Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

The **no** form of this command places the entity into an administratively enabled state.

Default

no shutdown

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>subscr-mgmt>shcv-policy>trigger shutdown)

Full Context

configure subscriber-mgmt shcv-policy trigger shutdown

Description

This command administratively disables the SHCV triggers.

The **no** form of this command administratively enables the the SHCV triggers.

Default

no shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>subscr-mgmt>shcv-policy>periodic shutdown)

Full Context

configure subscriber-mgmt shcv-policy periodic shutdown

Description

This command administratively disables the periodic connectivity verification.

The **no** form of this command administratively enables the periodic connectivity verification.

Default

no shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>vpls>sap>ipoe-session shutdown)

[Tree] (config>service>vprn>sub-if>grp-if>ipoe-session shutdown)

[Tree] (config>service>ies>sub-if>grp-if>ipoe-session shutdown)

Full Context

configure service vpls sap ipoe-session shutdown

configure service vprn subscriber-interface group-interface ipoe-session shutdown

configure service ies subscriber-interface group-interface ipoe-session shutdown

Description

The **shutdown** command enables or disables IPoE session management on a group interface or capture SAP.

A **shutdown** of the IPoE session CLI hierarchy on a group-interface clears all active IPoE sessions on that interface, resulting in a deletion of all corresponding subscriber hosts.

On wlan-gw group interfaces it is not possible to disable an IPoE session.

The **no** form of this command reverts to the default.

Default

shutdown no shutdown on wlan-gw group interfaces

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Description

The **shutdown** command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they can be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

Shutting down a subscriber interface on a 7750 SR will operationally shut down all child group interfaces and SAPs. Shutting down a group interface on a 7750 SR will operationally shut down all SAPs that are part of that group-interface.

The **no** form of this command puts an entity into the administratively enabled state.

Platforms

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

If the AS number was previously changed, the BGP AS number inherits the new value.

configure service vpls spoke-sdp shutdown

Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>python>py-policy>cache shutdown)

[Tree] (config>python>python-script shutdown)

Full Context

configure python python-policy cache shutdown

configure python python-script shutdown

Description

Shutting down a Python script triggers the system to load and compile the script from the configured location(s). Since the system supports three locations, the primary, secondary and tertiary, the system will try to load the Python script in that order.

Shutting down a Python script will disable the Python script and cause the corresponding packet to pass through without any modification.

The **no** form of this command enables the cache or policy script.

[Tree] (config>service>vprn>sub-if>grp-if>bonding-parameters shutdown)

Full Context

configure service ies subscriber-interface group-interface bonding-parameters shutdown

configure service vprn subscriber-interface group-interface bonding-parameters shutdown

Description

The **shutdown** command administratively disables the entity. When a bonding context is shut down, all bonding subscribers are removed and no new bonding subscribers can be created in this context. The bonding configuration can be altered.

When a bonding context is placed in **no shutdown**, bonding subscribers can be created with connections in the specified subscriber interfaces. The specified FPE and connections can no longer be changed in this mode.

Default

shutdown

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>ies>sub-if>grp-if>ipv6>rtr-sol shutdown)

Full Context

configure service ies subscriber-interface group-interface ipv6 router-solicit shutdown

Description

This command enables SLAAC triggered host creation.

The **no** form of this command disables SLAAC triggered host creation.

Default

no shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (debug>diam>diam-peer-plcy>avp-match shutdown)

Full Context

debug diam diam-peer-plcy avp-match shutdown

Description

This command enables or disables the **avp-match** *id* criteria for filtering debug output based on AVP value matching.

A shutdown of the **avp-match** *id* clears the learned diameter session ID.

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>lsp-history shutdown)

Full Context

configure router mpls lsp-history shutdown

Description

This command enables the collection of up to the last 50 significant events for each point-to-point RSVP-TE LSP.

A shutdown of the **lsp-history** pauses the collection of events, but does not remove previously collected events from memory.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>aaa>radius-srv-plcy>servers>health-check>test-account shutdown)

Full Context

configure aaa radius-server-policy servers health-check test-account shutdown

Description

This command disables the test account that probes the RADIUS server.

The **no** form of this command enables the capability.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

shutdown *sap-id* [**create**]

no shutdown *sap-id*

Context

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>l2-access-points>l2-ap shutdown)

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>l2-access-points>l2-ap shutdown)

Full Context

configure service ies subscriber-interface group-interface wlan-gw l2-access-points l2-ap shutdown

configure service vprn subscriber-interface group-interface wlan-gw l2-access-points l2-ap shutdown

Description

This command administratively enables this SAP to begin accepting Layer 2 packets for WIFI offloading.

The **no** form of this command disables this SAP.

Default

shutdown

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>subscr-mgmt>pfcp-association shutdown)

Full Context

configure subscriber-mgmt pfcp-association shutdown

Description

This command administratively enables or disables the PFCP association.

When administratively enabled, the system will try to maintain an active PFCP association with the configured peer. While no association is established, it will continue to retry setting up the association using the **association-setup-retry** configuration.

Shutting down a subscriber interface on a 7750 SR operationally shuts down all child group interfaces and SAPs. Shutting down a group interface on a 7750 SR operationally shuts down all SAPs that are part of that group interface.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (cfg>sys>pwr-mgmt>peq shutdown)

Full Context

configure system power-management peq shutdown

Description

This command administratively enables/disables the APEQ.

Platforms

7750 SR-12e, 7950 XRS

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>card>fp>egress>wred-queue-control shutdown)

Full Context

configure card fp egress wred-queue-control shutdown

Description

This command enables or disables egress WRED queue support on the forwarding plane. By default, WRED queue support is disabled (shutdown). While disabled, the various wred-queue-control commands may be executed on the forwarding plane and SAP egress QoS policies and egress queue group templates with wred-queue enabled may be applied to egress SAPs and port, respectively. The forwarding plane will allocate WRED pools to the WRED queues and the appropriate WRED mega-pool size and CBS reserve size will be calculated, but the WRED mega-pool will be empty and all buffers will be allocated to the default mega-pool. Each WRED queue will be mapped to its appropriate default pool.

Once the **no shutdown** command is executed, the calculated WRED mega-pool buffers will be moved from the default mega-pool to the WRED mega-pool. The WRED mega-pool CBS reserve size will be applied and each egress WRED queue will be moved from its default mega-pool buffer pool to its WRED pool within the WRED mega-pool hierarchy.

The **no** form of this command enables WRED queuing on an egress forwarding plane.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>macsec>connectivity-association shutdown)

Full Context

configure macsec connectivity-association shutdown

Description

This command shuts down the CA profile. All ports that are using this profile will not transmit PDUs as this command shuts down the MACsec for this profile.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>port>ethernet>efm-oam>link-monitoring shutdown)

Full Context

configure port ethernet efm-oam link-monitoring shutdown

Description

This command enables the link monitoring function. Issuing a no shutdown will start the process. Issuing a shutdown will clear any previously established negative conditions that were a result of the link monitoring process on this port and all collected data. This also controls the advertising capabilities.

The **no** form of this command activates the link monitoring function.

Default

configure port ethernet efm-oam link-monitoring errored-frame shutdown

configure port ethernet efm-oam link-monitoring errored-frame-period shutdown

configure port ethernet efm-oam link-monitoring errored-frame-seconds shutdown

Description

This command enables or disables the local counting, thresholding and actions associated with this type of local monitor. Peer received errors are not controlled by this command. Reaction to peer messaging is defined in the peer-rdi-rx hierarchy.

The **no** form of this command activates the local monitoring function and actions for the event.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>port>ethernet>dot1x>macsec>sub-port shutdown)

Full Context

configure port ethernet dot1x macsec sub-port shutdown

Description

This command shuts down the MACsec under this sub-port specifically, including MKA negotiation. In the shutdown state, this port is not MACsec capable and all PDUs will be transmitted and expected without encryption and authentication.

The **no** form of this command puts the port in MACsec-enabled mode. A valid CA, different than any other CA configured on any other sub-port of this port and also a *max-peer* value larger than 0 must be configured. In MACsec-enabled mode, packets are sent in cleartext until the MKA session is up, and if the **rx-must-be-encrypted** is set on the port, all incoming packets with no MACsec encapsulations are dropped.

configure service pw-template stp shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure eth-tunnel path eth-cfm mep shutdown
- configure eth-ring path shutdown

All

- configure service pw-template stp shutdown
- configure service sdp binding pw-port shutdown
- configure service sdp keep-alive shutdown
- configure service sdp shutdown
- configure service sdp class-forwarding shutdown

shutdown

Syntax

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>vpls>provider-tunnel>inclusive shutdown)

Full Context

configure service vpls provider-tunnel inclusive shutdown

Description

This command administratively enables and disables the service.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>vpls>proxy-nd shutdown)

[Tree] (config>service>vpls>proxy-arp shutdown)

Full Context

configure service vpls proxy-nd shutdown

configure service vpls proxy-arp shutdown

Description

This command enables and disables the proxy-ARP and proxy-nd functionality. ARP/GARP/ND messages will be snooped and redirected to the CPM for lookup in the proxy-ARP/proxy-ND table. The proxy-ARP/proxy-ND table is populated with IP->MAC pairs received from different sources (EVPN, static, dynamic). When the **shutdown** command is issued, it flushes the dynamic/EVPN dup proxy-ARP/proxy-ND table entries and instructs the system to stop snooping ARP/ND frames. All the static entries are kept in the table as *inactive*, regardless of their previous *Status*.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>system>bgp-evpn>eth-seg shutdown)

Full Context

configure service system bgp-evpn ethernet-segment shutdown

Description

This command changes the administrative status of the Ethernet-Segment.

The user can do **no shutdown** only when esi, multi-homing and lag/port/sdp are configured. If the Ethernet-Segment or the corresponding lag/port/sdp shutdown, the Ethernet-Segment route and the AD per-ES routes will be withdrawn. No changes are allowed when the Ethernet-Segment is **no shutdown**.

configure service ipipe eth-legacy-fault-notification shutdown

Description

Note: This command is no longer supported and will be removed in a future release.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>vpls>bgp-vpls shutdown)

Full Context

configure service vpls bgp-vpls shutdown

Description

This command administratively enables/disables the local BGP VPLS instance. On de-activation an MP-UNREACH-NLRI must be sent for the local NLRI.

The **no** form of this command enables the BGP VPLS addressing and the related BGP advertisement. The associated BGP VPLS MP-REACH-NLRI will be advertised in an update message and the corresponding received NLRIs must be considered to instantiate the data plane. RT, RD usage: same as in the BGP AD solution, if the values are not configured here, the value of the VPLS-id from under the bgp-ad node is used. If VPLS-id value is not configured either the MH site cannot be activated – i.e. no shutdown returns an error. Same applies if a pseudowire template is not specified under the BGP node.

configure router ldp targeted-session peer-template shutdown

configure router ldp interface-parameters interface ipv6 shutdown

configure router ldp aggregate-prefix-match shutdown

configure router ldp shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted. For an LDP interface, the **shutdown** command exists under the main interface context and under each of the interface IPv4 and IPv6 contexts.

- **shutdown** under the **interface** context brings down both IPv4 and IPv6 Hello adjacencies and stops Hello transmission in both contexts.
- **shutdown** under the **interface** IPv4 or IPv6 contexts brings down the Hello adjacency and stops Hello transmission in that context only.

The user can also delete the entire IPv4 or IPv6 context under the interface with the **no ipv4** or **no ipv6** command which in addition to bringing down the Hello adjacency will delete the configuration.

The **no** form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the **shutdown** and **no shutdown** states are always indicated in system generated configuration files.

Default

no shutdown

Platforms

configure router mpls lsp egress-statistics shutdown

configure router mpls lsp secondary shutdown

configure router mpls lsp-template egress-statistics shutdown

configure router mpls ingress-statistics p2mp-template-lsp shutdown

configure router mpls interface shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The **config**>**router**>**mpls**>**ingr-stats**>**p2mp-template-lsp**> **shutdown** command is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

The **config**>**router**>**mpls**>**lsp**>**primary-p2mp-instance**> **shutdown** is not supported on the 7450 ESS.

MPLS is not enabled by default and must be explicitly enabled (**no shutdown**).

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command places the entity into an administratively enabled state.

Default

no shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>pce-initiated-lsp>sr-te shutdown)

Full Context

configure router mpls pce-initiated-lsp sr-te shutdown

Description

This command administratively enables or disables the **sr-te** context for PCE initiated LSPs. A shutdown of the **sr-te** context under **pce-initiated-lsp** causes an error to be generated for new PCInitate messages, and existing PCE-initiated LSPs are taken to the **oper-down** state.

The **no** form of this command administratively enables the **sr-te** context for PCE initiated LSP.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>if>label-map shutdown)

Full Context

configure router mpls interface label-map shutdown

Description

This command disables the label map definition. This drops all packets that match the specified *in-label* specified in the **label-map** *in-label* command.

The **no** form of this command administratively enables the defined label map action.

Default

no shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>lsp shutdown)

[Tree] (config>router>mpls>lsp-template shutdown)

Full Context

configure router mpls lsp shutdown

configure router mpls lsp-template shutdown

Description

This command disables the existing LSP including the primary and any standby secondary paths.

To shutdown only the primary enter the **config router mpls lsp** *lsp-name* **primary** *path-name* **shutdown** command.

To shutdown a specific standby secondary enter the **config router mpls lsp** *lsp-name* **secondary** *path-name* **shutdown** command. The existing configuration of the LSP is preserved.

Use the **no** form of this command to restart the LSP. LSPs are created in a shutdown state. Use this command to administratively bring up the LSP.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>rib-api>mpls shutdown)

Full Context

configure router rib-api mpls shutdown

Description

This command disables the programming of tunnel and label FIB entries by the RIB-API gRPC service. It causes all existing tunnel and label FIB entries to be de-programmed from the data path, but they remain in the control plane database.

The **no** form of this command enables the programming of tunnel and label FIB entries by the RIB-API gRPC service.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>path shutdown)

Full Context

configure router mpls path shutdown

Description

This command disables the existing LSPs using this path. All services using these LSPs are affected. Binding information, however, is retained in those LSPs. Paths are created in the **shutdown** state.

The **no** form of this command administratively enables the path. All LSPs, where this path is defined as primary or defined as standby secondary, are (re)established.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>pcep>pcc shutdown)

[Tree] (config>router>pcep>pce shutdown)

Full Context

configure router pcep pcc shutdown

configure router pcep pce shutdown

Description

This command administratively disables the PCC or PCE process.

The following PCE parameters can only be modified when the PCEP session is shut down:

- **local-address**
- **keepalive**
- **dead-timer**

The **unknown-message-rate** PCE parameter can be modified without shutting down the PCEP session.

The following PCC parameters can only be modified when the PCEP session is shut down:

- **local-address**
- **keepalive**
- **dead-timer**
- **peer**

The following PCC parameters can be modified without shutting down the PCEP session:

- **report-path-constraints**
- **unknown-message-rate**

configure application-assurance group cflowd rtp-performance shutdown

configure application-assurance group transit-ip-policy radius shutdown

configure application-assurance group cflowd rtp-performance video-template dynamic-fields shutdown

Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The **shutdown** command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>app-assure>group>transit-ip>diameter shutdown)

Full Context

configure application-assurance group transit-ip-policy diameter shutdown

Description

This command removes all transit AA subscribers created via Diameter on this transit AA subscriber IP policy and clears all corresponding Diameter sessions.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>isa>aa-grp>overload-sub-quarantine shutdown)

Full Context

configure isa application-assurance-group overload-sub-quarantine shutdown

Description

This command disables the overload subscriber detection algorithm in the ISA group for the purpose of quarantining an overloaded subscriber. It is possible to manually quarantine an AA subscriber even when this command is disabled (**shutdown**).

The **no** form of this command enables the overload subscriber detection algorithm in the ISA group. When enabled, each ISA monitors the traffic on a continuous basis to identify AA subscribers that occupy more than their fair share of ISA resources and need to be quarantined.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (debug>app-assure>group>traffic-capture shutdown)

Full Context

debug application-assurance group traffic-capture shutdown

Description

This command administratively disables traffic capture.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (debug>app-assure>group>http-host-recorder shutdown)

[Tree] (debug>app-assure>group>port-recorder shutdown)

Full Context

debug application-assurance group http-host-recorder shutdown

debug application-assurance group port-recorder shutdown

Description

This commands allows to stop or start the http-host-recorder. To reset the recorded values execute shutdown followed by **no** shutdown.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>nat>map-domain>mapping-rule shutdown)

Full Context

configure service nat map-domain mapping-rule shutdown

Description

This command enables or disables a rule within a MAP domain. A MAP rule can be enabled (**no shutdown**) only when all parameters within the rule are defined. Disabling a rule within an instantiated MAP domain will withdraw the rule IPv4 routes and disable forwarding for the rule.

Interactions:

config>service>vprn>nat>map>map-domain *domain-name*

config>service>router>nat>map>map-domain *domain-name*

Shutdown of an instantiated MAP rule disables the rule (the rule routes will be withdrawn and forwarding will be disabled).

Default

shutdown

Platforms

VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>nat>map-domain shutdown)

Full Context

configure service nat map-domain shutdown

Description

This command enables or disables a MAP domain. A MAP domain can be enabled (**no shutdown**) only when the DMR prefix is configured. Disabling an instantiated domain will withdraw all routes associated with it.

Interactions:

config>service>vprn>nat>map>map-domain *domain-name*

config>service>router>nat>map>map-domain *domain-name*

Shutdown of a MAP domain template disables the instantiated MAP domain (the routes will be withdrawn and forwarding will be disabled).

configure router interface vrrp shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables an entity.

Default

no shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown** [**active**] [**standby**]

[**no**] **shutdown** [*cflash-id*]

Context

[Tree] (file shutdown)

Full Context

file shutdown

Description

This command shuts down (unmounts) the specified CPM(s).

Use the **no shutdown** [**active**] [**standby**] command to enable one or both CPM.

Use the **no shutdown** [*cflash-id*] command to enable a compact flash (cf1:, cf2:, or cf3:) on the CPM/CCM. The **no shutdown** command can be issued for a specific slot when no compact flash is present. When a flash card is installed in the slot, the card will be activated upon detection.

In redundant systems, use the **no shutdown** command on cf3: on both SF/CPMs or CCMs in order to facilitate synchronization. See the **config>redundancy synchronize** command.

Note:
The **shutdown** command must be issued prior to removing a flash card. If no parameters are specified, then the drive referred to by the current working directory will be shut down.

LED Status Indicators

Table 105: LED Status Indicators lists the possible states for the compact flash and their LED status indicators.

Table 105: LED Status Indicators

State	Description
Operational	If a compact flash is present in a drive and operational (no shutdown), the respective LED is lit green. The LED flickers when the compact flash is accessed. **Note:** Do not remove the compact flash during a read/write operation.
Flash defective	If a compact flash is defective, the respective LED blinks amber to reflect the error condition and a trap is raised.
Flash drive shut down	When the compact flash drive is shut down and a compact flash present, the LED is lit amber. In this state, the compact flash can be ejected.
No compact flash present, drive shut down	If no compact flash is present and the drive is shut down the LED is unlit.
No compact flash present, drive enabled	If no compact flash is present and the drive is not shut down the LED is unlit.
Ejecting a compact flash	The compact flash drive should be shut down before ejecting a compact flash card. The LED should turn to solid (not blinking) amber. This is the only mode to safely remove the flash card. If a compact flash drive is not shut down before a compact flash is ejected, the LED blinks amber for approximately 5 seconds before shutting off.

The **shutdown** or **no shutdown** state is not saved in the configuration file. Following a reboot all compact flash drives are in their default state.

Default

no shutdown

Parameters

cflash-id

Specifies the compact flash slot ID to be shut down or enabled. If *cflash-id* is specified, the drive is shut down or enabled. If no *cflash-id* is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, then the active CPM is assumed.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default the current compact flash device

active

Specifies that all drives on the active CPM are shutdown or enabled.

standby

Specifies that all drives on the standby CPM are shutdown or enabled.

When both **active** and **standby** keywords are specified, then all drives on both CPM are shutdown.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>satellite>eth-sat shutdown)

[Tree] (config>system>satellite>tdm-sat shutdown)

Full Context

configure system satellite eth-sat shutdown

configure system satellite tdm-sat shutdown

Description

This command disables the associated satellite.

If the associated satellite is active, the satellite will not be reset but all satellite client ports will be shut down.

If the satellite is not active but attempts to associate with the host, the satellite chassis will be brought up according to the satellite configuration but all client ports will be shut down.

The **no** form of this command removes the shutdown state and all client ports on active satellites will be brought back up.

shutdown

Platforms

7750 SR-a

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>ptp>peer shutdown)

Full Context

configure system ptp peer shutdown

Description

This command disables or enables a specific PTP peer. Shutting down a peer sends cancel unicast negotiation messages on any established unicast sessions. When shutdown, all received packets from the peer are ignored.

If the clock-type is **ordinary slave** or **boundary**, and PTP is **no shutdown**, the last enabled peer cannot be shutdown. This prevents the user from having PTP enabled without any peer configured and enabled.

Default

no shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>ptp>port shutdown)

Full Context

configure system ptp port shutdown

Description

This command disables or enables a specific PTP port. When shutdown, all PTP Ethernet messages are dropped on the IOM They will not be counted in the PTP message statistics. No PTP packets are transmitted by the node toward this port.

If the clock-type is **ordinary slave** or **boundary**, and PTP is **no shutdown**, the last enabled port or peer cannot be shutdown. This prevents the user from having PTP enabled without any means to synchronize the local clock to a parent clock.

Default

no shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>management-interface>remote-management>manager shutdown)

[Tree] (config>system>management-interface>remote-management shutdown)

Full Context

configure system management-interface remote-management manager shutdown

configure system management-interface remote-management shutdown

Description

This command administratively disables remote management.

The **no** form of this command administratively enables remote management.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>alarms shutdown)

Full Context

configure system alarms shutdown

Description

This command enables or disables the Facility Alarm functionality. When enabled, the Facility Alarm sub-system tracks active and cleared facility alarms and controls the Alarm LEDs on the CPMs. When Facility Alarm functionality is enabled, the alarms are viewed using the show system alarms command(s).

Default

no shutdown

Platforms

All

shutdown

Syntax

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>security>pki>ca-profile shutdown)

Full Context

configure system security pki ca-profile shutdown

Description

Use this command to enable or disable the ca-profile. The system verifies the configured cert-file and crl-file. If the verification fails, then the **no shutdown** command fails.

The ca-profile in a **shutdown** state cannot be used in certificate authentication.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>security>ssh>key-re-exchange>client shutdown)

[Tree] (config>system>security>ssh>key-re-exchange>server shutdown)

Full Context

configure system security ssh key-re-exchange client shutdown

configure system security ssh key-re-exchange server shutdown

Description

This command stops the key exchange. It sets the minutes and bytes to infinity so there will not be any key exchange during the PDU transmission.

Default

no shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>security>tacplus shutdown)

Full Context

configure system security tacplus shutdown

Description

This command administratively disables the TACACS+ protocol operation. Shutting down the protocol does not remove or change the configuration other than the administrative state.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables the protocol which is the default state.

Default

no shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>security>ldap>server shutdown)

[Tree] (config>system>security>ldap shutdown)

Full Context

configure system security ldap server shutdown

configure system security ldap shutdown

Description

In the **ldap** context, this command enables or disabled LDAP protocol operations.

In the **server** context, this command enables or disables the LDAP server. To perform **no shutdown**, an LDAP server address is required. To change the address, the user first needs to shut down the server.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>grpc>gnmi shutdown)

Full Context

configure system grpc gnmi shutdown

Description

This command stops the gNMI service.

The **no** form of this command starts the gNMI service.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>grpc>rib-api shutdown)

Full Context

configure system grpc rib-api shutdown

Description

This command stops the RibApi gRPC service, deletes all programmed RIB entries (stale and non-stale), but does not close the TCP connections.

The **no** form of this command restarts the RibApi gRPC service.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>grpc shutdown)

Full Context

configure system grpc shutdown

Description

This command stops the gRPC server. This closes all of the associated TCP connections and immediately purges all RIB entries that were programmed using the RibApi Service.

The **shutdown** command is not blocked if there are active gRPC sessions. Shutting down gRPC will terminate all active gRPC sessions.

The **no** form of this command starts the gRPC server.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>grpc>tcp-keepalive shutdown)

Full Context

configure system grpc tcp-keepalive shutdown

Description

This command stops the TCP keepalives from being sent to all gRPC clients.

The **no** form of this command restarts the sending of TCP keepalives to all gRPC clients.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>snmp>streaming shutdown)

Full Context

configure system snmp streaming shutdown

Description

This command administratively disables proprietary SNMP request/response bundling and TCP-based transport mechanism for optimizing network management of the router nodes.

The **no** form of the command administratively re-enables SNMP request/response bundling and TCP-based transport mechanism.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>snmp shutdown)

Full Context

configure system snmp shutdown

Description

This command administratively disables SNMP agent operations. System management can then only be performed using the command line interface (CLI). Shutting down SNMP does not remove or change configuration parameters other than the administrative state. This command does not prevent the agent from sending SNMP notifications to any configured SNMP trap destinations. SNMP trap destinations are configured under the **config>log>snmp-trap-group** context.

This command is automatically invoked in the event of a reboot when the processing of the configuration file fails to complete or when an SNMP persistent index file fails while the **bof persist on** command is enabled.

The **no** form of the command administratively enables SNMP which is the default state.

Default

no shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>security>tls>cert-profile shutdown)

Full Context

configure system security tls cert-profile shutdown

Description

This command disables the certificate profile. When the certificate profile is disabled, it will not be sent to the TLS server.

The **no** form of the command enables the certificate profile and allows it to be sent to the TLS server.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>security>tls>server-tls-profile shutdown)

[Tree] (config>system>security>tls>client-tls-profile shutdown)

Full Context

configure system security tls server-tls-profile shutdown

configure system security tls client-tls-profile shutdown

Description

This command administratively enables or disables the TLS profile. If the TLS profile is shut down, the TLS operational status will be down. Therefore, if the TLS profile is shut down, any application using TLS should not attempt to send any PDUs.

Platforms

All

shutdown

Syntax

configure router bgp group monitor shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the **shutdown** and **no shutdown** states are always indicated in system generated configuration files.

Default administrative states for services and service entities are described in Special Cases.

The **no** form of this command places an entity in an administratively enabled state.

configure router rip group neighbor shutdown

configure router ripng group shutdown

configure router rip shutdown

configure router ripng shutdown

Description

This command administratively disables an entity. Downing an entity does not change, reset or remove any configuration settings or statistics. Many objects must be shutdown before they may be deleted.

The **shutdown** command administratively downs an entity. Administratively downing an entity changes the operational state of the entity to down and the operational state of any entities contained within the administratively down entity.

Unlike other commands and parameters where the default state will not be indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

The **no** form of the command puts an entity into the administratively enabled state.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>segment-routing>maintenance-policy shutdown)

Full Context

configure router segment-routing maintenance-policy shutdown

Description

This command deactivates all segment routing policies and removes the associated entries from the forwarding plane of the router.

The **no** form of this command enables all segment routing policies so that they can be revalidated and reinstalled as necessary.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>segment-routing>sr-policies>egress-statistics shutdown)

[Tree] (config>router>segment-routing>sr-policies>ingress-statistics shutdown)

Full Context

configure router segment-routing sr-policies egress-statistics shutdown

configure router segment-routing sr-policies ingress-statistics shutdown

Description

This command administratively disables the collection of egress or ingress statistics for all segment routing policies.

The **no** form of this command administratively enables the collection of egress or ingress statistics for all segment routing policies.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>segment-routing>sr-policies shutdown)

Full Context

configure router segment-routing sr-policies shutdown

Description

This command deactivates all segment routing policies and removes the associated entries from the forwarding plane of the router.

It is necessary to execute this shutdown if you want to make a change to the reserved-label-block reference.

The **no** form of this command enables all segment routing policies so that they can be revalidated and reinstalled as necessary.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>seg-list shutdown)

Full Context

configure router segment-routing sr-policies static-policy segment-list shutdown

Description

This command deactivates a segment-list. If this is done on an active policy with more than one segment list, then traffic forwarded by the policy will be diverted to the remaining segment-lists.

The **no** form of this command enables the segment list so that it can be validated and installed as necessary.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (conf>router>segment-routing>sr-policies>policy shutdown)

Full Context

configure router segment-routing sr-policies static-policy shutdown

Description

This command deactivates the associated static policy and causes another policy for the same (color, endpoint) combination to be promoted as the active path, assuming there is another valid policy.

It is necessary to execute this shutdown if you want to make critical configuration changes to the static policy.

The **no** form of this command enables the static policy so that it can be validated and installed as necessary.

configure router segment-routing segment-routing-v6 micro-segment-locator shutdown

configure router segment-routing segment-routing-v6 micro-segment block shutdown

Description

This command administratively disables the block or micro-segment locator.

The **no** form of this command enables the block or micro-segment locator.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>bgp>egress-peer-engineering shutdown)

Full Context

configure router bgp egress-peer-engineering shutdown

Description

This command administratively enables or disables BGP-EPE. If enabled, peer node SIDs and peer adjacency SIDs are advertised in BGP-LS.

The **no** form of this command places the entity into an administratively enabled state and prevents peer node SIDs and peer adjacency SIDs from being advertised in BGP-LS.

Default

no shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>bgp>group>egress-engineering shutdown)

Full Context

configure router bgp group egress-engineering shutdown

Description

This command administratively enables or disable egress engineering on a BGP neighbor or group of neighbors.

If this command is enabled along with the **egress-peer-engineering** command in BGP, SIDs in the form of MPLS labels are allocated for the segments toward the neighbor and to all links (adjacencies). These adjacencies are then advertised in BGP LS.

The **no** form of this command places the entity into an administratively enabled state.

Default

no shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>subscr-mgmt>sis shutdown)

configure subscriber-mgmt group-interface-statistics shutdown

Description

This command disables the collection of aggregate group interface statistics.

The **no** form of this command enables group interface statistics collection.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>test-oam>link-meas>template shutdown)

Full Context

configure test-oam link-measurement measurement-template shutdown

Description

This command administratively enables and disables the measurement template. The **measurement-template** can be referenced even if it is disabled. The template must be administratively enabled to transmit probes on any associated IP interface. The template configuration can be modified even if it is administratively enabled. The template can be administratively disabled even if interfaces are actively registered with the template. When the template configuration is modified, all registered IP interfaces start from the initial state and enter a first reporting scenario. This is true even if the template is administratively disabled and enabled, and no configuration changes are made.

The **no** form of this command disables the measurement template.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>app-assure>group>ip-id-asst shutdown)

Full Context

configure application-assurance group ip-identification-assist shutdown

Description

This command administratively disables the IP identification assist feature.

The **no** form of this command enables the IP identification assist feature.

Default

no shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.231 sid

sid

Syntax

sid label *value*

Context

[Tree] (config>router>ospf>segm-rtng>adjacency-set sid)

[Tree] (config>router>isis>segm-rtng>adjacency-set sid)

Full Context

configure router ospf segment-routing adjacency-set sid

configure router isis segment-routing adjacency-set sid

Description

This command allows a static SID value to be assigned to an adjacency set in IS-IS or OSPF segment routing.

The **label** option specifies the value is assigned to an MPLS label.

The **no** form of this command removes the adjacency SID.

Parameters

label value

Specifies the value of adjacency SID label.

Values 18432 to 524287 | 1048575 (FP4 only)

Platforms

All

23.232 sid-action

sid-action

Syntax

sid-action *action*

no sid-action

Context

[Tree] (config>router>p2mp-sr-tree>replication-segment sid-action)

Full Context

configure router p2mp-sr-tree replication-segment sid-action

Description

This command configures the SID action to take for the replication segment of the P2MP SR tree.

The **no** form of this command removes the SID action.

Default

no sid-action

Parameters

action

Specifies the name of the SID action.

Values **push** — Specifies that an outgoing SID list is pushed and forwarded on to the corresponding programmed outgoing interfaces.

pop — Specifies that on the leaf node the incoming SID is popped on the underlay packet forwarded to the host.

swap — Specifies, if an incoming SID is configured, that the SID is swapped with an outgoing SID or SID list and forwarded to the corresponding OIF.

Platforms

All

23.233 sid-allocation

sid-allocation

Syntax

sid-allocation {**sequential** | **random**}

no sid-allocation

Context

[Tree] (config>subscr-mgmt>ppp-policy sid-allocation)

Full Context

configure subscriber-mgmt ppp-policy sid-allocation

Description

This command configures the method for allocating the PPPoE session ID.

For both **sequential** and **random** options, the session ID range is 1 to 8191.

The **no** form of this command reverts to the default.

Default

sid-allocation sequential

Parameters

sequential

Specifies for PPPoE sessions with the same client MAC address and active on the same SAP, to allocate the session ID in sequential order starting with

ID = 1.

random

Specifies for PPPoE sessions with the same client MAC address and active on the same SAP, to allocate a unique session ID in random order.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure router segment-routing segment-routing-v6 micro-segment sid-length

Description

This command configures the length of the micro-segments.

Default

sid-length 16

Parameters

sid-length

Specifies the length of micro-segments, in bits.

Values 16

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

23.235 sid-map

sid-map

Syntax

sid-map node-sid {**index** *value* [**range** *value*]} **prefix** {{*ip-addressImask*} | {*ip-address*} {*netmask*}} [**set-flags** {**s**}] [**level** { **1** | **2** | **1/2**}] [**clear-n-flag**]

no sid-map node-sid index *value*

Context

[Tree] (config>router>isis>segm-rtng>mapping-server sid-map)

Full Context

configure router isis segment-routing mapping-server sid-map

Description

This command configures the Segment Routing mapping server database in IS-IS.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value can be entered. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. The user can enter the first prefix with a mask lower than 32 and the SID or label binding TLV is advertised, but the routers will not resolve these prefix SIDs and will generate a trap.

By setting the S-flag, the user can indicate to the IS-IS routers in the rest of the network that the flooding scope of the SID or label binding TLV is the entire domain. In that case, a router receiving the TLV advertisement should leak it between ISIS levels. If leaked from level 2 to level 1, the D-flag must be set and once set the TLV cannot be leaked back into level 2. Otherwise, the S-flag is clear by default and the TLV must not be leaked by routers that receive the mapping server advertisement.

Note that the SR OS does not leak this TLV between IS-IS instances and does not support the multi-topology SID/Label Binding TLV format.

In addition, the user can specify the mapping server own flooding scope for the generated SID or label binding TLV using the **level** option. This option allows the user to narrow the flooding scope configured under the router IS-IS level-capability for a one or more SID or label binding TLVs if required. The default flooding scope of the mapping server is Layer 1 or Layer 2, which can be narrowed by the value configured under the router IS-IS level-capability.

The A-flag and M-flag are not supported by the mapping server feature. The mapping client ignores the flags.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix or range of prefixes, a prefix-SID sub-TLV within a ISIS SID or label binding TLV in that instance. The flooding scope of the TLV from the mapping server is determined as explained above. No further check of the reachability of that prefix in the mapping server route table is performed. Additionally, no check is performed if the SID index is a duplicate of an existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Parameters

index

Specifies the node SID index for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

Values 0 to 4294967295

value

Specifies the node SID range for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

Values 0 to 65535

ip-address/mask

Specifies the IP address and mask.

Values *ip-address:* **a.b.c.d.** (host bits must be 0)

mask: **0 to 32**

ip-address netmask

Specifies the IP address netmask.

Values **a.b.c.d.** (network bits all 1 and host bits all 0)

set-flags

Specifies the flooding scope of the SID/Label binding TLV.

Default **S-flag clear**

The TLV is not leaked by routers receiving the mapping server advertisement

level {1 | 2| 1/2}

Configures the mapping server own flooding scope for the generated SID/Label binding TLV.

Default 1/2

clear-n-flag

Specifies whether the node-sid flag (N-flag) should be cleared in a SID Label Binding TLV.

Platforms

All

sid-map

Syntax

sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*]

sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*] **scope** {**area** *area-id* | **as**}

no sid-map node-sid index *index-value*

Context

[Tree] (config>router>ospf>segm-rtng>mapping-server sid-map)

Full Context

configure router ospf segment-routing mapping-server sid-map

Description

This command configures the Segment Routing mapping server database in OSPF.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. If the user enters the first prefix with a mask lower than 32, the OSPF Extended Prefix Range TLV is advertised but a router which receives it will not resolve SID and instead originates a trap.

The user specifies the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV using the scope option. There is no default value. If the scope is a specific area, then the TLV is flooded only in that area.

An ABR that propagates an intra-area OSPF Extended Prefix Range TLV flooded by the mapping server in that area into other areas, sets the inter-area flag (IA-flag). The ABR also propagates the TLV if received with the inter-area flag set from other ABR nodes but only from the backbone to leaf areas and not vice-versa. However, if the exact same TLV is advertised as an intra-area TLV in a leaf area, the ABR will not flood the inter-area TLV into that leaf area.

Note:
SR OS does not leak this TLV between OSPF instances.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix, or range of prefixes, a prefix-SID sub-TLV within a OSPF Extended Prefix Range TLV in that instance. The flooding scope of the TLV from the mapping server is determined as previously explained. No further check of the reachability of that prefix in the mapping server route table is performed and no check if the SID index is duplicate with some existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Default

no prefix-sid-range

Parameters

index index-value

Specifies the index.

Values 0 to 4294967295

range range-value

Specifies the range.

Values 1 to 65535

prefix ip-address/mask

Specifies the IP address in dotted decimal notation.

Values ip-address/mask:

- ip-address a.b.c.d (host bits must be 0)

mask: 0 to 132

netmask

Specifies the netmask.

Values netmask — a.b.c.d (network bits all 1 and host bits all 0)

area area-id

Configures the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV.

Values ip-address | 0 to 4294967295

Platforms

All

23.236 sid-protection

sid-protection

Syntax

[**no**] **sid-protection**

Context

[Tree] (config>router>isis>interface sid-protection)

Full Context

configure router isis interface sid-protection

Description

This command enables or disables adjacency SID protection by LFA and remote LFA.

While LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternates** option in IS-IS or OSPF at the LER and LSR, there are applications where the user wants traffic to never divert from the strict hop computed by CSPF for a SR-TE LSP. In that case, the user can disable protection for all adjacency SIDs formed over a given network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

Default

sid-protection

Platforms

All

sid-protection

Syntax

[**no**] **sid-protection**

Context

[Tree] (config>router>ospf>area>interface sid-protection)

Full Context

configure router ospf area interface sid-protection

Description

This command enables or disables adjacency SID protection by LFA and remote LFA.

LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternate** option in IS-IS or OSPF at the LER and LSR. However, may be applications where the user never wants traffic to divert from the strict hop computed by CSPF for an SR-TE LSP. In this case, the user can disable protection for all adjacency SIDs formed over a particular network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

configure port tdm ds1 signal-mode

configure port tdm e1 signal-mode

Description

This command activates the signal mode on the channel. When enabled, it uses routing information to direct the payload of voice or data to its destination.

The **no** form of this command reverts to the default value.

Default

no signal-mode

Parameters

cas

Specifies channel associated signaling.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

23.239 signaling

signaling

Syntax

signaling *signaling*

Context

[Tree] (config>service>epipe>spoke-sdp-fec signaling)

Full Context

configure service epipe spoke-sdp-fec signaling

Description

This command enables a user to configure this router as the active or passive T-PE for signaling this MS-PW, or to automatically select whether this T-PE is active or passive based on the prefix. In an active role, this endpoint initiates MS-PW signaling without waiting for a T-LDP label mapping message to arrive from the far end T-PE. In a passive role, it will wait for the initial label mapping message from the far end before sending a label mapping for this end of the PW. In auto mode, if the SAII has the greater prefix value, then the router will initiate MS-PW signaling without waiting for a label mapping message from the far end. However, if the TAII has the greater value prefix, then the router will assume that the far end T-PE will initiate MS-PW signaling and will wait for that label mapping message before responding with a T-LDP label mapping message for the MS-PW in the reverse direction.

The **no** form of this command means that the router T-PE automatically selects the which router will initiate MS-PW signaling based on the prefix values configured in the SAII and TAII of the spoke SDP, as previously described.

Default

signaling auto

Parameters

signaling

Configures this router as the active T-PE for signaling this MS-PW.

Values auto, master

Platforms

All

signaling

Syntax

signaling {**off** | **tldp** | **bgp**}

Context

[Tree] (config>service>sdp signaling)

Full Context

configure service sdp signaling

Description

This command specifies the signaling protocol used to obtain the ingress and egress pseudowire labels in frames transmitted and received on the SDP. When signaling is *off* then labels are manually configured when the SDP is bound to a service. The signaling value can only be changed while the administrative status of the SDP is down. Additionally, the signaling can only be changed on an SDP if that SDP is not in use by BGP-AD or BGP-VPLS. BGP signaling can only be enabled if that SDP does not already have pseudowires signaled over it.

Note:
If the **tldp** option is selected as the mechanism for exchanging service labels over an MPLS or GRE SDP and the T-LDP session is automatically established, an explicit T-LDP session that is subsequently configured takes precedence over the automatic T-LDP session. However, if the explicit, manually-configured session is then removed, the system does not revert to the automatic session and the automatic session is also deleted. To address this, recreate the T-LDP session by disabling and re-enabling the SDP using the **shutdown** and **no shutdown** commands.

The **no** form of this command is not applicable. To modify the signaling configuration, the SDP must be administratively shut down and then the signaling parameter can be modified and re-enabled.

Default

signaling tldp

Parameters

off

Ingress and egress signal auto-labeling is not enabled. If this parameter is selected, then each service using the specified SDP must manually configure VPN labels. This configuration is independent of the SDP's transport type, GRE, MPLS (RSVP or LDP).

tldp

Ingress and egress pseudowire signaling using T-LDP is enabled. Default value used when BGP AD automatically instantiates the SDP.

bgp

Ingress and egress pseudowire signaling using BGP is enabled. Default value used when BGP VPLS automatically instantiates the SDP.

Context

[Tree] (config>log>acct-policy>cr significant-change)

Full Context

configure log accounting-policy custom-record significant-change

Description

This command configures the significant change required to generate the record. The custom record is only generated when the change in the reference counters equals or exceeds the configured (non-zero) significant change value. Only the reference counters for which there are corresponding counters configured under the related queues and policers are used for the significant change comparison. For reference queues and policers, the change applies to the sum of all configured reference queue and policer counters. When no reference counters are configured or **significant-change** is zero, the significant change reporting is not active.

Default

significant-change 0

Parameters

delta

Specifies the delta change (significant change) that is required for the custom record to be written to the XML file.

Values 0 to 4294967295 (For custom-record-aa-sub only values 0 or 1 are supported.)

Full Context

configure port sonet-sdh single-fiber

configure port ethernet single-fiber

Description

This command enables packet gathering and redirection of IP packets from a single fiber (RX) port of the Ethernet or SONET/SDH interface and redistributes packets to other interfaces through either static routes or policy-based forwarding.

This parameter can be applied in conjunction with the strip-label command. If they are applied together, the port must have the single-fiber option configured before it can be associated with an interface that is configured with the strip-label option.

Once a port is configured with single-fiber, traffic will no longer be transmitted out of that port. This command can be used in conjunction with strip-label.

Default

no single-fiber

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

no single-sfm-overload

Context

[Tree] (config>service>vprn single-sfm-overload)

Full Context

configure service vprn single-sfm-overload

Description

This command configures OSPF, OSPFv3 and IS-IS to set overload when the router has fewer than the full set of SFMs functioning, which reduces forwarding capacity. Setting overload enables a router to still participate in exchanging routing information, but routes all traffic away from it.

The conditions to set overload are as follows:

- 7950 XRS-20, 7750 SR-12/SR-7, and 7450 ESS-12/ESS-7 platforms: if an SF/CPMs fails, the protocol will set the overload
- 7950-40 XRS and 7750 SR-12e platforms: if two SFMs fail (a connected pair on the XRS-40) the protocol will set the overload

The **no** form of this command configures the router to not set overload if an SFM fails.

Default

no single-sfm-overload

Parameters

holdoff-time

Specifies the delay between detecting SFM failures and setting overload.

Values 1 to 600 seconds

Default 0 seconds

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS, VSR

configure service epipe site

Description

This command configures a Epipe site.

The **no** form of this command removes the name from the configuration.

Parameters

name

Specifies a site name up to 32 characters in length.

create

This keyword is mandatory while creating a Epipe service.

Platforms

All

23.249 site-activation-timer

site-activation-timer

Syntax

site-activation-timer *seconds*

no site-activation-timer

Context

[Tree] (config>redundancy>bgp-mh site-activation-timer)

Full Context

configure redundancy bgp-mh site-activation-timer

Description

This command defines the amount of time the service manager will keep the local sites in standby status, waiting for BGP updates from remote PEs before running the DF election algorithm to decide whether the site should be unblocked. The timer is started when one of the following event occurs only if the site is operationally up:

- Manual site activation using "no shutdown” at site-id level or at member object(s) level (for example, SAP(s) or PW(s)
- Site activation after a failure

The **no** form of this command sets the value to 2.

Default

no site-activation-timer

Parameters

seconds

Specifies the timer, in seconds.

Values 1 to 100

site-activation-timer

Syntax

site-activation-timer *seconds*

no site-activation-timer

Context

[Tree] (config>service>vpls>site site-activation-timer)

Full Context

configure service vpls site site-activation-timer

Description

This command configures the time-period the system keeps the local sites in standby status, waiting for BGP updates from remote PEs before running the DF (designated-forwarder) election algorithm to decide whether the site should be unblocked. This timer if terminated if an update is received for which the remote PE has transitioned from DF to non-DF.

The no form of this command removes the value from the configuration.

Default

site-activation-timer 2

Parameters

seconds

Specifies the site activation timer in seconds.

Values 0 to 100

Platforms

All

site-activation-timer

Syntax

site-activation-timer *seconds*

no site-activation-timer

Context

23.251 site-min-down-timer

site-min-down-timer

Syntax

site-min-down-timer *seconds*

no site-min-down-timer

Context

[Tree] (config>redundancy>bgp-multi-homing site-min-down-timer)

Full Context

configure redundancy bgp-multi-homing site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When this value is set and the site goes operationally down, it remains operationally down for at least the length of time configured by this timer, regardless of whether other state changes might cause the site to go operationally up. This timer is restarted every time the site transitions from operationally up to down.

This timer is optimized in the following circumstances:

- If the site goes down on the DF but there are no BGP multi-homing peers with the same site in an up state, this timer is not used.
- If the site goes down on the DF but there are no active BGP multi-homing peers, this timer is not used.

- If this timer is active and a BGP multihoming update is received from the DF indicating its site is down, this timer is immediately terminated and the BGP multihoming algorithm is triggered to determine whether this PE should become the DF.

The **no** form of this command removes the value from the configuration.

Default

no site-min-down-timer

Parameters

seconds

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 1 to 100

Platforms

All

site-min-down-timer

Syntax

site-min-down-timer *min-down-time*

no site-min-down-timer

Context

[Tree] (config>service>vpls>site site-min-down-timer)

Full Context

configure service vpls site site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The above operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the **site-min-down-timer** is not started and is not used.
- If the s**ite-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and

this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to the default value.

Default

Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

Parameters

min-down-time

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 0 to 100 seconds

Platforms

All

site-min-down-timer

Syntax

site-min-down-timer *min-down-time*

no site-min-down-timer

Context

[Tree] (config>service>epipe>site site-min-down-timer)

Full Context

configure service epipe site site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The preceding operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the s**ite-min-down-timer** is not started and is not used.
- If the **site-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and

this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to default value.

Default

Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

Parameters

min-down-time

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 0 to 100

Platforms

All

23.252 site-preference

site-preference

Syntax

site-preference *preference-value*

no site-preference

Context

[Tree] (config>service>epipe>site site-preference)

Full Context

configure service epipe site site-preference

Description

This command defines the value to advertise in the VPLS preference field of the BGP VPWS and BGP Multi-homing NLRI extended community. This value can be changed without having to shutdown the site itself. The site-preference is only applicable to VPWS services.

When not configured, the default is zero, indicating that the VPLS preference is not in use.

Default

no site-preference, value=0

Parameters

preference-value

Specifies the preference value to advertise in the NLRI L2 extended community for this site.

Values 1 to 65535

primary

Sets the site-preference to 65535.

backup

Sets the site-preference to 1.

size 1

Parameters

octets

Specifies the size in octets. The request payload is padded with zeros to the specified size.

Values 1 to 9786

Default 1

Platforms

All

size

Syntax

size *octets*

no size

Context

[Tree] (config>test-oam>icmp>ping-template size)

Full Context

configure test-oam icmp ping-template size

Description

This command configures the size of the Data field (in other words, padding) of the outgoing ICMP echo packet. Minimum packet sizes should be used to test connectivity. Larger packet size should only be used if there is a requirement to spot-check large packet size issues on a very limited number of tests and should not be used for normal connectivity testing. Packet sizes should never be configured to require fragmentation anywhere along the path. Exceeding these recommendations will negatively affect the scale and performance of icmp ping check testing.

The **no** form of this command reverts to the default value.

Default

size 56

Parameters

octets

Specifies the size of the ICMP echo ping padding field, in octets.

Values 12 to 9786

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

size-limit

Syntax

size-limit *limit-value*

no size-limit

Context

[Tree] (config>call-trace>location size-limit)

Full Context

configure call-trace location size-limit

Description

This command limits the total size of call-trace files on the specified compact flash card.

The **no** form of this command removes the size restriction.

Default

size-limit 1000

Parameters

limit-value

Specifies the total size of call-trace files on the specified compact flash card, in Mbytes.

Values 1 to 65536

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

size-limit

Syntax

size-limit *limit-value*

Context

[Tree] (config>call-trace>trace-profile size-limit)

Full Context

configure call-trace trace-profile size-limit

Description

This command specifies a maximum of how big a trace may grow before it is stopped.

Default

size-limit 10

Parameters

limit-value

Specifies the maximum data volume generated by a single call trace job to the output in megabytes. After reaching the limit the call trace job for a given host is automatically terminated.

Values 1 to 1000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.255 skip-gtp-ipv4-alloc

skip-gtp-ipv4-alloc

Syntax

[**no**] **skip-gtp-ipv4-alloc**

Context

[Tree] (config>subscr-mgmt>gtp>apn-policy>apn skip-gtp-ipv4-alloc)

Full Context

configure subscriber-mgmt gtp apn-policy apn skip-gtp-ipv4-alloc

Description

This command enables the ability to skip IPv4 address assignment using a GTP session setup response when PCO "allocation via NAS" is not present in a GTP session creation request. Without this configuration, IPv4 address allocation is done using GTP session setup response, even in absence of the PCO "allocation via NAS" in a GTP session setup request.

The **no** form of this command reverts to IPv4 address allocation using GTP.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.256 skip-ttl-decrement

skip-ttl-decrement

Syntax

[**no**] **skip-ttl-decrement**

Context

[Tree] (config>filter>gre-tun-tmp>ipv4 skip-ttl-decrement)

Full Context

configure filter gre-tunnel-template ipv4 skip-ttl-decrement

Description

This command enables an option to not decrement the TTL of the IP packet matching the IPv4/IPv6 filter, when it is encapsulated into the GRE tunnel header.

The **no** form of this command disables this option (default). This results in the matching of IP packet's TTL field to be decremented before it is encapsulated in the GRE tunnel header.

configure service vprn subscriber-interface group-interface sap static-host sla-profile

Description

This command specifies an existing SLA profile name to be associated with the static subscriber host. The SLA profile is configured in the **config>subscr-mgmt>sla-profile** context.

The **no** form of this command reverts to the default.

Parameters

sla-profile-name

Specifies the SLA profile name.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sla-profile

Syntax

sla-profile *sla-profile-name* [**create**]

no sla-profile *sla-profile-name*

Context

[Tree] (config subscr-mgmt sla-profile)

Full Context

configure subscriber-mgmt sla-profile

Description

This command configures an SLA profile mapping. Hosts associated with a subscriber are subdivided into Service Level Agreement (SLA) profiles. For each subscriber host an SLA profile can be specified. For a subscriber host, the SLA profile determines:

- The QoS-policies to use
  - The classification
  - The queues
  - The queue mapping
- The IP filters to use

The SLA profile also has the attribute host-limits which limits the total number of hosts (belonging to the same subscriber) on a certain SAP that can be using this SLA profile.

The **no** form of this command reverts to the default.

Parameters

sla-profile-name

Specifies the name of the SLA profile.

create

Keyword used to create the SLA profile.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Specifies the number of seconds for the console session to sleep, expressed as a decimal integer.

Values 1 to 100

Default 1

Platforms

All

23.263 slice-size

slice-size

Syntax

slice-size *slice-size*

no slice-size

Context

[Tree] (config>mirror>mirror-dest slice-size)

Full Context

configure mirror mirror-dest slice-size

Description

This command enables mirrored frame truncation and specifies the maximum size, in bytes, of a mirrored frame that can be transmitted to the mirror destination.

This command enables mirroring larger frames than the destination packet decode equipment can handle. It also allows conservation of mirroring resources by limiting the size of the packet stream through the router and the core network.

When defined, the mirror **slice-size** creates a threshold that truncates a mirrored frame to a specific size. For example, if the value of 256 bytes is defined, a frame larger than 256 bytes will only have the first 256 bytes transmitted to the mirror destination. The original frame is not affected by the truncation. The mirrored frame size may increase if encapsulation information is added during transmission through the network core or out the mirror destination SAP to the packet/protocol decode equipment.

The actual capability of the router to transmit a sliced or non-sliced frame is also dictated by the mirror destination SDP **path-mtu** or the mirror destination SAP physical MTU. Packets that require a larger MTU than the mirroring destination supports are discarded if the defined **slice-size** does not truncate the packet to an acceptable size.

Notes:

- When configuring IP mirroring, packet slice is rejected as an incorrect option as it will cause IP packets to be rejected by the next hop with an IP header verification error.
- Slice-size is not supported by CEM encap-types or IP-mirroring.

The **no** form of this command disables mirrored packet truncation.

Parameters

slice-size

Specifies the number of bytes to which mirrored frames are truncated, expressed as a decimal integer.

Values 128 to 9216

Platforms

configure port access egress channel pool slope-policy

Description

This command specifies an existing slope policy which defines high and low priority RED slope parameters and the time average factor. The policy is defined in the **config>qos>slope-policy** context.

Default

slope-policy default

Parameters

name

Specifies the policy name, a string up to 32 characters.

Platforms

All

slope-policy

Syntax

slope-policy *slope-policy-name*

no slope-policy

Context

[Tree] (config>card>fp>egress>wred-queue-control slope-policy)

Full Context

configure card fp egress wred-queue-control slope-policy

Description

This command configures WRED slopes within the WRED mega-pool. The WRED slopes in the WRED mega-pool are used when WRED queues are requesting buffers from the mega-pool while they are over their CBS threshold. Once over the CBS threshold, the WRED queue stops receiving buffers from the CBS reserve in the mega-pool and starts competing for buffers in the shared portion of the mega-pool. If the packet resulting in the buffer request is inplus-profile, the packet will be associated with the highplus-slope. In-profile packets are associated with the high slope. Out-of-profile packets are associated with the low slope. Exceed-profile packets are associated with the exceed slope. While the queue is within its CBS threshold, the slopes are ignored.

Within the defined slope-policy, each slope is enabled or disabled (no shutdown or shutdown) and each slope's geometry is defined as percentages of shared portion depth. If a slope is shutdown, the related traffic uses the minimum of the queue MBS and egress WRED megapool size as a drop tail.

The slope-policy also defines the time average factor (TAF) value that is used to determine how the pool's weighted average depth is calculated. The higher the factor, the slower the average depth tracks the actual pool depth.

The **no** form of this command reverts to the default slope policy to the WRED mega-pool.

Default

slope-policy default

Parameters

slope-policy-name

Specifies which slope policy the system should apply to the WRED mega-pool. When slope-policy is not executed, the WRED mega-pool will use the default slope policy. The defined slope policy must already exist or the command will fail. 32 characters maximum.

slope-policy

Syntax

slope-policy *policy-name*

no slope-policy

Context

[Tree] (config>qos>hs-pool-policy>root-tier>root-pool slope-policy)

[Tree] (config>qos>hs-pool-policy>mid-tier>mid-pool slope-policy)

Full Context

configure qos hs-pool-policy root-tier root-pool slope-policy

configure qos hs-pool-policy mid-tier mid-pool slope-policy

Description

This command specifies the slope policy to be used to define the high, low, and exceed slopes within the pool. The slope (high, low, or exceed) used on the egress queue for the packet that generated the buffer request is also used in the mid-pool from the applied slope policy. The pool's current allocation amount is applied to the appropriate slope to derive the buffer rejection probability. The probability value is compared to a randomly-generated number. If the probability decision generates a rejection decision or the buffer pool has no remaining free buffers, the buffer request fails and the arriving packet is discarded. Otherwise, a buffer is allocated as long as the port-class and root-tier buffer pools also honor the buffer request.

The **no** form of the command restores the default slope policy to the associated pool.

Default

slope-policy _tmnx_hs_default

Parameters

policy-name

Specifies the slope policy associated with this pool, up to 32 characters.

Platforms

7750 SR-7/12/12e

slope-policy

Syntax

slope-policy *policy-name*

no slope-policy

Context

[Tree] (config>qos>hs-port-pool-policy>alt-port-class-pools>class-pool slope-policy)

[Tree] (config>qos>hs-port-pool-policy>std-port-class-pools>class-pool slope-policy)

Full Context

configure qos hs-port-pool-policy alt-port-class-pools class-pool slope-policy

configure qos hs-port-pool-policy std-port-class-pools class-pool slope-policy

Description

This command specifies the slope policy that is used to define the high, low, and exceed slopes within the port-class pool. The slope used on the egress queue for the packet that generated the buffer request is also used in the class-pool. The pool's current allocation amount is applied to the appropriate slope to derive the buffer rejection probability. The probability value is compared to a randomly generated number. If the probability decision generates a rejection or the buffer pool has no remaining free buffers, the buffer request fails and the arriving packet is discarded. Otherwise, a buffer is allocated as long as the mid-tier and root-tier buffer pools also honor the buffer request.

The **no** form of the command restores the default slope policy to the associated class-pool.

Default

slope-policy _tmnx_hs_default

Parameters

policy-name

Specifies the policy name, up to 32 characters. This parameter is required when executing the **slope-policy** command and must refer to an existing slope policy within the system.

If a slope policy with the specified name does not exist, the **slope-policy** command fails without modifying the slope behavior on the pool. A non-existent slope-policy error is generated. After a slope policy is associated with any HSQ queue or buffer pool, the policy cannot be deleted.

Platforms

7750 SR-7/12/12e

slope-policy

configure qos slope-policy

Description

Commands in this context configure a QoS slope policy.

Default

slope-policy "default”

Parameters

name

The name of the slope policy.

Values Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

Platforms

All

slope-policy

Syntax

slope-policy *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy slope-policy)

Full Context

configure qos copy slope-policy

Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters

slope-policy

Indicates that the source policy ID and the destination policy ID are slope policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

```
ALA-7>config>qos# copy slope-policy default sp1
MINOR: CLI Destination "sp1" exists - use {overwrite}.
ALA-7>config>qos#overwrite
```

configure router mpls mpls-tp protection-template slow-psc-timer

Description

This command configures the slow timer value to be used for protection switching coordination (PSC) packets for MPLS-TP linear protection (RFC 6378).

Default

slow-psc-timer 5

Parameters

interval

Specifies the slow timer interval in seconds.

Values 5 to 60

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.267 slow-queue-threshold

slow-queue-threshold

Syntax

slow-queue-threshold *kilobits-per-second*

no slow-queue-threshold

Context

[Tree] (config>card>virt-sched-adj slow-queue-threshold)

Full Context

configure card virtual-scheduler-adjustment slow-queue-threshold

Description

This command overrides the system default rate threshold where policers and queues are placed in the "slow” queue category. Slow rate policers and queues use a different minimum rate calculation interval time than fast rate queues. The rate is determined based on the previous calculated offered rate for the policer or queue.

The default slow policer or queue rate is 1 Mb/s. The fast rate is derived by multiplying the slow rate by a factor of 1.5 resulting in a default fast rate of 1.5 Mb/s. The slow-queue-threshold command uses a "Kilobit-Per-Second” value to modify the default slow queue rate threshold and indirectly changes the fast queue rate threshold.

The **no** form of this command restores the default slow queue and fast rate thresholds.

Default

no slow-queue-threshold

Parameters

kilobits-per-second

Specifies that the kilobit-per-second parameter is required and is used to modify the default slow rate threshold. Defining a value of 0 forces all policers and queues to be treated as fast rate. Defining a value of 1000 (1 Mb/s) returns the threshold to the default value and is equivalent to executing **no slow-queue-threshold**.

The fast rate threshold is derived by multiplying the new slow rate threshold by a factor of 1.5.

Values 0 to 1000000 kb/s

Default 1000 kb/s

Full Context

configure service vprn log snmp-trap-group

Description

This command creates the context to configure a group of SNMP trap receivers and their operational parameters for a specific *log-id*.

A group specifies the types of SNMP traps and specifies the log ID that will receive the group of SNMP traps. The user must configure a trap group before SNMP traps can be sent.

To suppress the generation of all alarms and traps, see the **event-control** command. To suppress alarms and traps that are sent to this log-id, see the **filter** command. After alarms and traps are generated, they can be directed to one or more SNMP trap groups. Log events that can be forwarded as SNMP traps are always defined on the main event source.

The **no** form of this command deletes the SNMP trap group.

Default

There are no default SNMP trap groups.

Parameters

log-id* | *log-name

Specifies the log ID or name (up to 32 characters).

Values *log-id*: 1 to 100

name *log-name*

Specifies an optional log name of a log configured in the **log-id** context, up to 32 characters, that can be used to refer to the log after it is created. Alarms and traps cannot be sent to the trap receivers until a valid *log-id* exists.

Platforms

23.275 sntp

sntp

Syntax

[**no**] **sntp**

Context

[Tree] (config>system>time sntp)

Full Context

configure system time sntp

Description

This command creates the context to edit the Simple Network Time Protocol (SNTP).

SNTP can be configured in either broadcast or unicast client mode. SNTP is a compact, client-only version of the NTP. SNTP can only receive the time from SNTP/NTP servers. It cannot be used to provide time services to other systems.

The system clock is automatically adjusted at system initialization time or when the protocol first starts up.

When the time differential between the SNTP/NTP server and the system is more than 2.5 seconds, the time on the system is gradually adjusted.

SNTP is created in an administratively enabled state (**no shutdown**).

The **no** form of the command removes the SNTP instance and configuration. SNTP does not need to be administratively disabled when removing the SNTP instance and configuration.

Description

This command creates or deletes an instance of a software repository. The instance is identified by a repository name.

A software repository is used to obtain files to upgrade software on certain subsystems of the router (for example, Ethernet satellites).

Up to three locations can be specified within a software repository for the router to access files in the repository. The router will first attempt to access the file at the primary location. If the primary location is not configured or the files are not found at the primary location, then the router will attempt to access the files at the secondary location. If the secondary location is not configured or the files are not found at the secondary location, then the router will attempt to access the files at the tertiary location. If the tertiary location is not configured or the files are not found at the tertiary location, then the software repository access will fail.

The **no** form of the command removes the software repository.

Parameters

repository-name

Specifies a string, up to 32 characters, that uniquely identifies the software repository.

create

Specifies the keyword required when the software-repository context is first created. Once the context is created, it can be accessed without the **create** keyword.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.281 solicit-delay

solicit-delay

Syntax

solicit-delay *delay*

no solicit-delay

Context

[Tree] (config>service>vprn>sub-if>ipv6>dhcp6>relay>advertise-selection solicit-delay)

[Tree] (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>relay>advertise-selection solicit-delay)

[Tree] (config>service>ies>sub-if>grp-if>ipv6>dhcp6>relay>advertise-selection solicit-delay)

Full Context

configure service vprn subscriber-interface ipv6 dhcp6 relay advertise-selection solicit-delay

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection solicit-delay

configure service ies subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection solicit-delay

Description

This command configures the default time to delay DHCPv6 Solicit messages. The delay is applied to all DHCPv6 Solicit messages for which no per DHCPv6 server or per client MAC delay or preference option value is configured.

The **no** form of this command removes the delay timeout.

Parameters

delay

Specifies the default amount of time to delay DHCPv6 Solicit messages, in deciseconds.

Values 1 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection client-mac solicit-delay

configure service ies subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection client-mac solicit-delay

Description

This command configures the time to delay DHCPv6 Solicit messages with an odd or even source MAC address.

The **no** form of this command removes the delay timeout.

Parameters

delay

Specifies the time to delay DHCPv6 Solicit messages with an odd or even source MAC address, in deciseconds.

Values 1 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure router dhcp6 local-dhcp-server lease-hold-time-for solicited-release

configure service vprn dhcp local-dhcp-server lease-hold-time-for solicited-release

Description

This command enables the server to hold up a lease even in case of solicited release; for example, when the server receives a normal DHCP release message.

The **no** form of this command disables the ability of the server to hold up a lease when a solicited release is received.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.283 sonet-sdh

sonet-sdh

Syntax

sonet-sdh

Context

[Tree] (config>port sonet-sdh)

Full Context

configure port sonet-sdh

Description

This command enables access to the context to configure SONET/SDH ports. This context can only be used when configuring an OC-3 and OC-12 SONET/SDH ports on an appropriate MDA.

This command also enables access to the context to configure SONET/SDH parameters for an Ethernet port in WAN PHY (xgig wan) mode.

The 10 Gigabit Ethernet LAN port also has SONET/SDH characteristics. However, these characteristics are predetermined and not configurable.

This command is supported by TDM satellite.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vpls sap igmp-snooping static group source

configure service vpls mesh-sdp igmp-snooping static group source

configure service vpls sap mld-snooping static group source

Description

This command specifies a IPv4 or IPv6 unicast address that sends data on an interface. This enables a multicast receiver host to signal a router the group to receive multicast traffic from, and from the sources that the traffic is expected.

The **source** command is mutually exclusive with the specification of individual sources for the same group.

The **source** command in combination with the group is used to create a specific (S,G) static group entry.

Static (s,g) entries cannot be entered when a starg is already created.

Use the **no** form of this command to remove the source from the configuration.

Parameters

ip-address

Specifies the IPv4 unicast address

src-ipv6-address

Specifies the IPv6 unicast address.

Platforms

All

source

Syntax

source *ip-address*

no source

Context

[Tree] (config>service>vprn>if>sap>ip-tunnel source)

[Tree] (config>service>ies>if>sap>ip-tunnel source)

Full Context

configure service vprn interface sap ip-tunnel source

configure service ies interface sap ip-tunnel source

Description

This command configures the source IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The IPv4 or IPv6 address must belong to the one of the IP subnets associated with the public SAP interface of the tunnel-group. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the source address contains an IPv6 address it must be a global unicast address.

The **no** form of this command deletes the source address from the tunnel configuration. The tunnel must be administratively shutdown before issuing the **no source** command.

Default

no source

Parameters

ip-address

Specifies an IPv4 address or an IPv6 address.

Values

ipv4-address	a.b.c.d	
ipv6-address		x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
	x	[0..FFFF]H
	d	[0..255]D

Description

This command specifies the source IP address for the group range. Whenever a (*,G) report is received in the range specified by **grp-range** *start* and *end* parameters, it is translated to an (S,G) report with the value of this object as the source address.

Parameters

ip-address

Specifies the IP address that will be sending data.

Platforms

All

source

Syntax

[**no**] **source** *unicast-ip-prefix/mask*

Context

[Tree] (config>service>vprn>msdp source)

Full Context

configure service vprn msdp source

Description

This command limits the number of active source messages the router accepts from sources in the specified address range.

If the prefix and mask provided is already a configured then this command only provides the context to configure the parameters pertaining to this active source-message filter.

If the prefix and mask provided is not already a configured, then the source node instance must be created and the context to configure the parameters pertaining to this node should be provided. In this case, the $ prompt to indicate that a new entity (source) is being created should be used.

The source active msdp messages are not rate limited based on the source address range.

The **no** form of this message removes the source active rate limiter for this source address range.

Parameters

unicast-ip-prefix

Specifies the IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area.

Values ip-prefix/mask: ip-prefix a.b.c.d (host bits must be 0)

mask

Specifies the subnet mask for the range expressed as a decimal integer mask length or in dotted decimal notation.

Values 0 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

Platforms

no source *source-type*

Context

[Tree] (config>app-assure>group>anl source)

Full Context

configure application-assurance group access-network-location source

Description

This command configures location sources for the dynamic experience management. The location source types are, for example, 3G and congestion point.

Default

source mobile-3g

Parameters

source-type

Specifies the location or access technology.

Values **access-point** — Provides Dynamic Experience Management (DEM) for the WLGW access point.

Note:
The access points do not need to support the Nokia CEA function.

level

Specifies which congestion point within the specified source-type to monitor for congestion.

Values **MAC+VLAN** — WLGW access point (MAC) and radio (VLAN).

Note:
The access points do not need to support the Nokia CEA function.

[Tree] (config>oam-pm>session>ethernet source)

Full Context

configure oam-pm session ethernet source

Description

This command defines the source launch point identification Y.1731 parameters that are used by the individual tests within the session. If an MEP matching the configuration does not exist, the session is allowed to become active, however the frames sent frames and received as seen under the **show >oam-pm>statistics>session** *session-name* command is zero. The preferred reference to the MEP launch point is by *admin-name*. Therefore, the syntax **source mep** *mep-id* **domain-name** *admin-name* **association-name** *admin-name* should be used.

The **no** form of this command removes this session parameter.

Parameters

mep-id

Specifies the maintenance association end point identifier of the launch point.

Values 1 to 8191

md-index

Specifies the maintenance domain (MD) index value of the launch point. The **domain-name** *admin-name* parameter is preferred for specifying the domain information.

Values 1 to 4294967295

ma-index

Specifies the maintenance association (MA) index value of the launch point. The **association-name** *ma-name* parameter is preferred for specifying the association information.

Values 1 to 4294967295

admin-name

Specifies the name reference for the maintenance domain (MD), or the association (MA) *admin-name* value of the launch point, up to 64 characters.

Platforms

All

source

Syntax

source *ip-address*

no source

Context

[Tree] (config>oam-pm>session>ip source)

Full Context

configure oam-pm session ip source

Description

This command defines the source IP address that the session controller (launch point) uses for the test. The source address must be a local resident IP address in the context; otherwise, the response packets are processed by the TWAMP Light application. Only source addresses configured as part of TWAMP tests can process the reflected TWAMP packets from the session reflector.

The **no** form of this command removes the source address parameters.

Parameters

source

Indicates the launch point.

ip-address

Specifies the source IP address that the session controller (launch point) uses for the test.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Platforms

source

Syntax

source {**line-ref** | **internal-clock**}

Context

[Tree] (config>system>sync-if-timing>bits>output source)

Full Context

configure system sync-if-timing bits output source

Description

This command configures the values used to identify the source of the BITS (Building Integrated Timing Supply) output. This is either the signal recovered directly from ref1, ref2 or ptp, or it is the output of the node's central clock. The directly recovered signal would be used when the BITS output signal is feeding into an external standalone timing distribution device (BITS/SASE). The specific directly recovered signal

used is the best of the available signals based of the QL and/or the ref-order. The central clock output would be used when no BITS/SASE device is present and the BITS output signal is used to monitor the quality of the recovered clock within the system.

Default

source line-ref

Parameters

line-ref

Specifies that the BITS output timing is selected from one of the input references, without any filtering.

internal-clock

Specifies that the BITS output timing is driven from the system timing.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source *ip-address*

no source

Context

[Tree] (config>router>if>if-attr>delay>dyn>twamp>ipv4 source)

Full Context

configure router interface if-attribute delay dynamic twamp-light ipv4 source

Description

This command configures the unicast IPv4 address used as the source of the TWAMP Light test packet. When this command is not configured, the primary IPv4 address, or the reference IPv4 address in the case of unnumbered interfaces, is used as the source. This command can be used when the IPv4 primary address or reference interface is not the desired source address for the packet.

Changes are allowed without administratively disabling the IPv4 protocol.

The **no** form of this command removes the specified address, which causes the source address to be auto-learned.

Default

no source

Parameters

ip-address

Specifies TWAMP Light IPv4 source address.

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source

Syntax

source *ipv6-address*

no source

Context

[Tree] (config>router>if>if-attr>delay>dyn>twamp>ipv6 source)

Full Context

configure router interface if-attribute delay dynamic twamp-light ipv6 source

Description

This command configures the IPv6 address used as the source of the TWAMP Light test packet. When this command is not configured, no source address is present and an error is raised to prevent the transmission of the test packet.

The IPv6 protocol can be enabled even without addressing. However, the test will not transmit packets. The link local address must be in the form fe80::/64 in accordance with RFC 4291, *IP Version 6 Addressing Architecture*.

The **no** form of this command removes the specified address.

Default

no source

Parameters

ipv6-address

Specifies the TWAMP Light IPv6 source address.

Values

ipv6-address:	x:x:x:x:x:x:x:x
	x - [0 to FFFF]H
	unicast and link local IPv6 address only

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service ies interface ipv6 dhcp6-relay source-address

configure service ies subscriber-interface ipv6 dhcp6 relay source-address

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay source-address

Description

This command configures the source IPv6 address of the DHCPv6 relay messages.

The **no** form of this command reverts to the default.

Parameters

ipv6-address

Specifies the source IPv6 address of the DHCPv6 relay messages.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

d: [0 to 255]D

Platforms

All

- configure service ies interface ipv6 dhcp6-relay source-address
- configure service vprn interface ipv6 dhcp6-relay source-address

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface ipv6 dhcp6 relay source-address

source-address *ip-address*

no source-address

Context

[Tree] (config>aaa>l2tp-acct-plcy>radius-acct-server source-address)

Full Context

configure aaa l2tp-accounting-policy radius-accounting-server source-address

Description

This command configures the source address of the RADIUS messages.

The **no** form of this command reverts to the default value.

Parameters

ip-address

Specifies the source address to be used for NAT RADIUS accounting.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-address

Syntax

source-address *ip-address*

no source-address

Context

[Tree] (config>system>management-interface>remote-management source-address)

Full Context

configure system management-interface remote-management source-address

Description

This command configures the address local to this device that NISH uses to connect to this node.

If this command is also configured for a specific manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command causes the system to select the source address based on the selected routing instance of the manager.

Parameters

ip-address

Specifies the IP address that NISH managers use to connect to the node.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

Platforms

source-address

Syntax

source-address *ip-address*

no source-address

Context

[Tree] (config>system>management-interface>remote-management>manager source-address)

Full Context

configure system management-interface remote-management manager source-address

Description

This command configures the address local to this device that this NISH manager uses to connect to this node.

