advertise an extended NH encoding capability for NLRI AFI=1, NLRI SAFI=1 and next-hop AFI=2.

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if extended-unicast)

Full Context

configure mcast-management multicast-info-policy video-policy video-interface extended-unicast

Description

This command delays video unicast from switching over to multicast for 5 minutes. The unicast session can be extended further by sending an RTCP extension request, which resets the 5-minute timer. This is ideal for services that require unicast video and end devices that require extended time to switch over from unicast to multicast.

The **no** form of this command disables extended unicast. The unicast session switches over to multicast 1.5 seconds after the IGMP request is sent. Most Fast Channel Change deployments do not require a time extension.

Default

no extended-unicast

Platforms

[Tree] (config>service>vprn>ospf3 external-db-overflow)

Full Context

configure service vprn ospf external-db-overflow

configure service vprn ospf3 external-db-overflow

Description

This command enables limits on the number of non-default AS-external-LSA entries that can be stored in the LSDB and specifies a wait timer before processing these after the limit is exceeded.

The *limit* value specifies the maximum number of non-default AS-external-LSA entries that can be stored in the link-state database (LSDB). Placing a limit on the non-default AS-external-LSAs in the LSDB protects the router from receiving an excessive number of external routes that consume excessive memory or CPU resources. If the number of routes reach or exceed the *limit*, the table is in an overflow state. When in an overflow state, the router does not originate any new AS-external-LSAs and it withdraws all self-originated non-default external LSAs.

The *interval* specifies the amount of time to wait after an overflow state before regenerating and processing non-default AS-external-LSAs. The waiting period acts like a dampening period, which prevents the router from continuously running Shortest Path First (SPF) calculations caused by the excessive number of non-default AS-external LSAs.

The **external-db-overflow** must be set identically on all routers attached to any regular OSPF area. OSPF stub areas and not-so-stubby areas (NSSAs) are excluded.

The **no** form of this command disables limiting the number of non-default AS-external-LSA entries.

Default

no external-db-overflow — No limit on non-default AS-external-LSA entries.

Parameters

limit

The maximum number of non-default AS-external-LSA entries that can be stored in the LSDB before going into an overflow state expressed as a decimal integer.

Values -1 to 2147483647

Note:
Setting a value of -1 is equivalent to **no external-db-overflow**.

interval

The number of seconds after entering an overflow state before attempting to process non-default AS-external-LSAs expressed as a decimal integer.

Values 0 to 2147483647

Description

This command enables limits on the number of non-default AS-external-LSA entries that can be stored in the LSDB and specifies a wait timer before processing these after the limit is exceeded.

The *limit* value specifies the maximum number of non-default AS-external-LSA entries that can be stored in the link-state database (LSDB). Placing a limit on the non-default AS-external-LSAs in the LSDB protects the router from receiving an excessive number of external routes that consume excessive memory or CPU resources. If the number of routes reach or exceed the *limit*, the table is in an overflow state. When in an overflow state, the router will not originate any new AS-external-LSAs. In fact, it withdraws all the self-originated non-default external LSAs.

The *interval* specifies the amount of time to wait after an overflow state before regenerating and processing non-default AS-external-LSAs. The waiting period acts like a dampening period preventing the router from

continuously running Shortest Path First (SPF) calculations caused by the excessive number of non-default AS-external LSAs.

The **external-db-overflow** must be set identically on all routers attached to any regular OSPF area. OSPF stub areas and not-so-stubby areas (NSSAs) are excluded.

The **no** form of this command disables limiting the number of non-default AS-external-LSA entries.

Default

no external-db-overflow

Parameters

limit

Specifies the maximum number of non-default AS-external-LSA entries that can be stored in the LSDB before going into an overflow state expressed as a decimal integer.

Values 0 to 2147483647

interval

The number of seconds after entering an overflow state before attempting to process non-default AS-external-LSAs expressed as a decimal integer.

Context

[Tree] (config>service>vprn>isis>level external-preference)

Full Context

configure service vprn isis level external-preference

Description

This command configures the external route preference for the IS-IS level.

The **external-preference** command configures the preference level of either IS-IS level 1 or IS-IS level 2 external routes. By default, the preferences are as listed in the table below.

A route can be learned by the router by different protocols, in which case, the costs are not comparable. When this occurs, the preference decides the route to use.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is dependent on the default preference table. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used. If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of the route to use is determined by the configuration of the **ecmp** in the **config>router** context.

Default

Default preferences are listed in Table 32: Default Preferences.

Table 32: Default Preferences

Route Type	Preference	Configurable
Direct attached	0	No
Static route	5	Yes
MPLS	7	—
OSPF internal routes	10	No
IS-IS Level 1 internal	15	Yes
IS-IS Level 2 internal	18	Yes
OSPF external	150	Yes
IS-IS Level 1 external	160	Yes
IS-IS Level 2 external	165	Yes
BGP	170	Yes
BGP	170	Yes

Note:

1. Internal preferences are changed using the **preference** command in the **config>router>isis>level** *level-number* context.

Parameters

preference

The preference for external routes at this level as expressed.

Values 1 to 255

10.1 facility

facility

Syntax

facility *syslog-facility*

no facility

Context

[Tree] (config>service>vprn>log>syslog facility)

Full Context

configure service vprn log syslog facility

Description

This command configures the facility code for messages sent to the syslog target host.

Multiple syslog IDs can be created with the same target host but each syslog ID can only have one facility code. If multiple facility codes are entered, the last *facility-code* entered overwrites the previous facility-code.

If multiple facilities need to be generated for a single syslog target host, then multiple **log-id** entries must be created, each with its own filter criteria to select the events to be sent to the syslog target host with a given facility code.

The **no** form of this command reverts to the default value.

Default

local7 — Syslog entries are sent with the local7 facility code.

Parameters

syslog-facility

Specifies syslog facility name represents a specific numeric facility code. The code should be entered in accordance with the syslog RFC. However, the software does not validate if the facility code configured is appropriate for the event type being sent to the syslog target host.

Values kernel, user, mail, systemd, auth, syslogd, printer, netnews, uucp, cron, authpriv, ftp, ntp, logaudit, logalert, cron2, local0, local1, local2, local3, local4, local5, local6, local7

Valid responses per RFC3164, *The BSD syslog Protocol,* are listed in Table 36: Syslog Facility Codes.

Table 36: Syslog Facility Codes

Full Context

configure log syslog facility

Description

This command configures the facility code for messages sent to the syslog target host.

Multiple syslog IDs can be created with the same target host but each syslog ID can only have one facility code. If multiple facility codes are entered, the last *facility-code* entered overwrites the previous facility-code.

If multiple facilities need to be generated for a single syslog target host, then multiple **log-id** entries must be created, each with its own filter criteria to select the events to be sent to the syslog target host with a given facility code.

The **no** form of this command reverts to the default value.

Default

facility local7

Parameters

syslog-facility

Specifies a syslog facility name which represents a specific numeric facility code. The code must be entered in accordance with the syslog RFC. However, the software does not validate if the facility code configured is appropriate for the event type being sent to the syslog target host.

Values kernel, user, mail, systemd, auth, syslogd, printer, netnews, uucp, cron, authpriv, ftp, ntp, logaudit, logalert, cron2, local0, local1, local2, local3, local4, local5, local6, local7

Valid responses per RFC 3164, *The BSD syslog Protocol,* are listed in Table 37: Syslog Protocol Valid Responses.

Table 37: Syslog Protocol Valid Responses

Numerical Code	Facility Code
0	kernel
1	user
2	mail
3	systemd
4	auth
5	syslogd
6	printer
7	net-news
8	uucp
9	cron
10	auth-priv
11	ftp
12	ntp
13	log-audit

Numerical Code	Facility Code
14	log-alert
15	cron2
16	local0
17	local1
18	local2
19	local3
20	local4
21	local5
22	local6
23	local7

10.2 facility-fault

facility-fault

Syntax

[**no**] **facility-fault**

Context

[Tree] (config>port>ethernet>eth-cfm>mep facility-fault)

[Tree] (config>lag>eth-cfm>mep facility-fault)

Full Context

configure port ethernet eth-cfm mep facility-fault

configure lag eth-cfm mep facility-fault

Description

Allows the facility MEP to move from alarming only to network actionable function. This means a facility MEP will not merely report the defect conditions but will be able to action based on the transition of the MEP state. Without this command the facility MEP will only monitor and report and conditions of the MEP do not affect related services.

Default

no facility-fault

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

facility-fault

Syntax

[**no**] **facility-fault**

Context

[Tree] (config>router>if>eth-cfm>mep facility-fault)

Full Context

configure router interface eth-cfm mep facility-fault

Description

This command allows the facility MEP to move from alarming only to network actionable function. This means that a MEP facility reports both the defect conditions and the actions that are based on the transition of the MEP state.

The **no** form of this command causes the facility MEP to only monitor and report conditions on the MEPs that do not affect related services.

Default

no facility-fault

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

10.3 facility-id-permission

facility-id-permission

Syntax

facility-id-permission {**chassis**}

no facility-id-permission

Context

[Tree] (config>eth-cfm>domain>assoc facility-id-permission)

Full Context

configure eth-cfm domain association facility-id-permission

Description

This command allows the operator to include the sender-id TLV information that was specified under the **config>eth>system>sender-id** context for facility base MEPs. When this option is present under the maintenance association, the specific MPs in the association included the **sender-id** TLV information in ETH-CFM PDUs. MEPs include the **sender-id** TLV for CCM (not sub second CCM enabled MEPs), LBM/LBR, and LTM/LTR. MIPs include this value in the LBR and LTR PDUs.

Note:
LBR functions reflect all TLVs received in the LBM unchanged including the SenderID TLV. This command produces an error when a bridge-identifier is configured under the association. Facility MEPs do not support the bridge-identifier. Transmission of the Management Domain and Management Address fields are not supported in this TLV.

Parameters

chassis

Sends the configured chassis information defined under **eth-cfm>system** using the **sender-id** option.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

10.4 fail-action

fail-action

Syntax

fail-action {**continue** | **drop**}

no fail-action

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>match-radprox-cache fail-action)

Full Context

configure subscriber-mgmt local-user-db ipoe host match-radius-proxy-cache fail-action

Description

This command specifies the action to take when no match is found in the cache.

The **no** form of this command reverts to the default.

Default

fail-action drop

Parameters

continue

Specifies to continue when no match is found.

drop

Specifies to drop when no match is found.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

fail-action

Syntax

fail-action *fail-action*

no fail-action

Context

[Tree] (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>action fail-action)

Full Context

configure subscriber-mgmt isa-service-chaining vas-filter entry action fail-action

Description

This command configures the fail action when a packet matches with a VAS filter entry in a specific direction, but no mapping exists for the specified SF-IP or ESI in the specified EVPN service.

The **no** form of this command removes the fail action from the configuration.

Parameters

fail-action

Specifies the fail action.

Values drop, forward

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

fail-action

Syntax

fail-action {[**metric** *metric-value*] [**preference** *preference-value*] [**tag** *tag-value*] | withdraw}

no fail-action

Context

[Tree] (config>service>ies>sub-if>grp-if>sap>static-host>managed-routes>route-entry>cpe-check fail-action)

[Tree] (config>service>vprn>sub-if>grp-if>sap>static-host>managed-routes>route-entry>cpe-check fail-action)

Full Context

configure service ies subscriber-interface group-interface sap static-host managed-routes route-entry cpe-check fail-action

configure service vprn subscriber-interface group-interface sap static-host managed-routes route-entry cpe-check fail-action

Description

This command configures the fail action based on specific criteria.

The **no** form of this command removes the fail action from the configuration.

Parameters

metric-value

Specifies the route metric associated with the provisioned managed route if the CPE check fails.

Values 1 to 4294967295

preference-value

Specifies the route preference associated with the provisioned managed route if the CPE check fails.

Values 0 to 255

tag-value

Specifies the route tag used if the CPE check fails.

Values 1 to 4294967295

withdraw

Keyword to specify the withdrawal of the route entry if the CPE check fails.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

10.5 fail-on-error

fail-on-error

Syntax

[**no**] **fail-on-error**

Context

[Tree] (config>card fail-on-error)

[Tree] (config>card>xiom fail-on-error)

Full Context

configure card fail-on-error

configure card xiom fail-on-error

Description

This command controls the behavior of the card when any one of a specific set of card level errors is encountered in the system. When the **fail-on-error** command is enabled, and any one (or more) of the specific errors is detected, then the Operational State of the card is set to Failed. This Failed state will persist until the clear card command is issued (reset) or the card is removed and re-inserted (re-seat). If the condition persists after re-seating the card, then Nokia support should be contacted for further investigation.

Enabling **fail-on-error** is only recommended when the network is designed to be able to route traffic around a failed card (redundant cards, nodes or other paths exist).

The list of specific errors includes:

- CHASSIS event ID# 2063 – tmnxEqCardPChipMemoryEvent
- CHASSIS event ID# 2076 – tmnxEqCardPChipCamEvent
- CHASSIS event ID# 2059 – tmnxEqCardPChipError (for ingress Ethernet only)
- CHASSIS event ID# 2098 tmnxEqCardQChipBufMemoryEvent
- CHASSIS event ID# 2099 tmnxEqCardQChipStatsMemoryEvent
- CHASSIS event ID# 2101 tmnxEqCardQChipIntMemoryEvent
- CHASSIS event ID# 2103 tmnxEqCardChipIfCellEvent

On platforms without independent IOM/IMM and CPM cards, the node is rebooted if fail-on-error is enabled and one of the card level errors is encountered.

The tmnxEqCardPChipError is only considered as a trigger for card fail-on-error for ingress FCS errors (not egress FCS errors), and only for Ethernet MDAs or IMMs.

Note that upon the detection of the event/error in the system, the reporting of the event (logs) and the **fail-on-error** behavior of the card are independent. Log event control configuration will determine whether the events are reported in logs (or SNMP traps, and so on) and the **fail-on-error** configuration will determine the behavior of the card. This implies that the card can be configured to **fail-on-error** even if the events are

suppressed (some may be suppressed in the system by default). In order to facilitate post-failure analysis, Nokia recommends that you enable the reporting of the specific events/errors (**configure log event-control**) when **fail-on-error** is enabled.

Default

no fail-on-error

Platforms

All

- configure card fail-on-error

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- configure card xiom fail-on-error

fail-on-error

Syntax

[**no**] **fail-on-error**

Context

[Tree] (config>card>mda fail-on-error)

Full Context

configure card mda fail-on-error

Description

This command enables the fail-on-error feature. If an MDA is experiencing too many Egress XPL Errors, this feature causes the MDA to fail. This can force an APS switchover or **traffic re-route**. The purpose of this feature is to avoid situations where traffic is forced to use a physical link that suffers from errors but is still technically operational.

The feature uses values configured in the **config>card>mda>egress-xpl** context. When this feature is enabled on a MDA, if *window* consecutive minutes pass in which the MDA experiences more than *threshold* Egress XPL Errors per minute, then the MDA will be put in the *failed* state.

The **no** form of this command disables the feature on the MDA.

Platforms

All

10.6 fail-to-open

fail-to-open

Syntax

[**no**] **fail-to-open**

Context

[Tree] (config>isa>aa-grp fail-to-open)

Full Context

configure isa application-assurance-group fail-to-open

Description

This command configures the mode of operation during an operational failure of this application assurance group when no application assurance engines are available to service traffic. When enabled, all traffic that was to be inspected will be dropped. When disabled, all traffic that was to be inspected will be forwarded without any inspection as if the group was not configured at all.

Default

no fail-to-open

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.7 failed-mda-limit

failed-mda-limit

Syntax

failed-mda-limit *number*

no failed-mda-limit

Context

[Tree] (config>isa>nat-group failed-mda-limit)

Full Context

configure isa nat-group failed-mda-limit

Description

This command configures the maximum number of supported simultaneously failures in the active-active intra-chassis NAT redundancy model. Traffic from the failed ISAs is distributed over the remaining ISA in the system. Memory resources are reserved in every ISA to accommodate new mappings from the failed

ISA. However, bandwidth is not reserved and each ISA operates at max speed in all conditions (with failure or without the failure).

NAT translations are not preserved across switchovers and consequently they will have to be re-initiated by the clients.

For this command to take effect, the intra-chassis redundancy mode must be set to active-active (**config>isa>nat-group>redundancy active-active**).

Default

no failed-mda-limit

Parameters

number

Specifies the number of simultaneous ISA failures supported in active-active intra-chassis NAT redundancy model.

Values 1 to 2

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.8 failed-threshold

failed-threshold

Syntax

failed-threshold [1 to 1000]

failed-threshold all

Context

[Tree] (config>service>vpls>site failed-threshold)

Full Context

configure service vpls site failed-threshold

Description

This command defines the number of objects should be down for the site to be declared down. Both administrative and operational status must be evaluated and if at least one is down, the related object is declared down.