This command takes precedence over the command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command causes the source address to be inherited from the global context (**config**>**system**>**management-interface**>**remote-management**).

Parameters

ip-address

Specifies the IP address that NISH managers use to connect to the node.

Values

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

Full Context

configure subscriber-mgmt radius-accounting-policy radius-accounting-server source-address

configure subscriber-mgmt authentication-policy radius-authentication-server source-address

Description

This command configures the source address of the RADIUS packet.

The system IP address must be configured in order for the RADIUS client to work. See Configuring a System Interface in the Router Configuration Guide.

Note:
The system IP address must only be configured if the source-address is not specified. When the **no source-address** command is executed, the source address is determined at the moment the request is sent. This address is also used in the nas-ip-address attribute: over there it is set to the system IP address if **no source-address** was given.

The **no** form of this command reverts to the default value.

Default

System IP address

Parameters

ip-address

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-address

Syntax

source-address *ip-address* [**allow-connections**]

no source-address

Context

[Tree] (config>aaa>diam>node source-address)

Full Context

configure aaa diameter node source-address

Description

This command configures IPv4 source address that the SR OS node will use for its peering connection.

The **no** form of this command removes the IP address from the configuration.

Parameters

ip-address

Specifies IP prefix for the IP match criterion in dotted decimal notation

Values 0.0.0.0 **to** 255.255.255.255

allow-connections

Specifies to accept peering connections on the configured source IPv4 address. The peer initiating the connection can only be an inter-chassis peer.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-address

Syntax

source-address

Syntax

source-address *ip-address*

no source-address

Context

[Tree] (config>router>ldp>lsp-bfd source-address)

Full Context

configure router ldp lsp-bfd source-address

Description

This command configures the source address of periodic LSP ping packets and BFD control packets for LSP BFD sessions that are associated with LDP prefixes in the prefix list. The system IP address is used by default. If the system IP address is not routable from the far-end node of the BFD session, then an alternate routable IP address that is local to the source node should be used.

Default

no source-address

Parameters

ip-address

Specifies a routable IPv4 or IPv6 address that is local to the node.

Values *ipv4-address* — a.b.c.d

ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x — 0 to FFFF in hexadecimal

d — 0 to 255 in decimal

configure application-assurance radius-accounting-policy radius-accounting-server source-address

Description

This command configures the source address of the RADIUS packet. The system IP address must be configured in order for the RADIUS client to work. See "Configuring a System Interface" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide*. The system IP address must only be configured if the source-address is not specified. When the **no source-address** command is executed, the source address is determined at the moment the request is sent. This address is also used in the nas-ip-address attribute: over there it is set to the system IP address if no source address was given.

The **no** form of this command reverts to the default value, where the source address is the system IP address.

Default

no source-address

Parameters

ip-address

The IP prefix for the IP match criterion in dotted decimal notation.

Values 0.0.0.0 - 255.255.255.255

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-address

Syntax

source-address *ip-address*

no source-address

Context

[Tree] (config>service>ipfix>export-policy>collector source-address)

Full Context

configure service ipfix ipfix-export-policy collector source-address

Description

This command configures the source address from which UDP streams containing IPFIX flow records will be sourced.

Default

no source-address

Parameters

ip-address

Source IPv4 address from which UDP streams are sent.

Platforms

All

source-address

Syntax

source-address *ip-address*

no source-address

Context

[Tree] (config>filter>gre-tun-tmp>ipv4 source-address)

Full Context

configure filter gre-tunnel-template ipv4 source-address

Description

This command defines the source IPv4 address to be used in the GRE IP header used to encapsulate the matching IPv4/IPv6 packet. This IP address can be configured as any value and is not validated against a local IP address. The **source-address** command must be configured for the template to be valid.

The **no** form of this command removes the source IP address configuration from the associated GRE tunnel template.

Parameters

ip-address

Specifies the IPv4 address (in dotted decimal notation) to be used as the source address.

Platforms

All

source-address

Syntax

source-address [*ip-address*]

no source-address

Context

[Tree] (config>filter>redirect-policy>dest>ping-test source-address)

Full Context

configure filter redirect-policy destination ping-test source-address

Description

This command configures the source address to use in the IP packet of the ping test for this destination.

Default

no source-address

Parameters

ip-address

The source address of the IP packet. This can be IPv4 only for an IPv4 destination and IPv6 only for an IPv6 destination.

Values

ipv4-address:	a.b.c.d.
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Platforms

All

source-address

Syntax

source-address

Context

[Tree] (config>system>security source-address)

Full Context

configure system security source-address

Description

This command configures the IP source address that is used in all unsolicited packets sent by the application.

The configured source address applies only to packets transmitted in-band (for example, a network port on an IOM). Packets transmitted out-of-band on the management interface on the CPM Ethernet port use the address of the CPM Ethernet port as the IP source address in the packet.

When a source address is specified for the **ptp** application, the port-based 1588 hardware timestamping assist function will be applied to PTP packets matching the IPv4 address of the router interface used to ingress the SR/ESS or IP address specified in this command. If the IP address is removed, then the port-based 1588 hardware timestamping assist function will only be applied to PTP packets matching the IPv4 address of the router interface.

Platforms

configure system security dot1x radius-plcy source-address

Description

This command configures the NAS IP address to be sent in the RADIUS packet.

The **no** form of this command reverts to the default value.

Parameters

ip-address

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255

Platforms

All

source-address

Syntax

source-address *ip-address*

source-address prefix-list *prefix-list-name*

no source-address

Context

[Tree] (config>router>policy-options>policy-statement>entry>from source-address)

Full Context

configure router policy-options policy-statement entry from source-address

Description

This command specifies the source address that is embedded in the join or prune packet as a filter criterion.

The **no** form of this command removes the criterion from the configuration.

This command specifies a multicast data source address as a match criterion for this entry.

Default

no source-address

Parameters

ip-address

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

prefix-list-name

The prefix list name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms

All

source-address

Syntax

source-address *ipv6-address*

no source-address

Context

[Tree] (config>router>segment-routing>srv6 source-address)

Full Context

configure router segment-routing segment-routing-v6 source-address

Description

This command configures the global default source IPv6 address used in the SA field of the outer IPv6 header of the SRv6 encapsulated packet. This value is inherited in the BGP and service contexts by default, but can be overwritten in each context. A maximum of 16 address values can be configured in all contexts in the system.

There is no default value for this command. A default source IPv6 address must be configured in this context or in the BGP or service context. The system does not check if the entered address is a valid local address.

The **no** form of this command removes the source IPv6 address from the configuration.

Parameters

ipv6-address

Specifies the source IPv6 address of the SRv6.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

source-address

Syntax

source-address *ipv6-address*

no source-address

Context

[Tree] (config>router>bgp>srv6 source-address)

Full Context

configure router bgp segment-routing-v6 source-address

Description

This command configures the source IPv6 address for SRv6.

This command overrides the source IPv6 address for all address families in the base router instance. By default, BGP uses the value from the top level configuration under **config**>**router**>**segment-routing**>**segment-routing-v6**.

The **no** form of this command removes the source IPv6 address from the configuration.

Default

no source-address

Parameters

ipv6-address

Specifies the source IPv6 address of the SRv6.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

source-address-range

Syntax

source-address-range *start-ip-address*

no source-address-range

Context

[Tree] (config>aaa>isa-radius-plcy>servers source-address-range)

Full Context

configure aaa isa-radius-policy servers source-address-range

Description

This command specifies the first IP address in the range of IPv4 addresses that are assigned to a BB-ISA in a given NAT group for NAT RADIUS accounting. The IP addresses are unique within the NAT group and are used to bind the RADIUS client instantiated on each BB-ISA card. The number of IPv4 addresses allocated is equal to the number of BB-ISAs in a NAT group that are enabled for NAT RADIUS accounting. Although only the first IPv4 address is explicitly configured with this command, each internally allocated IPv4 address associated with the BB-ISA card can be seen in the routing table (via show commands) as /32 with protocol designation 'NAT'.

Default

no source-address-range

Parameters

start-ip-address

The starting IP address of the IP address range.

Values 0.0.0.0 - 255.255.255.255

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-address-range

Syntax

[**no**] **source-address-range start** *ip-address* **end** *ip-address*

Context

[Tree] (config>service>vprn>wlan-gw>gtp>source-ranges source-address-range)

Full Context

configure service vprn wlan-gw gtp source-ranges source-address-range

Description

This command configures a range of IP addresses used by ISA MDA's as source address in GTP messages.

The **no** form of this command removes the IP address ranges.

Parameters

start ip-address

Specifies the start of the source IP address range.

Values ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x [0..FFFF]H
d [0..255]D

end ip-address

Specifies the end of the source IP address range.

Values ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x [0..FFFF]H
d [0..255]D

23.287 source-bmac

source-bmac

Syntax

source-bmac *ieee-address*

no source-bmac

Context

[Tree] (config>service>pbb source-bmac)

Full Context

configure service pbb source-bmac

Description

This command configures the source B-VPLS MAC address to use with PBB and provisions a chassis level source B-MAC.

Parameters

ieee-address

The MAC address assigned to the B-MAC. The value should be input in either a xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

Platforms

All

source-bmac

Syntax

source-bmac *ieee-address*

Context

[Tree] (config>service>vpls>pbb source-bmac)

Full Context

configure service vpls pbb source-bmac

Description

This command configures the base source B-MAC for the B-VPLS. The first 32 bits must be the same with what is configured in the MC-LAG peer. If not configured here, it will inherit the chassis level B-MAC configured under the new PBB object added in the previous section. If the **use-sap-bmac** command is on, the value of the last 16 bits (lsb) of the source B-MAC must be part of the **reserved-source-bmac-lsb** configured at chassis level, under service PBB component. If that is not the case, the command will fail.

Platforms

All

23.288 source-bmac-lsb

source-bmac-lsb

Syntax

source-bmac-lsb *MAC-Lsb* [**es-bmac-table-size** *size*]

no source-bmac-lsb

Context

[Tree] (config>service>system>bgp-evpn>eth-seg source-bmac-lsb)

Full Context

configure service system bgp-evpn ethernet-segment source-bmac-lsb

Description

This command configures the least significant two bytes of the B-MAC used as the source B-MAC for packets generated from the Ethernet-Segment in PBB-EVPN.

When the multi-homing mode is **all-active**, this value and the first high order four bytes must match on all the PEs that are part of the same Ethernet-Segment.

The **es-bmac-table-size** parameter modifies the default value (8) for the maximum number of virtual bmacs that can be associated to the Ethernet-Segment, that is, the es-bmacs. When the **source-bmac-lsb** is configured, the associated **es-bmac-table-size** is reserved out of the total FDB. The es-bmac will consume a separate B-MAC per B-VPLS that is linked to an Ethernet-Segment.

Parameters

MAC-Lsb

Specifies the two least significant bytes of the es-bmac.

Values 1 to 65535, or xx-xx or xx:xx

size

Specifies the reserved space in the FDB for a specified es-bmac. By default the system reserves 8 entries for a specified Ethernet-Segment B-MAC.

Values 1 to 511999

Default 8

Platforms

All

source-bmac-lsb

Syntax

source-bmac-lsb *mac-lsb* **control-pw-vc-id** *vc-id*

no source-bmac-lsb

Context

[Tree] (config>service>sdp source-bmac-lsb)

Full Context

configure service sdp source-bmac-lsb

Description

This command defines the 16 least significant bits (lsb) which, when combined with the 32 most significant bits of the PBB **source-bmac**, are used as the virtual backbone MAC associated with this SDP. The virtual backbone MAC is used as the source backbone MAC for traffic received on a PBB EPIPE spoke-SDP with **use-sdp-bmac** configured (that is, a redundant pseudowire) and forwarded into the B-VPLS domain.

The control-pw-vc-id defines VC identifier of the spoke-SDP relating to the control pseudowire whose status is to be used to determine whether SPBM advertises this virtual backbone MAC. This is a mandatory parameter when the **source-bmac-lsb** is added or changed. The spoke SDP must have the parameter **use-sdp-bmac** for the control pseudowire to be active.

Default

no source-bmac-lsb

Parameters

mac-lsb

Specifies the 16 least significant bits of the virtual backbone MAC associated with this SDP.

Values 1 to 65535 or xx-xx or xx:xx

control-pw-vc-id *vc-id*

Specifies the VC identifier of the control pseudowire.

Values 1 to 4294967295

no source-class

Context

[Tree] (config>router>policy-options>policy-statement>entry>action source-class)

[Tree] (config>router>policy-options>policy-statement>default-action source-class)

Full Context

configure router policy-options policy-statement entry action source-class

configure router policy-options policy-statement default-action source-class

Description

This command specifies the policy accounting source class index to associate with matched routes.

Parameters

value

Specifies the default operational source-class for this policy statement.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

23.290 source-destination-prefix

source-destination-prefix

Syntax

[**no**] **source-destination-prefix**

Context

[Tree] (config>cflowd>collector>aggregation source-destination-prefix)

Full Context

configure cflowd collector aggregation source-destination-prefix

Description

This command configures cflowd aggregation based on source and destination prefixes.

The **no** form of this command removes this type of aggregation from the collector configuration.

Platforms

All

23.291 source-ip

source-ip

Syntax

source-ip *ip-address*

no source-ip

Context

[Tree] (config>subscr-mgmt>shcv-policy>vpls source-ip)

Full Context

configure subscriber-mgmt shcv-policy vpls source-ip

Description

This command configures the IPv4 address to be used as source address for connectivity verification in a VPLS service.

The **no** form of this command reverts to the default.

Parameters

ip-address

Specifies the IPv4 address to be used as source address for connectivity verification in a VPLS service.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-ip

Syntax

source-ip *ipv6-address*

no source-ip

Context

[Tree] (config>service>ies>sub-if>wlan-gw>pool-manager>dhcp6-client source-ip)

[Tree] (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client source-ip)

Full Context

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client source-ip

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client source-ip

Description

This command specifies the source-ip to be used by the DHCPv6 client.

The **no** form of this command removes the specific source-ip. In this case the DHCPv6 client will fall back to the IP address configured on the outgoing interface.

Parameters

ipv6-address

Specifies the IPv6 address, up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.292 source-ip-address

source-ip-address

Syntax

Full Context

configure service vprn subscriber-interface group-interface sap static-host managed-routes route-entry cpe-check source-ip-address

configure service ies subscriber-interface group-interface sap static-host managed-routes route-entry cpe-check source-ip-address

Description

This command configures the source IP address used in ICMP messages. When not specified, the system uses the address of the appropriate address family.

The **no** form of this command removes the IP address.

Parameters

ip-address

Specifies the source IP address.

Values ipv4-prefix: a.b.c.d

ipv6-prefix:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.293 source-ip-address-ranges

source-ip-address-ranges

Syntax

source-ip-address-ranges

Context

[Tree] (config>service>vprn>wlan-gw>gtp source-ip-address-ranges)

configure service vprn wlan-gw gtp source-ip-address-ranges

Description

Commands in this context configure IP addresses used by the ISA MDA's as source address in GTP messages

23.294 source-ip-origin

source-ip-origin

Syntax

source-ip-origin {**interface** | **vrrp**}

no source-ip-origin

Context

[Tree] (config>subscr-mgmt>shcv-policy>layer-3 source-ip-origin)

Full Context

configure subscriber-mgmt shcv-policy layer-3 source-ip-origin

Description

This command selects the source IP address to be used for SHCV messages.

The **no** form of this command reverts to the default.

Parameters

interface

Specifies to use the interface IP as the source address of SHCV.

vrrp

Specifies to use the VRRP configured IP as the source address of SHCV.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.295 source-mac

source-mac

Syntax

source-mac *ieee-address*

no source-mac

Context

[Tree] (config>subscr-mgmt>shcv-policy>vpls source-mac)

Full Context

configure subscriber-mgmt shcv-policy vpls source-mac

Description

Specifies the MAC address to be used as source address for connectivity verification in a VPLS service.

The **no** form of this command reverts to the default.

Parameters

ieee-address

Specifies the 48-bit MAC address in the xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.296 source-override

source-override

Syntax

source-override *ip-address* [**create**]

no source-override *ip-address*

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel source-override)

Full Context

configure mcast-management multicast-info-policy bundle channel source-override

Description

This command defines a multicast channel parameter override context for a specific multicast sender within the channel range. The specified sender's IP address must be the same IP type, IPv4 or IPv6, as defined in the **channel** command.

The **no** form of this command removes the specified sender override context from the channel range.

Parameters

ip-address

Specifies either an IPv4 or IPv6 address and must be the same IP type as the containing **channel** command range.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x - [0 to FFFF]H
		d - [0 to 255]D

create

The **create** keyword is required if creating a new source override when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the specified source override IP address already exists.

Platforms

All

23.297 source-port

source-port

Syntax

source-port *port-num*

no source-port

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>video source-port)

Full Context

configure mcast-management multicast-info-policy bundle video source-port

Description

This command configures the source port for upstream RET requests. The **source-port** *port-num* value is the only configuration parameter in the bundle "default" context.

The **no** form of the command removes the value from the configuration.

Parameters

port-num

Specifies the source port in the received RTP multicast stream.

Values 1024 to 65535

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

source-port

Syntax

source-port *port-id*

no source-port

Context

[Tree] (config>system>sync-if-timing>ref2 source-port)

[Tree] (config>system>sync-if-timing>ref1 source-port)

Full Context

configure system sync-if-timing ref2 source-port

configure system sync-if-timing ref1 source-port

Description

This command configures the source port for timing reference **ref1** or **ref2**. If the port is unavailable or the link is down, then the reference sources are re-evaluated according to the reference order configured in the **ref-order** command.

In addition to physical port on the 7750 SR, T1 or E1 channels on a channelized OC3/OC12/STM1/STM4 Circuit Emulation Service port can be specified if they are using adaptive timing.

There are restrictions on the source-port location for **ref1** and **ref2** based on platform. Refer to the description of the **ref1** command for details.

Default

no source-port

Parameters

port-id

Identifies the physical port in the *slot/mda/port*, **esat**-*id*/*slot*/*port*, or **pxc**-*id*.*sub-port* format.

Values *slot*/*mda*/*port* [.*channel*]

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-port

Syntax

source-port *port*

source-port grpc

no source-port

Context

[Tree] (config>system>management-interface>remote-management source-port)

Full Context

configure system management-interface remote-management source-port

Description

This command configures the TCP port local to this device that NISH uses to send packets to this node.

If this command is also configured for a specific manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command causes the system to select the default gRPC port, 57400.

Default

source-port grpc

Parameters

port

Specifies the TCP source port.

Values 1 to 65535

grpc

Keyword that specifies the default gRPC protocol port as the source port.

Platforms

All

source-port

Syntax

source-port *port*

source-port grpc

no source-port

Context

[Tree] (config>system>management-interface>remote-management>manager source-port)

Full Context

configure system management-interface remote-management manager source-port

Description

This command configures the TCP port local to this device that this NISH manager uses to send packets to this node.

This command takes precedence over the same command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command causes the source port to be inherited from the global context (**config**>**system**>**management-interface**>**remote-management**).

Parameters

port

Specifies the TCP source port.

Values 1 to 65535

Default 57400

grpc

Keyword that specifies the default gRPC protocol port as the source port.

Platforms

All

23.298 source-prefix

source-prefix

Syntax

[**no**] **source-prefix**

Context

[Tree] (config>cflowd>collector>aggregation source-prefix)

configure cflowd collector aggregation source-prefix

Description

This command configures cflowd aggregation based on source prefix information.

The **no** form of this command removes this type of aggregation from the collector configuration.

Platforms

All

source-prefix

Syntax

no source-prefix

source-prefix *ipv6-address/prefix-length*

Context

[Tree] (config>aaa>isa-radius-plcy>servers>ipv6 source-prefix)

Full Context

configure aaa isa-radius-policy servers ipv6 source-prefix

Description

This command configures an IPv6 prefix containing individual /128 addresses. These addresses are used as the source address for connections to IPv6 RADIUS servers.

The prefix must be large enough to accommodate all BB-ISAs or ESA VMs in the system.

The **no** form of this command removes the IPv6 prefix.

Default

no source-prefix

Parameters

ipv6-address/prefix-length

Specifies an IPv6 address and prefix length for the address.

Values

ipv6-prefix:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

d: [0 to 255]D

prefix-length: 0 to 128

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-prefix

Syntax

source-prefix *ip-prefix/length* **nat-policy** *nat-policy-name*

no source-prefix *ip-prefix/length*

Context

[Tree] (config>router>nat>inside source-prefix)

[Tree] (config>service>vprn>nat>inside source-prefix)

Full Context

configure router nat inside source-prefix

configure service vprn nat inside source-prefix

Description

This command configures the source prefix used to identify traffic for NAT processing. After the traffic is diverted to the ESA-VM or vISA, its source IP address is checked to determine if it belongs to the configured prefix. If it does, the traffic is processed by NAT, otherwise, it is dropped.

The **no** form of this command removes the source prefix used to identify traffic for NAT processing.

Parameters

nat-policy-name

Specifies the NAT policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.299 source-prefix-list

source-prefix-list

Syntax

source-prefix-list *prefix-list-name*

no source-prefix-list

Context

[Tree] (config>router>nat>inside source-prefix-list)

[Tree] (config>service>vprn>nat>inside source-prefix-list)

Full Context

configure router nat inside source-prefix-list

configure service vprn nat inside source-prefix-list

Description

This command references the **nat-prefix-list** that contains source IP addresses on the inside (private side).

The source IP addresses on the inside must be known in advance in a **dnat-only** instance. This is required so the corresponding routes can be installed in the routing table and thus the downstream traffic is properly routed towards the MS-ISAs where the original translation was performed (and state is kept).

In the **dnat-only** case, it is mandatory that the inside (private side) and the outside (public side) are in separated VPRNs.

Parameters

prefix-list-name

Specifies the name, up to 32 characters in length, of the NAT prefix list that contains the source IP addresses (original IP addresses).

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.300 source-prefix-only

source-prefix-only

Syntax

[**no**] **source-prefix-only**

Context

[Tree] (config>router>nat>inside>traffic-identification source-prefix-only)

[Tree] (config>service>vprn>nat>inside>traffic-identification source-prefix-only)

Full Context

configure router nat inside traffic-identification source-prefix-only

configure service vprn nat inside traffic-identification source-prefix-only

Description

This command enables the identification of traffic that is subject to NAT processing based on the source IP address in the packet.

Traffic is diverted to the ESA-VM or vISA for NAT processing using a configured destination prefix or a IPv4 filter. When this command is configured, after traffic arrives on the ESA-VM or vISA, the source IP address in the packet determines whether the traffic is processed by NAT or dropped. If the source IP address belongs to the configured source-prefix, traffic is processed by NAT. Otherwise, it is discarded.

Use the following commands to configure the source prefix:

configure service vprn nat inside source-prefix

configure router nat inside source-prefix

If traffic identification based on the source IP address is disabled, all traffic arriving to the ESA-VM or vISA is subject to NAT processing.

The **no** form of this command disables the identification of traffic that is subject to NAT processing.

Default

no source-prefix-only

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.301 source-udp-port

source-udp-port

Syntax

source-udp-port *udp-port-number*

no source-udp-port

Context

[Tree] (config>oam-pm>session>ip source-udp-port)

Full Context

configure oam-pm session ip source-udp-port

Description

This command should only be used when the source UDP port for the session-sender twamp-test packet must be specified.

The **no** form of this command means the session-sender automatically assigns the source UDP port from the available dynamic (private) UDP range.

Parameters

udp-port-number

Specifies the UDP source port.

Values 64374 to 64383

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-udp-port-pools

Syntax

source-udp-port-pools

Context

[Tree] (config>test-oam>twamp>twamp-light source-udp-port-pools)

Full Context

configure test-oam twamp twamp-light source-udp-port-pools

Description

Commands in this context configure the source UDP port pool allocation for TWAMP Light applications.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.303 source-vtep-security

source-vtep-security

Syntax

[**no**] **source-vtep-security**

Context

[Tree] (config>service>vpls>vxlan source-vtep-security)

Full Context

configure service vpls vxlan source-vtep-security

Description

This command enables the outer IP Source Address lookup of incoming VXLAN packets, and discards those coming from untrusted VTEPs. The list of trusted VTEPs is shown in the **show service vxlan** command. Specifically, it shows the existing learned EVPN VTEPs (always trusted), and the statically configured VTEPs in any service (Epipe and VPLS).

The command is supported in VXLAN instances with static egress VTEPs or VXLAN instances with EVPN created VTEPs.

The **no** version of this command disables the outer IP source address lookup.

Default

no source-vtep-security

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.304 sp-reverse-route

sp-reverse-route

Syntax

sp-reverse-route [**ignore-default-route**]

no sp-reverse-route

Context

[Tree] (config>ipsec>tnl-temp sp-reverse-route)

Full Context

configure ipsec tunnel-template sp-reverse-route

Description

This command enables the system to automatically create a reverse route based on dynamic LAN-to-LAN tunnel's TSi in private service.

If **ignore-default-route** is specified, the system ignores any full range traffic selector when creating a reverse route. Otherwise, the system refuses to create a CHILD_SA if any full range traffic selector is included in TSi.

The **no** form of this command disables sp-reverse-route.

Default

no sp-reverse-route

Parameters

ignore-default-route

Specifies to ignore any full range traffic selector in TSi.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.305 space

space

Syntax

[**no**] **space**

no spb

Context

[Tree] (config>service>vpls>spoke-sdp spb)

[Tree] (config>service>vpls spb)

[Tree] (config>service>vpls>sap spb)

Full Context

configure service vpls spoke-sdp spb

configure service vpls spb

configure service vpls sap spb

Description

This command enables Shortest Path Bridging (SPB) on a B-VPLS instance. SPB uses IS-IS that supports multiple instances, therefore an instance must be specified. The declaration of SPB in this context is the control configuration for the SPB. This is an SPB management interface and it manages the configuration for IS-IS. Various parameters that define this SPB instance are configured under this SPB instance. Several of the parameters are shared with other B-VPLS service instances using SPB.

SPB enables an instance of IS-IS protocol with the **no shutdown** command. Alternatively, the IS-IS protocol instance under SPB is disabled with the **shutdown** command in the **config>service>vpls b-vpls>spb** context.

A Forwarding Identifier (FID) is optionally specified which is an abstraction of the BVID used for forwarding in SPB. When no FID is configured the control VPLS is advertised with FID value 1. When a FID value is specified, the control VPLS is advertised and associated with the FID value specified. The default algorithm for any FID declared or implicit is low-path-id. When a FID is specified, the ect-algorithm can be specified for the FID and changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID for a control instance cannot be changed after it is created. To change a FID the SPB component would have to be shutdown, deleted and re-created with a new FID.

Note:
SPB operates with disable-learning, disable aging and discard-unknown. The state of these commands is ignored when SPB is configured.

Default

no spb

Parameters

isis-instance

Specifies the instance ID for an SPB IS-IS instance.

Values 1024 to 2047 (4 available)

Default 1024

FID

Specifies the FID value.

Values 1 to 4095

Default 1

Platforms

All

23.307 spbm-control-vpls

spbm-control-vpls

Syntax

spbm-control-vpls *service-id* **fid** *fid*

no spbm-control-vpls

Context

[Tree] (config>service>vpls>b-vpls spbm-control-vpls)

Full Context

configure service vpls b-vpls spbm-control-vpls

Description

This command associates a user B-VPLS with a particular control B-VPLS and a FID. The ECT algorithm and the behavior of unicast and multicast come from the association to the FID.

A Forwarding Identifier (FID) is specified which is an abstraction of the BVID used for forwarding in SPB. The ect-algorithm is associated with the FID and can be changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID must be independent from the FID assigned to other services.

Parameters

service-id

The B-VPLS service identifier.

Values 1 to 2147483647 | *svc-name*: 64 characters max

fid

The forwarding identifier.

Values 1 to 4095

23.308 spe-address

spe-address

Syntax

spe-address *global-id:prefix*

no spe-address

Context

[Tree] (config>service>pw-routing spe-address)

Full Context

configure service pw-routing spe-address

Description

This command configures a single S-PE Address for the node to be used for dynamic MS-PWs. This value is used for the pseudowire switching point TLV used in LDP signaling, and is the value used by pseudowire status signaling to indicate the PE that originates a pseudowire status message. Configuration of this parameter is mandatory to enable dynamic MS-PW support on a node.

If the S-PE Address is not configured, spoke-sdps that use dynamic MS-PWs and pw-routing local-prefixes cannot be configured on a T-PE. Furthermore, the node will send a label release for any label mappings received for FEC129 AII type 2.

The S-PE Address cannot be changed unless the dynamic ms-pw configuration is removed. Furthermore, changing the S-PE Address will also result in all dynamic MS-PWs for which this node is an S-PE being released. It is recommended that the S-PE Address should be configured for the life of an MS-PW configuration after reboot of the router.

The **no** form of this command removes the configured S-PE Address.

Default

no spe-address

Parameters

global-id

Specifies a 4-octet value that is unique to the service provider. For example, the global ID can contain the 2-octet or 4-octet value of the provider's Autonomous System Number (ASN).

Values

<global-id:prefix>:	<global-id>:{<prefix>| <ipaddress>}
global-id	1 to 4294967295
prefix	1 to 4294967295
ipaddress	a.b.c.d

23.309 speed

speed

Syntax

speed {**10** | **100** | **1000** | **10000** | **25000** | **40000** | **50000** | **100000**}

Context

[Tree] (config>port>ethernet speed)

Full Context

configure port ethernet speed

Description

For ports that support multiple speeds, this command configures the port speed to be used. This applies to the following:

- fast Ethernet when autonegotiate is disabled
- 10/100/1000 Ethernet when autonegotiate is disabled
- 10/1G ports supporting 10G SFP+ or 1G SFP
- 40/100G ports supporting QSFP28s on non-connector-based MDAs

If the port is configured to autonegotiate this parameter is ignored. Speed cannot be configured for ports that are part of a Link Aggregation Group (LAG).

Default

dependent on port type

Parameters

10

Sets the link to 10 Mb/s speed.

100

Sets the link to 100 Mb/s speed.

1000

Sets the link to 1000 Mb/s speed.

10000

Sets the link to 10000 Mb/s speed.

25000

Sets the link to 25000 Mb/s speed.

40000

Sets the link to 40000 Mb/s speed.

50000

Sets the link to 50000 Mb/s speed.

100000

Sets the link to 100000 Mb/s speed.

Platforms

All

speed

Syntax

speed {**oc3** | **oc12**}

no speed

Context

[Tree] (config>port>sonet-sdh speed)

Full Context

configure port sonet-sdh speed

Description

This command configures the speed of a SONET/SDH port as either OC3 or OC12. The framer for this MDA operates in groups of four. Changing the port speed for a port requires resetting the framer and causes a slight disruption on all four ports. The first framer controls ports 1,2,3,4, the second framer controls ports 5,6,7,8 and so on.

To change the port speed on a SONET/SDH port, the port must be administratively shut down and all channels must be removed. When the port speed is changed, the default channel configuration is recreated.

The **no** form of this command reverts back to default.

This command is supported on TDM satellite.

Default

speed oc12

Parameters

oc3

Sets the speed of the port to OC-3.

oc12

Sets the speed of the port to OC-12.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>port>tdm>ds1>channel-group speed)

Full Context

configure port tdm e1 channel-group speed

configure port tdm ds1 channel-group speed

Description

This command sets the speed of the DS-0 channels used in the associated channel-group.

Default

speed 64

Parameters

56

Specifies that 56k byte (7-bits per byte) encoding will be used for the associated DS-0 channels. This channel speed value is only supported on the m4-chds3-as and m12-chds3-as MDAs and on DS-1 channels (ESF and SF framing) and not on E-1 (G.704) channels.

64

Specifies that 64k byte (8-bits per byte) encoding will be used for the associated DS-0 channels.

Syntax

speed *speed*

Context

[Tree] (bof speed)

Full Context

bof speed

Description

This command configures the speed for the CPM management Ethernet port when autonegotiation is disabled in the running configuration and the Boot Option File (BOF).

If the port is configured to autonegotiate, this parameter is ignored.

Available speed options are dependent on the specific CPM variant in the system.

Default

speed 100

Parameters

speed

Sets the link speed, in Mb/s.

Values 10, 100, 1000

Platforms

All

23.310 spf

spf

Syntax

[**no**] **spf** [*level-number*] [*system-id*]

Context

[Tree] (debug>router>isis spf)

Full Context

debug router isis spf

Description

This command enables debugging for IS-IS SFP.

The **no** form of the command disables debugging.

Parameters

system-id

When specified, only the specified system-id is debugged. A 6-octet system identifier (xxxx.xxxx.xxxx).

level-number

Specifies the interface level (1, 2, or 1 and 2).

Platforms

All

spf

Syntax

spf [**type**] [*dest-addr*]

no spf

Context

[Tree] (debug>router>ospf spf)

[Tree] (debug>router>ospf3 spf)

Full Context

debug router ospf spf

debug router ospf3 spf

Description

This command enables debugging for OSPF SPF. Information regarding overall SPF start and stop times will be shown. To see detailed information regarding the SPF calculation of a given route, the route must be specified as an optional argument.

Parameters

type

Specifies the area to debug.

Values intra-area, inter-area, external

dest-addr

Specifies the destination IP address to debug.

Platforms

23.311 spf-wait

spf-wait

Syntax

spf-wait *spf-wait* [**spf-initial-wait** *spf-initial-wait*] [**spf-second-wait** *spf-second-wait*]

no spf-wait

Context

[Tree] (config>service>vpls>b-vpls>spb>timers spf-wait)

Full Context

configure service vpls b-vpls spb timers spf-wait

Description

This command defines the maximum interval between two consecutive SPF calculations in milliseconds. Timers that determine when to initiate the first, second and subsequent SPF calculations after a topology change occurs can be controlled with this command.

Subsequent SPF runs (if required) will occur at exponentially increasing intervals of the *spf-second-wait* interval. For example, if the *spf-second-wait* interval is 1000, then the next SPF will run after 2000 milliseconds, and then next SPF will run after 4000 milliseconds, etc., until it reaches the *spf-wait* value. The SPF interval will stay at *spf-wait* value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval will drop back to *spf-initial-wait*.

Default

no spf-wait

Parameters

spf-wait

Specifies the maximum interval in milliseconds between two consecutive SPF calculations.

Values 10 to 120000

Default 10000

spf-initial-wait

Specifies the initial SPF calculation delay in milliseconds after a topology change.

Values 10 to 100000

Default 1000

spf-second-wait

Specifies the hold time in milliseconds between the first and second SPF calculation.

Values 10 to 100000

Default 1000

spf-wait

Syntax

spf-wait *spf-wait* [**spf-initial-wait** *spf-initial-wait*] [**spf-second-wait** *spf-second-wait*]

23.312 spi

spi

Syntax

spi *spi*

no spi

Context

[Tree] (config>ipsec>static-sa spi)

Full Context

configure ipsec static-sa spi

Description

This command configures the SPI key value for an IPsec manual SA.

This command specifies the SPI (Security Parameter Index) used to lookup the instruction to verify and decrypt the incoming IPsec packets when the value of the **direction** command is **inbound**.

The SPI value specifies the SPI that will be used in the encoding of the outgoing packets when the when the value of the **direction** command is **outbound**. The remote node can use this SPI to lookup the instruction to verify and decrypt the packet.

If **no spi** is selected, then this static SA cannot be used.

The **no** form of this command reverts to the default value.

Default

no spi

Parameters

spi

Specifies the security parameter index for this SA.

Full Context

configure subscriber-mgmt local-user-db ppp host identification-strings spi-sharing-group-id

configure subscriber-mgmt local-user-db ipoe host identification-strings spi-sharing-group-id

Description

This command configures the SLA Profile Instance (SPI) sharing group identifier for an IPoE or PPPoE session. It overrides the default SPI sharing method (**def-instance-sharing**) configured in the SLA profile.

When an spi-sharing-group-id is configured, the IPoE or PPPoE session shares the SLA Profile Instance with other IPoE or PPPoE sessions from the same subscriber that: have the same SLA profile associated, are active on the same SAP, and have the same group identifier.

Configuring an **spi-sharing-group-id** *group-id* for an IPoE host, when the IPoE session is disabled on the group interface, results in a setup failure.

The **no** form of this command returns the SPI sharing group identifier to its default.

Parameters

group-id

Specifies the SPI group identifier.

Values 0 to 65535

Full Context

configure service vprn bgp group split-horizon

configure service vprn bgp split-horizon

configure service vprn bgp group neighbor split-horizon

Description

This command enables the use of split-horizon. When applied globally, to a group, or a specific peer, split-horizon prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

The configuration default is **no split-horizon**, meaning that no effort is taken to prevent a best route from being reflected back to the sending peer.

Caution:
Use of the **split-horizon** command may have a detrimental impact on peer and route scaling and therefore operators are encouraged to use it only when absolutely needed.

The **no** form of this command disables split horizon command which allows the lower level to inherit the setting from an upper level.

Default

no split-horizon

configure service vprn rip split-horizon

configure service vprn ripng group split-horizon

configure service vprn ripng group neighbor split-horizon

configure service vprn rip group neighbor split-horizon

configure service vprn rip group split-horizon

Description

This command enables the use of split-horizon. RIP uses split horizon with poison reverse to protect from such problems as "counting to infinity". Split horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **no** form of this command disables the **split-horizon** command, which allows the lower level to inherit the setting from an upper level.

Default

split-horizon enable

Parameters

enable

Enables split horizon and poison reverse.

disable

Enables split horizon without poison reverse. This allows the routes to be readvertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the

specified neighbor interface). The most specific value is used. In particular, if no value is set (**no split-horizon**), the lower level inherits the setting from the less-specific level.

configure router ripng group neighbor split-horizon

configure router ripng split-horizon

configure router rip split-horizon

configure router ripng group split-horizon

configure router rip group split-horizon

Description

This command enables the use of split-horizon.

RIP uses split-horizon with poison-reverse to protect from such problems as "counting to infinity". Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **split-horizon disable** command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (**no split-horizon**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command disables split horizon command which allows the lower level to inherit the setting from an upper level.

Default

enabled

Parameters

enable

Specifies enable split horizon and poison reverse.

disable

Specifies disable split horizon allowing routes to be re-advertised on the same interface on which they were learned with the advertised metric incremented by the **metric-in** value.

Platforms

All

23.317 split-horizon-group

split-horizon-group

Syntax

split-horizon-group [*group-name*] [**residential-group**] [**create**]

Context

[Tree] (config>service>vpls split-horizon-group)

Full Context

configure service vpls split-horizon-group

Description

This command creates a new split horizon group for the VPLS instance. Traffic arriving on a SAP or spoke-SDP within this split horizon group will not be copied to other SAPs or spoke-SDPs in the same split horizon group.

A split horizon group must be created before SAPs and spoke-SDPs can be assigned to the group.

The split horizon group is defined within the context of a single VPLS. The same group-name can be re-used in different VPLS instances.

Up to 30 split horizon groups can be defined per VPLS instance. Half are supported in i-VPLS.

The **no** form of this command removes the group name from the configuration.

Default

A split horizon group is by default not created as a residential-group.

Parameters

group-name

Specifies the name of the split horizon group to which the SDP belongs

residential-group

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

a) SAPs which are members of this Residential Split Horizon Group will have:

- Double-pass queuing at ingress as default setting (can be disabled)
- STP disabled (cannot be enabled)
- ARP reply agent enabled per default (can be disabled)
- MAC pinning enabled per default (can be disabled)

- Downstream broadcast packets are discarded thus also blocking the unknown, flooded traffic
- Downstream multicast packets are allowed when IGMP snooping is enabled

b) Spoke SDPs which are members of this Residential Split Horizon Group will have:

- Downstream multicast traffic supported
- Double-pass queuing is not applicable
- STP is disabled (can be enabled)
- ARP reply agent is not applicable (dhcp-lease-states are not supported on spoke-SDPs)
- MAC pinning enabled per default (can be disabled)

Full Context

configure service vpls bgp-evpn segment-routing-v6 split-horizon-group

configure service vpls bgp-evpn mpls split-horizon-group

Description

This command allows the user to configure an explicit split-horizon-group for all BGP-EVPN MPLS or SRv6 destinations that can be shared by other SAPs and/or spoke SDPs. The use of explicit split-horizon-groups for EVPN-MPLS or SRv6 and spoke SDPs allows the integration of VPLS and EVPN-MPLS or SRv6 networks.

If the **split-horizon-group** command for **bgp-evpn>mpls/srv6** contexts is not used, the default split-horizon-group (that contains all the EVPN destinations) is still used, but it is not possible to refer to it on SAPs/spoke SDPs. User-configured split-horizon-groups can be configured within the service context. The same group-name can be associated to SAPs, spoke SDPs, pw-templates, pw-template-bindings and EVPN-MPLS or SRv6 destinations. The configuration of **bgp-evpn>mpls/srv6> split-horizon-group** is only allowed if **bgp-evpn>mpls/srv6** is shutdown; no changes are allowed when **bgp-evpn>mpls/srv6** is **no shutdown**.

When the SAPs and/or spoke SDPs (manual or BGP-AD-discovered) are configured within the same **split-horizon-group** as the EVPN-MPLS or SRv6 endpoints, MAC addresses are still learned on them but they are not advertised in BGP-EVPN. If provider-tunnel is enabled in the bgp-evpn service, the SAPs and SDP bindings that share the same split-horizon-group of the EVPN-MPLS provider-tunnel are brought operationally down if the point-to-multipoint tunnel is operationally up.

Default

no split-horizon-group

Parameters

name

Specifies the split-horizon-group name.

Platforms

configure service vpls site split-horizon-group

Description

This command configures the value of split-horizon group associated with this site.

The **no** form of this command reverts the default.

Default

no split-horizon-group

Parameters

group-name

Specifies a split-horizon group name

Platforms

All

split-horizon-group

Syntax

split-horizon-group *group-name*

no split-horizon-group

Context

[Tree] (config>service>pw-template split-horizon-group)

Full Context

configure service pw-template split-horizon-group

Description

This command creates a new split horizon group (SGH).

Comparing a "residential” SGH and a "regular” SHG is that a residential SHG:

- Has different defaults for the SAP or SDP that belong to this group (ARP reply agent enabled (SAP only), MAC pinning enabled). These can be disabled in the configuration.
- Does not allow enabling spanning tree (STP) on a SAP. It is allowed on an SDP.
- Does not allow for downstream broadcast (broadcast/unknown unicast) on a SAP. It is allowed on an SDP.

- On a SAP, downstream multicast is only allowed when IGMP is enabled (for which an MFIB state exists; only IP multicast); on a SDP, downstream mcast is allowed.

When the feature was initially introduced, residential SHGs were also using ingress shared queuing by default to increase SAP scaling.

A residential SAP (SAP that belongs to a RSHG) is used to scale the number of SAPs in a single VPLS instance. The limit depends on the hardware used and is higher for residential SAPs (where there is no need for egress multicast replication on residential SAPs) than for regular SAPs. Therefore, residential SAPs are useful in residential aggregation environments (for example, triple play networks) with a VLAN/subscriber model.

The **no** form of the command removes the group name from the configuration.

Parameters

group-name

Specifies the name of the split horizon group to which the SDP belongs.

residential-group

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

- SAPs which are members of this Residential Split Horizon Group will have:
  - Double-pass queuing at ingress as default setting (can be disabled)
  - STP disabled (cannot be enabled)
  - ARP reply agent enabled per default (can be disabled)
  - MAC pinning enabled per default (can be disabled)
  - Downstream Broadcast packets are discarded thus also blocking the unknown, flooded traffic
  - Downstream Multicast packets are allowed when IGMP snooping is enabled
- Spoke SDPs which are members of this Residential Split Horizon Group will have:
  - Downstream multicast traffic supported
  - Double-pass queuing is not applicable
  - STP is disabled (can be enabled)
  - ARP reply agent is not applicable on the 7750 SR and 7450 ESS (dhcp-lease-states are not supported on spoke SDPs)
  - MAC pinning enabled per default (can be disabled)

Syntax

spoke-sdp *sdp-id*[**:***vc-id*] [**vc-type** {**ether** | **vlan**}] [**split-horizon-group** *group-name*] [**create**]

no spoke-sdp *sdp-id*[**:***vc-id*]

Context

[Tree] (config>service>vpls spoke-sdp)

Full Context

configure service vpls spoke-sdp

Description

This command binds a service to an existing Service Distribution Point (SDP). A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPLS service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. When removed, no packets are forwarded to the far-end router.

Default

No *sdp-id* is bound to a service.

Parameters

sdp-id

Specifies the SDP identifier

Values 1 to 32767

vc-id

Specifies the virtual circuit identifier

Values 1 to 4294967295

vc-type

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to

define the dot1q value expected by the far-end provider equipment. Changing the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ether, vlan

ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding. (hex 5)

vlan

Defines the VC type as VLAN. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

The VLAN VC-type inserts one dot1q tag within each encapsulated Ethernet packet transmitted to the far end and strips one dotQ tag, if a tag is present, from traffic received on the pseudowire.

The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

group-name

Specifies the name of the split horizon group to which the SDP belongs

endpoint

Specifies the service endpoint to which this SDP bind is attached. The service ID of the SDP binding must match the service ID of the service endpoint.

no endpoint

Removes the association of a spoke SDP with an explicit endpoint name

root-leaf-tag

Specifies a tagging spoke SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this SDP binding is a tag SDP that will use a default VID tag of 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

leaf-ac

Specifies an access (AC) spoke SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP binding type is a root-ac if *leaf-ac* or *root-leaf-tag* is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

no spoke-sdp *sdp-id*[**:***vc-id*]

Context

[Tree] (config>service>vpls spoke-sdp)

Full Context

configure service vpls spoke-sdp

Description

This command binds a service to an existing Service Distribution Point (SDP).

A spoke SDP is treated like the equivalent of a traditional bridge port where flooded traffic received on the spoke SDP is replicated on all other ports (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPLS service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end 7450 ESS or 7750 SR devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Parameters

sdp-id

Specifies the SDP identifier.

Values 1 to 17407

vc-id

Specifies the virtual circuit identifier.

Values 1 to 4294967295

vc-type

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ether, vlan

ether

Defines the VC type as Ethernet. The **ethernet**, **vlan,** and **vpls** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding (hex 5).

vlan

Defines the VC type as VLAN. The **ethernet**, **vlan,** and **vpls** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. The VLAN VC-type requires at least one dot1Q tag within each encapsulated Ethernet packet transmitted to the far end.

group-name

Specifies the name of the split horizon group to which the SDP belongs.

root-leaf-tag

Specifies a SAP as a root leaf tag SDP. This option is only available when the VPLS is designated as an E-Tree VPLS.

leaf-tag-vid

Specifies to replace the outer SDP ID for leaf traffic. The leaf tag VID is only significant between peering VPLS but the values must be consistent on each end.

leaf-ac

Specifies a SDP as a leaf access (AC) SDP. The default E-Tree SAP type is root AC if **leaf-ac** (or **root-leaf-tag**) is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

create

Keyword used to create the spoke SDP. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

Full Context

configure service vpls spoke-sdp

Description

This command binds a service to an existing Service Distribution Point (SDP). A spoke-SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke-SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPLS service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the sdp-id does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. After it is removed, no packets are forwarded to the far-end router.

Parameters

sdp-id

Specifies the SDP identifier

Values 1 to 17407

vc-id

Specifies the virtual circuit identifier

Values 1 to 4294967295

vc-type

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ether, vlan

ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke-SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke-SDP binding. (hex 5)

vlan

Defines the VC type as VLAN. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke-SDP bindings. The VLAN VC-type inserts one dot1q tag within each encapsulated Ethernet packet transmitted to the far end and strips one dotQ tag, if a tag is present, from traffic received on the pseudowire.

Note: The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

group-name

Specifies the name of the split horizon group to which the SDP belongs.

endpoint

Specifies the service endpoint to which this SDP bind is attached. The service ID of the SDP binding must match the service ID of the service endpoint.

no endpoint

Removes the association of a spoke-SDP with an explicit endpoint name.

root-leaf-tag

Specifies a tagging spoke-SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this SDP binding is a tag SDP that will use a default VID tag of 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

leaf-ac

Specifies an access (AC) spoke-SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP binding type is a root-ac if *leaf-ac* or *root-leaf-tag* is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

Description

This command binds a service to an existing Service Distribution Point (SDP). A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with an Epipe, VPLS, VPRN, VPRN service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

This command can also be used to associate a GRE tunnel carrying Ethernet payload with an Epipe and terminate it on a PW port referenced within the same Epipe service. The spoke SDP represents a L2oGRE tunnel with SDP delivery type set to **eth-gre-bridged**. With this configuration, the **vc-id** is unused since there is no multiplexing of Ethernet payload within the same tunnel. The **vc-id** value is included only to maintain the expected spoke SDP structure within an EPIPE service. For L2oGRE tunnels, the **vc-id** can be set to any arbitrary value within its configurable range.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Default

No *sdp-id* is bound to a service.

Parameters

sdp-id

The SDP identifier.

Values 1 to 17407

vc-id

The virtual circuit identifier. The VC-ID is not used with L2TPv3 SDPs or L2oGRE tunnels, however it must be configured.

Values 1 to 4294967295

vc-type

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ethernet

ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding.

vlan

Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a VLAN tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

The VLAN VC-type requires at least one dot1q tag within each encapsulated Ethernet packet transmitted to the far end.

Note: The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated

in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

no-endpoint

Removes the association of a spoke SDP with an explicit endpoint name.

endpoint-name

Specifies the name of the service endpoint.

icb

Specifies the spoke SDP as an inter-chassis backup SDP binding.

Context

[Tree] (config>mirror>mirror-dest spoke-sdp)

[Tree] (config>mirror>mirror-dest>remote-source spoke-sdp)

Full Context

configure mirror mirror-dest spoke-sdp

configure mirror mirror-dest remote-source spoke-sdp

Description

This command binds an existing (mirror) service distribution path (SDP) to the mirror destination service ID.

Spoke SDPs are used to send and receive mirrored traffic between mirror source and destination routers in a remote mirroring solution. A spoke SDP configured in the remote-source context (**remote-src>spoke-sdp**) is used on the destination router. A spoke SDP configured in the mirror service context (**mirror-dest>spoke-sdp**) is used on the source router.

The destination node should be configured with **remote-src>spoke-sdp** entries when using L2TPv3, MPLS-TP or LDP IPv6 LSP SDPs in the remote mirroring solution. For all other types of SDPs, r**emote-source>far-end** entries should be used.

Spoke SDPs are not applicable when routable LI encapsulation is employed (mirror-dest>encap).

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The **no** form of this command removes the SDP binding from the mirror destination service.

Default

An SDP ID is bound to a mirror destination service ID. If no SDP is bound to the service, the mirror destination will be local and cannot be sent to another router over the core network.

Parameters

sdp-id:vc-id

Specifies a locally unique SDP identification (ID) number. The SDP ID must exist. If the SDP ID does not exist, an error will occur and the command will not execute.

For mirror services, the *vc-id* defaults to the *service-id*. However, there are scenarios where the *vc-id* is being used by another service. In this case, the SDP binding cannot be created. So, to avoid this, the mirror service SDP bindings now accepts *vc-ids*.

Values 1 to 17407

no-endpoint

Removes the association of a SAP or a SDP with an explicit endpoint name.

name

Specifies the name of the endpoint associated with the SAP.

icb

Indicates that the SDP is of type Inter-Chassis Backup (ICB). This is a special pseudowire used for MC-LAG and pseudowire redundancy application.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. The ICB SDP cannot be added to the endpoint if the SAP is not part of a MC-LAG instance. This means that all other SAP types cannot exist on the same endpoint as an ICB SDP since non Ethernet SAP cannot be part of a MC-LAG instance. Conversely, a SAP which is not part of a MC-LAG instance cannot be added to an endpoint which already has an ICB SDP.

An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

Default Null. The user should explicitly configure this option at create time. The user can remove the ICB type simply by retyping the SDP configuration without the **icb** keyword.

Context

[Tree] (config>service>epipe spoke-sdp-fec)

Full Context

configure service epipe spoke-sdp-fec

Description

This command binds a service to an existing Service Distribution Point (SDP), using a dynamic MS-PW.

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

When using dynamic MS-PWs, the particular SDP to bind-to is automatically selected based on the Target Attachment Individual Identifier (TAII) and the path to use, specified under spoke SDP FEC. The selected SDP will terminate on the first hop S-PE of the MS-PW. Therefore, an SDP must already be defined in the config>service>sdp context that reaches the first hop router of the MS-PW. The router will in order to associate an SDP with a service. If an SDP to that is not already configured, an error message is generated. If the sdp-id does exist, a binding between that sdp-id and the service is created.

It differs from the spoke-sdp command in that the spoke-sdp command creates a spoke SDP binding that uses a pseudowire with the PW ID FEC. However, the spoke-sdp-fec command enables pseudowires with other FEC types to be used. Only the Generalized ID FEC (FEC129) may be specified using this command.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Parameters

spoke-sdp-fec-id

An unsigned integer value identifying the spoke SDP.

Values 1 to 4294967295

fec-type

An unsigned integer value for the type of the FEC used by the MS-PW.

Values 129 to 130

aii-type

An unsigned integer value for the Attachment Individual Identifier (AII) type used to identify the MS-PW endpoints.

Values 1 to 2

endpoint-name

Specifies the name of the service endpoint.

no endpoint

Adds or removes a spoke SDP association.

icb

Configures the spoke SDP as an inter-chassis backup SDP binding.

Full Context

configure service vprn pim spt-switchover-threshold

Description

This command configures a shortest path tree (SPT tree) switchover threshold for a group prefix.

Parameters

grp-ip-address

Specifies the multicast group address.

grp-ipv6-address

Specifies the multicast group address.

prefix-length

Specifies the address prefix length.

Values	grp-ipv6-address	: x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x [0 to FFFF]H
		d [0 to 255]D
	prefix-length	[1 to 128]

mask

Defines the mask of the multicast-ip-address.

Values 4 to 32

netmask

The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

spt-threshold

Specifies the configured threshold in kilobits per second (kb/s) for the group to which this (S,G) belongs. For a group G configured with a threshold, switchover to SPT for an (S,G) is attempted only if the (S,G)'s rate exceeds this configured threshold.

Platforms

All

spt-switchover-threshold

Syntax

Context

[Tree] (config>router>pim spt-switchover-threshold)

Full Context

configure router pim spt-switchover-threshold

Description

This command configures shortest path (SPT) tree switchover thresholds for group prefixes.

PIM-SM routers with directly connected routers receive multicast traffic initially on a shared tree rooted at the Rendezvous Point (RP). Once the traffic arrives on the shared tree and the source of the traffic is known, a switchover to the SPT tree rooted at the source is attempted.

For a group that falls in the range of a prefix configured in the table, the corresponding threshold value determines when the router should switch over from the shared tree to the source specific tree. The switchover is attempted only if the traffic rate on the shared tree for the group exceeds the configured threshold.

In the absence of any matching prefix in the table, the default behavior is to switchover when the first packet is seen. In the presence of multiple prefixes matching a given group, the most specific entry is used.

The **no** form of this command removes the parameters from the PIM configuration.

Parameters

grp-ipv4-prefix

Specifies the group IPv4 multicast address in dotted decimal notation.

Values a.b.c.d

ipv4-prefix-length

Specifies the length of the IPv4 prefix.

Values 4 to 32

netmask

Specifies the netmask associated with the IPv4 prefix, expressed in dotted decimal notation. Network bits must be 1, and host bits must be 0.

Values a.b.c.d

grp-ipv6-prefix

Specifies the group IPv6 multicast address in hexadecimal notation.

Values xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

xx — 0 to FF (hex)

ipv6-prefix-length

Specifies the length of the IPv6 prefix.

Values 8 to 128

spt-threshold

Specifies the configured threshold in kilobits per second (kb/s) for a group prefix. A switchover is attempted only if the traffic rate on the shared tree for the group exceeds this configured threshold. When the **infinity** keyword is specified, no switchover will occur at any time, regardless of the traffic level is detected.

Values 1 to 4294967294, infinity

configure service epipe sap eth-cfm squelch-ingress-ctag-levels

configure service vpls mesh-sdp eth-cfm squelch-ingress-ctag-levels

Description

This command defines the levels of the ETH-CFM packets that are silently discarded on ingress into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding plus an additional VLAN, up to a maximum tag length of two tags. All ETH-CFM packets inbound to the SAP or SDP binding that match the configured levels are dropped without regard for any other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option. The list of levels must be a complete contiguous list from 0 up to the highest level to be dropped. The command must be retyped in complete form to modify a previous configuration, if the operator does not want to delete it first. Entering the command without any valid level information removes the command from the configuration and disables the feature.

The **no** form of this command removes the silent discarding of previously matching ETH-CFM PDUs.

Default

configure router bgp next-hop-resolution shortcut-tunnel family resolution-filter sr-isis

Description

This command selects the Segment Routing (SR) tunnel type programmed by an IS-IS instance in TTM for next-hop resolution of BGP routes and labeled routes. This option allows BGP to use the segment- routing tunnel in the tunnel table submitted by the lowest preference IS-IS instance or, in case of a tie, the lowest numbered IS-IS instance.

Platforms

All

sr-isis

Syntax

[**no**] **sr-isis**

Context

[Tree] (config>oam-pm>session>ip>tunnel>mpls sr-isis)

Full Context

configure oam-pm session ip tunnel mpls sr-isis

Description

This command configures the specification of **sr-isis** specific tunnel information that is used to transport the test packets. Entering this context removes all other tunnel type options configured under the **configure oam-pm session ip tunnel mpls** context. Only a single **mpls** type can be configured for an OAM-PM session.

The **no** form of this command deletes the context and all configurations under it.

Parameters

ipv4-address

Specifies IPv4 address.

Values ipv4-address: a.b.c.d (host bits must be 0)

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>router>policy-options>policy-statement>entry>action sr-label-index)

Full Context

configure router policy-options policy-statement default-action sr-label-index

configure router policy-options policy-statement entry action sr-label-index

Description

This command associates a BGP segment-routing label index value with all /32 BGP labeled IPv4 routes matching the entry or policy **default-action**.

Note:
Avoid using this action in a policy entry that matches more than one /32 label-ipv4 route, otherwise SID conflicts are created.

The **sr-label-index** action only takes effect in BGP peer import policies (and only on received /32 label-ipv4 routes) and in route-table-import policies associated with the label-ipv4 RIB.

The **prefer-igp** applies only in a route-table-import policy. If **prefer-igp** is specified and BGP segment-routing uses **prefix-sid-range global**, then BGP tries, as a first priority, to use the IGP segment routing label index for the IGP route matched by the **route-table-import** policy. If the IGP route does not have an SID index, or **prefer-igp** is not configured or **prefix-sid-range** is not **global**, BGP tries to use the label index value specified by this command.

When this action occurs in a policy applied as a peer-import policy, it can add a prefix SID attribute to a received /32 label-ipv4 route that was not sent with this attribute, or it can replace the received prefix SID attribute with a new one.

If this command specifies an index value that causes a SID conflict with another BGP route, then all conflicting BGP routes are re-advertised with label values based on dynamic allocation rather than SID-based allocation.

If this command specifies an index value that causes a SID conflict with an IGP route, the BGP route is re-advertised with a label value based on dynamic allocation rather than an SID-based allocation.

The **no** form of this command causes matched BGP routes to be advertised without any new or changed prefix SID attributes.

Default

no sr-label-index

Parameters

value

Specifies the BGP segment routing label index to associate with the matched route or routes.

Values 0 to 52487

param-name

Specifies the **type** parameter variable name, up to 32 characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

prefer-igp

A keyword that is applicable only in **route-table-import** policies, to instruct BGP to borrow the SID index from the IGP route if it has an SID index and the **prefix-sid-range** is **global**.

Platforms

no sr-labels

Context

[Tree] (config>router>mpls-labels sr-labels)

Full Context

configure router mpls-labels sr-labels

Description

This command configures the range of the Segment Routing Global Block (SRGB). It is a label block which is used for assigning labels to segment routing prefix SIDs originated by this router. This range is carved from the system dynamic label range and is not instantiated by default.

This is a reserved label and once configured it cannot be used by other protocols such as RSVP, LDP, and BGP to assign a label dynamically.

Default

no sr-labels

Parameters

start-value

Specifies the start label value in the SRGB

Values 18432 to 524287 within dynamic label range | 1048575 (FP4 or FP5 only)

end-value

Specifies the end label value in the SRGB

Values 18432 to 524287 within dynamic label range | 1048575 (FP4 or FP5 only)

sr-te

Syntax

sr-te *value*

no sr-te

Context

[Tree] (config>router>mpls>tunnel-table-pref sr-te)

Full Context

configure router mpls tunnel-table-pref sr-te

Description

This command configures the tunnel table preference for an SR-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default

sr-te 8

Parameters

value

Specifies the tunnel table preference value for SR-TE LSP.

Values 1 to 255

Default 8

Platforms

All

sr-te

Syntax

[**no**] **sr-te**

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter sr-te)

Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter sr-te

Description

The sr-te value instructs the code to search for the set of lowest metric SR-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of SR-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of SR-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value are selected.

Default

no sr-te

sr-te-lsp

Syntax

[**no**] **sr-te-lsp** *lsp-name*

Context

[Tree] (config>service>sdp sr-te-lsp)

Full Context

configure service sdp sr-te-lsp

Description

This command configures an MPLS SDP of LSP type SR-TE.

The user can specify up to 16 SR-TE LSP names. The destination address of all LSPs must match that of the SDP far-end option. Service data packets are sprayed over the set of LSPs in the SDP using the same procedures as for tunnel selection in ECMP. Each SR-TE LSP can, however, have up to 32 next-hops at the ingress LER when the first segment is a node SID-based SR tunnel. Thus, the service data packet is forwarded over one of a maximum of 16x32 next-hops.

The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-te** tunnel type.

The signaling protocol for the service labels for an SDP using a SR-TE LSP can be configured to static (**off**), T-LDP (**tldp**), or BGP (**bgp**).

src-access-list *list-name*

no src-access-list *list-name*

Context

[Tree] (config>system>security>snmp src-access-list)

Full Context

configure system security snmp src-access-list

Description

This command is used to identify a list of source IP addresses that can be used to validate SNMPv1 and SNMPv2c requests once the list is associated with one or more SNMPv1 and SNMPv2c communities.

An src-address-list referenced by one or more **community** instances is used to verify the source IP addresses of an SNMP request using the **community** regardless of which VPRN/VRF interface (or "Base" interface) the request arrived on. For example, if an SNMP request arrives on an interface in vprn 100 but the request is referencing a **community**, then the source IP address in the packet would be validated against the src-address-list configured for the **community**. This occurs regardless of whether the request is destined to a VPRN interface address and the VPRN has SNMP access enabled, or the request is destined to the base system address via GRT leaking. If the request message's source IP address does not match the *ip-address* of any of the **src-host**s contained in the list, then the request is discarded and logged as an SNMP authentication failure.

Using src-access-list validation can have an impact on the time it takes for an SR OS node to reply to an SNMP request. It is recommended to keep the lists short, including only the addresses that are needed, and to place SNMP managers that send the highest volume of requests, such as the NSP NFM-P, at the top of the list.

A maximum of 16 source access lists can be configured. Each source access lists can contain a maximum of 16 source hosts.

The **no** form of this command removes the named src-access-list. You cannot remove an **src-access-list** that is referenced by one or more **community** instances.

Parameters

list-name

Configures the name or key of the **src-access-list**. The *list-name* parameter must begin with a letter (a-z or A-Z).

Platforms

All

Full Context

configure application-assurance group gtp gtp-filter imsi-apn-filter entry src-gsn

Description

This command configures a matching condition for the GSN IP address. The IP address value is checked only against the source IP address of the GTP packets that contain an APN IE or an IMSI IE.

Parameters

ip address

Specifies a valid unicast address associated with the IMSI-APN filter entry.

Values

ipv4-address	a.b.c.d[/mask]
	mask - [1..32]
ipv6-address	x:x:x:x:x:x:x:x/prefix-length
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
	prefix-length [1..128]

ip-prefix-list-name

Specifies an IP address prefix list for the source IP address match criteria, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.339 src-host

src-host

Syntax

src-host *host-name* **address** *ip-address*

no src-host *host-name*

Context

[Tree] (config>system>security>snmp>src-access-list src-host)

Full Context

configure system security snmp src-access-list src-host

Description

This command is used to configure a source IP address entry that can be used to validate SNMPv1 and SNMPv2c requests.

The **no** form of this command removes the specified entry.

Parameters

host-name

Configures the name of the **src-host** entry.

ip-address

Configures an allowed source address for SNMP requests. This can be an IPv4 or IPv6 address.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries entry match src-ip

Description

This command configures the source IP match condition.

The **no** form of this command reverts to the default.

Parameters

ipv6-address

Specifies the IPv6 address (applies only to the 7750 SR).

Values

ipv6-address	x:x:x:x:x:x:x:x (where x is [0 to FFFF]H)
	x:x:x:x:x:x:d.d.d.d (where d is [0 to 255]D)

prefix-length

Specifies the prefix length (applies only to the 7750 SR).

Values 1 to 128

ip-address/mask

Specifies the IPv4 address and mask.

Values ip-address a.b.c.d

mask 0 to 32

netmask

Specifies the mask, expressed as a dotted quad.

Values a.b.c.d

Platforms

Description

This command specifies a source TCP/UDP address to use as match criteria.

Default

no src-ip

Parameters

eq

Specifies that a successful match occurs when the flow matches the specified address or prefix.

neq

Specifies that a successful match occurs when the flow does not match the specified address or prefix.

ip-address

Specifies a valid unicast address.

Values		
	ipv4-address	a.b.c.d[/mask]
		mask - [1..32]
	ipv6-address	x:x:x:x:x:x:x:x/prefix-length
		x:x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D
		prefix-length [1..128]

ip-prefix-list-name

Specifies an IP prefix list name, up to 32 characters.

configure li li-filter li-ip-filter entry match src-ip

Description

This command configures source IP address LI filter match criterion.

The **no** form of this command removes any configured source IP. The match criterion is ignored.

Parameters

ip-address

Specifies an address specified as dotted quad.

Values a.b.c.d

mask

Specifies eight 16-bit hexadecimal pieces representing bit match criteria.

Values 1 to 32

ipv4-address-mask

Any mask expressed in dotted quad notation.

Values 0.0.0.0 to 255.255.255.255

Platforms

All

src-ip

Syntax

src-ip {ipv6-address/prefix-length | *ipv6-address ipv6-address-mask*}

Full Context

configure li li-filter li-ipv6-filter entry match src-ip

Description

This command configures source IPv6 address LI filter match criterion.

The **no** form of this command removes any configured source IPv6 address. The match criterion is ignored.

Parameters

ipv6-address

Specifies an IPv6 address entered as:.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

prefix-length

Specifies a length.

Values 1 to 128

ipv6-address-mask

Specifies an IPv6 address mask expressed as:

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

[Tree] (config>qos>sap-egress>ip-criteria>entry>match src-ip)

Full Context

configure qos sap-ingress ip-criteria entry match src-ip

configure qos sap-egress ip-criteria entry match src-ip

Description

This command configures a source IPv4 address range to be used as an SAP QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, e.g. 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

Default

no src-ip

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

prefix-list-name

Specifies the IPv4 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms

All

src-ip

Syntax

src-ip {*ipv6-address/prefix-length* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *ipv6-prefix-list-name*}

no src-ip

configure qos sap-egress ipv6-criteria entry match src-ip

configure qos sap-ingress ipv6-criteria entry match src-ip

Description

This command configures a source IPv6 address range to be used as an SAP QoS policy match criterion.

To match on the source IPv6 address, specify the address and its associated mask, for example, 2001:db8:1000::/64.

The **no** form of this command removes the source IPv6 address match criterion.

Default

no src-ip

Parameters

ipv6-address

Specifies the IPv6 address for the IP match criterion in hexadecimal digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D

prefix-length

Specifies the IPv6 prefix length for the IPv6 address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the IPv6 address mask.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

ipv6-prefix-list-name

Specifies the IPv6 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms

All

src-ip

Syntax

src-ip {*ip-address/mask* | *ip-address ipv4-address-mask* | **ip-prefix-list** *ip-prefix-list-name*}

configure qos network egress ip-criteria entry match src-ip

configure qos network ingress ipv6-criteria entry match src-ip

configure qos network egress ipv6-criteria entry match src-ip

configure qos network ingress ip-criteria entry match src-ip

Description

This command configures a source IPv4 or IPv6 address range to be used as a network QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, when specifying an IPv4 address, 10.1.0.0/16 or 10.1.0.0 255.255.0.0 can be used.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-list-name

Specifies an IPv4 prefix list which contains IPv4 address prefixes to be matched. IP prefix lists are only supported at a network ingress.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

mask

Specifies the length of the ipv6-address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

ipv6-prefix-list-name

Specifies an IPv6 prefix list which contains IPv6 address prefixes to be matched. IPv6 prefix lists are only supported at a network ingress.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms

All

configure filter ipv6-exception entry match src-ip

configure filter ipv6-filter entry match src-ip

Description

This command configures a source IPv4 or IPv6 address range to be used as an IP filter or IP exception match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, 10.1.0.0/16 for IPv4. The conventional notation of 10.1.0.0 255.255.0.0 may also be used for IPv4.

The **no** form of the command removes the source IP address match criterion.

Default

no src-ip

Parameters

ip-address

Specifies the destination IPv4 address specified in dotted decimal notation.

Values a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-listoripv6-prefix-list prefix-list-name

Specifies to use a list of IP prefixes referred to by prefix-list-name, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies an IPv6 prefix for the IP match criterion in hex digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0..FFFF]H
d: [0..255]D

prefix-length

Specifies whether a the IPv6 prefix length for the specified *ipv6-address* expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0..FFFF]H
d: [0..255]D

Description

This command configures a source IP address range or an IP prefix list to be used as a management access filter match criterion.

The **no** form of this command removes the source IP address match criterion.

Default

no src-ip

Parameters

ip-prefix

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

mask

Specifies the subnet mask length expressed as a decimal integer.

Values 1 **to** 32 (mask length), 0.0.0.0 **to** 255.255.255.255 (dotted decimal)

netmask

Specifies the dotted quad equivalent of the mask length.

Values 0.0.0.0 to 255.255.255.255

ip-prefix-list-name

Specifies the IP prefix list used as a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes .

Full Context

configure test-oam build-packet header ipv4 src-ipv4-address

debug oam build-packet packet field-override header ipv4 src-ipv4-address

Description

This command defines the source IPv4 address to be used in the IPv4 header.

The **no** form of this command removes the source IPv4 address.

Default

src-ipv4-address 0.0.0.0

Parameters

a.b.c.d

Specifies the IPv4 source address to be used in the IPv4 header.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.343 src-ipv6-address

src-ipv6-address

Syntax

src-ipv6-address *ipv6-address*

no src-ipv6-address

Context

[Tree] (config>test-oam>build-packet>header>ipv6 src-ipv6-address)

[Tree] (debug>oam>build-packet>packet>field-override>header>ipv6 src-ipv6-address)

Full Context

configure test-oam build-packet header ipv6 src-ipv6-address

debug oam build-packet packet field-override header ipv6 src-ipv6-address

Description

This command defines the source IPv6 address to be used in the IPv6 header.

The **no** form of the removes the source IPv6 address.

Parameters

ipv6-address

Specifies the IPv6 source address to be used in the IPv6 header.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	0 to FFFF]H
	d:	[0 to 255]D

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.344 src-mac

src-mac

Syntax

src-mac *ieee-address*

no src-mac

Context

[Tree] (config>redundancy>mc>peer>mc>l3-ring>connectivity-verify src-mac)

Full Context

configure redundancy multi-chassis peer multi-chassis l3-ring connectivity-verify src-mac

Description

This command specifies the source MAC address used for the Ring-Node Connectivity Verification of this ring node.

If all zeros are specified, then the MAC address of the system management processor (CPM) is used.

The **no** form of this command reverts to the default.

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

src-mac

Syntax

src-mac *ieee-address*

no src-mac

Context

[Tree] (config>redundancy>mc>peer>mcr>node>cv src-mac)

Full Context

configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify src-mac

Description

This command specifies the source MAC address used for the Ring-Node Connectivity Verification of this ring node.

A value of all zeros (000000000000 H (0:0:0:0:0:0)) specifies that the MAC address of the system management processor (CPM) is used.

Default

no src-mac

Parameters

ieee-address

Specifies the source MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

All

src-mac

Syntax

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>li>li-filter>li-mac-filter>entry>match src-mac)

Full Context

configure li li-filter li-mac-filter entry match src-mac

Description

This command configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the source mac as the match criteria.

Parameters

ieee-address

Specifies the 48-bit IEEE mac address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

Specifies a 48-bit mask that can be configured using the following formats.

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFF000000

Default **0xFFFFFFFFFFFF** (exact match)

Values 0x00000000000000 to 0xFFFFFFFFFFFF

Platforms

All

src-mac

Syntax

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match src-mac)

Full Context

configure qos sap-ingress mac-criteria entry match src-mac

Description

This command configures a source MAC address or range to be used as a service ingress QoS policy match criterion.

The **no** form of this command removes the source mac as the match criteria.

Default

no src-mac

Parameters

ieee-address

Enter the 48-bit IEEE MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

This 48-bit mask can be configured using the following formats:

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure all packets with a source MAC OUI value of 00-03-FA to be subject to a match condition, the entry should be specified as: 003FA000000 0xFFFFFF000000

Values 0x00000000000000 to 0xFFFFFFFFFFFF (hex)

Default 0xFFFFFFFFFFFF (hex) (exact match)

Platforms

All

src-mac

Syntax

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>filter>mac-filter>entry>match src-mac)

[Tree] (config>filter>ip-filter>entry>match src-mac)

[Tree] (config>filter>ipv6-filter>entry>match src-mac)

Full Context

configure filter mac-filter entry match src-mac

configure filter ip-filter entry match src-mac

configure filter ipv6-filter entry match src-mac

Description

Configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of the command removes the source mac as the match criteria.

Default

no src-mac

Parameters

ieee-address

Specifies the 48-bit IEEE MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit; both upper and lower case are supported.

ieee-address-mask

Specifies the 48-bit mask to match a range of MAC address values.

To configure so that all packets with a source MAC OUI value of 00:03:FA are subject to a match condition then the entry should be specified as: 00:03:FA:00:00:00 FF:FF:FF:00:00:00

Default ff:ff:ff:ff:ff:ff (exact match)

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is an hexadecimal digit; both upper and lower case are supported.

Platforms

All

src-mac

Syntax

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>system>security>mgmt-access-filter>mac-filter>entry>match src-mac)

Full Context

configure system security management-access-filter mac-filter entry match src-mac

Description

This command configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the source mac as the match criteria.