Default

failed-threshold all

Parameters

1 to 1000

Specifies the threshold for the site to be declared down.

10.10 failure-action

failure-action

Syntax

failure-action down

no failure-action

Context

[Tree] (config>router>ldp>lsp-bfd failure-action)

Full Context

configure router ldp lsp-bfd failure-action

Description

This command configures the action to take when LSP BFD fails on an LDP LSP.

The system generates an SNMP trap if BFD goes down on an LSP, regardless of whether a failure action is configured or not.

The **no** form of this command removes the failure action.

Default

no failure-action

Parameters

down

Specifies the LSP is marked as unusable in the TTM. If the LSP appears as a shortcut in RTM, then the route is removed.

Platforms

All

failure-action

Syntax

failure-action down

no failure-action

Context

[Tree] (config>service>ies>interface>spoke-sdp>bfd failure-action)

[Tree] (config>service>vpls>spoke-sdp>bfd failure-action)

[Tree] (config>service>vprn>interface>spoke-sdp>bfd failure-action)

[Tree] (config>service>epipe>spoke-sdp>bfd failure-action)

Full Context

configure service ies interface spoke-sdp bfd failure-action

configure service vpls spoke-sdp bfd failure-action

configure service vprn interface spoke-sdp bfd failure-action

configure service epipe spoke-sdp bfd failure-action

Description

This command configures the ability to bind the operational state of a spoke-SDP to the state of its VCCV BFD session.

If **failure-action down** is configured, the spoke-SDP is taken operationally down if the associated VCCV BFD session goes down. This configuration also allows BFD packets to be forwarded on an otherwise operationally down spoke-SDP in order to test the spoke-SDP connectivity.

The **no** form of this command removes the failure action.

Default

no failure-action

Parameters

down

Specifies that the spoke-SDP is taken operationally down if the associated VCCV BFD session goes down.

Platforms

All

failure-action

Syntax

failure-action *failure-action*

no failure-action

Context

[Tree] (config>router>mpls>lsp>bfd failure-action)

Full Context

configure router mpls lsp bfd failure-action

Description

This command configures what action occurs when LSP BFD fails on an RSVP or SR-TE LSP.

A failure action of **down** means an LSP is marked as unusable in TTM. If it appears as a shortcut in RTM, the route is removed. This failure action can only be configured on RSVP LSPs.

A failure action of **failover** causes the active path of an RSVP LSP to switch to the secondary or next-preference available secondary path. This option is only available for RSVP LSPs. It is not applicable to **one-hop-p2p** and **mesh-p2p** auto LSPs.

A failure action of **failover-or-down** means that a switchover from the active path is triggered on failure of the BFD session on the active path (primary or standby). If there is no available path to switch to, then the LSP is taken operationally down. For RSVP-TE LSPs, this failure action causes the two best-preference standby paths to be programmed in the data path, in addition to the primary.

The system generates an SNMP trap if BFD goes down on an LSP, regardless of whether a failure action is configured or not.

The **no** form of this command removes the failure action.

Default

no failure-action

Parameters

down

Specifies that the LSP will be marked as unusable in the TTM. If it appears as a shortcut in RTM, then the route will be removed.

failover

Specifies that the active path of an RSVP LSP will switch to the secondary path or next-preference available secondary path. This option is only available for RSVP LSPs. It is not applicable in the LSP template.

failover-or-down

Specifies that the active path of an SR-TE or RSVP-TE LSP switches to the secondary or next-preference available secondary path, or for the LSP to go operationally down if no other path is available.

Platforms

All

failure-action

Syntax

failure-action {**down** | **failover-or-down**}

no failure-action

Context

[Tree] (config>router>mpls>lsp-template>bfd failure-action)

Full Context

configure router mpls lsp-template bfd failure-action

Description

This command configures the action to take when LSP BFD fails on an RSVP LSP.

The system generates an SNMP trap if BFD goes down on an LSP, regardless of whether or not a failure action is configured.

The **no** form of this command removes the failure action.

Default

no failure-action

Parameters

down

Specifies that the LSP is marked as unusable in the TTM. If it appears as a shortcut in RTM, then the route is removed.

failover-or-down

Specifies that the active path of an SR-TE LSP switches to the secondary or next-preference available secondary path, or for the LSP to go operationally down if no other path is available. This option is only available for SR-TE LSPs.

Platforms

All

10.11 failure-mode

failure-mode

Syntax

failure-mode [**discard** | **per-link-hash**]

no failure-mode

Context

[Tree] (config>lag>link-map-profile failure-mode)

Full Context

configure lag link-map-profile failure-mode

Description

This command defines the failure mode for egress traffic of SAPs/network interfaces that use this link-map-profile when neither primary nor secondary links of this profile are available.

Default

failure-mode per-link-hash

Parameters

discard

Specifies egress traffic for SAPs/network interfaces using this link-map-profile is discarded to protect SAP/network interface traffic on other LAG links from impact of re-hashing the affected SAPs/network interfaces.

per-link-hash

Specifies egress traffic for SAPs/network interfaces using this link-map-profile is rehashed on remaining, available LAG links using per-link-hash algorithm. SAP/network interface QoS configurations dictate what traffic is discarded on any link that may become oversubscribed as result of the re-hash.

Platforms

All

10.12 failure-recovery

failure-recovery

Syntax

[**no**] **failure-recovery**

Context

[Tree] (config>sys>switch-fabric failure-recovery)

Full Context

configure system switch-fabric failure-recovery

Description

Commands in this context configure attributes related to the automatic switch fabric recovery process.

The automatic switch fabric recovery process is triggered when there are two resets of an IOM/XCM due to ICC failures within a small time frame. The recovery process involves the sequential resetting of SFM in case the issues are due to one of the SFM in the ICC communication path. As the final step in the recovery process, a CPM switchover is triggered to reset the active CPM.

Platforms

7450 ESS, 7750 SR-7, 7750 SR-12e, 7950 XRS

failure-threshold

Syntax

failure-threshold *number*

no failure-threshold

Context

[Tree] (config>test-oam>icmp>ping-template failure-threshold)

Full Context

configure test-oam icmp ping-template failure-threshold

Description

This command configures the count, when reached, that causes the transition of the IPv4 interface from operationally up to operationally down because of a ping template failure.

The **no** form of this command reverts to the default value.

Default

failure-threshold 3

Parameters

number

Specifies a count that causes the transition of the IP interface from operationally up to operationally down because of ping template failure.

Values 2 to 10

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

10.14 fallback-action

fallback-action

Syntax

fallback-action accept [**force-probing**]

fallback-action user-db *local-user-db-name* [**force-probing**]

no fallback-action

Context

[Tree] (config>subscr-mgmt>auth-plcy fallback-action)

Full Context

configure subscriber-mgmt authentication-policy fallback-action

Description

This command configures the action when no RADIUS server is available; servers are either out of service or are in a probing state.

The **no** form of this command removes the action from the configuration.

Parameters

accept

Specifies that all authentication requests are automatically accepted.

local-user-db-name

Specifies that the LUDB is used to authenticate to the server.

force-probing

Specifies that a subscriber or a test user Access-Request**,** depending which arrives first, is used to probe a RADIUS server before continuing with the configured **fallback-action**. This forces an out-of-service server to transition to a probing state.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

10.15 fallback-path-computation-method

fallback-path-computation-method

Syntax

fallback-path-computation-method {**none** | **local-cspf**}

no fallback-path-computation-method

Context

[Tree] (config>router>mpls>lsp-template fallback-path-computation-method)

[Tree] (config>router>mpls>lsp fallback-path-computation-method)

Full Context

configure router mpls lsp-template fallback-path-computation-method

configure router mpls lsp fallback-path-computation-method

Description

This command specifies the fallback path computation method used if all configured PCEs are down or the signaling overload and the redelegation timer has expired. This method is used regardless of whether the LSP is PCE-controlled and PCE-computed, or just PCE-computed.

The **no** form of this command removes the fallback path computation method used.

Default

fallback-path-computation-method none

Parameters

none

Specifies to fall back to using the named path for RSVP-TE LSPs.

local-cspf

Specifies to fall back to using local CSPF computation.

Platforms

All

10.16 falling-percent-reset

falling-percent-reset

Syntax

falling-percent-reset *percent-of-highest*

no falling-percent-reset

Context

[Tree] (config>mcast-mgmt>bw-plcy falling-percent-reset)

Full Context

configure mcast-management bandwidth-policy falling-percent-reset

Description

This command is configures the percentage of bandwidth decrease that must occur to reset the dynamic bandwidth monitoring function for a multicast channel. When a channel is configured to use the ingress dynamic bandwidth as the in-use bandwidth for ingress multicast path management, the system maintains a sliding window in time that defines how long the last highest bandwidth value associated with the channel should be used. The sliding window duration is derived from the channels bw-activity dynamic falling-delay parameter within the multicast information policy. Each time the system detects a current bandwidth for a channel that is equal to or greater than the current highest bandwidth for the channel, the sliding window is reset and the highest value is used when managing the ingress multicast paths. If the system does not detect a higher or equal bandwidth value for the channel within the window period, the system resets the sliding window and uses the next highest rate seen during the duration of the window period. In this way, the system delays relinquishing bandwidth for a dynamic bandwidth channel for a configurable period. If a momentary fluctuation (decrease) in ingress bandwidth occurs, the system ignores the bandwidth change.

While this is useful for momentary fluctuations in bandwidth, it may be desirable to react faster when the current bandwidth monitored for a channel drops significantly relative to the currently in-use bandwidth. When the bandwidth decrease is equal to or greater than the falling-percent-reset value, the system

immediately stops using the highest bandwidth and starts using the current bandwidth while resetting the sliding window.

If falling-percent-reset is set to 50%, when the current ingress dynamic bandwidth is 50% of the current in-use highest bandwidth, the system immediately uses the current dynamic ingress bandwidth as the highest bandwidth for the channel.

By default, the falling-percent-reset is 50% when a new bandwidth policy is created. The default bandwidth policy also has a hard configured value of 50%. Setting falling-percent-reset to 100 is equivalent to specifying no falling-percent-reset.

The **no** form of this command restores the default value of 50%.

Default

falling-percent-reset 50

Parameters

percent-of-highest

The percent-of-highest parameter is required and defines the percentage of decline between the current ingress dynamic bandwidth and the current in-use highest bandwidth at which the system resets the dynamic ingress bandwidth monitoring for the channel. When reset in this case, the system uses the current ingress dynamic bandwidth as the highest rate and continues monitoring. The parameter must be defined as an integer value representing a percentage.

Values 1 to 100 percent

Platforms

[Tree] (config>service>vprn>bgp>group>neighbor family)

Full Context

configure service vprn bgp family

configure service vprn bgp group family

configure service vprn bgp group neighbor family

Description

This command configures the set of BGP address families (AFI plus SAFI) to be supported by the applicable VPRN BGP sessions.

The **no** form of this command restores the default, which corresponds to unlabeled IPv4 unicast routes (AFI 1, SAFI 1) only.

Default

family ipv4

Parameters

ipv4

Adds support for the IPv4 unicast (unlabeled) address family.

label-ipv4

Adds support for the IPv4 unicast (labeled) address family.

ipv6

Adds support for the IPv6 unicast (unlabeled) address family.

mcast-ipv4

Adds support for the IPv4 multicast SAFI address family.

flow-ipv4

Adds support for the IPv4 FlowSpec address family.

mcast-ipv6

Adds support for the IPv6 multicast SAFI address family.

flow-ipv6

Adds support for the IPv6 FlowSpec address family.

Platforms

All

family

Syntax

family [**ipv4** | **ipv6**]

Context

[Tree] (config>router>mpls>lsp-template family)

Full Context

configure router mpls lsp-template family

Description

This command specifies if the lsp-template is for use in IPv4 or IPv6 SR-TE LSP.

This command is optional in a IPv4 SR-TE auto-LSP but must be set to **ipv6** value in a IPv6 SR-TE auto-LSP. By default, this command is set to **ipv4** value for backward compatibility.

When establishing both IPv4 and IPv6 SR-TE mesh auto-LSPs with the same parameters and constraints, a separate LSP template of type **mesh-p2p-srte** must be configured for each address family with the **family** CLI leaf set to the IPv4 or IPv6 value. SR-TE one-hop auto-LSPs can only be established for either IPv4 or IPv6 family, but not both. The **family** leaf in the LSP template of type **one-hop-p2p-srte** should be set to the desired IP family value.

The **no** form of this command reverts to the default value.

Default

family ipv4

Parameters

ipv4

Specifies the lsp-template is for use in IPv4 SR-TE LSP.

ipv6

Specifies the lsp-template is for use in IPv6 SR-TE LSP.

configure router bgp family

configure router bgp group neighbor family

Description

This command configures the set of BGP address families (AFI/SAFI) to be supported by the base router BGP sessions.

The **no** form of this command restores the default, which corresponds to unlabeled IPv4 unicast routes (AFI 1, SAFI 1) only.

Default

family ipv4

Parameters

ipv4

Advertises MP-BGP support for the IPv4 unicast (unlabeled) address family.

label-ipv4

Advertises MP-BGP support for the IPv4 unicast (labeled) address family.

vpn-ipv4

Advertises MP-BGP support for the IPv4 VPN (SAFI 128) address family.

ipv6

Advertises MP-BGP support for the IPv6 unicast (unlabeled) address family.

label-ipv6

Advertises MP-BGP support for the IPv6 unicast (labeled) address family.

vpn-ipv6

Advertises MP-BGP support for the IPv6 VPN (SAFI 128) address family.

mcast-ipv4

Advertises MP-BGP support for the IPv4 multicast SAFI address family.

l2-vpn

Advertises MP-BGP support for the L2 VPN address family.

mvpn-ipv4

Advertises MP-BGP support for the IPv4 multicast VPN address family.

mvpn-ipv6

Advertises MP-BGP support for the IPv6 multicast VPN address family.

mdt-safi

Advertises MP-BGP support for the MDT SAFI address family.

ms-pw

Advertises MP-BGP support for the multi-segment pseudowire address family.

flow-ipv4

Advertises MP-BGP support for the IPv4 FlowSpec address family.

flow-ipv6

Advertises MP-BGP support for the IPv6 FlowSpec address family.

route-target

Advertises MP-BGP support for RT constraint routes.

mcast-vpn-ipv4

Advertises MP-BGP support for the IPv4 VPN multicast (SAFI 129) address family.

evpn

Advertises MP-BGP support for the EVPN address family.

bgp-ls

Enables the advertisement of BGP-LS address family to the associated BGP neighbors.

mcast-ipv6

Advertises MP-BGP support for the IPv6 multicast SAFI address family.

mcast-vpn-ipv6

Advertises MP-BGP support for the IPv6 multicast routes from a VPRN over the provider network. This family is only applicable in the base BGP routing context.

sr-policy-ipv4

Advertises MP-BGP support for AFI1/SAFI73 IP address families for BGP routes that encode a segment-routing policy to an IPv4 destination.

sr-policy-ipv6

Advertises MP-BGP support for AF12/SAF173 IP address families for BGP routes that encode a segment-routing policy to an IPv6 destination.

flow-vpn-ipv4

Advertises support for the FlowSpec-VPN IPv4 address family (AFI 1, SAFI 134).

flow-vpn-ipv6

Advertises support for the FlowSpec-VPN IPv6 address family (AFI 2, SAFI 134).

no far-end *ip-address*

Context

[Tree] (config>mirror>mirror-dest>remote-source far-end)

Full Context

configure mirror mirror-dest remote-source far-end

Description

This command is used on a destination router in a remote mirroring solution. See the description for the **remote-source** command for additional information.

When using L2TPv3, MPLS-TP or LDP IPv6 LSP SDPs in the remote mirroring solution, the destination node should be configured with **remote-src>spoke-sdp** entries. For all other types of SDPs, r**emote-source>far-end** entries are used.

Up to 50 far-end entries can be specified.

The **no** form of this command removes the IP address from the remote source configuration.

Parameters

ip-address

Specifies the service IP address (system IP address) of the remote device sending mirrored traffic to this mirror destination service. If 0.0.0.0 is specified, any remote is allowed to send to this service.

Values 1.0.0.1 to 223.255.255.254

vc-id

Specifies the virtual circuit identifier of the remote source. For mirror services, the *vc-id* defaults to the *service-id*. However, if the *vc-id* is being used by another service a unique vc-id is required to create an SDP binding. For this purpose the mirror service SDP bindings accepts *vc-ids*. This VC ID must match the VC ID used on the spoke SDP that is configured on the source router.

ingress-vc-label

Specifies the ingress service label for mirrored service traffic on the **far end** device for manually configured mirror service labels.