Default

no src-mac

Parameters

ieee-address

Specifies the 48-bit IEEE mac address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

Specifies a 48-bit mask that can be configured using the formats listed in Table 106: ieee-address-mask Formats:

Table 106: ieee-address-mask Formats

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFF000000

Default 0xFFFFFFFFFFFF (exact match)

Values 0x00000000000000 to 0xFFFFFFFFFFFF

no src-port

Context

[Tree] (config>app-assure>group>policy>aqp>entry>match src-port)

Full Context

configure application-assurance group policy app-qos-policy entry match src-port

Description

This command specifies a source IP port, source port list, or source range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

Default

no src-port

Parameters

eq

Specifies that a successful match occurs when the flow matches the specified port.

neq

Specifies that a successful match occurs when the flow does not match the specified port.

port-num

Specifies the source port number.

Values 0 to 65535

start-port-num end-port-num

Specifies the start or end source port number.

Values 0 to 65535

port-list-name

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

src-port

Syntax

Context

[Tree] (config>app-assure>group>sess-fltr>entry>match src-port)

Full Context

configure application-assurance group session-filter entry match src-port

Description

This command specifies a source IP port, source port list, or source range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

Default

no src-port

Parameters

eq

Specifies that a successful match occurs when the flow matches the specified port.

gt

Specifies all port numbers greater than the port-number match.

lt

Specifies all port numbers less than the port-number match.

port-num

Specifies the source port number.

Values 0 to 65535

start-port-num end-port-num

Specifies the start or end source port number.

Values 0 to 65535

port-list-name

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure li li-filter li-ipv6-filter entry match src-port

configure li li-filter li-ip-filter entry match src-port

Description

This command configures a source TCP or UDP port number or port range for an IP LI filter match criterion. Note that an entry containing Layer 4 match criteria will not match non-initial (second, third, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the source port match criterion.

Parameters

lt

Specifies all port numbers less than *src-port-number* match.

gt

Specifies all port numbers greater than *src-port-number* match.

eq

Specifies that *src-port-number* must be an exact match.

src-port-number

Specifies the source port number to be used as a match criteria expressed as a decimal integer.

Values [0..65535]D
[0x0..0xFFFF]H
[0b0..0b1111111111111111]B

configure qos sap-egress ipv6-criteria entry match src-port

configure qos sap-ingress ipv6-criteria entry match src-port

Description

This command configures a source TCP or UDP port number or port range for a SAP QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

Default

no src-port

Parameters

{lt | gt | eq} *src-port-number*

The TCP or UDP port numbers to match, specified as less than (**lt**), greater than (**gt**), or equal to (**eq**) to the source port value, specified as a decimal integer.

Values 1 to 65535 (decimal)

range *startend*

The range of TCP or UDP port values to match, specified as between the *start* and *end* source port values inclusive.

Values 1 to 65535 (decimal)

Platforms

configure qos network ingress ip-criteria entry match src-port

configure qos network egress ip-criteria entry match src-port

configure qos network egress ipv6-criteria entry match src-port

configure qos network ingress ipv6-criteria entry match src-port

Description

This command configures a source TCP or UDP port number, port range, or a port list for a network QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

Default

no src-port

Parameters

lt

Keyword used to specify TCP or UDP port numbers to match that are less than the source port value.

gt

Keyword used to specify TCP or UDP port numbers to match that are greater than the source port value.

eq

Keyword used to specify TCP or UDP port numbers to match that are equal to the source port value.

src-port-number

The source port value, specified as a decimal integer.

Values 1 to 65535

port-list-name

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

start

Specifies the starting range of TCP or UDP source port values to match.

Values 1 to 65535

end

Specifies the end range of TCP or UDP source port values to match.

Values 1 to 65535

Platforms

All

src-port

Syntax

Full Context

configure filter ipv6-exception entry match src-port

configure filter ip-exception entry match src-port

configure filter ip-filter entry match src-port

configure filter ipv6-filter entry match src-port

Description

This command configures a source TCP, UDP, or SCTP port number, port range, or port match list for an IP filter or IP exception match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing "**src-port eq** 0" match criterion, may match non-initial fragments when the source port value is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the source port match criterion.

Default

no src-port

Parameters

lt | gt | eq

Specifies the operator to use relative to *src-port-number* for specifying the port number match criteria.

lt specifies that all port numbers less than *src-port-number* match.

gt specifies that all port numbers greater than *src-port-number* match.

eq specifies that *src-port-number* must be an exact match.

src-port-number

Specifies the source port number to be used as a match criteria expressed as a decimal integer, and in hexadecimal or binary format. Below shows decimal integer only.

Values 0 to 65535

port-list-name

Specifies to use a list of ports referred to by *port-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

src-port-number src-port-number

Specifies inclusive port range between two src-port-number values.

Platforms

VSR

Full Context

configure system security management-access-filter ipv6-filter entry src-port

configure system security management-access-filter ip-filter entry src-port

Description

This command restricts ingress management traffic to either the CPM/CCM Ethernet port or any other logical port (for example LAG) on the device.

When the source interface is configured, only management traffic arriving on those ports satisfy the match criteria.

The **no** form of this command reverts to the default value.

Default

no src-port

Parameters

port-id

Specifies the port ID in formats shown below.

Values

slot/*mda*/*port*[.*channel*]		
	aps	keyword
	group-id	1 to 128
ccag-id	**ccag**-*id*. *path-id*[*cc-type*]	
	ccag	keyword
	id	1 to 8
	path-id	**a**, **b**
	cc-type	**.sap-net**, **.net-sap**

cpm

Matches any traffic received on any Ethernet port.

lag-id

Specifies the LAG identifier.

Values 1 to 800

Context

[Tree] (config>test-oam>link-meas>template>twl src-udp-port)

Full Context

configure test-oam link-measurement measurement-template twamp-light src-udp-port

Description

This command configures a source UDP port to be used by the link measurement tests linked to this template.

Unless required, Nokia suggests that the link measurement dynamically select an available source UDP port from the dynamic range. Before a UDP port in the configurable range can be configured as a source it must be owned by the application. Use the **config**>**test-oam**>**twamp**>**twamp-light**> **source-udp-port-pools**>**port**>**pool-type** command to map the port range to the application.

To use a source port in this range for link-measurement, the selected port number must have a **pool-type link-measurement** configured. The source UDP port must be owned by the application prior to the configuration under the application. A configured **source-udp-port** cannot be used when multiple tests are configured between the same source IP, destination IP and destination UDP port. A conflict may occur when non-unique addressing is used between two peers. A conflicting situation may occur when tests between peers are using IPv6 discovery and the link-local addresses on both nodes are the same. Other conflicts exist, such as, multiple tests between peers using the same source and destination IP system address instead of an interface address. When this condition exists, the operational state of the link-measurement test is operationally down with a failure condition UdpPortUnavailable.

The **no** form of the command removes the port number from the link measurement template.

Default

no src-udp-port

Parameters

port-number

Specifies the source UDP port number.

Values 64374 to 64383

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure router mpls lsp secondary srlg

Description

This command enables the use of the SRLG constraint in the computation of a secondary path for an LSP at the head-end LER. The command is configurable for both RSVP-TE and SR-TE LSPs.

When SRLG is enabled, CSPF includes the SRLG constraint in the computation of the secondary LSP path if **path-computation-method local-cspf** is configured on the LSP. CSPF returns the list of SRLG groups along with the ERO during primary path CSPF computation. At a subsequent establishment of a secondary path with the SRLG constraint, the MPLS task again queries CSPF by providing the list of SRLG group numbers to be avoided. CSPF prunes all links with interfaces that belong to the same SRLGs as the interfaces included in the ERO of the primary path. If CSPF finds a path, the secondary path is set up. If a path is not found, MPLS keeps retrying the requests to CSPF.

An SRLG enabled secondary or standby path of the LSP configured with a value of the **path-computation-method** command other than **local-cspf** remains operationally down with a failure code of srlgPrimaryCspfDisabled(25).

When an LSP is administratively enabled, the SRLG-enabled secondary path is not tried if the first attempt to bring up the primary path is in progress. The SRLG enabled secondary path is kept down temporarily with failure code srlgPrimaryPathDown(26). After this first attempt, MPLS begins setting up the SRLG-

enabled standby paths. If primary path computation fails or primary path was not configured, MPLS requests CSPF to compute the secondary path using an empty primary SRLG list. The SRLG *disjoint* state field shows *True* in this scenario.

If the primary path is re-optimized, has undergone MBB, or has come back up after being down, the MPLS task check determines if any SRLG secondary paths should be re-signaled. If MPLS finds that a secondary path is no longer SRLG disjointed, and therefore becomes ineligible, MPLS puts it on a delayed MBB immediately after the expiry of the retry timer. If MBB fails at the first try, the secondary path is torn down and the path is put on retry if not active. If the secondary path is active, then it is only torn down and resignaled when the primary path is activated. The secondary path can remain active even when ineligible while the revert timer to activate the primary path is still running.

If the primary goes down while active, the LSP uses the path of an eligible SRLG secondary path if it is up. If all secondary eligible SRLG paths are down, MPLS uses a non-SRLG secondary path, if configured and up. While the LSP is using a non-SRLG secondary path, if an eligible SRLG secondary path comes back up, MPLS switches the path of the LSP to the eligible SRLG secondary path. As soon as a path for the primary is successfully computed by CSPF, MPLS schedules the delay retry MBB for the secondary path using the new SRLG list.

If the primary path goes down while inactive, for example it is waiting for the revert timer to expire, MPLS resets the SRLG list of the primary to empty and changes the state of all secondary paths, including the currently active one, to the Disjointed state. A delay retry MBB is still performed but results in no change to the active secondary path.

A secondary path that becomes ineligible as a result of an update to the SRLG membership list of the primary path has the ineligibility status removed on any of the following events:

- a successful delay retry MBB of the secondary SRLG path that makes it eligible again
- the secondary path goes down. MPLS puts the standby on retry at the expiry of the retry timer. If successful, it becomes eligible. If not successful after the retry-timer expires or the number of retries reached the number configured under the **retry-limit** parameter, it is left down.

Once the primary path of the LSP is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface that the primary path is using is not considered until the next opportunity the primary path is re-signaled. The primary path may be re-signaled due to a failure or to a make-before-break operation. Make-before-break occurs as a result of a global revertive operation, a timer based or manual re-optimization of the LSP path, or an operator change to any of the path constraints.

Once an SRLG secondary path is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface the secondary path is using is not considered until the next opportunity when the secondary path is re-signaled. The secondary path is re-signaled due to a failure, to a re-signaling of the primary path, or to a make before break operation. Make-before-break occurs as a result of a timer based or manual re-optimization of the secondary path, or an operator change to any of the path constraints of the secondary path, except for enabling or disabling the **srlg** command itself. Enabling or disabling the **srlg** command on an active secondary or on an active or inactive secondary standby path causes the path to be torn down and re-signaled.

In addition, the user-configured **include** or **exclude** admin group statements for a secondary path are also checked together with the SRLG constraints by CSPF.

The following behavior of the feature is specific to the SR-TE LSP.

- An SRLG-enabled SR-TE LSP secondary path with SID label hops remains operational with failure code srlgPathWithSidHops(59).
- An SR-TE LSP uses IGP advertised link SRLG information in the TE database. It does not support the use of SRLG information in the static user SRLG database (**configure router mpls srlg-database**).

- Delay Retry MBB for making a non-disjointed path a disjointed one is not supported with an SR-TE LSP. Instead, the system performs a break-before-make (that is, teardown and retry) operation. If a non-disjointed path is the active path of the LSP, that path is torn down and retried after the router switches to another path (for example, after **revert-timer** expires). If the non-disjointed path is not an active path, it is torn down and retried immediately.

The **no** form of this command reverts to the default value.

23.357 srlg-frr

srlg-frr

Syntax

srlg-frr [**strict**]

no srlg-frr

Context

[Tree] (config>router>mpls srlg-frr)

Full Context

configure router mpls srlg-frr

Description

This command enables the use of the SRLG constraint in the computation of FRR bypass or detour to be associated with any primary LSP path on this system.

When this option is enabled, CSPF includes the SRLG constraint in the computation of a FRR detour or bypass for protecting the primary LSP path.

CSPF prunes all links with interfaces that belong to the same SRLG as the interface that is being protected, that is, the outgoing interface at the PLR the primary path is using. If one or more paths are found, the MPLS task will select one based on best cost and will signal the bypass/detour. If not found and the user has included the **strict** option, the bypass/detour is not setup and the MPLS task will keep retrying the request to CSPF. Otherwise, if a path exists that meets the other TE constraints, other than the SRLG one, the bypass/detour is setup.

A bypass or a detour LSP path is not intended to be SRLG disjoint from the entire primary path. Only the SRLGs of the outgoing interface at the PLR that the primary path is using are avoided.

When the MPLS task is searching for an SRLG bypass tunnel to associate with the primary path of the protected LSP, it will first check if any configured manual bypass LSP with CSPF enabled satisfies the SRLG constraints. The search skips any non-CSPF manual bypass LSP because there is no ERO returned to check the SRLG constraint. If no path is found, the task will check if an existing dynamic bypass LSP satisfies the SRLG and other primary path constraints. If not found, it will make a request to CSPF.

Once the primary path of the LSP is configured and is operationally up, subsequent changes to the SRLG group membership of an interface the primary path is using are not considered by the MPLS task at the PLR for bypass/detour association until the next opportunity the bypass LSP path or the primary path is resignaled. The path may be resignaled due to a failure or a Make-Before-Break (MBB) operation. MBB occurs as a result of a global revertive operation, a timer based or manual re-optimization of the bypass LSP or LSP primary path, or a user update of the primary path constraints.

Once the bypass or detour path is set up and is operationally up, subsequent changes to the SRLG group membership of an interface the bypass/detour path is using are not considered by the MPLS task at the PLR until the next opportunity when the association with the primary LSP path is rechecked. The association is rechecked if the bypass path is re-optimized using the timer or manual resignal MBB. Detour paths cannot be re-optimized separately from the primary path.

Enabling or disabling **srlg-frr** command only takes effect when the LSP primary path or the bypass path is resignaled. The user can either wait for the resignal timer to expire or cause the paths to be resignaled immediately by executing, at the ingress LER, the manual resignal command for the LSP primary path or for the bypass LSP path.

A MPLS interface can belong to a maximum of 64 SRLG groups. The SRLG groups are configured using the **config>router>if-attribute>srlg-group** command. The SRLG groups that an RSVP interface belong to are configured using the **srlg-group** command in the **config>router>mpls>interface** context.

The **no** form of this command reverts to the default value.

Default

no srlg-frr

Parameters

strict

configure router mpls interface srlg-group

configure router interface if-attribute srlg-group

configure service ies interface if-attribute srlg-group

configure service vprn interface if-attribute srlg-group

Description

This command configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface.

An interface can belong to up to 64 SRLG groups. However, each single operation of the **srlg-group** command allows a maximum of five (5) groups to be specified at a time. Once an SRLG group is bound to one or more interface, its value cannot be changed until all bindings are removed.

The configured SRLG membership is applied in all levels/areas the interface is participating in. The same interface cannot have different memberships in different levels/areas.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

The **no** form of this command deletes one or more of the SRLG memberships of an interface. The user can also delete all memberships of an interface by not specifying a group name.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain. Each single operation of the **srlg-group** command allows a maximum of 5 groups to be specified at a time.

Platforms

All

srlg-group

Syntax

srlg-group *group-name* **value** *group-value* [**penalty-weight** *penalty-weight*]

no srlg-group *group-name*

Context

[Tree] (config>router>if-attribute srlg-group)

Full Context

configure router if-attribute srlg-group

Description

This command defines a Shared Risk Link Group (SRLG) which can be associated with an IP or MPLS interface.

SRLG is used to tag IP or MPLS interfaces which share a specific fate with the same identifier. For example, an SRLG group identifier could represent all links which use separate fibers but are carried in the same fiber conduit. If the conduit is accidentally cut, all the fiber links are cut which means all interfaces using these fiber links will fail.

The user first configures locally on each router the name and identifier of each SRLG group. A maximum of 1024 SRLGs can be configured per system.

The user then configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface. A maximum of 64 SRLGs can be applied to a given interface.

When SRLGs are applied to MPLS interfaces, CSPF at an LER will exclude the SRLGs of interfaces used by the LSP primary path when computing the path of the secondary path. CSPF at an LER or LSR will also exclude the SRLGs of the outgoing interface of the primary LSP path in the computation of the path of the FRR backup LSP. This provides path disjointness between the primary path and the secondary path or FRR backup path of an LSP.

When SRLGs applied to IES, VPRN, or network IP interfaces, they are evaluated in the route next-hop selection by adding the **srlg-enable** option in a route next-hop policy template applied to an interface or a set of prefixes. For instance, the user can enable the SRLG constraint to select a LFA next-hop for a prefix which avoids all interfaces that share fate with the primary next-hop.

The following provisioning rules are applied to SRLG configuration. The system will reject the creation of a SRLG if it re-uses the same name but with a different group value than an existing group. The system

will also reject the creation of an SRLG if it re-uses the same group value but with a different name than an existing group.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

A user may specify a penalty weight (**penalty-weight**) associated with an SRLG. This controls the likelihood of paths with links sharing SRLG values with a primary path being used by a bypass or detour LSP. The higher the penalty weight, the less desirable it is to use the link with a given SRLG.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain.

group-value

Specifies the integer value associated with the group. The association of group name and value should be unique within an IP/MPLS domain.

Values 0 to 4294967295

penalty-weight

Specifies the integer value of the penalty weight that is assigned to the SRLG group

Values 0 to 65535

Default 0

[Tree] (config>service>vprn>sub-if>grp-if srrp)

Full Context

configure service ies subscriber-interface group-interface srrp

configure service vprn subscriber-interface group-interface srrp

Description

This command creates a Subscriber Router Redundancy Protocol (SRRP) instance on a group IP interface. An SRRP instance manages all subscriber subnets within the group interfaces subscriber IP interface or other subscriber IP interfaces that are associated through a wholesale/retail relationship. Only one unique SRRP instance can be configured per group interface.

The **no** form of this command removes an SRRP instance from a group IP interface. Once removed, the group interface ignores ARP requests for the SRRP gateway IP addresses that may exist on subscriber subnets associated with the group IP interface. Then the group interface stops routing using the redundant IP interface associated with the group IP interface and will stop routing with the SRRP gateway MAC address. Ingress packets destined to the SRRP gateway MAC will also be silently discarded. This is the same behavior as a group IP interface that is disabled (shutdown).

The **no** form of this command removes the SRRP ID from the configuration.

Default

no srrp

Parameters

srrp-id

Specifies a 32 bit instance ID that must be unique to the system. The instance ID must also match the instance ID used by the remote router that is participating in the same SRRP context. SRRP is intended to perform a function similar to VRRP where adjacent IP hosts within local subnets use a default gateway to access IP hosts on other subnets.

configure router policy-options policy-statement default-action srv6-locator

configure router policy-options policy-statement entry action srv6-locator

Description

This command configures either a string encoding a midstring parameter delimited by at signs (@), or a reference to a named locator for the SRv6 TLV to use.

For a VRF export policy, the referenced locator must already be configured using the commands in the **configure service vprn segment-routing-v6 locator** context.

For a BGP export policy, the referenced locator must already be configured using the commands in the **configure router segment-routing segment-routing-v6 base-routing-instance locator** context.

The **no** form of this command specifies not to use a locator for the SRv6 TLV.

Default

no srv6-locator

Parameters

name

Specifies either a string encoding a midstring parameter delimited by at signs (@) or a reference to a named locator for the SRv6 TLV to use, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

23.365 srv6-micro-segment-locator

srv6-micro-segment-locator

Syntax

srv6-micro-segment-locator *name*

no srv6-micro-segment-locator

Context

[Tree] (config>router>policy-options>policy-statement>entry>action srv6-micro-segment-locator)

[Tree] (config>router>policy-options>policy-statement>default-action srv6-micro-segment-locator)

Full Context

configure router policy-options policy-statement entry action srv6-micro-segment-locator

configure router policy-options policy-statement default-action srv6-micro-segment-locator

Description

This command configures either a string encoding a midstring parameter delimited by at signs (@), or a reference to a named micro-segment (uSID) locator for the SRv6 TLV to use.

For a VRF export policy, the referenced uSID locator must already be configured using the commands in the **configure service vprn segment-routing-v6 micro-segment-locator** context.

For a BGP export policy, the referenced uSID locator must already be configured using the commands in the **configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator** context.

The **no** form of this command specifies not to use a uSID locator for the SRv6 TLV.

Default

no srv6-micro-segment-locator

Parameters

name

Specifies either a string encoding a midstring parameter delimited by at signs (@) or a reference to a named uSID locator for the SRv6 TLV to use, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

23.366 srv6-return-path-bfd-sid

srv6-return-path-bfd-sid

Syntax

srv6-return-path-bfd-sid *ipv6-address* | *param-name*

no srv6-return-path-bfd-sid

Context

[Tree] (config>router>policy-options>policy-statement>default-action srv6-return-path-bfd-sid)

[Tree] (config>router>policy-options>policy-statement>entry>action srv6-return-path-bfd-sid)

Full Context

configure router policy-options policy-statement default-action srv6-return-path-bfd-sid

configure router policy-options policy-statement entry action srv6-return-path-bfd-sid

Description

This command applies to the initiator of Seamless Bidirectional Forwarding Detection sessions. This command configures the S-BFD session to echo mode and pushes an additional SRv6 SID in the SRH for S-BFD packets only when it is sent on the imported SRv6 policy.

The return-path SID refers to a binding SID on a SRv6 policy configured on the far-end router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this SRv6 return path. The **no** form of this command disables the controlled return-path SID and echo mode for S-BFD.

Parameters

ipv6-address

Specifies the IPv6 address.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

param-name

Specifies the parameter variable name, up to 32 characters. Policy parameters must start and end with an at-sign (@).

Platforms

All

23.367 srv6-sid

srv6-sid

Syntax

srv6-sid *ipv6-address*

no srv6-sid

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>seg-list>segment srv6-sid)

Full Context

configure router segment-routing sr-policies static-policy segment-list segment srv6-sid

Description

This command defines the 128-bit SRv6 SID for the segment. The policy can only be administratively enabled if its type (defined with the **configure router segment-routing sr-policies static-policy type** command) and all its segments (defined with the **configure router segment-routing sr-policies static-policy segment-list segment** command) are SRv6.

Parameters

ipv6-address

Specifies the SID, up to 72 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

23.368 srv6-sid-prefix

srv6-sid-prefix

Syntax

srv6-sid-prefix {*ipv6-prefix/prefix-length* | *param-name*}

no srv6-sid-prefix

Context

[Tree] (config>router>policy-options>policy-statement>entry>from srv6-sid-prefix)

Full Context

configure router policy-options policy-statement entry from srv6-sid-prefix

Description

This command configures either the name of a prefix policy variable or an IPv6 prefix and prefix length, as match criterion for a BGP route.

Note: If the name of a prefix policy variable is the match criterion, the name must start and end with an at sign (@).

A BGP route matches this criterion if it has an SRv6 TLV, and the SID or micro-segment (uSID) value in that TLV is matched by the bits of the IPv6 prefix (up to the specified prefix length).

This match criterion is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.

Default

no srv6-sid-prefix

Parameters

ipv6-prefix/prefix-length

Specifies the IPv6 address and prefix length.

Values

ipv6-prefix:	x:x:x:x:x:x:x:x (host bits must be 0)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
prefix-length:	0 to 128

param-name

Specifies the name of a prefix policy variable, which can be up to 32 characters and must start and end with an at sign (@)

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

23.369 srv6-tlv

srv6-tlv

Syntax

srv6-tlv {**present** | **not-present**}

no srv6-tlv

Context

[Tree] (config>router>policy-options>policy-statement>entry>from srv6-tlv)

Full Context

configure router policy-options policy-statement entry from srv6-tlv

Description

This command configures whether the entry matches a BGP route with a prefix SID attribute containing an SRv6 TLV. This match criterion is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.

The **no** form of this command disables the router from taking whether a BGP route has a prefix SID attribute containing an SRv6 TLV into consideration when matching a BGP route with the entry.

Default

no srv6-tlv

Parameters

present

Specifies that a BGP route only matches this entry if it has a prefix SID attribute containing an SRv6 TLV.

not-present

Specifies that a BGP route only matches this entry if it does not have a prefix SID attribute containing an SRv6 TLV.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

23.370 ssap

ssap

Syntax

ssap *ssap-value* [*ssap-mask*]

no ssap

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match ssap)

Full Context

configure qos sap-ingress mac-criteria entry match ssap

Description

This command configures an Ethernet 802.2 LLC SSAP value or range for an ingress SAP QoS policy match criterion.

This is a 1-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The **no** form of this command removes the ssap match criterion.

Default

no ssap

Parameters

ssap-value

The 8-bit ssap match criteria value in hex.

Values 0x00 to 0xFF (hex)

ssap-mask

This is optional and can be used when specifying a range of ssap values to use as the match criteria.

This 8-bit mask can be configured using the following formats:

Format Style	Format Syntax	Example
Decimal	DDD	240
Hexadecimal	0xHH	0xF0
Binary	0bBBBBBBBB	0b11110000

Values 0x00 to 0xFF

Platforms

Syntax

ssap *ssap-value* [*ssap-mask*]

no ssap

Context

[Tree] (config>filter>mac-filter>entry>match ssap)

Full Context

configure filter mac-filter entry match ssap

Description

This command configures an Ethernet 802.2 LLC SSAP value or range for a MAC filter match criterion.

This is a one-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria.

The **no** form of the command removes the ssap match criterion.

Default

no ssap

Parameters

ssap-value

Specifies the 8-bit ssap match criteria value in decimal, hexadecimal or binary.

Values 0 to 255

ssap-mask

Specifies an optional parameter that may be used when specifying a range of ssap values to use as the match criteria.

This 8 bit mask and the ssap value can be configured as described in Table 107: 8-bit Mask Syntax.

Table 107: 8-bit Mask Syntax

ssh

Syntax

ssh *host* [**-l** *username*] [**-v** *ssh-version*] [{**router** *router-instance* | **service-name** *service-name*}] [**re-exchange-min** *minutes*] [**re-exchange-mbyte** *megabytes*]

Context

[Tree] (ssh)

Full Context

ssh

Description

This command initiates a client SSH session with the remote host and is independent from the administrative or operational state of the SSH server. However, to be the target of an SSH session, the SSH server must be operational. This command also allows the user to initiate a SSH session, with a key re-exchange, based on maximum megabytes or minutes, whichever occurs first. If the re-exchange options are not set, the default behavior will not perform a key re-exchange.

Quitting SSH while in the process of authentication is accomplished by either executing a ctrl-c or "~." (tilde and dot), assuming the "~" is the default escape character for SSH session.

Parameters

host

Specifies the remote host for the SSH session.

Values

host: *user@hostname* - [up to 255 characters]	
user	up to 32 characters
hostname	[*dns-name* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface: up to 32 characters, mandatory for link local addresses
dns-name	up to128 characters

username

Specifies the user name to use when opening the SSH session, up to 32 characters.

router-instance

Specifies the router name or service ID.

Values

router-instance: *router-name* or *vprn-svc-id*

router-name	"Base", "management", "vpls-management"
vprn-svc-id	1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

minutes

Specifies the time interval after which the SSH client will initiate the key-re-exchange.

Values 1 to 1440 minutes

megabytes

Specifies the number of megabytes, on a SSH session, after which the SSH client will initiate the key re-exchange.

Values 1 to 64000 megabytes

[Tree] (config>system>security>profile ssh-max-sessions)

Full Context

configure system security cli-session-group ssh-max-sessions

configure system security profile ssh-max-sessions

Description

This command is used to limit the number of SSH-based sessions available to all users that are part of a particular profile, or to all users of all profiles that are part of the same **cli-session-group**.

The **no** form of this command disables the command and the profile or group limit is not applied on the number of sessions.

Default

no ssh-max-sessions

Parameters

number-of-sessions

Specifies the maximum number of allowed SSH-based sessions.

Values 0 to 50

Platforms

All

23.374 ssh-reply

ssh-reply

Syntax

[**no**] **ssh-reply**

Context

[Tree] (config>service>ies>if>vrrp ssh-reply)

Full Context

configure service ies interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner vrrp virtual-router-id nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply

Platforms

All

ssh-reply

Syntax

[**no**] **ssh-reply**

Context

[Tree] (config>service>vprn>if>vrrp ssh-reply)

Full Context

configure service vprn interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instance's IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner **vrrp** *virtual-router-id* nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply

Platforms

All

ssh-reply

Syntax

[**no**] **ssh-reply**

Context

[Tree] (config>router>if>vrrp ssh-reply)

Full Context

configure router interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH requests directed at the virtual router instance IP addresses. This command is only applicable to IPv4.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses.

This limitation can be disregarded for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ssh-reply** command enables the non-owner master to reply to SSH requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Correct login and CLI command authentication is still enforced.

When **ssh-reply** is not enabled, SSH requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH requests regardless of the **ssh-reply** setting.

The **ssh-reply** command is only available in non-owner **vrrp** nodal context.

By default, SSH requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command discards all SSH request messages destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply — SSH requests to the virtual router instance IP addresses are discarded.

23.381 stable-pool-sizing

stable-pool-sizing

Syntax

[**no**] **stable-pool-sizing**

Context

[Tree] (config>card>fp stable-pool-sizing)

Full Context

configure card fp stable-pool-sizing

Description

This command provides a stable buffer pool allocation environment for all default port buffer pools on a forwarding plane. This stable environment is provided at the expense of optimal buffer allocation between the various port buffer pools. Normally, port pools are sized according to a ports relative bandwidth with other ports and the ability of a port to use pool buffers. As an example, on a forwarding plane with two potential MDAs and only one equipped, the normal behavior is to provide all available default pool buffers to the ports on the currently equipped MDA. If a second MDA is equipped in the future, buffers are freed from the existing MDA and provided to the ports on the new MDA. Stable pool sizing alters this behavior by reserving buffers for both MDAs whether they are equipped or not thus preventing a resizing event when an MDA is equipped. In addition, existing ports on a module always receive their maximum bandwidth share of buffers independent on any sub-rate condition that may currently exist. This provides a stable amount of buffers to other ports on the module independent of link or configuration events that may occur on the port.

Stable pool sizing preserves the ability to modify the effective bandwidth used to determine a port's relative share of the available buffers through the use of the ing-percentage-of-rate and egr-percentage-of-rate commands under the port configuration. Changing the values associated with these commands will cause a reevaluation of buffer distribution and thus a possible resizing of pools on each port within the module. These commands have no effect on ports associated with other modules on the forwarding plane.

Stable pool sizing may be enabled or disabled at any time on a forwarding plane. The system will dynamically change the pool sizes according to the stable pool sizing state.

When a port connector breakout is configured, its ports is included in the stable pool sizing calculation. Consequently, adding or removing a port connector breakout to or from the configuration will cause the buffer pool allocation to be recalculated even when stable pool sizing is enabled.

The **no** form of this command disables stable pool sizing on a forwarding plane. Existing buffer pools are resized according to normal pool sizing behavior.

configure router bgp group graceful-restart stale-routes-time

configure router bgp graceful-restart stale-routes-time

Description

This command configures the maximum amount of time in seconds that stale routes should be maintained after a graceful restart is initiated.

The **no** form of this command resets the stale routes time back to the default of 360 seconds.

Default

no stale-routes-time

Parameters

time

Specifies the amount of time that stale routes should be maintained after a graceful restart is initiated.

Values 1 to 3600 seconds

Platforms

All

23.385 stale-time

stale-time

Syntax

stale-time *seconds*

no stale-time

standard-multi-instance

Syntax

[**no**] **standard-multi-instance**

Context

[Tree] (config>service>vprn>isis standard-multi-instance)

Full Context

configure service vprn isis standard-multi-instance

Description

This command enables IS-IS multi-instance (MI) as described in draft-ginsberg-isis-mi-bis-01. Multiple instances allow instance-specific adjacencies to be formed that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV identifying the instance and the topology to which the PDU belongs. A single topology is supported in each instance, so the instance-specific topology identifier (ITID) is set to 0 and cannot be changed.

The **standard-multi-instance** (based on draft-ginsberg-isis-mi-bis-01) and **iid-tlv-enable** (based on draft-ietf-isis-mi-02) commands cannot be configured in the same instance, because the MAC addresses and PDUs from the two standards are incompatible.

The **no** form of this command removes the **standard-multi-instance** configuration.

Default

no standard-multi-instance

Platforms

Platforms

All

23.387 standby

standby

Syntax

[**no**] **standby**

Context

[Tree] (config>router>mpls>lsp>secondary standby)

Full Context

configure router mpls lsp secondary standby

Description

The secondary path LSP is normally signaled once the primary path LSP fails. The **standby** keyword ensures that the secondary path LSP is signaled and maintained indefinitely in a hot standby state. Standby paths are selected in preference to non-standby secondary paths. When multiple standby secondary paths exist, then the path-preference is used to determine the order in which the paths are selected. If multiple standby secondary paths have the same, lowest, path-preference value then the system will select the path with the lowest up-time. When the primary path is re-established then the traffic is switched back to the primary path LSP.

The **no** form of this command specifies that the secondary LSP is signaled when the primary path LSP fails.

Description

This command enables standby-signaling-slave for an Epipe.

Platforms

All

standby-signaling-slave

Syntax

[**no**] **standby-signaling-slave**

Context

[Tree] (config>service>epipe>spoke-sdp standby-signaling-slave)

[Tree] (config>service>epipe>endpoint standby-signaling-slave)

Full Context

configure service epipe spoke-sdp standby-signaling-slave

configure service epipe endpoint standby-signaling-slave

Description

When this command is enabled, the node will block the transmit forwarding direction of a spoke SDP based on the pseudowire standby bit received from a T-LDP peer.

This command is present at the endpoint level as well as the spoke SDP level. If the spoke SDP is part of an explicit-endpoint, it will not be possible to change this setting at the spoke SDP level. An existing spoke SDP can be made part of the explicit endpoint only if the settings do not conflict. A newly created spoke SDP, which is part of a specific explicit-endpoint, will inherit this setting from the endpoint configuration.

This command is mutually exclusive with an endpoint that is part of an mc-lag, mc-aps or an ICB.

If the command is disabled, the node assumes the existing independent mode of behavior for the forwarding on the spoke SDP.

Default

no standby-signaling-slave

Full Context

configure qos slope-policy high-slope start-avg

configure qos slope-policy low-slope start-avg

configure qos slope-policy exceed-slope start-avg

configure qos slope-policy highplus-slope start-avg

Description

This command sets the exceed, low, high, or highplus Random Early Detection (RED) slope position for the shared buffer average utilization value where the packet discard probability starts to increase above zero. The percent parameter is expressed as a percentage of the shared buffer size.

The **no** form of this command restores the start-avg value to the default setting. If the max-avg setting is smaller than the default, an error will occur and the start-avg setting will not be changed to the default.

Default

start-avg 85 - Highplus slope default is 85% buffer utilization before discard probability starts to increase above zero.

start-avg 70 — High slope default is 70% buffer utilization before discard probability starts to increase above zero.

start-avg 50 — Low slope default is 50% buffer utilization before discard probability starts to increase above zero.

start-avg 30 — Exceed slope default is 30% buffer utilization before discard probability starts to increase above zero.

Parameters

percent

The percentage of the shared buffer space for the buffer pool at which point the drop probability starts to increase above zero. The value entered must be less than or equal to the current setting of **max-avg**. If the entered value is greater than the current value of **max-avg**, an error will occur and no change will take place.

configure router dhcp server pool failover startup-wait-time

configure router dhcp6 server pool failover startup-wait-time

configure router dhcp local-dhcp-server failover startup-wait-time

Description

This command enables the startup wait time during which each peer waits after the initialization process before assuming the active role for the prefix designated as local or access-driven. This is to avoid transient issues during the initialization process.

The **startup-wait-time** should be configured to an interval in which, after boot, both nodes can set up an MCS TCP link and start MCS. The timer is restarted each time the server downloads a lease from the MCS database and stops when the last state record from the peer is synchronized. The next state is (PRE-)NORMAL, unless the timer times out or is forced to stop via the tools command (**tools>perform>router>dhcp** or **dhcp6>local-dhcp-server** *server-name*>**pool**/**failover**>**abort-startup-wait**), in which case the local DHCP server transitions immediately to the COMMUNICATIONS-INTERRUPTED state.

Default

startup-wait-time min 2

Parameters

minutes

Specifies the startup wait time, in minutes.

Values 1 to 59

seconds

Specifies the startup wait time, in seconds.

Values 1 to 59

hours

Specifies the startup wait time, in hours.

Values 1

Full Context

configure subscriber-mgmt sla-profile ingress qos queue stat-mode

configure subscriber-mgmt sla-profile egress qos queue stat-mode

configure subscriber-mgmt sla-profile ingress qos policer stat-mode

configure subscriber-mgmt sla-profile egress qos policer stat-mode

Description

This command is used to configure the forwarding plane octet and packet counters of a policer or queue to count packets of a specific type or state. For example separate counters for IPv4/IPv6 or separate counters for offered high and low priority policed traffic.

For policers, this command overrides the policer stat-mode configuration as defined in the sap-ingress or sap-egress qos policy. For details on sap-ingress and sap-egress policer stat-mode, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide*. For use in Enhanced Subscriber Management (ESM) context only, an additional stat-mode enables separate counters for IPv4 and IPv6 packets.

When a policer's stat-mode is changed while the sla profile is in use, any previous counter values are lost and any new counters are set to zero.

For queues, this command sets the stat-mode. Queue stat-mode is only available for use in Enhanced Subscriber Management (ESM) context to enable separate IPv4/IPv6 counters.

A queue's stat-mode cannot be changed while the SLA profile is in use.

The **no** form of this command reverts to the default.

Default

For policers, the default is no stat-mode override. The sap-ingress or sap-egress stat-mode is used instead.

For queues, the default is to count in-/out-of-profile octets and packets.

Parameters

stat-mode

Specifies the stat mode for the policer.

For ingress and egress qos queue stat-mode overrides.

For ingress and egress qos policer stat-mode overrides, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for details on the **sap-ingress** and **sap-egress policer stat-mode** parameters.

For use in Enhanced Subscriber Management (ESM) context only:

Values no-stats, minimal, offered-profile-no-cir, offered-priority-no-cir, offered-profile-cir, offered-priority-cir, offered-total-cir, offered-limited-profile-cir, offered-profile-capped-cir, offered-limited-capped-cir, v4-v6 (count IPv4 and IPv6 forwarded/dropped octets and packets separately)

configure card fp ingress access queue-group policer-override policer stat-mode

Description

This command configures the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, high priority or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported which prevents any packet accounting, the use of the policer's **parent** command requires at the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. Once a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

See the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for details on the policer stat-mode parameters.

configure service cpipe sap ingress policer-override policer stat-mode

configure service epipe sap ingress policer-override policer stat-mode

configure service epipe sap egress policer-override policer stat-mode

Description

The SAP QoS policy's **policer stat-mode** command is used to configure the forwarding plane counters that allow offered, output, and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potentially large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and indicates how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's parent command requires that the policer's **stat-mode** to be set at least to the minimal setting so that offered statistics are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free statistics can be viewed by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The current active stat mode setting will continue to be used by the policer.

The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

The **no** form of this command attempts to return the policer's stat-mode setting to **minimal**.

Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for detailed information about the supported parameters for the **policer stat-mode** command.

configure qos sap-ingress policer stat-mode

configure qos sap-ingress dynamic-policer stat-mode

Description

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority, or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made

a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 108: Ingress Policer Stat Mode Summary .

Table 108: Ingress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in-profile and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped, and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 109: Ingress Accounting Statistics Collected in minimal stat-mode .

	aod	AllOctetsDropped
For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

offered-profile-no-cir

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) traffic nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 110: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in Table 111: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode .

For. LowPrio	lpf	LowPriorityPacketsForwarded
	lof	LowPriorityOctetsForwarded

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises hard in/out and uncolored traffic. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 112: Ingress Accounting Statistics Collected in offered-profile-cir stat-mode .

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does

not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 113: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or

out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 114: Ingress Accounting Statistics Collected in offered-total-cir stat-mode .

offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-**

profile-cir is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 115: Ingress Accounting Statistics Collected in offered-limited-profile-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (Uncolor).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 116: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer

comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the "offered undefined" statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

This mode is intended to be used with **profile-capped** configured within the policer.

The impact of using **offered-limited-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 117: Ingress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

configure qos sap-egress dynamic-policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in Table 118: Egress Policer Stat-mode Summary.

Table 118: Egress Policer Stat-mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In or out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-profile-cir	4	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In or out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 119: Egress Accounting Statistics Collected in minimal stat-mode .

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 120: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 121: Egress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 122: Egress Accounting Statistics Collected in offered-total-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 123: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using o**ffered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 124: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

configure qos sap-egress policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in Table 125: Egress Policer Stat-mode Summary.

Table 125: Egress Policer Stat-mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In or out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-profile-cir	4	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In or out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is reclassified at egress to exceed-profile
offered-four-profile-no-cir	4	Inplus, in, out, or exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				is reclassified at egress to inplus and/ or exceed-profile
offered-total-cir-four-profile	4	Single counter entering policer	Inplus, in, out, or exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is reclassified at egress to profile inplus

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in Table 126: Egress Accounting Statistics Collected in minimal stat-mode .

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 127: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 128: Egress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 129: Egress Accounting Statistics Collected in offered-total-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 130: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile

traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using o**ffered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 131: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

offered-total-cir-exceed

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 132: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode .

offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus, in, out and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped, and forwarded counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus and/or exceed-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 133: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode .

offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both **profile inplus** and **profile exceed**.

This mode is intended to be used when traffic is reclassified at egress to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 134: Egress Accounting Statistics Collected in offered-total-cir-four-profile stat-mode .

configure qos queue-group-templates ingress queue-group policer stat-mode

Description

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority or low-priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The stat-modes are described in Table 135: Stat Mode Descriptions.

Table 135: Stat Mode Descriptions

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				only in- and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in- and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 136: Ingress Accounting Statistics Collected in minimal stat-mode .

offered-profile-no-cir

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 137: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 138: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 139: Ingress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in Table 140: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in Table 141: Ingress Accounting Statistics collected in offered-total-cir stat-mode .

	oof	OutOfProfileOctetsForwarded

offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in Table 142: Ingress Accounting Statistics Collected in offered-limited-profile-cir stat-mode .

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as 'out-of-profile' due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in Table 143: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

	oof	OutOfProfileOctetsForwarded

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the 'offered undefined' statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

This mode is intended to be used with **profile-capped** configured within the policer.

The impact of using **offered-limited-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 144: Ingress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

configure qos queue-group-templates egress queue-group policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 145: Egress Policer Stat Mode Summary.

Table 145: Egress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				only in- and out-of-profile.
offered-profile-cir	4	In/out/uncolored (that corresponds to in- or out-of-profile from the ingress processing) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In/out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored (that corresponds to in- or out-of-profile from the ingress processing) entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured.
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed.
offered-four-profile-no-cir	4	Inplus/in/out/exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic is egress reclassified

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				to profile inplus and/ or exceed.
offered-total-cir-four-profile	4	Single counter entering policer	Inplus/in/out/exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is egress reclassified to profile inplus.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates one forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the **show** output and those collected when **collect-stats** is enabled are described in Table 146: Egress Accounting Statistics Collected in minimal stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-of profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped and forwarded statistics are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 147: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover traffic reclassified to in-profile (that includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 148: Egress Accounting Statistics Collected in offered-profile-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 149: Egress Accounting Statistics Collected in offered-total-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

Table 149: Egress Accounting Statistics Collected in offered-total-cir stat-mode

	oof	OutOfProfileOctetsForwarded

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover in-profile traffic (that includes traffic reclassified to inplus-profile) and out-of-profile traffic (that includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft-in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 150: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is comprised of hard inplus, hard in, hard out, and hard exceed, as well as soft in and soft out. The offered counters cover traffic reclassified to in-profile (that includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (uncolor).

In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in**, and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 151: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

	oof	OutOfProfileOctetsForwarded

offered-total-cir-exceed

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 152: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus-profile, in-profile, out-of-profile, and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped and forwarded counters for both profile inplus and profile exceed.

This mode is intended to be used when traffic is egress reclassified to profile inplus and/or exceed. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 153: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out, and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 154: Egress Accounting Statistics Collected in offered-total-cir-four-profile stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

configure router mpls lsp egress-statistics stat-mode

configure router mpls lsp-template egress-statistics stat-mode

Description

This command sets the mode used for collecting LSP statistics.

The **no** form of this command reverts to the default.

Default

stat-mode per-fc

Parameters

per-fc

Specifies that RSVP-TE statistics will be collected per FC.

aggregate

Specifies that SR-TE statistics will be collected as an aggregate across all FCs.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.401 state

state

Syntax

[**no**] **state**

Context

[Tree] (config>subscr-mgmt>wlan-gw>ue-query state)

Full Context

configure subscriber-mgmt wlan-gw ue-query state

Description

This command enables matching on a specific UE state. Multiple states can be provisioned.

The **no** form of this command disables matching on the specified UE state (all UEs match).

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

state

Syntax

state *state*

no state

Context

[Tree] (config>router>policy-options>policy-statement>entry>from state)

Full Context

configure router policy-options policy-statement entry from state

Description

This command identifies in resilient gateways which routes are associated with an active context and which routes are associated with a standby context.

Default

no state

Parameters

state

Specifies the state.

Values srrp-master — Used in non-CUPS BNG resiliency. Identifies routes associated with an active SRRP instance.

srrp-non-master — Used in non-CUPS BNG resiliency. Identifies routes associated with a standby SRRP instance.

ipsec-master-with-peer — Used in stateful Multi-Chassis IPsec (MC-IPsec) redundancy. Identifies routes associated with an active MC-IPsec node with a reachable peer.

ipsec-non-master — Used in stateful MC-IPsec redundancy. Identifies routes associated with a standby MC-IPsec node.

ipsec-master-without-peer — Used in stateful MC-IPsec redundancy. Identifies routes associated with an active MC-IPsec node without a reachable peer.

fsg-active — Used in BNG CUPS inter-UPF resiliency. Identifies routes associated with an FSG on the active BNG UPF. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes, but not loopback addresses.

fsg-standby — Used in BNG CUPS inter-UPF resiliency. Identifies routes associated with an FSG on the standby BNG UPF. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes, but not loopback addresses.

configure router pcep pcc state-timer

Description

This command configures the state timer for PCE-initiated LSPs. The state timer must be set to a value greater than the redelegation timer.

The **no** form of the command sets this value to the default.

Default

state-timer 180 action remove

Parameters

seconds

Specifies the number of seconds before the state timer expires.

Values 1 to 3600

action

Specifies the actions that are taken on undelegated LSPs upon the state timer expiration.

Values remove, none

Default remove

configure service vpls proxy-arp static

Description

This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either learned or CStatic (conditional static MAC) in order to become active.

Parameters

ip-address

Specifies the IPv4 address for the static entry.

ieee-address

Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

Platforms

All

static

Syntax

static *ipv6-address ieee-address* {**host** | **router**}

no static *ipv6-address*

Context

[Tree] (config>service>vpls>proxy-nd static)

Full Context

configure service vpls proxy-nd static

Description

This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either dynamic or CStatic (Conditional Static MAC) in order to become active. Along with the IPv6 and MAC, the entry must also be configured as either host or router. This will determine if the received NS for the entry will be replied with the R flag set to 1 (router) or 0 (host).

Parameters

ipv6-address

Specifies the IPv6 address for the static entry.

ieee-address

Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

host

Specifies that the entry is type "host”.

router

Specifies that the entry is type "router”.

Full Context

configure service ies interface static-arp

configure service vprn interface static-arp

Description

This command configures a static address resolution protocol (ARP) entry associating a subscriber IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address will be replaced with the new MAC address.

The **no** form of this command removes a static ARP entry.

Parameters

ip-address

Specifies the IP address for the static ARP in IP address dotted decimal notation.

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Platforms

All

Context

[Tree] (config>router>if static-arp)

Full Context

configure router interface static-arp

Description

This command configures a static Address Resolution Protocol (ARP) entry associating an IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a specific IP address already exists and a new MAC address is configured for the IP address, the existing MAC address is replaced by the new MAC address.

The number of static-arp entries that can be configured on a single node is limited to 1000.

Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address. Use proxy ARP so the router responds to ARP requests on behalf of another device.

The **no** form of this command removes a static ARP entry.

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa*-*bb*-*cc*-*dd* -*ee*-*ff*, where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Platforms

All

23.410 static-cak

static-cak

Syntax

[**no**] **static-cak**

Context

[Tree] (config>macsec>connectivity-association static-cak)

Full Context

configure macsec connectivity-association static-cak

Description

This command allows the configuration of a Connectivity Association Key (CAK). The CAK is responsible for managing the MKA.

Platforms

All

23.411 static-entry

static-entry

Syntax

static-entry *ip-prefix/ip-prefix-length* **upto** *prefix-length2* **origin-as** *as-number* [{**valid** | **invalid**}]

no static-entry *ip-prefix/ip-prefix-length* **upto** *prefix-length2* **origin-as** *as-number*

Context

[Tree] (config>router>origin-validation static-entry)

Full Context

configure router origin-validation static-entry

Description

This command configures a static VRP entry indicating that a specific origin AS is either valid or invalid for a specific IP prefix range. Static VRP entries are stored along with dynamic VRP entries (learned from local cache servers using the RPKI-Router protocol) in the origin validation database of the router. This database is used for determining the **origin-validation** state of IPv4 and/or IPv6 BGP routes received over sessions with the **enable-origin-validatio**n command configured.

Static entries can only be configured under the **config**>**router**>**origin-validation** context of the base router.

Parameters

ip-prefix/ip-prefix-length

Specifies an IPv4 or IPv6 address with a minimum prefix length value.

Values 60 to 3600

prefix-length2

Specifies the maximum prefix length.

Values 1 to 128

as-number

Specifies as-number.

Values 0 to 4294967295

valid

Specifies a keyword meaning the static entry expresses a valid combination of origin AS and prefix range.

invalid

Specifies a keyword meaning the static entry expresses an invalid combination of origin AS and prefix range.

[Tree] (config>service>ies>sub-if>grp-if>sap static-host)

Full Context

configure service vprn subscriber-interface group-interface sap static-host

configure service ies subscriber-interface group-interface sap static-host

Description

This command creates a static subscriber host for the SAP. Static subscriber hosts may be used by the system for various purposes. Applications within the system that make use of static host entries include anti-spoof, ARP reply agent and source MAC population into the VPLS forwarding database.

Multiple static hosts may be defined on the SAP. Each host is identified by either a source IP address, a source MAC address or both a source IP and source MAC address. Every static host definition must have at least one address defined, IP or MAC.

Static hosts can exist on the SAP even with anti-spoof and ARP reply agent features disabled. When enabled, each feature has different requirements for static hosts.

The **no** form of this command removes a static entry from the system. The specified *ip-address* and *mac-address* must match the host's exact IP and MAC addresses as defined when it was created. When a static host is removed from the SAP, the corresponding anti-spoof filter entry and/or FDB entry is also removed.

Parameters

ip-prefix[/prefix-length

Specifies information for the specified IP address and mask.

mac-address

Specifies a MAC address. The MAC address must be specified for **anti-spoof mac**, and **anti-spoof ip-mac** and arp-reply-agent (**arp-reply-agent** is supported by the 7450 ESS only). Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

Every static host definition must have at least one address defined, IP or MAC.

force

Specifies the forced removal of the static host addresses.

create

Keyword used to create the static host instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

static-host

Syntax

static-host ip *ip-address* [**mac** *ieee-address*] [**create**]

configure service vprn interface sap static-host

Description

This command creates a static subscriber host for the SAP. Static subscriber hosts may be used by the system for various purposes. Applications within the system that make use of static host entries include anti-spoof, ARP reply agent and source MAC population into the VPLS forwarding database.

Multiple static hosts may be defined on the SAP. Each host is identified by either a source IP address, a source MAC address or both a source IP and source MAC address. Every static host definition must have at least one address defined, IP or MAC.

Static hosts can exist on the SAP even with anti-spoof and ARP reply agent features disabled. When enabled, each feature has different requirements for static hosts.

The **no** form of this command removes a static entry from the system. The specified *ip-address* and *mac-address* must match the host's exact IP and MAC addresses as defined when it was created. When a static host is removed from the SAP, the corresponding anti-spoof filter entry and/or FDB entry is also removed.

Parameters

ip-address

Specify this optional parameter when defining a static host. The IP address must be specified for **anti-spoof ip**, **anti-spoof ip-mac** and **arp-reply-agent** (**arp-reply-agent** is supported by the 7450 ESS only). Only one static host may be configured on the SAP with a given IP address.

mac-address

Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof mac**, and **anti-spoof ip-mac** and arp-reply-agent (**arp-reply-agent** is supported by the 7450 ESS only). Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

Every static host definition must have at least one address defined, IP or MAC.

force

Specifies the forced removal of the static host addresses.

create

Keyword used to create the static host instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

configure service vpls spoke-sdp static-isid

Description

This command configures the static-isid context.

Platforms

All

23.416 static-label-range

static-label-range

Syntax

static-label-range *static-range*

no static-label-range

Context

[Tree] (config>router>mpls-labels static-label-range)

Full Context

configure router mpls-labels static-label-range

Description

This command configures the range of MPLS static label values shared among static LSP, MPLS-TP LSP, and static service VC label. Once this range is configured, it is reserved and cannot be used by other protocols such as RSVP, LDP, BGP, or Segment Routing to assign a label dynamically.

Default

static-label-range 18400

Parameters

static-range

Specifies the size of the static label range in number of labels. The minimum label value in the range is 32. The maximum label value is therefore computed as {32+ static-range-1}.

Values 0 to 262112

Default 18400

Platforms

All

23.417 static-lsp

static-lsp

Syntax

[**no**] **static-lsp** *lsp-name*

Context

[Tree] (config>router>mpls static-lsp)

Full Context

configure router mpls static-lsp

Description

This command is used to configure a static LSP on the ingress router. The static LSP is a manually set up LSP where the nexthop IP address and the outgoing label (push) must be specified.

The **no** form of this command deletes this static LSP and associated information.

The LSP must be shutdown first in order to delete it. If the LSP is not shut down, the **no static-lsp** *lsp-name* command does nothing except generate a warning message on the console indicating that the LSP is administratively up.

Parameters

lsp-name

Specifies the name that identifies the LSP.

Values Up to 32 alphanumeric characters.

Platforms

All

23.418 static-lsp-fast-retry

static-lsp-fast-retry

Syntax

static-lsp-fast-retry *seconds*

no static-lsp-fast-retry

Context

[Tree] (config>router>mpls static-lsp-fast-retry)

Full Context

configure router mpls static-lsp-fast-retry

Description

This command specifies the value used as the fast retry timer for a static LSP.

When a static LSP is trying to come up, the MPLS request for the ARP entry of the LSP next-hop may fail when it is made while the next-hop is still down or unavailable. In that case, MPLS starts a retry timer before making the next request. This enhancement allows the user to configure the retry timer, so that the LSP comes up as soon as the next-hop is up.

The **no** form of this command reverts to the default.

Default

no static-lsp-fast-retry

Parameters

seconds

Specifies the value (in s), used as the fast retry timer for a static LSP.

Values 1 to 30

Platforms

All

[Tree] (config>service>vpls>spoke-sdp static-mac)

Full Context

configure service vpls mesh-sdp static-mac

configure service vpls sap static-mac

configure service vpls spoke-sdp static-mac

Description

This command creates a remote static MAC entry in the Virtual Private LAN Service (VPLS) forwarding database (FDB) associated with the Service Distribution Point (SDP).

In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or with a Service Distribution Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Local and remote static MAC entries create a permanent MAC address to SDP association in the forwarding database for the VPLS instance so that MAC address is not learned on the edge device.

Note:
Static MAC definitions on one edge device are not propagated to other edge devices participating in the VPLS instance, that is, each edge device has an independent forwarding database for the VPLS.

Only one static MAC entry (local or remote) can be defined per MAC address per VPLS instance.

By default, no static MAC address entries are defined for the SDP.

The **no** form of this command deletes the static MAC entry with the specified MAC address associated with the SDP from the VPLS forwarding database.

Parameters

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa-bb-cc-dd -ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

create

Keyword used to create the static MAC instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

All

static-mac

Syntax

static-mac

Context

[Tree] (config>service>vpls static-mac)

Full Context

configure service vpls static-mac

Description

A set of conditional static MAC addresses can be created within a VPLS supporting BGP-EVPN. Conditional Static Macs are also supported in B-VPLS with SPBs. Unless they are configured as **black-hole**, conditional Static Macs are dependent on the SAP/SDP state.

This command allows the assignment of a set of conditional Static MAC addresses to a SAP/ spoke-SDP or **black-hole**. In the FDB, the static MAC is then associated with the active SAP or spoke-SDP.

When configured in conjunction with SPBM services, Static MACs are used for PBB Epipe and I-VPLS services that may terminate external to SPBM. If this is configured under a Control B-VPLS the interface referenced will not use IS-IS for this neighbor. This may also be configured under a User B-VPLS where the corresponding interface is not supported under the Control B-VPLS.

Static MACs configured in a BGP-EVPN service are advertised as protected (EVPN will signal the MAC as protected).

Platforms

All

static-mac

Syntax

static-mac

Context

[Tree] (config>service>vpls>interface static-mac)

Context

[Tree] (config>app-assure>group>transit-prefix-policy static-remote-aa-sub)

Full Context

configure application-assurance group transit-prefix-policy static-remote-aa-sub

Description

This command configures static remote transit aa-subs with a name and an app-profile. Remote transit subscribers are configured for sites on the opposite side of the system as the parent SAP/spoke- SDP. A new remote transit sub with both a name and an app-profile is configured with the create command. Static

remote transit aa-subs must have an explicitly assigned app-profile. An existing remote transit sub can optionally be assigned a different app-profile.

The **no** form of this command removes the name from the transit prefix policy.

Parameters

transit-aasub-name

Specifies a transit aasub-name up to 32 characters.

app-profile-name

Specifies the name of an existing application profile up to 32 characters.

create

Keyword used to create a new app-profile entry.

23.423 static-route

static-route

Syntax

[**no**] **static-route** *route-name*

Context

[Tree] (config>service>pw-routing static-route)

Full Context

configure service pw-routing static-route

Description

This command configures a static route to a next hop S-PE or T-PE. Static routes may be configured on either S-PEs or T-PEs.

A default static route is entered as follows:

static-route 0:0:next_hop_ip_addresss

or

static-route 0:0.0.0.0:next_hop_ip_address

The **no** form of this command removes a previously configured static route.

Parameters

route-name

Specifies the static pseudowire route.

Values

route-name	<global-id>:<prefix>:<next-hop-ip_addr>
global-id	0 to 4294967295
prefix	a.b.c.d | 0 to 4294967295
next-hop-ip_addr	a.b.c.d

static-route

Syntax

[**no**] **static-route** *ip-prefix/ip-prefix-length* **next-hop** *ip-address*

Context

[Tree] (bof static-route)

Full Context

bof static-route

Description

This command creates a **static route** entry for the CPM management Ethernet port in the running configuration and the Boot Option File (BOF).

This command allows manual configuration of static routing table entries. These static routes are only used by traffic generated by the CPM Ethernet port. To reduce configuration, manual address aggregation should be applied where possible.

A maximum of 10 static routes can be configured on the CPM port.

The **no** form of this command deletes the static route.

Default

no static-route

Parameters

ip-prefix/ip-prefix-length

Specifies the destination address of the static route in dotted decimal notation.

Values

ip-prefix/ip-prefix-length	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-le	0 to 32

	ipv6-prefix	*x:x:x:x:x:x:x:x* (eight 16-bit pieces) *x:x:x:x:x:x:d.d.d.d* *x*: [0 to FFFF]H *d*: [0to 255]D
	ipv6-prefix-le	0 to128
ip-address	ipv4-address	a.b.c.d
	ipv6-address	*x:x:x:x:x:x:x:x* (eight 16-bit pieces) *x:x:x:x:x:x:d.d.d.d* *x*: [0 to FFFF]H *d*: [0 to 255]D

Note:
IPv6 is applicable to the 7750 SR and 7950 XRS only.

mask

Specifies the subnet mask, expressed as an integer or in dotted decimal notation.

Values 1 to 32 (mask length), 128.0.0.0 to255.255.255.255 (dotted decimal)

ip-address

Specifies the next hop IP address used to reach the destination.

Platforms

All

23.424 static-route-entry

static-route-entry

Syntax

static-route-entry *ip-prefix*/*prefix-length* [**mcast**]

no static-route-entry *ip-prefix*/*prefix-length* [**mcast**]

Context

[Tree] (config>service>vprn static-route-entry)

Full Context

configure service vprn static-route-entry

Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

Once the static route context for the specified prefix and netmask has been created, additional parameters associated with the static route(s) may be specified through the inclusion of additional static-route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

IPv6 static routes are not supported on the 7450 ESS except in mixed mode.

Default

No static routes are defined.

Parameters

ip-prefix/prefix-length

The destination address of the static route.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

Values The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

mcast

Specifies that the associated static route should be populated in the associated VPRN multicast route table.

Platforms

All

static-route-entry

Syntax

[**no**] **static-route-entry** *ip-prefixlprefix-length* [**mcast**]

Context

[Tree] (config>router static-route-entry)

Full Context

configure router static-route-entry

Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

After the static route context for the specified prefix and netmask has been created, additional parameters associated with the static routes may be specified through the inclusion of additional static route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

Default

No static routes are defined.

Parameters

ip-prefix/prefix-length

Specifies the destination address of the static route.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-prefix	a.b.c.d (host bits must be 0)	
ipv4-prefix-length	0 to 32	
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x	[0 to FFFF]H
	d	[0 to 255]D
ipv6-prefix-length	0 to 128	

Values The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

ip-address

Specifies the IP address of the IP interface. The *ip-addr* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses

Values The following value applies to the 7450 ESS:

ipv4-address	a.b.c.d (host bits must be 0)

mcast

Indicates that static route being configured is used for multicast table only.

Full Context

configure application-assurance group http-enrich field static-string

Description

This command configures an HTTP header enrichment template field static string.

The **no** form of this command removes the template field static string.

Default

no static-string

Parameters

static-string

Specifies a static string.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.428 static-tunnel-redundant-next-hop

static-tunnel-redundant-next-hop

Syntax

static-tunnel-redundant-next-hop *ip-address*

no static-tunnel-redundant-next-hop

Context

[Tree] (config>service>ies>if static-tunnel-redundant-next-hop)

[Tree] (config>service>vprn>if static-tunnel-redundant-next-hop)

Full Context

configure service ies interface static-tunnel-redundant-next-hop

configure service vprn interface static-tunnel-redundant-next-hop

Description

This command specifies redundant next-hop address on public or private IPsec interface (with public or private tunnel-sap) for static IPsec tunnel. The specified next-hop address will be used by standby node to shunt traffic to master in case of it receives them. Refer to the *7450 ESS, 7750 SR, and VSR Multiservice Integrated Service Adapter and Extended Services Appliance Guide* for information about IPsec commands and descriptions.

The next-hop address will be resolved in routing table of corresponding service.

The **no** form of this command removes the address from the interface configuration.

Parameters

ip-address

Specifies the static ISA tunnel redundant next-hop address.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.429 station

station

Syntax

station *station-name* [**create**]

Full Context

configure router bgp group monitor station

configure router bgp monitor station

configure service vprn bgp group monitor station

configure router bgp group neighbor monitor station

configure service vprn bgp group neighbor monitor station

Description

This command configures the set of BMP monitoring stations for which BMP messages are to be sent, at the global BGP instance level, per group or for a particular neighbor.

Whatever value is configured for the station parameter at the most specific BGP hierarchy level is used.

- If a station list or the **no station** command is configured at a neighbor context, then that value is used.
- If **no station** command is configured at the neighbor context, the group value is used.
- If a station list or the **no station** command is configured at a group context, then that value is used.
- If **no station** command is configured at the group context, the global value is used.
- If a station list or the **no station** command is configured at the global context, then that value is used.
- If **no station** command is configured at the global context, then a **no station** is assumed.

The **no** form of this command disables sending BMP messages to BMP monitoring stations.

Parameters

name

Specifies up to eight station names up to 32 characters. Allowed values are any string up to 32 characters long composed of printable,7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

all

Specifies all configured stations.

Platforms

All

23.430 station-address

station-address

Syntax

station-address *ip-address* | *ipv6-address* **port** *port*

no station-address

Context

[Tree] (config>bmp>station>connection station-address)

Full Context

configure bmp station connection station-address

Description

This command configures the IP address and TCP port number of the remote BMP monitoring station. This is a mandatory parameter and must be configured before the associated station can transitioned out of the shut down state.

The **no** form of this command removes the configured station IP address and port number for the BMP session. The **no station-address** command cannot be accepted unless the BMP or station instance is shut down.

Parameters

ip-address

Specifies the station address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address

Specifies the station address expressed in dotted decimal notation. Allowed value is a valid routable IPv6 address on the router, either an interface or system IPv6 address.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

port

Specifies the TCP (destination) port number to be used when establishing the connection to the associated BMP station.

Values 1 to 65535

Full Context

debug wlan-gw group statistic

Description

This command enables debugging of the specified statistic. The first packet that causes an increase of the specified statistic is shown in debug output. After the first packet, debugging of the counter is stopped.

Parameters

type

Displays the type of statistic to be debugged; for example, DHCP or RADIUS.

Values packet-errors, host-errors, bd-errors, forwarding, reassembly, aa, radius, arp, dhcp, dhcp6, icmp, icmp6

name

Specifies the name, up to 256 characters, of the statistic within that group. For a complete list, see the command **show isa wlan-gw-group** *wlan-gw-group-id* **member** *member-id* **statistics**.

- configure service ies interface ipsec ipsec-tunnel dynamic-keying cert status-verify

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure ipsec ipsec-transport-mode-profile dynamic-keying cert status-verify
- configure service vprn interface sap ipsec-tunnel dynamic-keying cert status-verify
- configure service vprn interface sap ipsec-gw cert status-verify
- configure service ies interface sap ipsec-gw cert status-verify

status-verify

Syntax

status-verify default-result {revoked | good}

no status-verify

Context

[Tree] (config>system>security>tls>server-tls-profile status-verify)

[Tree] (config>system>security>tls>client-tls-profile status-verify)

Full Context

configure system security tls server-tls-profile status-verify

configure system security tls client-tls-profile status-verify

Description

This command configures the certificate revocation status verification parameters for end-entity (EE) certificates in the TLS client or server. This configuration overrides the existing revocation check policy.

By default the router checks the certification revocation status, but if this command is set to **good**, the end-entity certificate revocation status is overwritten and a good revocation status is returned for the EE certificate.

If this command is set to **revoked**, the router returns the actual revocation status of the end-entity certificate.

The **no** form of this command returns the actual revocation status to that of the end entity certificate.

Default

status-verify default-result revoked

Parameters

good

Specifies that the certificate is considered acceptable.

revoked

Specifies that the certificate is considered revoked.

Platforms

All

23.437 std-acct-attributes

std-acct-attributes

Syntax

[**no**] **std-acct-attributes**

Context

[Tree] (config>subscr-mgmt>acct-plcy>include-radius-attribute std-acct-attributes)

Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute std-acct-attributes

Description

This command enables reporting of aggregated forwarded IPv4 and IPv6 octet, packet and gigaword counters using standard RADIUS attributes. This attribute is by default. It can be enabled simultaneously with detailed per queue or policer counters (**detailed-acct-attributes**).

The **no** form of this command reverts to the default.

steering-route

Syntax

steering-route *ip-prefix/length*

no steering-route

Context

[Tree] (config>service>vprn>nat>inside>redundancy steering-route)

Full Context

configure service vprn nat inside redundancy steering-route

Description

This command configures specifies the IP address and prefix length of the steering route. The steering route is used in the realm of this virtual router instance as an indirect next-hop for all the traffic that must be routed to the large scale NAT function.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

steering-route

Syntax

steering-route *ip-prefix/length*

no steering-route

Context

[Tree] (config>router>nat>inside>redundancy steering-route)

Full Context

configure router nat inside redundancy steering-route

Description

This command is optionally used in LSN44 multi-chassis redundancy when filters are used on the inside to send traffic destined for the LSN44 function to MS-ISA, where NAT is performed.

If configured, the steering-route is advertised only from the active LSN44 node: the purpose is to bring the LSN44 node activity awareness to downstream routers. In this fashion, downstream routers can make a more intelligent decision when forwarding traffic in the upstream direction. Based on the steering-route, traffic can be sent directly towards the active LSN44 node. This route avoids an extra forwarding hop which would ensue in the case without LSN44 activity awareness, where the upstream traffic can be forwarded to the standby LSN44 node and then to the active LSN44 node.

LSN44 node activity (active/standby) is evaluated per isa-group based on monitoring routes advertised on the outside.

The **no** form of the command removes the ip-prefix/length from the configuration.

Parameters

ip-prefix/length

Specifies the IP address and length of the steering route.

Values

ip-prefix:	a.b.c.d
ip-prefix-length:	0 to 32

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.441 sticky-dest

Full Context

configure filter ipv6-filter entry sticky-dest

configure filter mac-filter entry sticky-dest

configure filter redirect-policy sticky-dest

configure filter ip-filter entry sticky-dest

Description

This command configures sticky destination behavior for redundant PBR/PBF actions. Configuring sticky destination has an effect on PBR/PBF actions whether a secondary action is configured.

The *hold-time-up* parameter allows the operator to delay programming of a PBR/PBF action for a specified amount of time. The timer is only started when transitioning from all configured targets being down (that is, the primary target if no secondary target is configured, or both the primary and secondary targets when both are configured) to at least one target being up.

When the timer expires, the primary PBR/PBF action is programmed if its target is up. If the primary PBR/PBF target is down and a secondary PBR/PBF action has been configured and its target is up, then this secondary PBR/PBF action is programmed. In all other cases, no specific programming occurs when the timer expires.

When sticky destination is configured and the secondary PBR/PBF target is up and its associated action is programmed, it is not automatically replaced by the primary PBR/PBF action when its target transitions from down to up. In this situation, programming the primary PBR/PBF action can be forced using the **activate-primary-action** tools command.

Changing the value of the timer while the timer is running takes effect immediately (that is, the timer is restarted immediately using the new value).

The **no** form of the command disables sticky destination behavior.

Default

no sticky-dest

Parameters

hold-time-up

Specifies the initial delay in seconds. Zero is equivalent to **no-hold-time-up** (no delay).

Values 0 to 65535 seconds

Platforms

All

23.442 sticky-dr

sticky-dr

Syntax

sticky-dr [**priority** *dr-priority*]

no sticky-dr

Context

[Tree] (config>service>vprn>pim>if sticky-dr)

Full Context

configure service vprn pim interface sticky-dr

Description

This command enables sticky-dr operation on this interface. When enabled, the priority in PIM hellos sent on this interface when elected as the designated router (DR) is modified to the value configured in *dr-priority*. This is done to avoid the delays in forwarding caused by DR recovery, when switching back to the old DR on a LAN when it comes back up.

By enabling **sticky-dr** on this interface, it will continue to act as the DR for the LAN even after the old DR comes back up.

The **no** form of this command disables sticky-dr operation on this interface.

Default

no sticky-dr

Parameters

priority *dr-priority*

Sets the DR priority to be sent in PIM Hello messages following the election of that interface as the DR, when sticky-dr operation is enabled.

Values 1 to 4294967295

Platforms

All

sticky-dr

Syntax

23.443 sticky-ecmp

sticky-ecmp

Syntax

sticky-ecmp

no sticky-ecmp

Context

[Tree] (config>router>policy-options>policy-statement>entry>action sticky-ecmp)

[Tree] (config>router>policy-options>policy-statement>default-action sticky-ecmp)

Full Context

configure router policy-options policy-statement entry action sticky-ecmp

configure router policy-options policy-statement default-action sticky-ecmp

Description

This command specifies that BGP routes matching an entry or default-action of a route policy should be tagged internally as requiring sticky ECMP behavior. When a BGP route with multiple equal-cost BGP next-hops is programmed for sticky ECMP the failure of one or more of its BGP next-hops causes only the affected traffic flows to be re-distributed to the remaining next-hops; by default (without sticky-ECMP) all flows are potentially affected, even those using a next-hop that did not fail.

Default

no sticky-ecmp

Platforms

All

23.444 sticky-msaps

sticky-msaps

Syntax

sticky-msaps [**idle-timeout** *seconds*]

no sticky-msaps

Context

[Tree] (config>subscr-mgmt>msap-policy sticky-msaps)

Full Context

configure subscriber-mgmt msap-policy sticky-msaps

Description

This command prevents MSAPs associated with the specified MSAP policy from being deleted unless a manual **clear** command is issued. If this command is not enabled, an MSAP is deleted when a host creation fails or when a subscriber is no longer associated with the MSAP, for example, when a subscriber ends the session. This feature is useful for an operator who wants to keep historical statistics on MSAPs. It can also speed up host creation on an MSAP since the MSAP is already created. The **idle-timeout** parameter allows the removal of MSAPs that are idle for longer than the specified time.

The **no** form of this command allows an MSAP to be deleted when a host creation fails or when a subscriber is no longer associated with the MSAP.

Default

no sticky-msaps

Parameters

seconds

Specifies the idle timeout, in seconds.

Values 5 to 604800

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.448 strict

strict

Syntax

[**no**] **strict**

Context

[Tree] (config>app-assure>group>tcp-validate strict)

Full Context

configure application-assurance group tcp-validate strict

Description

This command specifies whether enforcement of TCP sequence and acknowledgment numbers is applied. If a packet does not meet the expected sequence or acknowledgment number, it is dropped.

This command should only be enabled if the expected bit error rate or packet loss is low. For example, if acknowledgments are lost before being detected by AA, the server timeouts are triggered and retransmissions occur. If **strict** is enabled, these retransmissions would resemble a reply attack and would be dropped by AA.

The **no** form of this command removes TCP sequence and acknowledgment number enforcement.

Default

no strict

23.449 strict-adjacency-check

strict-adjacency-check

Syntax

[**no**] **strict-adjacency-check**

Context

[Tree] (config>service>vprn>isis strict-adjacency-check)

Full Context

configure service vprn isis strict-adjacency-check

Description

This command enables strict checking of address families (IPv4 and IPv6) for IS-IS adjacencies. When enabled, adjacencies do not come up unless both routers have exactly the same address families configured. If there is an existing adjacency with unmatched address families, it is torn down.

This command is used to prevent black-holing traffic when IPv4 and IPv6 topologies are different. When disabled (**no strict-adjacency-check**) a BFD session failure for either IPv4 or IPv6 will cause the routes for the other address family to be removed as well.

When disabled (**no strict-adjacency-check**), both routers only need to have one common address family to establish the adjacency.

Default

no strict-adjacency-check

Platforms

All

strict-adjacency-check

Syntax

[**no**] **strict-adjacency-check**

strict-ero-nhop-direct-resolution

Syntax

[**no**] **strict-ero-nhop-direct-resolution**

Context

[Tree] (config>router>mpls strict-ero-nhop-direct-resolution)

Full Context

configure router mpls strict-ero-nhop-direct-resolution

Description

This command enables the strict Explicit Route Object (ERO) next-hop direct resolution. The feature restricts the routes used to resolve the next hop of an ERO address to local and host routes. This command avoids using a next hop over a parallel link when a half link is up in the routing table.

When enabled, this command applies to an ERO when all of the following conditions are met:

- the ERO next hop is an IPv4 address
- the ERO object is a strict hop
- the IPv4 address matches the primary subnet of a local numbered interface

An ERO that meets the preceding conditions restricts resolution of the next hop to a LOCAL or a HOST route. If no such route exists, RSVP rejects the PATH message with ErrCode = Routing Error (24) and SubErrCode = Bad Strict Node (2).

The **no** form of this command disables the strict ERO next-hop direct resolution.

Default

no strict-ero-nhop-direct-resolution

[Tree] (config>subscr-mgmt>sub-ident-pol strings-from-option)

Full Context

configure subscriber-mgmt sub-ident-policy strings-from-option

Description

This command enables DHCPv4 option processing on DHCP ACK for subscriber host identification.

The parameter *dhcp-option-number* specifies the DHCPv4 option number containing subscriber host identification strings such as subscriber ID, sub-profile, sla-profile strings, and so on. The identification strings can be inserted by an SR OS based DHCPv4 server via a local user database lookup.

Applicable to DHCPv4 hosts and PPP hosts that use the internal DHCP client to get an IPv4 address from an SR OS based DHCPv4 server.

The **no** form of this command reverts to the default.

Default

no strings-from-option

Parameters

dhcp-option-number

Specifies the DHCPv4 option number containing subscriber host identification strings.

Values 1 to 254

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.456 strip-label

strip-label

Syntax

[**no**] **strip-label**

Context

[Tree] (config>router>if strip-label)

Full Context

configure router interface strip-label

Description

This command forces packets to be stripped of all (max 5) MPLS labels before the packets are handed over for possible filter (PBR) processing.

If the packets do not have an IP header immediately following the MPLS label stack after the strip, they are discarded. Only MPLS encapsulated IP, IGP shortcuts and VPRN over MPLS packets will be processed. However, IPv4 and IPv6 packets that arrive without any labels are supported on an interface with **strip-label** enabled.

This command operates in promiscuous mode. This means that the router does not filter on the destination MAC address of the Ethernet frames. In some network designs, multiple ports may be tapped and combined into interface toward the router. Promiscuous mode allows all of these flows to be processed without requiring the destination MAC address to be updated to match the router address.

This command is supported on:

- Optical ports for the 7750 SR and 7450 ESS
- IOM3-XP cards for the 7750 SR and 7450 ESS
- Null/Dot1q encaps
- Network ports
- IPv4
- IPv6

In order to associate an interface that is configured with the strip-label parameter with a port, the port must be configured as single-fiber for the command to be valid.

Packets that are subject to the strip-label action and are mirrored (using mirrors or lawful interception) will contain the original MPLS labels (and other L2 encapsulation) in the mirrored copy of the packet, as they appeared on the wire, when the mirror-dest type is the default type "ether". If the mirror-dest type is "ip-only", then the mirrored copy of the packet will not contain the original L2 encapsulation or the stripped MPLS labels.

The **no** form of this command removes the strip-label command.

Default

no strip-label

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vprn igmp group-interface sub-hosts-only

Description

This command enables the IGMP traffic from known hosts only.

The **no** form of this command disable the IGMP traffic from known hosts only

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-hosts-only

Syntax

[**no**] **sub-hosts-only**

Context

[Tree] (config>router>igmp>group-interface sub-hosts-only)

Full Context

configure router igmp group-interface sub-hosts-only

Description

This command disables the processing of IGMP messages outside of the subscriber-host context. No other hosts outside of the subscriber-hosts can create IGMP states.

Disabling this command allows the creation of the IGMP states that correspond to the AN that operate in IGMP proxy mode. In this mode, the AN will hide source IP addresses of IGMP messages and will source IGMP messages with its own IP address. In this case, an IGMP state can be created under the **sap** context. This IGMP state creation under the SAP is controlled via the import policy under the group-interface.

The IGMP state processing for regular subscriber-hosts is unaffected by this command.

The **no** form of the command disables the command.

Default

sub-hosts-only

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-hosts-only

Syntax

[**no**] **sub-hosts-only**

Context

[Tree] (config>router>mld>group-interface sub-hosts-only)

Full Context

configure router mld group-interface sub-hosts-only

Description

This command processes the handling of MLD joins received from hosts that are not known in subscriber management or on which no MLD policy is applied.

Disabling this command allows the creation of the MLD states that correspond to the AN that operate in MLD proxy mode. In this mode, the AN will hide source IP addresses of MLD messages and will source MLD messages with its own IP address. In this case, an MLD state can be created under the **sap** context. This MLD state creation under the SAP is controlled via the import policy under the group-interface.

The MLD state processing for regular subscriber-hosts is unaffected by this command.

The **no** form of the command enables the command.

Default

sub-hosts-only

23.463 sub-ident-policy

sub-ident-policy

Syntax

[**no**] **sub-ident-policy** *sub-ident-policy-name*

Context

[Tree] (config>subscr-mgmt sub-ident-policy)

Full Context

configure subscriber-mgmt sub-ident-policy

Description

This command configures a subscriber identification policy. Each subscriber identification policy can have a default subscriber profile defined. The subscriber identification policy default subscriber profile overrides the system default and the subscriber SAP default subscriber profiles. Defining a subscriber identification policy default subscriber profile is optional.

The subscriber identification policy default subscriber profile cannot be defined with the subscriber profile name default.

Defining a subscriber profile as a subscriber identification policy default subscriber profile will cause all active subscribers currently associated with a subscriber SAP using the policy and associated with a subscriber policy through the system default or subscriber SAP default subscriber profiles to be reassigned to the subscriber policy defined as default on the subscriber identification policy.

Attempting to delete a subscriber profile that is currently defined as a default for a subscriber identification policy will fail.

When attempting to remove a subscriber identification policy default subscriber profile definition, the system will evaluate each active subscriber on all subscriber SAPs the subscriber identification policy is currently associated with that are using the default definition to determine whether the active subscriber can be either reassigned to a subscriber SAP default or the system default subscriber profile. If all active subscribers cannot be reassigned, the removal attempt will fail.

The **no** form of this command reverts to the default.

Parameters

sub-ident-policy-name

Specifies the name of the subscriber identification policy, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service ies subscriber-interface group-interface sap-parameters sub-sla-mgmt sub-ident-policy

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt sub-ident-policy

Description

This command associates a subscriber identification policy to this SAP. The subscriber identification policy must be defined prior to associating the profile with a SAP in the **config>subscr-mgmt>sub-ident-policy** context.

Subscribers are managed by the system through the use of subscriber identification strings such as a subscriber identifier, an sla-profile string, a sub-profile string and an app-profile string.

The subscriber identification policy performs following functions for subscriber hosts and sessions associated with the SAP or MSAP:

- mapping of sla-profile, sub-profile and app-profile strings obtained from authentication (for example, LUDB, RADIUS, Diameter, or Python) into profile names that are configured on the router
- for IPoE DHCPv4 hosts, the subscriber identification strings can be derived from the DHCP ACK message sent to the subscriber host using a Python script referenced in the sub-ident-policy
- for PPPoE hosts that get an IPv4 address via the PPPoE DHCPv4 client and for IPoE DHCPv4 hosts, an SR OS DHCPv4 server in combination with an LUDB returns the identification strings in a DHCPv4 option. The **strings-from-option** command in the sub-ident-policy tells the system from which option to extract the identification strings.

The **no** form of this command removes the default subscriber identification policy from the SAP configuration.

Parameters

sub-ident-policy-name

Specifies a subscriber identification policy for this SAP.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

no sub-ident-policy

Context

[Tree] (config>app-assure>group>transit-ip-policy sub-ident-policy)

Full Context

configure application-assurance group transit-ip-policy sub-ident-policy

Description

This command associates a subscriber identification policy to this SAP. The subscriber identification policy must be defined prior to associating the profile with a SAP in the **config>subscribermgmt>sub-ident-policy** context.

Subscribers are managed by the system through the use of subscriber identification strings. A subscriber identification string uniquely identifies a subscriber. For static hosts, the subscriber identification string is explicitly defined with each static subscriber host.

For dynamic hosts, the subscriber identification string must be derived from the DHCP ACK message sent to the subscriber host. The default value for the string is the content of Option 82 CIRCUIT-ID and REMOTE-ID fields interpreted as an octet string. As an option, the DHCP ACK message may be processed by a subscriber identification policy which has the capability to parse the message into an alternative ASCII or octet string value.

When multiple hosts on the same port are associated with the same subscriber identification string they are considered to be host members of the same subscriber.

A sub-ident-policy can also be used for identifying dynamic transit subscriber names.

The **no** form of this command removes the default subscriber identification policy from the SAP configuration.

Default

no sub-ident-policy

Parameters

sub-ident-policy-name

Specifies the subscriber identification policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

sub-insert-shared-pccrule

Syntax

sub-insert-shared-pccrule start-entry *entry-id* **count** *count*

no sub-insert-shared-pccrule

Context

[Tree] (config>qos>sap-egress sub-insert-shared-pccrule)

[Tree] (config>qos>sap-ingress sub-insert-shared-pccrule)

Full Context

configure qos sap-egress sub-insert-shared-pccrule

configure qos sap-ingress sub-insert-shared-pccrule

Description

This command defines the range of filter and QoS policy entries that are reserved for shared entries received in Flow-Information AVP via Gx interface (PCC rules – Policy and Charging Control).

The **no** form of this command disables the insertion, which will result in a failure of PCC rule installation.

Default

no sub-insert-shared-pccrule

Parameters

entry-id

Specifies the lowest entry in the range.

Values 1 to 65535

count

Specifies the number of entries in the range.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-insert-shared-pccrule

Syntax

sub-insert-shared-pccrule start-entry *entry-id* **count** *count*

no sub-insert-shared-pccrule

Context

[Tree] (config>filter>ip-filter sub-insert-shared-pccrule)

[Tree] (config>filter>ipv6-filter sub-insert-shared-pccrule)

Full Context

configure filter ip-filter sub-insert-shared-pccrule

configure filter ipv6-filter sub-insert-shared-pccrule

Description

This command defines the range of filter and QoS policy entries that are reserved for shared entries received in Flow-Information AVP via Gx interface (PCC rules – Policy and Charging Control). The **no** form of this command disables the insertion, which will result in a failure of PCC rule installation.

Default

no sub-insert-shared-pccrule

Parameters

entry-id

Specifies the lowest entry in the range.

Values 1 to 2097151

count

Specifies the number of entries in the range.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.467 sub-insert-shared-radius

sub-insert-shared-radius

Syntax

sub-insert-shared-radius start-entry *entry-id* **count** *count*

no sub-insert-shared-radius

Context

[Tree] (config>filter>ip-filter sub-insert-shared-radius)

[Tree] (config>filter>ipv6-filter sub-insert-shared-radius)

Full Context

configure filter ip-filter sub-insert-shared-radius

configure filter ipv6-filter sub-insert-shared-radius

Description

This command configures the insert point for shared host rules from RADIUS.

Default

no sub-insert-shared-radius

Parameters

entry-id

Identifies a filter on this system.

Values 1 to 2097151

count

Specifies the count.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.468 sub-insert-wmark

sub-insert-wmark

Syntax

sub-insert-wmark low *low-watermark* **high** *high-watermark*

no sub-insert-wmark

Context

[Tree] (config>filter>ip-filter sub-insert-wmark)

[Tree] (config>filter>ipv6-filter sub-insert-wmark)

Full Context

configure filter ip-filter sub-insert-wmark

configure filter ipv6-filter sub-insert-wmark

Description

This command configures the low and high watermark percentage for inserted filter entry usage reporting.

The **no** form of the command reverts to the default.

Default

sub-insert-wmark low 90 high 95

Parameters

low-watermark

Specifies the utilization of the filter ranges for filter entry insertion, at which a table full alarm will be cleared by the agent.

Values 0 to 100

high-watermark

Specifies the utilization of the filter ranges for filter entry insertion, at which a table full alarm will be raised by the agent.

Values 0 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.469 sub-mcac-policy

sub-mcac-policy

Syntax

sub-mcac-policy *sub-mcac-policy-name* [**create**]

no sub-mcac-policy *b*

Context

[Tree] (config>subscr-mgmt sub-mcac-policy)

Full Context

configure subscriber-mgmt sub-mcac-policy

Description

This command creates a policy template with MCAC bandwidth limits that are applied to the subscriber.

Per interface mcac bandwidth limits are set directly under the interface (regular interface or group-interface) and no such policy templates are needed.

The need for a separate policy template for subscribers is due to the fact that groups of subscribers under the same group-interface can share certain settings that can be configured via this template.

To summarize, the MCAC bandwidth constraints for subscribers are defined in the sub-mcac-policy while the mcac bandwidth constraints for the interface are configured directly under the **igmp>interface>mcac** or **igmp>grp-if>mcac** context without the need for policy templates.

Note:
The sub-mcac-policy only deals with the mcac bandwidth limits and not the channel bandwidth definitions. Channels bandwidth is defined in a different policy (in the **config>router>mcac** context) and that policy is applied on the interface level as follows:

- For group-interface: under the **config>service>vprn>igmp>grp-if>mcac** context
- For regular interface: under the **config>service/router>igmp>interface>mcac** context.

In case of HQoS Adjustment, it is mandatory that the sub-mcac-policy be created and applied to the subscriber. The sub-mac-policy does not have to contain any bandwidth constrains, but it has to be in a no shutdown state in order for HQoS Adjustment to work.

The **no** form of this command reverts to the default.

Parameters

policy-name

Specifies the name of the policy up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

sub-mcac-policy

Syntax

sub-mcac-policy *policy-name*

no sub-mcac-policy

Context

[Tree] (config>subscr-mgmt>sub-prof sub-mcac-policy)

Full Context

configure subscriber-mgmt sub-profile sub-mcac-policy

Description

This command references the policy template in which the mcac bandwidth limits are defined. Mcac for the subscriber is effectively enabled with this command when the sub-profile is applied to the subscriber. The bandwidth of the channels is defined in a different policy (under the **config>router>mcac** context) and this policy is applied on the interface level as follows:

- For group-interfaces under the **config>service>vprn>igmp>grp-if>mcac** context
- For regular interfaces under the **config>service/router>igmp>interface>mcac** context

In case of HQoS Adjustment, it is mandatory that the sub-mcac-policy be created and applied to the subscriber. The sub-mac-policy does not have to contain any bandwidth constrains, but it has to be in a no shutdown state in order for HQoS Adjustment to work.

The **no** form of this command removes the policy from the configuration.

Parameters

policy-name

Specifies the policy name configured in the config>subscr-mgmt>sub-mcac-policy context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

configure service vpls sap static-host sub-profile

configure service vprn interface sap static-host sub-profile

configure service vprn subscriber-interface group-interface sap static-host sub-profile

Description

This command specifies an existing subscriber profile name to be associated with the static subscriber host.

The **no** form of this command reverts to the default.

Parameters

sub-profile-name

Specifies the sub-profile name.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-profile

Syntax

[**no**] **sub-profile** *subscriber-profile-name*

Context

[Tree] (config subscr-mgmt sub-profile)

Full Context

configure subscriber-mgmt sub-profile

Description

Commands in this context configure a subscriber profile. A subscriber profile is a template used to define the aggregate QoS for all hosts within a subscriber context. This is done through the definition of the egress and ingress scheduler policies that govern the aggregate SLA for subscribers using the subscriber profile. Subscriber profiles also allow for specific SLA profile definitions when the default definitions from the subscriber identification policy must be overridden.

Subscribers are either explicitly mapped to a subscriber profile template or are dynamically associated by one of various non-provisioned subscriber profile definitions.

A subscriber host can be associated with a subscriber profile in the following ways, listed from lowest to highest precedence:

1. The subscriber profile named default.
2. The subscriber profile defined as the subscriber SAP default.
3. The subscriber profile found by the subscriber identification policy sub-profile-map.
4. The subscriber profile found by the subscriber identification policy explicit map.

In the event that no defaults are defined and the subscriber identification string is not explicitly provisioned to map to a subscriber profile, either the static subscriber host creation will fail or the dynamic subscriber host DHCP ACK is discarded.

Default Subscriber profile:

When a subscriber profile is created with the *subscriber-profile-name* default, it is used when no other subscriber profile is associated with the subscriber host by the system. Creating a subscriber profile with the *subscriber-profile-name* default is optional. If a default subscriber profile is not created, all subscriber hosts subscriber identification strings must match either a non-provisioned default or be provisioned as an explicit match to a subscriber profile.

The default profile has no effect on existing active subscriber on the system as they exist due to higher precedence mappings.

Attempting to delete any subscriber profile (including the profile named default) while in use by existing active subscribers will fail.

The **no** form of this command reverts to the default.

Parameters

subscriber-profile-name

Specifies the name of the subscriber profile, up to 32 characters.

create

Keyword used to create the subscriber profile.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>ident-strings sub-profile-string)

Full Context

configure subscriber-mgmt local-user-db ipoe host identification-strings sub-profile-string

configure subscriber-mgmt local-user-db ppp host identification-strings sub-profile-string

Description

This command specifies the subscriber profile string which is encoded in the identification strings.

The **no** form of this command returns to the default.

Parameters

sub-profile-string

Specifies the subscriber profile string, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-profile-string

Syntax

sub-profile-string *string*

no sub-profile-string

Context

[Tree] (config>subscr-mgmt>vrgw>brg>brg-profile sub-profile-string)

Full Context

configure subscriber-mgmt vrgw brg brg-profile sub-profile-string

Description

This string will be used as a default for subscriber-profile lookup. This string can be overridden during BRG or host authentication. The **no** form of the command removes the string from the configuration.

Default

no sub-profile-string

Parameters

string

Specifies the string used to look up the subscriber profile.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.476 sub-ring

sub-ring

Syntax

[**no**] **sub-ring** {**virtual-link** | **non-virtual-link**}

Context

[Tree] (config>eth-ring sub-ring)

Full Context

configure eth-ring sub-ring

Description

This command specifies this ring-id to be sub-ring as defined in G.80312. By declaring this ring as a sub-ring object, this ring will only have one valid path and the sub-ring will be connected to a major ring or a VPLS instance.

The **virtual-link** keyword declares that a sub-ring is connected to another ring and control messages can be sent over the attached ring to the other side of the sub-ring.

The **non-virtual-link** channel parameter declares that a sub-ring may be connected to another ring or to a VPLS instance but no control messages from the sub-ring use the attached ring or VPLS instance. The non-virtual channel behavior is standard G.8032 capability.

The **no** form of this command deletes the sub-ring and its virtual channel associations.

Default

no sub-ring

Parameters

virtual-link

Specifies that the interconnection is to a ring and a virtual link will be used.

non-virtual-link

Specifies that the interconnection is to a ring or a VPLS instance and a virtual link will not be used.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.478 subject

subject

Syntax

subject {**eq** | **neq**} *subject* [*regexp*]

no subject

Context

[Tree] (config>service>vprn>log>filter>entry>match subject)

Full Context

configure service vprn log filter entry match subject

Description

This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

The **no** form of this command removes the subject match criterion.

Default

no subject

Parameters

eq | neq

This operator specifies the type of match. Valid operators are listed below.

Values

Operator	Notes
eq	equal to
neq	not equal to

subject

A string used as the subject match criterion.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered.

When **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

Platforms

All

subject

Syntax

subject {**eq** | **neq**} *subject* [*regexp*]

no subject

Context

[Tree] (config>log>filter>entry>match subject)

Full Context

configure log filter entry match subject

Description

This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

The **no** form of this command removes the subject match criterion.

Parameters

eq | neq

Specifies the match type. Valid operators are listed in Table 155: Valid Operators.

Table 155: Valid Operators

Operator	Notes
eq	equal to
neg	not equal to

subject

Specifies a string up to 32 characters, used as the subject match criterion.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered. When the **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

23.479 subnet

subnet

Syntax

subnet {*ip-address*/*mask* | *ip-address netmask*} [**create**]

no subnet {*ip-address*/*mask* | *ip-address netmask*}

Context

[Tree] (config>service>vprn>dhcp>server>pool subnet)

[Tree] (config>router>dhcp>server>pool subnet)

Full Context

configure service vprn dhcp local-dhcp-server pool subnet

configure router dhcp local-dhcp-server pool subnet

Description

This command creates a subnet of IP addresses to be served from the pool. The subnet cannot include any addresses that were assigned to subscribers without those addresses specifically excluded. When the subnet is created, no IP addresses are made available until a range is defined.

The **no** form of the removes the subnet parameters from the configuration.

Parameters

ip-prefix/mask

Specifies the address prefix and mask. A mask of 255.255.255.255 is reserved for system IP addresses.

Values ip-prefix: a.b.c.d

mask: 8 to 32

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

Values a.b.c.d, any mask expressed as dotted quad

create

Keyword used to create the subnet. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

subnet-mask

Syntax

subnet-mask *ip-address*

no subnet-mask

Context

[Tree] (config>router>dhcp>server>pool>subnet>options subnet-mask)

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>options subnet-mask)

Full Context

configure router dhcp local-dhcp-server pool subnet options subnet-mask

configure subscriber-mgmt local-user-db ipoe host options subnet-mask

Description

This command specifies the subnet-mask option to the client. The mask can either be defined (for supernetting) or taken from the pool address.

The **no** form of this command removes the address from the configuration.

Parameters

ip-address

Specifies the IP address of the subnet mask. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.482 subrate

subrate

Syntax

subrate {**digital-link** | **larscom**} *rate-step*

no subrate

Context

[Tree] (config>port>tdm>ds3 subrate)

Full Context

configure port tdm ds3 subrate

Description

This command configures the channel service unit (CSU) compatibility mode to interoperate with existing DS-3 subrate standards.

This configuration applies only for non-channelized DS-3s on ASAP TDM MDAs.

The **no** form of this command remove the subrate functionality.

Default

no subrate

Parameters

digital-link

Enables the Digital-Link (Quick Eagle) CSU compatibility mode.

larscom

Enables the Larscom CSU compatibility mode.

rate-step

Specifies the subrate value for the associated DS-3.

Values 1 to 147 (digital-link) 1 to 14 (larscom)

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

configure mirror mirror-source subscriber

Description

This command adds hosts of a subscriber to mirroring service.

Parameters

sub-ident-string

Specifies the name of the subscriber identification policy.

sap-id

Specifies the physical port identifier portion of the SAP definition.

ip-address

Specifies the service IP address (system IP address) of the remote device sending LI traffic. If 0.0.0.0 is specified, any remote router is allowed to send to this service.

Values 1.0.0.1 to 223.255.255.254

ieee-address

Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name

Each host of a subscriber can use a different sla-profile. This option allows interception of only the hosts using the specified sla-profile. In some deployments sla-profiles are assigned per type of traffic. There can be, for example, a specific sla-profile for voice traffic (which could be used for all SIP-hosts). The name can have up to 32 characters.

fc

Specifies the name of the forwarding class with which to associate traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error will be returned and the **fc** command will have no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* will override the default forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

egress

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

ingress

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination prior to ingress packet modification.

host-type

Specifies the host type for mirroring. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipoe, ppp

family

Specifies the IP family for mirroring. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipv4, ipv6

Platforms

All

subscriber

Syntax

subscriber *sub-ident-string* [**sap** *sap-id* [**ip** *ip-address*] [**mac** *ieee-address*] | **sla-profile** *sla-profile-name*] [**fc** {[**be**] [**l2**] [**af**] [**l1**] [**h2**] [**ef**] [**h1**] [**nc**]}] [**intercept-id** *intercept-id*] [**session-id** *session-id*] {[**ingress**] [**egress**]} [**host-type** *host-type*] [**family** *ip-family*]

no subscriber *sub-ident-string*

Context

[Tree] (config>li>li-source subscriber)

Full Context

configure li li-source subscriber

Description

This command adds hosts of a subscriber to mirroring service.

Parameters

sub-ident-string

Specifies the name of the subscriber identification policy.

sap-id

Specifies the physical port identifier portion of the SAP definition.

ip-address

Specifies the service IP address (system IP address) of the remote device sending LI traffic. If 0.0.0.0 is specified, any remote router is allowed to send to this service.

Values 1.0.0.1 to 223.255.255.254

ieee-address

Specifies a MAC address when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name

Specifies an SLA profile name, up to 32 characters. Each host of a subscriber can use a different sla-profile. This option allows interception of only the hosts using the specified sla-profile. In some deployments sla-profiles are assigned per type of traffic. There can be, for example, a specific sla-profile for voice traffic (which could be used for all SIP-hosts).

fc

The name of the forwarding class with which to associate LI traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error will be returned and the **fc** command will have no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* will override the default forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

intercept-id

Specifies the intercept-id that is inserted into the packet header for all mirrored packets of the associated li-source entry. This *intercept-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs.

For all types of **li-source** entries (**filter**, **nat**, **sap**, or **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** or **ip-udp-shim-sampled** routable encap, no *intercept-id* is inserted and none can be specified against the **li-source** entries.

Values 1 to 4294967295 (32b) For **nat li-source** entries that are using a mirror service that is not configured with routable encap

Values 1 to 1,073,741,824 (30b) For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and no direction-bit.

Values 1 to 536,870,912 (29b) For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and with the direction-bit enabled.

session-id

Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream

LI gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encapsulation (**config>mirror>mirror-dest>encap>ip-udp-shim**).

For all types of **li-source** entries (**filter**, **nat**, **sap**, or **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, a *session-id* field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** or **ip-udp-shim-sampled** routable encap, no *session-id* is inserted and none can be specified against the **li-source** entries.

Values 1 to 4,294,967,295 (32b)

ingress

Specifies the ingress policy for lawful intercept.

egress

Specifies the egress policy for lawful intercept.

host-type

Specifies the host type for lawful intercept. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipoe, ppp

ip-family

Specifies the IP family for lawful intercept. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipv4, ipv6

Platforms

no subscriber *sub-ident-string*

Context

[Tree] (debug>mirroring-source subscriber)

Full Context

debug mirroring-source subscriber

Description

This command adds hosts of a subscriber to mirroring service.

Parameters

sub-ident-string

Specifies the name of the subscriber identification policy.

sap-id

Specifies the physical port identifier portion of the SAP definition.

ip-address

The service IP address (system IP address) of the remote 7750 SR or 7450 ESS device sending LI traffic.

Values 1.0.0.1 to 223.255.255.254

ieee-address

Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name

Specifies the SLA profile name, up to 32 characters.

fc

Specifies name of the forwarding class with which to associate LI traffic.

Values be, l2, af, l1, h2, ef, h1, nc

ingress

Specifies information for the ingress policy.

egress

Specifies information for the egress policy.

23.484 subscriber-bw-limit

subscriber-bw-limit

Syntax

subscriber-bw-limit *bandwidth*

no subscriber-bw-limit

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if subscriber-bw-limit)

Full Context

configure mcast-management multicast-info-policy video-policy video-interface subscriber-bw-limit

Description

This command configures of an egress per-subscriber bandwidth limit for the combined retransmission and Fast Channel Change (FCC) replies for requests received directed to the IP address. If the bandwidth for a request will exceed the bandwidth limit, the request is logged and dropped.

The **no** form of the command disables enforcement of an egress bandwidth limit.

Default

no subscriber-bw-limit

Parameters

bandwidth

The per-subscriber egress bandwidth limit for retransmission and FCC packets in kilobits per second expressed as an integer indicates infinity or no limit.

Values 1 to 4294967295 kb/s

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

23.485 subscriber-data

subscriber-data

Syntax

[**no**] **subscriber-data**

Context

[Tree] (config>aaa>isa-radius-plcy>acct-include-attributes subscriber-data)

Full Context

configure aaa isa-radius-policy acct-include-attributes subscriber-data

Description

This command enables the inclusion of subscriber data attributes.

The **no** form of the command excludes subscriber data attributes.

Default

no subscriber-data

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.486 subscriber-id

subscriber-id

Syntax

subscriber-id *sub-ident-string*

no subscriber-id

Context

23.488 subscriber-interface

subscriber-interface

Syntax

subscriber-interface *ip-int-name* [**create**] [**wan-mode** *mode*]

subscriber-interface *ip-int-name* [**create**] **fwd-service** *service-id* **fwd-subscriber-interface** *fwd-int-name* [**wan-mode** *mode*]

no subscriber-interface *ip-int-name*

Context

[Tree] (config>service>vprn subscriber-interface)

[Tree] (config>service>ies subscriber-interface)

Full Context

configure service vprn subscriber-interface

configure service ies subscriber-interface

Description

This command allows the operator to create special subscriber-based interfaces. It is used to contain multiple group interfaces. Multiple subnets associated with the subscriber interface can be applied to any of the contained group interfaces in any combination. The subscriber interface allows subnet sharing between group interfaces.

The **no** form of this command reverts to the default.

Parameters

ip-int-name

Specifies the interface name of a subscriber interface, up to 32 characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

create

Keyword used to create the subscriber interface.

fwd-service *service-id*

Specifies the wholesale service ID or service name.

Values *service-id*: 1 to 214748364

svc-name: A string up to 64 characters

ip-int-name

Specifies the wholesale subscriber interface.

wan-mode *mode*

Specifies the WAN mode as 64-bit or 128-bit. To change the WAN mode after creation, the interface must first be removed then recreated.

Values *mode64*, *mode128*

Default *mode64*

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subscriber-interface-statistics

Syntax

subscriber-interface-statistics

Context

[Tree] (config>subscr-mgmt subscriber-interface-statistics)

Full Context

configure subscriber-mgmt subscriber-interface-statistics

Description

Commands in this context enable or disable the collection of subscriber interface statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.490 subscriber-limit

subscriber-limit

Syntax

subscriber-limit *limit*

no subscriber-limit

Context

[Tree] (config>service>vprn>nat>outside>pool subscriber-limit)

Full Context

configure service vprn nat outside pool subscriber-limit

Description

This command configures the maximum number of subscribers per outside IP address.

If multiple port blocks per subscriber are used, the block size is typically small; all blocks assigned to a given subscriber belong to the same IP address; the subscriber limit guarantees that any subscriber can get a minimum number of ports.

Parameters

limit

Specifies the maximum number of subscribers per outside IP address.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Description

Commands in this context configure per service subscriber management parameters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subscriber-mgmt

Syntax

subscriber-mgmt

Context

[Tree] (config subscriber-mgmt)

Full Context

configure subscriber-mgmt

Description

Commands in this context configure subscriber management entities. A subscriber is uniquely identified by a subscriber identification string. Each subscriber can have several DHCP sessions active at any time. Each session is referred to as a subscriber host and is identified by its IP address and MAC address.

All subscriber hosts belonging to the same subscriber are subject to the same hierarchical QoS (HQoS) processing. The HQoS processing is defined in the sub-profile (the subscriber profile). A sub-profile refers to an existing scheduler policy (configured in **the config>qos>scheduler-policy** context) and offers the possibility to overrule the rate of individual schedulers within this policy.

Because all subscriber hosts use the same scheduler policy instance, they must all reside on the same complex.

Platforms

subscriber-mgmt

Syntax

subscriber-mgmt [**ipoe**] [**pppoe**]

no subscriber-mgmt

Context

[Tree] (config>redundancy>multi-chassis>peer>sync subscriber-mgmt)

Full Context

configure redundancy multi-chassis peer sync subscriber-mgmt

Description

This command specifies whether subscriber management information should be synchronized with the multi-chassis peer.

Default

no subscriber-mgmt

Parameters

ipoe

Specifies to synchronize IPoE subscribers. The use of the keyword must match on both nodes, otherwise the subscriber synchronization fails.

pppoe

Specifies to synchronize PPPoE subscribers. The use of the keyword must match on both nodes, otherwise the subscriber synchronization fails.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.492 subscriber-prefix-length

subscriber-prefix-length

Syntax

subscriber-prefix-length *prefix-length*

no subscriber-prefix-length

Context

[Tree] (config>service>vprn>nat>inside>dslite subscriber-prefix-length)

Full Context

configure service vprn nat inside dual-stack-lite subscriber-prefix-length

Description

This command configures the IPv6 prefix length of the DS-Lite subscribers.

The **no** form of this command reverts the default.

Default

subscriber-prefix-length 128

Parameters

prefix-length *prefix-length*

Specifies the IPv6 prefix length of the DS-Lite subscriber.

Values 32 to 64, 128

Default 128

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscriber-prefix-length

Syntax

subscriber-prefix-length *prefix-length*

no subscriber-prefix-length

Context

[Tree] (config>router>nat>inside>dual-stack-lite subscriber-prefix-length)

Full Context

configure router nat inside dual-stack-lite subscriber-prefix-length

Description

This command sets the value for the number of high order bits of the source IPv6 address that will be considered as DS-Lite subscriber. The remaining bits of the source IPv6 address will be masked off, effectively aggregation all IPv6 source addresses under the configured prefix length into a single DS-Lite subscriber. Source IPv4 addresses/ports of the traffic carried within the DS-Lite subscriber will be translated into a single outside IPv4 address and the corresponding deterministic port-block (port-blocks can be extended).

The range of values for subscriber-prefix-length in non-deterministic DS-Lite is limited from 32 to 64 (a prefix will be considered as a DS-Lite subscriber) or it can be set to a value of 128 (the source IPv6 address is considered as a DS-Lite subscriber).

In cases where deterministic DS-Lite is enabled in a giver inside routing context, the range of values of the **subscriber-prefix-length** depends on the value of *dslite-max-subscriber-limit* parameter as follows:

subscriber-prefix-length – n = [32..64,128]

where n = log2(dslite-max-subscriber-limit)

[or in an alternate form: dslite-max-subscriber-limit = 2^n.]

In other words the largest prefix length for the deterministic DS-Lite subscriber will be 32+n, where n = log2(dslite-max-subscriber-limit). The subscriber prefix length can extend up to 64 bits. Beyond 64 bits for the subscriber prefix length, there only one value is allowed: 128. In the case n must be 0, which means that the mapping between B4 elements (or IPv6 address) and the IPv4 outside addresses is in 1:1 ratio (no sharing of outside IPv4 addresses).

This parameter can be changed only when there are no deterministic prefixes configured in the same routing context.

The **no** form of the command reverts to the default.

Default

128

Parameters

prefix-length

In non-deterministic DS-Lite this value can be [32..64,128], assuming that the deterministic DS-Lite is not concurrently enabled in the same inside routing context. In case that deterministic DS-Lite is enabled, this value can be within the range [(32+n)..64,128] where n = log2(dslite-max-subscriber-limit). The value of 128 is allowed only when n=0 (each subscriber is mapped to a single outside IPv4 IP address).

Values 32 to 64

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscriber-prefix-length

Syntax

subscriber-prefix-length *prefix-length*

no subscriber-prefix-length

configure service nat nat-policy timeouts subscriber-retention

configure service nat up-nat-policy timeouts subscriber-retention

Description

This command specifies the subscriber retention timeout, which is the time a NAT subscriber and its associated IP address are kept after all hosts and associated port blocks have expired. If a NAT subscriber host appears before the retention timeout has elapsed, it is given the same outside IP address.

Default

no subscriber-retention

Parameters

hrs *hours*

Specifies the hours a subscriber's IP address is kept after all hosts and port blocks have expired.

Values 1 to 24

min *minutes*

Specifies the minutes a subscriber's IP address is kept after all hosts and port blocks have expired.

Values 1 to 59

Platforms

Context

[Tree] (config>qos>fp-resource-policy>aggregate-shapers>queue-sets>default-size subscribers)

Full Context

configure qos fp-resource-policy aggregate-shapers queue-sets default-size subscribers

Description

This command configures the default queue-set size for subscribers.

Parameters

size

Specifies the size of the queue sets.

Values 2 to 8

non-shaper-queues

Specifies that subscribers will not use hardware aggregate shapers on FPs where the FP resource policy is applied.

Platforms

7750 SR-1, 7750 SR-s

23.497 subscription

subscription

Syntax

subscription *percentage*

no subscription

Context

[Tree] (config>router>rsvp>interface subscription)

Full Context

configure router rsvp interface subscription

Description

This command configures the percentage of the link bandwidth that RSVP can use for reservation and sets a limit for the amount of over-subscription or under-subscription allowed on the interface.

When the **subscription** is set to zero, no new sessions are permitted on this interface. If the *percentage* is exceeded, the reservation is rejected and a log message is generated.

The **no** form of this command reverts the *percentage* to the default value.

Default

subscription 100

Parameters

percentage

Specifies the percentage of the interface's bandwidth that RSVP allows to be used for reservations.

Values 0 to 1000

Platforms

All

subscription

Syntax

subscription *subscription-id* **cancel**

subscription cancel-all

23.500 summaries

summaries

Syntax

[**no**] **summaries**

Context

[Tree] (config>service>vprn>ospf>area>nssa summaries)

[Tree] (config>service>vprn>ospf>area>stub summaries)

[Tree] (config>service>vprn>ospf3>area>nssa summaries)

Full Context

configure service vprn ospf area nssa summaries

configure service vprn ospf area stub summaries

configure service vprn ospf3 area nssa summaries

Description

This command enables sending summary (type 3) advertisements into a stub area or Not So Stubby Area (NSSA) on an Area Border Router (ABR). This parameter is particularly useful to reduce the size of the routing and Link State Database (LSDB) tables within the stub or nssa area. By default, summary route advertisements are sent into the stub area or NSSA.

The **no** form of this command disables sending summary route advertisements and, for stub areas, only the default route is advertised by the ABR.

Default

summaries — Summary routes are advertised by the ABR into the stub area or NSSA.

summary-address

Syntax

summary-address {*ip-prefix/mask* | *ip-prefix* [*netmask*]} [*level*] [**tag** *tag*]

no summary-address {*ip-prefix/mask* | *ip-prefix* [*netmask*]}

Context

[Tree] (config>service>vprn>isis summary-address)

Full Context

configure service vprn isis summary-address

Description

This command creates summary-addresses for the specified router or VPRN instance.

Parameters

ip-prefix/mask

Specifies information for the specified IP prefix and mask length.

Values

ip-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d

	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

netmask

The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level

Specifies IS-IS level area attributes. If no level parameter is specified, the default is level-1/2.

Values level-1, level-2, level-1/2

tag *tag*

Assigns a route tag to the summary address.

Values 1 to 4294967295

Platforms

All

configure router isis summary-address

Description

This command creates summary-addresses.

Default

no summary-address

Parameters

ip-prefix/ip-prefix-length

Specifies the IP prefix and prefix length of the summary address.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

netmask

Specifies the subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level

Specifies IS-IS level area attributes. If no level parameter is specified, the default is level-1/2.

Values level-1, level-2, level-1/2

tag

Assigns a route tag to the summary address.

Values 1 to 4294967295

algo-id

Specifies the algorithm topology applied for the summary address. If no algo-id parameter is specified, the default is 0.

Values 0, 128 to 255

summary-crit

Syntax

summary-crit dst-addr

summary-crit src-addr

no summary-crit

Context

[Tree] (config>filter>log>summary summary-crit)

Full Context

configure filter log summary summary-crit

Description

This command defines the key of the index of the mini-table. If key information is changed while summary is administratively enabled (no shutdown), the filter summary mini-table is flushed and recreated with different key information. Log packets received during the reconfiguration time will be handled as if summary was not active.

The **no** form of the command reverts to the default parameter.

Default

summary-crit src-addr

Parameters

dst-addr

Specifies that received log packets are summarized based on the destination IPv4, IPv6, or MAC address.

src-addr

Specifies that received log packets are summarized based on the source IPv4, IPv6 or MAC address.

Platforms

All

suppress-lsn-events

Syntax

[**no**] **suppress-lsn-events**

Context

[Tree] (configure>isa>wlan-gw-group>nat suppress-lsn-events)

Full Context

configure isa wlan-gw-group nat suppress-lsn-events

Description

This command suppresses the generation of Large Scale NAT (LSN) events when RADIUS accounting is enabled.

By default, only one logging facility for tracking subscribers in LSN44, DS-Lite, and NAT64 can be enabled at the time, either the SR OS event logging facility or the RADIUS logging facility. Note that SR OS event logs can be sent to multiple destinations, such as the console session, a telnet or SSH session, memory logs, file destinations, SNMP trap groups, and syslog destinations.

If RADIUS logging is enabled, the NAT logs are sent to the RADIUS destination and the NAT logs are suppressed in the SR OS event logging facility, for example, NAT logs are not sent to the syslog server.

If RADIUS logging is disabled, the NAT logs are sent to the SR OS event logging facility, for example, syslog, assuming that the events are enabled via the SR OS event-control (**config> log>event-control nat event generate**).

The **no** form of this command, the NAT logs can be sent to both logging facilities simultaneously, the SR OS event logging facility and RADIUS logging facility.

Default

suppress-lsn-events

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

suppress-lsn-events

Syntax

[**no**] **suppress-lsn-events**

Context

[Tree] (config>isa>nat-group suppress-lsn-events)

Full Context

configure isa nat-group suppress-lsn-events

Description

This command suppresses the generation of Large Scale NAT (LSN) events when RADIUS accounting is enabled.

By default, only one logging facility for tracking subscribers in LSN44, DS-Lite, and NAT64 can be enabled at the time: either the SR OS event logging facility or the RADIUS logging facility. SR OS event logs can be sent to multiple destinations, such as the console session, a telnet or SSH session, memory logs, file destinations, SNMP trap groups, and syslog destinations.

If RADIUS logging is enabled, the NAT logs are sent to the RADIUS destination and the NAT logs are suppressed in the SR OS event logging facility, for example, NAT logs are not sent to the syslog server.

If RADIUS logging is disabled, the NAT logs are sent to the SR OS event logging facility; for example, syslog, assuming that the events are enabled via the event-control command (**config> log>event-control nat event generate**).

By explicitly disabling this command (**no suppress-lsn-events**), the NAT logs can be sent to both logging facilities simultaneously, the SR OS event logging facility, and the RADIUS logging facility.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.512 suppress-lsn-sub-blks-free

suppress-lsn-sub-blks-free

Syntax

[**no**] **suppress-lsn-sub-blks-free**

Context

[Tree] (configure>isa>wlan-gw-group>nat suppress-lsn-sub-blks-free)

Full Context

configure isa wlan-gw-group nat suppress-lsn-sub-blks-free

Description

This command suppresses the tmnxNatLsnSubBlksFree summary notification and use the tmnxNatPlBlockAllocationLsn notifications. When the SR OS node is in a state of excessive logging, the queue associated with the transmission of logs on the MS-ISA can become congested. This event further delays the generation of logs, and with this, further allocations and deallocations of NAT resources (port-blocks) is stalled until the queue is relieved of congestion. For example, an excessive logging state in the system can be caused by issuing a command to clear a large number of NAT subscribers where a large number of resources (port-blocks) are released at once.

The **suppress-lsn-sub-blks-free** command enables the generation of individual logs carried in event-id 2012 for every released port block regardless of the state of the transmission queue (whether congested or not). If NAT subscribers have a large number of allocated port blocks (this could be hundreds of port blocks per subscriber), generating individual logs per port-block release contributes to the congestion.

To alleviate transmission queue congestion, this behavior can be changed by disabling this command (**no suppress-lsn-sub-blks-free**). This causes the suppression of logs related to the release of individual port blocks of a NAT subscriber when the transmission queue is congested. As a result, only a summarized release log via event-id 2021 for the subscriber is generated. The purpose of this new log is to inform the operator in a single message that all ports blocks for the subscriber are released. For example, the log message for LSN is "LSN subscriber all blocks freed”. The benefit of such summarization (or log

aggregation) is to alleviate the congestion of the transmission queue and consequently accelerate resource releases. An effect is the decreased granularity of information.

If summarization is enabled (**no suppress-lsn-sub-blks-free**) while there is no logging congestion in the system, the port block releases continue to be logged individually via the event-id 2012 (assuming that this is enabled in the event control), except for the last port block of the subscriber. When the last port block is released, the log with event-id 2021 is generated indicating that all port blocks for the subscriber are now released without carrying the specific information about this last port block that is released.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

suppress-threshold

Syntax

suppress-threshold *suppress-penalties* **reuse-threshold** *reuse-penalties*

Context

[Tree] (config>port>ethernet>dampening suppress-threshold)

Full Context

configure port ethernet dampening suppress-threshold

Description

This command configures the penalties thresholds at which the port state events to the upper layer are dampened (suppress threshold) and then permitted (reuse threshold).

Parameters

suppress-penalties

Specifies the threshold at which the port up state is suppressed until the accumulated penalties drop below the reuse threshold again.

Values 1 to 20000

Default 2000

reuse-penalties

Specifies the threshold at which the port up state is no longer suppressed, after the port has been in a suppressed state and the accumulated penalties decay drops below this threshold. The reuse threshold value must be less than the suppress threshold value.

Values 1 to 20000

Default 1000

svc-ping

Syntax

svc-ping *ip-address* [**service** *service-id*] [**local-sdp**] [**remote-sdp**]

Context

[Tree] (oam svc-ping)

Full Context

oam svc-ping

Description

This command tests a service ID for correct and consistent provisioning between two service end points.

The **svc-ping** command accepts a far-end IP address and a service ID for local and remote service testing. The following information can be determined from **svc-ping**:

Local and remote service existence

- Local and remote service state
- Local and remote service type correlation
- Local and remote customer association
- Local and remote service-to-SDP bindings and state
- Local and remote ingress and egress service label association

Unlike **sdp-ping**, only a single message is sent per command; no count nor interval parameter is supported and round trip time is not calculated. A time out value of 10 seconds is used before failing the request. The forwarding class is assumed to be Best-Effort Out-of-Profile.

If no request is sent or a reply is not received, all remote information is shown as N/A.

To terminate a **svc-ping** in progress, use the CLI break sequence <Ctrl-C>.

Upon request time out, message response, request termination, or request error the following local and remote information is displayed. See Table 156: Svc-ping. Local and remote information is dependent upon service existence and reception of reply.

Table 156: Svc-ping

Field	Description	Values
Request Result	The result of the **svc-ping** request message.	Sent - Request Timeout
		Sent - Request Terminated
		Sent - Reply Received
		Not Sent - Non-Existent Service-ID
		Not Sent - Non-Existent SDP for Service
		Not Sent - SDP For Service Down
		Not Sent - Non-existent Service Egress Label
Service-ID	The ID of the service being tested.	service-id
Local Service Type	The type of service being tested. If *service-id* does not exist locally, N/A is displayed.	Epipe, Ipipe, Fpipe, Apipe
		TLS
		IES
		Mirror-Dest
		—
Local Service Admin State	The local administrative state of *service-id*. If the service does not exist locally, the administrative state is Non-Existent.	Admin-Up
		Admin-Down
		Non-Existent
Local Service Oper State	The local operational state of *service-id*. If the service does not exist locally, the state is N/A.	Oper-Up
		Oper-Down
		—
Remote Service Type	The remote type of service being tested. If *service-id* does not exist remotely, N/A is displayed.	Epipe, Ipipe, Fpipe, Apipe
		TLS
		IES

Field	Description	Values
		Mirror-Dest
		—
Remote Service Admin State	The remote administrative state of *service-id*. If the service does not exist remotely, the administrative state is Non-Existent.	Up
		Down
		Non-Existent
Local Service MTU	The local **service-mtu** for *service-id*. If the service does not exist, N/A is displayed.	*service-mtu*
		—
Remote Service MTU	The remote **service-mtu** for *service-id*. If the service does not exist remotely, N/A is displayed.	*remote-service-mtu*
		—
Local Customer ID	The local *customer-id* associated with *service-id*. If the service does not exist locally, N/A is displayed.	*customer-id*
		—
Remote Customer ID	The remote *customer-id* associated with *service-id*. If the service does not exist remotely, N/A is displayed.	*customer-id*
		—
Local Service IP Address	The local system IP address used to terminate remotely configured SDP-ID (as the **far-end** address). If an IP interface has not been configured to be the system IP address, N/A is displayed.	*system-ip-address*
		—
Local Service IP Interface Name	The name of the local system IP interface. If the local system IP interface has not been created, N/A is displayed.	*system-interface-name*
		—
Local Service IP Interface State	The state of the local system IP interface. If the local system IP interface has not been created, Non-Existent is displayed.	Up
		Down
		Non-Existent
Expected Far-end Address	The expected IP address for the remote system IP interface. This must be the **far-end** address entered for the **svc-ping** command.	*orig-sdp-far-end-addr*
		dest-ip-addr
		—
Actual Far-end Address	The returned remote IP address. If a response is not received, the displayed value is N/A. If the far-end service IP interface is down or non-existent, a message reply is not expected. **sdp-ping** should also fail.	*resp-ip-addr*
		—

Field	Description	Values
Responders Expected Far-end Address	The expected source of the originator's *sdp-id* from the perspective of the remote router terminating the *sdp-id*. If the far-end cannot detect the expected source of the ingress *sdp-id* or the request is transmitted outside the *sdp-id*, N/A is displayed.	*resp-rec-tunnel-far-end-address* —
Originating SDP-ID	The *sdp-id* used to reach the **far-end** IP address if **sdp-path** is defined. The originating *sdp-id* must be bound to the *service-id* and terminate on the **far-end** IP address. If an appropriate originating *sdp-id* is not found, Non-Existent is displayed.	orig-sdp-id Non-Existent
Originating SDP-ID Path Used	Whether the Originating router used the originating *sdp-id* to send the **svc-ping** request. If a valid originating *sdp-id* is found, operational and has a valid egress service label, the originating router should use the *sdp-id* as the requesting path if **sdp-path** has been defined. If the originating router uses the originating *sdp-id* as the request path, Yes is displayed. If the originating router does not use the originating *sdp-id* as the request path, No is displayed. If the originating *sdp-id* is non-existent, N/A is displayed.	Yes No —
Originating SDP-ID Administrative State	The local administrative state of the originating *sdp-id*. If the *sdp-id* has been shutdown, Admin-Down is displayed. If the originating *sdp-id* is in the no shutdown state, Admin-Up is displayed. If an originating *sdp-id* is not found, N/A is displayed.	Admin-Up Admin-Up —
Originating SDP-ID Operating State	The local operational state of the originating *sdp-id*. If an originating *sdp-id* is not found, N/A is displayed.	Oper-Up Oper-Down —
Originating SDP-ID Binding Admin State	The local administrative state of the originating *sdp-id*s binding to *service-id*. If an *sdp-id* is not bound to the service, N/A is displayed.	Admin-Up Admin-Up —
Originating SDP-ID Binding Oper State	The local operational state of the originating *sdp-id*s binding to *service-id*. If an *sdp-id* is not bound to the service, N/A is displayed.	Oper-Up Oper-Down —
Responding SDP-ID	The *sdp-id* used by the far end to respond to the **svc-ping** request. If the request was received without the **sdp-path** parameter, the responding router does not use an *sdp-id* as the return path,	*resp-sdp-id* Non-Existent

Field	Description	Values
	but the appropriate responding *sdp-id* is displayed. If a valid *sdp-id* return path is not found to the originating router that is bound to the *service-id*, Non-Existent is displayed.	
Responding SDP-ID Path Used	Whether the responding router used the responding *sdp-id* to respond to the **svc-ping** request. If the request was received via the originating *sdp-id* and a valid return *sdp-id* is found, operational and has a valid egress service label, the far-end router should use the *sdp-id* as the return *sdp-id*. If the far end uses the responding *sdp-id* as the return path, Yes is displayed. If the far end does not use the responding *sdp-id* as the return path, No is displayed. If the responding *sdp-id* is non-existent, N/A is displayed.	Yes No —
Responding SDP-ID Administrative State	The administrative state of the far-end *sdp-id* associated with the return path for *service-id*. When a return path is administratively down, Admin-Down is displayed. If the return *sdp-id* is administratively up, Admin-Up is displayed. If the responding *sdp-id* is non-existent, N/A is displayed.	Admin-Up Admin-Up N/A
Responding SDP-ID Operational State	The operational state of the far-end *sdp-id* associated with the return path for *service-id*. When a return path is operationally down, Oper-Down is displayed. If the return *sdp-id* is operationally up, Oper-Up is displayed. If the responding *sdp-id* is non-existent, N/A is displayed.	Oper-Up Oper-Down —
Responding SDP-ID Binding Admin State	The local administrative state of the responder's *sdp-id* binding to *service-id*. If an *sdp-id* is not bound to the service, N/A is displayed.	Admin-Up Admin-Down —
Responding SDP-ID Binding Oper State	The local operational state of the responder's *sdp-id* binding to *service-id*. If an *sdp-id* is not bound to the service, N/A is displayed.	Oper-Up Oper-Down —
Originating VC-ID	The originator's VC-ID associated with the *sdp-id* to the far-end address that is bound to *service-id*. If the *sdp-id* signaling is off, *originator-vc-id* is 0. If the *originator-vc-id* does not exist, N/A is displayed.	*originator-vc-id* —
Responding VC-ID	The responder's VC-ID associated with the *sdp-id* to *originator-id* that is bound to *service-id*. If the *sdp-id* signaling is off or the service binding to *sdp-*	*responder-vc-id* —

Field	Description	Values
	id does not exist, *responder-vc-id* is 0. If a response is not received, N/A is displayed.	
Originating Egress Service Label	The originating service label (VC-Label) associated with the *service-id* for the originating *sdp-id*. If *service-id* does not exist locally, N/A is displayed. If *service-id* exists, but the egress service label has not been assigned, Non-Existent is displayed.	*egress-vc-label* — Non-Existent
Originating Egress Service Label Source	The originating egress service label source. If the displayed egress service label is manually defined, Manual is displayed. If the egress service label is dynamically signaled, Signaled is displayed. If the *service-id* does not exist or the egress service label is non-existent, N/A is displayed.	Manual Signaled —
Originating Egress Service Label State	The originating egress service label state. If the originating router considers the displayed egress service label operational, Up is displayed. If the originating router considers the egress service label inoperative, Down is displayed. If the *service-id* does not exist or the egress service label is non-existent, N/A is displayed.	Up Down —
Responding Service Label	The actual responding service label in use by the far-end router for this *service-id* to the originating router. If *service-id* does not exist in the remote router, N/A is displayed. If *service-id* does exist remotely but the remote egress service label has not been assigned, Non-Existent is displayed.	*rec-vc-label* — Non-Existent
Responding Egress Service Label Source	The responder's egress service label source. If the responder's egress service label is manually defined, Manual is displayed. If the responder's egress service label is dynamically signaled, Signaled is displayed. If the *service-id* does not exist on the responder or the responder's egress service label is non-existent, N/A is displayed.	Manual Signaled —
Responding Service Label State	The responding egress service label state. If the responding router considers its egress service label operational, Up is displayed. If the responding router considers its egress service label inoperative, Down is displayed. If the *service-id* does not exist or the responder's egress service label is non-existent, N/A is displayed.	Up Down —
Expected Ingress Service Label	The locally assigned ingress service label. This is the service label that the far-end is expected to use for *service-id* when sending to the originating router. If *service-id* does not exist locally, N/A is displayed.	*ingress-vc-label* —

Field	Description	Values
	If *service-id* exists but an ingress service label has not been assigned, Non-Existent is displayed.	Non-Existent
Expected Ingress Label Source	The originator's ingress service label source. If the originator's ingress service label is manually defined, Manual is displayed. If the originator's ingress service label is dynamically signaled, Signaled is displayed. If the *service-id* does not exist on the originator or the originators ingress service label has not been assigned, N/A is displayed.	Manual Signaled —
Expected Ingress Service Label State	The originator's ingress service label state. If the originating router considers its ingress service label operational, Up is displayed. If the originating router considers its ingress service label inoperative, Down is displayed. If the *service-id* does not exist locally, N/A is displayed.	Up Down —
Responders Ingress Service Label	The assigned ingress service label on the remote router. This is the service label that the far end is expecting to receive for *service-id* when sending to the originating router. If *service-id* does not exist in the remote router, N/A is displayed. If *service-id* exists, but an ingress service label has not been assigned in the remote router, Non-Existent is displayed.	*resp-ingress-vc-label* — Non-Existent
Responders Ingress Label Source	The assigned ingress service label source on the remote router. If the ingress service label is manually defined on the remote router, Manual is displayed. If the ingress service label is dynamically signaled on the remote router, Signaled is displayed. If the *service-id* does not exist on the remote router, N/A is displayed.	Manual Signaled —
Responders Ingress Service Label State	The assigned ingress service label state on the remote router. If the remote router considers its ingress service label operational, Up is displayed. If the remote router considers its ingress service label inoperative, Down is displayed. If the *service-id* does not exist on the remote router or the ingress service label has not been assigned on the remote router, N/A is displayed.	Up Down —

Parameters

ip-address

Specifies the far-end IP address to which to send the **svc-ping** request message in dotted decimal notation.

Values a.b.c.d

service-id

Specifies the service ID of the service being tested must be indicated with this parameter. The service ID need not exist on the local router to receive a reply message.

Values 1 to 2147483647, service-name: up to 64 characters

local-sdp

Specifies the **svc-ping** request message should be sent using the same service tunnel encapsulation labeling as service traffic. If **local-sdp** is specified, the command attempts to use an egress *sdp-id* bound to the service with the specified **far-end** IP address with the VC-Label for the service. The far-end address of the specified *sdp-id* is the expected *responder-id* within the reply received. The *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reach the far end; this can be IP/GRE or MPLS. On originator egress, the service-ID must have an associated VC-Label to reach the far-end address of the *sdp-id* and the *sdp-id* must be operational for the message to be sent.

If **local-sdp** is not specified, the **svc-ping** request message is sent with GRE encapsulation with the OAM label.

Table 157: Message Encapsulation indicates whether a message is sent and how the message is encapsulated based on the state of the service ID.

Table 157: Message Encapsulation

Local Service State	local-sdp Not Specified		local-sdp Specified	
	Message Sent	Message Encapsulation	Message Sent	Message Encapsulation
Invalid Local Service	Yes	Generic IP/GRE OAM (PLP)	No	None
No Valid SDP-ID Bound	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid But Down	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid and Up, But No Service Label	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid, Up and Egress Service Label	Yes	Generic IP/GRE OAM (PLP)	Yes	SDP Encapsulation with Egress Service Label (SLP)

remote-sdp

Specifies **svc-ping** reply message from the **far-end** should be sent using the same service tunnel encapsulation labeling as service traffic.

If **remote-sdp** is specified, the **far-end** responder attempts to use an egress *sdp-id* bound to the service with the message originator as the destination IP address with the VC-Label

for the service. The *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reply to the originator; this can be IP/GRE or MPLS. On responder egress, the service-ID must have an associated VC-Label to reach the originator address of the *sdp-id* and the *sdp-id* must be operational for the message to be sent.

If **remote-sdp** is not specified, the **svc-ping** request message is sent with GRE encapsulation with the OAM label.

Table 158: Message Response Encapsulation indicates how the message response is encapsulated based on the state of the remote service ID.

Table 158: Message Response Encapsulation

Remote Service State	Message Encapsulation	
	remote-sdp Not Specified	**remote-sdp Specified**
Invalid Ingress Service Label	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
Invalid Service-ID	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
No Valid SDP-ID Bound on Service-ID	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid But Down	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, but No Service Label	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, Egress Service Label, but VC-ID Mismatch	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, Egress Service Label, but VC-ID Match	Generic IP/GRE OAM (PLP)	SDP Encapsulation with Egress Service Label (SLP)

23.518 svlan-statistics

svlan-statistics

Syntax

svlan-statistics

Context

[Tree] (config>subscr-mgmt svlan-statistics)

Full Context

configure subscriber-mgmt svlan-statistics

Description

Commands in this context enable subscriber VLAN statistics collection.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.519 swap

swap

Syntax

swap {*out-label* | **implicit-null-label**} **nexthop** *ip-address*

no swap

Context

[Tree] (config>router>mpls>if>label-map swap)

Full Context

configure router mpls interface label-map swap

Description

This command swaps the incoming label and specifies the outgoing label and next hop IP address on an LSR for a static LSP.

The **no** form of this command removes the swap action associated with the *in-label*.

Parameters

implicit-null-label

Specifies the use of the implicit label value for the outgoing label of the swap operation.

out-label

Specifies the label value to be swapped with the in-label. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment
- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services
- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services
- label values 131,072 through 1,048,575 are reserved for future use

Values 16 to 1048575

nexthop *ip-address*

Specifies the IP address to forward to. If an ARP entry for the next hop exists, then the static LSP will be marked operational. If ARP entry does not exist, software will set the operational status of the static LSP to down and continue to ARP for the configured nexthop. Software will continuously try to ARP for the configured nexthop at a fixed interval.

23.520 sweep

sweep

Syntax

sweep start *dispersion-start* **end** *dispersion-end*

Context

[Tree] (config>port>dwdm>coherent sweep)

Full Context

configure port dwdm coherent sweep

Description

This command allows users to configure the dispersion sweep 'start' and 'end' values for the automatic mode of coherent control. If the user knows the approximate or theoretical residual dispersion of the link, this command can be used to limit the range of sweeping for the automatic control mode and thus achieve faster link up.

Parameters

dispersion-start

Specifies the lower range limit for the dispersion compensation.

Values -50000 to 50000

Default -25500

dispersion-end

Specifies the upper range limit for the dispersion compensation.

Values -50000 to 50000

Default 2000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.521 switch-defined-cookie

switch-defined-cookie

Syntax

[**no**] **switch-defined-cookie**

Context

[Tree] (config>open-flow>of-switch>flowtable switch-defined-cookie)

Full Context

configure open-flow of-switch flowtable switch-defined-cookie

Description

This command enables OpenFlow switch-defined Flow Table cookie encoding for flowtable 0 that allows multi-service operation.

The **no** form of the command disables the above function.

Default

no switch-defined-cookie

Platforms

All

23.522 switch-fabric

switch-fabric

Syntax

switch-fabric

Context

[Tree] (config>system switch-fabric)

Full Context

configure system switch-fabric

Description

Commands in this context configure switch fabric parameters.

Platforms

7450 ESS, 7750 SR-7, 7750 SR-12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

23.523 switching-mode

switching-mode

Syntax

switching-mode {**bi-directional** | **uni-directional**}

Context

[Tree] (config>port>aps switching-mode)

Full Context

configure port aps switching-mode

Description

This command configures the switching mode for the APS group.

Parameters

bi-directional

Configures the group to operate in Bidirectional 1+1 Signaling APS mode.

uni-directional

Configures the group to operate in Unidirectional 1+1 Signaling APS mode.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

23.524 switchover-exec

switchover-exec

Syntax

switchover-exec *file-url*

no switchover-exec

Context

[Tree] (config>system switchover-exec)

Full Context

configure system switchover-exec

Description

This command specifies the location and name of the CLI script file executed following a redundancy switchover from the previously active CPM card. A switchover can happen because of a fatal failure or by manual action.

The CLI script file can contain commands for environment settings, classic CLI debug configuration (excluding mirroring settings), and other commands not maintained by the configuration redundancy.

The following commands are not supported in the switchover-exec file: clear, configure, candidate, oam, tools, oam, ping, traceroute, mstat, mtrace and mrinfo.

Default

no switch-over-exec

Parameters

file-url

Specifies the location and name of the CLI script file.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn*/][*file-path*]
	243 chars max
	directory length 99 chars max each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

23.525 symbol-monitor

symbol-monitor

Syntax

symbol-monitor

Context

[Tree] (config>port>ethernet symbol-monitor)

Full Context

configure port ethernet symbol-monitor

Description

This command configures Ethernet Symbol Monitoring parameters. Support for symbol monitoring is hardware dependent. An error message indicating that the port setting cannot be modified will be presented when attempting to enable the feature or configure the individual parameters on unsupported hardware.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.526 sync

sync

Syntax

[**no**] **sync**

Context

[Tree] (config>redundancy>multi-chassis>peer sync)

Full Context

configure redundancy multi-chassis peer sync

Description

Commands in this context configure synchronization parameters.

Default

no sync

Platforms

All

sync

Syntax

[**no**] **sync**

Context

[Tree] (config>isa>nat-group>inter-chassis-redundancy sync)

Full Context

configure isa nat-group inter-chassis-redundancy sync

Description

This command configures synchronization of NAT flows between the nodes.

The **no** form of this command disables synchronization of NAT flows that were enabled between the ISAs or ESAs across the nodes. This allows NAT reconfiguration on both nodes. The synchronization of flows must be disabled on both nodes, active and standby, while NAT configuration changes are performed. The active NAT node continues to forward traffic while flow synchronization is disabled.

Default

no sync

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.527 sync-boot-env

sync-boot-env

Syntax

sync-boot-env

Context

[Tree] (admin>satellite>eth-sat sync-boot-env)

Full Context

admin satellite eth-sat sync-boot-env

Description

The command forces the specified Ethernet-satellite chassis to synchronize the boot image.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.528 sync-e

sync-e

[Tree] (config>card>mda sync-e)

Full Context

configure card xiom mda sync-e

configure card mda sync-e

Description

This command enables synchronous Ethernet on the MDA. Then any port on the MDA can be used as a source port in the sync-if-timing configuration.

The **no** form of this command disables synchronous Ethernet on the MDA.

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- configure card xiom mda sync-e

All

- configure card mda sync-e

sync-e

Syntax

[**no**] **sync-e**

Context

[Tree] (config>system>satellite>eth-sat sync-e)

Full Context

configure system satellite eth-sat sync-e

Description

This command enables the Ethernet satellite for synchronous Ethernet operation so that the transmit timing of the satellite access ports use the frequency of the host router's central clock.

To enable this functionality, both host ports on the router that connect to the U1 and U2 ports of the satellite must be synchronous Ethernet-capable ports.

When the Ethernet satellite is configured for synchronous Ethernet, ESMC frames are enabled on the host ports. The SSM code-type used between the host and the satellite should be manually configured on the host ports to match the code-type desired on the satellite client ports. The code-type setting on the host ports does not restrict the code-type used on the satellite client ports, as those may be configured on an individual port basis.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.529 sync-if-timing

sync-if-timing

23.531 synchronize

synchronize

Syntax
synchronize {**boot-env** | **config**}

Context

[Tree] (config>redundancy synchronize)

Full Context

configure redundancy synchronize

Description

This command performs a synchronization of the standby CPMs images and/or config files to the active CPM. Either the **boot-env** or **config** parameter must be specified. In the **config>redundancy** context, this command performs an automatically triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPMs have identical operational parameters. This includes the saved configuration, CPM, XCM, and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM.

If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

Default

synchronize config

Parameters

boot-env

Synchronizes all files required for the boot process (boot loader, BOF configuration, SR OS images, and all configuration files).

config

Synchronizes the primary, secondary, and tertiary configuration files, SSH keys, the password history and the model-driven commit history.

Default config

Platforms

All

synchronize

Syntax

synchronize cert

synchronize {**boot-env** | **config**}

Context

[Tree] (admin>redundancy synchronize)

Full Context

admin redundancy synchronize

Description

This command performs a synchronization of the standby CPM's images and/or configuration files to the active CPM. Either the **boot-env** or **config** parameter must be specified.

In the **admin>redundancy** context, this command performs a manually triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPM have identical operational parameters. This includes the saved configuration, CPM, XCM, and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM. If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

The **no** form of the command removes the parameter from the configuration.

Default

no synchronize

Parameters

cert

Synchronizes the imported certificate, key, and CRL files.

boot-env

Synchronizes all files required for the boot process (boot loader, BOF, images, and configuration).

config

Synchronizes the primary, secondary, and tertiary configuration files.

Platforms

All

23.532 synchronous-execution

synchronous-execution

Syntax

synchronous-execution *seconds*

synchronous-execution never

Context

[Tree] (config>system>management-interface>ops>global-timeouts synchronous-execution)

Full Context

configure system management-interface operations global-timeouts synchronous-execution

Description

This command configures the period of time that operations launched as "'synchronous" (the default method for all operations) are allowed to execute before they are automatically stopped, and their associated data is deleted.

If a specific execution timeout is not included in the request for a particular synchronous operation, this system-level timeout applies.

Note:
This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own **timeout** parameter).

Caution:
This timeout also applies to operations requested in the MD-CLI interface (for example, ping, file dir, and so on). If **synchronous-execution** is enabled with a specific time value, MD-CLI operations are subject to this timeout and are interrupted if they execute longer than the configured **synchronous-execution** time.

Default

synchronous-execution never

Parameters

seconds

Specifies the period of time, in seconds, that synchronous operations are allowed to execute.

Values 1 to 604800

never

Keyword to specify that an execution timeout is not applied to synchronous operations.

Platforms

All

23.533 syslog

syslog

Syntax

syslog script *name*

no syslog

Context

[Tree] (config>python>py-policy syslog)

Full Context

configure python python-policy syslog

Description

This command enables Python script to process syslog related messages and events.

The **no** form of this command disables the Python script to process syslog related messages and events.

Parameters

name

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

Platforms

All

syslog

Syntax

syslog *syslog-id* [**name** *syslog-name*]

no syslog *syslog-id*

Context

[Tree] (config>service>vprn>log syslog)

Full Context

configure service vprn log syslog

Description

This command creates the context to configure a Syslog target host that is capable of receiving selected Syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 30 Syslog IDs can be configured.

No log events are sent to a Syslog target address until the syslog-id has been configured as the log destination (**to**) in the log-id node.

The Syslog ID configured in the **configure**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config>log**.

Default

No syslog IDs are defined.

Parameters

syslog-id

Specifies the Syslog ID for the Syslog destination.

Values 1 to 30

name syslog-name

Specifies an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

Platforms

All

syslog

Syntax

syslog

Context

[Tree] (config>app-assure>group>evt-log syslog)

Full Context

configure application-assurance group event-log syslog

Description

Commands in this context configure the target syslog server.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

syslog

Syntax

syslog

Context

[Tree] (config>service>nat syslog)

Full Context

configure service nat syslog

Description

Commands in this context configure syslog reporting of NAT flow parameters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

syslog

Syntax

syslog *syslog-id* [**name** *syslog-name*]

no syslog *syslog-id*

Context

[Tree] (config>log syslog)

Full Context

configure log syslog

Description

Commands in this context configure a Syslog target host capable of receiving selected syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 10 Syslog IDs can be configured.

Log events are not sent to a Syslog target address until the *syslog-id* is configured as the log destination (**to**) in the node specified by the Log ID.

The Syslog ID configured in the **config**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config**>**log**.

The **no** form of this command removes the Syslog configuration.

Parameters

syslog-id

Specifies the Syslog ID for the Syslog destination.

Values 1 to 10

name syslog-name

Configures an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

Platforms

All

23.534 syslog-export-policy

syslog-export-policy

Syntax

syslog-export-policy *policy-name*

no syslog-export-policy

Context

[Tree] (config>service>nat>nat-policy syslog-export-policy)

Full Context

configure service nat nat-policy syslog-export-policy

Description

This command creates a syslog export policy with a set of transport parameters that will be used to transmit NAT flow records in syslog format to an external collector node. This policy name is then referenced from the nat-policy applied to an inside routing context.

Default

no syslog-export-policy

Parameters

policy-name

Specifies the name of the syslog export policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

syslog-export-policy

Syntax

syslog-export-policy *name* [**create**]

no syslog-export-policy *name*

Context

[Tree] (config>service>nat>syslog syslog-export-policy)

Full Context

configure service nat syslog syslog-export-policy

Description

This command creates a syslog export policy with a set of transport parameters that are used to transmit NAT flow records in syslog format to an external collector node. This policy name is then referenced from the NAT policy applied to an inside routing context.

The **no** form of the command removes the policy name from the configuration.

Parameters

name

Specifies the syslog export policy name, up to 32 characters.

create

Keyword used to create the syslog export policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.535 system

system

Syntax

system

Context

[Tree] (config>eth-cfm system)

system-base-mac

Syntax

system-base-mac *mac-address*

no system-base-mac

Context

[Tree] (bof system-base-mac)

Full Context

bof system-base-mac

Description

This command is used to specify the base MAC address for a VSR-based system. The specified MAC address is used as the first MAC address by the system to assign MAC addresses to individual interfaces.

It is strongly recommended that a unique base MAC address is assigned to each VSR instance with a minimum gap of 1024 between base addresses to avoid a MAC address overlap.

The **no** form of this command removes the configured system base MAC address.

Default

no system-base-mac

Parameters

mac-address

Specifies the MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS-20, 7950 XRS-20e, VSR

23.537 system-behavior

system-behavior

Syntax

system-behavior

Context

[Tree] (config>subscr-mgmt system-behavior)

Full Context

configure subscriber-mgmt system-behavior

Description

Commands in this context configure system-wide subscriber management behavior parameters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.538 system-filter

system-filter

Syntax

system-filter

Context

[Tree] (config>filter system-filter)

Full Context

configure filter system-filter

Description

Commands in this context activate system filter policies.

Platforms

23.539 system-id

system-id

Syntax

system-id *system-id*

no system-id

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident system-id)

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification system-id

Description

This command specifies the system ID to match for a host lookup. When the LUDB is accessed through a DHCPv4 server, the system ID is matched against the Nokia vendor specific sub-option in DHCP Option 82.

Note:
This command is only used when **system-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the system ID from the configuration.

Parameters

system-id

Specifies the system ID, up to 255 characters

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

system-id

Syntax

[**no**] **system-id**

[Tree] (config>subscr-mgmt>msap-policy>vpls-only>dhcp>option>vendor system-id)

Full Context

configure service vprn subscriber-interface group-interface dhcp option vendor-specific-option system-id

configure service vpls sap dhcp option vendor-specific-option system-id

configure service ies subscriber-interface group-interface dhcp option vendor-specific-option system-id

configure service vprn interface dhcp option vendor-specific-option system-id

configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option vendor-specific-option system-id

Description

This command specifies whether the system-id is encoded in the Nokia vendor-specific sub-option of Option 82.