The defined *ing-svc-label* is entered into the ingress service label table which causes ingress packet with that service label to be handled by this mirror destination service.

The specified *ing-svc-label* must not have been used for any other service ID and must match the egress service label being used on the spoke SDP that is configured on the source router. It must be within the range specified for manually configured service labels defined on this router. It may be reused for other far end addresses on this *mirror-dest-service-id*.

Values 2048 to 18431

tldp

Specifies that the label is obtained through signaling via the LDP.

icb

Specifies that the remote source is an inter-chassis backup SDP binding.

Platforms

All

no far-end *ip-address* | *ipv6-address*

Context

[Tree] (config>service>sdp far-end)

Full Context

configure service sdp far-end

Description

This command configures the system IP address of the far-end destination router for the Service Distribution Point (SDP) that is the termination point for a service.

The far-end IP address must be explicitly configured. The destination IP address must be that of an SR OS and for a GRE SDP it must match the system IP address of the far end router.

If the SDP uses GRE for the destination encapsulation, the IP address is checked against other GRE SDPs to verify uniqueness. If the IP address is not unique within the configured GRE SDPs, an error is generated and the IP address is not associated with the SDP. The local device may not know whether the IP address is actually a system IP interface address on the far-end device.

If the SDP uses MPLS encapsulation, the **far-end** address is used to check LSP names when added to the SDP. If the " **to** IP address" defined within the LSP configuration does not exactly match the SDP **far-end** address, the LSP will not be added to the SDP and an error will be generated. Alternatively, an SDP that uses MPLS can have an MPLS-TP node with an MPLS-TP node-id and (optionally) a global ID. In this case, the SDP must use an MPLS-TP LSP and the SDP **signaling** parameter must be set to **off**.

An SDP cannot be administratively enabled until a **far-end** *ip-address* or MPLS-TP node-id is defined. The SDP is operational when it is administratively enabled (**no shutdown**) and the **far-end** *ip-address* is contained in the IGP routing table as a host route. OSPF ABRs should not summarize host routes between areas. This can cause SDPs to become operationally down. Static host routes (direct and indirect) can be defined in the local device to alleviate this issue.

On a tunnel configured as SDP with delivery type of eth-gre-bridged, this command designates L2oGRE tunnel end points. This is the only configuration option allowed for this type of SDP.

The **no** form of this command removes the currently configured destination IP address for the SDP. The *ip-address* parameter is not specified and will generate an error if used in the **no far-end** command. The SDP must be administratively disabled using the **config service sdp shutdown** command before the **no far-end** command can be executed. Removing the far-end IP address will cause all *lsp-name* associations with the SDP to be removed.

Parameters

far-end

Specifies the far-end termination point for the GRE tunnel.

ip-address* | *ipv6-address

Specifies a IPv4 or IPv6 address of the far-end SR OS for the SDP in dotted decimal notation.

node-id

Specifies the MPLS-TP Node ID of the far-end system for the SDP, either in dotted decimal notation (a.b.c.d) or an unsigned 32-bit integer (1 to 4294967295). This parameter is mandatory for an SDP using an MPLS-TP LSP.

global-id

Specifies a MPLS-TP Global ID of the far-end system for the SDP, in an unsigned 32-bit integer (0 to 4294967295). This parameter is optional for an SDP using an MPLS-TP LSP. If not entered, a default value for the Global ID of '0' is used. A global ID of '0' indicates that the far-end node is in the same domain as the local node. The user must explicitly configure a Global ID if its value is non-zero.

configure service vpls sap igmp-snooping fast-leave

configure service vpls spoke-sdp igmp-snooping fast-leave

configure service vpls sap mld-snooping fast-leave

Description

This command enables fast leave.

When IGMP fast leave processing is enabled, the 7450 ESS or 7750 SR immediately removes a SAP or SDP from the IP multicast group when it detects an IGMP leave message on that SAP or SDP. Fast leave processing allows the switch to remove a SAP or SDP that sends a leave message from the forwarding table without first sending out group-specific queries to the SAP or SDP, which speeds up the process of changing channels.

Fast leave should only be enabled when there is a single receiver present on the SAP or SDP.

When fast leave is enabled, the configured **last-member-query-interval** value is ignored.

Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping fast-leave

Description

This command enables fast leave.

When IGMP fast leave processing is enabled, the 7450 ESS or 7750 SR will immediately remove a SAP or SDP from the IP multicast group when it detects an IGMP leave on that SAP or SDP. Fast leave processing allows the switch to remove a SAP or SDP that sends a leave from the forwarding table without first sending out group-specific queries to the SAP or SDP, and thus speeds up the process of changing channels (zapping).

Fast leave should only be enabled when there is a single receiver present on the SAP or SDP.

When fast leave is enabled, the configured **last-member-query-interval** value is ignored.

The **no** form of this command reverts to the default.

fast-leave

Syntax

[**no**] **fast-leave**

Context

[Tree] (config>subscr-mgmt>mld-policy fast-leave)

Full Context

configure subscriber-mgmt mld-policy fast-leave

Description

This command enables fast leave. When fast leave processing is enabled, the router immediately removes a SAP or SDP from the IP multicast group when it detects an MLD leave on that SAP or SDP. Fast leave processing allows the switch to remove a SAP or SDP that sends a leave from the forwarding table without first sending out group-specific queries to the SAP or SDP, and thus speeds up the process of changing channels (zapping).

Fast leave should only be enabled when there is a single receiver present on the SAP or SDP.

When fast leave is enabled, the configured last-member-query-interval value is ignored.

The **no** form of this command reverts to the default.

Default

fast-leave

fast-leave

Syntax

[**no**] **fast-leave**

Context

[Tree] (config>service>pw-template>igmp-snooping fast-leave)

Full Context

configure service pw-template igmp-snooping fast-leave

Description

This command enables fast leave.

When IGMP fast leave processing is enabled, the 7750 SR will immediately remove a SAP or SDP from the IP multicast group when it detects an IGMP **leave** on that SAP or SDP. Fast leave processing allows the switch to remove a SAP or SDP that sends a **leave** from the forwarding table without first sending out group-specific queries to the SAP or SDP, and thus speeds up the process of changing channels (zapping).

Fast leave should only be enabled when there is a single receiver present on the SAP or SDP.

When fast leave is enabled, the configured last-member-query-interval value is ignored.

Default

no fast-leave

fast-reroute

Syntax

fast-reroute [**backup-sr-tunnel**]

no fast-reroute

Context

[Tree] (config>router>ldp fast-reroute)

Full Context

configure router ldp fast-reroute

Description

This command enables LDP Fast-Reroute (FRR) procedures. When enabled, LDP uses both the primary next-hop and LFA next-hop, when available, for resolving the next-hop of an LDP FEC against the corresponding prefix in the routing table. This will result in LDP programming a primary NHLFE and a backup NHLFE into the forwarding engine for each next-hop of a FEC prefix for the purpose of forwarding packets over the LDP FEC.

When any of the following events occurs, LDP instructs in the fast path the forwarding engines to enable the backup NHLFE for each FEC next-hop impacted by this event:

- An LDP interface goes operationally down, or is admin shutdown.
- An LDP session to a peer went down as the result of the Hello or Keep-Alive timer expiring.
- The TCP connection used by a link LDP session to a peer went down, due say to next-hop tracking of the LDP transport address in RTM, which brings down the LDP session.
- A BFD session, enabled on a T-LDP session to a peer, times-out and as a result the link LDP session to the same peer and which uses the same TCP connection as the T-LDP session goes also down.
- A BFD session enabled on the LDP interface to a directly connected peer, times out and brings down the link LDP session to this peer.

The **tunnel-down-dump-time** option or the **label-withdrawal-delay** option, when enabled, does not cause the corresponding timer to be activated for a FEC as long as a backup NHLFE is still available.

Because LDP can detect the loss of a neighbor/next-hop independently, it is possible that it switches to the LFA next-hop while IGP is still using the primary next-hop. Also, when the interface for the previous primary next-hop is restored, IGP may re-converge before LDP completed the FEC exchange with it neighbor over that interface. This may cause LDP to de-program the LFA next-hop from the FEC and blackhole traffic. In order to avoid this situation, it is recommended to enable IGP-LDP synchronization on the LDP interface.

When the SPF computation determines there is more than one primary next-hop for a prefix, it will not program any LFA next-hop in RTM. Thus, the LDP FEC will resolve to the multiple primary next-hops that provide the required protection.

The **backup-sr-tunnel** option enables the use of SR tunnel, as a remote LFA or TI-LFA backup tunnel next-hop by an LDP FEC.

As a pre-requisite, the user must enable the stitching of LDP and SR in the LDP-to-SR direction. That is because the LSR must perform the stitching of the LDP ILM to SR tunnel when the primary LDP next-hop of the FEC fails. Thus LDP must listen to SR tunnels programmed by the IGP in TTM but the mapping server feature is not required.

Assuming the following:

- the **backup-sr-tunnel** option is enabled in LDP
- the {**loopfree-alternates remote-lfa**} and/or the {**loopfree-alternates ti-lfa**} option is enabled in the IGP instance
- LDP was able to resolve the primary next-hop of the LDP FEC in RTM

IGP SPF will run both the base LFA and the TI-LFA algorithms and if it does not find a backup next-hop for a prefix of an LDP FEC, it will also run the remote LFA algorithm. If IGP finds a TI-LFA or a remote LFA tunnel next-hop, LDP programs the primary next-hop of the FEC using a LDP NHLFE and programs the LFA backup next-hop using a LDP NHLFE pointing to the SR tunnel endpoint. Note that the LDP packet is not "tunneled” over the SR tunnel. The LDP label is actually stitched to the segment routing label stack. LDP points both the LDP ILM and the LTN to the backup LDP NHLFE which itself uses the SR tunnel endpoint.

The behavior of the feature is thus similar to the LDP-to-SR stitching feature, except the behavior is augmented to allow the stitching of an LDP ILM/LTN to a SR tunnel also when the primary LDP next-hop of the FEC fails.

If the LDP FEC primary next-hop failed and LDP has pre-programmed a remote LFA or TI-LFA next-hop with a LDP backup NHLFE pointing to SR tunnel, the LDP ILM/LTN switches to it. Note that if for some reason the failure impacted only the LDP tunnel primary next-hop but not the SR tunnel primary next-hop, the LDP backup NHLFE will effectively point to the primary next-hop of the SR tunnel and traffic of the LDP ILM/LTN will follow this path instead of the TI-LFA or remote LFA next-hop of the SR tunnel until the latter is activated.

This feature is limited to IPv4 /32 prefixes in both LDP and SR.

The **no** form of this command disables the use of SR tunnels as backups for LDP FECs and disables LDP FRR.

Context

[Tree] (config>router>mpls>lsp-template fast-reroute)

[Tree] (config>router>mpls>lsp fast-reroute)

Full Context

configure router mpls lsp-template fast-reroute

configure router mpls lsp fast-reroute

Description

This command creates a pre-computed detour LSP from each node in the path of the LSP. In case of failure of a link or LSP between two nodes, traffic is immediately rerouted on the pre-computed detour LSP, thus avoiding packet-loss.

When **fast-reroute** is enabled, each node along the path of the LSP tries to establish a detour LSP as follows:

- Each upstream node sets up a detour LSP that avoids only the immediate downstream node, and merges back on to the actual path of the LSP as soon as possible.

  If it is not possible to set up a detour LSP that avoids the immediate downstream node, a detour can be set up to the downstream node on a different interface.
- The detour LSP may take one or more hops (see **config>router>mpls>lsp hop-limit**, **config>router>mpls>lsp>primary-p2mp-instance hop-limit**) before merging back on to the main LSP path.
- When the upstream node detects a downstream link or node failure, the ingress router switches traffic to a standby path if one was set up for the LSP.

Fast reroute is available only for the primary path. No configuration is required on the transit hops of the LSP. The ingress router will signal all intermediate routers using RSVP to set up their detours. TE must be enabled for fast-reroute to work.

If an LSP is configured with **fast-reroute** *frr-method* specified but does not enable CSPF, then global revertive will not be available for the LSP to recover.

The **no** form of the **fast-reroute** command removes the detour LSP from each node on the primary path. This command will also remove configuration information about the hop-limit and the bandwidth for the detour routes.

The **no** form of **fast-reroute hop-limit** command reverts to the default value.

Note:
A one-to-one detour backup LSP cannot be used at the PLR for ABR node protection. As a result, a PLR node does not signal a one-to-one detour LSP for ABR protection. In addition, the ABR node rejects a Path message that it has received from a third-party implementation configured with a detour object and a loose ERO next-hop. The Path message is rejected regardless of whether the **cspf-on-loose-hop** command is enabled on the node. When the router transits ABR for the detour path, the router rejects the signaling of an inter-area detour backup LSP.

Default

no fast-reroute — When fast-reroute is specified, the default fast-reroute method is one-to-one.

Parameters

frr-method

Configures the fast-reroute method.

Values **one-to-one** — In the one-to-one technique, a label switched path is established which intersects the original LSP somewhere downstream of the point of link or node failure. For each LSP which is backed up, a separate backup LSP is established.

Values **facility** — This option, sometimes called many-to-one, takes advantage of the MPLS label stack. Instead of creating a separate LSP for every backed-up LSP, a single LSP is created which serves to backup up a set of LSPs. This LSP tunnel is called a bypass tunnel.

The bypass tunnel must intersect the path of the original LSP(s) somewhere downstream of the point of local repair (PLR). Naturally, this constrains the set of LSPs being backed-up through that bypass tunnel to those that pass through a common downstream node. All LSPs which pass through the PLR and through this common node which do not also use the facilities involved in the bypass tunnel are candidates for this set of LSPs.

10.22 fast-start

fast-start

Syntax

[**no**] **fast-start**

Context

[Tree] (config>qos>adv-config-policy>child-control>offered-measurement fast-start)

Full Context

configure qos adv-config-policy child-control offered-measurement fast-start

Description

This command is used to enable fast detection of initial bandwidth on a child policer or queue associated with the policy. Multiple offered rate counter reads may be performed per the sampling interval. The system accumulates these counter values and evaluates the delta at the conclusion of the sampling interval. When fast-start is enabled, the system identifies all children associated with the policy that enter the inactive state (current offered rate is zero). Any inactive 'fast start' child that has a positive offered counter during a sampling period bypasses the normal sampling interval and does an immediate offered rate evaluation.

This option is intended for use with children that would benefit from faster than normal startup detection, typically those of a real-time nature.

When this parameter is not enabled, the system uses the normal sampling interval behavior of both newly active and currently active children.

The **no** form of this command is used to restore the sampling-interval-based offered rate evaluation for newly active children.

Platforms

All

Full Context

configure qos adv-config-policy child-control offered-measurement fast-stop

Description

This command is used to enable fast detection of lack of offered rate on a child policer or queue associated with the policy. Multiple offered rate counter reads may be performed per sampling interval. The system accumulates these counter values and evaluates the delta at the conclusion of the sampling interval. When fast-stop is enabled, the system bypasses the sampling interval for any currently active 'fast stop' child that has a zero offered counter measurement and does an immediate offered rate evaluation using the zero value.

This option is intended for use with children where other children would benefit from faster than normal inactive detection, typically those of a real-time nature.

When this parameter is not enabled, the system uses the normal sampling interval behavior of both newly inactive and currently active children.

The **no** form of this command is used to restore the sampling-interval-based offered rate evaluation for newly inactive children.

configure service vpls sap fault-propagation-bmac

configure service vpls spoke-sdp fault-propagation-bmac

configure service vpls mesh-sdp fault-propagation-bmac

Description

This command configures associated B-MAC addresses for fault propagation on a B-VPLS SAP or SDP binding. The statement can appear up to four times in the configuration to support four remote B-MAC addresses in the same remote B-VPLS. The configured VPLS must be a B-VPLS.

The **no** form of this command removes the specified MAC name or MAC address from the list of Fault Propagation B-MAC addresses associated with the SAP (or SDP).

Parameters

mac-name

Specifies a (predefined) MAC name to associate with the SAP or SDP, indirectly specifying a Fault Propagation B-MAC address. Up to 32 characters in length

ieee-address

Specifies a MAC address to associate with the SAP or SDP, directly specifying a Fault Propagation B-MAC address. The value should be input in either a xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

configure service ipipe sap eth-cfm collect-lmm-fc-stats fc

configure service epipe sap eth-cfm collect-lmm-fc-stats fc

Description

This command creates individual counters for the specified FCs without regard for profile. All countable packets that match a configured FC, regardless of profile, will be included in this counter.

A differential is performed when this command is re-entered. Omitted FCs will stop counting, newly added FCs will start counting, and unchanged FCs will continue to count.

Up to eight FCs may be specified. An FC that is specified as part of this command for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the same context.