The **no** form of this command reverts to the default.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option vendor-specific-option system-id
- configure service vprn subscriber-interface group-interface dhcp option vendor-specific-option system-id
- configure service ies subscriber-interface group-interface dhcp option vendor-specific-option system-id

All

- configure service vpls sap dhcp option vendor-specific-option system-id

- configure service vprn interface dhcp option vendor-specific-option system-id

system-id

Syntax

system-id *isis-system-id*

no system-id

Context

[Tree] (config>service>vprn>isis system-id)

Full Context

configure service vprn isis system-id

Description

This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference order:

1. **config>service>vprn>isis>system-id**
2. **config>service>vprn>isis>router-id**
3. **config>service>vprn>router-id**
4. **config>service>vprn>if>address**
5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, a **shutdown** and then **no shutdown** must be performed on the IS-IS instance. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

Default

no system-id

Parameters

isis-system-id

12 hexadecimal characters in dotted-quad notation.

Values aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

Platforms

All

system-id

Syntax

[**no**] **system-id**

Context

system-id

Syntax

system-id *isis-system-id*

no system-id

Context

[Tree] (config>router>isis system-id)

Full Context

configure router isis system-id

Description

This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference:

1. **config>router>isis>system-id**
2. **config>router>isis>router-id**
3. **config>router>router-id**
4. **config>router>interface>system> address**
5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, the IS-IS instance must be **shutdown** and then **no shutdown**. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

Parameters

isis-system-id

Specifies 12 hexadecimal characters in dotted-quad notation.

Values aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

Platforms

All

23.540 system-ip-load-balancing

system-ip-load-balancing

Syntax

[**no**] **system-ip-load-balancing**

Context

[Tree] (config>system>load-balancing system-ip-load-balancing)

Full Context

configure system load-balancing system-ip-load-balancing

Description

This command enables the use of the system IP address in the ECMP hash algorithm to add a per system variable. This can help guard against cases where multiple routers, in series, will end up hashing traffic to the same ECMP/LAG path.

This command is set at a system wide basis, however if certain IOMs do not support the new load-balancing algorithm, they will continue to use the default algorithm. By default, the IPv4 system IP address is used in the hash algorithm. When no IPv4 system IP address is configured, the IPv6 system IP address, when configured, is used in the hash algorithm.

The **no** form of the command resets the system wide algorithm to default.

Default

no system-ip-load-balancing

Platforms

All

23.541 system-mac

system-mac

Syntax

system-mac *mac-address*

no system-mac

Context

[Tree] (config>system>ned>profile system-mac)

Full Context

configure system network-element-discovery profile system-mac

Description

This command configures the MAC address to be advertised.

The **no** form of this command removes any explicitly defined MAC address and chassis MAC address will be advertised.

Default

no system-mac

Parameters

mac-address

Specifies the MAC address to be associated with the profile in *xx:xx:xx:xx:xx:xx* or *xx-xx-xx-xx-xx-xx* format.

Platforms

All

23.542 system-password

[Tree] (admin>system>security system-password)

Full Context

admin system security system-password

Description

This operational command changes a local system password.

Parameters

admin-password

Specifies to change the administrative password.

dynsvc-password

Specifies to change the dynamic services password.

Platforms

All

23.543 system-priority

system-priority

Syntax

system-priority *value*

no system-priority

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ep system-priority)

Full Context

configure redundancy multi-chassis peer mc-endpoint system-priority

Description

This command allows the operator to set the system priority. The peer configured with the lowest value is chosen to be the master. If system-priority are equal then the one with the highest system-id (chassis MAC address) is chosen as the master.

The **no** form of this command sets the system priority to default.

Default

no system-priority

Parameters

value

Specifies the priority assigned to the local MC-EP peer.

Values 1 to 255

Platforms

All

23.544 system-profile

system-profile

Syntax

system-profile {**profile-a** | **profile-b**}

no system-profile

Context

[Tree] (bof system-profile)

Full Context

bof system-profile

Description

This command configures the system profile in the BOF.

System profile none represents the existing system capabilities and allows FP3-, FP4-, and FP5-based hardware to co-exist within a system. This is indicated by the omission of the **system-profile** parameter in the BOF, except on 7750 SR-1 systems.

System profile **profile-a** is primarily targeted at subscriber services and layer 2 and 3 VPN business services.

System profile **profile-b** is primarily targeted at infrastructure routing, core, peering, and DC-GW applications.

System profile **profile-a** and **profile-b** are supported on 7950 XRS-20/20e, 7750 SR-1 and 7750 SR-12e systems, and support only FP4- and FP5-based line cards.

The system profile on 7750 SR-1 systems should be set to **profile-a**. It is set by default to **profile-a** when the **system-profile** parameter is omitted from the BOF, or configured to an invalid value.

On 7950 XRS-20/20e and 7750 SR-12e systems, default system profile is none.

On all other systems, the **system-profile** parameter must not be configured in the BOF which sets the system profile to none.

The **no** form of this command removes the **system-profile** parameter from the BOF.

Parameters

profile-a

Specifies that the system profile is for subscriber services and Layer 2 and 3 VPN business services.

profile-b

Specifies that the system profile is primarily targeted at infrastructure routing, core, peering, and DC-GW applications.

Platforms

All

23.545 system-reserve

system-reserve

Syntax

system-reserve *percent-of-buffers*

no system-reserve

Context

[Tree] (config>qos>hs-pool-policy system-reserve)

Full Context

configure qos hs-pool-policy system-reserve

Description

This command defines the amount of HSQ IOM buffers that is set aside for internal system use. By default, 5% of the total buffer space is reserved for system internal queues. The command is provided for the case where the reserved buffer space is either insufficient or excessive. Exercise care when modifying this value.

When the system reserve value is changed, all the provisioned port-class, mid-tier, and root pool sizes are reevaluated and possibly changed.

Use the **show hs-pools** *card-slot-number* **fp** *forwarding-plane* **egress** command to display the current buffer allocation and buffer usage conditions on an HSQ IOM.

The **no** form of the command reverts to the default system reserve value.

Default

system-reserve 5.0

Parameters

percent-of-buffers

Specifies the percentage of HS buffers that are reserved for internal system use. This parameter is required when executing the **system-reserve** command. The parameter accepts a percent value with two decimal places (100th of a percent).

Values 1.00 to 30.00

Platforms

24.5 table-size

table-size

Syntax

table-size *table-size*

Context

[Tree] (config>service>vpls>proxy-arp table-size)

[Tree] (config>service>vpls>proxy-nd table-size)

Full Context

configure service vpls proxy-arp table-size

configure service vpls proxy-nd table-size

Description

This command adds a table-size limit per service. By default, the table-size limit is 250; it can be set up to 16k entries per service. A non-configurable implicit high watermark of 95% and low watermark of 90% exists, per service and per system. When those watermarks are reached, a syslog/trap is triggered. When the system/service limit is reached, entries for a specified IP can be replaced (a different MAC can be learned and added) but no new IP entries will be added, regardless of the type (Static, evpn, dynamic). If the user attempts to change the **table-size** value to a value that cannot accommodate the number of existing entries, the attempt will fail.

Default

table-size 250

Parameters

table-size

Specifies the table-size as number of entries for the service.

Values 1 to 16384

Platforms

All

24.6 tacplus

configure router isis interface tag

Description

This command configures a route tag to the specified IP address of an interface.

The **no** form of this command removes the tag value from the configuration.

Default

no tag

Parameters

tag

Specifies a route tag.

Values 1 to 4294967295

Platforms

All

tag

Syntax

tag {**no-tag** | *tag*}

no tag

Context

[Tree] (config>router>policy-options>policy-statement>entry>from tag)

Full Context

configure router policy-options policy-statement entry from tag

Description

This command matches the tag value in static or IGP routes. A decimal or hexadecimal value of 4 octets can be entered. For IS-IS, OSPF, and static routes, all four octets can be used. For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag field match criterion.

Default

no tag

Parameters

tag

Matches the configured tag value.

Values Accepts decimal or hexadecimal formats:

- IS-IS, OSPF and static routes: 0x0 – 0xFFFFFFFF or 1 – 4294967295
- RIP and RIPng: 0x0 – 0xFFFF or 1 – 65535

no-tag

Specifies that no tag value is set.

Platforms

All

tag

Syntax

tag *tag*

no tag

Context

[Tree] (config>router>policy-options>policy-statement>default-action tag)

[Tree] (config>router>policy-options>policy-statement>entry>action tag)

Full Context

configure router policy-options policy-statement default-action tag

configure router policy-options policy-statement entry action tag

Description

This command assigns a tag to routes matching the entry, which is then applied to IGP routes. A decimal or hexadecimal value of 4 octets can be entered.

For IS-IS and OSPF, all four octets can be used.

For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag.

Default

no tag

Parameters

tag

Assigns an IS-IS, OSPF, RIP or RIPng tag to routes matching the entry.

Values Accepts decimal or hexadecimal formats:

IS-IS and OSPF: 0x0–0xFFFFFFFF or 1–4294967295

RIP and RIPng: 0x0–0xFFFF or 1–65535

name — The tag parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

Platforms

tag

Syntax

tag *tag-id*

no tag

Context

[Tree] (config>qos>sap-ingress>ip-criteria>entry tag)

[Tree] (config>qos>sap-ingress>ipv6-criteria>entry tag)

Full Context

configure qos sap-ingress ip-criteria entry tag

configure qos sap-ingress ipv6-criteria entry tag

Description

This command associates a tag with the criteria entry.

Tag identifiers are not supported in SAP ingress QoS policies, MAC criteria statements, or in SAP egress QoS policies.

The **no** form of this command removes the tag.

Parameters

tag-id

Specifies the tag ID.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tag

Syntax

tag *tag*

no tag

Context

[Tree] (config>router>isis>srv6>locator tag)

Full Context

configure router isis segment-routing-v6 locator tag

Description

This command configures a route tag to advertise in the locator TLV.

The **no** form of this command removes the tag value from the configuration.

Default

no tag

Parameters

tag

Specifies a route tag.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

tag

Syntax

tag *value*

no tag

Context

[Tree] (config>service>vprn>sub-if>grp-if>sap>static-host>managed-routes>route-entry tag)

no tag-protocol-id

Context

[Tree] (config>test-oam>build-packet>header>dot1q tag-protocol-id)

[Tree] (debug>oam>build-packet>packet>field-override>header>dot1q tag-protocol-id)

Full Context

configure test-oam build-packet header dot1q tag-protocol-id

debug oam build-packet packet field-override header dot1q tag-protocol-id

Description

This command defines the Dot1Q tag protocol ID to be used in the test Dot1Q header.

The **no** form of this command removes the tag protocol ID value.

Default

tag-protocol-id 0x8100 (33024)

Parameters

tag-protocol-id

Specifies the Dot1Q tag protocol ID to be used in the test Dot1Q header in either decimal or hexadecimal.

Values 1536 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tag-protocol-id

Syntax

tag-protocol-id *tag-protocol-id*

no tag-protocol-id

Context

[Tree] (config>test-oam>build-packet>header>pbb tag-protocol-id)

Full Context

configure test-oam build-packet header pbb tag-protocol-id

Description

This command defines the PBB Tag Protocol Identifier (TPID) to be used in the test PBB header.

The **no** form of this command reverts to the default.

Default

tag-protocol-id 0x88E7 (35047)

Parameters

tag-protocol-id

Specifies a tag Protocol Identifier (TPID) for a PBB packet header to be launched by the OAM **find-egress** tool.

Values 1536 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tag-protocol-id

Syntax

tag-protocol-id *tag-protocol-id*

Description

This command defines the PBB TPID to be used in the PBB header.

The **no** form of this command reverts to the default.

Default

tag-protocol-id 0

Parameters

tag-protocol-id

Specifies a TPID for a PBB packet header to be launched by the OAM **find-egress** tool.

Values 1536 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.10 taii-type2

taii-type2

Syntax

taii-type2 *global-id:node-id:ac-id*

no taii-type2

Context

[Tree] (config>service>cpipe>spoke-sdp>pw-path-id taii-type2)

[Tree] (config>service>vpls>spoke-sdp>pw-path-id taii-type2)

[Tree] (config>service>epipe>spoke-sdp>pw-path-id taii-type2)

Full Context

configure service cpipe spoke-sdp pw-path-id taii-type2

configure service vpls spoke-sdp pw-path-id taii-type2

configure service epipe spoke-sdp pw-path-id taii-type2

Description

This command configures the Target Individual Attachment Identifier (TAII) for an MPLS-TP spoke SDP. If this is configured on a spoke SDP for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the saii-type2 of the mate spoke SDP.

Parameters

global-id

Specifies the global ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values 0 to 4294967295

node-id

Specifies the node ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values a.b.c.d or 0 to 4294967295

ac-id

Specifies the attachment circuit ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

taii-type2

Syntax

taii-type2 *global-id:prefix:ac-id*

no taii-type2

Context

[Tree] (config>service>epipe>spoke-sdp-fec taii-type2)

Full Context

configure service epipe spoke-sdp-fec taii-type2

Description

taii-type2 configures the target attachment individual identifier for the SDP SDP. This is only applicable to FEC129 AII type 2.

This command is blocked in CLI if this end of the spoke SDP is configured for single-sided auto configuration (using the **auto-config** command).

Parameters

global-id

Specifies a global ID of this router T-PE. This value must correspond to one of the global_id values configured for a local-prefix under **config>service>pw-routing>local-prefix** context.

Values 1 to 4294967295

prefix

Speecifies prefix on this router T-PE that the spoke SDP SDP is associated with. This value must correspond to one of the prefixes configured under **config>service>pw-routing>local-prefix** context.

Values an IPv4-formatted address a.b.c.d or 1 to 4294967295

ac-id

Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

Platforms

All

taii-type2

Syntax

taii-type2 *global-id:node-id:ac-id*

no taii-type2

Context

[Tree] (config>service>ies>if>spoke-sdp>pw-path-id taii-type2)

Full Context

configure service ies interface spoke-sdp pw-path-id taii-type2

Description

This command configures the target individual attachment identifier (TAII) for an MPLS-TP spoke-sdp. If this is configured on a spoke-sdp for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the saii-type2 of the mate spoke-sdp.

Parameters

global-id

Specifies the global ID at the target PE or T-PE for the MPLS-TP PW for a spoke-SDP.

Values 0 to 4294967295

node-id

Specifies the node ID at the target PE or T-PE for the MPLS-TP PW for a spoke-SDP.

Values a.b.c.d or 0 to 4294967295

ac-id

Specifies the attachment circuit ID at the target PE or T-PE for the MPLS-TP PW for a spoke-SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

taii-type2

tail-end

Syntax

[**no**] **tail-end**

Context

[Tree] (config>router>lsp-bfd tail-end)

Full Context

configure router lsp-bfd tail-end

Description

This command enables the context to configure LSP BFD tail end parameters.

The **no** form of this command removes the context.

Default

no tail-end

Platforms

All

24.12 target-name

target-name

Syntax

target-name {node-name | user-agent | custom-string *name***}**

no target-name

Context

[Tree] (config>system>grpc-tunnel>tunnel target-name)

Full Context

configure system grpc-tunnel tunnel target-name

Description

This command assigns a target name that the node will register with.

The **no** form of this command removes the target name.

Default

no target-name

Parameters

node-name

Keyword to register the tunnel with the node name configured using the **configure system name** command.

user-agent

Keyword to register the tunnel with the user agent name string defined as *node-name:vendor:model:software-version*.

custom-string

Assigns an arbitrary string as the target name.

name

Specifies a string, up to 64 characters, that defines the target name.

Platforms

All

24.13 target-power

target-power

Syntax

target-power *power*

Context

[Tree] (config>port>dwdm>coherent target-power)

Full Context

configure port dwdm coherent target-power

Description

This command configures the target transmit optical power for the port.

Default

target-power 1.00

Parameters

power

Specifies the desired average output power in dBm.

Values -20.00 to 3.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.14 target-retry-wait

target-retry-wait

Syntax

target-retry-wait *seconds*

Context

[Tree] (config>li>x-interfaces>x3>timeouts target-retry-wait)

Full Context

configure li x-interfaces x3 timeouts target-retry-wait

Description

This command configures the retry interval for target tunnel set up.

Parameters

seconds

Specifies the time that the system must wait before attempting another tunnel creation request to avoid overloading the LIC.

Values 300 to 1200

Default 300

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.15 target-type

target-type

Syntax

target-type {grpc-server | ssh-server | custom-type *type***}**

no target-type

Context

[Tree] (config>system>grpc-tunnel>tunnel>handler target-type)

Full Context

configure system grpc-tunnel tunnel handler target-type

Description

This command assigns a server as a handler for all tunnel sessions.

The **no** form of this command disables the tunnel handler server.

Default

no target-type

Parameters

grpc-server

Keyword that assigns the gRPC server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "GNMI_GNOI”.

ssh-server

Keyword that assigns the SSH server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "SSH”.

custom-type

Keyword that assigns an arbitrary string as the target type.

type

Specifies a string, up to 255 characters, defining the client to serve as a handler for all tunnel sessions. Values used by gRPC tunnel protocol, such as "GNMI_GNOI” or "SSH” can also be used.

Platforms

All

24.16 targeted-session

targeted-session

Syntax

targeted-session

Context

[Tree] (config>router>ldp targeted-session)

Full Context

configure router ldp targeted-session

Description

This command configures targeted LDP sessions. Targeted sessions are LDP sessions between non-directly connected peers. Hello messages are sent directly to the peer platform instead of to all the routers on this subnet multicast address. The user can configure different default parameters for IPv4 and IPv6 LDP targeted hello adjacencies.

The discovery messages for an indirect LDP session are addressed to the specified peer and not to the multicast address.

Platforms

All

24.17 task-scheduling-int

task-scheduling-int

Syntax

task-scheduling-int *percent-of-default*

no task-scheduling-int

Context

[Tree] (config>card>virt-sched-adj task-scheduling-int)

Full Context

configure card virtual-scheduler-adjustment task-scheduling-int

Description

This command overrides the system default time between scheduling the hierarchical virtual scheduling task. By default, the system "wakes" the virtual scheduler task every 50ms; this is equivalent to five 10ms timer ticks. The task-scheduling-int command uses a percent value parameter to modify the number of timer ticks.

While the system accepts a wide range of percent values, the result is rounded to the nearest 10ms tick value. The fastest wake interval is 10ms (1 timer tick).

The **no** form of this command restores the default task scheduling interval of the card's hierarchical virtual scheduler task.

Parameters

percent-of-default:

Specifies that the percent-of-default parameter is required and is used to modify the default task scheduling interval for the hierarchical virtual scheduling task on the card. Defining 100.00 percent is equivalent to removing the override.

Values 0.01% to 1000.00%

Default 100.00%

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries entry match tcp-ack

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries entry match tcp-ack

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries entry match tcp-ack

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries entry match tcp-ack

Description

This command configures the TCP ACK match condition.

The **no** form of this command reverts to the default.

Parameters

true

Enables checking for the ACK bit.

false

Disables checking for the ACK bit.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tcp-ack

Syntax

tcp-ack {**true** | **false**}

no tcp-ack

Context

[Tree] (config>filter>ip-filter>entry>match tcp-ack)

Full Context

configure filter ipv6-filter entry match tcp-ack

configure filter ip-filter entry match tcp-ack

Description

This command configures an IP filter match criterion based on the Acknowledgment (ACK) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-ack

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

tcp-ack

Syntax

tcp-ack {**true** | **false**}

no tcp-ack

Context

[Tree] (cfg>sys>sec>cpm>ip-filter>entry>match tcp-ack)

[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match tcp-ack)

Full Context

configure system security cpm-filter ip-filter entry match tcp-ack

configure system security cpm-filter ipv6-filter entry match tcp-ack

Description

This command configures matching on the ACK bit being set or reset in the control bits of the TCP header of an IP or IPv6 packet as an IP filter match criterion.

Note:
An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the criterion from the match entry.

Default

no tcp-ack

Parameters

true

Specifies matching on IP or IPv6 packets that have the ACK bit set in the control bits of the TCP header of an IP or IPv6 packet.

false

Specifies matching on IP or IPv6 packets that do not have the ACK bit set in the control bits of the TCP header of the IP or IPv6 packet.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tcp-adv-func

Syntax

tcp-adv-func *size*

Context

[Tree] (config>isa>aa-grp>shared-resources tcp-adv-func)

Full Context

configure isa aa-group shared-resources tcp-adv-func

Description

This command configures the allocation of shared resource pool for TCP advanced functions.

Default

tcp-adv-func 100

Parameters

size

Specifies the allocation of the shared resource pool.

Values 0 to 100

24.21 tcp-client-reset

tcp-client-reset

Syntax

[**no**] **tcp-client-reset**

Context

[Tree] (config>app-assure>group>http-redirect tcp-client-reset)

Full Context

configure application-assurance group http-redirect tcp-client-reset

Description

This command enables an HTTP-redirect policy to initiate a TCP reset towards the client if the AA policy results in a redirect with packet drop but the http redirect cannot be delivered. Scenarios for this include HTTPs (TLS) sessions, blocking of non-HTTP TCP traffic, and blocking of existing flows after a policy re-evaluate of an existing subscriber.

The **no** form of this command disables the command.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Description

Commands in this context configure the sending of TCP keepalives by the router towards all gRPC clients.

Enabling TCP keepalive speeds up the detection of certain failures. The TCP keepalives sent by the router are controlled by three commands: **idle-time**, **interval**, and **retries**. The router starts sending TCP keepalives when the connection has been idle (no TCP segments sent or received) for more than **idle-time** seconds. At that point, the router sends a probe (TCP ACK with a sequence number = current sequence number - 1) and expects a TCP ACK. It repeats this probe every **interval** seconds for the configured number of **retries**. If no response is received to any of the probes, the connection is immediately closed, which starts the purge timer if the TCP connection is currently supporting the RibApi service.

Context

[Tree] (config>service>ies>if tcp-mss)

[Tree] (config>service>ies>if>ipv6 tcp-mss)

Full Context

configure service ies interface tcp-mss

configure service ies interface ipv6 tcp-mss

Description

This command statically sets the TCP maximum segment size (MSS) for TCP connections originated from the associated IP interface to the specified value.

The **no** form of this command removes the static value and allows the TCP MSS value to be calculated based on the IP MTU value by subtracting the base IP and TCP header lengths from the IP MTU value (tcp_mss = ip_mtu – 40).

Default

no tcp-mss

Parameters

mss-value

The TCP MSS value that should be used in the TCP SYN packet during the three-way handshake negotiation of a TCP connection.

Note: 9158 = max-IP_MTU (9198)-40

Values 536 to 9746 (IPv4) 1220 to 9726 (IPv6)

Context

[Tree] (config>router>bgp tcp-mss)

[Tree] (config>service>vprn>bgp tcp-mss)

Full Context

configure router bgp tcp-mss

configure service vprn bgp tcp-mss

Description

This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

Default

no tcp-mss

Parameters

mss-value

Specifies the The router uses the TCP SYN to advertise the TCP MSS option value towards its peer. MSS value, in bytes, to use with the peers that fall within the scope of the command.

Values 384 to 9746

Platforms

All

tcp-mss

Syntax

tcp-mss ip-stack

tcp-mss *mss-value*

no tcp-mss

Full Context

configure service vprn bgp group tcp-mss

configure router bgp group tcp-mss

configure router bgp group neighbor tcp-mss

configure service vprn bgp group neighbor tcp-mss

Description

This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value,

depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.

- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

Default

no tcp-mss

Parameters

mss-value

Specifies the TCP MSS value, in bytes, to use with the peers that fall within the scope of the command.

Values 384 to 9746

ip-stack

This keyword requests that TCP MSS be derived from mechanisms and configurations outside of BGP, including the configuration of **tcp-mss** at the IP interface level. It provides a method to override inheritance within the BGP configuration.

Platforms

All

24.28 tcp-mss-adjust

tcp-mss-adjust

Syntax

tcp-mss-adjust *segment-size*

no tcp-mss-adjust

Context

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw tcp-mss-adjust)

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw tcp-mss-adjust)

Full Context

configure service vprn subscriber-interface group-interface wlan-gw tcp-mss-adjust

configure service ies subscriber-interface group-interface wlan-gw tcp-mss-adjust

Description

This command configures the TCP Maximum Segment Size (MSS) adjustment for the wlan-gw gateway.

The **no** form of this command disables adjusting tcp-mss values.

For DSM, this only applies to packets sent in the downstream direction (TCP SYN towards UE). For the upstream direction, it is also required to configure MSS adjust under the applicable NAT-policy.

Parameters

segment-size

Specifies the value to put into the TCP Maximum Segment Size (MSS) option if not already present, or if the present value is higher.

Values 160 to 10240

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-mss-adjust

Syntax

tcp-mss-adjust *segment-size*

no tcp-mss-adjust

Context

Full Context

configure service nat nat-policy tcp-mss-adjust

configure service nat up-nat-policy tcp-mss-adjust

configure service nat firewall-policy tcp-mss-adjust

Description

This command configures the value to adjust the TCP Maximum Segment Size (MSS) option.

The **no** form of the command returns the segment size to the default.

Default

no tcp-mss-adjust

Parameters

segment-size

Specifies the value to put into the TCP Maximum Segment Size (MSS) option if not already present, or if the present value is higher.

Values 160 to 10240

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat up-nat-policy tcp-mss-adjust
- configure service nat nat-policy tcp-mss-adjust

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy tcp-mss-adjust

tcp-mss-adjust

Syntax

tcp-mss-adjust

Context

[Tree] (config>filter>ip-filter>entry>action tcp-mss-adjust)

[Tree] (config>filter>ipv6-filter>entry>action tcp-mss-adjust)

Full Context

configure filter ip-filter entry action tcp-mss-adjust

configure filter ipv6-filter entry action tcp-mss-adjust

Description

This command activates the adjustment of the TCP Maximum Segment Size (MSS) option of TCP packets matching the entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-mss-adjust

Syntax

tcp-mss-adjust *segment-size*

no tcp-mss-adjust

Context

[Tree] (config>service>nat>map-domain tcp-mss-adjust)

Full Context

configure service nat map-domain tcp-mss-adjust

Description

This command enables the TCP maximum segment size (MSS) adjustments in a MAP domain. The TCP SYN and SYN-ACK packets are intercepted in both directions, and if their MSS value is larger than the one configured using this command, the MSS value in the packet is re-written (lowered) to the configured value. The end hosts use the lowest setting of the two hosts. The MSS value does not account for the IP or TCP header length.

If the MSS value in the SYN or SYN-ACK is not found, a new value is added and set to the configured value.

Default

no tcp-mss-adjust

Parameters

segment-size

Specifies the maximum size of the segment.

Values 160 to 8626

Platforms

VSR

24.29 tcp-ns

tcp-ns

Syntax

tcp-ns {**true** | **false**}

no tcp-ns

Context

[Tree] (config>filter>ipv6-filter>entry>match tcp-ns)

[Tree] (config>filter>ip-filter>entry>match tcp-ns)

Full Context

configure filter ipv6-filter entry match tcp-ns

configure filter ip-filter entry match tcp-ns

Description

This command configures an IP filter match criterion based on the Nonce Sum (NS) TCP Flag bit, defined in RFC 3540, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-ns

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

24.30 tcp-optimizer

tcp-optimizer

Syntax

tcp-optimizer *tcp-optimizer-name [***create***]*

no tcp-optimizer *tcp-optimizer-name*

Context

[Tree] (config>app-assure>group tcp-optimizer)

Full Context

configure application-assurance group tcp-optimizer

Description

This command configures the TCP optimizer policy. When a TCP optimizer policy is removed or deleted, the existing flows using this policy are abandoned, and optimization is stopped. If, however, the TCP optimizer action is removed from a session-filter entry (in the **config>app-assure>group>sess-fltr>entry action** context), the existing flows are not affected.

The **no** form of this command removes the specified TCP optimizer policy.

Parameters

tcp-optimizer-name

Specifies the name of the TCP optimizer policy, up to 32characters.

create

This keyword is mandatory when creating a TCP optimizer policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-option-number

Syntax

tcp-option-number

Context

[Tree] (config>system>security>keychain tcp-option-number)

Full Context

configure system security keychain tcp-option-number

Description

Commands in this context configure the TCP option number to be placed in the TCP packet header.

Platforms

All

24.32 tcp-performance

tcp-performance

Syntax

tcp-performance

Context

[Tree] (config>app-assure>group>cflowd tcp-performance)

Full Context

configure application-assurance group cflowd tcp-performance

Description

Commands in this context configure Cflowd TCP performance export parameters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.33 tcp-protocols

tcp-protocols

Syntax

tcp-protocols *protocol-set*

Context

[Tree] (config>app-assure>group>tether-detect>ttl-mon tcp-protocols)

Full Context

configure application-assurance group tethering-detection ttl-monitoring tcp-protocols

Description

This command configures whether AA analyzes all TCP traffic or only traffic from standard applications that generate consistent TTL values. Configuring AA to analyze all TCP traffic is typically recommended.

Default

tcp-protocols standard

Parameters

protocol-set

Specifies the scope of analysis for TCP traffic.

Values standard, all

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.34 tcp-psh

tcp-psh

Syntax

tcp-psh {**true** | **false**}

no tcp-psh

Context

[Tree] (config>filter>ipv6-filter>entry>match tcp-psh)

[Tree] (config>filter>ip-filter>entry>match tcp-psh)

Full Context

configure filter ipv6-filter entry match tcp-psh

configure filter ip-filter entry match tcp-psh

Description

This command configures an IP filter match criterion based on the Push (PSH) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-psh

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

24.35 tcp-rst

tcp-rst

Syntax

tcp-rst [min *minutes*] **[sec** *sec*]

no tcp-rst

Context

[Tree] (config>service>nat>up-nat-policy>timeouts tcp-rst)

[Tree] (config>service>nat>nat-policy>timeouts tcp-rst)

[Tree] (config>service>nat>firewall-policy>timeouts tcp-rst)

Full Context

configure service nat up-nat-policy timeouts tcp-rst

configure service nat nat-policy timeouts tcp-rst

configure service nat firewall-policy timeouts tcp-rst

Description

This command suspends the use of the outside TCP ports that have been used in translations for TCP connections that are closed via TCP RST. Once this timer expires, the outside ports can be reused for new TCP translations.

The **no** form of the command reverts to the default.

Default

no tcp-rst

Parameters

minutes

Specifies the timeout, in minutes, after receiving a RST and closing the session before going to the LISTEN state again.

Values 1 to 4

sec

Specifies the timeout, in seconds, after receiving a RST and closing the session before going to the LISTEN state again.

Values 1 to 59

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat up-nat-policy timeouts tcp-rst
- configure service nat nat-policy timeouts tcp-rst

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy timeouts tcp-rst

tcp-rst

Syntax

tcp-rst {**true** | **false**}

no tcp-rst

Context

[Tree] (config>filter>ip-filter>entry>match tcp-rst)

Full Context

configure filter ipv6-filter entry match tcp-rst

configure filter ip-filter entry match tcp-rst

Description

This command configures an IP filter match criterion based on the Reset (RST) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-rst

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

24.36 tcp-session-parameters

tcp-session-parameters

Syntax

tcp-session-parameters

Context

[Tree] (config>router>ldp tcp-session-parameters)

Full Context

configure router ldp tcp-session-parameters

Description

Commands in this context configure parameters applicable to TCP transport session of an LDP session to remote peer.

Platforms

All

24.37 tcp-stack

tcp-stack

Syntax

tcp-stack *tcp-stack-type*

Context

[Tree] (config>app-assure>group>tcp-optimizer tcp-stack)

Full Context

configure application-assurance group tcp-optimizer tcp-stack

Description

This command configures the TCP stack used toward the subscriber.

Note:

- The TCP stack used toward the core network is new-reno, and it is not configurable.
- TCP BBR, TCP Illinois, and TCP Westwood implement a sender-side modification of the TCP congestion window algorithm that improves upon the performance of TCP Reno in wireless networks with lossy links.

The **no** form of this command reverts to the default.

Default

tcp-westwood

Parameters

tcp-stack-type

Specifies the TCP stack used toward the subscriber.

Values tcp-bbr | tcp-illinois | tcp-new-reno | tcp-westwood

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Syntax

tcp-syn {**true** | **false**}

no tcp-syn

Context

[Tree] (cfg>sys>sec>cpm>ip-filter>entry>match tcp-syn)

[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match tcp-syn)

Full Context

configure system security cpm-filter ip-filter entry match tcp-syn

configure system security cpm-filter ipv6-filter entry match tcp-syn

Description

This command configures matching on the SYN bit being set or reset in the control bits of the TCP header of an IP or IPv6 packet as an IP filter match criterion.

Note:
An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The SYN bit is normally set when the source of the packet wants to initiate a TCP session with the specified destination IP or IPv6 address.

The **no** form of this command removes the criterion from the match entry.

Default

no tcp-syn

Parameters

true

Specifies matching on IP or IPv6 packets that have the SYN bit set in the control bits of the TCP header.

false

Specifies matching on IP or IPv6 packets that do not have the SYN bit set in the control bits of the TCP header.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.41 tcp-urg

tcp-urg

Syntax

tcp-urg {**true** | **false**}

no tcp-urg

Context

[Tree] (config>filter>ip-filter>entry>match tcp-urg)

[Tree] (config>filter>ipv6-filter>entry>match tcp-urg)

Full Context

configure filter ip-filter entry match tcp-urg

configure filter ipv6-filter entry match tcp-urg

Description

This command configures an IP filter match criterion based on the Urgent (URG) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-urg

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

24.42 tcp-validate

tcp-validate

Syntax

tcp-validate *tcp-validate-name*

no tcp-validate

Context

[Tree] (config>app-assure>group>policy>aqp>entry>action tcp-validate)

Full Context

configure application-assurance group policy app-qos-policy entry action tcp-validate

Description

This command assigns an existing TCP validation policy as an action on flows matching this AQP entry.

tcp-validate can only be called from AQP entries that:

- have no matching conditions that relate to information extracted from the incoming IP packets; for example, no application or IP address.
- allow the following match conditions:
  - none
  - aa-sub
  - characteristic
  - traffic-direction (both only)

    traffic-direction cannot be unidirectional (from or to sub). It can either be set to both or left unspecified.

The **no** form of this command removes the TCP validation policy action from flows matching this AQP entry.

Default

no tcp-validate

Parameters

tcp-validate-name

Specifies the name of the TCP validation policy for this application assurance profile. The TCP validation policy is configured using the **config**>**app-assure**>**group**>**tcp-validate** *tcp-validate-name* command.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-validate

Syntax

tcp-validate *tcp-validate-name* **direction** *direction* [**create**]

no tcp-validate *tcp-validate-name* **direction** *direction*

Context

[Tree] (config>app-assure>group>statistics>tca tcp-validate)

Full Context

configure application-assurance group statistics threshold-crossing-alert tcp-validate

Description

This command configures TCA for the counter, and enables the capture of drop or admit events due to the specified TCP validation function.

Parameters

tcp-validate-name

Specifies the name of the TCP validation policy up to 32 characters.

direction

Specifies the traffic direction in relation to the AA subscriber.

Values from-sub, to-sub

create

This keyword is mandatory when creating a TCA instance.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-validate

Syntax

tcp-validate *tcp-validate-name* [**create**]

no tcp-validate *tcp-validate-name*

Context

[Tree] (config>app-assure>group tcp-validate)

Full Context

configure application-assurance group tcp-validate

Description

This command configures a TCP validation policy.

The **no** form of this command removes the specified TCP validation policy.

Default

no tcp-validate

Parameters

tcp-validate-name

Specifies the name of the TCP validation policy up to 32 characters.

create

This keyword is mandatory when creating a TCP validation policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.45 tdm

tdm

Syntax

tdm

Context

[Tree] (config>port tdm)

Full Context

configure port tdm

Description

Commands in this context configure DS-1/E-1 and DS-3/E-3 parameters for a port on a channelized MDA T1/E1. This context cannot be accessed on non-channelized MDAs.

TDM is a mechanism to divide the bandwidth of a stream into separate channels or time slots by assigning each stream a different time slot in a set. TDM repeatedly transmits a fixed sequence of time slots over a single transmission channel. Each individual data stream is reassembled at the receiving end based on the timing.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

te-class

Syntax

te-class *te-class-number* **class-type** *ct-number* **priority** *priority*

no te-class te-class-number

Context

[Tree] (config>router>rsvp>diffserv-te te-class)

Full Context

configure router rsvp diffserv-te te-class

Description

This command configures a TE class. A TE class is defined as:

TE Class = {Class Type (CT), LSP priority}

Eight TE classes are supported. There is no default TE class once Diff-Serv is enabled. The user has to explicitly define each TE class.

When Diff-Serv is disabled, there will be an internal use of the default CT (CT0) and eight pre-emption priorities as shown in Table 159: Default Class Type.

Table 159: Default Class Type

Class Type (CT internal)	LSP Priority
0	7
0	6
0	5
0	4
0	3
0	2
0	1
0	0

The **no** form of this command deletes the TE class.

Parameters

te-class ***te-class-number***

Specifies the TE class number.

Values 0 to 7

class-type ***ct-number***

Specifies the Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

Values 0 to 7

priority ***priority***

Specifies the LSP priority.

Values 0 to 7

24.49 te-down-threshold

te-down-threshold

Syntax

te-down-threshold *threshold-level* [*threshold-level*]

no te-down-threshold

Context

[Tree] (config>router>rsvp>interface te-down-threshold)

[Tree] (config>router>rsvp te-down-threshold)

Full Context

configure router rsvp interface te-down-threshold

configure router rsvp te-down-threshold

Description

This command configures the specific threshold levels per node and per interface. Threshold levels are for reserved bandwidth per interface. The **te-threshold-update** command is used to enable or disable threshold-based IGP TE updates. Any reserved bandwidth change per interface is compared with all the threshold levels and trigger an IGP TE update if a defined threshold level is crossed in either direction (LSP setup or teardown). Threshold-based updates must be supported with both ISIS and OSPF. A minimum of one and a maximum of 16 threshold levels is supported.

Threshold levels configured per node is inherited by all configured RSVP interfaces. Threshold levels defined under the RSVP interface is used to trigger IGP updates if non-default threshold levels are configured.

The **no** form of this command resets te-down-threshold to its default value.

Default

no te-down-threshold (equals following values 100 99 98 97 96 95 90 85 80 75 60 45 30 15 0)

Parameters

threshold-level

Specifies the threshold level.

Values 0 to 100

Platforms

All

24.50 te-metric

te-metric

Syntax

te-metric *value*

no te-metric

Context

[Tree] (config>router>mpls>interface te-metric)

Full Context

configure router mpls interface te-metric

Description

This command configures the TE metric used on the interface. This metric is in addition to the interface metric used by IGP for the shortest path computation.

This metric is flooded as part of the TE parameters for the interface using an opaque LSA or an LSP. The IS-IS TE metric is encoded as sub-TLV 18 as part of the extended IS reachability TLV. The metric value is encoded as a 24-bit unsigned integer. The OSPF TE metric is encoded as a sub-TLV Type 5 in the Link TLV. The metric value is encoded as a 32-bit unsigned integer.

When the use of the TE metric is enabled for an LSP, CSPF will first prune all links in the network topology which do not meet the constraints specified for the LSP path. Such constraints include bandwidth, admin-groups, and hop limit. Then, CSPF will run an SPF on the remaining links. The shortest path among the all SPF paths will be selected based on the TE metric instead of the IGP metric which is used by default.

The TE metric in CSPF LSP path computation can be configured by entering the command **config>router>mpls>lsp>metric-type te**.

Note that the TE metric is only used in CSPF computations for MPLS paths and not in the regular SPF computation for IP reachability.

The **no** form of this command reverts to the default value.

Default

no te-metric

The value of the IGP metric is advertised in the TE metric sub-TLV by IS-IS and OSPF.

Parameters

value

Specifies the metric value.

Values 1 to 16777215

Platforms

Full Context

admin satellite eth-sat tech-support

admin tech-support

Description

This command creates a system core dump. If the *file-url* is omitted, and a *ts-location* is defined, then the **tech support** file will have an automatic SR OS generated file name based on the system name and the date and time and will be saved to the directory indicated by the configured *ts-location*.

The format of the auto-generated filename is ts-XXXXX.YYYYMMDD.HHMMUTC.dat where:

- XXXXX: system name with special characters expanded to avoid problems with file systems (for example, a '.' is expanded to %2E.)
- YYYYMMDD: Date with leading zeros on year, month and day
- HHMM: Hours and Minutes in UTC time (24hr format, always 4 chars, with leading zeros on hours and minutes)

Note:
This command should only be used with authorized direction of Nokia support.

Parameters

file-url

Specifies the file URL location to save the binary file.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn*/][*file-path*]
	199 chars max
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*

Context

[Tree] (telnet)

Full Context

telnet

Description

This command opens a Telnet session to a remote host. In SR-series networks, the Telnet servers limit Telnet clients to three login attempts; if unsuccessful, the Telnet client session is disconnected. The number is not user configurable.

If a source address is specified, it is used for the source IP address in the originated IP packets for the Telnet session.

Parameters

ip-address

Specifies the IP address or the DNS name (if DNS name resolution is configured).

Values

ipv4-address	*a.b.c.d*	
ipv6-address	*x:x:x:x:x:x:x:x*[-interface]	*x*: [0 to FFFF]H
	x:x:x:x:x:x:d.d.d.d[-interface]	*d*: [0 to 255]D *ipv6-address* interface: up to 32 characters, mandatory for link local addresses
dns-name	up to 128 characters	

Note:
IPv6 applies to the 7750 SR and 7950 XRS.

dns-name

Specifies the DNS name (if DNS name resolution is configured), up to 128 characters.

port

Specifies the TCP port number to use Telnet to the remote host, expressed as a decimal integer.

Values 1 to 65535

Default 23

router-instance

Specifies the router name or service ID used to identify the router instance.

Values *router-instance*: *router-name* or *vprn-svc-id*

router-name	"Base", "management", vpls-management"
vprn-svc-id	1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

source ip-address

Specifies the source IP address to use as the source of the Telnet packets.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d

[Tree] (config>router>if>ipv6>vrrp telnet-reply)

Full Context

configure router interface vrrp telnet-reply

configure router interface ipv6 vrrp telnet-reply

Description

This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances' IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

This limitation can be disregarded for certain applications. Ping, SSH and Telnet can each be individually enabled or disabled on a per-virtual-router-instance basis.

The **telnet-reply** command enables the non-owner master to reply to Telnet requests directed at the virtual router instances' IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Correct login and CLI command authentication is still enforced.

When **telnet-reply** is not enabled, Telnet requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the **telnet-reply** setting.

The **telnet-reply** command is only available in non-owner **vrrp** nodal context.

By default, Telnet requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of the command configures discarding all Telnet request messages destined to the non-owner virtual router instance IP addresses.

Default

no telnet-reply — Telnet requests to the virtual router instance IP addresses are discarded.

configure system security telnet-server

Description

This command enables Telnet servers running on the system.

Telnet servers are shut down by default. At system startup, only SSH servers are enabled.

Telnet servers in networks limit a Telnet clients to three retries to login. The Telnet server disconnects the Telnet client session after three retries.

The **no** form of this command disables Telnet servers running on the system.

[Tree] (config>service>vpls temp-flooding)

[Tree] (config>service>template>vpls-template temp-flooding)

Full Context

configure service vpls temp-flooding

configure service template vpls-template temp-flooding

Description

The temporary flooding is designed to minimize failover times by eliminating the time it takes to flush the MAC tables and if MVRP is enabled the time it takes for MVRP registration. Temporary flooding is initiated only upon xSTP TCN reception. During this procedure while the MAC flush takes place the frames received on one of the VPLS SAPs/pseudowires are flooded in a VPLS context which for MVRP case includes also the unregistered MVRP trunk ports. The MAC Flush action is initiated by the STP TCN reception or if MVRP is enabled for the data VPLS, by the reception of a MVRP New message for the SVLAN ID associated with the data VPLS. As soon as the MAC Flush is done, regardless of whether the temp-flooding timer expired or not, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. This command provides a flood-time value that configures a fixed amount of time, in seconds, during which all traffic is flooded (BUM or known unicast) as a safety mechanism. Once the flood-time expires, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. The temporary flooding timer should be configured in such a way to allow auxiliary processes like MAC Flush, MMRP and/or MVRP to complete/converge. The temporary flooding behavior applies to regular VPLS, VPLS instantiated with VPLS-template, IVPLS and BVPLS when MMRP is disabled.

The **no** form of this command disables the temporary flooding behavior.

Default

no temp-flooding

Parameters

flood-time

Specifies the flood time, in seconds

Values 3 to 600

configure application-assurance group template

Description

This command refers to the template of parameters passed from the AA-ISA to the redirect server via JavaScript in the redirect packet. The template is specific to the redirect server being used in the network.

Currently, two partners are used and tested with AA-ISA redirect solution, Barefruit and Xerocole.

The **no** form of this command reverts to the default.

Parameters

template-id

Specifies an HTTP error redirect template.

1 = Barefruit specific template

2 = xerocole specific template.

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>app-assure>group>http-redirect template)

Full Context

configure application-assurance group http-redirect template

Description

This command configures the template that defines which parameters are appended to the HTTP host redirect field in the redirect message.

The HTTP redirect template provides HTTP 302 redirect containing only the URL specified in the redirect policy, with no other parameters.

The **no** form of this command removes the template from the configuration.

Default

no template

Parameters

template-id

Specifies the HTTP Policy Redirect template.

Values 1 — Javascript based redirect embedded in HTTP 200 OK response with a predefined number of arguments automatically appended to the redirect URL

2 — HTTP 302 Redirect with a predefined number of arguments automatically appended to the redirect URL.

3 — HTTP 302 Redirect with no parameters appended to the URL (empty).

4 — Empty Redirect format using Javascript.

5 — Redirect supporting macro substitution using HTTP 302.

6 — Redirect supporting macro substitution using Javascript.

The name of the template to be created or removed, up to 32 characters.

Platforms

All

template

Syntax

[**no**] **template** *name*

Context

[Tree] (config>router>route-next-hop-policy template)

Full Context

configure router route-next-hop-policy template

Description

This command creates a template to configure the attributes of a Loop-Free Alternate (LFA) Shortest Path First (SPF) policy. An LFA SPF policy allows the user to apply specific criteria, such as admin group and SRLG constraints, to the selection of an LFA backup next-hop for a subset of prefixes that resolve to a specific primary next-hop.

The user first creates a route next-hop policy template under the global router context and then applies it to a specific OSPF or IS-IS interface in the global routing instance or in a VPRN instance.

A policy template can be used in both IS-IS and OSPF to apply the specific criteria to prefixes protected by LFA. Each instance of IS-IS or OSPF can apply the same policy template to one or more interface.

The commands within the route next-hop policy template use the **begin-commit-abort** model. The following are the steps to create and modify the template:

To create a template, the user enters the name of the new template directly under the route-next-hop-policy context.

1. To delete a template that is not in use, the user enters the **no** form for the template name under the route-next-hop-policy context.
2. The user enters the editing mode by executing the begin command under the route-next-hop-policy context. The user can then edit and change any number of route next-hop policy templates. However, the parameter value will still be stored temporarily in the template module until the commit is executed under the route-next-hop-policy context. Any temporary parameter changes will be lost if the user enters the abort command before the commit command.
3. The user is allowed to create or delete a template instantly once in the editing mode without the need to enter the commit command. Furthermore, the abort command, if entered, will have no effect on the prior deletion or creation of a template.

Once the commit command is issued, IS-IS or OSPF will re-evaluate the templates and if there are any net changes, it will schedule a new LFA SPF to re-compute the LFA next-hop for the prefixes associated with these templates.

Parameters

name

Specifies the name of the template, up to 32 characters.

Platforms

All

template-format

Syntax

template-format {**format1** | **format2**}

no template-format

Context

[Tree] (config>service>ipfix>ipfix-export-policy template-format)

Full Context

configure service ipfix ipfix-export-policy template-format

Description

This command selects one of two template formats that contains a set of element IDs and their interpretation in IPFIX NAT flow logging. The difference between the two formats is related to the fields conveying information about the translated source IP addresses and ports (outside IP addresses and ports). Further, format 1 conveys information about the translated source port (post NAT) in the sourceTransportPort information element while format 2 conveys this information in the postNAPTsourceTrasportPort element.

Further, format1 conveys information about the translated source port (post NAT) in the information element sourceTransportPort while a new information element postNAPTsourceTrasportPort is introduced in format2 to carry this information.

For more information about template formats, refer to "Template Formats” in the *7450 ESS, 7750 SR, and VSR Multiservice Integrated Service Adapter and Extended Services Appliance Guide*, where the table lists supported information elements and their description for each format.

The **no** form of the command reverts to the default value.

Default

template-format format1

Parameters

format1

Specifies that template format 1 is used by the IPFIX collectors associated with this IPFIX Export policy.

format2

Specifies that template format 2 is used by the IPFIX collectors associated with this IPFIX Export policy.

Context

[Tree] (config>service>ipfix>export-policy>collector template-refresh-timeout)

Full Context

configure service ipfix ipfix-export-policy collector template-refresh-timeout

Description

This command configures the time interval in which Template Set messages are sent to the collector node. Template sets is an IPFIX message that defines fields for subsequent IPFIX messages but contains no data of its own. In other words, IPFIX data is not passed as set of TLVs, but instead data is encoded with a scheme defined through the Template Set message.

Default

template-refresh-timeout min 10

Parameters

hours

Specifies the time interval, in hours, after which IPFIX templates are resent to this collector.

Values 1 to 24

minutes

Specifies the time interval, in minutes, after which IPFIX templates are resent to this collector.

Values 1 to 59

seconds

Specifies the time interval, in seconds, after which IPFIX templates are resent to this collector.

Values 1 to 59

days

Specifies the time interval, in days, after which IPFIX templates are resent to this collector.

24.70 template-set

template-set

Syntax

template-set {**basic** | **mpls-ip** | **l2-ip** | **mpls-transport**}

Context

[Tree] (config>cflowd>collector template-set)

Full Context

configure cflowd collector template-set

Description

This command specifies the set of templates sent to the collector when using cflowd Version 9 or Version 10.

Default

template-set basic

Parameters

basic

Specifies that basic flow data is sent.

mpls-ip

Specifies that extended flow data is sent that includes IP and MPLS flow information.

If the sampled traffic is part of a locally configured service or IPv4 or IPv6 traffic is being forwarded with an MPLS shortcut, then the MPLS labels associated with that service encapsulation are included in the extended flow data for both network ingress and egress sampling.

l2-ip

Specifies that extended flow data is sent that includes Layer 2 (Ethernet) and IP flow information. This template is only applicable for V10 (IPFIX) collectors.

mpls-transport

Specifies that cflowd can collect flow statistics for MPLS traffic using only the outer transport label, EXP bit value, and ingress interface as the flow identifier. This template enables the collection of flow statistics on a core router to develop LSP usage statistics.

24.74 tertiary-config

tertiary-config

Syntax

tertiary-config *file-url*

no tertiary-config

Context

[Tree] (bof tertiary-config)

Full Context

bof tertiary-config

Description

This command specifies the name and location of the tertiary configuration file.

The system attempts to use the configuration specified in **tertiary-config** if both the primary and secondary config files cannot be located. If this file cannot be located, the system boots with the factory default configuration.

Note that if an error in the configuration file is encountered, the boot process aborts.

The **no** form of this command removes the **tertiary-config** configuration.

Parameters

file-url

Specifies the tertiary configuration file location, expressed as a file URL.

Values

file-url	{*local-url* | *remote-url*} (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]
remote-url	[{ftp://| tftp://} *login:pswd@remote-locn*/][*file-path*]

configure service vprn dns tertiary-dns

Description

This command configures the tertiary DNS server for DNS name resolution. The tertiary DNS server is used only if the primary DNS server and the secondary DNS server do not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the tertiary DNS server from the configuration.

Default

no tertiary-dns — No tertiary DNS server is configured.

Parameters

ip-address

The IP or IPv6 address of the tertiary DNS server.

Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x[-interface]

x:x:x:x:x:x:d.d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

24.76 tertiary-image

tertiary-image

Syntax

tertiary-image *file-url*

no tertiary-image

Context

[Tree] (bof tertiary-image)

Full Context

bof tertiary-image

Description

This command specifies the tertiary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (*.tim files) must be located in the same directory.

The **no** form of this command removes the **tertiary-image** configuration.

Parameters

file-url

Specifies the file URL; can be either local (this CPM) or a remote FTP server.

Values

file-url	{*local-url* | *remote-url*} (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]
remote-url	[{ftp://| tftp://} *login:pswd@remote-locn*/][*file-path*]

Context

[Tree] (config>router>bgp>orr>location tertiary-ip-address)

Full Context

configure router bgp optimal-route-reflection location tertiary-ip-address

Description

This command specifies the tertiary IP address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable to find a node in its topology database that matches the primary address, then the TE DB tries to find a node with the matching secondary address. If this attempt also fails, the TE DB then tries to find a node with the matching tertiary address.

The IP addresses specified for a location should be topologically "close" to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IP address information.

Default

no tertiary-ip-address

Parameters

ipv4-address

Specifies the tertiary IPv4 address of a location, expressed in dotted decimal notation.

Values a.b.c.d

Platforms

configure router bgp optimal-route-reflection location tertiary-ipv6-address

Description

This command specifies the tertiary IPv6 address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable find a node in its topology database that matches a primary address of the location, then it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address.

The IP addresses specified for a location should be topologically "close" to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IPv6 address information.

Default

no tertiary-ipv6-address

Parameters

ipv6-address

Specifies the tertiary IPv6 address of a location.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H

This is not an option when the **session-type** is configured as **proactive**. On-demand tests do not start until the **config>oam-pm>session>start** command has been issued and they stop when the **config>oam-pm>session>stop** command is issued.

The **no** form of this command removes a previously configured test-duration value and allows the TWAMP Light test to execute until it is stopped manually.

Parameters

seconds

Specifies the length of time, in seconds, that the TWAMP Light test runs.

Values 1 to 86400

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

test-duration

Syntax

test-duration *seconds*

no test-duration

Context

[Tree] (config>oam-pm>session>mpls>dm test-duration)

Full Context

configure oam-pm session mpls dm test-duration

Description

This command defines the length of time the test runs before stopping automatically. This command is only valid when a session has been configured with a **session-type** of **on-demand**. This is not an option when the **session-type** is configured as **proactive**.

On-demand tests do not start until the **oam-pm>session>start** command has been issued and they stops when scheduled or the **oam-pm>session>stop** command is issued.

The **no** form of this command removes a previously configured test-duration and allow the test to run until manually stopped.

Parameters

seconds

Specifies the number of seconds the test runs from its start time.

Values 1 to 8640

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.85 test-fail-enable

test-fail-enable

Syntax

[**no**] **test-fail-enable**

Context

[Tree] (config>saa>test>trap-gen test-fail-enable)

Full Context

configure saa test trap-gen test-fail-enable

Description

This command enables the generation of a trap when a test fails. In the case of a ping test, the test is considered failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** parameter.

The **no** form of this command disables the trap generation.

Platforms

All

24.86 test-fail-threshold

test-fail-threshold

Syntax

test-fail-threshold *threshold*

no test-fail-threshold

Context

[Tree] (config>saa>test>trap-gen test-fail-threshold)

Full Context

configure saa test trap-gen test-fail-threshold

Description

This command configures the threshold for trap generation on test failure.

This command has no effect when **test-fail-enable** is disabled. This command is not applicable to SAA trace route tests.

The **no** form of this command returns the threshold value to the default.

Default

test-fail-threshold 1

Parameters

threshold

Specifies the number of consecutive test failures required to generate a trap.

Values 0 to 15

Platforms
All

24.87 test-oam

test-oam

Syntax
test-oam

Context

24.88 test-pattern

test-pattern

Syntax
test-pattern {**all-zeros** | **all-ones**} [**crc-enable**]
no test-pattern

Context
[Tree] (config>eth-tunnel>path>eth-cfm>mep>eth-test-enable test-pattern)

Full Context
configure eth-tunnel path eth-cfm mep eth-test-enable test-pattern

Description
This command configures the test pattern for eth-test frames.

The **no** form of this command removes the values from the configuration.

Parameters

all-zeros

Specifies to use all zeros in the test pattern.

all-ones

Specifies to use all ones in the test pattern.

crc-enable

Generates a CRC checksum.

Default all-zeros

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

test-pattern

Syntax

test-pattern {**all-zeros** | **all-ones**} [**crc-enable**]

no test-pattern

Context

[Tree] (config>lag>eth-cfm>mep>eth-test test-pattern)

[Tree] (config>router>if>eth-cfm>mep>eth-test test-pattern)

[Tree] (config>port>ethernet>eth-cfm>mep>eth-test test-pattern)

Full Context

configure lag eth-cfm mep eth-test-enable test-pattern

configure router interface eth-cfm mep eth-test-enable test-pattern

configure port ethernet eth-cfm mep eth-test-enable test-pattern

Description

This command specifies the test pattern of the ETH-TEST frames. This does not have to be configured the same on the sender and the receiver.

The **no** form of this command reverts to the default values.

Default

test-pattern all-zeros

Parameters

all-zeros

Specifies to use all zeros in the test pattern.

all-ones

Specifies to use all ones in the test pattern.

crc-enable

Generates a CRC checksum.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tethered-flow

Syntax

[no] tethered-flow

Context

[Tree] (config>app-assure>group>policy>chrg-fltr>entry>match tethered-flow)

Full Context

configure application-assurance group policy charging-filter entry match tethered-flow

Description

This command configures the addition of the tethering status to the match criteria used by this charging filter entry.

The **no** form of this command removes the tethering status match criteria.

Default

no tethered-flow

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.90 tethering-detection

tethering-detection

Syntax

tethering-detection

Context

[Tree] (config>app-assure>group tethering-detection)

Full Context

configure application-assurance group tethering-detection

Description

Commands in this context configure tethering detection for the group. The **shutdown** and **no shutdown** commands are used in this context to enable or disable tethering detection.

Default

tethering-detection shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.91 tethering-summary

tethering-summary

Syntax

[**no**] **tethering-summary**

Context

[Tree] (config>app-assure>group>statistics>aa-partition tethering-summary)

Full Context

configure application-assurance group statistics aa-partition tethering-summary

Description

This command enables tethering summary statistics collection within an aa-partition.

The **no** form of this command disables tethering summary statistics collection.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.92 third-party

third-party

Syntax

[**no**] **third-party**

Context

[Tree] (config>service>nat>pcp-server-policy>option third-party)

Full Context

configure service nat pcp-server-policy option third-party

Description

This command enables/disables support for the **third-party** option.

Default

no third-party

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.93 third-party-nexthop

[Tree] (config>service>vprn>bgp>group>neighbor third-party-nexthop)

[Tree] (config>service>vprn>bgp third-party-nexthop)

Full Context

configure service vprn bgp group third-party-nexthop

configure service vprn bgp group neighbor third-party-nexthop

configure service vprn bgp third-party-nexthop

Description

Use this command to enable the router to send third-party next-hop to EBGP peers in the same subnet as the source peer, as described in RFC 4271. If enabled when an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next-hop is left unchanged. Third-party next-hop is not done if the address family of the transport does not match the address family of the route.

The **no** form of this command prevents BGP from performing any third party next-hop processing toward any single-hop EBGP peers within the scope of the command. No third-party next-hop means the next-hop will always carry the IP address of the interface used to establish the TCP connection to the peer.

Default

no third-party-nexthop

Platforms

24.95 threshold

threshold

Syntax

threshold *xpl-errors*

Context

[Tree] (config>card>mda>egress-xpl threshold)

Full Context

configure card mda egress-xpl threshold

Description

This command configures the Egress XPL Error Threshold value used by the **fail-on-error** feature.

Default

threshold 1000

Parameters

xpl-errors

Specifies an upper limit on the frequency of Egress XPL Errors that can occur on the MDA. When **fail-on-error** is enabled, if the MDA experiences more than *xpl-errors* errors per minute for the specified number of minutes from the **window** *minutes* command, the MDA will be put in the failed state.

The threshold value cannot be changed while **fail-on-error** is enabled for this MDA.

Values 1 to 1000000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure card mda ingress-xpl threshold

Description

This command configures the Ingress XPL Error Threshold value used by the **fail-on-error** feature.

Default

threshold 1000

Parameters

xpl-errors

Specifies an upper limit on the frequency of Ingress XPL Errors that can occur on the MDA. When **fail-on-error** is enabled, if the MDA experiences more than *xpl-errors* errors per minute for the specified number of minutes from the **window** *minutes* command, the MDA will be put in the failed state.

The threshold value cannot be changed while **fail-on-error** is enabled for this MDA.

Values 1 to 1000000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

threshold

Syntax

threshold {**ber-sd** | **ber-sf**} **rate** *threshold-rate*

no threshold {**ber-sd** | **ber-sf**}

Context

[Tree] (config>port>sonet-sdh threshold)

Full Context

configure port sonet-sdh threshold

Description

This command configures the line signal degradation bit error rate (BER) and line signal failure thresholds.

Line signal (b2) bit interleaved parity error rates are measured and when they cross either the degradation or failure thresholds alarms are raised (see the **report-alarm** command), furthermore if the failure threshold is crossed the link will be set to operationally down.

For APS configurations, if the **ber-sd** or **ber-sf** threshold rates must be modified, the changes must be performed at the line level on both the working and protect APS port member.

The **no** form of this command reverts to the default value.

Default

threshold ber-sd rate 6 — Signal degrade BER threshold of 10-6.

threshold ber-sf rate 3 — Signal failure BER threshold of 10-3.

Parameters

ber-sd

Specifies the BER that specifies signal degradation.

ber-sf

Specifies the BER that specifies signal failure.

threshold-rate

The BER negative exponent (n in 10-n), expressed as a decimal integer.

Values 3 to 9 (10-3 to 10-9) for ber-sd, 3 to 6 for ber-sf

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

threshold

Syntax

threshold {**ber-sd** | **ber-sf**} **rate** {**1** | **5** | **10** | **50** | **100**}

no threshold {**ber-sd** | **ber-sf**}

Context

[Tree] (config>port>tdm>ds1 threshold)

[Tree] (config>port>tdm>e1 threshold)

Full Context

configure port tdm ds1 threshold

configure port tdm e1 threshold

Description

This command configures the line signal degradation bit error rate (BER) and line signal failure thresholds.

Line signal (b2) bit interleaved parity error rates are measured and when they cross either the degradation or failure thresholds alarms are raised (see the **report-alarm** command), furthermore if the failure threshold is crossed the link will be set to operationally down.

The **no** form of this command reverts to the default value.

Default

threshold ber-sd rate 5 threshold ber-sf rate 50

Parameters

ber-sd

Specifies the BER that specifies signal degradation.

ber-sf

Specifies the BER that specifies signal failure.

rate

Specifies the number of errors, in millions.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

threshold

Syntax

threshold *threshold*

no threshold

Context

[Tree] (config>router>segment-routing>maintenance-policy threshold)

Full Context

configure router segment-routing maintenance-policy threshold

Description

This command configures the minimum number of S-BFD sessions that must be up in order to consider the SR policy candidate path to which the maintenance template is bound to be up. If it is below this number, then the policy candidate path is marked as BFD degraded by the system. This command is only valid in the **ecmp-protected** mode.

The **no** form of this command reverts to the default.

Default

threshold 1

Parameters

threshold

Specifies the minimum number of S-BFD sessions that must be up.

Values 1 to 32

Platforms

All

threshold

Syntax

throttle-rate

Syntax

throttle-rate *events* [**interval** *seconds*]

no throttle-rate

Context

[Tree] (config>log throttle-rate)

Full Context

configure log throttle-rate

Description

This command configures the number of events and interval length to be applied to all event types that have throttling enabled by the **event-control** command and do not have a **specific-throttle-rate** configured.

The **no** form of this command reverts to the default values.

Default

throttle-rate 2000 interval 1

Parameters

events

Specifies the number of log events that can be logged within the specified interval for a specific event. Once the limit has been reached, any additional events of that type will be dropped, for example, the event drop count will be incremented. At the end of the throttle interval if any events have been dropped a trap notification will be sent.

Values 1 to 20000

Default 2000

seconds

Specifies the number of seconds that an event throttling interval lasts.

Values 1 to 1200

Default 1

Platforms

All

24.99 throughput-alarm

throughput-alarm

Syntax

ti-lfa

Syntax

ti-lfa [**max-sr-frr-labels** *value*] [**max-srv6-frr-sids** *sids-value*]

no ti-lfa

Context

[Tree] (config>router>isis>lfa ti-lfa)

Full Context

configure router isis loopfree-alternates ti-lfa

Description

This command enables the use of the Topology-Independent LFA (TI-LFA) algorithm in the LFA SPF calculation for this IS-IS instance.

The **no** form of this command disables the use of the TI-LFA algorithm in the LFA SPF calculation for this IS-IS instance.

Default

no ti-lfa

Parameters

value

Specifies the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

Values 0 to 3

Default 2

sids-value

Specifies the maximum number of SRv6 SIDs allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

Values 0 to 3

[Tree] (config>router>ospf>loopfree-alternates ti-lfa)

Full Context

configure router ospf3 loopfree-alternates ti-lfa

configure router ospf loopfree-alternates ti-lfa

Description

This command enables the use of the Topology Independent Loop-Free Alternate (TI-LFA) algorithm in the LFA SPF calculation for this OSPF or OSPFv3 instance.

The **no** form of this command disables the use of the TI-LFA algorithm in the LFA SPF calculation in this OSPF or OSPFv3 instance.

Default

no ti-lfa

Parameters

max-sr-frr-labels [*value*]]

Specifies the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

Values 0 to 3

Default 2

24.101 tier

tier

Syntax

tier {**1** | **2**}

Context

[Tree] (config>qos>policer-control-policy tier)

Full Context

configure qos policer-control-policy tier

Description

This command is used to create, configure, and delete tiered arbiters. Two tiers are supported that always exist, specified as tier 1 and tier 2. Tiered arbiters enable the creation of a bandwidth control hierarchy for managing child policers in an arbitrary fashion. Each arbiter enables parenting of child policers within eight strict levels of priority and a maximum aggregate rate may be defined for the children that the arbiter will enforce. Arbiters created on tier 1 are automatically parented to the root arbiter that is always present. Arbiters created on tier 2 default to the root arbiter as parent but can also be explicitly parented to a tier 2 arbiter. Child policers associated with an instance of the **policer-control-policy** can be parented to any tiered arbiter or to the root arbiter.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

tier

Syntax

[**no**] **tier** *tier*

Context

[Tree] (config>qos>scheduler-policy tier)

Full Context

configure qos scheduler-policy tier

Description

This command identifies the level of hierarchy that a group of schedulers are associated with. Within a tier level, a scheduler can be created or edited. Schedulers created within a tier can only be a child (take bandwidth from a scheduler in a higher tier). Tier levels increase sequentially with 1 being the highest tier. All tier 1 schedulers are considered to be root and cannot be a child of another scheduler. Schedulers defined in tiers other than 1 can also be root (parentless).

3 tiers (levels 1, 2, and 3) are supported.

The **save config** and **show config** commands only display information on scheduler tiers that contain defined schedulers. When all schedulers have been removed from a level, that level ceases to be included in output from these commands.

Parameters

tier

This parameter is required to indicate the group of schedulers to create or be edited. Tier levels cannot be created or deleted. If a value for level is given that is out-of-range, an error will occur and the current context of the CLI session will not change.

Values 1 to 3

Platforms

24.102 time

time

Syntax

time

Context

[Tree] (config>system time)

Full Context

configure system time

Description

Commands in this context configure the system time zone and time synchronization parameters.

Platforms

All

time

Syntax

time *time*

Context

[Tree] (config>system>security>pki>cert-udp-prof>sched time)

Full Context

configure system security pki certificate-update-profile schedule time

Description

This command configures the time relative to the valid certificate period.

Default

time 86400

Parameters

time

Specifies the time relative to valid certificate period.

Values 3600 to 157680000

Platforms

All

24.103 time-average-factor

time-average-factor

Syntax

time-average-factor *taf-value* [**dec-only**]

no time-average-factor

Context

[Tree] (config>qos>adv-config-policy>child-control>offered-measurement time-average-factor)

Full Context

configure qos adv-config-policy child-control offered-measurement time-average-factor

Description

This command is used to weight the new offered rate with a portion of the previous offered rate. It would be expected that this command would mainly be used with the dec-only option enabled.

The adjustment to the offered rate is performed using the following formula when taf-value is not set to '0':

Adjusted_Rate = ((Prev_Offered_Rate x (taf-value – 1)) + New_Offered_Rate) / taf-value

If the dec-only option is specified, the adjustment is only applied when New_Offered_Rate is less than the Prev_Offered_Rate. When taf-value is set to '0', the adjustment is never applied.

The **no** form of this command is used to remove the time average factor adjustments to new offered rate measurements.

Parameters

taf-value

The taf-value is specified as a whole number between 0 and 64. The value '0' has special meaning in that it disables the time average factor adjustment and has the same effect as no time-average-factor.

Default 0

Values 0 to 64

dec-only

This keyword is an optional parameter. When enabled, the time average factor adjustment is only applied if the new offered rate is decreasing compared to the previous offered

rate. If the new offered rate is greater than the previous offered rate, the adjustment is not applied.

Platforms

All

time-average-factor

Syntax

time-average-factor *value*

no time-average-factor

Context

[Tree] (config>qos>slope-policy time-average-factor)

Full Context

configure qos slope-policy time-average-factor

Description

This command sets a weighting factor to calculate the new shared buffer average utilization after assigning buffers for a packet entering a queue. To derive the new shared buffer average utilization, the buffer pool takes a portion of the previous shared buffer average and adds it to the inverse portion of the instantaneous shared buffer utilization.

The **time-average-factor** command sets the weighting factor between the old shared buffer average utilization and the current shared buffer instantaneous utilization when calculating the new shared buffer average utilization

The TAF value applies to all high- and low-priority RED slopes for ingress and egress access buffer pools controlled by the slope policy.

The **no** form of this command restores the default setting.

Default

time-average-factor 7

Parameters

value

Represents the Time Average Factor (TAF), expressed as a decimal integer. The value specified for TAF affects the speed at which the shared buffer average utilization tracks the instantaneous shared buffer utilization. A low value weights the new shared buffer average utilization calculation more to the shared buffer instantaneous utilization; zero using it exclusively. A high value weights the new shared buffer average utilization calculation more to the previous shared buffer average utilization value.

Values 0 to 15

Platforms

All

24.104 time-display

time-display

Syntax

time-display {**local** | **utc**}

Context

[Tree] (environment time-display)

Full Context

environment time-display

Description

This command displays time stamps in the CLI session based on local time or Coordinated Universal Time (UTC).

The system keeps time internally in UTC and is capable of displaying the time in either UTC or local time based on the time zone configured.

This environment command only applies to times displayed in the current CLI session. This includes displays of event logs and all other places where a time stamp is displayed.

In event logs, the selected time is used to control the timestamps in the CLI output of **show log log-id** and in YANG state in the /state/log/log-id branch (for logs such as session, cli, memory, SNMP and NETCONF).

Also see the **configure log log-id time-format** command.

Default

time-display local

Parameters

local

Indicates that local time should be used.

utc

Indicates that UTC time should be used.

Platforms

All

time-display

Syntax

time-display {**local** | **utc**}

Context

[Tree] (config>system>management-interface>cli>md-cli>environment time-display)

Full Context

configure system management-interface cli md-cli environment time-display

Description

This command configures whether the time is displayed in coordinated Universal Time (UTC) or local time (as configured in **config**>**system**>**time**).

Default

time-display local

Parameters

local

Specifies that the local time zone is used.

utc

Specifies that UTC is used.

Platforms

All

time-exceeded

Syntax

time-exceeded [*number seconds*]

no time-exceeded

Context

[Tree] (config>service>ies>if>ipv6>icmp6 time-exceeded)

Full Context

configure service ies interface ipv6 icmp6 time-exceeded

Description

This command specifies whether time-exceeded ICMP messages should be sent. When enabled, ICMPv6 time-exceeded messages are generated by this interface.

When disabled, ICMPv6 time-exceeded messages are not sent.

The **no** form of this command reverts to the default.

Default

time-exceeded 100 10

Parameters

number

Specifies the number of time-exceeded ICMP messages are to be issued in the time frame specified by the *seconds* parameter.

Values 10 to 2000

seconds

Specifies the time frame, in seconds, that is used to limit the number of time-exceeded ICMP message to be issued.

Values 1 to 60

Platforms

All

time-exceeded

Syntax

time-exceeded [*number seconds*]

configure li log log-id time-format

Description

This command specifies whether the time should be displayed in local or Coordinated Universal Time (UTC) format.

Default

time-format utc

Parameters

local

Specifies that timestamps are written in the system's local time.

utc

Specifies that timestamps are written using the UTC value. This was formerly called Greenwich Mean Time (GMT) and Zulu time.

Platforms

All

time-format

Syntax

time-format {**local** | **utc**}

Context

[Tree] (config>log>log-id time-format)

Full Context

configure log log-id time-format

Description

This command specifies whether the time should be output in local or Coordinated Universal Time (UTC) format in the following event log locations:

- in the syslog TIMESTAMP field
- in the timestamp of log events inside log files on local storage devices

The timestamp in the filename of event log files is not affected by this command.

The output of **show log log-id** and the output of YANG state under /state/log/log-id are not affected by this command. See the **environment time-display** command.

Default

time-format utc

Parameters

local

Specifies that timestamps are written in the system's local time.

utc

Specifies that timestamps are written using the UTC value. This was formerly called Greenwich Mean Time (GMT) and Zulu time.

no time-range

Context

[Tree] (config>app-assure>group>tod-override time-range)

Full Context

configure application-assurance group policer tod-override time-range

Description

This command configures up to seven time-ranges applicable to a particular override-id. The time-range can be configured as daily or weekly policies.

When using a daily override the operator can select which days during the week from Sunday to Saturday it is applicable along with the start/end hour/min time range repeated over these days.

When using a weekly override the operator can select between which days in the week the policy start up to the hours/min for both start day and end day.

Default

no time-range

Parameters

daily

Schedule the override as a daily occurrence.

weekly

Schedule the override as a weekly occurrence.

Values			
	start-time	daily	<hh>:<mm>
		weekly	<day>,<hh>:<mm>
			<hh> : 0..23
			<mm> : 0 | 15 | 30 | 45
	end-time	daily	<hh>:<mm>
		weekly	<day>,<hh>:<mm>
			<hh> 0..23
			<mm> 0 | 15 | 30 | 45

This command configures the number of seconds the router waits for a response from a TACACS+ server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

Specifies the number of seconds the router waits for a response from a TACACS+ server, expressed as a decimal integer.

Values 1 to 90

Platforms

All

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>router>mpls>lsp-self-ping timeout)

Full Context

configure router mpls lsp-self-ping timeout

Description

This command configures a timeout value for LSP Self Ping. The LSP Self Ping timer is started when the RESV message is received for an LSP. The system then periodically sends LSP Self Ping packets until the timer expiry or the receipt of the first LSP Self Ping reply, whichever comes first. If the timeout expires before an LSP Self Ping packet is received, then the configured **timeout-action** is performed.

The **no** form of this command reverts to the default value.

Default

timeout 300

Parameters

seconds

Specifies the value, in seconds, of the fast retry timer for a secondary path.

Values 3 to 3600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

timeout

Syntax

timeout *seconds*

configure saa test type-multi-line lsp-ping timeout

configure saa test type-multi-line lsp-ping sr-policy timeout

Description

This command configures the number, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of the request probes.

The **no** form of this command reverts to the default value.

Default

timeout 5

Parameters

timeout

Specifies the timeout value in seconds.

Values 1 to 10

Default 5

Platforms

All

timeout

Syntax

timeout *timeout*

no timeout

Context

[Tree] (config>saa>test>type-multi-line>lsp-trace>sr-policy timeout)

Full Context

configure saa test type-multi-line lsp-trace sr-policy timeout

Description

This command configures the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

timeout

Specifies the timeout value in seconds.

Values 1 to 60

Default 3

Platforms

All

timeout

Syntax

timeout [*seconds*]

no timeout

Context

[Tree] (config>filter>redirect-policy>dest>ping-test timeout)

Full Context

configure filter redirect-policy destination ping-test timeout

Description

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far-end host. If a reply is not received within this time the far-end host is considered unresponsive.

Default

timeout 1

Parameters

seconds

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far end host.

Values 1 to 60

Platforms

All

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>vrrp>vrrp-policy-id>priority-event>host-unreachable timeout)

Full Context

configure vrrp vrrp-policy-id priority-event host-unreachable timeout

Description

This command defines the time, in seconds, that must pass before considering the far-end IP host unresponsive to an outstanding ICMP echo request message.

The **timeout** value is not directly related to the configured **interval** parameter. The **timeout** value may be larger, equal, or smaller, relative to the **interval** value.

If the **timeout** value is larger than the **interval** value, multiple ICMP echo request messages may be outstanding. Every ICMP echo request message transmitted to the far end host is tracked individually according to the message identifier and sequence number.

With each consecutive attempt to send an ICMP echo request message, the timeout timer is loaded with the **timeout** value. The timer decrements until:

- an internal error occurs preventing message sending (request unsuccessful)
- an internal error occurs preventing message reply receiving (request unsuccessful)
- a required route table entry does not exist to reach the IP address (request unsuccessful)
- a required ARP entry does not exist and ARP request timed out (request unsuccessful)
- a valid reply is received (request successful)

It is possible for a required ARP request to succeed or timeout after the message timeout timer expires. In this case, the message request is unsuccessful.

If an ICMP echo reply message is not received prior to the **timeout** period for a given ICMP echo request, that request is considered to be dropped and increments the consecutive message drop counter for the priority event.

If an ICMP echo reply message with the same sequence number as an outstanding ICMP echo request message is received prior to that message timing out, the request is considered successful. The consecutive message drop counter is cleared and the request message no longer is outstanding.

If an ICMP Echo Reply message with a sequence number equal to an ICMP echo request sequence number that had previously timed out is received, that reply is silently discarded while incrementing the priority event reply discard counter.

The **no** form of the command reverts to the default value.

Default

timeout 1

Parameters

seconds

The number of seconds before an ICMP echo request message is timed out. Once a message is timed out, a reply with the same identifier and sequence number is discarded.

Values 1 to 60

timeout

Syntax

timeout *timeout*

no timeout

Context

[Tree] (config>service>sdp>keep-alive timeout)

Full Context

configure service sdp keep-alive timeout

Description

This command configures the time interval that the SDP waits before tearing down the session.

Default

timeout 5

Parameters

timeout

Specifies the timeout time, in seconds.

Values 1 to 10

Platforms

All

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>system>security>radius timeout)

Full Context

configure system security radius timeout

Description

This command configures the number of seconds the router waits for a response from a RADIUS server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

Specifies the number of seconds the router waits for a response from a RADIUS server, expressed as a decimal integer.

Values 1 to 90

Platforms

All

timeout

Syntax

timeout *second*s

no timeout

Context

[Tree] (config>system>security>tacplus timeout)

configure system security tacplus timeout

Description

This command configures the number of seconds the router waits for a response from a TACACS+ server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

The number of seconds the router waits for a response from a TACACS+ server, expressed as a decimal integer.

Values 1 to 90

Platforms

All

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>system>security>ldap timeout)

Full Context

configure system security ldap timeout

Description

The **timeout** value is the number of seconds that the SR OS will wait for a response from the current server that it is trying to establish a connection with. If the server does not reply within the configured **timeout** value, the SR OS will increment the retry counter by 1. The SR OS attempts to establish the connection to the current server up to the configured **retry** value before it moves to the next configured server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

The length of time that the SR OS waits for a response from the server.

Values 1 to 90

Default 3

Platforms

All

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>system>security>dot1x>radius-plcy timeout)

Full Context

configure system security dot1x radius-plcy timeout

Description

This command configures the number of seconds the router waits for a response from a RADIUS server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

Specifies the number of seconds the router waits for a response from a RADIUS server, expressed as a decimal integer.

Values 1 to 90

Platforms

All

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>test-oam>icmp>ping-template timeout)

Full Context

configure test-oam icmp ping-template timeout

Description

This command configures the time the function waits before declaring an ICMP echo request packet is lost. This is the timer used to time out the interval transmitted packets. The timeout can be equal to or lower than the interval but not higher.

The **no** form of this command reinstates the default value for timeout.

Default

timeout 5

Parameters

seconds

Specifies the time, in seconds, before declaring an ICMP echo request being lost.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.111 timeout-action

timeout-action

Syntax

timeout-action *action*

no timeout-action

Context

[Tree] (config>service>vprn>l2tp>tunnel-selection-blacklist timeout-action)

[Tree] (config>router>l2tp>tunnel-selection-blacklist timeout-action)

Full Context

configure service vprn l2tp tunnel-selection-blacklist timeout-action

configure router l2tp tunnel-selection-blacklist timeout-action

Description

This command defines an action that is executed on the entity (peer/tunnel) in the denylist once the entity becomes eligible for selection again.

The **no** form of this command reverts to the default.

Default

timeout-action remove-from-blacklist

Parameters

action

Specifies the Action to be taken when a tunnel or peer has been in the denylist for the max-period of time.

Values **remove-from-blacklist** — The peer or tunnel in the denylist is removed completely from the denylist and made eligible for the selection process once the max-time expires. In this mode of operation, multiple new sessions can be mapped into the same, newly released tunnel from the denylist. The first such session will try to setup the tunnel, while the other is buffered until the tunnel establishment process is completed. In case that the tunnel remains unavailable, it is placed in the denylist again. Consequently, all new sessions are re-negotiated over an alternate tunnel.

try-one-session — Once the max-time expired, the peer or tunnel in the denylist is made available for selection only to a single new session request. Only upon successful tunnel establishment will the incoming new sessions be eligible to be mapped into this tunnel. This behavior will avoid session establishment delays in case that the tunnel just removed from the denylist is still unavailable.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

timeout-action

Syntax

timeout-action {**retry** | **switch**}

no timeout-action

Context

[Tree] (config>router>mpls>lsp-self-ping timeout-action)

Full Context

configure router mpls lsp-self-ping timeout-action

Description

This command configures an action that the router takes when the timeout LSP self ping timeout timer expires. The lsp-self-ping timer is started when the RESV is received for an LSP. If the retry is configured and the timeout expires before an LSP self ping packet is received, then the system tears down the candidate path and goes back to CSPF for a new path. If the switch is configured and the timeout expires before an LSP self ping packet is received, then the system switches to the candidate path.

The **no** form of this command reverts to the default value.

Default

timeout-action retry

Parameters

retry

Specifies to retry the candidate path when the timeout expires.

switch

Specifies to switch to the candidate path when the timeout expires.

Full Context

configure service vprn ripng group neighbor timers

configure service vprn rip timers

configure service vprn rip group neighbor timers

configure service vprn ripng timers

configure service vprn ripng group timers

configure service vprn rip group timers

Description

This command configures the values for the update, timeout, and flush timers:

- **update timer**

  Determines how often RIP updates are sent.

- **timeout timer**

  If a router is not updated by the time the timer expires, the route is declared invalid, but maintained in the RIP database.

- **flush timer**

  Determines how long a route is maintained in the RIP database, after it has been declared invalid. Once this timer expires it is flushed from the RIP database completely.

The **no** form of this command resets all timers to their default values of 30, 180, and 120 seconds respectively.

Default

no timers

Parameters

update

The RIP update timer value in seconds.

Values 1 to 600

Default 30

timeout

The RIP timeout timer value in seconds.

Values 1 to 1200

Default 180

flush

The RIP flush timer value in seconds.

Values 1 to 1200

Default 120

Platforms

All

Syntax

timers [**neighbor** *ip-address* | **group** *name*]

no timers

Context

[Tree] (debug>router>bgp timers)

Full Context

debug router bgp timers

Description

This command logs all BGP timer events to the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

configure port tdm e1 channel-group timeslots

configure port tdm ds1 channel-group timeslots

Description

This command defines the list of DS-0 timeslots to be used in the DS-1 or E-1 channel-group. The timeslots are defaulted as defined below when encap-type is set **to/from atm**. ATM channel groups do not allow timeslots to change.

The **no** form of this command removes DS-0 timeslots from a channel group.

Parameters

timeslots

Specifies the timeslot(s) to be associated with the channel group. The value can consist of a list of timeslots. Each member of the list can either be a single timeslot or a range of timeslots.

Values 1 to 24 for DS-1 interfaces (the full range is auto-configured for ATM channel groups and cannot be changed) 2 to 32 for E-1 interfaces (the 2 to 16,18 to 32 ranges are auto-configured for ATM channel groups and cannot be changed)

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.117 timing

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ethernet>lmm>availability timing)

Full Context

configure oam-pm session ethernet lmm availability timing

Description

This command defines various availability parameters for LMM availability testing. This command does not define the probe interval. Validation occurs when the LMM test is activated using the **no shutdown** command. The maximum size of the availability window cannot exceed 100 seconds (100 000 milliseconds). LMM test activation fails if the availability window exceeds the maximum value.

The **no** form of this command restores the default values for all timing parameters, and uses those values to compute availability and set the loss frequency.

Parameters

frames

Specifies the number of SLM frames that define the size of the small measurement window. Each delta-t is marked as a high-loss interval or non-high-loss interval based on the **flr-threshold**. The size of the delta-t measurement is the product of the number of frames and the interval.

Values 1 to 50

Default 10

deltas

Specifies the number of consecutive delta-t measurement intervals that make up the sliding window over which availability and unavailability determined. Transitions from one state to another occurs when the **consec-delta-t** are in a new state. The sliding window cannot exceed 100 seconds.

Values 2 to 10

Default 10

threshold

Specifies the number of consecutive unavailable delta-t intervals that, when reached or exceeded, increments the CHLI counter. A CHLI counter is an indication that the

sliding window is available but has crossed a threshold of consecutive unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is incremented during times of availability.

Values 1 to 9

Default 5

Platforms

All

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **interval** *milliseconds* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ethernet>slm timing)

Full Context

configure oam-pm session ethernet slm timing

Description

This command defines various availability parameters and the probe spacing (interval) for the SLM frames. The maximum size of the availability window cannot exceed 10 s (10 000 ms).

The **no** form of this command installs the default values for all timing parameters and use those values to compute availability and set the SLM frequency. If an SLM test is in the **no shutdown** state, it always has timing parameters, default or operator configured.

Parameters

frames

Specifies the of SLM frames that define the size of the delta-t (small measurement window). Each delta-t is marked as available or unavailable based on the flr-threshold. The size of the delta-t measurement is the product of the number of frames and the interval.

Values 1 to 50

Default 10

deltas

Specifies the number of consecutive delta-t small measurement intervals that make up the sliding window over which availability and unavailability is determined. Transitions from one state to another occurs when the consec-delta-t is in a new state.

Values 2 to 10

Default 10

milliseconds

Specifies the number of milliseconds between the transmission of the SLM frames. By design, the default value for the SLM interval is different than the default interval for DMM.

Values 100, 1000

Default 100

threshold

Specifies the number of consecutive high loss intervals (unavailable delta-t) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, it is only incremented during times of availability.

Values 1 to 9

Default 5

Platforms

All

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss timing)

Full Context

configure oam-pm session ip twamp-light loss timing

Description

This command defines various availability parameters but not the probe interval. A single TWAMP-Light frame is used to collect both delay and loss metrics; the interval is common to both and as such not unique per metric type. Any TWAMP light test that is attempting to become active validates the configuration of the timing parameter regardless of which statistics are being recorded.

The **no** form of this command restores the default values for all timing parameters and use those values to compute availability and set the loss frequency.

Default

timing frames-per-delta-t 1 consec-delta-t 10 chli-threshold 5

Parameters

frames

Defines the size of the small measurement window. Each delta-t is marked as available of unavailable based on the flr-threshold. The size of the delta-t measurement is the product of the number of frames and the interval. This value defaults to a different value thank single probe per metric approaches.

Values 1 to 50

Default 1

deltas

Specifies the number of consecutive delta-t small measurement intervals that make up the sliding window over which availability and unavailability are determined. Transitions from one state to another occurs when the consec-delta-t are now in a new state. The sliding window cannot exceed 100 seconds.

Values 2 to 10

Default 10

threshold

Specifies the number of consecutive high loss intervals (unavailable delta-t) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is only incremented during times of availability.

Values 1 to 9

Full Context

configure service vprn log syslog tls-client-profile

configure log syslog tls-client-profile

Description

This command specifies the Transport Layer Security (TLS) client profile used to encrypt syslog communications. When configured, syslog messages are sent using TLS.

Any change to this command results in a brief interruption of the event log, which may cause the loss of a few syslog messages.

The **no** form of this command removes TLS encryption of syslog communications and sends syslog messages over UDP.

Parameters

tls-client-profile

Specifies the name of a TLS profile configured in the **config**>**system**>**security**>**tls** context, up to 32 characters.

Platforms

All

tls-client-profile

Syntax

tls-client-profile *profile-name*

no tls-client-profile

Context

[Tree] (config router pcep pcc peer tls-client-profile)

Full Context

configure router pcep pcc peer tls-client-profile

Description

This command configures a TLS client profile on the PCC. When the TLS profile is configured, the PCC tries to establish a PCEP connection with the PCE over TLS. Because SR OS supports a strict TLS-only mode, both the PCE and PCC must support TLS. If a TLS failure occurs, the connection over TLS is closed and a new connection is retried within 60 seconds.

The **no** form of this command removes TLS encryption from the communication between this PCC and the PCE.

Default

no tls-client-profile

Parameters

profile-name

Specifies the TLS client profile name, up to 32 characters.

tls-profile

Syntax

tls-profile *tls-profile-name*

no tls-profile

Context

[Tree] (config system security ldap server tls-profile)

Full Context

configure system security ldap server tls-profile

Description

This command attaches a TLS client profile to the LDAP client. The parameter in the TLS profile is used to encrypt the LDAP connection to the server. Each LDAP server can use its own TLS profile.

When a TLS profile is assigned, the LDAP application will send encrypted PDUs from the client to the LDAP server. If TLS is operationally down, the LDAP application should not send any PDUs.

The **no** form of this command removes the TLS profile from LDAP and disables the TLS encryption from LDAP.

Parameters

tls-profile-name

Specifies the TLD profile for encryption.

Platforms

24.122 tls-re-negotiate-timer

tls-re-negotiate-timer

Syntax

tls-re-negotiate-timer *timer-min*

no tls-re-negotiate-timer

Context

[Tree] (config>system>security>tls>server-tls-profile tls-re-negotiate-timer)

Full Context

configure system security tls server-tls-profile tls-re-negotiate-timer

Description

This command configures the timed interval after which the server is triggered to send a Hello request message to all clients and force a renegotiation of the symmetric encryption key. When an interval of 0 is configured, the server will never send a hello request message.

Default

tls-re-negotiate-timer 0

Parameters

timer-min

Specifies the interval, in minutes, after which the server is triggered to send a Hello request message.

Values 0 to 65000

Platforms

All

24.123 tls-server-profile

tls-server-profile

Syntax

tls-server-profile *name*

no tls-server-profile

Context

[Tree] (config system grpc tls-server-profile)

Full Context

configure system grpc tls-server-profile

Description

This command adds a configured TLS server profile to the gRPC session. The TLS server is used for encryption of the gRPC session. gRPC will not transmit any PDUs if there is a TLS server profile assigned to it and the TLS connection is down.

The **no** form of this command removes the specified TLS server profile from the gRPC session.

Parameters

name

Specifies the name of the TLS server profile configured under the **config**>**system**>**security**>**tls** context.

Platforms

All

tls-server-profile

Syntax

tls-server-profile *name*

no tls-server-profile

Context

[Tree] (config router pcep pce tls-server-profile)

Full Context

configure router pcep pce tls-server-profile

Description

This command configures a TLS server profile on the PCE. When a TLS server profile is configured, the PCE accepts TLS handshakes from the PCC. Because SR OS supports a strict TLS mode only, both the PCE and the PCC must support TLS. If a TLS failure occurs, the connection over TLS is closed and a new connection is retried within 60 seconds.

The **no** form of this command removes the specified TLS server profile.

Default

no tls-server-profile

Parameters

name

Specifies the name of the TLS server profile, up to 32 characters.

Platforms

VSR-NRC

24.124 tls-wait-timer

tls-wait-timer

Syntax

tls-wait-timer *tls-wait-timer*

no tls-wait-timer

Context

[Tree] (config>router>pcep>pcc>peer tls-wait-timer)

Full Context

configure router pcep pcc peer tls-wait-timer

Description

This command configures the time that the PCC waits before declaring a TLS handshake failure if the handshake is not established.

The **no** form of this command reverts to the default.

Default

tls-wait-timer 60

Parameters

tls-wait-timer

Specifies the time, in seconds.

Values 60 to 255

Platforms

All

24.125 tls13-cipher

tls13-cipher

Syntax

tls13-cipher *index* **name** *cipher-suite-code*

no tls13-cipher *index*

[Tree] (config>system>security>tls>client-cipher-list tls13-cipher)

Full Context

configure system security tls server-cipher-list tls13-cipher

configure system security tls client-cipher-list tls13-cipher

Description

This command configures the TLS 1.3-supported ciphers that are used by the client and server.

The **no** form of this command removes the cipher suite.

Parameters

index

Specifies the index number, which provides the location of the cipher in the negotiation list. The lower index numbers are higher in the negotiation list, and the higher index numbers are at the bottom of the list.

Values 1 to 255

cipher-suite-code

Specifies the cipher suite code.

Values tls-aes128-gcm-sha256
tls-aes256-gcm-sha384

[Tree] (config>system>security>tls>server-group-list tls13-group)

Full Context

configure system security tls client-group-list tls13-group

configure system security tls server-group-list tls13-group

Description

This command configures the TLS 1.3-supported group suite codes sent by the client or server in their respective Hello messages.

SR OS supports the use of Elliptic-curve Diffie-Hellman Ephemeral (ECDHE) groups.

The **no** form of this command removes the group suite code.

Parameters

index

Specifies the index number , which provides the location of the group suite code in the client or server group list. The lower index numbers are higher in the list and the higher index numbers are at the bottom of the list.

Values 1 to 255

group-suite-code

Specifies the group suite code.

Syntax

to [*ip-address* | **node-id** [*a.b.c.d* | *1...4294967295*]]

Context

[Tree] (config>router>mpls>lsp to)

Full Context

configure router mpls lsp to

Description

This command specifies the IP address or MPLS-TP node-id of the egress router for the LSP. This command is mandatory to create an LSP.

An IP address for which a route does not exist is allowed in the configuration. If the LSP signaling fails because the destination is not reachable, an error is logged and the LSP operational status is set to down.

For a non MPLS-TP LSP, the **to** *ip-address* can be an IP address of a network IP interface, the system interface, or a loopback interface of the egress router. When used in a SDP, if the LSP **to** address does not match the SDP address, the LSP is not included in the SDP definition.

For an MPLS-TP LSP, the **to node-id** may be either in 4-octet IPv4 address format, or a 32-bit unsigned integer. This command is mandatory to create an MPLS-TP LSP. A value of zero is invalid. This **to** address is used in the MPLS-TP LSP ID, and the MPLS-TP MEP ID for the LSP.

Default

no default

Parameters

ip-address

Specifies the IP address of the egress router. When the LSP type is **sr-te**, then an IPv6 address can be used.

Values ipv4-address — a.b.c.d

ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x — 0 to FFFF (hexadecimal)

d — 0 to 255 (decimal)

node-id ***a.b.c.d.*** **|** ***1...4294967295***

4-octet IPv4 formatted or unsigned 32-bit integer MPLS-TP node-id of the egress router.

Platforms

All

to

Syntax

to *ip-address*

Context

[Tree] (config>router>mpls>static-lsp to)

Full Context

configure router mpls static-lsp to

Description

This command specifies the IP address of the egress router for the static LSP. When creating an LSP this command is required. The **to** IP address may be the address of a local interface, the system IP interface, or of a loopback interface of the egress router. When used in a SDP and the **to** address does not match the far-end SDP address, the LSP is not included in the SDP definition.

Parameters

ip-address

Specifies the system IP address of the egress router.

Platforms

All

Syntax

to memory [*size*]

to netconf [*size*]

to session

to snmp [*size*]

Context

[Tree] (config>li>log>log-id to)

Full Context

configure li log log-id to

Description

Commands in this context configure the destination type for the event log.

The source of the data stream must be specified in the **from** command prior to configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of a memory log, NETCONF log, or SNMP log needs to be modified, the log ID must be removed and then re-created.

Parameters

size

The size parameter indicates the number of events that can be stored into memory.

Default 100

Values 50 to 1024

Platforms

All

to

Syntax

to *ipv4-address*

no to

Context

[Tree] (config>oam-pm>session>mpls>lsp>rsvp-auto to)

Full Context

configure oam-pm session mpls lsp rsvp-auto to

Description

This command specifies an IPv4 address used (with the LSP template) to identify the LSP to be tested.

One of three mandatory configuration statements that are required to identify automatically created RSVP LSPs, using **config>router>mpls>lsp-template**. The **config>router>mpls>auto-lsp>lsp-template** links three distinct functions, the **config>router>policy-options>prefix-list**, **config>router>policy-options>policy-statement>entry>from** and the **config>router>mpls> lsp-template**. The **to** address is the same address configured as the **from** address for the **config>router>policy-options>policy-statement>entry>from**. The required identifiers are **from**, **lsp-template** and **to**, all under this node.

Parameters

ipv4-address

Specifies the IPv4 address.

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

to

Syntax

to file *file-id*

Context

[Tree] (config>log>accounting-policy to)

Full Context

configure log accounting-policy to

Description

This command specifies the destination for the accounting records selected for the accounting policy.

Parameters

file-id

Specifies the destination for the accounting records selected for this destination. The characteristics of the file ID must have already been defined in the **config>log>file** context. A file ID can only be used once.

The file is generated when the file policy is referenced. This command identifies the type of accounting file to be created. The file definition defines its characteristics.

If the **to** command is executed while the accounting policy is in operation, then it becomes active during the next collection interval.

Values 1 to 99

Platforms

All

to

Syntax

[**no**] **to**

Context

[Tree] (config>router>policy-options>policy-statement>entry to)

Full Context

configure router policy-options policy-statement entry to

Description

This command creates the context to configure export policy match criteria based on a route's destination or the protocol into which the route is being advertised.

If no condition is specified, all route destinations are considered to match.

The **to** command context only applies to export policies. If it is used for an import policy, match criteria is ignored.

The **no** form of this command deletes export match criteria for the route policy statement entry.

Platforms

All

to

Syntax

to cli [*size*]

to console

to file *log-file-id*

to memory [*size*]

to netconf [*size*]

to session

to snmp [*size*]

to syslog *syslog-id*

Context

[Tree] (config>log>log-id to)

Full Context

configure log log-id to

Description

This command specifies a destination for the log data.

The source of the data stream must be specified in the **from** command before configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of an SNMP or memory log needs to be modified, the log ID must be removed and then recreated.

Parameters

cli

Specifies that events selected for the log are directed to any subscribed CLI session. Subscribe to a CLI log from within a CLI session using the **tools**>**perform**>**log**>**subscribe-to log-id** *log-id* command. Events are sent to the CLI session for the duration of that CLI session, or until an **unsubscribe-from** command is issued. A local circular memory log is maintained for CLI logs.

console

Specifies that events selected for the log are directed to the console. If the console is not connected, all the entries are dropped.

file *log-file-id*

Specifies that events selected for the log are directed to a file with the specified *log-file-id*. The characteristics of the *log-file-id* referenced in this parameter must have already been defined in the **config**>**log**>**file** *file-id* context. When the *file-id* location parameter is modified, log files are not written to the new location until a rollover occurs or the log is manually cleared. A rollover can be forced by using the **clear**>**log** command. Subsequent log entries are then written to the new location. If a rollover does not occur or the log is not cleared, the old location continues to be used.

Values 1 to 99, *name* (up to 64 characters max)

memory

Specifies that events selected for the log are directed to a memory file. A memory file is a circular buffer; when the file is full, each new entry replaces the oldest entry in the log. If the optional size parameter is not configured, the default value is used.

Default 100

netconf

Specifies that events selected for the log are directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream** *stream-name* for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.

session

Specifies that events selected for the log are directed to the current console or telnet session. This command is only valid for the duration of the session. When the session is terminated, the **to session** configuration is removed. A log ID with a **session** destination is saved in the configuration file but the **to session** part is not stored.

size

Specifies the maximum size of the log data destination, in bytes.

Values 50 to 3000

snmp

Specifies that events selected for the log are directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.

syslog *syslog-id*

Specifies that events selected for the log are directed to the specified syslog collector. To remain consistent with the standards governing syslog, messages to syslog are truncated to 1024 bytes. The characteristics of the *syslog-id* referenced in this parameter must have already been defined in the **config**>**log**>**syslog** *syslog-id* context.

Values 1 to 10

Full Context

configure service ies interface tos-marking-state

configure service vprn subscriber-interface group-interface tos-marking-state

configure service vprn interface tos-marking-state

configure service ies subscriber-interface group-interface tos-marking-state

Description

This command is used to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field are not remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interface as untrusted.

When the ingress interface is set to untrusted, all egress network IP interfaces remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions.

Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.

The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** form of this command restores the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

Default

tos-marking-state trusted

Parameters

trusted

The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set.

untrusted

Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

Platforms

All

configure isa video-group watermark bandwidth total

Description

This command sets the watermark to trigger the SNMP trap if the combined FCC and RET bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the bandwidth available is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

Default

total 90

Parameters

percent

Specifies the percentage of the system resources per ISA.

Values 1 to 99

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

24.138 total-capacity

total-capacity

Syntax

total-capacity *capacity*

no total-capacity

Context

[Tree] (config>mcast-mgmt>chassis-level>plane-capacity total-capacity)

Full Context

configure mcast-management chassis-level per-mcast-plane-capacity total-capacity

Description

This command configures the total multicast plane capacity supported individually by all switch fabric multicast planes.

The multicast plane capacity is determined based on the provisioned line cards and switch fabrics in the chassis.

The **no** form of this command reverts to the default.

Parameters

capacity

Specifies the multicast plane capacity in Mb/s.

Values 2000, 4000, 5250, 8250, 15000, 19000, dynamic (Specifies that multicast plane capacity is determined based on provisioned line cards and switch fabrics in the chassis.)

Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

24.139 total-flow-duration

total-flow-duration

Syntax

[**no**] **total-flow-duration**

Context

[Tree] (config>log>acct-policy>cr>aa>aa-sub-cntr total-flow-duration)

Full Context

configure log accounting-policy custom-record aa-specific aa-sub-counters total-flow-duration

Description

This command includes the total flow duration flow count in the AA subscriber's custom record. This command only applies to the 7750 SR.

The **no** form of this command excludes the total flow duration flow count.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.140 total-flows-completed-count

total-flows-completed-count

Syntax

[**no**] **total-flows-completed-count**

Context

[Tree] (config>log>acct-policy>cr>aa>aa-sub-cntr total-flows-completed-count)

Full Context

configure log accounting-policy custom-record aa-specific aa-sub-counters total-flows-completed-count

Description

This command includes the total flows completed count in the AA subscriber's custom record. This command only applies to the 7750 SR.

The **no** form of this command excludes the total flow duration flow count.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.141 tp-tunnel-id-range

tp-tunnel-id-range

Syntax

tp-tunnel-id-range *start-id end-id*

no tp-tunnel-id-range

Context

[Tree] (config>router>mpls>mpls-tp tp-tunnel-id-range)

Full Context

configure router mpls mpls-tp tp-tunnel-id-range

Description

This command configures the range of MPLS tunnel IDs reserved for MPLS-TP LSPs. The maximum difference between the start-id and end-id is 4K.

The tunnel ID referred to here is the RSVP-TE tunnel ID. This maps to the MPLS-TP Tunnel Number. There are some cases where the dynamic LSPs may have caused fragmentation to the number space such that contiguous range [*end-id* – *start-id*] is not available. In these cases, the command will fail.

There are no default values for the *start-id* and *end-id* of the tunnel id range, and they must be configured to enable MPLS-TP.

Default

no tp-tunnel-id-range

Parameters

start-id

Specifies the start ID.

Values 1 to 61440

end-id

Specifies the end ID.

Values 1 to 61440

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.142 trace

trace

Syntax

trace sap *sap-id* [**mac** *ieee-address*] [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]

trace mac *ieee-address* [**sap** *sap-id*] [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]

trace circuit-id *circuit-id* [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]

trace remote-id *remote-id* [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]

no trace [**sap** *sap-id*] [**mac** *ieee-address*] [{**circuit-id** *circuit-id* | **remote-id** *remoteid*}]

no trace name *trace-name*

Context

[Tree] (debug>call-trace>ipoe trace)

Full Context

debug call-trace ipoe trace

Description

This command enables tracing for IPoE sessions specified by the configured parameters. This command can trace a single session or multiple sessions, and can use wildcard characters.

This command can be executed multiple times to start multiple traces. When rules overlap, such as for a wildcard SAP and a specific SAP, the rule that a specific trace is associated with cannot be guaranteed.

The **no** form of this command prevents new traces from being configured and terminates all trace jobs that were previously started using the **trace** command.

Parameters

circuit-id

Specifies a circuit ID that is used to filter sessions to trace. The *circuit-id* and *remote-id* parameters are mutually exclusive.

ieee-address

Specifies a MAC address that is used to identify a session to trace, in the format "ab:cd:ef:01:23:45”. A wildcard character can be used to match all remaining octets; for example, the format "ab:cd:ef:*” can be used to filter by OUI.

num

Specifies the maximum number of jobs that may be started with this rule.

Values 1 to 50

Default 1

remote-id

Specifies a remote ID that is used to filter sessions to trace. The *remote-id* and *circuit-id* parameters are mutually exclusive.

sap-id

Specifies a SAP to trace. The following formats are accepted:

- *port*/*lag*/*pw-port*:*svlan*.*cvlan*
- *port*/*lag*/*pw-port*:*vlan*
- *port*/*lag*/*pw-port*
- *port*/*lag*/*pw-port*:*vlan*.*
- *port*/*lag*/*pw-port*:* (also matches *.*)

trace-existing-sessions

Specifies that existing IPoE sessions is traced. If this parameter is not included, only new IPoE sessions is traced.

trace-name

Specifies the name by which the trace is referenced, up to 16 characters.

trace-profile-name

Specifies the name of the trace profile to be applied. The default parameters is used if a trace profile is not specified.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.143 trace-profile

trace-profile

Syntax

trace-profile *profile-name* [**create**]

no trace-profile *profile-name*

Context

[Tree] (config call-trace trace-profile)

Full Context

configure call-trace trace-profile

Description

This command creates a profile that can be applied to a specific trace job.

Parameters

profile-name

Specifies the unique name of the call trace profile.

create

Keyword used to create the trace profile instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.144 trace-string

trace-string

Syntax

trace-string [*trace-string*]

no trace-string

Context

[Tree] (config>port>sonet-sdh>path trace-string)

Full Context

configure port sonet-sdh path trace-string

Description

This command specifies that a J1-path-trace that identifies the circuit is inserted continuously at source. This can be checked against the expected value by the receiver. If no trace string is entered then a null string is used.

The **no** form of this command resets the string to its default.

This command is supported on TDM satellite.

Default

The default J1 value is *Alcatel XXX YYY* where XXX is the platform number, such as "7750" or "7450", and YYY is the platform acronym, such as "SR" or "ESS". The value does not change when the encap-type changes. The J1 string contains all zeros for a non-provisioned path.

Parameters

trace-string

Specifies either a string up to 62 bytes for SONET or 15 bytes for SDH. If the string contains spaces, enclose it in quotation marks. String 'zeros' will send all zeros in the J1 bytes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.145 traceroute

traceroute

Syntax

traceroute *ip-address* | *dns-name* [**decode** {**original-datagram**}] [**dest-port** *port-number*] [**dest-port-udp-fixed**] [**detail**] [**min-ttl** *min-ttl*] [**no-dns**] [**probe-count** *probes-per-hop*] [**protocol udp | tcp**] [{**router** *router-or-service*} | {**router-instance** *router-instance*} | {**service-name** *service-name*}] [**size** *pad-size*] [**source** *ip-address*] [**tos** *type-of-service*] [**ttl** *max-ttl*] [**wait** *milliseconds*]

traceroute [**srv6-policy color** *color-id* **endpoint** *ip-address* [**segment-list** *segment-list-id*] [**decode** {**original-datagram**}] [**dest-port** *port-number*] [**dest-port-udp-fixed**] [**detail**] [**min-ttl** *min-ttl*] [**no-dns**] [**probe-count** *probes-per-hop*] [**protocol udp** | **tcp**] [**size** *pad-size*] [**tos** *type-of-service*] [**ttl** *max-ttl*] [**wait** *milliseconds*]

Context

[Tree] (traceroute)

Full Context

traceroute

Description

The IP traceroute utility determines the route to a destination address. DNS lookups of the responding hosts are enabled by default.

traceroute srv6-policy

This command launches a traceroute of an SRv6 policy matching a specific color and endpoint. The traceroute probe may optionally be targeted at a specific segment list of the SRv6 policy. When the segment list is not specified, the traceroute probe is sent on the lowest available segment list.

Parameters

dest-port-udp-fixed

Specifies that the destination UDP port number should not increment with each packet transmitted. By default, the UDP traceroute starts with destination UDP port 33434 and each subsequent packet sent to this destination UDP port increases by 1. The next packet uses UDP seat port 33435, the next 33436, and so on.

For a UDP test, this parameter prevents the per-transmitted packet increment of the destination UDP port number. The TCP protocol does not increment the destination TCP port, using a single destination TCP port for all traceroute packets for the test.

decode

Perform additional original datagram parsing functions. This parameter must be used with the **detail** parameter.

detail

Specifies to display additional information about the resulting packet.

dns-name

Specifies the DNS name, up to 63 characters, of the far-end device to which to send the traceroute request message.

endpoint *ipv6-address*

Specifies an SRv6 policy for a specific endpoint as the target of the traceroute.

Values

ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

ip-address

Specifies the far-end IP address to which to send the traceroute request message in dotted decimal notation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

max-ttl

Specifies the maximum Time-To-Live (TTL) value to include in the traceroute request, expressed as a decimal integer.

Values 1 to 255

Default 30

milliseconds

Specifies the time in milliseconds to wait for a response to a probe, expressed as a decimal integer.

Values 1 to 60000

Default 5000

min-ttl

Specifies the IP TTL in the initial traceoute packet to target a specific node or starting node along the path.

Values 1 to 255

Default 1

no-dns

Specifies that, when the **no-dns** keyword is specified, DNS lookups of the responding hosts are not performed, and only the IP addresses are printed.

original-datagram

Parse the returned original datagram including IPv6 for and SRH header information.

pad-size

Specifies the number of bytes added to the UDP or TCP payload.

Values 0 to 9786

Default 0

port-number

Specifies the transport protocol destination port number.

Values 1 to 65535

Default 33434

probes-per-hop

Specifies the number of probes per hop.

Values 1 to 10

Default 3

protocol udp | tcp

Sets the transport protocol for the traceroute packet. The TCP protocol is silently discarded on a targeted VRPN service. VPRN services only respond to UDP traceroutes.

Default udp

router-or-service

Specifies the routing instance or service, by number. The *router-instance* parameter is the preferred parameter to specify the router or service.

Values router-name: Base, management, vpls-management

vprn-svc-id: 1 to 2147483647

Default Base

router-instance

Specifies the preferred method for entering a service name. Stored as the service name, this is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

Values router-name: Base, management, *cpm-vr-name*, vpls-management

vprn-svc-name: up to 64 characters

cpm-vr-name: up to 32 characters

service-name

Specifies the alias function that allows the service-name to be used, converted, and stored as service ID.

source *ip-address*

Specifies the source IP address to use as the source of the probe packets, in dotted decimal notation. If the IP address is not one of the device's interfaces, an error is returned.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

type-of-service

Specifies the Type-of-Service (ToS) bits in the IP header of the probe packets, expressed as a decimal integer.

Values 0 to 255

Default 0

srv6-policy

Keyword to specify that the traceroute probe is applied to an SRv6 policy.

color-id

Specifies the SRv6 policy color ID.

Values 0 to 4294967295

port-number

Specifies the transport protocol destination port number.

Values 1 to 65535

Default 33434

probes-per-hop

Specifies the number of probes per hop.

Values 1 to 10

Default 3

segment-list

Specifies the segment list to trace.

Values 1 to 32

Platforms

All

Output

The following examples show traceroute example outputs.

The following tables describe the ICMPv4 Type 3, and the ICMPv6 Type 1 and 2 symbols in the CLI outputs. For references without a symbol in the form !<code>, see www.iana.org/assignments/icmp-parameters/icmp-parameters.xhtml.

Table 160: ICMPv4 Type 3 symbols in CLI

Symbol	Description	Code
!N	Destination Network Unreachable	0
!P	Destination Protocol Unreachable	2
!	Destination Port Unreachable	3

Symbol	Description	Code
!F-mtu	Fragmentation Needed and Don't Fragment was Set	4
!S	Source Route Failed	5
!X	Communication Administratively Prohibited	13
!V	Host Precedence Violation	14
!C	Precedence Cutoff In Effect	15

Table 161: ICMPv6 Type 1 symbols in CLI

Symbol	Description	Code
!N	No Route to Destination	0
!H	Destination Address Unreachable	3
!	Destination Port Unreachable	4

Table 162: ICMPv6 Type 2 symbols in CLI

Symbol	Description	Code
!F-mtu	MTU Exceeded - Fragmentation Required	0

24.146 traceroute-reply

traceroute-reply

Syntax

[**no**] **traceroute-reply**

Context

[Tree] (config>service>ies>if>ipv6>vrrp traceroute-reply)

Full Context

configure service ies interface ipv6 vrrp traceroute-reply

Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **trace-route-reply** status.

Default

no traceroute-reply

Platforms

All

24.147 track-accounting

track-accounting

Syntax

track-accounting [**start**] [**stop**][**interim-update**][**accounting-on**] [**accounting-off**]

no track-accounting

Context

[Tree] (config>router>radius-proxy>server>cache track-accounting)

[Tree] (config>service>vprn>radius-proxy>server>cache track-accounting)

Full Context

configure router radius-proxy server cache track-accounting

configure service vprn radius-proxy server cache track-accounting

Description

This command specifies the type of RADIUS accounting packets from RADIUS client (a WIFI AP) that the router should track.

The **no** form of this command removes the parameters from the configuration.

Parameters

start

Specifies that the router will update the associated ESM-host with the RADIUS client (for example, a WIFI AP) that generated the accounting-start. This is required in cases where a UE roams to a new AP that does not re-authenticate due to key caching.

stop

Specifies that the router will remove the corresponding ESM host and forward the accounting-stop packet to the external RADIUS server.

accounting-on | accounting-off

Specifies that the router will remove all ESM hosts associated with the RADIUS client (a WIFI AP), and forward the accounting-on packet to the external RADIUS server.

interim-update

Specifies that the router will update the associated ESM-host with the RADIUS client (a WIFI AP) that generated the interim-update. The interim-updates with the updated information are sent to the RADIUS server as scheduled.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.148 track-authentication

track-authentication

Syntax

track-authentication [**accept**]

no track-authentication

Context

[Tree] (config>router>radius-proxy>server>cache track-authentication)

[Tree] (config>service>vprn>radius-proxy>server>cache track-authentication)

Full Context

configure router radius-proxy server cache track-authentication

configure service vprn radius-proxy server cache track-authentication

Description

This command specifies if RADIUS authentication (from the AP) should be tracked in order to update the ESM host with the RADIUS client (for example, WIFI AP) on UE mobility. It also specifies the authentication packet from RADIUS client (for example, a WIFI AP) that the router should track for mobility.

The **no** form of this command stops tracking authentication for UE mobility.

Default

track-authentication accept

Parameters

accept

Indicates access-accept is tracked for mobility.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.149 track-delete-hold-time

track-delete-hold-time

Syntax

track-delete-hold-time *seconds*

no track-delete-hold-time

Context

[Tree] (config>router>radius-proxy>server>cache track-delete-hold-time)

Full Context

configure router radius-proxy server cache track-delete-hold-time

Description

This command specifies the delete hold-time in case the DHCP host gets a trigger to delete from the matched RADIUS Proxy server.

The **no** form of this command reverts to the default.

Default

track-delete-hold-time 0

Parameters

seconds

Specifies the delete hold time, in seconds.

Values 0 to 600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.150 track-mobility

track-mobility

Syntax

track-mobility

Context

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range track-mobility)

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range track-mobility)

Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility

Description

Commands in this context configure RADIUS-proxy cache information required for subscribers that are created via data-triggered authentication. The RADIUS proxy cache enables efficient handling of UE mobility.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.151 track-password-change

track-password-change

Syntax

[**no**] **track-password-change**

Context

[Tree] (config>service>vprn>l2tp>group>l2tpv3 track-password-change)

Full Context

configure service vprn l2tp group l2tpv3 track-password-change

Description

This command enables tracking of password changes, allowing password tunnel passwords to be changed without bringing down active tunnels or sessions. This is only supported with L2TPv3.

The **no** form of this command disables password change tracking.

Default

no track-password-change

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.152 track-srrp

track-srrp

Syntax

track-srrp *srrp-instance* **peer** *ip-address* **sync-tag** *sync-tag*

no track-srrp *srrp-instance*

Context

[Tree] (config>router>l2tp>failover track-srrp)

[Tree] (config>service>vprn>l2tp>failover track-srrp)

Full Context

configure router l2tp failover track-srrp

configure service vprn l2tp failover track-srrp

Description

This command sets the sync-tag to be used to synchronize the tunnels with track-srrp *srrp-id* to MCS *peer IP-@*. The same sync-tag should be configured on the MCS peer.

The **no** form of this command reverts to the default.

Default

Removes the sync-tag for the indicated track-srrp.

Parameters

srrp-instance

Specifies the Simple Router Redundancy Protocol (SRRP) instance used for Multi-Chassis redundancy failover that is associated with this Layer Two Tunneling Protocol Tunnel.

sync-tag

Specifies a synchronization tag to be used while synchronizing with the peer.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-srrp

Syntax

[**no**] **track-srrp** [*srrp-instance*]

Context

[Tree] (config>redundancy>multi-chassis>peer>sync>track-srrp-instances track-srrp)

Full Context

configure redundancy multi-chassis peer sync track-srrp-instances track-srrp

Description

This command configures a tracked SRRP instance.

The **no** form of this command removes the SRRP instance identifier from the configuration.

Parameters

srrp-instance

Indicates the unique identifier of the tracked SRRP instance.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-srrp

Syntax

track-srrp *srrp-id*

no track-srrp

Context

[Tree] (config>service>vpls>sap track-srrp)

Full Context

configure service vpls sap track-srrp

Description

This command configures the SRRP instance this capture SAP will track. This is a capture SAP level command. This command is important in PPPoE deployments with MSAPs. PPPoE operation requires that the MAC address learned by the client at the very beginning of the session negotiation phase remains unchanged for the lifetime of the session (RFC 2516). This command ensures that the virtual MAC address used during the PPPoE session negotiation phase on the capture SAP is the same virtual MAC address that is used by the SRRP on the group interface on which the session is established. Therefore, it is mandated that the SRRP instance (and implicitly the group-interface) where the session belongs to is known in advance. If the group interface name for the session is returned by the RADIUS, it must be ensured that this group interface is the one on which the tracked SRRP instance is configured. PPPoE sessions on the same capture SAP cannot be shared across multiple group interfaces, but instead they all must belong to a single group interface that is known in advance.

The same restrictions apply to IPoE clients in MC Redundancy scenario if they are to be supported concurrently on the same capture SAP as PPPoE.

The supported capture SAP syntax is this:

sap <port-id>:X.* capture-sap

The capture SAP syntax that is not supported is this:

sap <port-id>:*.* capture-sap

The **no** form of this command removes the SRRP ID from this configuration.

Parameters

srrp-id

Specifies the SRRP instance number.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Syntax

[**no**] **tracking-support**

Context

[Tree] (config>service>vprn>mvpn>pt>inclusive>pim tracking-support)

Full Context

configure service vprn mvpn provider-tunnel inclusive pim tracking-support

Description

This command enables the setting of the T bit in the LAN Prune Delay option of the Hello message. This indicates the router's capability to disable Join message suppression.

The **no** form of this command disables the setting.

Default

no tracking-support

Platforms

All

tracking-support

Syntax

[**no**] **tracking-support**

Context

[Tree] (config>service>vprn>pim>if tracking-support)

Full Context

configure service vprn pim interface tracking-support

Description

This command sets the T bit in the LAN Prune Delay option of the Hello Message. This indicates the router's capability to disable Join message suppression.

Default

no tracking-support

Platforms

All

tracking-support

Syntax

[**no**] **tracking-support**

Context

[Tree] (config>router>pim>interface tracking-support)

Full Context

configure router pim interface tracking-support

Description

This command sets the T bit in the LAN Prune Delay option of the Hello Message. This indicates the router's capability to enable join message suppression. This capability allows for upstream routers to explicitly track join membership.

The **no** form of this command disables tracking support.

Default

no tracking-support

Platforms

Context

[Tree] (debug>app-assure>group traffic-capture)

Full Context

debug application-assurance group traffic-capture

Description

This command configures debugging for traffic capture.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.156 traffic-class

traffic-class

Syntax

traffic-class *traffic-class*

no traffic-class

Context

[Tree] (config>test-oam>build-packet>header>mpls traffic-class)

[Tree] (debug>oam>build-packet>packet>field-override>header>mpls traffic-class)

Full Context

configure test-oam build-packet header mpls traffic-class

debug oam build-packet packet field-override header mpls traffic-class

Description

This command defines the traffic class value to be used in the MPLS header.

The **no** form of this command removes the traffic class value.

Default

traffic-class 0 (BE)

Parameters

traffic-class

Specifies the MPLS traffic class to be used in the MPLS header.

Values 0 to 7

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.157 traffic-direction

traffic-direction

Syntax

traffic-direction {**subscriber-to-network** | **network-to-subscriber** | **both**}

Context

[Tree] (config>app-assure>group>policy>aqp>entry>match traffic-direction)

Full Context

configure application-assurance group policy app-qos-policy entry match traffic-direction

Description

This command specifies the direction of traffic where the AQP match entry will be applied.

To use a policer action with the AQP entry the match criteria must specify a traffic-direction of either subscriber-to-network or network-to-subscriber.

Default

traffic-direction both

Parameters

subscriber-to-network

Traffic from a local subscriber will match this AQP entry.

network-to-subscriber

Traffic to a local subscriber will match this AQP entry.

both

Combines subscriber-to-network and network-to-subscriber.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.158 traffic-engineering

traffic-engineering

Syntax

[**no**] **traffic-engineering**

Context

[Tree] (config>router>isis traffic-engineering)

Full Context

configure router isis traffic-engineering

Description

This command enables this IS-IS instance to advertise TE link attributes for RSVP-TE and SR-TE enabled interfaces.

Default

no traffic-engineering

Platforms

All

traffic-engineering

Syntax

[**no**] **traffic-engineering**

Context

[Tree] (config>router>ospf traffic-engineering)

Full Context

configure router ospf traffic-engineering

Description

This command enables the advertisement of the traffic engineering information for the router and its links.

Traffic engineering enables the router to perform route calculations constrained by nodes or links. The traffic engineering of this router are limited to calculations based on link and nodal constraints.

The **no** form of this command disables the advertisement of the traffic engineering information.

Default

no traffic-engineering

Platforms

Description

This command associates the IPsec transform sets allowed for this tunnel. A maximum of four transforms can be specified. The transforms are listed in decreasing order of preference (the first one specified is the most preferred).

Default

no transform

Parameters

transform-id

Specifies the value used for transforms for dynamic keying.

Values 1 to 2048

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.165 transit

transit

Syntax

transit [**inherit** | **all** | **vc-only** | **none**]

Context

[Tree] (config>service>vprn>ttl-propagate transit)

Full Context

configure service vprn ttl-propagate transit

Description

This command overrides the global configuration of the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in a given VPRN service context.

The global configuration is performed under config>router>ttl-propagate>vprn-transit.

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

Default

transit inherit

Parameters

inherit

specifies the TTL propagation behavior is inherited from the global configuration under config>router>ttl-propagate>vprn-transit.

none

specifies the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack.

vc-only

specifies the TTL of the IP packet is propagated into the VC label and not into the labels. in the transport label stack

all

specifies the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

Platforms

configure router ospf3 area virtual-link transit-delay

configure router ospf3 area interface transit-delay

configure router ospf area interface transit-delay

configure router ospf area virtual-link transit-delay

Description

This command configures the estimated time, in seconds, that it takes to transmit a link state advertisement (LSA) on the interface or virtual link.

The **no** form of this command reverts to the default delay time.

Default

transit-delay 1

Parameters

seconds

Specifies the transit delay in seconds expressed as a decimal integer.

Values 1 to 1800

Platforms

All

24.168 transit-ip-policy

transit-ip-policy

Syntax

transit-ip-policy *ip-policy-id* [**create**]

no transit-ip-policy *ip-policy-id*

Context

[Tree] (config>app-assure>group transit-ip-policy)

Full Context

configure application-assurance group transit-ip-policy

Description

This command defines a transit AA subscriber IP policy. Transit AA subscribers are managed by the system through the use of this policy assigned to services, which determines how transit subs are created and removed for that service.

The **no** form of this command deletes the policy from the configuration. All associations must be removed in order to delete a policy.

Parameters

ip-policy-id

An integer that identifies a transit IP profile entry.

Values 1 to 65535

create

Keyword used to create the entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure port ethernet efm-oam transmit-interval

Description

This command configures the transmit interval of OAM PDUs.

Default

transmit-interval 10 multiplier 5

Parameters

interval

Specifies the transmit interval, in 100 milliseconds.

Values 1 to 600

multiplier

Specifies the multiplier for transmit-interval to set local link down timer.

Values 2 to 5

Platforms

All

transmit-interval

Syntax

transmit-interval *transmit-interval*

no transmit-interval

Context

[Tree] (config>lag>bfd>family transmit-interval)

Full Context

configure lag bfd family transmit-interval

Description

This command specifies the transmit timer used for micro-BFD session over the associated LAG links.

The **no** form of this command removes the transmit timer from the configuration.

Default

transmit-interval 100

Parameters

transmit-interval

Specifies the interval value, in milliseconds.

Values 10 to 100000

Default 100 for CPM3 or later, 1000 for all others

Platforms

All

transmit-interval

Syntax

transmit-interval *transmit-interval*

no transmit-interval

Context

[Tree] (config>router>bfd>bfd-template transmit-interval)

Full Context

configure router bfd bfd-template transmit-interval

Description

This command specifies the transmit timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.

The **no** form of this command reverts to the default value.

Default

transmit-interval 100

Parameters

transmit-interval

Specifies the transmit interval. The minimum interval that can be configured is hardware dependent.

Values 10 ms to 100,000 ms in 1 ms intervals

Default 10 ms for CPM3 or higher; 1 second for other hardware

Platforms

All

transmit-interval

Syntax

transmit-interval *transmit-interval*

no transmit-interval

Context

[Tree] (config>router>lsp-bfd>tail-end transmit-interval)

Full Context

configure router lsp-bfd tail-end transmit-interval

Description

This command configures the LSP BFD minimum transmit interval for the tail end of LSP BFD sessions.

The **no** form of this command reverts to the default value.

Default

transmit-interval 1000

Parameters

transmit-interval

Specifies the transmit interval, in milliseconds.

Values 100 to 1000

Default 1000

Platforms

Full Context

configure router ldp interface-parameters ipv4 transport-address

configure router ldp interface-parameters ipv6 transport-address

configure router ldp interface-parameters interface ipv6 transport-address

configure router ldp interface-parameters interface ipv4 transport-address

Description

This command configures the transport address to be used when setting up the LDP TCP sessions. The transport address can be configured as **interface** or **system**. The transport address can be configured globally (applies to all LDP interfaces) or per interface. The most specific value is used.

The **config**>**router**>**ldp**>**if-params**>**ipv6**> **transport-address** command is not supported on the 7450 ESS.

With the transport-address command, you can set up the LDP interface to the connection which can be set to the interface address or the system address. However, there can be an issue of which address to use when there are parallel adjacencies. This situation can not only happen with parallel links, it could be a link and a targeted adjacency since targeted adjacencies request the session to be set up only to the system IP address.

The **transport-address** value should not be **interface** if multiple interfaces exist between two LDP neighbors. Depending on the first adjacency to be formed, the TCP endpoint is chosen. In other words, if one LDP interface is set up as **transport-address interface** and another for **transport-address system**, then, depending on which adjacency was set up first, the TCP endpoint addresses are determined. After that, because the hello contains the LSR ID, the LDP session can be checked to verify that it is set up and then match the adjacency to the session.

For any iLDP interface, as the **local-lsr-id** parameters is changed to **interface**, the **transport-address** configuration loses effectiveness. Since it will be ignored and the iLDP session will always use the relevant interface IP address as transport-address even though system is chosen.

The **no** form of this command, at the global level, sets the transport address to the default value.

The **no** form of this command, at the interface level, sets the transport address to the value defined under the global level.

Default

system

Parameters

interface

Specifies the IP interface address is used to set up the LDP session between neighbors. The transport address interface cannot be used if multiple interfaces exist between two neighbors, since only one LDP session is set up between two neighbors.

system

Specifies the system IP address is used to set up the LDP session between neighbors.

24.181 transport-tunnel

transport-tunnel

Syntax

transport-tunnel

Context

[Tree] (config>router>bgp>next-hop-res>labeled-routes transport-tunnel)

Full Context

configure router bgp next-hop-resolution labeled-routes transport-tunnel

Description

Commands in this context configure options for the next-hop resolution of BGP labeled routes (VPN-IP and labeled-unicast) using tunnels in TTM. The context allows the selection of different tunnel resolution options for different types of BGP labeled routes: label-unicast IPv4, label-unicast IPv6, and VPN-IP routes (both VPN-IPv4 and VPN-IPv6).

By default (if this context and the resolution options are not configured), these routes resolve only to LDP tunnels.

If the **resolution** option is explicitly set to **disabled**, the default binding to LDP tunnel resumes. If **resolution** is set to **any**, then any supported tunnel type is allowed and the selection is based on the lowest numerical TTM preference value.

Platforms

no trap-target *name*

Context

[Tree] (config>service>vprn>log>snmp-trap-group trap-target)

Full Context

configure service vprn log snmp-trap-group trap-target

Description

This command adds/modifies a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group**, and at least one **snmp-trap-group** must be configured.

The **snmp-trap-group** command is used to add or remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Default

No SNMP trap targets are defined.

Parameters

name

specifies the name of the trap target up to 28 characters in length

address ***ip-address***

The IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H
	d: [0 to 255]D
	interface: 32 characters maximum, mandatory for link local addresses

The ipv6-address applies to the 7750 SR.

port

Specifies the destination UDP port used to send traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Values 1 to 65535

Default 162

snmpv1* | *snmpv2c* | *snmpv3

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

Pre-existing conditions are checked before the snmpv3SecurityName is accepted. These are:

- The username must be configured.
- The v3 access group must be configured.
- The v3 notification view must be configured.

Values snmpv1, snmpv2c, snmpv3

Default snmpv3

notify-community community* | *security-name

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If no **notify-community** is configured, then no alarms nor traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community

The community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If

the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

security-name

The *security-name* as defined in the config>system>security>user context for SNMP v3. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy}

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Values no-auth-no-privacy, auth-no-privacy, privacy

Default no-auth-no-privacy. This parameter can only be configured if SNMPv3 is also configured.

replay

Enable replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table. Because of route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-start-wait and route-recovery-wait timers under config>log>app-route-notifications can help reduce the probability of lost events.

Context

[Tree] (config>log>snmp-trap-group trap-target)

Full Context

configure log snmp-trap-group trap-target

Description

This command configures a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group** and at least one **trap-target** must be configured.

The **trap-target** command is used to add/remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

Note:
If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Parameters

name

Specifies the name of the trap target, up to 28 characters.

ip-address

Specifies the IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group. ipv6 applies to the 7750 SR only.

Values ipv4-address a.b.c.d (host bits must be 0)

ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses

port

Specifies the destination UDP port used for sending traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Default 162

Values 1 **to** 65535

snmpv1* | *snmpv2c* | *snmpv3

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. The security name is the name of a locally configured user. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

The following conditions must all be met before traps will be issued using an SNMPv3 trap-target:

The user name must be configured, and must be configured with an snmp group that exists.

The v3 access group must be configured, or be one of the built-in SR OS views.

The v3 notification view must be configured, or be one of the built-in SR OS views.

Default snmpv3

Values snmpv1, snmpv2c, snmpv3

community* | *security-name

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If the **notify-community** is not configured, then no alarms or traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community-name

Specifies the community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

security-name

For SNMPv3 trap targets, specifies the *security-name* as defined in the **config>system>security>user** context. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy}

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Default **no-auth-no-privacy**. This parameter can only be configured if SNMPv3 is also configured.

Values no-auth-no-privacy, auth-no-privacy, privacy

replay

Enables the replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table.

Note:
Due to route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-

start-wait and route-recovery-wait timers under the **config>log>app-route-notifications** context can help reduce the probability of lost events.

Platforms

tree

Syntax

tree [**detail**] [**flat**]

Context

[Tree] (tree)

Full Context

tree

Description

This command displays the command hierarchy structure of the current working context.

Parameters

detail

Displays parameter information for each command shown in the tree output.

flat

Displays the full context on each line.

Platforms

All

24.186 trigger

trigger

Syntax

trigger *trigger-type*

Context

[Tree] (config>subscr-mgmt>shcv-policy trigger)

Full Context

configure subscriber-mgmt shcv-policy trigger

Description

This command enables to context to configure SHCV triggers.

Parameters

trigger-type

Specifies the trigger SHCV properties for the subscriber management group-interface.

Values **ip-conflict** — Upon detecting an IP conflict for the new host, a trigger SHCV is sent using a unicast ARP/NS. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

host-limit-exceeded — Upon exceeding the limit for (**sla-profile host-limits** or **session-limits**, **sub-profile host-limits** or **session-limits**, **ipoe-session sap-session-limit**, **ipoe-session session-limit**, and **arp-host host-limit**), a trigger SHCV is sent. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

inactivity — A trigger SHCV is sent to the idle host to verify the host's connectivity to the BNG. An unresponsive host is removed from the system.

mobility — Detects an IP or MAC conflict between different SAPs. Upon detecting a MAC or an IP conflict, a trigger SHCV is sent. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

mac-learning — Specifies the trigger SHCV properties to learn the MAC address of static hosts. Upon a **no shutdown**, a trigger SHCV is sent to the host to learn the host's MAC address.

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>mobility trigger)

Full Context

configure service vprn subscriber-interface group-interface wlan-gw mobility trigger

configure service ies subscriber-interface group-interface wlan-gw mobility trigger

Description

This command specifies the type of packet used as a mobility trigger.

The **no** form of this command removes the parameters from the configuration and disables data-plane mobility.

Parameters

data

Specifies that data traffic be used as a trigger.

iapp

Specifies that Inter Access Point Protocol (IAPP) messages be used as a trigger.

control

Specifies that control traffic can be used as a trigger.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

trigger

Syntax

[**no**] **trigger** [**neighbor** *ip-int-name* | *ip-address*]

Context

[Tree] (debug>router>rip trigger)

Full Context

debug router rip trigger

Description

This command enables debugging for RIP trigger updates.

Parameters

ip-int-name* | *ip-address

Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms

All

trigger

Syntax

[**no**] **trigger** [**neighbor** *ip-int-name* | *ipv6-address*]

Context

[Tree] (debug>router>ripng trigger)

Full Context

debug router ripng trigger

Description

This command enables debugging for RIP trigger updates.

Parameters

ip-int-name*| *ipv6-address

Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms

All

24.187 trigger-alarm-msg

trigger-alarm-msg

Syntax

trigger-alarm-msg *message-string*

no trigger-alarm-msg

Context

[Tree] (config>system>alarm-contact-input trigger-alarm-msg)

Full Context

configure system alarm-contact-input trigger-alarm-msg

Description

This command configures a message string to send with SNMP trap and log event messages that are generated when the system generates an alarm. The system generates the default message "Alarm Input Triggered" if no message is configured. The **trigger-alarm-msg** string is included in the log event when the pin changes from the normal state.

The **no** form of this command reverts to the default message "Alarm Input Triggered".

Default

no-trigger-alarm-msg

Parameters

message-string

Specifies a printable character string, up to 160 characters.

Platforms

7750 SR-a

24.188 trigger-entry

trigger-entry

Syntax

[**no**] **trigger-entry** *entry-id*

Context

[Tree] (config>log>event-trigger>event trigger-entry)

Full Context

configure log event-trigger event trigger-entry

Description

This command configures an instance of a trigger for an EHS handler. A trigger entry binds a set of matching criteria for a log event to a particular handler. If the log event occurs in the system and matches the criteria configured in the associated log filter then the handler will be executed.

The **no** form of this command removes the specified trigger entry.

Parameters

entry-id

Specifies the identifier of the EHS event trigger entry.

Values 1 to 1500

Platforms

All

24.189 trigger-fault

trigger-fault

Syntax

trigger-fault {**dying-gasp** | **critical-event**}

no trigger-fault

Context

[Tree] (config>port>ethernet>efm-oam trigger-fault)

Full Context

configure port ethernet efm-oam trigger-fault

Description

This command configures the appropriate flag field in the Information OAM PDU, bursting three consecutive packets during the off cycle. If the local port state is operational, this command changes the local port state to "Link Up". If the local port state is not operational, this configuration is installed as an EFM reason to prevent the port from returning to an Up operational state. This command can be used as a precursor to a port shutdown. This terminates the peering relationship without having to wait for protocol timeouts, assuming the peer supports the necessary action when receiving the dying gasp or critical event flag setting.

The **no** form of this command disables this functionality.

Default

no trigger-fault

Parameters

dying-gasp

Keyword to set the dying gasp flag.

critical-event

Keyword to set the critical event flag.

Platforms

All

24.190 trigger-packet

trigger-packet

Syntax

trigger-packet [**dhcp**] [**pppoe**] [**arp**] [**dhcp6**] [**rtr-solicit**] [**data**]

no trigger-packet

Context

[Tree] (config>service>vpls>sap trigger-packet)

Full Context

configure service vpls sap trigger-packet

Description

This command enables triggering packet to initiate RADIUS authentication that provides a service context. The authentication, together with the service context for this request, creates a managed SAP. The VLAN is the same as the triggering packet. This SAP behaves as a regular SAP but the configuration is not user-editable and not maintained in the configuration file. The managed SAP remains active as long as the session is active.

The **no** form of this command reverts to the default.

Parameters

dhcp

Specifies whether the receipt of DHCP trigger packets on this VPLS SAP when the keyword **capture-sap** is specified in the **sap** command creation string, will result in a RADIUS authentication that will provide a service context and the creation of a SAP with a value of managed.

pppoe

Specifies whether the receipt of PPPoE trigger packets on this VPLS SAP when the keyword **capture-sap** is specified in the **sap** command creation string, will result in a RADIUS authentication that will provide a service context and the creation of a SAP with a value of managed.

arp

Indicates that ARP is the type of trigger packets for this entry.

dhcp6

Indicates that DHCP6 is the type of trigger packets for this entry.

rtr-solicit

Indicates that router solicit is the type of trigger packets for this entry.

data

Indicates that data is the type of trigger packets for this entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

trigger-packet

Syntax

[**no**] **trigger-packet**

Context

[Tree] (config>subscr-mgmt>git trigger-packet)

Full Context

configure subscriber-mgmt group-interface-template trigger-packet

Description

This command configures the router to process the specified types of trigger packets on dynamic SAPs.

The **no** form of this command disables the processing of trigger packets.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.191 triggered-policy

triggered-policy

Syntax

[**no**] **triggered-policy**

Context

[Tree] (config>router triggered-policy)

Full Context

configure router triggered-policy

Description

This command triggers route policy re-evaluation.

By default, when a change is made to a policy in the **config router policy options** context and then committed, the change is effective immediately. There may be circumstances when the changes should or must be delayed; for example, if a policy change is implemented that would affect every BGP peer on a router, the consequences could be dramatic. It is more effective to control changes on a peer by peer basis.

If the **triggered-policy** command is enabled, and a given peer is established, and you want the peer to remain up, then, in order for a change to a route policy to take effect, a **clear** command with the *soft* or *soft-inbound* option must be used. In other words, when a **triggered-policy** is enabled, any routine policy change or policy assignment change within the protocol will not take effect until the protocol is reset or a clear command is issued to re-evaluate route policies; for example, **clear router bgp neighbor x.x.x.x soft**. This keeps the peer up and the change made to a route policy is applied only to that peer, or group of peers.

Default

no triggered-policy

Platforms

trust-anchor

Syntax

[**no**] **trust-anchor** *ca-profile-name*

Context

[Tree] (config>ipsec>trust-anchor-profile trust-anchor)

Full Context

configure ipsec trust-anchor-profile trust-anchor

Description

This command specifies a CA profile as a trust anchor CA. Up to 8 multiple trust anchors can be specified in a single trust anchor profile.

The **no** form of this command removes the name from the configuration.

Parameters

ca-profile-name

Specifies the name of the trust anchor profile, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

trust-anchor

Syntax

[**no**] **trust-anchor** *ca-profile-name*

Context

[Tree] (config>system>security>tls>trust-anchor-profile trust-anchor)

Full Context

configure system security tls trust-anchor-profile trust-anchor

Description

This command configures a trust anchor with a CA profile used by the TLS profile. Up to eight CA profiles can be configured under the trust anchor. TLS will read the CA profiles one by one to try to authenticate the server certificate.

Parameters

ca-profile-name

Specifies the name of the TLS trust anchor, up to 32 characters.

Platforms

All

[Tree] (config>service>ies>if>dhcp trusted)

[Tree] (config>service>ies>sub-if>grp-if>dhcp trusted)

[Tree] (config>router>if>dhcp trusted)

Full Context

configure service vprn interface dhcp trusted

configure service ies interface dhcp trusted

configure service ies subscriber-interface group-interface dhcp trusted

configure router interface dhcp trusted

Description

This command enables relaying untrusted packets. According to RFC 3046, *DHCP Relay Agent Information Option*, a DHCP request where the giaddr is 0.0.0.0 and which contains an Option 82 field in the packet, should be discarded, unless it arrives on a "trusted" circuit. If the **trusted** mode is enabled on an IP interface, the Relay Agent (the router) modifies the requested giaddr to be equal to the ingress interface and forward the request.

The **no** form of this command reverts to the default.

Default

no trusted

Platforms

All

- configure service vprn interface dhcp trusted
- configure service ies interface dhcp trusted
- configure router interface dhcp trusted

24.196 trusted-mac-time

trusted-mac-time

Syntax

trusted-mac-time *range*

Context

[Tree] (config>service>vpls>bgp-evpn>mac-duplication trusted-mac-time)

Full Context

configure service vpls bgp-evpn mac-duplication trusted-mac-time

Description

This command determines how long a MAC address needs to stay in the FDB as type learned without being flushed or changed in its type so that the MAC is declared as trusted for the mac-duplication procedures. If the MAC changes from SAP to SAP within the same VPLS service and node, the MAC does not reset its trusted MAC timer.

Default

trusted-mac-time 5

Parameters

range

Specifies the time, in minutes, before the MAC address can be flushed from the FDB.

Values 1 to 15

Platforms

All

24.197 trusted-server

trusted-server

Syntax

trusted-server *address* [**create**]

[**no**] **trusted-server** *address*

Context

[Tree] (config>app-assure>group>ip-id-asst>pdns trusted-server)

Full Context

configure application-assurance group ip-identification-assist passive-dns trusted-server

Description

Commands in this context configure a DNS server that the IP identification assist feature is allowed to passively monitor.

The **no** form of this command deletes the DNS server.

Parameters

address

Specifies the IPv4 or IPv6 address for the DNS server.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

ts-list

Syntax

ts-list *list-name* [**create**]

no ts-list *list-name*

Context

[Tree] (config>ipsec ts-list)

Full Context

configure ipsec ts-list

Description

This command creates a new traffic selector (TS).

The **no** form of this command removes the list name from the configuration.

Parameters

list-name

Specifies the name of the TS-list.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.199 ts-location

ts-location

Syntax

ts-location *file-url*

no ts-location

Context

[Tree] (config>system>security>tech-support ts-location)

Full Context

configure system security tech-support ts-location

Description

The **ts-location** command is used (along with an automatic system generated file name) when no *file-url* parameter is provided for the **admin tech-support** command. If **no ts-location** is defined then the operator must provide a file-url with the **admin tech-support** command itself.

The directory specified for the ts-location is not auto-created by SR OS. The operator must ensure that it exists.

See the **admin tech-support** command for more details about the system generated file name.

Default

no ts-location

Parameters

file-url

Specifies the destination directory for auto-named tech-support files (when no *file-url* is specified with the **admin tech-support** command). The *file-url* for the **ts-location** must be a directory (no filename or extension). The root directory (for example, cf1:\) is blocked for local compact flash destinations. A sub-directory (for example, cf2:\tech-support) must be used if local cf is the location.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[ftp://*login:pswd@remote-locn*/][*file-path*]
	247 chars max
	directory length 99 chars max each
remote-locn	[*hostname* | *ipv4-address* | "["*ipv6-address*"]"]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

24.202 ttl

ttl

Syntax

ttl *value*

Context

[Tree] (config>subscr-mgmt>pfcp-association>tx ttl)

Full Context

configure subscriber-mgmt pfcp-association tx ttl

Description

This command configures initial TTL value that is sent in the IP header.

Default

ttl 255

Parameters

value

Specifies the TTL value, in seconds.

This value must be identical on both the BNG UPF and CPF. For information about the BNG CUPS CPF configuration, refer to the *CMG BNG CUPS Control Plane Function Guide* and the *7750 SR MG and CMG CLI Reference Guide*.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ttl

Syntax

ttl *label-ttl*

no ttl

Context

[Tree] (config>saa>test>type-multi-line>lsp-ping>sr-policy ttl)

[Tree] (config>saa>test>type-multi-line>lsp-ping ttl)

Full Context

configure saa test type-multi-line lsp-ping sr-policy ttl

configure saa test type-multi-line lsp-ping ttl

Description

This command configures a time-to-live value for the MPLS label.

The **no** form of this command reverts to the default value.

Default

ttl 255

Parameters

label-ttl

Specifies the time-to-live value.

Values 1 to 255

Default 255

Platforms

All

ttl

Syntax

ttl min-ttl *min-label-ttl* **max-ttl** *max-label-ttl*

no ttl

Context

[Tree] (config>saa>test>type-multi-line>lsp-trace>sr-policy ttl)

Full Context

configure saa test type-multi-line lsp-trace sr-policy ttl

Description

This command configures minimum and maximum time-to-live values.

The **no** form of this command removes the configuration.

Parameters

min-label-ttl

Specifies the minimum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

Values 1 to 255

Default 1

max-label-ttl

Specifies the maximum TTL value in the MPLS label for the LDP treetrace test, expressed as a decimal integer.

Values 1 to 255

Default 30

Platforms

All

ttl

Syntax

ttl *time-to-live*

no ttl

Context

[Tree] (config>oam-pm>session>ip ttl)

Full Context

configure oam-pm session ip ttl

Description

This command defines the value of the TTL field of the packet header.

The **no** form of this command restores the default value.

Default

ttl 225

Parameters

time-to-live

Specifies the value to be used in the TTL field.

Values 1 to 255

Default 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ttl

Syntax

ttl *time-to-live*

no ttl

Context

[Tree] (config>oam-pm>session>mpls ttl)

Full Context

configure oam-pm session mpls ttl

Description

This command defines the value of the MPLS TTL for DM packets.

The **no** form of this command reverts the default value.

Default

ttl 255

Parameters

time-to-live

Specifies the value to be used in the TTL field.

Values 1 to 255

Default 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ttl

Syntax

ttl *value*

no ttl

Context

[Tree] (config>test-oam>icmp>ping-template ttl)

Full Context

configure test-oam icmp ping-template ttl

Description

This command configures the TTL value used in the outgoing ping packet. The interface being tested must be directly connected on the same subnet.

The **no** form of this command reinstates the default value for TTL.

Default

ttl 1

Parameters

value

Specifies the value to be used in the TTL field.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ttl

Full Context

configure test-oam link-measurement measurement-template twamp-light ttl

Description

This command configures the Time to Live (TTL) value in the TWAMP Light test packet.

Default

ttl 1

Parameters

time-to-live

Specifies the value to be used in the TTL field.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ttl

Syntax

ttl {**lt** | **gt** | **eq**} *ttl-value*

ttl range *ttl-value ttl-value*

no ttl

Context

[Tree] (config>filter>ip-filter>entry>match ttl)

Full Context

configure filter ip-filter entry match ttl

Description

This command configures the Time To Live (TTL) match criteria.

The **no** form of this command removes the configuration.

Default

no ttl

Parameters

lt

Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt

Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq

Specifies "equal to”.

ttl-value

Specifies the maximum TTL value.

configure service ies interface icmp ttl-expired

Description

This command configures the rate Internet Control Message Protocol (ICMP) TTL expired messages are issued by the IP interface.

By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the limiting the rate of TTL expired messages on the router interface and reverts to the default values.

Default

ttl-expired 100 10

Parameters

number

The maximum number of ICMP TTL expired messages to send, expressed as a decimal integer. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds

The time frame in seconds used to limit the *number* of ICMP TTL expired messages that can be issued, expressed as a decimal integer.