The **no** form of this command removes all previously defined FCs and stops counting for those FCs.

Default

no fc

Parameters

fc-name

Specifies the name of the FC for which to create an individual profile-unaware counter. In order for the counter to be used, the **config**>**oam-pm**>**session**> **ethernet**>**priority** command must be configured with a numerical value representing the FC name (7 = NC, 6 = H1, 5 = EF, 4 = H2, 3 = L1, 2 = AF, 1 = L2, 0 = BE), and the **config**>**oam-pm**>**session**>**ethernet**>**lmm**>**enable-fc-collection** command must be enabled.

[Tree] (config>router>mpls>class-forwarding-policy fc)

Full Context

configure router mpls class-forwarding-policy fc

Description

This command configures the mapping of FCs to up to six forwarding sets for the class-based forwarding (CBF) of an LDP FEC or a BGP prefix over IGP shortcuts.

All FCs are mapped to set 1 as soon as the policy is created. The user can then make changes to the mapping of FCs as required. An FC that is not added to the class forwarding policy is thus always mapped to set 1. An FC can only be mapped to one forwarding set. One or more FCs can map to the same set. The user can indicate the initial default set by including the **default-set** option.

The default forwarding set forwards packets of an FC when all LSPs of the forwarding set that the FC maps to become operationally down. The router uses the user-configured default set as the initial default set if no default is configured; otherwise, it elects the lowest numbered set as the default forwarding set in a class forwarding policy. When the last LSP in a default forwarding set goes into an operationally down state, the router designates the next lowest numbered set as the new default forwarding set.

Parameters

{be | l2 | af | l1 | h2 | ef | h1 | nc}

Specifies the name of the forwarding class.

set-id

Specifies the class forwarding set.

Values 1 to 4 (in system profile None/A)
1 to 6 (in system profile B)

Context

[Tree] (config>router>rsvp>diffserv-te fc)

Full Context

configure router rsvp diffserv-te fc

Description

This command maps one or more system forwarding classes to a Diff-Serv Class Type (CT). The default mapping is shown in Table 38: Forwarding Classes Mapping.

Table 38: Forwarding Classes Mapping

FC ID	FC Name	FC Designation	Class Type (CT)
7	Network Control	NC	7
6	High-1	H1	6
5	Expedited	EF	5
4	High-2	H2	4
3	Low-1	L1	3
2	Assured	AF	2
1	Low-2	L2	1
0	Best Effort	BE	0

The **no** form of this command reverts to the default mapping for the forwarding class name.

Parameters

class-type *ct-number*

The Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

Values 0 to 7

fc *fc-name*

no fc

Context

[Tree] (config>mirror>mirror-dest fc)

Full Context

configure mirror mirror-dest fc

Description

This command specifies a forwarding class for all mirrored packets transmitted to the destination SAP or SDP overriding the default (be) forwarding class. All packets are sent with the same class of service to

minimize out-of-sequence issues. The mirrored packet does not inherit the forwarding class of the original packet.

When the destination is on a SAP, a single egress queue is created that pulls buffers from the buffer pool associated with the *fc-name*.

When the destination is on an SDP, the *fc-name* defines the DiffServ-based egress queue that is used to reach the destination. The *fc-name* also defines the encoded forwarding class of the encapsulation.

The FC configuration also affects how mirrored packets are treated at the ingress queuing point on the line cards. One ingress queue is used per mirror destination (service) and that is an expedited queue if the configured FC is expedited (one of nc, h1, ef or h2). The ingress mirror queues have no CIR, but a line-rate PIR.

The **no** form of this command reverts the mirror-dest service ID forwarding class to the default forwarding class.

Default

The best effort (be) forwarding class is associated with the mirror-dest service ID.

Parameters

fc-name

The name of the forwarding class with which to associate mirrored service traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error is returned and the **fc** command has no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* overrides the default forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

Platforms

no fc

Context

[Tree] (config>test-oam>ldp-treetrace fc)

Full Context

configure test-oam ldp-treetrace fc

Description

This command indicates the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. Table 39: fc Request Packet and Behavior summarizes this behavior.

Table 39: fc Request Packet and Behavior

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • pkt queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • pkt queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2}

	• exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

Default

no fc

Parameters

fc-name

Specifies the forwarding class of the MPLS echo request packets.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out}

Specifies the profile value to be used with the forwarding class specified in the **fc-name** parameter.

Context

[Tree] (config>qos>post-policer-mapping fc)

Full Context

configure qos post-policer-mapping fc

Description

This command specifies the forwarding class and profile state of an egress policed packet that is to be mapped to another forwarding class and profile, where the profile state is that of the resulting profile after the packet has been processed by the egress policer.

The new forwarding class and profile state is configured using the **maps-to** command.

The traffic remarking is based on the marking configured for the forwarding class and profile of the traffic after being policed but before it is remapped.

The **no** form of this command deletes the forwarding class and profile remapping statement, including the **maps-to** command.

Parameters

fc-name

Specifies one of the eight forwarding classes supported by the system.

Values be, l2, af, l1, h2, ef, h1, nc

profile

Specifies one of the egress packet profile states.

Values exceed, in, inplus, out

Platforms

fc

Syntax

fc *fc-name* [**create**]

no fc *fc-name*

Context

[Tree] (config>qos>sap-ingress fc)

Full Context

configure qos sap-ingress fc

Description

The **fc** command creates a class or subclass instance of the forwarding class fc-name. When the *fc-name* is created, classification actions can be applied and the subclass can be used in match classification criteria. Attempting to use an undefined subclass in a classification command will result in an execution error and the command will fail.

The **no** form of this command removes all the explicit queue mappings for *fc-name* forwarding types. The queue mappings revert to the default queues for *fc-name*. To successfully remove a subclass, all associations with the subclass in the classification commands within the policy must first be removed or diverted to another forwarding class or subclass.

Parameters

fc-name

The parameter subclass-name is optional and must be defined using a dot separated notation with a preceding valid system-wide forwarding class name. Creating a subclass follows normal naming conventions. Up to sixteen ASCII characters may be used. If the same sub-name is used with two or more forwarding class names, each is considered a different instance of subclass. A subclass must always be specified with its preceding forwarding class name. When a forwarding class is created or specified without the optional subclass, the parent forwarding class is assumed.

Within the SAP ingress QoS policy, up to 56 subclasses may be created. Each of the 56 subclasses may be created within any of the eight parental forwarding classes. When the limit of 56 is reached, any further subclass creations will fail and the subclass will not exist.

Successfully creating a subclass places the CLI within the context of the subclass for further subclass parameter definitions. Within the subclass context, commands may be executed that define subclass priority (within the parent forwarding class queue mapping), subclass color aware profile settings, subclass in-profile and out-of-profile precedence or DSCP markings.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a pre-existing subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (.). If *subclass-name* does not exist in the context of *fc-name*, an error will occur. If *subclass-name* is removed using the **no fc** *fc-name.subclass-name* **force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

Values

fc: *class*[.*subclass*]

class: be, l2, af, l1, h2, ef, h1, nc

subclass: 29 characters max

create

Required parameter when creating a SAP QoS ingress policy forwarding class.

fc

Syntax

fc *fc-name* [**create**]

no fc *fc-name*

Context

[Tree] (config>qos>sap-egress fc)

Full Context

configure qos sap-egress fc

Description

The **fc** fc-*name* node within the SAP egress QoS policy is used to contain the explicitly defined queue mapping and dot1p marking commands for *fc-name*. When the mapping for *fc-name* points to the default queue and the dot1p marking is not defined, the node for *fc-name* is not displayed in the **show configuration** or **save configuration** output unless the detail option is specified.

The **no** form of this command removes the explicit queue mapping and dot1p marking commands for *fc-name*. The queue mapping reverts to the default queue for *fc-name* and the dot1p marking (if appropriate) uses the default of 0.

Default

no fc

Parameters

fc-name

This parameter specifies that the forwarding class queue mapping or dot1p marking is to be edited. The value given for *fc-name* must be one of the predefined forwarding classes in the system.

Values be, l2, af, l1, h2, ef, h1, nc

Context

[Tree] (cfg>qos>qgrps>egr>qgrp fc)

Full Context

configure qos queue-group-templates egress queue-group fc

Description

The **fc** command is used to enter the forwarding class mapping context for the given fc-name. Each forwarding class has a default mapping depending on the egress queue group template. The system-created policer-output-queue template contains queues 1 and 2 by default with queue 1 being best-effort and queue 2 expedited. Forwarding classes be, l1, af and l2 all map to queue 1 by default. Forwarding classes h1, ef, h2 and nc all map to queue 2 by default. More queues may be created within the policer-output-queues template and the default forwarding classes may be changed to any defined queue within the template.

When all other user-defined egress queue group templates are created, only queue 1 (best-effort) exists and all forwarding classes are mapped to that queue. Other queues may be created and the forwarding classes may be changed to any defined queue within the template.

Besides the default mappings within the templates, the egress queue group template forwarding class queue mappings operate the same as the forwarding class mappings in a sap-egress QoS policy.

The template forwarding class mappings are the default mechanism for mapping egress policed traffic to a queue within an egress port queue group associated with the template. If a queue-id is explicitly specified in the QoS policy forwarding class policer mapping, and that queue exists within the queue group, the template forwarding class mapping is ignored.

On the 7450 ESS and 7750 SR, egress policed subscriber traffic works in a slightly different way. The subscriber and subscriber host support destination and organization strings are used to identify the egress port queue group. In this instance, the forwarding class mappings are always used and any queue overrides in the QoS policy are ignored. If neither string exists for the subscriber host, the egress queue group queue-id can be derived from either the QoS policy policer mapping or the template forwarding class queue mappings.

The **no** form of this command is used to return the specified forwarding class to its default template queue mapping.

Parameters

fc-name

A valid forwarding class must be specified as *fc-name* when the **fc** command is executed. When the **fc** *fc-name* command is successfully executed, the system will enter the specified forwarding class context where the **queue** *queue-id* command may be executed.

Values **be**, **l1**, **af**, **l2**, **h1**, **ef**, **h2**, **nc**

Description

This command creates individual counters for the specified FCs without regard for profile. All countable packets that match a configured FC, regardless of profile, will be included in this counter.

A differential is performed when this command is re-entered. Omitted FCs will stop counting, newly added FCs will start counting, and unchanged FCs will continue to count.

Up to eight FCs may be specified. An FC that is specified as part of this command for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the same context.

The **no** form of this command removes all previously defined FCs and stops counting for those FCs.

Default

no fc

Parameters

fc-name

Specifies the name of the FC for which to create an individual profile-unaware counter. A maximum of eight fc-names can be specified in a single statement. In order for the counter to be used, the **config**>**oam-pm**>**session**> **ethernet**>**priority** command must be configured with a numerical value representing the FC name (7 = NC, 6 = H1, 5 = EF, 4 = H2, 3 = L1, 2 = AF, 1 = L2, 0 = BE), and the **config**>**oam-pm**>**session**>**ethernet**>**lmm**>**enable-fc-collection** command must be enabled.

Values nc, h1, ef, h2, l1, af, l2, be

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

no fc

Context

[Tree] (config>router>policy-options>policy-statement>entry>action fc)

Full Context

configure router policy-options policy-statement entry action fc

Description

This command associates a forwarding-class and optionally priority with the routes matched by a route policy entry. The command takes effect when the action of the route policy entry is accept, next-entry, or next-policy. It has no effect except in route policies applied as VRF import policies, BGP import policies, or RIP import policies.

The **no** form of this command removes the QoS association of the routes matched by the route policy entry.

Default

no fc

Parameters

fc

Specify the name of one of the predefined forwarding classes in the system.

Values be, l2, af, l1, h2, ef, h1, nc

Default none (no QoS information is associated with matched routes)

priority {low | high}

This parameter associates an enqueuing priority with routes matched by the policy entry. Specifying a priority is optional.

Values **high** — Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. After the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low — Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. After the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

Default low

configure service vpls mesh-sdp eth-cfm collect-lmm-fc-stats fc-in-profile

configure service vpls sap eth-cfm collect-lmm-fc-stats fc-in-profile

Description

This command creates individual counters for the specified FCs with regard for profile. All countable packets that match a configured FC and are deemed to be in-profile will be included in this counter.

A differential is performed when this command is re-entered. Omitted FCs will stop counting, newly added FCs will start counting, and unchanged FCs will continue to count.

Up to eight FCs may be specified. An FC that is specified as part of this command for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the same context.

The **no** form of this command removes all previously defined FCs and stops counting for those FCs.

Default

no fc-in-profile

Parameters

fc-name

Specifies up to eight names of the FC for which to create an individual profile-aware counter. In order for the counter to be used, the **config**>**oam-pm**>**session**>**ethernet**>**priority** command must be configured with a numerical value representing the FC name (7 = NC, 6 = H1, 5 = EF, 4 = H2, 3 = L1, 2 = AF, 1 = L2, 0 = BE), and the **config**>**oam-pm**>**session**>**ethernet**>**lmm**>**enable-fc-collection** command must be enabled.

Values nc, h1, ef, h2, l1, af, l2, be

10.29 fcc

fcc

Syntax

fcc *percent*

Context

[Tree] (config>isa>video-group>watermark>session fcc)

[Tree] (config>isa>video-group>watermark>bandwidth fcc)

Full Context

configure isa video-group watermark session fcc

configure isa video-group watermark bandwidth fcc

Description

This command sets the watermark to trigger the SNMP trap if the FCC bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the available bandwidth is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

Default

fcc 90

Parameters

percent

Specifies the percentage of the system resources per ISA.

Values 1 to 99

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

configure mcast-management multicast-info-policy video-policy video-interface sd fcc-burst

configure mcast-management multicast-info-policy video-policy video-interface pip fcc-burst

Description

This command sets the burst rate at which the Fast Channel Change (FCC) server will send unicast data to the FCC client above the received rate to allow the client to catchup to the multicast stream.

This parameter is only applicable if the FCC server mode is **burst**.

The **no** form of the command returns the parameter to the default value.

Default

fcc-burst 25

Parameters

burst-percentage

Specifies the percentage of nominal bandwidth used to catch up to the multicast stream.

Values

HD:	0 to 100
SD and PIP:	0 to 600

Default 25

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

configure mcast-management multicast-info-policy bundle video fcc-channel-type

configure mcast-management multicast-info-policy bundle channel source-override video fcc-channel-type

configure mcast-management multicast-info-policy bundle channel video fcc-channel-type

Description

This command configures the channel type for the bundle/channel. The channel type is used in the video policy to set various Fast Channel Change (FCC) parameters including the type of FCC and various FCC rates.

The **no** form of this command returns the parameter to the default value.

Default

no fcc-channel-type

Parameters

hd

The channel type is High-Definition (HD) (Default).

sd

The channel type is Standard Definition (SD).

pip

The channel type is Picture in Picture (PIP).

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

Full Context

configure mcast-management multicast-info-policy bundle channel video fcc-min-duration

configure mcast-management multicast-info-policy bundle video fcc-min-duration

Description

This command configures the minimum time duration, in milliseconds, of the Fast Channel Change (FCC) burst. The value of this object determines the starting point of the FCC burst. If the current Group of Pictures (GOP) has less than the minimum duration worth of data, FCC burst begins from the previous GOP.

The **no** form of the command reverts to the default value.

Default

fcc-min-duration 300

Parameters

time

Specifies the FCC burst minimum duration, in milliseconds.

Values 300 to 8000

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

fcc-server

Syntax

[**no**] **fcc-server**

Context

[Tree] (config>isa>video-group fcc-server)

Full Context

configure isa video-group fcc-server

Description

This command enables the FCC server capability for the ISA video group. FCC server cannot be enabled if ad insertion or the local RET server is enabled.

FCC server parameters can be configured in a multicast information policy or a service, but the parameters will have no effect if the FCC server is disabled or if the video group is administratively disabled (shutdown).

The **no** form of the command disables the FCC server.

Default

no fcc-server

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

configure mcast-management multicast-info-policy video-policy video-interface pip fcc-server

configure mcast-management multicast-info-policy video-policy video-interface sd fcc-server

Description

This command enables the Fast Channel Change (FCC) server and sets the mode to send the FCC unicast stream.

The mode indicates how the FCC server will send information to the client. When **burst** is specified, the FCC server will send the channel at a nominally faster rate than the channel was received based on the applicable fcc-burst setting. When **dent** is specified, the FCC server will selectively discard frames from the

original stream based on the applicable dent-threshold setting. If no mode is specified, burst is the default mode.

The **no** form of the command disables the FCC server at that context and subordinate contexts.

Default

no fcc-server

Parameters

mode burst

Sets the mode of the FCC server to burst when sending the channel to the FCC client.

mode dent

Sets the mode of the FCC server to dent when sending the channel to the FCC client.

mode hybrid

Combines the burst and dent modes.

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

Full Context

configure mcast-management multicast-info-policy bundle channel video fcc-server

configure mcast-management multicast-info-policy bundle channel source-override video fcc-server

configure mcast-management multicast-info-policy bundle video fcc-server

Description

This command enables Fast Channel Change (FCC) for a multicast bundle or channel. Additional parameters such as **fcc-channel-type** should also be configured to match the characteristics of the bundle/channel.

The **no** form of the command disables removes the FCC configuration for the bundle/channel context and implies the setting is inherited from a higher context or the default policy.

Default

no fcc-server

Parameters

disable

Explicitly disables the FCC server within the policy. For the default bundle within the default multicast information policy, the **no** form of the command and the **disable** keyword have the same meaning and imply that the server is disabled.

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

Syntax

fdb-table-size *table-size*

no fdb-table-size

Context

[Tree] (config>service>system fdb-table-size)

Full Context

configure service system fdb-table-size

Description

This command configures the maximum system FDB table size, which is dependent on the chassis type. CPMs with at least 16 GB of memory are required when exceeding 500k MAC addresses in a system. The table size cannot be reduced below its default value, which is also chassis-dependent.

The maximum system FDB table size also limits the maximum FDB table size of any card within the system.

The **no** version of this command sets the table size to its default.

The command default depends on the chassis type and available memory.

Parameters

table-size

Specifies the maximum system FDB table size.

Values 255999 to 2047999

Platforms

All

10.42 fec

fec

Syntax

fec {**g709** | **enhanced**}

no fec

Context

[Tree] (config>port>otu fec)

Full Context

configure port otu fec

Description

This command enables the Forwarding Error Correction (FEC) encoder/decoder and specifies the FEC encoder/decoder mode to use when enabled.

The following rules must be followed:

- The port's OTU must be enabled to set or change the FEC mode.
- The port must be shut down before changing the FEC mode.
- The sf-sd-method must be changed to BIP8 before setting the FEC mode to disabled.

Note that FEC cannot be disabled on OTU3 encapsulated OC768 or 40-Gigabit Ethernet by the **no fec** command. Therefore, the default depends on the port type. The default for OTU3 encapsulated OC768 or 40-Gigabit Ethernet is **fec enhanced**.

The **no** form of this command disables FEC encoder and decoder.

Default

no fec

Parameters

enhanced

Enables the FEC encoder and decoder with a proprietary enhanced FEC algorithm.

g709

Enables the FEC encoder and decoder with the standard G.709 FEC algorithm.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fec-limit

Syntax

fec-limit *limit* [**log-only**] [**threshold** *percentage*]

no fec-limit

Context

[Tree] (config>router>ldp>session-params>peer fec-limit)

Full Context

configure router ldp session-parameters peer fec-limit

Description

This command configures a limit on the number of FECs which an LSR will accept from a given peer and add into the LDP label database. The limit applies to the aggregate count of all FEC types including service FEC. Once the limit is reached, any FEC received will be released back to the peer. This behavior is different from the per-peer import policy which will still accept the FEC into the label database but will not resolve it.

When the FEC limit for a peer is reached, the LSR performs the following actions:

1. Generates a trap and a syslog message.
2. Generates a LDP notification message with the LSR overload status TLV, for each LDP FEC type including service FEC, to this peer only if this peer advertised support for the LSR overload sub-TLV via the LSR Overload Protection Capability TLV at session initialization.
3. Releases, with LDP Status Code of "No_Label_Resources", any new FEC, including service FEC, from this peer which exceeds the limit.

If a legitimate FEC is released back to a peer, while the FEC limit was exceeded, the user must have a means to replay that FEC back to the router LSR once the condition clears. This is done automatically if the peer is an SR OS-based router and supports the LDP overload status TLV (SR OS 11.0R5 and higher). Third-party peer implementations must support the LDP overload status TLV or provide a manual command to replay the FEC.

The **threshold** option allows to set a threshold value when a trap and an syslog message are generated as a warning to the user in addition to when the limit is reached. The default value for the threshold when not configured is 90%.

The **log-only** option causes a trap and syslog message to be generated when reaching the threshold and limit. However, LDP labels are not released back to the peer.

If the user decreases the limit value such that it is lower than the current number of FECs accepted from the peer, the LDP LSR raises the trap for exceeding the limit. In addition, it will set overload for peers which signaled support for LDP overload protection capability TLV. However, no existing resolved FECs from the peer which does not support the overload protection capability TLV should be de-programmed or released.

A different trap is released when crossing the threshold in the upward direction, when reaching the FEC limit, and when crossing the threshold in the downward direction. However the same trap will not be generated more often than 2 minutes apart if the number of FECs oscillates around the threshold or the FEC limit.

Default

no fec-limit

Parameters

limit

Specifies the aggregate count of FECs of all types which can be accepted from this LDP peer.

log-only

Specifies that only a trap and syslog message are generated when reaching the threshold and limit. However, LDP labels are not released back to the peer.

percentage

Specifies the threshold value (as a percentage) that triggers a warning syslog message and trap to be sent.

no fec-originate *ip-prefix/mask* **next-hop** *ip-address* **interface interface-name**

no fec-originate *ip-prefix/mask* **pop**

Context

[Tree] (config>router>ldp fec-originate)

Full Context

configure router ldp fec-originate

Description

This command defines a way to originate a FEC (with a swap action) for which the LSR is not egress, or to originate a FEC (with a pop action) for which the LSR is egress.

Parameters

ip-prefix/mask

Specifies information for the specified IP prefix and mask length.

Values

ipv4-prefix - a.b.c.d	
ipv4-prefix-le - [0..32]	
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
	ipv6-prefix-le - [0..128]

next-hop

Specifies the IP address of the next hop of the prefix.

advertised-label

Specifies the label advertised to the upstream peer. If not configured, then the label advertised should be from the label pool. If the configured static label is not available then the IP prefix is not advertised.

out-label

Specifies the LSR to swap the label. If configured, then the LSR should swap the label with the configured swap-label. If not configured, then the default action is pop if the next-hop parameter is not defined.

The next-hop, advertised-label, swap-label parameters are all optional. If next-hop is configured but no swap label specified, it will be a swap with label 3, such as, pop and forward to the next-hop. If the next-hop and swap-label are configured, then it is a regular swap. If no parameters are specified, a pop and route is performed.

Values 16 to 1048575

in-label

Specifies the number of labels to send to the peer associated with this FEC.

Values 32 to 1023

pop

Specifies to pop the label and transmit without the label.

interface *interface-name*

Specifies the name of the interface the label for the originated FEC is swapped to. For an unnumbered interface, this parameter is mandatory since there is no address for the next-hop. For a numbered interface, it is optional.

Syntax

[**no**] **fec-prefix** *ip-prefix*[*mask*]

Context

[Tree] (config>router>ldp>egr-stats fec-prefix)

Full Context

configure router ldp egress-statistics fec-prefix

Description

This command configures statistics in the egress data path at the ingress LER or LSR for an LDP FEC. The user must execute the **no shutdown** command for this command to effectively enable statistics. The egress data path counters will be updated for both originating and transit packets. Originating packets may be service packets or IP user and control packets forwarded over the LDP LSP when used as an IGP shortcut. Transit packets of the FEC which are label switched on this node.

When ECMP is enabled and multiple paths exist for a FEC, the same set of counters are updated for each packet forwarded over any of the NHLFEs associated with this FEC and for as long as this FEC is active.

The statistics can be enabled on prefix FECs imported from both LDP neighbors and T-LDP neighbors (LDP over RSVP). LDP sets up egress statistics collection for the LDP tunnels whose FECs match the exact prefix specified in this command. Service FECs, that is, FEC 128 and FEC 129, are not valid. LDP FEC egress statistics are collected at the Penultimate-Popping Hop (PHP) node for a LDP FEC using an implicit null egress label.

The **no** form of this command disables the statistics in the egress data path and removes the accounting policy association from the LDP FEC.

Parameters

ip-prefix

Specifies the IP address representing the FEC.

Values			
	IPv4 prefix:	*a.b.c.d*	*a*, *b*, *c*, *d* - 0 to 255; decimal
	IPv6 prefix:	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)	*x* - 0 to FFFF; hexadecimal
		x:x:x:x:x:x:d.d.d.d	

mask

Specifies the mask of the IP address.

Values IPv4: 0 to 32

IPv6: 0 to 128

field

Syntax

[**no**] **field** *field-name*

Context

[Tree] (config>app-assure>group>http-enrich field)

Full Context

configure application-assurance group http-enrich field

Description

This command specifies the fields to insert into the HTTP header. The command must be repeated for each field to be inserted. The same field cannot be inserted twice into the header under different header names.

Note:
AA can insert two copies of the following fields in the same HTTP header (with a different header name): **imei-hyphenated**, i**mei-hyphenated-2**, **imsi**, **imsi-2**, **static-string**, **static-string-2**, **user-location-raw**, and **user-location-raw2**.

The **no** form of this command removes the specified field so that it is not inserted into the HTTP header.

Parameters

field-name

Specifies the fields to insert into the HTTP header.

Values The following parameters are supported in any deployment:

- **static-string** — header name for the inserted string
- **static-string-2** — header name for the inserted string
- **subscriber-id** — header name for the subscriber ID
- **subscriber-ip** — header name for the subscriber IP address

The following parameters are supported in Fixed Wireless Access (FWA) deployments only:

- **apn** — APN used by the UE
- **apn-ni** — APN Network Identifier (APN-NI) used by the UE
- **billing-type** — UE charging type (charging characteristics)
- **dynamic-acr** — dynamic Anonymous Customer Record (ACR)
- **static-acr** — static ACR
- **imei-sv** — subscriber IMEI with format AABBBBBBCCCCCCEE
- **imei-hyphenated** — subscriber IMEI with format AABBBBBB-CCCCCC-EE
- **imei-hyphenated-2** — subscriber IMEI with format AABBBBBB-CCCCCC-EE
- **imsi** — subscriber IMSI
- **imsi-2** — subscriber IMSI
- **msisdn** — subscriber MSISDN

- **msisdn-ts** — subscriber MSISDN appended with the UNIX timestamp
- **msisdn-without-cc** — subscriber MSISDN without a country code
- **pgw_ggsn-address** — PGW/GGSN address serving the UE
- **plmn-id** — Public Land Mobile Network (PLMN) ID of the SGSN/MME
- **rat-type** — Radio Access Technology (RAT) type
- **timestamp** — timestamp inserted in UNIX time format Example: 1531204313
- **user-location** — UE LOCATION (ULI)
- **user-location-3gpp** — ULI encoded as defined in 3GPP 29.061
- **user-location-raw** — ULI in raw format <ULI-TYPE1>[+<ULI-TYPE2>]=<ULI HEX>

  Example: x-locinfo: TAI+ECGI=1300622c46130062014adf16
- **user-location-raw-2** — ULI in raw format <ULI-TYPE1>[+<ULI-TYPE2>]=<ULI HEX>

  Example: x-locinfo: TAI+ECGI=1300622c46130062014adf16

Full Context

file

Description

Specifies the context to enter and perform file system operations. When entering the **file** context, the prompt changes to reflect the present working directory. Navigating the file system with the **cd ..** command results in a changed prompt.

The **exit all** command leaves the file system/file operation context and returns to the operational root CLI context. The state of the present working directory is maintained for the CLI session. Entering the **file** command returns the cursor to the working directory where the **exit** command was issued.

Platforms

All

10.54 file-id

file-id

Syntax

[**no**] **file-id** *file-id* [**name** *file-policy-name*]

Context

[Tree] (config>log file-id)

Full Context

configure log file-id

Description

This command creates the context to configure a file policy that is used as the destination for an event log or billing (accounting) file.

This command defines the file location and characteristics that are to be used as the destination for a log event message stream or accounting/billing information. The file defined in this context is subsequently specified in the **to** command under **log-id** or **accounting-policy** to direct specific logging or billing source streams to the file destination.

A file policy can only be assigned to either *one* **log-id** or *one* **accounting-policy**. It cannot be reused for multiple instances. A file policy and associated file definition must exist for each log and billing file that must be stored in the file system.

A file is created when the file policy defined in this command is selected as the destination type for a specific log or accounting record. Log files are collected in a "log" directory. Accounting files are collected in an "act" directory.

The file names for a log are created by the system as summarized in Table 40: Log File Names.

Table 40: Log File Names

File Type	File Name
Log File	log*llff-timestamp*
Accounting File	act*aaff-timestamp*

Where:

- *ll* is the *log-id*
- *aa* is the accounting *policy-id*
- *ff* is the file-id
- The *timestamp* is the actual timestamp when the file is created. The format for the timestamp is *yyyymmdd-hhmmss* where:
  - *yyyy* is the year (for example, 2006)
  - *mm* is the month number (for example, 12 for December)
  - *dd* is the day of the month (for example, 03 for the 3rd of the month)
  - *hh* is the hour of the day in 24 hour format (for example, 04 for 4 a.m.)
  - *mm* is the minutes (for example, 30 for 30 minutes past the hour)
  - *ss* is the number of seconds (for example, 14 for 14 seconds)
- The accounting file is compressed and has a gz extension.

When initialized, each file contains:

- The *log-id* description.
- The time the file was opened.
- The reason the file was created.
- If the event log file was closed properly, the sequence number of the last event stored on the log is recorded.

If the process of writing to a log file fails (for example, the compact flash card is full) and if a backup location is not specified or fails, the log file will not become operational even if the compact flash card is replaced. Enter either a **clear log** command or a **shutdown/no shutdown** command to reinitialize the file.

If the primary location fails (for example, the compact flash card fills up during the write process), a trap is sent and logging continues to the specified backup location. This can result in truncated files in different locations.

The **no** form of this command removes the file policy from the configuration. A file policy can only be removed from the configuration if the policy is not the designated output for a log destination. The actual log or accounting file remain on the file system when a file policy is deleted.

Parameters

file-id

The file identification number for the file policy, expressed as a decimal integer.

Values 1 to 99

name file-policy-name

Configures an optional file policy name, up to 64 characters, that can be used to refer to the file policy after it is created. If the name begins with a numerical digit (from 1 to 9), the name is a number from 1 to 99.

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry file-transmission-profile

Description

This command specifies the file-transmission-profile for the **url-entry**. When the system downloads a CRL from the configured URL in the **url-entry** it will use the transportation parameter configured in the **file-transmission-profile**. **auto-crl-update** supports Base/Management/VPRN routing instance. **vpls-management** is not supported. In case of VPRN, the HTTP server port can only be 80 or 8080.

The **no** form of this command removes the specified profile name.

Default

no file-transmission-profile

Parameters

profile-name

Specifies the name of the file transmission profile to be matched up to 32 characters. The profile name is configured in the **config>system>file-transmission-profile** context.

Platforms

All

10.58 file-url

file-url

Syntax

file-url *file-url*

no file-url

Context

[Tree] (config>mirror>mirror-dest>pcap file-url)

Full Context

configure mirror mirror-dest pcap file-url

Description

This command specifies a file URL for the FTP or TFTP server, including the filename for packet capture transfer. After the file URL is entered, the system attempts to establish a connection and creates a file using the filename specified. The command prompt displays an error and rejects the file URL if the session establishment fails, if write privilege to remote server fails, or if the session experiences a sudden termination. If the FTP or TFTP server is unreachable, the command prompt is halted for further input until the retires are timed out after 24 seconds (after four attempts of about six seconds each). This command overwrites any file on the FTP or TFTP server with the same filename.

The **no** form of this command removes the *file-url* instance and stops the packet capture and file transfer session.

Parameters

file-url

Specifies the URL for the file to direct the search.

Values [*local-url* | *remote-url*]

where:

- *local-url* — [*cflash-id/*] [*file-path*]
  180 chars max, including *cflash-id*
  directory length 99 chars max each

- *remote-url* — [{ftp://| tftp://} *login*:*pswd*@*remote-locn*/][*file-path*]
  180 chars max
  directory length 99 chars max each
  where: *remote-locn* — [*hostname* | *ipv4-address* | *ipv6-address*]

configure service vprn interface spoke-sdp ingress filter

configure service vprn network-interface egress filter

configure service vprn redundant-interface spoke-sdp ingress filter

configure service vprn redundant-interface spoke-sdp egress filter

configure service vprn interface spoke-sdp egress filter

Description

This command associates an IP filter policy with an ingress or egress Service Access Point (SAP) or IP interface. An IP filter policy can be associated with spoke SDPs. Filter policies control the forwarding and dropping of packets based on IP or MAC matching criteria.

The filter command is used to associate a filter policy with a specified ip-filter-id with an ingress or egress SAP. The ip-filter-id must already be defined before the filter command is executed. If the filter policy does not exist, the operation fails and an error message returned.