Values 1 to 60

Platforms

All

ttl-expired

Syntax

[Tree] (config>router>bgp>group>neighbor ttl-security)

Full Context

configure router bgp group ttl-security

configure router ldp tcp-session-parameters peer-transport ttl-security

configure system login-control ssh ttl-security

configure system login-control telnet ttl-security

configure router bgp group neighbor ttl-security

Description

This command configures TTL security parameters for incoming packets. When the feature is enabled, LDP will accept incoming IP packets from a peer only if the TTL value in the packet is greater than or equal to the minimum TTL value configured for that peer. Per-peer-queueing must be enabled in order for TTL protection to operate.

The **no** form of this command disables TTL security.

Parameters

min-ttl-value

Specifies the minimum TTL value for an incoming BGP packet.

Values 1 to 255

24.207 tunnel

tunnel

Syntax

tunnel *tunnel-name* [**create**]

no tunnel *tunnel-name*

Context

[Tree] (config>router>l2tp>group tunnel)

[Tree] (config>service>vprn>l2tp>group tunnel)

Full Context

configure router l2tp group tunnel

configure service vprn l2tp group tunnel

Description

This command configures an L2TP tunnel. A tunnel exists between a LAC-LNS pair and consists of a Control Connection and zero or more L2TP sessions. The tunnel carries encapsulated PPP datagrams and control messages between the LAC and the L2TP Network Server (LNS).

The **no** form of this command removes the tunnel name from the configuration.

Parameters

tunnel-name

Specifies a valid string to identify an L2TP, up to 32 characters.

create

Mandatory keyword to create a new tunnel.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax

tunnel *connection-id*

Context

[Tree] (debug>router>l2tp tunnel)

Full Context

debug router l2tp tunnel

Description

This command enables debugging for an L2TP tunnel.

Parameters

connection-id

Specifies the connection ID of the L2TP session associated with this session.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax

no tunnel

Context

[Tree] (config>service>epipe>pbb tunnel)

Full Context

configure service epipe pbb tunnel

Description

This command configures a Provider Backbone Bridging (PBB) tunnel with Backbone VPLS (B-VPLS) service information.

Parameters

service-id

Specifies the B-VPLS service for the PBB tunnel associated with this service.

Values *service-id*: 1 to 2147483648

svc-name: 64 characters maximum

backbone-dest-mac *mac-name*

Specifies the backbone destination MAC name for PBB packets up to 32 characters in length.

backbone-dest-mac *ieee-address*

Specifies the backbone destination MAC-address for PBB packets as xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

isid *ISID*

Specifies a 24 bit service instance identifier for the PBB tunnel associated with this service. As part of the PBB frames, it is used at the destination PE as a demultiplexer field.

Values 0 to 16777215

Platforms

All

tunnel

Syntax

tunnel *ipsec-tunnel-name* [**detail**] [**no-dpd-debug**] [**display-keys**]

no tunnel *ipsec-tunnel-name*

Context

[Tree] (debug>ipsec tunnel)

Full Context

debug ipsec tunnel

Description

This command enables debugging for specified IPsec tunnel.

Note:
Up to 16 IPsec tunnels are allowed, to enable debugging, at a time.

Parameters

ipsec-tunnel-name

Specifies the name of ipsec-tunnel, up to 32 characters.

detail

Displays detailed debug information.

no-dpd-debug

Stops logging IKEv1 and IKEv2 DPD events for less noise during debug.

display-keys

Specifies the IKE-SA and CHILD-SA keys for inclusion in the debug output.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax

[**no**] **tunnel** *ip-address*

Context

Context

[Tree] (config>port>ethernet>dot1x tunnel-dot1q)

Full Context

configure port ethernet dot1x tunnel-dot1q

Description

This command configures the tunneling of single tagged (dot1q) dot1x packets arriving on the port. When enabled, the router extracts these packets to the CPM.

The **no** form of this command disables the tunelling of the dot1q dot 1x packets on the port.

Default

tunnel-dot1q

Platforms

All

24.210 tunnel-down-damp-time

tunnel-down-damp-time

Syntax

tunnel-down-damp-time *seconds*

no tunnel-down-damp-time

Context

[Tree] (config>router>ldp tunnel-down-damp-time)

Full Context

configure router ldp tunnel-down-damp-time

Description

This command specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager (TTM).

When LDP can no longer resolve a FEC and de-activates it, it de-programs the NHLFE in the data path. It will however delay deleting the LDP tunnel entry in the TTM until the tunnel-down-damp-time timer expires. This means users of the LDP tunnel, such as SDPs (all services) and BGP (L3 VPN), will not be notified immediately. Traffic is still blackholed because the forwarding engine NHLFE has been de-programmed.

If the FEC gets resolved before the tunnel-down-damp-time timer expires, then LDP programs the forwarding engine with the new NHLFE and performs a tunnel modify event in TTM updating the dampened entry in TTM with the new NHLFE information. If the FEC does not get resolved and the tunnel-down-damp-time timer expires, LDP posts a tunnel down event to TTM which deletes the LDP tunnel.

When there is an upper layer (user of LDP) which depends of LDP control plane for failover detection then label withdrawal delay and tunnel-down-damp-time options must be set to 0.

An example is pseudowire redundancy where the primary PW does not have its own fast failover detection mechanism and the node depends on LDP tunnel down event to activate the standby PW.

The **no** form of this command resumes the default value of this command.

Default

no tunnel-down-damp-time (which equals a value of 3 seconds)

Parameters

seconds

Specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager.

Platforms

All

24.211 tunnel-elmi

tunnel-elmi

Syntax

[**no**] **tunnel-elmi**

Context

[Tree] (config>service>vpls tunnel-elmi)

Full Context

configure service vpls tunnel-elmi

Description

This command enables the tunneling of E-LMI packets in a VPLS service. The following must also be the case for this command to function:

- the **configure port ethernet elmi mode uni-n** command is not configured
- the **configure service vpls tunnel-elmi true** command is enabled
- the E-LMI packets map to that VPLS service

This command configures E-LMI packets in a VPLS service to be tunneled when the **configure port ethernet elmi mode uni-n** is not configured and the **configure service vpls tunnel-elmi** is enabled and the E-LMI packets map to that VPLS service.

The **no** form of this command disables tunneling of the E-LMI packets for a VPLS service.

Default

no tunnel-elmi

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.215 tunnel-far-end

tunnel-far-end

Syntax

tunnel-far-end *ip-address* | *ipv6-address*

no tunnel-far-end [*ip-address* | *ipv6-address*]

Context

[Tree] (config>service>sdp tunnel-far-end)

Full Context

configure service sdp tunnel-far-end

Description

This command enables the user to specify an SDP tunnel destination address that is different from the configuration in the SDP far-end option. The SDP must be shutdown first to add or change the configuration of the **tunnel-far-end** option.

When this option is enabled, service packets are encapsulated using an LDP LSP with a FEC prefix matching the value entered in ip-address. By default, service packets are encapsulated using an LDP LSP with a FEC prefix matching the address entered in the SDP far-end option.

The T-LDP session to the remote PE is still targeted to the address configured under the **far-end option**. This means that targeted hello messages are sent to the far-end address, which is also the LSR-ID of the remote node. TCP based LDP messages, such as initialization and label mapping messages, are sent to the address specified in the transport-address field of the "hello" message received from the remote PE. This address can be the same as the remote PE LSR-ID, or a different address. This feature works, however, if the signaling option in the SDP is set to off instead of tldp, in which case, the service labels are statically configured.

This feature operates on an SDP of type LDP only. It can be used with VLL, VPLS, and VPRN services when an explicit binding to an SDP with the **tunnel-far-end** is specified. It also operates with a spoke interface on an IES or VPRN service. Finally, this feature operates with a BGP AD based VPLS service when the **use-provisioned-sdp** option is enabled in the pseudowire template.

This feature is not supported in an SDP of type MPLS when an RSVP LSP name is configured under the SDP. It also does not work with a mixed-lsp SDP.

The **no** form of this command disables the use of the **tunnel-far-end** option and returns to using the address specified in the far-end.

Default

no tunnel-far-end

Parameters

ip-address* | *ipv6-address

Specifies the system address of the far-end router for the SDP in dotted decimal notation.

Platforms

All

configure service ies subscriber-interface group-interface sap eth-cfm tunnel-fault

configure service vprn eth-cfm tunnel-fault

configure service ies eth-cfm tunnel-fault

configure service epipe eth-cfm tunnel-fault

Description

Allows the individual service SAPs to react to changes in the tunnel MEP state. When tunnel-fault accept is configured at the service level, the SAP will react according to the service type, Epipe will set the operational flag and VPLS, IES and VPRN SAP operational state will become down on failure or up on clear. This command triggers the OAM mapping functions to mate SAPs and bindings in an Epipe service as well as setting the operational flag. If AIS generation is the requirement for the Epipe services this command is not required. See the **ais-enable** command under the **config>service>epipe>sap>eth-cfm>ais-enable** context for more details. This works in conjunction with the tunnel-fault accept on the individual SAPs. Both must be set to accept to react to the tunnel MEP state. By default the service level command is "ignore" and the SAP level command is "accept". This means simply changing the service level command to "accept" will enable the feature for all SAPs. This is not required for Epipe services that only wish to generate AIS on failure.

Default

tunnel-fault ignore (Service Level)

tunnel-fault accept (SAP Level for Epipe and VPLS)

Parameters

accept

Shares fate with the facility tunnel MEP.

ignore

Does not share fate with the facility tunnel MEP.

24.217 tunnel-group

tunnel-group

Syntax

tunnel-group *tunnel-group-id* [**create**]

tunnel-group *tunnel-group-id* **isa-scale-mode** *isa-scale-mode* [**create**]

no tunnel-group *tunnel-group-id*

Context

[Tree] (config>isa tunnel-group)

Full Context

configure isa tunnel-group

Description

This command allows a tunnel group to be created or edited. A tunnel group is a set of one or more MS-ISAs that support the origination and termination of IPsec and IP/GRE tunnels. All of the MS-ISAs in a tunnel group must have **isa-tunnel** as their configured mda-type. On VSR, **isa-scale-mode** must be specified, which defines the number of tunnels on each ISA.

The **no** form of this command deletes the specified tunnel group from the configuration

Parameters

tunnel-group-id

Identifies the tunnel group.

Values 1 to 16

isa-scale-mode

Defines the maximum number of tunnels (all types combined) which can be established on each ISA of the tunnel group and for the whole tunnel-group.

Values tunnel-limit-32k, where k equals 1024

create

Mandatory keyword used when creating tunnel group in the ISA context. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>router>igmp tunnel-interface)

Full Context

configure router tunnel-interface

configure router igmp tunnel-interface

Description

This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces and associate each to a different RSVP P2MP LSP.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain "::" (two :s) nor contain a ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

Parameters

rsvp-p2mp *lsp-name*

Specifies the LSP. The LSP name can be up to 32 characters long and must be unique.

ldp-p2mp *p2mp-id*

Identifier used for signaling MLDP P2MP LSP.

Values 1 to 4294967296 (on leaf node)
1 to 8192 (on root node)

sender *sender-address*

Specifies the sender IP address: a.b.c.d.

[Tree] (config>router>pim tunnel-interface)

Full Context

configure router pim tunnel-interface

Description

This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces in PIM and associate each to a different RSVP P2MP LSP.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain "::" (two :s) nor contain a ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

The **no** form of this command removes the tunnel parameters.

Parameters

lsp-name

Specifies the LSP, up to 32 characters.

ip-address

Specifies the sender IP address.

Description

This command sets the size of the payload in IPv6 packet in downstream DS-Lite direction. The payload is, in essence, the tunneled IPv4 packet.

tunnel-mtu

Syntax

tunnel-mtu *bytes*

no tunnel-mtu

Context

[Tree] (config>router>isis>segment-routing tunnel-mtu)

Full Context

configure router isis segment-routing tunnel-mtu

Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into TTM is determined like in the case of an IGP tunnel; for example, LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU is determined by IGP as explained below.

The MTU of the SR tunnel in bytes is then determined as follows:

*SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr-overhead)*4}*

Where:

Cfg_SR_MTU is the MTU configured by the user for all SR tunnels within a given IGP instance using the above CLI. If no value was configured by the user, the SR tunnel MTU will be determined by the IGP interface calculation explained next.

IGP_Tunnel_MTU is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.

frr-overhead is set to 1 if **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated anytime any of the above parameters used in its calculation changes. This includes when the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default

no tunnel-mtu

Parameters

bytes

Specifies the size of the Maximum Transmission Unit (MTU) in bytes.

Values 512 to 9786

Platforms

All

tunnel-mtu

Syntax

tunnel-mtu *bytes*

no tunnel-mtu

Context

[Tree] (config>router>ospf3>segm-rtng tunnel-mtu)

[Tree] (config>router>ospf>segm-rtng tunnel-mtu)

Full Context

configure router ospf3 segment-routing tunnel-mtu

configure router ospf segment-routing tunnel-mtu

Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into the TTM is determined as the same as an IGP tunnel; for example, for an LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU will be determined by IGP as follows:

The MTU of the SR tunnel in bytes is then determined as follows:

SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr—overhead)X4}

Where:

- *Cfg_SR_MTU* is the MTU configured by the user for all SR tunnels within an IGP instance using the tunnel-mtu command. If no value is configured by the user, the SR tunnel MTU is determined by the IGP interface calculation explained in the next bullet point.
- *IGP_Tunnel_MTU* is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.
- *frr-overhead* is set to 1 if the **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated whenever any of the above parameters used in its calculation changes. This includes if the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default

no tunnel-mtu

Parameters

bytes

Specifies the size of the MTU in bytes.

Values 512 to 9786

tunnel-next-hop

Syntax

tunnel-next-hop

Context

[Tree] (config>router>isis>igp-shortcut tunnel-next-hop)

Full Context

configure router isis igp-shortcut tunnel-next-hop

Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next-hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note:
An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable (disable) IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

Platforms

Syntax

tunnel-next-hop

Context

[Tree] (config>router>ospf>igp-shortcut tunnel-next-hop)

[Tree] (config>router>ospf3>igp-shortcut tunnel-next-hop)

Full Context

configure router ospf igp-shortcut tunnel-next-hop

configure router ospf3 igp-shortcut tunnel-next-hop

Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note:
An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable or disable IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

Platforms

All

24.225 tunnel-port-policy

tunnel-port-policy

Syntax

tunnel-port-policy [*tunnel-port-policy*]

no tunnel-port-policy

Context

[Tree] (config>isa>wlan-gw-group tunnel-port-policy)

Full Context

configure isa wlan-gw-group tunnel-port-policy

Description

This command configures the tunnel port policy of this WLAN Gateway ISA group. If a tunnel port policy is associated with a WLAN Gateway ISA group, ports created for this group can take applicable configuration from that policy. This policy is applicable to those ports that take part in the per-tunnel QoS processing.

The **no** form of the command removes the **tunnel-port-policy** name from the configuration.

Default

no-tunnel-policy

Parameters

tunnel-port-policy

Specifies the tunnel port policy of this WLAN Gateway ISA group, up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.226 tunnel-qinq

tunnel-qinq

Syntax

[**no**] **tunnel-qinq**

Context

[Tree] (config>port>ethernet>dot1x tunnel-qinq)

Full Context

configure port ethernet dot1x tunnel-qinq

Description

This command configures the tunneling of double tagged (QinQ) dot1x packets. When enabled, the router extracts the packets to the CPM.

The **no** form of this command disables the tunelling of the QinQ dot1x packets on the port.

Default

tunnel-qinq

Platforms

All

24.227 tunnel-query

tunnel-query

Syntax

tunnel-query *query-id* [**name** *name*] [**create**]

no tunnel-query *query-id*

Context

[Tree] (config>subscr-mgmt>wlan-gw tunnel-query)

Full Context

configure subscriber-mgmt wlan-gw tunnel-query

Description

This command creates a tunnel query where filter criteria over WLAN-GW tunnels are defined. This query can later be used to retrieve the state of the tunnels and Layer 2 access points (which are modeled as tunnels) matching the configured criteria.

The **no** form of this command removes the query.

Parameters

query-id

Specifies the ID assigned to a query.

Values 1 to 1024

name

Specifies the name assigned to a query, up to 32 characters.

create

Creates a tunnel query.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel-remote-address

Syntax

tunnel-remote-address *ip-address*

no tunnel-remote-address

Context

[Tree] (config>subscr-mgmt>wlan-gw>ue-query tunnel-remote-address)

Full Context

configure subscriber-mgmt wlan-gw ue-query tunnel-remote-address

Description

This command enables matching on UEs that are active on a tunnel with the specified source IP address.

The **no** form of this command disables matching on the remote tunnel address.

Default

no tunnel-remote-address

Parameters

ip-address

Specifies the IPv4 or IPv6 address of the remote tunnel.

Values	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.229 tunnel-resource-limit

tunnel-resource-limit

Syntax

tunnel-resource-limit direction *direction* [**create**]

no tunnel-resource-limit direction *direction*

Context

[Tree] (config>app-assure>group>statistics>tca>gtp-filter tunnel-resource-limit)

Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter tunnel-resource-limit

Description

This command configures a TCA for the counter capturing the usage of the total number of GTP tunnel resources. A tunnel-resource-limit TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or from the network side (**to-sub**). The **create** keyword is mandatory when creating a TCA.

Parameters

direction

Specifies the traffic direction.

Values from-sub, to-sub

create

Keyword used to create the TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.230 tunnel-router

tunnel-router

Syntax

tunnel-router *router-instance*

no tunnel-router

Context

[Tree] (config>subscr-mgmt>wlan-gw>ue-query tunnel-router)

Full Context

configure subscriber-mgmt wlan-gw ue-query tunnel-router

Description

This command enables matching on UEs that are active on a tunnel which is terminated in the specified router instance.

The **no** form of this command disables matching on the tunnel router instance.

Default

no tunnel-router

Parameters

router-instance

Specifies the routing instance.

Values *router-name* - Base

vprn-svc-id - 1 to 2147483647

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>router>l2tp tunnel-session-limit)

Full Context

configure service vprn l2tp tunnel-session-limit

configure router l2tp tunnel-session-limit

Description

This command configures the L2TP session limit for each tunnel of the specified router.

The **no** form of this command removes the tunnel session limit value from the configuration.

Default

no tunnel-session-limit

Parameters

session-limit

Specifies the allowed number of sessions within the given context.

Values 1 to 65535

unlimited

Specifies to use the maximum number of sessions available.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.234 tunnel-source-ip

tunnel-source-ip

[Tree] (config>router>wlan-gw>xconnect tunnel-source-ip)

Full Context

configure service vprn wlan-gw xconnect tunnel-source-ip

configure router wlan-gw xconnect tunnel-source-ip

Description

This command configures the IPv6 address and prefix for the tunnel source.

The **no** form of this command removes IPv6 address and prefix length from the cross-connect configuration.

Parameters

ipv6-address/prefix-length

Specifies the tunnel source IPv6 address and prefix length of the cross-connect.

Values ipv6-address/prefix: ipv6-address x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x [0..FFFF]H
d [0..255]D
(no multicast address)
prefix-length [1 to 128]

tunnel-table

Syntax

tunnel-table [*ip-address*] [{**ldp** | **rsvp** [**tunnel-id** *tunnel-id*] | **sdp** [**sdp-id** *sdp-id*}]]

Context

[Tree] (debug>router>ip tunnel-table)

Full Context

debug router ip tunnel-table

Description

This command enables debugging for tunnel tables.

Platforms

All

24.236 tunnel-table-pref

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>ldp tunnel-table-pref)

Full Context

configure router ldp tunnel-table-pref

Description

This command configures the tunnel table preference for LDP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default

tunnel-table-pref 9

Parameters

preference

Specifies the preference value.

Values 1 to 255

Default 9

Platforms

All

tunnel-table-pref

Syntax

tunnel-table-pref

Context

[Tree] (config>router>mpls tunnel-table-pref)

Full Context

configure router mpls tunnel-table-pref

Description

Commands in this context configure the tunnel table preference for RSVP-TE LSP and SR-TE LSP tunnel types.

Platforms

All

tunnel-table-pref

Syntax

tunnel-table-pref *preference-value*

no tunnel-table-pref

Context

[Tree] (config>router>mpls>fwd-policies>fwd-policy tunnel-table-pref)

Full Context

configure router mpls forwarding-policies forwarding-policy tunnel-table-pref

Description

This command configures the TTM preference value of an MPLS forwarding policy.

The *preference-value* parameter is used by applications to select one tunnel type to bind to in TTM when multiple tunnel types are enabled for the application.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command removes the configured TTM preference parameter value of the MPLS forwarding policy and assigns the default value.

Default

no tunnel-table-pref

Parameters

preference-value

Specifies the preference value.

Values 1 to 255

Default 4

Platforms

All

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>isis>segment-routing tunnel-table-pref)

Full Context

configure router isis segment-routing tunnel-table-pref

Description

This command configures the TTM preference of SR tunnels created by the IGP instance. This is used in the case of BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the new tunnel binding commands are configured to the **any** value which parses the TTM for tunnels in the protocol preference order. The user can choose to either go with the global TTM preference or list explicitly the tunnel types they want to use. When they list the tunnel types explicitly, the TTM preference will still be used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected one fails. Also, a reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to TTM a SR tunnel entry for each resolved remote node SID prefix and programs the data path with the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the setting of the default preference of the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as **SR-ISIS** and **SR-OSPF**).

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9

- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on lowest IGP instance-id.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

Default

tunnel-table-pref 11

Parameters

preference

Specifies the integer value to represent the preference of IS-IS or OSPF SR tunnels in TTM.

Values 1 to 255

Platforms

All

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>ospf3>segm-rtng tunnel-table-pref)

[Tree] (config>router>ospf>segm-rtng tunnel-table-pref)

Full Context

configure router ospf3 segment-routing tunnel-table-pref

configure router ospf segment-routing tunnel-table-pref

Description

This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel types explicitly, the TTM preference is still used to select one

type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

Note:
The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on the lowest IGP instance ID. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

Default

tunnel-table-pref 10

Parameters

preference

Specifies the integer value to represent the preference of IS-IS, OSPF, or OSPF3 SR tunnels in the TTM.

Values 1 to 255

Platforms

All

configure ipsec tunnel-template

Description

This command creates a tunnel template. Up to 2000 templates are allowed.

Parameters

ipsec-template-identifier

Specifies the template identifier.

Values 1 to 2048

create

Mandatory keyword used when creating a tunnel-template in the IPsec context. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.238 tunnel-termination

tunnel-termination

Syntax

tunnel-termination {*ip-address* | *ipv6-address*} **fpe** *fpe-id* [**create**]

no tunnel-termination {*ip-address* | *ipv6-address*}

Context

[Tree] (config>service>vprn>vxlan tunnel-termination)

Full Context

configure service vprn vxlan tunnel-termination

Description

This command instructs the system to redirect traffic to the corresponding PXC interface associated with the configured FPE when the destination IP address matches the configured tunnel termination IP address. Because the IP address is registered, the system can respond to ICMP packets directed to it.

The **no** form of this command removes the non-system IP address as the tunnel termination IP address.

Parameters

ip-address* | *ipv6-address

Specifies the non-system IPv4 or IPv6 address that terminates the VXLAN.

Values ip-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

where:

x: [0 to FFFF]H

d: [0 to 255]D

fpe-id

Specifies the FPE identifier associated with the PXC port or LAG that processes and terminates the VXLAN.

Values 1 to 64

create

Mandatory keyword to create the FPE.

Platforms

All

tunnel-termination

Syntax

tunnel-termination *ip-address* **fpe** *fpe-id* **[create]**

no tunnel-termination *ip-address*

Context

[Tree] (config>service>system>vxlan tunnel-termination)

Full Context

configure service system vxlan tunnel-termination

Description

This command instructs the system to redirect traffic to the corresponding PXC interface associated with the configured Forwarding Path Extension (FPE) when the destination IP address matches the configured tunnel-termination IP address. The IP address is also registered, which enables the system to respond to ICMP packets directed to it.

Parameters

ip-address

Specifies the non-system IPv4 or IPv6 address that terminates the VXLAN.

fpe-id

Specifies the FPE identifier associated with the PXC port or LAG that processes and terminates the VXLAN.

Values 1 to 64

create

Creates the FPE.

Platforms

All

Syntax

tunnel-termination [*ip-address* | *ipv6-address*] **fpe** *fpe-id* [**create**]

no tunnel-termination [*ip-address* | *ipv6-address*]

Context

[Tree] (config>service>system>gre-eth-bridged tunnel-termination)

Full Context

configure service system gre-eth-bridged tunnel-termination

Description

This command configures an end-point IP address for a GRE tunnel carrying Ethernet payload that is to be terminated on a PW SAP. It also associates this IP address with the FPE object that is providing cross-connect logic between the tunnel and the PW port. This IP address fully supports ICMP protocols such as PING, traceroute, and others.

Parameters

ip-address

The tunnel end-point IP address in the SR OS node.

ipv6-address

The tunnel end-point IPv6 address in the SR OS node.

fpe id

The FPE ID that is providing cross-connect service between the GRE tunnel and the PW port.

Values 1 to 64

Platforms

[Tree] (config>router>ldp>targ-session>auto-tx>ipv4 tunneling)

Full Context

configure router ldp targeted-session auto-rx ipv4 tunneling

configure router ldp targeted-session auto-tx ipv4 tunneling

Description

This command enables the local system to use the targeted LDP session to send FEC/label bindings that it has advertised to other LDP peers. For LDP rLFA, the source node requires the PQ node's label binding information in order to reach the destination. Therefore, this command must be enabled for the **auto-rx** context. However, because **auto-rx** has lower precedence, **tunneling** must be enabled under the **auto-tx** command, in case **auto-rx** is in a **no shutdown** state on the same system.

The **no** form of this command disables the local system from sending FEC/label bindings.

Default

no tunneling

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.243 two-way-delay-test

two-way-delay-test

Syntax

two-way-delay-test {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**priority** *priority*]

Context

[Tree] (oam>eth-cfm two-way-delay-test)

Full Context

oam eth-cfm two-way-delay-test

Description

This command issues an ETH-CFM two-way delay test.

Parameters

mac-address

Specifies a unicast destination MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

remote-mepid *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

priority

Specifies the priority.

Values 0 to 7

Default 7

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.244 two-way-slm-test

two-way-slm-test

Syntax

two-way-slm-test {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**priority** *priority*] [**send-count** *send-count*] [**size** *data-size*] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (oam>eth-cfm two-way-slm-test)

Full Context

oam eth-cfm two-way-slm-test

Description

This command configures an Ethernet CFM two-way SLM test in SAA.

Parameters

mac-address

Specifies a unicast destination MAC address in the format xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

remote-mepid *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

priority

Specifies the priority.

Values 0 to 7

Default 7

send-count

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. The message interval value must be expired before the next message request is sent.

Values 1 to 1000

Default 1

data-size

Specifies the size of the data portion of the data TLV. If 0 is specified, no data TLV is added to the packet.

Values 0 to 1500

Default 0

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded. The *timeout* value must be less than the interval.

Values 1 to 10

Default 5

interval

Specifies the **interval** parameter in seconds, expressed as a decimal integer. This parameter is used to configure the spacing between probes within a test run.

Values 0.1 to 0.9, 1 to 10

Default 5

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.245 tx

tx

Syntax

tx

Context

[Tree] (config>subscr-mgmt>pfcp-association tx)

Full Context

configure subscriber-mgmt pfcp-association tx

Description

Commands in this context configure parameters that determine how PFCP messages are sent.

Default

tx

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tx

Syntax

tx auto-generated

tx bytes *byte-string* [*byte-string*...(up to 64 byte-strings max, 64 bytes max)]

tx string *identifier*

no tx

Context

[Tree] (config>port>otu>pm-tti tx)

Full Context

configure port otu pm-tti tx

Description

This command enables the user to configure the transmit (tx) trail trace identifier (TTI) for path monitoring (PM) in the ODU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes.

The **no** form of this command reverts to the default TTI value.

Default

Auto-generated in the format of *nodename:iomnum/mdanum/portnum/dwdmchan*

The auto-generated value has five sections:

- Nodename — The first section is the name of the node.
- iomnum — The second section contains the IOM slot number.
- mdanum — The third section contains the MDA slot number.
- portnum — The fourth section contains the port number.
- dwdmchan — The fifth section contains the DWDM channel number (see the table "DWDM Channel Numbers” in the **channel** command [**config>port>dwdm channel**, **config>port>dwdm>coherent channel**, **config>port>dwdm>tdcm channel**]).

Parameters

auto-generated

Specifies to use the system generated (default) TTI.

identifier

Sets the PM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0.

byte-string

Sets the PM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings. Up to 64 byte strings can be specified in a single statement.

Values 0 to FF, in hexadecimal byte notation

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

Syntax

tx *byte*

tx auto

Context

[Tree] (config>port>otu>psi-payload tx)

Full Context

configure port otu psi-payload tx

Description

This command allows the user to configure the transmit payload type value in byte 0 of the payload structure identifier (PSI) of the OPU overhead.

Default

3 for 10GE-LAN/WAN or OC192 with OTU encapsulation; 5 for GFP framed 10GE-LAN with OTU encapsulation.

Parameters

auto

Transmits the standard value in the payload type field.

byte

Specifies the transmit payload type value in bytes.

Values [00 to FF] Hexadecimal notation

Default 00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

Syntax

tx auto-generated

tx bytes *byte-string* [*byte-string*)]

tx string *identifier*

no tx

Context

[Tree] (config>port>otu>sm-tti tx)

Full Context

configure port otu sm-tti tx

Description

This command allows the user to configure the transmit (tx) trail trace identifier (TTI) for section monitoring (SM) in the OTU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes.

The **no** form of this command reverts to the default TTI value.

Default

Auto-generated in the format of *nodename:iomnum/mdanum/portnum/dwdmchan*

The auto-generated value has five sections:

- Nodename — The first section is the name of the node.
- iomnum — The second section contains the IOM slot number.
- mdanum — The third section contains the MDA slot number.
- portnum — The fourth section contains the port number.
- dwdmchan — The fifth section contains the DWDM channel number (see the table "DWDM Channel Numbers" in the **channel** command [**config>port>dwdm channel**, **config>port>dwdm>coherent channel**, **config>port>dwdm>tdcm channel**]).

Parameters

auto-generated

Specifies to use the system generated (default) TTI.

identifier

Sets the SM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0. Up to 64 byte strings can be specified in a single statement.

byte-string

Sets the SM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings.

Values 0 to FF, in hexadecimal byte notation

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

Syntax

tx {**string** *identifier* | **bytes** *byte-sequence* | **auto-generated**}

Context

[Tree] (config>port>otu>psi-trace tx)

Full Context

configure port otu psi-trace tx

Description

This command allows the user to configure the transmit trace in bytes 1 to 255 (skipping byte 0) of the payload structure identifier (PSI) of the OPU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 255 bytes.

Default

Blank (all zeros)

Parameters

auto-generated

Sets the default PSI trace.

identifier

Sets the PSI trace to the string provided by the user. If the string is less than 255 bytes, the remaining bytes will be set to 0.

byte-sequence

[byte1 byte2 to byte64] Sets the PSI trace to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings.

Values 0 to FF, in hexadecimal byte notation

24.246 tx-credit-max

no tx-mgmt-address

Context

[Tree] (config>port>ethernet>lldp>dstmac tx-mgmt-address)

Full Context

configure port ethernet lldp dest-mac tx-mgmt-address

Description

This command specifies which management address to transmit. The operator can choose to send the system IPv4 address, the system IPv6 address, the out-of-band IPv4 address, the out-of-band IPv6 address, or any combination of these. The system address is sent only once. The address must be configured for the specific version of the protocol in order to send the management address.

The **no** form of the command resets value to the default.

Default

no tx-mgmt-address

Parameters

system

Specifies to use the system IP address. The system address will only be transmitted once it has been configured if this parameter is specified.

system-ipv6

Specifies to use the system IPv6 address. The system address will only be transmitted once it has been configured if this parameter is specified.

oob

Specifies to use the out-of-band IPv4 address for active CPM.

oob-ipv6

Specifies to use the out-of-band IPv6 address for active CPM.

tx-tlvs

Syntax

tx-tlvs [**port-desc**] [**sys-name**] [**sys-desc**] [**sys-cap**]

no tx-tlvs

Context

[Tree] (config>port>ethernet>lldp>dstmac tx-tlvs)

Full Context

configure port ethernet lldp dest-mac tx-tlvs

Description

This command specifies which LLDP TLVs to transmit. The TX TLVs, defined as a bitmap, includes the basic set of LLDP TLVs whose transmission is allowed on the local LLDP agent by the network management. Each bit in the bitmap corresponds to a TLV type associated with a specific optional TLV. Organizationally-specific TLVs are excluded from this bitmap.

There is no bit reserved for the management address TLV type since transmission of management address TLVs are controlled by another object.

The **no** form of this command resets the value to the default.

Default

no tx-tlvs

Parameters

port-desc

Indicates that the LLDP agent should transmit port description TLVs.

sys-name

Indicates that the LLDP agent should transmit system name TLVs.

sys-desc

Indicates that the LLDP agent should transmit system description TLVs.

sys-cap

Indicates that the LLDP agent should transmit system capabilities TLVs.

Platforms

24.255 tx-while-sync-uncertain

tx-while-sync-uncertain

Syntax

[**no**] **tx-while-sync-uncertain**

Context

[Tree] (config>system>ptp tx-while-sync-uncertain)

Full Context

configure system ptp tx-while-sync-uncertain

Description

This command configures the local PTP clock to transmit Announce messages to downstream clocks, indicating it has not yet stabilized on the recovered synchronization source (upstream clocks or GM clock). While the PTP clock is unsynchronized, the SyncUncertain state is true.

The **no** form of this command prevents the local PTP clock from sending Announce messages to downstream clocks to indicate it is not synchronized to a valid timing source. If the **no** form of this command is used while the clock's SyncUncertain state is true, unicast negotiation grant requests are not granted and current grants are canceled.

Default

tx-while-sync-uncertain

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

type

Syntax

type {**sr-mpls** | **srv6**}

Context

[Tree] (conf>router>segment-routing>sr-policies>policy type)

Full Context

configure router segment-routing sr-policies static-policy type

Description

This command configures the type of the static policy. Only commands relevant to the type of the static policy (SRv6 or SR-MPLS) can be executed. The type of the static policy can only be changed to a new type if there is no configuration present for the old type, or if all configuration for the old type is deleted.

Default

type sr-mpls

Parameters

sr-mpls

Specifies segment routing MPLS.

srv6

Specifies segment routing IPv6.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

type

Syntax

type *reflector-type*

Context

[Tree] (config>router>twamp-light>reflector type)

[Tree] (config>service>vprn>twamp-light>refl type)

Full Context

configure router twamp-light reflector type

configure service vprn twamp-light reflector type

Description

This command configures the processing behavior of the TWAMP Light reflector. When the value is **twamp-light**, the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is **stamp**, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet.

In mixed environments where different types of session senders may be targeting a common TWAMP Light reflector, the value should be set to stamp. When the reflector is operating in stamp mode, the primary parsing is based on STAMP, checking and processing known TLVs, and also determining when TLVs are not present and the arriving PDU is a TWAMP Light PDU. A session sender launching a TWAMP Light-based packet must use all zeros and a padding pattern zero when the pad size is non zero.

Default

type twamp-light

Parameters

reflector-type

Specifies the type of processing behavior for the reflector.

Values stamp, twamp-light

Platforms

[Tree] (config>service>vprn type)

Full Context

configure service vprn type

Description

This command designates the type of VPRN instance being configured for hub and spoke topologies. Use the **no** form to reset to the default of a fully meshed VPRN.

Default

no type

Parameters

hub

Specifies a hub VPRN which allows all traffic from the hub SAPs to be routed to the destination directly, while all traffic from spoke VPRNs or network interfaces can only be routed to a hub SAP.

spoke

Specifies a spoke VPRN which allows traffic from associated SAPs or spoke terminations to only be forwarded through routes learned from separate VPRN, which should be configured as a type Hub VPRN.

subscriber-split-horizon

Controls the flow of traffic for wholesale subscriber applications.

Platforms

All

type

Syntax

[**no**] **type**

Context

[Tree] (config>saa>test type)

Full Context

configure saa test type

Description

This command creates the context to provide the test type for the named test. Only a single test type can be configured.

A test can only be modified while the test is in shut down mode.

Once a test type has been configured, the command can be modified by re-entering the command. However, the test type must be the same as the previously entered test type.

To change the test type, the old command must be removed using the **config>saa>test>no type** command.

The **no** form of this command removes the test type parameters from the configuration.

Platforms

All

type

Syntax

type *filter-type*

no type

Context

[Tree] (config>qos>sap-ingress>ipv6-criteria type)

[Tree] (config>qos>sap-ingress>ip-criteria type)

Full Context

configure qos sap-ingress ipv6-criteria type

configure qos sap-ingress ip-criteria type

Description

This command sets the **ip-criteria** and **ipv6-criteria** type to control the type of match entries configurable in this context.

Default

type normal

Parameters

filter-type

Specifies which type of entries that the **ip-criteria** and **ipv6-criteria** statements can contain.

Values **normal** — Regular match criteria are allowed; VXLAN VNI matching is not allowed.

tagged-entries — Specifies that entries within that criteria statement are tagged. Tagged entries are not populated by default, they are only populated when their tag value is activated using the criteria override under an Ethernet SAP.

The **type** can only be changed from **normal** to **tagged-entries** if there are no **ip-criteria** or **ipv6-criteria** entries configured and the SAP ingress QoS policy is not applied to any object.

A SAP ingress QoS policy configured with a criteria statement with **type tagged-entries** is not supported within an SLA profile, sub profile or MSAP policy, or under an IES/VPRN group interface SAP.

The configuration of **type tagged-entries** is mutually exclusive with the configuration of the **match dst-port** in the same criteria statement.

vxlan-vni — Matching is allowed on a VXLAN VNI for VXLAN and VXLAN GPE frames.

The type cannot be changed when **ip-criteria** or **ipv6-criteria** entries are configured. If there are no **ip-criteria** or **ipv6-criteria** entries configured, the type can be changed from **vxlan-vni** to **normal**. The type can only be changed from **normal** to **vxlan-vni** if there are no **ip-criteria** or **ipv6-criteria** entries configured but it is necessary that the SAP ingress QoS policy is also not applied to any object in order to change from **normal** to **vxlan-vni**.

A SAP ingress QoS policy configured with **type vxlan-vni** can be applied to any Ethernet SAPs, except for a PW-SAP, B-VPLS SAP, or CCAG SAP, in any applicable service.

Full Context

configure router policy-options policy-statement default-action type

configure router policy-options policy-statement entry action type

Description

This command sets the subtype for the Type 5 LSA (external LSA).

The **no** form of this command disables assigning a type in the route policy entry.

Default

type 2

Parameters

type

Specifies the type metric.

Values Subtype 1 — The external metric in the external LSA is comparable with the internal metric, and thus one can sum up all the metrics along the path (both internal and external) to get the total cost to the destination.

Subtype 2 — The metric in the external LSA is much more important than the internal metric, so the internal metrics should only be considered when comparing two external routes that have the same external metric.

param-name

The type parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

ua

Syntax

[**no**] **ua** *function-value*

Context

[Tree] (config>router>segment-routing>srv6>inst>ms-loc>func ua)

Full Context

configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function ua

Description

Commands in this context configure the attributes of the uA micro-SID function associated with a P2P interface. The uA micro-SID function encodes the behavior of an adjacency SID.

The range of allowed configurable values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1] to form a uA micro-SID.

Static micro-SID values range in [1024*global-sid-entries, 1024*global-sid-entries + max-entries – 1].

A static function value can be configured for each combination of SRH mode and protection type.

For a specified interface, the static function value associated with the same combination of protection type and SRH mode overrides any corresponding automatically allocated function value (**ua-auto-allocate** command configuration).

If more than one value is configured for an interface and combination of SRH mode and protection type, they are all advertised in IS-IS.

When used in remote TI-LFA repair tunnel programming, IS-IS uses rules to select one uA value from the multiple values received in IS-IS link advertisements.

The values assigned to loopback and system interfaces are not advertised in IS-IS.

The uA micro-SID functions for adjacencies over broadcast interfaces are always automatically allocated based on the configuration of the following command:

```
configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator
 function ua-auto-allocate
```

The **no** form of this command removes the function value from the configuration.

Parameters

function-value

Specifies the SRv6 uA function.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

25.2 ua-auto-allocate

ua-auto-allocate

Syntax

[**no**] **ua-auto-allocate srh-mode** *srh-mode* **protection** *protection*

Context

[Tree] (config>router>segment-routing>srv6>inst>ms-loc>func ua-auto-allocate)

Full Context

configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function ua-auto-allocate

Description

This command configures a list entry for the automatic allocation of the uA micro-SID function for all adjacencies over all network interfaces on the router (P2P and broadcast interfaces).

Auto-allocated uA function value (N) is drawn by the system from the following range [max-entries + 1, 2^sid-length – 1024*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro SID range [1024*global-sid-entries, 2^sid-length – 1]. Dynamic micro-SID values range in [1024*global-sid-entries + max-entries, 2^sid-length – 1].

A list entry is a combination of the protection type and the SRH mode. Any combinations in addition to the maximum number of entries supported by this command must be allocated statically for each P2P interface. The maximum number of entries in this list is two.

When no list entries are configured, no uA function values are automatically allocated by default for a micro-segment locator.

Note:
Any change to this list causes a re-allocation of new function values to all interfaces on the router that results in flooding them to the network and triggers a new SPF in all routers.

The **no** form of this command removes the function value from the configuration.

Parameters

srh-mode

Specifies the SRH mode for the SID.

Values psp — Penultimate Segment Pop (PSP) of the SRH

usp — Ultimate Segment Pop (USP) of the SRH

psp-usd — Supports both PSP of the SRH and Ultimate Segment Decapsulation (USD) on the same SID

usp-usd — Supports both USP of the SRH and USD on the same SID

psp-usp-usd — Supports PSP and USP of the SRH with USD on the same SID

protection

Specifies whether the adjacency SID is protected.

Values protected, unprotected

25.9 udp-port

udp-port

Syntax

udp-port *udp-port-number*

Context

[Tree] (config>router>mtrace2 udp-port)

[Tree] (config>service>vprn>mtrace2 udp-port)

Full Context

configure router mtrace2 udp-port

configure service vprn mtrace2 udp-port

Description

This command specifies the destination and listening port for the **mtrace2** command. When it is configured, this command generates Mtrace2 packets with the configured UDP port, and also listens on the same port for any incoming Mtrace2 packets.

Port 33435 is the IANA-assigned port for Mtrace2. On several operating systems (for example, Linux OS, SR OS), this port is also used by traceroute. On SR OS, if port 33435 is configured as the Mtrace2 port, SR OS does not respond to traceroute on this port.

Default

5000

Parameters

udp-port-number

Specifies the UDP port for the test.

Values 1024 to 49151

Platforms

All

25.10 udp-protocols

udp-protocols

Syntax

udp-protocols *protocol-set*

Context

[Tree] (config>app-assure>group>tether-detect>ttl-mon udp-protocols)

Full Context

configure application-assurance group tethering-detection ttl-monitoring udp-protocols

Description

This command configures whether AA analyzes all UDP traffic or only traffic from standard applications that generate consistent TTL values. Configuring AA to analyze only standard UDP traffic is recommended.

Default

udp-protocols standard

Parameters

protocol-set

Specifies the scope of analysis for UDP traffic.

Values standard, all

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.11 udp-return-object

udp-return-object

Syntax

udp-return-object *ip-address*

no udp-return-object

Context

[Tree] (config>oam-pm>session>mpls>lsp>rsvp udp-return-object)

[Tree] (config>oam-pm>session>mpls>lsp>rsvp-auto udp-return-object)

Full Context

configure oam-pm session mpls lsp rsvp udp-return-object

configure oam-pm session mpls lsp rsvp-auto udp-return-object

Description

This command configures the destination IP address used by the far end of the test to send a test response. The UDP port in the UDP-Return Object is set to 64353 for MPLS DM PDUs.

RSVP tunnels are unidirectional and must include a configured local address for the responder can route the response back by the IP control plane. If the configuration is absent, the DN test fails to activate. If the configured IP address is not a local address, the command fails.

The **no** form of this command removes the udp-return-object IP address.

Parameters

ip-address

Specifies the destination IP.

Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

25.13 udt2m

udt2m

Syntax

udt2m [*function-value*]

no udt2m

Context

[Tree] (config>service>vpls>srv6>ms-locator>function udt2m)

Full Context

configure service vpls segment-routing-v6 micro-segment-locator function udt2m

Description

This command configures the SRv6 uDT2M behavior and function value that is associated with the SRv6 instance in the service. This means that decapsulation and table lookup for IPv6 prefixes occurs in the VPLS service.

The range of allowed configurables values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1] to form a uDT2M micro-SID. Static micro-SID values range in [1024*global-sid-entries, 1024*global-sid-entries + max-entries – 1].

If no value is configured, the system draws a function value (N) from the following range [max-entries + 1, 2^sid-length – 1024*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1]. Dynamic micro-SID values range in [1024*global-sid-entries + max-entries, 2^sid-length – 1].

The **no** form of this command removes the function behavior and value from the configuration.

Parameters

function-value

Specifies the SRv6 micro-segment uDT2M function value.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Description

This command configures the SRv6 uDT6 behavior and function value that is associated with the SRv6 instance in the service. This implies that decapsulation and table lookup for IPv6 prefixes occurs in the VPRN.

The range of allowed configurables values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro SID range [1024*global-sid-entries, 2^sid-length – 1] to form a uDT6 micro-SID. Static micro-SID values range in [1024*global-sid-entries, 1024*global-sid-entries + max-entries – 1].

If no value is configured, the system draws a function value (N) from the following range [max-entries + 1, 2^sid-length – 1024*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1]. Dynamic micro-SID values range in [1024*global-sid-entries + max-entries, 2^sid-length – 1].

The **no** form of this command removes the function behavior and value from the configuration.

Parameters

function-value

Specifies the SRv6 micro-segment uDT6 function value.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

25.18 udx2

udx2

Syntax

udx2 [*function-value*]

no udx2

Context

[Tree] (config>service>epipe>srv6>ms-locator>function udx2)

Full Context

configure service epipe segment-routing-v6 micro-segment-locator function udx2

Description

This command configures the SRv6 micro-segment uDX2 behavior and function value that is associated with the SRv6 instance in the service. This means that decapsulation and cross-connect to the egress SAP occurs in the Epipe service.

The range of allowed configurables values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1] to form a uDX2 micro-SID. Static micro-SID values range in [1024*global-sid-entries, 1024*global-sid-entries + max-entries – 1].

If no value is configured, the system draws a function value (N) from the following range [max-entries + 1, 2^sid-length – 1024*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1]. Dynamic micro-SID values range in [1024*global-sid-entries + max-entries, 2^sid-length – 1].

The **no** form of this command removes the function behavior and value from the configuration.

Parameters

function-value

Specifies the SRv6 micro-segment uDX2 function value.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

25.19 ue

ue

Syntax

ue *ieee-address* [**profile** *trace-profile-name*]

no ue *ieee-address*

Context

[Tree] (debug>call-trace>wlan-gw ue)

Full Context

debug call-trace wlan-gw ue

Description

This command starts tracing the UE with the specified MAC address. The trace is started with default parameters or optionally parameters specified in the trace-profile.

The **no** form of this command stops the trace and make sure no new traces are started.

Parameters

ieee-address

Displays information about the MAC address of this UE.

trace-profile-name

Specifies the name of a configured trace profile.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.20 ue-creation-type

ue-creation-type

Syntax

Context

[Tree] (config>aaa>isa-radius-plcy>acct-include-attributes ue-creation-type)

Full Context

configure aaa isa-radius-policy acct-include-attributes ue-creation-type

Description

This command enables including the Alc-Wlan-Ue-Creation-Type.

Default

no ue-creation-type

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.21 ue-query

ue-query

Syntax

ue-query *query-id* [**name** *name*] [**create**]

no ue-query *query-id*

Context

[Tree] (config>subscr-mgmt>wlan-gw ue-query)

Full Context

configure subscriber-mgmt wlan-gw ue-query

Description

This command creates a UE query where filter criteria over WLAN-GW ISA UEs are defined. This query can later be used to retrieve state of the UEs matching the configured criteria.

The **no** form of this command removes the query.

Parameters

query-id

Specifies the ID assigned to a query.

Values 1 to 1024

name

Specifies the name assigned to a query, up to 32 characters.

create

Creates a UE query.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.22 ue-state

ue-state

Syntax

[**no**] **ue-state**

Context

[Tree] (config>subscr-mgmt>wlan-gw>tunnel-query ue-state)

Full Context

configure subscriber-mgmt wlan-gw tunnel-query ue-state

Description

This command enables matching on a specific UE state. Multiple states can be provisioned. If no UE state specifier is configured, UE state matching is disabled (all UEs match).

This match criteria can be combined with minimum and maximum match criteria, which will then apply only to UEs of the specified state.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.23 uli

uli

Syntax

[**no**] **uli**

Context

[Tree] (config>subscr-mgmt>auth-plcy>include-radius-attribute uli)

Full Context

configure subscriber-mgmt authentication-policy include-radius-attribute uli

Description

This command enables the inclusion of the User Location Information in AAA protocols as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the attribute.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

uli

Syntax

[**no**] **uli**

Context

[Tree] (config>subscr-mgmt>acct-plcy>include-radius-attribute uli)

Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute uli

Description

This command, in case of ESM over GTP access, includes the ULI VSA in accounting. This VSA contains the last VSA as received via GTP. Use the **configure subscriber-mgmt radius-accounting-policy triggered-updates gtp-change uli-change** command to trigger an interim accounting update whenever ULI changes.

The **no** form of this command disables inclusion of the ULI VSA.

Default

no uli

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.24 uli-change

uli-change

Syntax

[**no**] **uli-change**

Context

[Tree] (config>subscr-mgmt>acct-plcy>triggered-updates>gc uli-change)

Full Context

configure subscriber-mgmt radius-accounting-policy triggered-updates gtp-change uli-change

Description

This command configures the router to send an interim accounting update when a user location change is detected.

The **no** form of the command configures the router not to send an interim accounting update when a user location change is detected.

Default

no uli-change

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.25 umh-pe

umh-pe

Syntax

umh-pe *ip-address* **standby** *ip-address*

no umh-pe *ip-address*

Context

[Tree] (config>service>vprn>mvpn>umh-pe-backup umh-pe)

Full Context

configure service vprn mvpn umh-pe-backup umh-pe

Description

This command assigns a standby PE to each primary PE that must be selected as an alternative PE in case the UFD session on tunnel from primary PE is detected down. Standby for a PE cannot be modified without shutting down the MVPN instance.

If a primary PE is not assigned a standby PE then the UMH selection would fall back to the default method.

Platforms

All

25.26 umh-pe-backup

umh-pe-backup

Syntax

umh-pe-backup

Context

[Tree] (config>service>vprn>mvpn umh-pe-backup)

configure service vprn mvpn provider-tunnel selective umh-rate-monitoring

Description

Commands in this context configure bandwidth monitoring for UMH redundancy.

Platforms

All

25.28 umh-selection

umh-selection

Syntax

umh-selection {**highest-ip** | **hash-based** | **tunnel-status** | **unicast-rt-pref**}

no umh-selection

Context

[Tree] (config>service>vprn>mvpn umh-selection)

Full Context

configure service vprn mvpn umh-selection

Description

This command specifies which UMH selection mechanism to use, highest IP address, hash based or provider tunnel status.

The **no** form of this command resets it back to default.

Default

umh-selection highest-ip

Parameters

highest-ip

Specifies that the highest next-hop IP address is selected as UMH. The RTM may have just one next-hop to the source, but **highest-ip** uses all of the next-hops available to BGP that appear in the BGP database.

hash-based

Specifies that the UMH selection is based on hash-based procedures set out in RFC6513, section 5.1.3. The RTM may have just one next-hop to the source, but **hash-based** uses all of the next-hops available to BGP that appear in the BGP database.

tunnel-status

Specifies that UMH selection is based on the state of the tunnel as well as the available unicast routes through the tunnel. Not supported for IPv6.

unicast-rt-pref

When selected, best unicast route will decide which UMH is chosen. All PE routers shall prefer the same route to the UMH for the UMH selection criterion (for example BGP path selection criteria must not influence one PE to choose different UMH from another PE).

Platforms

25.30 unavailability-event

unavailability-event

Syntax

unavailability-event {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]

no unavailability-event {**forward** | **backward** | **aggregate**}

Context

[Tree] (config>oam-pm>session>ethernet>lmm>loss-events unavailability-event)

[Tree] (config>oam-pm>session>ip>twamp-light>loss-events unavailability-event)

[Tree] (config>oam-pm>session>ethernet>slm>loss-events unavailability-event)

Full Context

configure oam-pm session ethernet lmm loss-events unavailability-event

configure oam-pm session ip twamp-light loss-events unavailability-event

configure oam-pm session ethernet slm loss-events unavailability-event

Description

This command sets the threshold to be applied to the overall count of the unavailability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as unavailable. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default

no unavailability-event forward

no unavailability-event backward

no unavailability-event aggregate

Parameters

forward

Specifies the threshold is applied to the forward direction count.

backward

Specifies the threshold is applied to the backward direction count.

aggregate

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold

Specifies a numerical value compared to the unavailability counter that is the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

A value of zero means that the unavailability counter must be 0.

[Tree] (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp>mcac unconstrained-bw)

Full Context

configure subscriber-mgmt sub-mcac-policy unconstrained-bw

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping mcac unconstrained-bw

Description

This command configures the bandwidth for the interface or subscriber's multicast CAC policy traffic. When disabled (**no unconstrained-bw**), there is no checking of bandwidth constraints on the interface or subscriber level. When enabled and a policy is defined, enforcement is performed. The allocated bandwidth for optional channels should not exceed the **unconstrained-bw** minus the **mandatory-bw** and the mandatory channels have to stay below the specified value for the **mandatory-bw**. After this interface and subscriber check, the bundle checks are performed.

The **no** form of this command reverts to the default.

Parameters

bandwidth

Specifies bandwidth assigned for interface's MCAC policy traffic, in kilobits per second (kb/s).

Values 0 to 2147483647

mandatory-bw

Specifies the bandwidth pre-reserved for all the mandatory channels on a given interface in kilobits per second (kb/s).

If the *bandwidth* value is 0, no mandatory channels are allowed. If the value of *bandwidth* is '-1', then all mandatory and optional channels are allowed.

If the value of *mandatory-bw* is equal to the value of *bandwidth*, then all the unconstrained bandwidth on a given interface is allocated to mandatory channels configured through multicast CAC policy on that interface and no optional groups (channels) are allowed.

The value of *mandatory-bw* should always be less than or equal to that of *bandwidth*, An attempt to set the value of *mandatory-bw* greater than that of *bandwidth*, will result in inconsistent value error.

configure router igmp group-interface mcac unconstrained-bw

configure router mld interface mcac unconstrained-bw

configure router igmp interface mcac unconstrained-bw

configure router mld group-interface mcac unconstrained-bw

Description

This command enables MCAC (or HMCAC) function on the corresponding level (subscriber, group-interface or redirected interface). When MCAC (or HMCAC) is enabled and a channel definition policy is referenced, admission control is performed. The allocated bandwidth for optional channels should not exceed the unconstrained-bw minus the mandatory-bw. The mandatory channels have to stay below the specified value for the mandatory-bw.

In HMCAC, the subscriber is checked first against its bandwidth limits followed by the check on the redirected interface or the group-interface against the bandwidth limits defined there.

In case that redirection is enabled and HMCAC enabled, the channel definition policy must be referenced under the redirected interface level. If it is referenced under the group-interface level, it will be ignored.

Subscriber MCAC (only subscriber is checked for available resources) is supported only with direct subscriber replication (no redirection). In this case the channel definition policy must be referenced under the group-interface.

If the redirection is enabled but the policy is referenced only under the group-interface, no admission control is executed (HMCAC or MCAC).

The **no** form of this command removes the values from the configuration.

Default

no unconstrained-bw

Parameters

bandwidth

Specifies the unconstrained bandwidth in kb/s for the MCAC policy.

Values 0 to 2147483647

mandatory-bw

Specifies the mandatory bandwidth in kb/s for the MCAC policy.

Values 0 to 2147483647

Platforms

All

- configure router mld interface mcac unconstrained-bw

25.35 unconsumed-agg-rate

unconsumed-agg-rate

Syntax

unconsumed-agg-rate percent *percent-of-unconsumed-agg-rate*

no unconsumed-agg-rate

Context

[Tree] (config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance unconsumed-agg-rate)

Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance unconsumed-agg-rate

Description

This command configures the percentage of the unconsumed aggregate rate that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **unconsumed-agg-rate percent** to its default value.

Default

unconsumed-agg-rate 100.00

Parameters

percent-of-unconsumed-agg-rate

Specifies the percentage of the unconsumed aggregate rate that can be given to a queue.

Values 0.00 to 100.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

25.36 unconsumed-higher-tier-rate

unconsumed-higher-tier-rate

Syntax

unconsumed-higher-tier-rate percent *percent-of-unconsumed-higher-tier-rate*

no unconsumed-higher-tier-rate

Context

[Tree] (config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance unconsumed-higher-tier-rate)

Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance unconsumed-higher-tier-rate

Description

This command configures the percentage of the unconsumed higher tier rate that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. Higher tier refers to the Vport aggregate rate and port scheduler level, group, and maximum rates.

This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **unconsumed-higher-tier-rate percent** to its default value.

Default

unconsumed-higher-tier-rate 100.00

Parameters

percent-of-unconsumed-higher-tier-rate

Specifies the percentage of the unconsumed higher tier rate that can be given to a queue.

Values 0.00 to 100.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

25.37 underflow-limit

underflow-limit

Syntax

underflow-limit *number* **threshold** *percent* [**bw** *bandwidth-in-mbps*]

no underflow-limit

Context

[Tree] (config>router>mpls>lsp>auto-bandwidth underflow-limit)

[Tree] (config>router>mpls>lsp-template>auto-bandwidth underflow-limit)

Full Context

configure router mpls lsp auto-bandwidth underflow-limit

configure router mpls lsp-template auto-bandwidth underflow-limit

Description

This command configures underflow-triggered auto-bandwidth adjustment. An underflow auto-bandwidth adjustment can occur any time during the adjust-interval; it is triggered when the number of consecutive underflow samples reaches the threshold N configured as part of this command. The new bandwidth of the LSP after a successful underflow adjustment is the maximum data rate observed in the last N consecutive underflow samples.

A sample interval is counted as an underflow if the average data rate during the sample interval is lower than the currently reserved bandwidth by at least the thresholds configured as part of this command.

The **no** form of this command disables underflow-triggered automatic bandwidth adjustment.

Default

no underflow-limit

Parameters

number

Specifies the number of consecutive underflow samples that triggers an underflow auto-bandwidth adjustment attempt.

Values 0 to 10

percent

Specifies the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as a percentage of the current bandwidth, for counting an underflow sample.

Values 0 to100

bandwidth-in-mbps

Specifies the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s) relative to the current bandwidth, for counting an underflow sample.

Values 0 to 6400000

Full Context

configure oam-pm session ethernet lmm loss-events undet-availability-event

configure oam-pm session ethernet slm loss-events undet-availability-event

configure oam-pm session ip twamp-light loss-events undet-availability-event

Description

This command sets the threshold to be applied to the overall count of the undetermined availability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as undetermined available. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default

no undet-availability-event forward

no undet-availability-event backward

no undet-availability-event aggregate

Parameters

forward

Specifies the threshold is applied to the forward direction count.

backward

Specifies the threshold is applied to the backward direction count.

aggregate

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold

Specifies the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

A value of zero means that the undetermined availability counter must be 0.

no unique-sid-per-sap

Context

[Tree] (config>subscr-mgmt>ppp-policy unique-sid-per-sap)

Full Context

configure subscriber-mgmt ppp-policy unique-sid-per-sap

Description

This command assigns a unique session ID to each PPPoE session active on a single SAP.

On a capture SAP, a unique session ID is assigned per capture SAP: multiple sessions that are active on the same or different MSAP have a unique session ID per capture SAP.

With the optional parameter **per-msap**, a unique session ID is assigned per MSAP:

- multiple sessions that are active on the same MSAP have a unique session ID per MSAP

- multiple sessions that are active on different MSAPs are not guaranteed to have a unique session ID

The session ID range is 1 to 8191.

By default, all PPPoE sessions with a different client MAC address and active on a given SAP or MSAP have a session ID of 1 (**sid-allocation sequential**) or a random value in the range 1 to 8191 (**sid-allocation random**).

The **no** form of this command reverts to the default.

Parameters

per-msap

Assigns a unique session ID for PPPoE sessions that are active on the same MSAP. This parameter has no effect on regular SAPs.

unknown-mac-route

Syntax

[**no**] **unknown-mac-route**

Context

[Tree] (config>service>vpls>bgp-evpn unknown-mac-route)

Full Context

configure service vpls bgp-evpn unknown-mac-route

Description

This command enables the advertisement of the unknown-mac-route in BGP. This will be coded in an EVPN MAC route where the MAC address is zero and the MAC address length 48. By using this unknown-mac-route advertisement, the user may decide to optionally turn off the advertisement of MAC addresses learned from SAPs and SDP-bindings, hence reducing the control plane overhead and the size of the FDB tables in the data center. All the receiving NVEs supporting this concept will send any unknown-unicast packet to the owner of the unknown-mac-route, as opposed to flooding the unknown-unicast traffic to all other nodes part of the same VPLS. Although the 7750 SR, 7450 ESS, or 7950 XRS can be configured to generate and advertise the unknown-mac-route, the router will never honor the unknown-mac-route and will flood to the vpls flood list when an unknown-unicast packet arrives to an ingress SAP/SDP-binding.

Use of the unknown-mac-route is only supported for BGP-EVPN VXLAN.

Default

no unknown-mac-route

25.51 unknown-policer

unknown-policer

Syntax

unknown-policer *policer-id* [**fp-redirect-group**]

no unknown-policer

Context

[Tree] (config>qos>sap-ingress>fc unknown-policer)

Full Context

configure qos sap-ingress fc unknown-policer

Description

Within a **sap-ingress** QoS policy forwarding class context, the **unknown-policer** command is used to map packets that match the forwarding class and are considered unknown in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination based on the ingress service type and the service instance forwarding records. If the service type is VPLS and the destination MAC address is unicast, but the MAC has not been learned and populated within the VPLS services FDB, the packet is classified into the unknown forwarding type.

Unknown forwarding type packets are mapped to either an ingress multipoint queue (using the **unknown** *queue-id* or **unknown** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**unknown-policer** *policer-id*). The **unknown** and **unknown-policer** commands within the forwarding class context are mutually exclusive. By default, the unknown forwarding type is mapped to the SAP ingress default multipoint queue. If the **unknown-policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the unknown forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast,

unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site, or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

The **unknown-policer** command is ignored for instances of the policer applied to SAPs or subscribers' multiservice site where unknown packets are not supported.

When the unknown forwarding type within a forwarding class is mapped to a policer, the unknown packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unknown forwarding type within the forwarding class to the default multipoint queue. If all forwarding class forwarding types had been removed from the default multipoint queue, the queue will not exist on the SAPs or subscriber or multiservice site associated with the QoS policy and the **no broadcast-policer** command will cause the system to attempt to create the default multipoint queue on each object. If the system cannot create the queue on each instance, the **no unknown-policer** command will fail and the unknown forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no unknown-policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters

policer-id

When the forwarding class **unknown-policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

fp-redirect-group

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms

25.53 unknown-protocols

unknown-protocols

Syntax

unknown-protocols

Context

[Tree] (config>service>nat>firewall-policy unknown-protocols)

Full Context

configure service nat firewall-policy unknown-protocols

Description

Commands in this context configure the treatment of flows of unknown Layer 4 protocols, which are protocols that cannot be natively handled by the system.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.54 unknown-queue

unknown-queue

Syntax

unknown-queue *queue-id* [**group** *queue-group-name*]

no unknown-queue

Context

[Tree] (config>qos>sap-ingress>fc unknown-queue)

Full Context

configure qos sap-ingress fc unknown-queue

Description

This command overrides the default unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters

queue-id

Specifies an existing multipoint queue defined in the **config>qos>sap-ingress** context.

Values Any valid multipoint *queue-id* in the policy including 2 through 32.

Default 11

group *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified queue-id within the queue-group-name. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the

queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts.

Platforms

All

unknown-queue

Syntax

unknown-queue *queue-id*

no unknown-queue

Context

[Tree] (config>qos>shared-queue>fc unknown-queue)

Full Context

configure qos shared-queue fc unknown-queue

Description

This command configures the unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters

queue-id

The *queue-id* must be an existing, multipoint queue defined in the **config>qos>sap-ingress** context policer-output-queues profile. For the 7950 XRS, this is not configurable in the policer-output-queues profile.

Values 25 to 32

Full Context

configure service ies subscriber-interface unnumbered

configure service vprn subscriber-interface unnumbered

Description

This command can be configured only for subscriber interfaces that do not have an IPv4 address explicitly configured and is therefore operationally in a DOWN state. By configuring this command, the subscriber interface borrows the IPv4 address from the referenced interface (directly or indirectly via IP address) that must be operationally UP and located in the same routing instance as the subscriber interface. This allows the subscriber interface to be operationally UP and consequently allow forwarding of the subscriber traffic.

Such interface is referred as unnumbered interface, since it does not have explicitly configured a unique IP address. Subscriber hosts under the unnumbered subscriber interface are installed in the fib as /32 hosts.

Without this command the subscriber interface is operationally DOWN and subscriber-host instantiation is not possible.

This command is mutually exclusive with the allow-unmatched-subnets command under the same CLI hierarchy.

The operation of IPv6 host is not affected by this command.

The **no** form of this command reverts to the default.

Parameters

ip-int-name

Specifies the interface name from which an IPv4 address is borrowed.

ip-address

Specifies the IP address from an optionally up interface that is used for subscriber interface.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Platforms

All

unnumbered

Syntax

unnumbered [{*ip-int-name* | *ip-address*}]

no unnumbered

Context

[Tree] (config>router>if unnumbered)

Full Context

configure router interface unnumbered

Description

This command sets an IP interface as an unnumbered interface and specifies the IP address to be used for the interface.

To conserve IP addresses, unnumbered interfaces can be configured. The address used when generating packets on this interface is the *ip-addr* parameter configured.

An error message will be generated if an **unnumbered** interface is configured, and an IP address already exists on this interface.

The **no** form of this command removes the IP address from the interface, effectively removing the unnumbered property. The interface must be **shutdown** before **no unnumbered** is issued to delete the IP address from the interface, or an error message will be generated.

Default

no unnumbered

Parameters

ip-int-name* | *ip-address

Optional. Specifies the IP address or IP interface name to associate with the unnumbered IP interface in dotted decimal notation. The configured IP address must exist on this node. It is recommended to use the system IP address as it is not associated with a specific interface and is therefore always reachable. The system IP address is the default if no *ip-addr* or *ip-int-name* is configured.

configure service ies subscriber-interface group-interface icmp unreachables

configure service vprn interface icmp unreachables

Description

This command configures the rate for ICMP host and network destination unreachable messages issued on the router interface.

The **unreachables** command enables the generation of ICMP destination unreachables on the router interface. The rate at which ICMP unreachables is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of destination unreachable messages which can be issued on the interface for a given time interval.

By default, generation of ICMP destination unreachables messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP destination unreachable messages on the router interface and reverts to the default values.

Default

unreachables 100 10

Parameters

number

Specifies the maximum number of ICMP unreachable messages to send. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds

Specifies the time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued.

Values 1 to 60

25.58 untrusted

untrusted

Syntax

untrusted [**default-forwarding** *default-forwarding*]

no untrusted

Context

[Tree] (config>router>if untrusted)

Full Context

configure router interface untrusted

Description

This command configures the state of untrusted for a network IP interface.

The untrusted state identifies the participating interfaces in the label security feature for prefixes of a VPN family at an inter-AS boundary. The router supports a maximum of 15 network interfaces that can participate in this feature.

The user normally applies this command to an inter-AS interface. PIP keeps track of the untrusted status of each interface. In the data path, such an interface causes the default forwarding to be set to the *default-forwarding* value.

For backward compatibility reasons, the interface **default-forwarding** is set to the **forward** value; this means that labeled packets are checked in the normal way against the table of programmed ILMs to decide if they should be dropped or forwarded in a GRT, a VRF, or a L2 service context.

If the user sets the *default-forwarding* value to **drop**, all labeled packets received on that interface are automatically dropped.

This command sets the default behavior for an untrusted interface in the data path and for all ILMs. When enabling the label security for VPN IPv4 or VPN IPv6 prefixes, BGP programs the data path to provide an exception to the normal way of forwarding handling away from the default for those VPRN ILMs.

The **no** form of this command returns the interface into the default state of trusted.

Default

no untrusted

Parameters

default-forwarding

Specifies the default forwarding behavior of labeled packets received on this interface.

Values forward, drop

Default forward

25.59 unzip

unzip

Syntax

unzip *source-file-url* [*dest-file-url*] **list**

unzip *source-file-url dest-file-url* [**create-destination**] [**force**]

Context

[Tree] (file unzip)

Full Context

file unzip

Description

This command expands the contents of a ZIP file to the local file system. Any file that is zipped using the store, deflate, or zip64 compression methods can be unzipped. The source ZIP file location can be a locally installed solid-state storage device or a remote FTP or TFTP server. Files can only be unzipped to the active CPM.

Parameters

source-file-url, dest-file-url

Specifies the source or destination file URL.

Values

local-url	[*cflash-id*/]*file-path*
	200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	{ftp | tftp}://[*login*:*pswd*@]
	remote-locn / [*file-path*]
	247 chars max, *file-path* 199 chars max
remote-locn	{*hostname* | *ipv4-address* | "["i*pv6-address*"]" }[:*port*]|
ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H
	d: [0 to 255]D
	interface - 32 characters max, for link local addresses
port	[0 to 65535]
cflash-id	cf1: | cf1-A: | cf2: | cf2-A: | cf3: | cf3-A:

create-destination

Specifies that a non-existent directory structure that is explicitly entered as the destination file URL is created as part of the unzip operation. This parameter is required to create new directories.

list

Lists the content of the ZIP file without performing the unzip operation.

force

Overwrites without prompting, any file or directory contained within the ZIP file that already exists in the destination URL. This keyword does not automatically create new directories explicitly specified by *dest-file-url*. To create these directories, use the **create-destination** flag.

up-nat-policy

Syntax

up-nat-policy *name* [**create**]

Context

[Tree] (config>service>nat up-nat-policy)

Full Context

configure service nat up-nat-policy

Description

This command creates a NAT policy template for BNG CUPS UPF. This template is instantiated for a set of subscribers sharing in a NAT pool. The policy includes parameters that define the BNG CUPS UPF NAT behavior, such as, but not limited to, the following:

- ALGs
- filtering mode
- watermarks
- ports and NAT flow limits
- priority NAT flows
- protocol timers

When the BNG CPF does not receive the NAT policy template, a default template takes effect if it is configured on the BNG UPF. The name of the default NAT policy template on the BNG UPF must equal default.

Parameters

create

Keyword required to create a new NAT policy for BNG CUPS UPF.

name

Specifies the UP NAT policy name, up to 32 characters. The name default has a special meaning representing the default NAT policy template. The system uses the default template when the BNG CPF does not receive a more specific name when the subscriber is instantiated.

25.64 up-threshold

up-threshold

Syntax

up-threshold *percent-change* [**bw** *absolute-change*]

Context

[Tree] (config>router>rsvp>dbw-accounting up-threshold)

Full Context

configure router rsvp dbw-accounting up-threshold

Description

This command sets the minimum change (in percent of the latest advertised value) above which an increase in MRLB (IS-IS TE sub-TLV 10) or MRB (OSPF TE sub-TLV 7) triggers an IGP-TE update. This configuration only applies to a change in MRLB or MRB caused by dark bandwidth. Other events affecting MRLB or MRB (such as the change of the subscription factor or the loss of link in a LAG over which the RSVP interface is defined) trigger an immediate TE update, regardless of the importance of the impact.

Optionally, the threshold can also be expressed as an absolute value. In this case, the evaluation of the change is made using the percent change and the absolute change. An IGP-TE update is sent if both of these thresholds are crossed. Changing this parameter in the course of dark bandwidth accounting does not affect the accounting cycle.

Default

up-threshold 0

Parameters

percent-change

Specifies the minimum increase in MRLB/MRB, expressed in percent.

Values 0 to 100

absolute-change

Specifies the minimum increase in MRLB/MRB, expressed in Mb/s.

Values 0 to 1000000

Platforms

7750 SR, 7750 SR-s, 7950 XRS, VSR

25.65 update

update

Syntax

update [**neighbor** *ip-address* | **group** *name*]

no update

Context

[Tree] (debug>router>bgp update)

Full Context

debug router bgp update

Description

This command decodes and logs all sent and received update messages in the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms

All

Output

The following output is an example of debug router BGP update information.