In general, filters applied to SAPs (ingress or egress) apply to all packets on the SAP. One exception is non-IP packets are not applied to IP match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use scope command within the filter definition to change the scope to local or global. The default scope of a filter is local.

Parameters

ip *ip-filter-id*

Specifies IP filter policy. The filter ID must already exist within the created IP filters.

Values 1 to 65535

Description

This command associates a filter policy with an ingress or egress Service Access Point (SAP). Filter policies control the forwarding and dropping of packets based on the matching criteria. MAC filters are only allowed on Epipe and Virtual Private LAN Service (VPLS) SAPs.

The **filter** command is used to associate a filter policy with a specified *ip-filter-id* or *ipv6-filter-id* (7750 SR) with an ingress or egress SAP. The filter policy must already be defined before the **filter** command is executed. If the filter policy does not exist, the operation fails and an error message returned.

In general, filters applied to SAPs (ingress or egress) apply to all packets on the SAP. One exception is non-IP packets are not applied to the match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

Parameters

ip *ip-filter-id*

Specifies the ID for the IP filter policy and corresponds to a previously created IP filter policy in the **config>filter>ip-filter** context.

Values 1 to 65535

ipv6 *ipv6-filter-id*

Specifies the IPv6 filter policy. The filter ID must already exist within the created IPv6 filters.

Values 1 to 65535

mac *mac-filter-id*

Specifies the MAC filter policy. The specified filter ID must already exist within the created MAC filters. The filter policy must already exist within the created MAC filters.

Description

This command associates an IP filter policy or MAC filter policy with an ingress or egress Service Access Point (SAP) or IP interface.

Filter policies control the forwarding and dropping of packets based on IP or MAC matching criteria. There are two types of filter policies: IP and MAC. Only one type may be applied to a SAP at a time.

The **filter** command is used to associate a filter policy with a specified *filter ID* with an ingress or egress SAP. The *filter ID* must already be defined before the **filter** command is executed. If the filter policy does not exist, the operation will fail and an error message returned.

In general, filters applied to SAPs (ingress or egress) apply to all packets on the SAP. One exception is non-IP packets are not applied to IP match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

Parameters

ip *ip-filter-id*

Specifies IP filter policy. The filter ID must already exist within the created IP filters.

Values 1 to 65535

ipv6 *ipv6-filter-id*

Specifies the IPv6 filter policy. The filter ID must already exist within the created IPv6 filters.

Values 1 to 65535

mac *mac-filter-id*

Specifies the MAC filter policy. The specified filter ID must already exist within the created MAC filters. The filter policy must already exist within the created MAC filters.

Full Context

configure service ies interface spoke-sdp ingress filter

configure service ies interface spoke-sdp egress filter

Description

This command associates an IP filter policy filter policy with an ingress or egress spoke SDP.

Filter policies control the forwarding and dropping of packets based on matching criteria.

MAC filters are only allowed on Epipe and Virtual Private LAN Service (VPLS) SAPs.

The **filter** command is used to associate a filter policy with a specified *ip-filter-id* with an ingress or egress spoke SDP. The *ip-filter-id* must already be defined in the **config>filter** context before the **filter** command is executed. If the filter policy does not exist, the operation fails and an error message returned.

In general, filters applied to SAPs or spoke SDPs (ingress or egress) apply to all packets on the SAP or spoke SDPs. One exception is non-IP packets are not applied to IP match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

Parameters

ip

Keyword indicating the filter policy is an IP filter.

ip-filter-id

The filter name acts as the ID for the IP filter policy. Allowed values are an integer in the range of 1 and 65535 that corresponds to a previously created IP filter policy. The filter ID must already exist within the created IP filters.

Context

[Tree] (config>service>vprn>log filter)

[Tree] (config>service>vprn>log>log-id filter)

Full Context

configure service vprn log filter

configure service vprn log log-id filter

Description

This command creates a context for an event filter. An event filter specifies whether to forward or drop an event or trap based on the match criteria.

Filters are configured in the **filter** *filter-id* context and then applied to a log in the **log-id** *log-id* context. Only events for the configured log source streams destined to the log ID where the filter is applied are filtered.

Changes made to an existing filter using any of the sub-commands are immediately applied to the destinations where the filter is applied.

By default, no event filters are defined. Event filters must be explicitly configured.

The **no** form of this command removes the filter association from log IDs, which causes those logs to forward all events.

Default

No event filters are defined.

Parameters

filter-id

Specifies the unique filter ID.

Values 1 to 1500

name filter-name

Configures an optional filter name, up to 64 characters, that can be used to refer to the filter after it is created.

Platforms

Description

This command adds an event filter policy with the log destination.

The **filter** command is optional. If no event filter is configured, all events, alarms and traps generated by the source stream will be forwarded to the destination.

An event filter policy defines (limits) the events that are forwarded to the destination configured in the log-id. The event filter policy can also be used to select the alarms and traps to be forwarded to a destination **snmp-trap-group**.

The application of filters for debug messages is limited to application and subject only.

Accounting records cannot be filtered using the **filter** command.

Only one filter-id can be configured per log destination.

The **no** form of this command removes the specified event filter from the *log-id*.

Parameters

filter-id

Specifies the event filter policy ID used to associate the filter with the *log-id* configuration. The event filter policy ID must already be defined in **config>log>filter** *filter-id*.

Values 1 to 1000

Platforms

All

Syntax

filter ip *ip-filter-id*

filter ipv6 *ipv6-filter-id*

no filter [**ip** *ip-filter-id*] [**ipv6** *ipv6-filter-id*]

Context

[Tree] (config>router>if>egress filter)

[Tree] (config>router>if>ingress filter)

Full Context

configure router interface egress filter

configure router interface ingress filter

Description

This command associates an IP filter policy with an IP interface.

Filter policies control packet forwarding and dropping based on IP match criteria.

The *ip-filter-id* must have been preconfigured before this **filter** command is executed. If the filter ID does not exist, an error occurs.

Only one filter ID can be specified.

The **no** form of this command removes the filter policy association with the IP interface.

Default

no filter

Parameters

ip-filter-id

The filter name acts as the ID for the IP filter policy expressed as a decimal integer. The filter policy must already exist within the **config>filter>ip** context.

Values 1 to 16384

ipv6-filter-id

The filter name acts as the ID for the IPv6 filter policy expressed as a decimal integer. The filter policy must already exist within the **config>filter>ipv6** context. This parameter only applies to the 7750 SR and 7950 XRS.

Values 1 to 65535

Platforms

Context

[Tree] (config>service>pw-template>ingress filter)

[Tree] (config>service>pw-template>egress filter)

Full Context

configure service pw-template ingress filter

configure service pw-template egress filter

Description

This command associates an IP filter policy or MAC filter policy on egress or ingress. Filter policies control the forwarding and dropping of packets based on IP or MAC matching criteria. There are two types of filter policies: IP and MAC. Only one type may be applied to a SAP at a time.

The **filter** command is used to associate a filter policy with a specified *filter ID* with an ingress or egress SAP. The *filter ID* must already be defined before the **filter** command is executed. If the filter policy does not exist, the operation will fail and an error message returned.

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **filter-name** command can be used in all configuration modes.

This command is mutually exclusive with the **filter-name** command. Only one or the other can be configured.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

Parameters

ip-filter-id

Specifies the IP filter policy.

Values 1 to 65535

ipv6-filter-id

Specifies the IPv6 filter policy.

Values 1 to 65535

mac-filter-id

Specifies the MAC filter policy.

Values 1 to 65535

Platforms

All

filter

Syntax

filter *filter-id* [**name** *filter-name*]

no filter *filter-id*

Context

[Tree] (config>log filter)

Full Context

configure log filter

Description

This command creates a context for an event filter. An event filter specifies whether to forward or drop an event or trap based on the match criteria.

Filters are configured in the **filter** *filter-id* context and then applied to a log in the **log-id** *log-id* context. Only events for the configured log source streams destined to the log ID where the filter is applied are filtered.

Changes made to an existing filter using any of the sub-commands are immediately applied to the destinations where the filter is applied.

By default, no event filters are defined. Event filters must be explicitly configured.

The **no** form of this command removes the filter association from log IDs, which causes those logs to forward all events.

Parameters

filter-id

Specifies the unique filter ID.

Values 1 to 1500

name filter-name

Configures an optional filter name, up to 64 characters, that can be used to refer to the filter after it is created.

Platforms

All

filter

Syntax

filter *filter-id*

no filter

Context

[Tree] (config>log>log-id filter)

Full Context

configure log log-id filter

Description

This command adds an event filter policy with the log destination.

The **filter** command is optional. If an event filter is not configured, all events, alarms and traps generated by the source stream will be forwarded to the destination.

An event filter policy defines (limits) the events that are forwarded to the destination configured in the log-id. The event filter policy can also be used to select the alarms and traps to be forwarded to a destination **snmp-trap-group**.

The application of filters for debug messages is limited to application and subject only.

Accounting records cannot be filtered using the **filter** command.

Only one filter ID can be configured per log destination.

The **no** form of this command removes the specified event filter from the *log-id*.

Parameters

filter-id

Specifies the event filter policy ID is used to associate the filter with the *log-id* configuration. The event filter policy ID must already be defined in **config>log>filter** *filter-id*.

no filter-id-range

Context

[Tree] (config>filter>md-auto-id filter-id-range)

Full Context

configure filter md-auto-id filter-id-range

Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to filters that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A filter created with an explicitly-specified ID cannot use an ID in this range. In classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>filter md-auto-id** command for further details.

Default

no filter-id-range

Parameters

start *filter-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

Values 1 to 2147483647

end *filter-id*

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

Values 1 to 2147483647

configure filter ip-exception filter-name

Description

This command configures filter-name attribute of a given filter. filter-name, when configured, can be used instead of filter ID to reference the given policy in the CLI.

Default

no filter-name

Parameters

filter-name

Specifies a string up to 64 characters in length that uniquely identifies this filter policy.

The following restrictions apply to the *filter-name*:

- Policy names may not begin with a number (0-9).
- Policy names may not begin with the underscore "_" character (e.g. _myPolicy). Names that start with underscore are reserved for system generated names.
- "fSpec-x" (where x is any number) cannot be used as a user defined filter name.

Full Context

configure service pw-template egress filter-name

configure service pw-template ingress filter-name

Description

This command associates an IP filter policy or MAC filter policy on egress or ingress. Filter policies control the forwarding and dropping of packets based on IP or MAC matching criteria. There are two types of filter policies: IP and MAC. Only one type may be applied to a SAP at a time.

The **filter-name** command is used to associate a filter policy with a specified *filter name* with an ingress or egress SAP. The *filter name* must already be defined before the **filter-name** command is executed. If the filter policy does not exist, the operation will fail and an error message returned.

This command is mutually exclusive with the **filter** command. Only one or the other can be configured.

The **no** form of this command removes any configured filter name association with the SAP or IP interface. The filter name itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter name and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

Parameters

ip-name

Specifies the IP filter policy. The filter name must already exist within the created IP filters, up to 64 characters.

ipv6-name

Specifies the IPv6 filter policy. The filter name must already exist within the created IPv6 filters, up to 64 characters.

mac-name

Specifies the MAC filter policy. The specified filter name must already exist within the created MAC filters. The filter policy must already exist within the created MAC filters, up to 64 characters.

10.72 flags-tlv

flags-tlv

Syntax

[no] flags-tlv

Context

[Tree] (config>router>fad>flex-algo flags-tlv)

Full Context

configure router flexible-algorithm-definitions flex-algo flags-tlv

Description

This command advertises the FAD Flags TLV to provide additional context on how the router must run a constrained SPF (cSPF). The IETF definition includes only the M-flag for use in the FAD Flags TLV. When it is set, the M-flag specifies the use of a Flex-Algorithm specific prefix metric. The M-flag is important for inter-area or inter-domain routing support with Flex-Algorithms.

When a router advertises a FAD, it is optional to advertise the FAD Flags TLV. However, when a FAD that includes the FAD Flags TLV is received, then the router must decode the flags before participating in the Flex-Algorithm.

By default, the following considerations apply to the FAD Flags TLV.

- SR OS sets the M-flag and advertises the FAD Flags TLV.
- When a FAD Flags TLV is received, SR OS decodes the flags and modifies the cSPF computation based upon the M-flag status.

The **no** form of this command prevents the advertisement of the FAD Flags TLV within a FAD.

Default

flags-tlv

10.73 flex-algo

flex-algo

Syntax

flex-algo *flex-algo*

no flex-algo

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop flex-algo)

Full Context

configure router static-route-entry indirect tunnel-next-hop flex-algo

Description

This command instructs the tunnel towards the indirect static-route next-hop to use the specified flexible algorithm.

It is assumed that the router using this command is participating in the flexible algorithm. This command instructs the router to lookup the indirect next-hop using flexible algorithm tunnels. If flexible algorithm aware tunnel to the indirect next-hop does not exist, then the static-route is not activated.

The expected outcome of this command is that when the router receives an IP payload packet, that it is steered towards the indirect next-hop using a flexible algorithm aware segment-routing tunnel if such tunnel exists. If such tunnel does not exist, then the route is not active, and the received IP packet will be dropped, if no other Longest Prefix Match (LPM) route exists.

If the *flex-algo* parameter is specified, the resolution filter can only use matching flexible algorithm-aware segment routing tunnels created by flexible algorithm-aware routing protocols (for example, SR IS-IS).

The **no** form of this command disables flexible algorithm-aware indirect next-hop resolution.

Default

no flex-algo

Parameters

flex-algo

Configures or deconfigures tunnel-next-hop flexible algorithm for resolving indirect static-route-entry.

Values 128 to 255

Platforms

All

flex-algo

Syntax

flex-algo *fad-name* [**create**]

no flex-algo *fad-name*

Context

[Tree] (config>router>fad flex-algo)

Full Context

configure router flexible-algorithm-definitions flex-algo

Description

This command configures the definition context for a Flexible Algorithm Definition (FAD). Parameters, including the FAD priority, metric type, links to construct a flexible algorithm topology graph, and a description of the algorithm. Up to 256 local FADs can be configured on a router.

The FAD configuration parameters are grouped using the *fad-name* as the reference anchor. When an IGP is configured to use and advertise a local configured FAD, the *fad-name* is used as the reference anchor.

The **no** form of this command deletes the configured parameters and removes the defined FAD.

Default

no flex-algo

Parameters

fad-name

Specifies the name of the flexible algorithm, up to 32 characters, that is used as reference anchor for the configured parameters.

create

Specifies the mandatory keyword to create a router instance.

Context

[Tree] (config>app-assure>group>policy>aqp>entry>match flow-attribute)

Full Context

configure application-assurance group policy app-qos-policy entry match flow-attribute

Description

This command configures a flow attribute to use as match criteria.

The **no** form of this command reverts to the default value.

Default

no flow-attribute

Parameters

flow-attribute-name

Specifies the name of the flow attribute, up to 256 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

flow-attribute

Syntax

[**no**] **flow-attribute** *flow-attribute-name*

Context

[Tree] (config>isa>aa-grp flow-attribute)

Full Context

configure isa application-assurance-group flow-attribute

Description

This command enables the specified flow attribute.

The **no** form of this command disables the attribute.

Parameters

flow-attribute-name

Specifies the name of the flow attribute, up to 256 characters.

Values

video	This attribute specifies streaming or real-time video media traffic transferred between a sender and receiver. It does not differentiate adaptive and nonadaptive video streaming. Assigned to flows based on packet payload inspection (many protocols) or behavioral mechanisms, and may be used together with the RTC attribute to identify video call traffic.
abr_service	This attribute is assigned to adaptive bit rate traffic exchanges where the traffic rate or behavior can be automatically adjusted based on changes in network conditions. Assigned by application filter configuration or by behavioral mechanisms.
audio	This attribute is assigned to streaming or real-time audio media traffic transferred between a sender and

	receiver. Assigned to flows based on packet payload inspection or behavioral mechanisms, and may be used together with the RTC attribute to identify voice call traffic.
encrypted	This attribute is assigned to traffic exchanges where the initial payload or the entirety of the exchange is encrypted. Assigned to sessions based on packet payload inspection or by behavioral mechanisms.
download	This attribute is assigned to traffic that has a high likelihood of exchanging data predominantly in the network to subscriber direction over the lifetime of a session. May be assigned to sessions based on behavioral mechanisms.
upload	This attribute is assigned to traffic that has a high likelihood of exchanging data predominantly in the subscriber to network direction over the lifetime of the session. The upload and download attributes are mutually exclusive. Assigned to sessions based on behavioral mechanisms.
real_time_ communication	This attribute is assigned to traffic that provides a low latency or real-time exchange of information between two or more communicating endpoints. Assigned by packet payload inspection of an RTP protocol being used or by behavioral mechanisms.
esni	This attribute is assigned to traffic that uses an encrypted server name indication (eSNI), as part of the TLS layer negotiation

[Tree] (config>app-assure>group>policer flow-count)

Full Context

configure application-assurance group policer tod-override flow-count

configure application-assurance group policer flow-count

Description

This command configures the flow count for the flow-count-limit policer. It is recommended to configure flow count subscriber-level policer for AA subscribers to ensure fair usage of flow resources between AA subscribers.

Default

no flow-count

Parameters

flow-count

Specifies the flow count for the flow-count-limit policer.

Values 0 to 100000000, **max**

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.80 flow-count-limit

flow-count-limit

Syntax

flow-count-limit *policer-name* [**event-log** *event-log-name*]

no flow-count-limit

Context

[Tree] (config>app-assure>group>policy>aqp>entry>action flow-count-limit)

Full Context

configure application-assurance group policy app-qos-policy entry action flow-count-limit

Description

This command assigns an existing flow count limit policer as an action on flows matching this AQP entry.

The match criteria for the AQP entry must specify a uni-directional traffic direction before a policer action can be configured. If a policer is used in one direction in an AQP match entry the same policer name cannot be used by another AQP entry which uses a different traffic direction match criteria.

When multiple policers apply to a single flow, the final action on a packet is the worst case of all policer outcomes (for example, if one of the policers marks packet out of profile, the final marking will reflect that).

The **no** form of this command removes this flow policer from actions on flows matching this AQP entry.

Default

no flow-count-limit

Parameters

policer-name

Specifies the name of the existing flow setup rate policer for this application assurance profile. The *policer-name* is configured in the **config>app-assure>group>policer** context.

event-log-name

Specifies the name of the event log used when event logging is enabled, up to 32 characters, which is used when event logging is enabled.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.81 flow-label

flow-label

Syntax

flow-label *flow-label* [*mask*]

no flow-label

Context

[Tree] (config>filter>ipv6-filter>entry>match flow-label)

Full Context

configure filter ipv6-filter entry match flow-label

Description

This command configures the flow-label and optional mask match condition.

The **no** form of the command reverts to the default.

Default

no flow-label

Parameters

flow-label

Specifies the flow label to be used as a match criterion. Value can be expressed as a decimal integer, as well as in hexadecimal or binary format. The following value shows decimal integer format only.

Values 0 to 1048575

mask

Specifies the flow label mask value for this policy IPv6 Filter entry. Value can be expressed as a decimal integer, as well as in hexadecimal or binary format. The following value shows decimal integer format only.

Values 0 to 1048575

Platforms

All

flow-label

Syntax

flow-label *value*

no flow-label

Context

[Tree] (config>system>security>mgmt-access-filter>ipv6-filter>entry flow-label)

Full Context

configure system security management-access-filter ipv6-filter entry flow-label

Description

This command configures flow label match conditions. Flow labeling enables the labeling of packets belonging to particular traffic flows for which the sender requests special handling, such as non-default quality of service or real-time service. This command only applies to the 7750 SR and 7950 XRS.

Parameters

value

Specifies the flow identifier in an IPv6 packet header that can be used to discriminate traffic flows (See RFC 3595, *Textual Conventions for IPv6 Flow Label*.)

Values 0 to 1048575

Platforms

All

flow-label

Syntax

configure application-assurance group cflowd comprehensive flow-rate2

configure application-assurance group cflowd tcp-performance flow-rate2

Description

This command specifies the per-flow second sampling rate for the cflowd export of Application Assurance performance statistics.

The **no** form of this command reverts to the default.

Default

no flow-rate2

Parameters

sample-rate

Specifies the rate at which to sample flows that are eligible for TCP and/or RTP performance measurement.

Values 1 to 1000

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.86 flow-setup-direction

flow-setup-direction

Syntax

flow-setup-direction {**subscriber-to-network** | **network-to-subscriber** | **both**}

Context

[Tree] (config>app-assure>group>policy>app-filter>entry flow-setup-direction)

Full Context

configure application-assurance group policy app-filter entry flow-setup-direction

Description

This command configures the direction of flow setup to which the application filter entry is to be applied.

Default

flow-setup-direction both

Parameters

subscriber-to-network

Specifies that the app-filter entry will be applied to flows initiated by a local subscriber.

network-to-subscriber

Specifies that the app-filter entry will be applied to flows initiated from a remote destination towards a local subscriber.

both

Specifies that the app filter entry will be applied for subscriber-to-network and network-to-subscriber traffic.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.87 flow-setup-high-wmark

flow-setup-high-wmark

Syntax

flow-setup-high-wmark *high-watermark*

Context

[Tree] (config>app-assure flow-setup-high-wmark)

Full Context

configure application-assurance flow-setup-high-wmark

Description

This command configures the system wide high watermark threshold for per-ISA throughput in packets/second when an alarm will be raised by the agent. The value must be larger than or equal to the packet-rate-low-wmark parameter.

Default

flow-setup-high-wmark max

Parameters

high-watermark

Specifies the high watermark for flow setup rate alarms. The value must be larger than or equal to the flow-setup-low-wmark value.

Values 1 to 800000, **max** flows/sec (disabled)

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.88 flow-setup-low-wmark

flow-setup-low-wmark

Syntax

flow-setup-low-wmark *low-watermark*

no flow-setup-low-wmark

Context

[Tree] (config>app-assure flow-setup-low-wmark)

Full Context

configure application-assurance flow-setup-low-wmark

Description

This command configures the flow setup rate on the ISA-AA when a flow setup alarm will be raised by the agent.

Default

flow-setup-low-wmark 0

Parameters

low-watermark

Specifies the low watermark for flow setup rate alarms. The value must be larger than or equal to the flow-setup-high-wmark value.

Values 1 to 799999 flows/sec

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.89 flow-spec-dest

flow-spec-dest

Syntax

flow-spec-dest *prefix-list-name*

no flow-spec-dest

Context

[Tree] (config>router>policy-options>policy-statement>entry>from flow-spec-dest)

Full Context

configure router policy-options policy-statement entry from flow-spec-dest

Description

This command is used to match BGP FlowSpec routes on the basis of the destination IP prefix in the flow specification. An IPv4 FlowSpec route is matched by this command if its NLRI contains a type 1 subcomponent encoding a prefix and prefix-length that is covered by an entry in the referenced prefix-list. An IPv6 FlowSpec route is matched by this command if its NLRI contains a type 1 component encoding prefix-offset=0 and a prefix & prefix-length that is covered by an entry in the referenced prefix-list.

The **flow-spec-dest** command has no effect when the policy is not applied as a BGP import or export policy.

Default

no flow-spec-dest

Parameters

prefix-list-name

Specifies the name of a prefix-list containing IPv4 and/or IPv6 prefix entries [up to 64 characters].

Platforms

All

10.90 flow-spec-source

flow-spec-source

Syntax

flow-spec-source *prefix-list-name*

no flow-spec-source

Context

[Tree] (config>router>policy-options>policy-statement>entry>from flow-spec-source)

Full Context

configure router policy-options policy-statement entry from flow-spec-source

Description

This command is used to match BGP FlowSpec routes on the basis of the source IP prefix in the flow specification. An IPv4 FlowSpec route is matched by this command if its NLRI contains a type 2 subcomponent encoding a prefix and prefix-length that is covered by an entry in the referenced prefix-list. An IPv6 FlowSpec route is matched by this command if its NLRI contains a type 2 component encoding prefix-offset=0 and a prefix & prefix-length that is covered by an entry in the referenced prefix-list.

The **flow-spec-source** command has no effect when the policy is not applied as a BGP import or export policy.

Default

no flow-spec-source

Parameters

prefix-list-name

Specifies the name of a prefix-list containing IPv4 and/or IPv6 prefix entries, up to 64 characters.

Platforms

All

10.91 flow-table-high-wmark

flow-table-high-wmark

Syntax

flow-table-high-wmark *high-watermark*

no flow-table-high-wmark

Context

[Tree] (config>app-assure flow-table-high-wmark)

Full Context

configure application-assurance flow-table-high-wmark

Description

This command configures the system-wide high watermark threshold as a percentage of the flow table size for the per-ISA utilization of the flow records when a full alarm will be raised by the agent.

Default

flow-table-high-wmark 95

Parameters

high-watermark

Specifies the high watermark for flow table full alarms, in percent.

Values 0 to 100

Default 95

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.92 flow-table-low-wmark

flow-table-low-wmark

Syntax

flow-table-low-wmark *low-watermark*

no flow-table-low-wmark

Context

[Tree] (config>app-assure flow-table-low-wmark)

Full Context

configure application-assurance flow-table-low-wmark

Description

This command configures the system-wide low watermark threshold as a percentage of the flow table size for per-ISA. The value must be lower than or equal to the **flow-table-high-wmark** *high-watermark* parameter.

Default

flow-table-low-wmark 90

Parameters

low-watermark

Specifies the low watermark for flow table full alarms, in percent.

Values 0 to 100

Default 90

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.93 flow-timeout-on-switchover

flow-timeout-on-switchover

Syntax

flow-timeout-on-switchover *percent*

Context

[Tree] (config>isa>nat-group>inter-chassis-redundancy flow-timeout-on-switchover)

Full Context

configure isa nat-group inter-chassis-redundancy flow-timeout-on-switchover

Description

This command configures an initial flow timeout on the newly activated node for the **nat-group** after a switchover. This timeout stays in effect only if there is no traffic present over this flow; otherwise, the first packet over the flow after the switchover resets the flow timeout to the originally configured value (under the NAT policy configuration).

This command configuration restricts the flow timeout to a portion of the originally configured value.

Default

flow-timeout-on-switchover 50

Parameters

percent

Specifies the percentage of the originally configured timeout value for the flow under the **nat-policy**.

Values 1 to 50

Platforms
7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.94 flows-active-count

Full Context

configure service ies interface spoke-sdp ingress flowspec

configure service vprn interface sap ingress flowspec

configure service ies interface sap ingress flowspec

configure service vprn interface spoke-sdp ingress flowspec

Description

This command enables IPv4 FlowSpec filtering on an access IP interface associated with a VPRN or IES service. Filtering is based on all of the IPv4 FlowSpec routes that have been received and accepted by the corresponding BGP instance. Ingress IPv4 traffic on an interface can be filtered by both a user-defined IPv4 filter and FlowSpec. Evaluation proceeds in this order:

- user-defined IPv4 filter entries
- FlowSpec derived filter entries
- user-defined IPv4 filter default-action

The **no** form of this command removes IPv4 FlowSpec filtering from an IP interface.

Default

no flowspec. No access interfaces have IPv4 FlowSpec enabled.

Description

This command is used to configure the Fault Notification Generation time values for raising the alarm. This timer is used for network management processes and is not tied into delaying the notification to the fault management system on the network element. This timer does not affect fault propagation mechanisms.

Parameters

time

Specifies the time, in centiseconds (10ms intervals), that a defect condition at or above the **low-priority-defect** must be present before raising alarm.

Values 0, 250, 500, 1000

Default 0

Platforms

10.102 follow

follow

Syntax

follow router *router-instance* **pool** *name*

no follow

Context

[Tree] (config>service>vprn>nat>outside>pool>redundancy follow)

[Tree] (config>router>nat>outside>pool>redundancy follow)

Full Context

configure service vprn nat outside pool redundancy follow

configure router nat outside pool redundancy follow

Description

This command implicitly enables Pool Fate-Sharing Group (PFSG) which is required in case of multiple NAT policies per inside routing context. A NAT pool configured with this command will not advertise or monitor any route in order to change its (activity) state but instead it will directly follow the state of the lead pool in the PFSG. Once the lead pool changes its (activity) state, all the remaining pools following the lead pool will change their state accordingly.

Default

no follow

Parameters

router *router-instance*

Specifies the routing instance where the lead pool resides.

Values <router-name> | <service-id>

router-name - Base

service-id - 1 to 2147483647

pool *name*

Specifies the pool whose activity state is being shared up to 32 characters in length.

Platforms

10.103 force-auth

force-auth

Syntax

force-auth [**cid-change**] [**rid-change**]

force-auth disabled

no force-auth

Context

[Tree] (config>service>ies>sub-if>grp-if>ipoe-session force-auth)

[Tree] (config>service>vprn>sub-if>grp-if>ipoe-session force-auth)

Full Context

configure service ies subscriber-interface group-interface ipoe-session force-auth

configure service vprn subscriber-interface group-interface ipoe-session force-auth

Description

By default, if the circuit-id/interface-id or remote-id in the IPoE session re-authentication trigger packet (such as a DHCP renewal) is not empty and different from the circuit-id/interface-id or remote-id stored in the IPoE session data, a forced re-authentication is performed, ignoring the configured **min-auth-interval**. This default behavior can be changed with this command.

The **no** form of this command reverts to the default behavior.

Default

force-auth cid-change rid-change force-auth disabled on wlan-gw group interfaces

Parameters

cid-change

Perform a forced re-authentication upon a circuit-id/interface-id change. An empty circuit-id/interface-id is not considered a change.

rid-change

Perform a forced re-authentication upon a remote-id change. an empty remote-id is not considered a change. For DHCPv6, the enterprise number is excluded from the comparison.

disabled

Specifies that the **min-auth-interval** never is ignored. The system does not perform a forced re-authentication upon a circuit-id or interface-id or remote-id change.

force-ipv6cp

Syntax

[**no**] **force-ipv6cp**

Context

[Tree] (config>subscr-mgmt>loc-user-db>ppp>host force-ipv6cp)

Full Context

configure subscriber-mgmt local-user-db ppp host force-ipv6cp

Description

This command specifies if the IPv6 control protocol should be negotiated after PPP reaches the Network-Layer Protocol phase.

The **no** form of this command reverts to the default.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

10.105 force-l2pt-boundary

force-l2pt-boundary

Syntax

force-l2pt-boundary [**cdp**] [**dtp**] [**pagp**] [**stp**] [**udld**] [**vtp**]

no force-l2pt-boundary

Context

[Tree] (config>service>vpls>sap force-l2pt-boundary)

Full Context

configure service vpls sap force-l2pt-boundary

Description

Enabling force-l2pt-boundary will force all SAPs managed by the specified m-vpls instance on the corresponding port to have l2pt-termination enabled. This command is applicable only to SAPs created under m-vpls regardless of the flavor of STP currently active. It is not applicable to spoke-SDPs.

The execution of this command will fail as soon as at least one of the currently managed SAPs (all SAPs falling within the specified managed-vlan-range) does not have l2pt-termination enabled regardless of its admin/operational status.

If force-l2pt-boundary is enabled on a specified m-vpls SAP, all newly created SAPs falling into the specified managed-vlan-range will have l2pt-termination enabled per default.

Extending or adding new range into a managed-vlan-range declaration will fail as soon as there is at least one SAPs falling into the specified vlan-range does not have l2pt-termination enabled.

Disabling l2pt-termination on currently managed SAPs will fail as soon as the force-l2pt-boundary is enabled under corresponding m-vpls SAP.

Parameters

cdp

Specifies the Cisco discovery protocol

dtp

Specifies the dynamic trunking protocol

pagp

Specifies the port aggregation protocol

stp

Specifies all spanning tree protocols: stp, rstp, mstp, pvst (default)

udld

Specifies unidirectional link detection

vtp

Specifies the virtual trunk protocol

configure service epipe spoke-sdp force-qinq-vc-forwarding

configure service vpls spoke-sdp force-qinq-vc-forwarding

configure service vpls mesh-sdp force-qinq-vc-forwarding

Description

This command forces the datapath to push two VLAN tags at network egress when sending traffic on SDP bindings or EVPN destinations. The VLAN tag values are derived from the service-delimiting tags at the ingress, depending on the configured parameter. At network ingress this command, configured on EVPN-MPLS or the SDP-binding, pops two VLAN tags at most.

The **no** form of this command disables the datapath from pushing any VLAN tags in SDP bindings or EVPN, or from popping two VLAN tags.

Default

no force-qinq-vc-forwarding

Parameters

c-tag-c-tag

Specifies that the router pushes two tags with the same value derived from the inner service delimiting tag. At network ingress, two VLAN tags are extracted at most and the C-tag and S-tag p/de bits are propagated to the egress SAPs.

s-tag-c-tag

Specifies that the router pushes two tags that are copied from the QinQ service-delimiting VLAN values and may be different. At network ingress, two VLAN tags are extracted at most and the p/de bits are propagated to the egress SAP service-delimiting S-tag and C-tag respectively.

force-qtag-forwarding

Syntax

[**no**] **force-qtag-forwarding**

Context

[Tree] (config>service>vpls>pbb force-qtag-forwarding)

Full Context

configure service vpls pbb force-qtag-forwarding

Description

This command forces the addition of a IEEE 802.1q tag after the Customer MAC (C-MAC) addresses when the PBB header is built, as it egresses a related BVPLS.

It is used to preserve the dot1q and DE bits from the customer domain when the service delimiting qtags are stripped when the packet is ingressing a PBB Epipe or an IVPLS. The VLAN value of the service delimiting qtag if one exists is used for the corresponding inserted dot1q field. If a service delimiting qtag does not exist, then the value of zero is used for all the inserted qtag bits.

The **no** form of this command sets default behavior.

Default

no force-qtag-forwarding

Platforms

All

force-qtag-forwarding

Syntax

[**no**] **force-qtag-forwarding**

force-reference {**ref1** | **ref2** | **bits** | **bitsa** | **bitsb** | **gnss** | **gnssa** | **gnssb** | **ptp** | **synce** | **syncea** | **synceb**}

no force-reference

Context

[Tree] (debug>sync-if-timing force-reference)

Full Context

debug sync-if-timing force-reference

Description

This command forces the system synchronous timing output to use a specific reference.

Note:
The list of available references may vary depending on the platform; all references are not supported on every platform.

Only use this command to test and debug problems. Network synchronization problems may appear if you leave network elements with this manual override setting. After forcing the system timing reference input, clear it using the **no force-reference** command.

This command also clears the Wait-to-Restore state of the reference so that the reference can be selected.

This command can also force the CPM clock to use a specific input reference.

When the command is executed, the CPM clock on the active CPM immediately switches its input reference to that specified by the command. If the specified input is not available (shutdown), or in a disqualified state, the CPM clock shall use the next qualified input reference based on the selection rules.

This command also affects the BITS output port on the active CPM. If the BITS output port selection is set to line-reference and the reference being forced is not the BITS input port, then the system uses the forced reference to generate the signal out the BITS output port. If the BITS output port selection is set to internal-clock, then the system uses the output of the CPM clock to generate the signal for the BITS output port.

On a CPM activity switch, the force command is cleared and normal reference selection is determined.

Debug configurations are not saved between reboots.

Parameters

ref1

Specifies that the clock uses the first timing reference.

ref2

Specifies that the clock uses the second timing reference.

bits

Specifies that the clock uses the external network interface on the active CPM to be the highest priority input.

bitsa

Specifies that the clock uses the bitsa timing reference, for redundant systems with a BITS port on each CPM.

bitsb

Specifies that the clock uses the bitsb timing reference, for redundant systems with a BITS port on each CPM.

gnss

Specifies that the clock uses the GNSS port as a timing reference. This keyword is supported only on 7750 SR single-slot platforms.

gnssa

Specifies that the clock uses the GNSS port on the CPM in slot A as a timing reference. This keyword is supported only on 7750 SR-2e platforms.

gnssb

Specifies that the clock uses the GNSS port on the CPM in slot B as a timing reference. This keyword is supported only on 7750 SR-2e platforms.

ptp

Specifies that the clock uses the PTP timeReceiver as the timing reference. This keyword is supported on 7450 ESS and 7750 SR platforms.

synce

Specifies that the clock uses the SyncE/1588 timing reference on non-redundant systems.

syncea

Specifies that the clock uses the SyncE/1588 timing reference on CPM A of redundant systems.

synceb

Specifies that the clock uses the SyncE/1588 timing reference on CPM B of redundant systems.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>service>vprn>server force-renews)

Full Context

configure router dhcp local-dhcp-server force-renews

configure service vprn server force-renews

Description

This command enables the sending of sending FORCERENEW messages for DHCP.

The **no** form of this command disables the sending of FORCERENEW messages.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

10.112 force-switchover

force-switchover

Syntax

force-switchover [**now**] [**ignore-status**]

Context

[Tree] (admin>redundancy force-switchover)

Full Context

admin redundancy force-switchover

Description

This command forces a switchover to the standby CPM card. The primary CPM reloads its software image and becomes the secondary CPM.

Parameters

now

Forces the switchover to the redundant CPM card immediately.

ignore-status

Forces a switchover despite any diagnostics or conditions on the standby. This is true even if the standby cannot reach the extension CPMs on the extension chassis of a 7950 XRS-40 via its local CPM interconnect ports.

This option is supported on 7950 XRS-20 and 7950 XRS-40 platforms only.

Platforms

All

10.113 force-unique-ip-addresses

force-unique-ip-addresses

Syntax

[**no**] **force-unique-ip-addresses**

Context

[Tree] (config>service>vprn>nat>inside>l2-aware force-unique-ip-addresses)

[Tree] (config>router>nat>inside>l2-aware force-unique-ip-addresses)

Full Context

configure service vprn nat inside l2-aware force-unique-ip-addresses

configure router nat inside l2-aware force-unique-ip-addresses

Description

This command enforces the uniqueness of IPv4 addresses of L2-aware subscribers in an inside routing context.

This functionality is required if multicast sourced from the inside routing context is enabled for L2-aware subscribers.

The **no** form of this command allows L2-aware subscribers to have overlapping IPv4 addresses.

Default

no force-unique-ip-addresses

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.114 force-vlan-vc-forwarding

Full Context

configure service epipe bgp-evpn mpls force-vlan-vc-forwarding

configure service epipe bgp-evpn segment-routing-v6 force-vlan-vc-forwarding

configure service vpls bgp-evpn segment-routing-v6 force-vlan-vc-forwarding

configure service vpls bgp-evpn mpls force-vlan-vc-forwarding

Description

This command enables the system to preserve the VLAN ID and 802.1p bits of the service-delimiting qtag in a new tag, which is sent in the customer frame to the EVPN destinations.

If this configuration is used in conjunction with the **sap ingress vlan-translation** command, the configured translated VLAN ID is the VLAN ID sent to the EVPN destinations, instead of the service-delimiting tag VLAN ID. If the ingress SAP or SDP binding is null-encapsulated, the output VLAN ID and p-bits are zero.

The **no** form of this command does not preserve the VLAN ID and 802.1p bits of the service-delimiting qtag.

Default

no force-vlan-vc-forwarding

Platforms

All

- configure service vpls bgp-evpn mpls force-vlan-vc-forwarding

Full Context

configure service vpls spoke-sdp force-vlan-vc-forwarding

configure service vpls mesh-sdp force-vlan-vc-forwarding

configure service epipe spoke-sdp force-vlan-vc-forwarding

Description

This command forces vc-vlan-type forwarding in the datapath for spoke and mesh SDPs which have either vc-type. This command is not allowed on vlan-vc-type SDPs.

The **no** version of this command sets default behavior.

Default

no force-vlan-vc-forwarding

Platforms

All

10.115 foreign-ip

foreign-ip

Syntax

foreign-ip *ip-address*[*/mask*]

no foreign-ip

Context

[Tree] (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>match foreign-ip)

Full Context

configure subscriber-mgmt isa-service-chaining vas-filter entry match foreign-ip

Description

This command configures the foreign IP address or subnet in the match criterion for this entry. The foreign IP or subnet implies a matching destination IP for upstream traffic and a source IP for downstream traffic.

The **no** form of this command removes the IP address or subnet from the match criterion in the entry.

Parameters

ip-address/mask

Specifies the IPv4 address and mask.

Values ip-address a.b.c.d

mask 0 to 32

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

foreign-ip

Syntax

[**no**] **foreign-ip**

Context

[Tree] (config>service>nat>syslog>syslog-export-policy>include foreign-ip)

Full Context

configure service nat syslog syslog-export-policy include foreign-ip

Description

This command includes the foreign IP address in the flow log. A foreign IP address is the original IP address toward the destination node and in DNAT it is replaced by the destination IP.

If DNAT is not used, the foreign IP address (the IP address of the destination node) is the same on both sides of NAT.

The **no** form of the command disables the feature.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

foreign-ip

Syntax

foreign-ip *ip-address*

no foreign-ip

Context

[Tree] (config>service>nat>nat-classifier>entry>match foreign-ip)

Full Context

configure service nat nat-classifier entry match foreign-ip

Description

This command specifies matching on a foreign IP, that is the destination IP address of the NAT inside service before translation.

Default

no foreign-ip

Parameters

ip-address

Specifies the foreign IP address.

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.116 foreign-port

foreign-port

Syntax

foreign-port *port*

no foreign-port

Context

[Tree] (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>match foreign-port)

Full Context

configure subscriber-mgmt isa-service-chaining vas-filter entry match foreign-port

Description

This command configures the foreign TCP/UDP port to match in this entry of the VAS filter.

The **no** form of this command

Parameters

port

Specifies the foreign IP port to match.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

foreign-port

Syntax

[**no**] **foreign-port**

Context

[Tree] (config>service>nat>syslog>syslog-export-policy>include foreign-port)

Full Context

configure service nat syslog syslog-export-policy include foreign-port

Description

This command includes the foreign port address in the flow log. A foreign port is the port towards the destination node and this port is not translated by any form of NAT.

A foreign port (the port towards the destination node) is the same on both sides of NAT.

The **no** form of the command disables the feature.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.117 format

format

Syntax

format [*cflash-id*] [**reliable**]

Context

[Tree] (file format)

Full Context

file format

Description

This command formats the compact flash. The compact flash must be shut down before starting the format.

Parameters

cflash-id

Specifies the compact flash type.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

reliable

Enables the reliance file system and disables the default DoS file system. This option is valid only on compact flashes 1 and 2.

Context

[Tree] (config>filter>ip-filter>entry>action forward)

[Tree] (config>filter>ipv6-filter>entry>action forward)

Full Context

configure filter ip-filter entry action forward

configure filter ipv6-filter entry action forward

Description

This command sets the context for specific forward commands to be performed.

Parameters

connection-id

Specifies that the packet should be forwarded over the specified connection (specified by the connection ID under the bonding group interface), if that connect is available. Outside of a bonding egress context, the behavior of this filter is undefined.

Values 1, 2

esi service-id

Specifies that the packet matching the entry is forwarded to an ESI-identified first appliance in Nuage service chain using EVPN-resolved VXLAN tunnel in the specified VPLS service.

esi sf-ip vas-interface router

Specifies that the packet matching the entry is forwarded to ESI/SF-IP identified first appliance in Nuage service chain using EVPN-resolved VXLAN tunnel over the configured VAS interface in the specified VPRN service.

gre-tunnel-name

Specifies the GRE tunnel name up to 32 characters.

lsp

Specifies that the packet matching the entry is forwarded using the specified lsp.

mpls-policy

Specifies the redirection of the traffic to the programed instance of the MPLS FP specified by its endpoint IPv4 or IPv6 address. The behavior results in a simple forward if no policy exists, if no instance is programmed, and if the policy or instance is administratively down.

next-hop

Specifies that the packet matching the entry is forwarded in the routing context of the incoming interface using direct or indirect IPv4 address in the routing lookup.

next-hop router

Specifies that the packet matching the entry is forwarded in the configured routing context using direct or indirect IPv4 address in the routing lookup.

next-hop interface

Specifies that the packet matching the entry is forwarded using the configured local interface.

redirect-policy

Specifies that the packet matching the entry is forwarded using forward next-hop or forward next hop router and the IP address of destination selected by the configured redirect policy. If no destination is selected, packets are subject to action forward.

router

Specifies that the packet matching the entry is routed in the configured routing instance and not in the incoming interface routing instance.

sap

Specifies that the packet matching the entry is forwarded using the configured SAP.

sdp

Specifies that the packet matching the entry is forwarded using the configured SDP.

srte-policy

Specifies the redirection of the traffic to the programed instance of the SR-TE policy specified by its endpoint IPv4 address or IPv6 address and color. The behavior results in a simple forward if no policy exists, if no instance is programmed, and if the policy or instance is administratively down.

color-id

Specifies the color identifier of the specified SR-TE policy.

Values 0 to 4294967295

vprn-target

Specifies that the packet matching the entry is redirected towards a designated BGP next-hop (**bgp-nh**). The user may specify an LSP (**lsp** *lsp-name*) to use towards that next-hop. If no LSP is specified, the system will automatically select one. The user must specify the routing context (**router** {*router-instance* | **service-name** *service-name*}) in which the system will perform the lookups in order to derive the proper VPRN service label. The user may specify an advertised prefix route (**adv-prefix** *ip-address/prefix-length*). This is needed in case label per VRF is not the label allocation method configured at the BGP peer.

esi

Specifies a 10-byte Ethernet Segment Identifier.

ip-address/mask

Specifies an IPv4 advertised route in the CIDR notation. The IPv4 address is in dotted decimal notation.

Values ip-address a.b.c.d (host bits must be 0)

mask: 0 to 32

ipv6-address/prefix-length

Specifies an IPv6 advertised route in the CIDR notation.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d, where "x" is [0..FFFF]H, and "d" is [0..255]

prefix-length: 0 to 128

bgp-nh ip-address

Specifies the IPv4 address (in dotted decimal notation) of the target BGP next-hop.

Values ip-address d.d.d.d

ipv6-address

Specifies the IPv6 address of a direct or indirect next hop to forward matching packets or of the service SID to use with the SRv6 policy.

ip-int-name

Specifies the name of an egress IP interface where matching packets will be forwarded from. This parameter is only valid for unnumbered point-to-point interfaces. If the string contains special characters (such as #, $, spaces), the entire string must be enclosed within double quotes.

interface-name

Specifies the (maximum 32-character) name of an egress R-VPLS IP interface used to forward the packets using ESI redirect for VPRN/IES service.

lsp-name

Specifies an existing RSVP-TE, MPLS-TP, or SR-TE LSP that supports LSP redirect.

policy-name

Specifies an IPv4 redirect policy configured in the config>filter>redirect-policy context.

sap-id

Specifies an existing VPLS Ethernet SAP.

sdp-id:vc-id

Specifies an existing VPLS SDP.

router-instance

Specifies "Base" or an existing VPRN service ID. For the **forward vprn-target bgp-nh** command, *router-instance* must specify an existing VPRN service ID.

service-name

Specifies an existing VPRN service name.

vpls-service-id

Specifies an existing VPLS service ID or service name.

Full Context

configure filter mac-filter entry action forward

Description

This command sets the context for specific forward commands to be performed.

Parameters

esi

Specifies a 10-byte Ethernet Segment Identifier.

service-id

Specifies that a packet matching the entry is forwarded to an ESI-identified first appliance in the Nuage service chain using an EVPN-resolved VXLAN tunnel in the specified VPLS service.

vpls-service-id

Specifies an existing VPLS service ID or service name.

sap

Specifies that the packet matching the entry is forwarded using the configured SAP.

sap-id

Specifies an existing VPLS Ethernet SAP.

sdp

Specifies that the packet matching the entry is forwarded using the configured SDP.

sdp-id:vc-id

Specifies an existing VPLS SDP.

[Tree] (config>service>template>vpls-template>stp forward-delay)

Full Context

configure service vpls stp forward-delay

configure service template vpls-template stp forward-delay

Description

RSTP, as defined in the IEEE 802.1D-2004 standards, will normally transition to the forwarding state via a handshaking mechanism (rapid transition), without any waiting times. If handshaking fails (e.g. on shared links, see below), the system falls back to the timer-based mechanism defined in the original STP (802.1D-1998) standard.

A shared link is a link with more than two nodes (for example, a shared 10/100BaseT segment). The port-type command is used to configure a link as point-to-point or shared.

For timer-based transitions, the 802.1D-2004 standard defines an internal variable forward-delay, which is used in calculating the default number of seconds that a SAP or spoke-SDP spends in the discarding and learning states when transitioning to the forwarding state.

The value of the forward-delay variable depends on the STP operating mode of the VPLS instance:

- in rstp or mstp mode, but only when the SAP or spoke-SDP has not fallen back to legacy STP operation, the value configured by the hello-time command is used;
- in all other situations, the value configured by the forward-delay command is used.

Default

forward-delay 15

Parameters

seconds

The forward delay timer for the STP instance in seconds

Values 4 to 30

Platforms

forward-ipv4-packets

Syntax

[**no**] **forward-ipv4-packets**

Context

[Tree] (config>service>vprn>if>ipv6 forward-ipv4-packets)

Full Context

configure service vprn interface ipv6 forward-ipv4-packets

Description

This command allows an IPv6-only interface (with no configured IPv4 addresses) to be used for forwarding transit and locally originating and terminating IPv4 packets.

The interface will report that its IPv4 oper-state is up if its IPv6 oper-state is up. Be aware that not all protocols will observe the interface as up from an IPv4 perspective. This command is mostly intended to support BGP routing use cases. Refer to RFC 5549, Advertising IPv4 Network Layer Reachability Information with an IPv6 Next Hop, for further information.

The **no** form of this command restores the default behavior and prevents the interface from forwarding IPv4 packets if it has no configured IPv4 subnets.

Platforms