Output Example

```
debug router bgp update
```

```

[Tree] (config>service>dynsvc>acct-1 update-interval)

Full Context

configure service dynamic-services dynamic-services-policy accounting-2 update-interval

configure service dynamic-services dynamic-services-policy accounting-1 update-interval

Description

This command specifies the interval between each RADIUS Accounting Interim-Update message (minimum 5 minutes; maximum 180 days).

The **no** form of this command disables the sending of Accounting Interim-Update messages.

A RADIUS specified Accounting Interim Interval overrides the CLI configured value.

Default

no update-interval (do not send Accounting Interim-Update messages)

Parameters

hrs

specifies the interval in hours.

Values 1 to 23

min

Specifies the interval in minutes.

Values 1 to 59

days

specifies the interval in days.

Values 1 to 180

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

update-interval

Syntax

update-interval [**hrs** *hours*] [**min** *minutes*] [**days** *days*]

no update-interval

Context

[Tree] (config>service>dynsvc>ladb>user>idx>acct update-interval)

Full Context

configure service dynamic-services local-auth-db user-name index accounting update-interval

Description

This command specifies the time between each dynamic data service accounting interim update for this accounting destination. This command overrides the local configured value in the dynamic services policy.

The **no** form of this command disables the generation of interim accounting updates to this destination.

The minimum update interval is 5 minutes.

Parameters

hours

Specifies the interval in hours.

Values 1 to 23

minutes

Specifies the interval in minutes.

Values 1 to 59

days

Specifies the interval in days.

Values 1 to 180

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

update-interval

Syntax

update-interval *minutes*

no update-interval

Context

[Tree] (config>subscr-mgmt>acct-plcy update-interval)

Full Context

configure subscriber-mgmt radius-accounting-policy update-interval

Description

This command specifies the interval at which accounting data of subscriber hosts is updated in a RADIUS Accounting Interim-Update message. Requires interim-update to be enabled when specifying the accounting mode in the radius accounting policy.

A RADIUS specified interim interval (attribute [85] Acct-Interim-Interval) overrides the CLI configured value.

The **no** form of this command reverts to the default.

Parameters

minutes

Specifies the interval, in minutes, at which accounting data of subscriber hosts is updated.

Values 5 to 259200

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

update-interval

Syntax

update-interval *minutes* [**jitter** *seconds*]

no update-interval

Context

[Tree] (config>ipsec>rad-acct-plcy update-interval)

Full Context

configure ipsec radius-accounting-policy update-interval

Description

This command enables the system to send RADIUS interim-update packets for IKEv2 remote-access tunnels. The RADIUS attributes in the interim-update packet are the same as acct-start. The value of the Acct-status-type in the interim-update message is 3.

Default

update-interval 10

Parameters

minutes

Specifies the interval in minutes.

Values 5 to 259200

seconds

Specifies the jitter as the number of seconds when the system sends each interim-update packet.

Values 0 to 3600

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

update-interval

Syntax

update-interval *seconds*

Context

[Tree] (config>test-oam>link-meas>template>twl>ipv6-dest-disc update-interval)

Full Context

configure test-oam link-measurement measurement-template twamp-light ipv6-destination-discovery update-interval

Description

This command configures the transmission frequency used to maintain the peer address. IPv6 discovery packets are generated to ensure that the peer address has not changed. After the **discovery-timer** expires or a peer is discovered during the **discovery-timer** phase the value of **update-interval** is used to continue to monitor the address of the peer. When set to zero, maintaining the peer address is disabled after the initial discovery phase. If the peer has not been discovered during that phase, disabling and enabling the IPv6 protocol can be used to restart the discovery process.

Default

update-interval 600

Parameters

seconds

Specifies the frequency used for probe packets once **discovery-timer** expires.

Values 0 to 3600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>service>dynsvc>acct-2 update-interval-jitter)

Full Context

configure service dynamic-services dynamic-services-policy accounting-1 update-interval-jitter

configure service dynamic-services dynamic-services-policy accounting-2 update-interval-jitter

Description

This command specifies the absolute maximum random delay introduced on the update interval between two RADIUS Accounting Interim Update messages. The effective maximum random delay value is the minimum of the configured absolute jitter value and 10% of the configured update-interval.

A value of zero sends the accounting interim update message without introducing an additional random delay.

The **no** form of this command sets the default to 10% of the configured update-interval.

Default

no update-interval-jitter (10% of the configured update-interval)

Parameters

seconds

Specifies the absolute maximum jitter value in seconds.

Values 0 to 3600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

update-interval-jitter

Syntax

update-interval-jitter absolute *seconds*

no update-interval-jitter

Context

[Tree] (config>subscr-mgmt>acct-plcy update-interval-jitter)

Full Context

configure subscriber-mgmt radius-accounting-policy update-interval-jitter

Description

This command specifies the absolute maximum random delay introduced on the update interval between two accounting interim update messages. The effective maximum random delay value is the minimum of the configured absolute jitter value and 10% of the configured update-interval.

A value of zero will send the accounting interim update message without introducing an additional random delay.

The **no** form of this command sets the default to 10% of the configured update-interval.

Parameters

seconds

Specifies the absolute maximum jitter value in seconds.

Values 0 to 36000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service vprn gtp upf-data-endpoint

configure router gtp upf-data-endpoint

Description

This command configures the GTP - User Plane (GTP-U) endpoint used by BNG CUPS FWA sessions.

The **no** form of the command disables GTP-U termination for BNG CUPS FWA sessions.

Default

no upf-data-endpoint

Parameters

interface-name

Specifies an interface name on which GTP-U packets terminate. The name must start with a letter and can be up to 32 characters.

fpe-id

Specifies the forwarding path extension (FPE) ID used to encapsulate and decapsulate GTP-U traffic.

Values 1 to 64

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.74 upgrade

upgrade

Syntax

upgrade *index* **path** *upgrade-name*

no upgrade *index*

Context

[Tree] (config>card upgrade)

[Tree] (config>card>xiom upgrade)

[Tree] (config>card>mda upgrade)

Full Context

configure card upgrade

configure card xiom upgrade

configure card mda upgrade

Description

This command assigns a license level upgrade to the card, XIOM, or XMA. There can be multiple upgrades applied to a card, XIOM, or XMA. The first upgrade must use index 1 and then next index 2 and so on. Also, when removing upgrades, the largest index must be removed first and then the next largest removed and so on.

The path indicates the starting level and the new level that will apply due to the upgrade. For example, "cr1200g-cr1600g" can be applied to an XMA that is currently at the cr1200g level and after application of the upgrade, the operational level of the XMA shall be cr1600g.

There must be an upgrade license available for the path specified. Available upgrades can be checked using the **show licensing entitlements** command.

Note:
Some upgrades require a hard reset of the card or MDA to take effect. In general, this is required when the Full Duplex bandwidth is being changed.

Parameters

index

Specifies the order of the upgrade.

Values 1 to 6

upgrade-name

Specifies the upgrade name to be applied, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-1se

- configure card upgrade

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- configure card xiom upgrade

Context

[Tree] (config>router>gtp uplink)

[Tree] (config>service>vprn>gtp uplink)

Full Context

configure router gtp uplink

configure service vprn gtp uplink

Description

This command enables GTP configuration related to a GTP uplink using the Gn, S2a, or S2b interface.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

uplink

Syntax

uplink arbiter *arbiter-name*

uplink policer *policer-id*

uplink queue *queue-id*

uplink scheduler *scheduler-name*

no uplink

Context

[Tree] (config>subscr-mgmt>gtp>apn-policy>apn>ambr-qos-mapping uplink)

Full Context

configure subscriber-mgmt gtp apn-policy apn ambr-qos-mapping uplink

Description

When enabled, the uplink rate in the APN-AMBR IE in an incoming GTP message is interpreted as a rate override for the specified ingress QoS object. For queues and policers, the PIR is overridden.

This override uses standard SR OS QoS overrides. Therefore, a subsequent Gx/RADIUS-based override removes this override.

The **no** form of this command disables the override mechanism.

Default

no uplink

Parameters

arbiter-name

Specifies the name of the arbiter to be overridden, up to 32 characters.

policer-id

Specifies the ID of the policer to be overridden.

Values 1 to 63

queue-id

Specifies the ID of the queue to be overridden.

Values 1 to 32

scheduler-name

Specifies the name of the scheduler to be overridden, up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

uplink

Syntax

uplink *port-id*

uplink system-default

uplink none

Context

[Tree] (config>system>satellite>port-template>port uplink)

Full Context

configure system satellite port-template port uplink

Description

This command configures the uplink association to be used for the associated satellite port.

Parameters

port-id

Specifies the satellite physical port ID. This must use the format *slot*/*mda*/*port*. All satellites have a single slot and a single MDA, so these values will always be 1. For example, port 10 would be specified as 1/1/10.

system-default

Specifies that the uplink association is returned to the system default.

none

Clears the uplink association.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

25.76 uplink-forwarding-while-standby

uplink-forwarding-while-standby

Syntax

no uplink-mbr-gbr

Context

[Tree] (config>subscr-mgmt>sla-prof>pfcp>seq uplink-mbr-gbr)

Full Context

configure subscriber-mgmt sla-profile pfcp-mappings session-qer uplink-mbr-gbr

Description

This command configures the uplink MBR/GBR to QoS override mapping.

The **no** form of the command disables the uplink MBR/GBR mapping.

Default

no uplink-mbr-gbr

Parameters

arbiter-name

Specifies the arbiter target of the MBR/GBR override. The arbiter name can be up to 32 characters.

policer-id

Specifies the policer ID target of the MBR/GBR override.

Values 1 to 63

queue-id

Specifies the queue ID target of the MBR/GBR override.

Values 1 to 8

scheduler-name

Specifies the scheduler name target of the MBR/GBR override. The scheduler name can be up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.79 upnp

upnp

Syntax

upnp

Context

[Tree] (config>service upnp)

Full Context

configure service upnp

Description

Commands in this context configure UPnP parameters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.80 upnp-mappings

upnp-mappings

Syntax

upnp-mappings [*upnp-mappings*]

no upnp-mappings

Context

[Tree] (config>isa>wlan-gw-group>nat>session-limits upnp-mappings)

Full Context

configure isa wlan-gw-group nat session-limits upnp-mappings

Description

This command limits the number of Universal Plug 'n Play mappings per member

The **no** form of this command reverts to the default value.

Default

upnp-mappings 524288

Parameters

upnp-mappings

specifies, for each MDA in this ISA group, the maximum number of Universal Plug 'n Play (UPnP) mappings.

Values 1 to 524288

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

upnp-mappings

Syntax

upnp-mappings *limit* **no upnp-mappings**

Context

[Tree] (config>isa>nat-group>session-limits upnp-mappings)

Full Context

configure isa nat-group session-limits upnp-mappings

Description

This command specifies the maximum number of UPnP mappings per ISA.

Default

524288

Parameters

limit

Specifies the maximum number of UPnP mappings.

Values 1 to 524288

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.81 upnp-policy

upnp-policy

Syntax

upnp-policy *policy-name* [**create**]

no upnp-policy *policy-name*

Context

[Tree] (config>service>upnp upnp-policy)

Full Context

configure service upnp upnp-policy

Description

This command creates a new upnp-policy or enters the configuration context of an existing upnp-policy.

The **no** form of the command removes the upnp-policy policy-name from the configuration.

Parameters

policy-name

Specifies the name of the UPnP policy up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

upnp-policy

Syntax

upnp-policy *policy-name*

no upnp-policy

Context

[Tree] (config>subscr-mgmt>sub-prof upnp-policy)

Full Context

configure subscriber-mgmt sub-profile upnp-policy

Description

This command enables UPnP IGD services for the subscriber. All ESM hosts of the subscriber could use the UPnP protocol to create port mapping. This feature only support L2-Aware NAT host.

UPnP parameters are defined in the referenced upnp-policy configured in the **config> service>upnp** context.

Default

no upnp-policy

Parameters

policy-name

Specifies the UPnP policy associated with this subscriber profile up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.82 upstream-ip-filter

upstream-ip-filter

Syntax

upstream-ip-filter *filter-id*

no upstream-ip-filter

Context

[Tree] (config>service>vprn>nat>outside upstream-ip-filter)

[Tree] (config>router>nat>outside upstream-ip-filter)

Full Context

configure service vprn nat outside upstream-ip-filter

configure router nat outside upstream-ip-filter

Description

This command configures the ip-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance; it is useful for traffic that bypasses the ingress filters applied in the inside virtual router instance, such as DS-Lite traffic.

Default

no upstream-ip-filter

Parameters

filter-id

Specifies the identifier of an IP filter.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.83 upstream-ipv6-filter

upstream-ipv6-filter

Syntax

upstream-ipv6-filter *filter-id*

no upstream-ipv6-filter

Context

[Tree] (config>service>vprn>nat>outside upstream-ipv6-filter)

[Tree] (config>router>nat>outside upstream-ipv6-filter)

Full Context

configure service vprn nat outside upstream-ipv6-filter

configure router nat outside upstream-ipv6-filter

Description

This command configures the ipv6-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance. This is useful for shared v6 filters that apply to all v6 DSM hosts.

Default

no upstream-ipv6-filter

Parameters

filter-id

Specifies the identifier of an ipv6-filter.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.84 url

url

Syntax

url *rdr-url-sting*

no url

Context

[Tree] (config>subscr-mgmt>http-rdr-plcy url)

Full Context

configure subscriber-mgmt http-redirect-policy url

Description

This command configures the HTTP URL to re-direct the matching traffic to. It also can specify inclusion of original URL, MAC address and IP address of the subscriber in the redirect URL.

Parameters

rdr-url-sting

Specifies the URL to redirect to.

Values

rdr-url-string		Up to 255 characters
macro substitutions:		
	$URL	Request-URI in the HTTP GET Request received
	$MAC	A string that represents the MAC address of the subscriber host
	$IP	A string that represents the IP address of the subscriber host

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

url

Syntax

url *url-string* [**service-id** *service-id*]

url *url-string* [**service-name** *service-name*]

no url

Context

[Tree] (config>system>security>pki>ca-profile>cmpv2 url)

Full Context

configure system security pki ca-profile cmpv2 url

Description

This command specifies HTTP URL of the CMPv2 server. The URL must be unique across all configured ca-profiles.

The URL will be resolved by the DNS server configured (if configured) in the corresponding router context.

If the *service-id* is 0 or omitted, then system will try to resolve the FQDN via DNS server configured in bof.cfg. After resolution, the system will connect to the address in management routing instance first, then base routing instance.

If the service is VPRN, then the system only allows HTTP ports 80 and 8080.

Default

no url

Parameters

url-string

Specifies the HTTP URL of the CMPv2 server up to 180 characters.

service-id *service-id*

Specifies the service instance that used to reach CMPv2 server.

Values Service ID: 1 to 2147483647

base-router: 0

Platforms

All

url

Syntax

url *url*

no url

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update>crl-urls>url-entry url)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry url

Description

This command specifies the HTTP URL of the CRL file for the **url-entry**. The system supports both IPv4 and IPv6 HTTP connections.

Note:
The URL must point to a DER encoded CRL.

Default

no url

Parameters

url

Specifies the URL, which specifies the location, where an updated CRL can be downloaded from.

Platforms

All

url

Syntax

url *url-string* [**service-id** *service-id*]

url *url-string* [**service-name** *service-name*]

no url

Context

[Tree] (config>system>security>pki>ca-profile>cmp2 url)

Full Context

configure system security pki ca-profile cmp2 url

Description

This command specifies HTTP URL of the CMPv2 server. The URL must be unique across all configured ca-profiles.

The URL will be resolved by the DNS server configured (if configured) in the corresponding router context.

If the *service-id* is 0 or omitted, then system will try to resolve the FQDN via DNS server configured in bof.cfg. After resolution, the system will connect to the address in management routing instance first, then base routing instance.

Note:
If the service is VPRN, then the system only allows HTTP ports 80 and 8080.

Parameters

url-string

Specifies the HTTP URL of the CMPv2 server, up to 180 characters.

service-id *service-id*

Specifies the service instance that used to reach CMPv2 server.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **url** *url-string* **service-name** *service-name* variant can be used in all configuration modes.

Values service-id: 1 to 2147483647 base-router: 0

service-name service-name

Identifies the service, up to 64 characters.

25.85 url-entry

url-entry

Syntax

url-entry *entry-id* [**create**]

no url-entry *entry-id*

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update>crl-urls url-entry)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry

Description

This command creates a new **crl-url** entry with the **create** parameter, or enters an existing url-entry configuration context without **create** parameter.

The **no** form of this command removes the specified entry.

Parameters

entry-id

Specifies a URL configured on this system.

Values 1 to 8

create

Creates an auto URL entry.

Platforms

All

25.86 url-filter

url-filter

Syntax

url-filter *url-filter-name* [**characteristic** *characteristic-name*]

no url-filter

Context

[Tree] (config>app-assure>group>aqp>entry>action url-filter)

Full Context

configure application-assurance group app-qos-policy entry action url-filter

Description

This command configures a url-filter action for flows matching this entry.

Parameters

url-filter-name

Specifies the name of the url-filter policy.

characteristic-name

Specifies the name of the characteristic.

url-filter

Syntax

url-filter *url-filter-name* [**create**]

no url-filter *url-filter-name*

Context

[Tree] (config>app-assure>group url-filter)

Full Context

configure application-assurance group url-filter

Description

This command configures a URL filter action for flows of a specific type matching this entry.

If no URL filters are specified then no URL filters will be evaluated.

Parameters

url-filter-name

Specifies the Application-Assurance URL filter that will be evaluated.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.87 url-list

url-list

Syntax

url-list *url-list-name* [**create**]

no url-list *url-list-name*

Context

[Tree] (config>app-assure>group url-list)

Full Context

configure application-assurance group url-list

Description

This command configures a url-list object. The url-list points to a file containing a list of URLs located on the system Compact Flash. The url-list is then referenced in a url-filter object in order to filter and redirect subscribers when a URL from this file is accessed.

The **no** form of this command removes the url-list object.

Parameters

url-list-name

Specify the Application-Assurance url-list

create

Keyword used to create the URL list.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

url-list

Syntax

url-list *url-list-name* **upgrade**

Context

[Tree] (admin>app-assure>group url-list)

Full Context

admin application-assurance group url-list

Description

This command upgrades the URL list.

Parameters

url-list-name

Specifies the application assurance URL list, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Syntax

[**no**] **urpf-check**

Context

[Tree] (config>subscr-mgmt>git>ipv4 urpf-check)

Full Context

configure subscriber-mgmt group-interface-template ipv4 urpf-check

Description

This command enables the uRPF check on this interface.

The **no** form of this command disables the uRPF check on this interface.

Default

no urpf-check

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

urpf-check

Syntax

urpf-check

no urpf-check

Context

[Tree] (config>service>vprn>network>ingress urpf-check)

Full Context

configure service vprn network ingress urpf-check

Description

This command enables the unicast RPF (uRPF) check of network ingress traffic to include traffic associated with the VPRN if the incoming network interface is configured with the **urpf-selected-vprns** command

If the command is not configured, then traffic associated with this VPRN that arrives on a network interface with **urpf-selected-vprns** configured bypasses the uRPF checking options specified for that network interface.

Default

no urpf-check

Platforms

All

urpf-check

Syntax

configure router interface urpf-check

Description

This command enables unicast RPF (uRPF) Check on this interface.

The **no** form of this command disables unicast RPF (uRPF) Check on this interface.

Platforms

All

25.89 urpf-selected-vprns

urpf-selected-vprns

Syntax

[**no**] **urpf-selected-vprns**

Context

[Tree] (config>router>if urpf-selected-vprns)

Full Context

configure router interface urpf-selected-vprns

Description

This command enables uRPF checking of incoming traffic on the network interface for the following packets.

- Packets associated with the global routing table (base router) context.
- Packets associated with VPRNs that have enabled the uRPF check using the **config**>**service**>**vprn**>**network**> **ingress**>**urpf-check** command.

If the command is not configured, the default action is to perform uRPF checks for all ingress traffic on the network interface (associated with the base router and all VPRNs) based on the IPv4 and IPv6 **urpf-check** configuration options of the network interface.

Default

no urpf-selected-vprns

Platforms

All

25.90 usage-monitoring

usage-monitoring

Syntax

[**no**] **usage-monitoring**

Context

[Tree] (config>app-assure>group>statistics>aa-sub usage-monitoring)

Full Context

configure application-assurance group statistics aa-sub usage-monitoring

Description

This command enables Gx usage monitoring the given AA group/partition. It can only be enabled if there is enough usage monitoring resources for all existing subs. Once disabled, all monitoring instances for AA subscribers are silently removed (no PCRF notifications) and all subsequent AA Gx usage monitoring messages are ignored.

Default

no usage-monitoring

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.91 use-arp

use-arp

Syntax

[**no**] **use-arp**

Context

[Tree] (config>service>ies>if>dhcp use-arp)

[Tree] (config>service>vprn>if>dhcp use-arp)

Full Context

configure service ies interface dhcp use-arp

configure service vprn interface dhcp use-arp

Description

This command enables the use of ARP to determine the destination hardware address.

The **no** form of this command disables the use of ARP to determine the destination hardware address.

Platforms

All

25.92 use-bgp-routes

use-bgp-routes

Syntax

[**no**] **use-bgp-routes**

Context

[Tree] (config>service>vprn>bgp>next-hop-res use-bgp-routes)

Full Context

configure service vprn bgp next-hop-resolution use-bgp-routes

Description

This command enables the use of BGP routes to resolve BGP next hops. When this command is enabled, any unlabeled IPv4 or IPv6 BGP route received from a VPRN BGP peer becomes resolvable by up to four other BGP routes in order to resolve the route to a VPRN IP interface.

This command also allows unlabeled IPv4 or IPv6 BGP routes leaked from the GRT with unresolved next hops (in the GRT) to be resolvable by BGP-VPN routes (of the VPRN).

The **no** form of this command reverts to the default behavior. By default, a VPRN BGP route is not resolvable by another VPRN BGP route or by a BGP-VPN route.

Default

no use-bgp-routes

Platforms

All

use-bgp-routes

Syntax

[**no**] **use-bgp-routes**

Context

[Tree] (config>router>bgp>next-hop-res use-bgp-routes)

Full Context

configure router bgp next-hop-resolution use-bgp-routes

Description

This command specifies whether to use BGP routes to recursively resolve the BGP next-hop of unlabeled IPv4 and unlabeled IPv6 routes. Up to four levels of recursion are supported.

The **no** form of this command reverts to the default behavior. By default, a BGP route is not resolvable by another BGP route.

Default

no use-bgp-routes

Platforms

All

use-bgp-routes

Syntax

use-bgp-routes

Context

[Tree] (config>router>bgp>next-hop-res>lbl-routes use-bgp-routes)

Full Context

configure router bgp next-hop-resolution labeled-routes use-bgp-routes

Description

Commands in this context configure labeled route options for next-hop resolution.

Platforms

All

25.93 use-broadcast-address

use-broadcast-address

Syntax

[**no**] **use-broadcast-address**

Context

[Tree] (config>port>ethernet>dwl use-broadcast-address)

Full Context

configure port ethernet down-when-looped use-broadcast-address

Description

This command specifies whether or not the down when looped destination MAC address is the broadcast address, or the local port MAC address, as specified in the port's MAC address.

Platforms

All

25.94 use-broadcast-mac

use-broadcast-mac

Syntax

[**no**] **use-broadcast-mac**

Context

[Tree] (config>service>ipipe>sap use-broadcast-mac)

Full Context

configure service ipipe sap use-broadcast-mac

Description

This command enables the user of a of broadcast MAC on SAP.

An Ipipe VLL service with the command enabled forwards unicast IP packets using the broadcast MAC address until the ARP cache is populated with a valid entry for the CE IP and MAC addresses.

The **no** form of this command enables the user of a of broadcast MAC on SAP.

Default

no use-broadcast-mac

Platforms

All

25.95 use-def-mcast

use-def-mcast

Syntax

[**no**] **use-def-mcast**

Context

[Tree] (config>service>vpls>isid-policy>entry use-def-mcast)

Full Context

configure service vpls isid-policy entry use-def-mcast

Description

The **use-def-mcast** option prevents local installation of the ISIDs in the range in the MFIB and uses the default multicast tree instead for a B-VPLS. In a node that does not have I-VPLS or static-isids, this command prevents the building of an MFIB entry for this ISID when received in a SPBM TLV and allows the broadcast of ISID based traffic on the default multicast tree. If an **isid-policy** exists, the core nodes can have this policy to prevent connectivity problems when some nodes are advertising an ISID and others are not. In a I-VPLS service if the customer MAC (C-MAC) is unknown, a frame will have the Multicast DA for an ISID (PBB-OUI + ISID) flooded on the default multicast tree and not pruned.

Default

no use-def-mcast

Platforms

All

25.96 use-default-template

use-default-template

25.98 use-es-bmac

use-es-bmac

Syntax

[**no**] **use-es-bmac**

Context

[Tree] (config>service>vpls>pbb use-es-bmac)

Full Context

configure service vpls pbb use-es-bmac

Description

This command is only supported in B-VPLS instances where BGP-EVPN is enabled and controls the source B-MAC used by the system for packets coming from the SAP or spoke-SDPs when they belong to an EVPN Ethernet-Segment.

If enabled, the system will use a source B-MAC derived from the source-bmac (high order four bytes) and the least significant two bytes configured in **config>service>system>bgp-evpn>eth-seg>source-bmac-lsb** for all the packets coming from the local ethernet-segment.

If **no use-es-bmac** is configured, the system will use the regular source-bmac (provided by the **config>service>vpls>pbb>source-bmac** command, or the chassis bmac if the source-bmac is not configured).

Default

no use-es-bmac

Platforms

All

25.99 use-gi-address

use-gi-address

Syntax

use-gi-address [**scope** *scope*]

Context

[Tree] (config>service>vprn>dhcp>server use-gi-address)

[Tree] (config>router>dhcp>server use-gi-address)

Full Context

configure service vprn dhcp local-dhcp-server use-gi-address

configure router dhcp local-dhcp-server use-gi-address

Description

This command enables the use of gi-address matching. If the gi-address flag is enabled, a pool can be used even if a subnets is not found. If the **local-user-db-name** is not used, the gi-address flag is used and addresses are handed out by GI only. If a user must be blocked from getting an address the server maps to a local user database and configures the user with no address.

A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface the pool may provide IP addresses from any of the subnets included when the GI is matched to any of its subnets. This allows a pool to be created that represents a sub-int.

The **no** form of the reverts to the default.

Parameters

scope

Specifies if addresses are handed out for a certain subnet where the gi-address belongs to only or for all subnets part of the pool.

Values **subnet** — Addresses are only handed out for the subnet where the gi-address is part.

pool — All subnets part of the pool which contain subnet where the gi-address is part of can hand out addresses.

use-global-sampling-rate

Syntax

[**no**] **use-global-sampling-rate**

Context

[Tree] (config>mirror>mirror-dest use-global-sampling-rate)

Full Context

configure mirror mirror-dest use-global-sampling-rate

Description

This command configures each mirror destination service to use the global sampling rate, which allows a single high-rate sampling rate for the entire system.

The **no** form of this command disables use of the global sampling rate for the mirror destination service. Disabling the global sampling rate causes each mirror destination to mirror either at the full rate (all packets) or to mirror at the mirror destination sampling rate if the sampling rate is specified under the **sampling-rate** command.

Default

no use-global-sampling-rate

Platforms

All

25.101 use-ingress-l2tp-dscp

use-ingress-l2tp-dscp

Syntax

[**no**] **use-ingress-l2tp-dscp**

Context

[Tree] (config>subscr-mgmt>sla-prof>egress use-ingress-l2tp-dscp)

Full Context

configure subscriber-mgmt sla-profile egress use-ingress-l2tp-dscp

Description

This command enables the use of the DSCP marking taken from the L2TP header received on an L2TP Access Concentrator (LAC) for egress classification for the subscriber host using the associated sla-profile.

This command is ignored if the ingress packet is not identified as an L2TP packet.

The **no** form of this command reverts to the default.

[Tree] (config>router>dhcp6>server use-link-address)

Full Context

configure service vprn dhcp6 local-dhcp-server use-link-address

configure router dhcp6 local-dhcp-server use-link-address

Description

This command configures the local pool selection for IPv6 address or prefix assignment for the configured link-address under relay configuration. The selected pool will contain a prefix covering the link-address. The scope option defines the scope for the match. With scope **subnet**, the prefix or address selection is limited to the prefix in the pool that covers the link-address. With scope **pool**, all the prefixes in the selected pool are eligible for assignment.

The **no** form of the reverts to the default.

Default

scope subnet

Parameters

scope

Specifies the scope of the IP address selection.

Values **subnet** — Specifies that the prefix or address selection is limited to the prefix in the pool that covers the link address.

pool — Specifies that all prefixes in the selected pool are eligible for assignment.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure qos sap-egress use-policer-result-marking-dot1p-inner

Description

This command enables using the egress policer value as a criteria with which to mark dot1p-inner bits.

The **no** form of this command disables this feature.

Default

no use-policer-result-marking-dot1p-inner

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

25.108 use-pool-from-client

use-pool-from-client

Syntax

use-pool-from-client delimiter *delimiter*

use-pool-from-client

no use-pool-from-client

Context

[Tree] (config>router>dhcp>server use-pool-from-client)

[Tree] (config>service>vprn>dhcp>server use-pool-from-client)

Full Context

configure router dhcp local-dhcp-server use-pool-from-client

configure service vprn dhcp local-dhcp-server use-pool-from-client

Description

This command enables the use of the pool indicated by DHCP client. When enabled, the IP address pool to be used by this server is the pool is indicated by the vendor-specific sub-option 13 of the DHCP option 82. When disabled or if there is no sub-option 13 in the DHCP message, the pool selection falls back to the **use-gi-address** configuration.

The **no** form of this command disables the use of the pool indicated by DHCP client.

Parameters

delimiter

A single ASCII character specifies the delimiter of separating primary and secondary pool names in Option82 VSO.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.109 use-sap-bmac

use-sap-bmac

Syntax

[**no**] **use-sap-bmac**

Context

[Tree] (config>service>vpls>pbb use-sap-bmac)

Full Context

configure service vpls pbb use-sap-bmac

Description

This command enables on a per BVPLS basis the use of source B-MACs allocated to multi-homed SAPs (assigned to an MC-LAG) in the related IVPLS or Epipe service. The command will fail if the value of the source-bmac assigned to the BVPLS is the hardware (chassis) B-MAC. That is, the **source-bmac** must be a configured one.

Default

no use-sap-bmac

Platforms

All

25.110 use-sdp-bmac

use-sdp-bmac

Syntax

[**no**] **use-sdp-bmac**

Context

[Tree] (config>service>epipe>spoke-sdp use-sdp-bmac)

Full Context

configure service epipe spoke-sdp use-sdp-bmac

Description

This command indicates that this spoke SDP is expected to be part of a redundant pseudowire connected to a PBB Epipe service. Enabling this parameter will cause traffic forwarded from this spoke SDP into the B-VPLS domain to use a virtual backbone MAC as its source MAC address when both this, and the control pseudowire, are in the active state on this BEB. This virtual backbone MAC is derived from the SDP source-bmac-lsb configuration.

This command will fail when configuring it under a spoke SDP within a PBB-Epipe that is connected to a B-VPLS with mac-notification enabled.

Default

no use-sdp-bmac

Platforms

All

25.111 use-virtual-mac

use-virtual-mac

Syntax

[**no**] **use-virtual-mac**

Context

[Tree] (config>router>router-advert>if use-virtual-mac)

Full Context

configure router router-advertisement interface use-virtual-mac

Description

This command enables sending router advertisement messages using the VRRP virtual MAC address, provided that the virtual router is currently the master.

If the virtual router is not the master, no router advertisement messages are sent.

The **no** form of this command disables sending router advertisement messages.

Default

no use-virtual-mac

Platforms

All

25.112 use-vrtr-if-index

use-vrtr-if-index

Syntax

[**no**] **use-vrtr-if-index**

Context

[Tree] (config>cflowd use-vrtr-if-index)

Full Context

configure cflowd use-vrtr-if-index

Description

This command is used to export flow data using interface indexes (ifIndex values), which can be used directly as the index into the IF-MIB tables for retrieving interface statistics. Specifically, if this command is enabled, the ingressInterface (ID=10) and egressInterface (ID= 14) fields in IP flow templates used to export the flow data to cflowd version 9 and version 10 collectors will be populated with the IF-MIB ifIndex of that interface. In addition, for version 10 templates, two fields are available in the IP flow templates to specify the virtual router ID associated with the ingress and egress interfaces.

The **no** form of this command removes the command from the active configuration and causes cflowd to return to the default behavior of populating the ingress and egress interface ID with the global IF index IDs.

Default

no use-vrtr-if-index

Platforms

All

25.113 user

user

Syntax

[**no**] **user** *user-name*

Context

[Tree] (config>system>security user)

Full Context

configure system security user

Description

This command creates a local user and a context to edit the user configuration.

If a new *user-name* is entered, the user is created. When an existing *user-name* is specified, the user parameters can be edited.

When creating a new user and then entering the **info** command, the system displays a password in the output. This is expected behavior in the hash2 scenario. However, when using that user name, there will be no password required. The user can login to the system and then <ENTER> at the password prompt, the user will be logged in.

Unless an administrator explicitly changes the password, it will be null. The hashed value displayed uses the username and null password field, so when the username is changed, the displayed hashed value will change.

The **no** form of this command deletes the user and all configuration data. Users cannot delete themselves.

Parameters

user-name

Specifies the name of the user up to 32 characters.

Platforms

All

[Tree] (config>service>vprn>sub-if>grp-if>wpp user-db)

Full Context

configure service ies subscriber-interface group-interface wpp user-db

configure service vprn subscriber-interface group-interface wpp user-db

Description

This command configures the user database.

Note:
If configured, the values configured under grp-if will only be used if there is no corresponding value returned from LUDB lookup.

This command specifies the LUDB system use to lookup while creating initial host before WPP authentication. LUDB could return WPP attributes such as portal name, **initial-sla-profile**, **initial-sub-profile**, and so on LUDB is configured in **config>subscr-mgmt>local-user-db** context.

The **no** form of this command reverts to the default.

Parameters

local-user-db-name

Specifies the Local User Database name up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-db

Syntax

[**no**] **user-db**

Context

[Tree] (config>service>ies>sub-if>grp-if>ipv6>rtr-sol user-db)

Full Context

configure service ies subscriber-interface group-interface ipv6 router-solicit user-db

Description

This command enables the use of the local-user-database for authentication.

The **no** form of this command reverts to the default.

Parameters

local-user-db-name

Specifies the name of the local-user-database to authenticate the router-solicit. The local-user-database can also return a static prefix or a pool name for address assignment.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>service>vprn>sub-if>grp-if>ipoe-session user-db)

Full Context

configure service ies subscriber-interface group-interface ipoe-session user-db

configure service vpls sap ipoe-session user-db

configure service vprn subscriber-interface group-interface ipoe-session user-db

Description

This command configures the local user database to use for IPoE session authentication.

When configured on a capture SAP, the group interface must have the same local user database configured.

On a wlan-gw group interface, the **no** form of this command indicates that the user database is picked from the following sources in the order shown:

1. dhcp
2. ipv6>dhcp6
3. ipv6>router-solicit

If no user database can be found in any of these locations, processing continues as if no user database was configured. This behavior is for backwards compatibility reasons only; when using a LUDB, it should be explicitly added to the IPoE session configuration.

The **no** form of this command reverts to the default.

Parameters

local-user-db-name

Specifies the local user database name up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service ies subscriber-interface group-interface ipv6 dhcp6 user-ident

configure service vprn subscriber-interface group-interface ipv6 dhcp6 user-ident

Description

This feature is only applicable when DHCPv6-snooping is enabled. The Ethernet header MAC address on DHCPv6 is used as the default key host identification. This command allows addition the keys for identifying the DHCPv6 host. The *interface-id* can be included in addition to the MAC key to further differentiate each DHCPv6 host.

The **no** form of this command reverts to the default.

Default

user-ident mac

Parameters

user-ident

Specifies the DHCP6 user-identification for this interface.

Values **mac** — Specifies to use only the Ethernet MAC of the DHCPv6 message to identify the host.

mac-interface-id — Specifies to additionally use the interface-id to identify the DHCPv6 host.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure router dhcp local-dhcp-server user-ident

Description

This command configures the user identification method for the DHCPv4 server.

The **no** form of the reverts to the default.

Default

user-ident mac-circuit-id

Parameters

user-ident

Specifies the user identification method

Values **client-id** — Specifies to use the DHCPv4 client identifier as the user identification method.

circuit-id — Specifies to use the circuit identifier of the DHCPv4 client as the user identification method.

mac — Specifies to use the MAC address of the DHCPv4 client as the user identification method.

mac-circuit-id — Specifies to use the MAC address and circuit identifier of the DHCPv4 client as the user identification method.

remote-id — Specifies to use the MAC address of the remote end as the user identification method.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-ident

Syntax

user-ident *user-ident*

no user-ident

Context

[Tree] (config>router>dhcp6>server user-ident)

[Tree] (config>service>vprn>dhcp6>server user-ident)

Full Context

configure router dhcp6 local-dhcp-server user-ident

configure service vprn dhcp6 local-dhcp-server user-ident

Description

This command configures the keys for identification of the DHCPv6 lease being held in the lease-database (for configured period after lease timeout). Subscriber requesting a lease via DHCPv6 that matches an existing lease based on this configured key is handed the matched prefix or address. This allows address and prefix "stickiness" for DHCPv6 assigned prefixes (IA_NA or PD).

The **no** form of the reverts to the default.

Default

user-ident duid

Parameters

user-ident

Specifies the user identification method.

Values **duid** — Specifies the IPv6 DHCP unique identifier from DHCPv6.

interface-id — Specifies the IPv6 interface-id option.

interface-id-link-local — Specifies the interface-id and link-local address.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure subscriber-mgmt diameter-application-policy gx include-avp user-location-info

configure subscriber-mgmt diameter-application-policy nasreq include-avp user-location-info

Description

This command enables the inclusion of the 3GPP-User-Location-Information AVP as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the AVP.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.118 user-name

user-name

Syntax

user-name *name* [**create**]

no user-name *name*

Context

[Tree] (config>service>dynsvc>ladb user-name)

Full Context

configure service dynamic-services local-auth-db user-name

Description

This command creates a user name entry in the local authentication database. The user name entry is used to match with the user name of a local authenticated dynamic service data trigger. The user name of a dynamic service data trigger is fixed to the **sap-id**. When matched, the corresponding authentication data is used to set up the dynamic data services.

The **no** form of this command removes the user name entry from the local authentication database configuration.

Parameters

name

Specifies the user name entry name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-name

Syntax

user-name-format *format* **append** [*domain-name*] [**mac-format** *mac-format*]

user-name-format *format* **append** *domain-name*

user-name-format *format* **default-domain** *domain-name* [**mac-format** *mac-format*]

user-name-format *format* **replace** *domain-name* [**mac-format** *mac-format*]

user-name-format *format* **strip** [**mac-format** *mac-format*]

no user-name-format

Context

[Tree] (config>subscr-mgmt>auth-policy user-name-format)

Full Context

configure subscriber-mgmt authentication-policy user-name-format

Description

This command defines the format of the "user-name" field in the session authentication request sent to the RADIUS server.

The **no** form of this command switches to the default format, **mac**.

Default

By default, the MAC source address of the DHCPv4 DISCOVER or DCHPv6 SOLICIT message is used in the user-name field.

Parameters

format

Specifies the user name format in RADIUS message.

Values ascii-converted-circuit-id, ascii-converted-tuple, circuit-id, dhcp-client-vendor-opts, mac, mac-giaddr, tuple

ascii-converted-circuit-id — Identical to circuit-id, but the user name is sent to the RADIUS server as a string of hex digits, for use if there is binary data in the circuit-id

ascii-converted-tuple — Identical to tuple, but the circuit-id part of the user name is sent to the RADIUS server as a string of hex digits, for use if there is binary data in the circuit-id

circuit-id — If the system serves as a DHCP relay server which inserts option 82 info, the user name is formatted as defined under DHCP information option. If the system is not a DHCP relay server, the circuit-id is taken from option 82 in the received DHCP message. If no circuit-id can be found, the DHCP-msg is rejected.

dhcp-client-vendor-opts — IPoEv4 host (IPoE session enabled or disabled on group-interface) — The RADIUS user-name is a concatenation of the DHCPv4 Client Identifier Option 61, an "@" delimiter, and the DHCPv4 Vendor Class Identifier Option 60. Non-printing characters in the DHCP option values are converted as described below.

IPoEv6 host (IPoE session enabled on group-interface) — The RADIUS user-name is a concatenation of the identifier field of a type 2 DUID in the DHCPv6 Client Identifier Option 1, the "@" delimiter, and the opaque data field of the first vendor class data in the DHCPv6 Vendor Class Option 16. Non-printing characters in the DHCP option values are converted as described below.

IPoEv6 host (IPoE session disabled on group-interface) — The MAC source address of the DHCPv6 SOLICIT message.

In the absence of a DHCPv4 Client Identifier Option 61 or a DHCPv6 Client Identifier Option 1 containing a DUID type 2, the DHCP client MAC address is used.

In the absence of a DHCPv4 Vendor Class Identifier Option 60 or a DHCPv6 Vendor Class Option 16, the "@" delimited is omitted and nothing is appended.

Non-printing characters, that is, characters outside the ASCII range hex 21 through hex 7E, are converted into an underscore (hex 5F) character.

mac — The MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message is used in the user-name field. The format of the MAC address string used as the user name in the RADIUS authentication requests uses lowercase hex digits, and ":" as the inter-digit separator, for example, 00:11:22:aa:bb:cc is valid but 00-11-22-AA-BB-CC will return an error. The RADIUS server must be configured accordingly, otherwise the authentication request will fail.

mac-giaddr — A concatenation of the MAC address and the Relay Agent IP address (giaddr)

tuple — Specifies that the concatenation of MAC source address and circuit-ID are used in the user-name field

mac-format

Specifies how a MAC address is represented when contacting a RADIUS server. This is only used while the value of is equal to the DHCP client vendor options and if the MAC address is used by default of the DHCP client vendor options.

Examples:	ab:	00:0c:f1:99:85:b8 7xxx style
	XY-	00-0C-F1-99-85-B8 IEEE canonical style
	mmmm.	0002.03aa.abff Cisco style

append

Specifies the data type which is an enumerated integer that indicates what needs to be appended to the user-name sent to the RADIUS server.

Values 1 — nothing 2 — domain name

domain

Specifies to user the domain name. In some instances it is desired to add a domain only to usernames which have omitted the domain (@domain). In these instances a default-domain can be appended to usernames which lack a @domain.

append

Adds a "@" delimiter and the specified string after the PAP/CHAP username. No allowance is made for the presence of an existing domain or @ delimited.

replace

Replaces the character-string after the "@" delimiter with the string specified.

strip

Removes all characters after and including the "@" delimiter.

For example:

```
Command: append
String:     domainA-1.com
PAP/CHAP User:    someuser
Resulting User:    someuser@domainA-1.com

Command: append
String:     domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@existing-domain.net@domainA-1.com

Command: strip
String:
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser

Command: replace
String:     domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@domainA-1.com

Command: default-domain
String:    domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@existing-domain.net

Command: default-domain
String: domainA-1.com
PAP/CHAP User:    someuser
Resulting User:    someuser@domainA-1.com
```

user-name-format

Syntax

user-name-format *format*

no user-name-format

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>nasreq user-name-format)

Full Context

configure subscriber-mgmt diameter-application-policy nasreq user-name-format

Description

This command defines the format of the User-Name AVP value in Diameter NASREQ AA-Requests for IPoE hosts.

The **no** form of this command reverts to the default.

Parameters

format

Specifies the format of the User-Name AVP value.

Values **mac** — Specifies to use the MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message in the user-name field. The format of the MAC address string is defined with the **mac-forma**t CLI command.

circuit-id — Specifies to use the circuit ID to identify the user toward the server. If the system serves as a DHCP relay server which inserts option 82 info, the user name is formatted as defined under DHCP information option. If the system is not a DHCP relay server, the circuit-id is taken from option 82 in the received DHCP message. If no circuit-id can be found, the DHCP-msg is rejected.

tuple — Specifies to use a concatenation of MAC source address and circuit-ID.

ascii-converted-circuit-id — Identical to circuit-id, but the user name is a string of hex digits, for use if there is binary data in the circuit-id.

ascii-converted-tuple — Specifies a string of hex digits, for use if there is binary data in the circuit-id.

dhcp-client-vendor-opts — Specifies to use a concatenation of the DHCPv4 Client Identifier Option 61, the "@" delimiter, and the DHCPv4 Vendor Class Identifier Option 60. Non-printing characters in the DHCP option values are converted as described below.

In the absence of a DHCPv4 Client Identifier Option 61, the DHCP client MAC address is used.

In the absence of a DHCPv4 Vendor Class Identifier Option 60, the "@" delimiter is omitted and nothing is appended.

Non-printing characters, that is, characters outside the ASCII range hex 21 through hex 7E, are converted into an underscore (hex 5F) character.

mac-giaddr — Specifies to use a concatenation of MAC source address and DHCP GI address.

nas-port-id — Specifies to use a value of the nas-port-id with format defined in the include-avp section.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-name-format

Syntax

user-name-format *user-name-format* [**mac-format** *mac-format*]

no user-name-format

Context

[Tree] (config>aaa>isa-radius-plcy user-name-format)

Full Context

configure aaa isa-radius-policy user-name-format

Description

This command defines the format of the user-name field in the session authentication request sent to the RADIUS server. For authentication of IPv6 triggers (ICMPv6, DHCPv6, IPv6 data-trigger) the user-name format will always fall back to mac only.

The **no** form of the command switches to the default format, **mac**.

Default

user-name-format mac mac-format alu (the MAC source address of the DHCP DISCOVER message is used in the user-name field)

Parameters

user-name-format

Specifies the user name format in RADIUS message.

mac-format

Specifies how a MAC address is represented when contacting a RADIUS server. This is only used while the value of is equal to the DHCP client vendor options and if the MAC address is used by default of the DHCP client vendor options.

Examples: ab: 00:0c:f1:99:85:b8 Nokia 7xxx style

XY-	00-0C-F1-99-85-B8 IEEE canonical style

25.120 user-name-operation

user-name-operation

Syntax

user-name-operation *operation* [**domain** *domain-name*]

no user-name-operation

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>nasreq user-name-operation)

Full Context

configure subscriber-mgmt diameter-application-policy nasreq user-name-operation

Description

This command enables domain name manipulation of the user name, such as append, strip, replace or add as default.

For IPoE, this command only applies when **user-name-format** is configured to **dhcp-client-vendor-opts**.

The **no** form of this command reverts to the default.

Parameters

operation

Specifies the user name manipulations with respect to domain name values.

Values **append-domain** – appends an "@" delimiter with the specified domain-name at the end of the user-name, independent if a domain name was already present

strip-domain – removes all characters after and including the "@" delimiter

default-domain – adds an "@" delimiter and the specified domain name to user-names that have no domain name present

replace-domain – replaces the characters after the "@" delimiter with the specified domain-name

domain-name

Specifies the domain name string to be used in the specified operation, up to 128 characters.

25.121 user-srlg-db

user-srlg-db

Syntax

user-srlg-db [**enable** | **disable**]

Context

[Tree] (config>router>mpls user-srlg-db)

Full Context

configure router mpls user-srlg-db

Description

This command enables the use of CSPF by the user SRLG database. When the MPLS module makes a request to CSPF for the computation of an SRLG secondary path, CSPF will query the local SRLG and compute a path after pruning links that are members of the SRLG IDs of the associated primary path. When MPLS makes a request to CSPF for an FRR bypass or detour path to associate with the primary path, CSPF queries the user SRLG database and computes a path after pruning links that are members of the SRLG IDs of the PLR outgoing interface.

If an interface was not entered into the user SRLG database, it is assumed that it does not have any SRLG membership. CSPF will not query the TE database for IGP advertised interface SRLG information.

The disable keyword disables the use of the user SRLG database. CSPF will then resume queries into the TE database for SRLG membership information. The user SRLG database is maintained.

Default

user-srlg-db disable

25.122 user-template

user-template

Syntax

user-template {**tacplus_default** | **radius_default** | **ldap-default**}

Context

[Tree] (config>system>security user-template)

Full Context

configure system security user-template

Description

This command configures default security user template parameters.

Parameters

tacplus_default

Specifies the default TACACS+ user template. All parameters of the tacplus_default template except the "profile" are actively applied to all TACACS+ users if tacplus **use-default-template** is enabled. The **profile** parameter is used for AAA command authorization if TACACS+ authorization is disabled, or if the TACACS+ server does not return a priv-lvl for a user when **use-priv-lvl** is enabled under **tacplus authorization**. See the **tacplus authorization** command for more details.

radius_default

Specifies the default RADIUS user template. The radius_default template is actively applied to a RADIUS user if radius authorization is enabled, radius **use-default-template** is enabled, and no VSAs are returned with the auth-accept from the RADIUS server.

ldap_default

Specifies the default LDAP user template.

username

Syntax

username *user-name*

username *user-name* **no-domain**

username *user-name* **domain-only**

no username

Context

[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>host-ident username)

Full Context

configure subscriber-mgmt local-user-db ppp host host-identification username

Description

This command specifies the PPPoE username to match for a host lookup. When **no-domain** or **domain-only** is specified, the username "user[@domain]" is converted to a user and a domain entity by splitting it on the first @-sign before matching on the specific entity.

Note:
This command is only used when **username** is configured as one of the **match-list** parameters.

The **no** form of this command removes the username from the configuration.

Parameters

username

Specifies the user name, up to 253 characters, of this host. For example, "jane@nokia.com”.

no-domain

Only the user user part of the username is specified and used for matching. For example "jane".

domain-only

Only the domain part of the username is specified and used for matching, for example, nokia.com.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

username

Syntax

[**no**] **username** *username*

Context

[Tree] (debug>service>id>ppp username)

Full Context

debug service id ppp username

Description

This command enable PPP debug for the specified username. since not all PPP packets contain username, so a MAC debug filter is created automatically when system sees a PPP packet contain the specified username.

Multiple username filters can be specified in the same debug command.

The **no** form of this command disables debugging.

Parameters

user-name

Specifies the PPP username.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.124 usm-community

usm-community

Syntax

usm-community *community-string* [**hash** | **hash2** | **custom**] **group** *group-name* [**src-access-list** *list-name*]

no usm-community *community-string* [**hash** | **hash2** | **custom**]

Context

[Tree] (config>system>security>snmp usm-community)

Full Context

configure system security snmp usm-community

Description

This command is used to associate a community string with an SNMPv3 access group and its view. The access granted with a community string is restricted to the scope of the configured group.

Nokia's SR OS implementation of SNMP uses SNMPv3. In order to implement SNMPv1 and SNMPv2c configurations, several access groups are predefined. In order to implement SNMP with security features (Version 3), security models, security levels, and USM communities must be explicitly configured. Optionally, additional views which specify more specific OIDs (MIB objects in the subtree) can be configured.

The **no** form of this command removes a community string.

Parameters

community-string

Specifies the SNMPv1/SNMPv2c community string to determine the SNMPv3 access permissions to be used. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

group

Specifies the group that governs the access rights of this community string. This group must be configured first in the **config**>**system**>**security**>**snmp**> **access group** context. Nokia does not recommend associating a **usm-community** with an SNMP access group that is configured with the **li** (lawful intercept) context.

list-name

Specifies the usm-community to reference a specific src-access-list that will be used to validate the source IP address of all received SNMP requests that use this usm-community. Multiple **community**, **usm-community**, or **vprn snmp community** instances can reference the same **src-access-list**.

configure service ies interface vpls egress v6-routed-override-filter

Description

This command configures an IPv6 filter ID that is applied to packets egressing the IES R-VPLS interface. The filter overrides existing egress IPv6 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of this command removes the IPv4 routed override filter from the egress IES R-VPLS interface. When removed, egress IPv6 routed packets uses the IPv6 egress filter applied to VPLS endpoint, if configured

Parameters

ipv6-filter-id

Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

Platforms

All

v6-routed-override-filter

Syntax

v6-routed-override-filter *ipv6-filter-id*

no v6-routed-override-filter

Context

[Tree] (config>service>ies>if>vpls>ingress v6-routed-override-filter)

Full Context

configure service ies interface vpls ingress v6-routed-override-filter

Description

This command configures an IPv6 filter ID that is applied to all ingress packets entering the VPLS or I-VPLS service. The filter overrides any existing ingress IPv6 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IPv6 routed packets use any existing ingress IPv6 filter on the VPLS virtual port.

The no v6-routed-override-filter command is used to remove the IPv6 routed override filter from the ingress IP interface. When removed, the IPv6 ingress routed packets within a VPLS service attached to the IP interface will use the IPv6 ingress filter applied to the packet's virtual port, when defined.

Parameters

ipv6-filter-id

Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

Platforms

All

v6-routed-override-filter

Syntax

v6-routed-override-filter *ipv6-filter-id*

no v6-routed-override-filter

Context

[Tree] (config>service>vprn>if>vpls>egress v6-routed-override-filter)

Full Context

configure service vprn interface vpls egress v6-routed-override-filter

Description

This command configures an IPv6 filter ID that is applied to packets egressing the VPRN R-VPLS interface. The filter overrides existing egress IPv6 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of the command removes the IPv4 routed override filter from the egress VPRN R-VPLS interface. When removed, egress IPv6 packets will use the IPv6 egress filter applied to the VPLS endpoint, if configured.

Parameters

ipv6-filter-id

Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

Platforms

All

v6-routed-override-filter

Syntax

v6-routed-override-filter *ipv6-filter-id*

no v6-routed-override-filter

Context

[Tree] (config>service>vprn>if>vpls>ingress v6-routed-override-filter)

Full Context

configure service vprn interface vpls ingress v6-routed-override-filter

Description

This command configures an IPv6 filter ID that is applied to all ingress packets entering the VPLS service. The filter overrides any existing ingress IPv6 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IPv6 routed packets use the any existing ingress IPv6 filter on the VPLS virtual port.

The **no** form of the command removes the IPv6 routed override filter from the ingress IP interface. When removed, the IPv6 ingress routed packets within a VPLS service attached to the IP interface uses the IPv6 ingress filter applied to the packet's virtual port, when defined.

Parameters

ipv6-filter-id

Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay lease-split valid-lifetime

configure service ies subscriber-interface ipv6 dhcp6 relay lease-split valid-lifetime

Description

This command configures the DHCPv6 lease split valid lifetime (short lease time). DHCPv6 lease split is active when enabled and for all IA_NA and IA_PD options in the transaction the configured lease split valid lifetime (short lease time) is less than or equal to the renew time T1 committed by the server (long renew time) or 50 percent of the preferred lifetime committed by the server when T1 committed by the server equals zero.

The **no** form of this command reverts to the default value.

Default

valid-lifetime hrs 1

Parameters

[days *days*] [hrs *hours*] [min *minutes*] [sec *seconds*]

Specifies the valid lifetime values

Values		
	days:	0 to 3650
	hours:	0 to 23
	minutes:	0 to 59
	seconds	0 to 59

Platforms

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server valid-lifetime

configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server valid-lifetime

Description

This command configured valid-lifetime for DHCPv6 lease (address/prefix).

The valid lifetime is the length of time an address/prefix remains in the valid state (for example, the time until invalidation). The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address/prefix becomes invalid and must not be used in communications. RFC 2461, sec 6.2.1 recommends default value of 30 days.

Each address/prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (DHCP server, RADIUS, ESM). To request an extension of the lifetimes assigned to an address, the client sends a Renew message to the addressing authority. The addressing authority sends a Reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption.

The lifetimes are transmitted from the addressing authority to the client in the IA option on the top level (not the address or prefix level).

The **no** form of this command reverts to the default.

Default

valid-lifetime days 1

Parameters

infinite

Specifies that the valid lifetime is infinite.

Values	days:	0 to 49710
	hours:	0 to 23
	minutes:	0 to 59
	seconds	0 to 59

Platforms

Description

This command specifies the remaining time for this prefix to be valid for the purpose of on-link determination.

The **no** form of this command reverts to the default.

Default

valid-lifetime 86400

Parameters

seconds

Specifies the time for the prefix to remain valid on this interface in seconds.

Values 0 to 4294967295

infinite

Specifies that the remaining time will never expire. The value 4294967295 is interpreted as infinite.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

valid-lifetime

Syntax

valid-lifetime {*seconds* | **infinite**}

Context

[Tree] (config>service>vprn>router-advert>if valid-lifetime)

Full Context

configure service vprn router-advert interface valid-lifetime

Description

This command specifies the length of time in seconds that the prefix is valid for the purpose of on-link determination. A value of all one bits (0xffffffff) represents infinity.

The address generated from an invalidated prefix should not appear as the destination or source address of a packet.

Default

valid-lifetime 2592000

Parameters

seconds

Specifies the remaining length of time in seconds that this prefix will continue to be valid.

Values 0 to 429496729

infinite

Specifies that the prefix will always be valid. A value of 4,294,967,295 represents infinity.

Description

This command specifies the length of time in seconds that the prefix is valid for the purpose of on-link determination. A value of all one bits (0xffffffff) represents infinity.

The address generated from an invalidated prefix should not appear as the destination or source address of a packet.

Default

valid-lifetime 2592000

Parameters

seconds

Specifies the remaining length of time in seconds that this prefix will continue to be valid.

infinite

Specifies that the prefix will always be valid. A value of 4,294,967,295 represents infinity.

Platforms

All

26.6 validate

validate

Syntax

validate [*file-url*]

Context

[Tree] (admin>system>license validate)

Full Context

admin system license validate

Description

This command performs a validation on the license file pointed to by the command line argument. A validation ensures that the license is compatible with the current state of the target system but it does not change the existing license. Aspects that can cause a failure in the validation include:

- The license file was created for a different target system. The UUID encoded into the file must match that defined by the specific hardware platform.
- The license file does not include license information for the release of software currently running on the system.
- The current date/time reported to system is outside the validity period encoded in the license.
- The system is currently using a hardware upgrade license that is not included in the new file being validated.

Note:
If the CLM tool is being used for license management, it shall perform the validation and activation and there is no need to enter these commands manually.

Parameters

file-url

Specifies the file URL location to read the license file.

Values local-url, remote-url

Note:
IPv6 addresses apply only to 7750 SR and 7950 XRS.

Platforms

All

validate

Syntax

[**no**] **validate**

Context

26.7 validate-dest-prefix

validate-dest-prefix

Syntax

validate-dest-prefix

no validate-dest-prefix

Context

[Tree] (config>service>vprn>bgp>flowspec validate-dest-prefix)

Full Context

configure service vprn bgp flowspec validate-dest-prefix

Description

This command enables or disables validation of received IPv4 and IPv6 FlowSpec routes that contain a destination-prefix subcomponent.

A FlowSpec route with a destination-prefix subcomponent is considered invalid if both of the following are true:

- it was originated outside the local AS of the receiving BGP router
- the neighbor AS of the FlowSpec route does not match the neighbor AS of the best match BGP (unicast) route for the destination prefix or the neighbor AS of any longer match BGP (unicast) route for the destination prefix

An invalid route is retained in the BGP but it is not used for filtering traffic or propagated to other BGP routers.

The **no** form of this command disables the validation procedure based on destination-prefix.

Default

no validate-dest-prefix

Platforms

All

validate-dest-prefix

Syntax

[**no**] **validate-dest-prefix**

Context

[Tree] (config>router>bgp>flowspec validate-dest-prefix)

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit validity-time

Description

This command configures the validity time for the interim credit allocated to rating groups of a Diameter Gy session when Extended Failure Handling (EFH) is active. When either the allocated interim credit is consumed or the validity time expires, a new attempt is made to establish a Diameter Gy session with the Online Charging Server (OCS).The validity time applies to all interim credit allocated via the **config>subscr-mgmt>diam-appl-plcy** *application-policy-name*>**gy>extended-failure-handling>interim-credit>volume** and **config>subscr -mgmt>category-map** *category-map-name*>**category** *category-name*>**default-credit** CLI commands.

A validity time value of 0 (zero) disables the validity time for the assigned interim credit.

The **no** form of this command resets the value to the default value.

Default

validity-time 1800

Parameters

seconds

Specifies the validity time, in seconds, applicable to the interim credit.

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

26.15 value

value

Syntax

value *value*

Context

[Tree] (config>service>system>bgp-evpn>eth-seg>service-carving>manual>preference value)

Full Context

configure service system bgp-evpn ethernet-segment service-carving manual preference value

Description

This command modifies the default preference value used for the PE in the ES. An ES shutdown is not required to modify this value during maintenance operations.

Default

value 32767

Parameters

value

Determines the preference value used in the preference-based DF election algorithm.

Values 0 to 65535

Platforms

All

value

Syntax

value *function-value*

no value

Context

[Tree] (conf>router>segment-routing>srv6>ms-locator>un value)

Full Context

configure router segment-routing segment-routing-v6 micro-segment-locator un value

Description

This command configures the function value for uN. This draws the Nth value (where N = function-value) of the global micro-SID range (0 excluded) to form a unique uN micro SID. The configured value must be a unique network-wide permicro-SID block.

Parameters

function-value

Specifies the function value for uN.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

value

Syntax

[**no**] **value** *value-name*

Context

[Tree] (config>app-assure>group>policy>aso>char value)

Full Context

configure application-assurance group policy app-service-options characteristic value

Description

This command configures a characteristic value.

The **no** form of this command removes the value for the characteristic.

Parameters

value-name

Specifies a string of up to 32 characters uniquely identifying this characteristic value.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

value

Syntax

value *value*

no value

Full Context

configure service ies subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection preference-option value

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection preference-option value

configure service vprn subscriber-interface ipv6 dhcp6 relay advertise-selection preference-option value

Description

This command configures the default preference option value. A DHCPv6 preference option with specified value is inserted in the DHCPv6 advertise message for DHCPv6 clients for which no per DHCPv6 server or per client-mac solicit delay or preference option value is configured.

The **no** form of this command removes the configuration.

Parameters

value

Specifies the default preference option value.

Values 0 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

26.16 vas-filter

vas-filter

Syntax

vas-filter *name* [**create**]

no vas-filter *name*

Context

[Tree] (config>subscr-mgmt>isa-svc-chain vas-filter)

Full Context

configure subscriber-mgmt isa-service-chaining vas-filter

Description

This command configures a Value Added Service filter.

The **no** form of this command removes the VAS filter name from the configuration.

Default

This command configures a value added service (VAS) filter that can be associated to an L2-aware NAT host, and is matched on the NAT ISA to select flows for a host that needs to be steered to remote value-added services.

Parameters

name

Specifies a VAS filter name, up to 32 characters.

create

Keyword used to create the VAS filter instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.17 vas-if-type

vas-if-type

Syntax

vas-if-type {**to-from-access** | **to-from-network** | **to-from-both**}

no vas-if-type

Context

[Tree] (config>service>ies>if vas-if-type)

Full Context

configure service ies interface vas-if-type

Description

This command configures the type of a Value Added Service (VAS) facing interface. To change the **vas-if-type**, the **shutdown** command is required. The **vas-if-type** and **loopback** commands are mutually exclusive.

The **no** form of this command removes the VAS interface type configuration.

Default

no vas-if-type

Parameters

to-from-access

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from access interfaces (upstream) is redirected to a PBR target reachable over this interface for upstream VAS processing. Downstream traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

to-from-network

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from network interfaces (downstream) is redirected to a PBR target reachable over this interface for downstream VAS processing. Upstream traffic after VAS processing must arrive on this interface, so that regular routing can be applied.

to-from-both

Used when a single interface is used for VAS connectivity (no local-to-local traffic). For service chaining, both traffic arriving from access interfaces and from network interfaces is redirected to a PBR target reachable over this interface for upstream/downstream VAS processing. Traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

Context

[Tree] (config>service>system>bgp-evpn>ethernet-segment vc-id-range)

Full Context

configure service system bgp-evpn ethernet-segment vc-id-range

Description

This command determines the VC-IDs associated with the virtual Ethernet Segment on a specific SDP based on the following considerations:

- VC-IDs for manual spoke-SDP and BGP-AD are included in the range.
- Th mesh-sdp VC-IDs are not allowed on a SDP used by a virtual ES.
- A maximum of 8 ranges are allowed.
- A range can be comprised of a single VC-ID.
- A **vc-id-range** can be comprised of a single VC-ID.
- Shutting down the ES is not required prior to making changes.

The **no** form of the command removes the configured range. Only the first VC-ID value is required to remove the range.

Parameters

vc-id

Specifies the VC-ID. When configuring a range of VC-IDs (and not a single value), the value of the second VC-ID must be greater than the first VC-ID.

configure service sdp binding pw-port ingress vc-label

Description

This command configures the ingress VC label used for the PW representing the PW port.

Note that the maximum value of the vc-label that may be configured is limited by the **config**>**router**>**mpls-labels**>**static-label-range** command.

Default

no vc-label

Parameters

vc-label

Specifies a VC ingress value that indicates a specific connection.

Values 32 to 18431

Platforms

All

26.21 vc-type

vc-type

Syntax

vc-type {**ether** | **vlan**}

no vc-type

Context

[Tree] (config>service>sdp>binding>pw-port vc-type)

Full Context

configure service sdp binding pw-port vc-type

Description

This command sets the forwarding mode for the pseudowire port. The vc-type is signaled to the peer, and must be configured consistently on both ends of the pseudowire. vc-type VLAN is only configurable with dot1q encapsulation on the pseudowire port. The tag with vc-type vlan only has significance for transport, and is not used for service delineation or ESM. The top (provider tag) is stripped while forwarding out of the pseudowire, and a configured vlan-tag (for vc-type vlan) is inserted when forwarding into the pseudowire. With vc-type ether, the tags if present (max 2), are transparently preserved when forwarding in our out of the pseudowire.

The **no** form of the command reverts to the default value.

Default

vc-type ether

Parameters

ether

Specifies **ether** as the virtual circuit (VC) associated with the SDP binding.

vlan

Specifies **vlan** as the virtual circuit (VC) associated with the SDP binding.

Platforms

All

vc-type

Syntax

vc-type {**ether** | **vlan**}

Context

[Tree] (config>service>pw-template vc-type)

Full Context

configure service pw-template vc-type

Description

This command overrides the default VC type signaled for the binding to the far end SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

- The VC type value for Ethernet is 0x0005.
- The VC type value for an Ethernet VLAN is 0x0004.

Parameters

ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding. (hex 5)

vlan

Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a vlan-tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

Note:
The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

Full Context

configure saa test type vccv-ping

oam vccv-ping

Description

This command configures a Virtual Circuit Connectivity Verification (VCCV) ping test. A vccv-ping test checks connectivity of a VLL inband. It checks to verify that the destination (target) PE is the egress for the Layer 2 FEC. It provides for a cross-check between the dataplane and the control plane. It is inband which means that the **vccv-ping** message is sent using the same encapsulation and along the same path as user packets in that VLL. The **vccv-ping** test is the equivalent of the lsp-ping test for a VLL service. The vccv-ping reuses an lsp-ping message format and can be used to test a VLL configured over both an MPLS and a GRE SDP.

Note that VCCV ping can be initiated on T-PE or S-PE. If initiated on the S-PE, the **reply-mode** parameter must be used with the **ip-routed** value The ping from the T-PE can have either values or can be omitted, in which case the default value is used.

If a VCCV ping is initiated from T-PE to neighboring a S-PE (one segment only), then it is sufficient to only use the **spoke-sdp-fec-id** parameter. However, if the ping is across two or more segments, at least the **spoke-sdp-fec-id**, **src-ip-address** *ip-addr*, **dst-ip-address** *ip-addr*, **ttl** *vc-label-ttl* parameters are used where:

- The **src-ip-address** is system IP address of the router preceding the destination router.
- The *vc-label-ttl* parameter must have a value equal or higher than the number of pseudowire segments.

Note that VCCV ping is a multi-segment pseudowire. For a single-hop pseudowire, only the peer VCCV CC bit of the control word is advertised when the control word is enabled on the pseudowire.

VCCV ping on multi-segment pseudowires require that the control word be enabled in all segments of the VLL. If the control word is not enabled on a spoke SDP, it is signaled peer VCCV CC bits to the far end, consequently the **vccv-ping** cannot be successfully initiated on that specific spoke SDP.

If the **saii-type-2** and **taii-type-2** parameters are specified by the user of this command for a FEC129 pseudowire, then these values are used by the vccv-ping echo request message instead of the saii and taii of the spoke-sdp indexed by the **spoke-sdp-fec** parameter, or any saii and taii received in a switching point TLV for the pseudowire. Furthermore, the user must enter the **saii** and **taii** in accordance with the direction of the pseudowire as seen from the node on which the **vccv-ping** command is executed. However, the values of the **saii** and **taii** sent in the echo request message are swapped with respect to the user-entered values to match the order in the installed FEC on the targeted node. The output of the command for FEC129 type 2 pseudowire reflects the order of the **saii** and **taii** stored on the targeted node.

This command, when used with the **static** option, configures a Virtual Circuit Connectivity Verification (VCCV) ping test for static MPLS-TP pseudowires used in a VLL service. It checks to verify that the destination (target) PE is the egress for the Static PW FEC. It provides for a cross-check between the dataplane and the configuration. The **vccv-ping static** command reuses an **lsp-ping** message format and can be used to test an MPLS-TP pseudowire VLL configured over an MPLS SDP. VCCV Ping for MPLS-TP pseudowires always uses the VCCV control word (associated channel header) with either an IPv4 channel type (0x0021) or on-demand CV message channel type (0x0025).

Note that **vccv-ping static** can only be initiated on a T-PE. Both the echo request and reply messages are send using the same, in-band, encapsulation. If the **target-fec-type** option is not specified, then the target FEC stack contains a static PW FEC TLV. The contents of this TLV are populated based on the source node ID, source global ID, and destination global ID and destination node ID in the **vccv-ping** command (or taken from the pseudowire context if omitted from the command).

The **target-fec-type** option allows the user to test a segment of a MS-PW that does not have the same FEC type as the local segment from the T-PE where the **vccv-ping** command is issued. This is applicable for performing VCCV ping on an MS-PW comprised of static PW FEC segments and dynamically signaled PW ID FEC segments.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Parameters

sdp-id:vc-id

Specifies that if a FEC 128 PW is tested, then its VC ID must be indicated with this parameter. The VC ID needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

Values sdp-id: 1 to 32767

vc-id: 1 to 4294967295

reply-mode {ip-routed | control-channel}

Indicates to the far end, the method to send the reply message. The option **ip-routed** indicates an out-of-band reply mode using the vccv control channel. The option **control-channel** indicates an in-band reply mode using the vccv control channel.

Default control-channel

src-ip-address ***ip-addr***

Specifies the source IP address.

Values a.b.c.d

dst-ip-address ***ip-addr***

Specifies the destination IP address.

Values a.b.c.d

src-ip-address ***ip-addr***

Specifies the source IP address.

Values a.b.c.d

pw-id

Specifies the pseudowire ID to be used for performing a VCCV ping operation. The pseudowire ID is a non-zero 32-bit connection ID required by the FEC 128, as defined in RFC 8029, Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures.

Values 1 to 4294967295

target-fec-type

Specifies the FEC type for a remote PW segment targeted by a VCCV Ping echo request. This parameter is used if VCCV Ping is used along a MS-PW where a static MPLS-TP PW segment using the static PW FEC is switched to a T-LDP signaled segment using the PW ID FEC (FEC128), or vice versa, thus requiring the user to explicitly specify a target FEC that is different from the local segment FEC.

Values **pw-id-fec** — Indicates that FEC element for the remote target PW

00000000000000000000000000000000000000000000000000000000000000000000000000000000 segment is of type PW ID (FEC128).

static-pw-fec — Indicates that FEC element for the remote target PW segment is of type Static PW FEC.

attachment-group-identifier

Specifies the attachment group identifier for the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

Values 0 to 4294967295

pw-path-id-saii ***global-id:node-id:ac-id***

Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

node-id — Specifies the node-id on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

pw-path-id-taii *global-id:node-id:ac-id*

Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

node-id — Specifies the node-id on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

saii-type2 *global-id*:*prefix*:*ac-id*

Specifies that if a FEC129 AII Type 2 pseudowire is tested, then the source attachment individual identifier (SAII) must be indicated. The **saii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

taii-type2 *global-id:prefix:ac-id*

Specifies that if a FEC129 AII Type 2 pseudowire is tested, then the target attachment individual identifier (TAII) must be indicated. The **taii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

global-id — Specifies the global ID of the far end T-PE of the FEC129 pseudowire.

Values 0 to 4294967295

Default 0

node-id — Specifies the node-id on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique TAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

spoke-sdp-fec-id

Specifies that if a FEC 129 PW is tested, then its *spoke-sdp-fec-id* must be indicated with this parameter. The *spoke-sdp-fec-id* must already exist on the local router and the far-end peer must indicate that it supports VCCV to allow the user to send **vccv-ping** message.

spoke-sdp-fec is mutually exclusive with the *sdp-id:vc-id* parameter.

Values 1 to 4294967295

assoc-channel {ipv4 | non-ip}

Specifies the associated channel encapsulation format to use for the VCCV ping echo request and echo reply packet for a PW that uses the static PW FEC. An associated channel type of ipv4 must be used if a vccv-ping is performed to a remote segment of a different FEC type.

Values **ipv4** – IPv4 encapsulation in an IPv4 pseudowire associated channel (channel type 0x0021)

non-ip –MPLS-TP encapsulation without UDP/IP headers, in pseudowire associated channel using channel type 0x025.

Default non-ip

global-id

Specifies the MPLS-TP global ID for the far end node of the pseudowire under test. If this is not entered, then the *dest-global-id* is taken from the pseudowire context.

Values 0 to 4294967295

Default 0

node-id

Specifies the MPLS-TP node ID of the far end node for the pseudowire under test. If this is not entered, then the *dest-global-id* is taken from the pseudowire context.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

Default 0

sender-src-address ip-addr

Specifies the 4-octet IPv4 address of the node originating the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

remote-dst-address ip-addr

Specifies the 4-octet IPv4 address of the far end node that is a target of the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

pw-type

Specifies the PW type value of the PW segment targeted on the far end node. This field must be included to populate the PW type field of the PW ID FEC in the FEC static TLV, when the far end FEC type is different form the local FEC type and the **target-fec-type** *pw-id-fec*.

Values atm-cell (=3), atm-sdu (=2), atm-vcc (=9), atm-vpc (=10), cesopsn (=21), cesopsn-cas (=23), ether (=5), satop-e1 (=17), satop-t1 (=18), 1 to 65535

send-count

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message interval value must have expired before the next message request is sent.

Values 1 to 100

Default 1

fc-name

Specifies the **fc** parameter be used to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

The LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end 7750 SR that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message. The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating SR.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

The ToS byte is not modified. Table 163: vccv-ping Request Packet and Behavior summarizes this behavior.

Table 163: vccv-ping Request Packet and Behavior

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values

	• tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

Default out

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

octets

Specifies the size, in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request pay-load is padded with zeros to the specified size. Note that an OAM command is not failed if the user entered a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

vc-label-ttl

Specifies the time-to-live value for the vc-label of the echo request message. The outer label TTL is still set to the default of 255 regardless of this value.

Values 1 to 255

Default 1

Platforms

All

Output

The following output is an example of VCCV ping information.

Output Example

```
Ping TPE to SPE on a LDP/GRE tunnel
===================================

*A:Dut-B# oam vccv-ping 3:1
VCCV-PING 3:1 88 bytes MPLS payload
Seq=1, send from intf toSPE1-D-8 to NH 12.1.8.2
       reply from 4.4.4.4 via Control Channel

configure saa test type vccv-trace

oam vccv-trace

Description

This command configures a Virtual Circuit Connectivity Verification (VCCV) automated trace test. The automated VCCV-trace can trace the entire path of a PW with a single command issued at the T-PE or at an S-PE. This is equivalent to LSP-Trace and is an iterative process by which the source T-PE or S-PE node sends successive VCCV-Ping messages with incrementing the TTL value, starting from TTL=1. In each iteration, the T-PE builds the MPLS echo request message in a way like VCCV-Ping. The first message with TTL=1 has the next-hop S-PE T-LDP session source address in the Remote PE Address

field in the PW FEC TLV. Each S-PE which terminates and processes the message includes in the MPLS echo reply message the FEC 128 TLV corresponding the PW segment to its downstream node. The source T-PE or S-PE node can then build the next echo reply message with TTL=2 to test the next-next hop for the MS-PW. It copies the FEC TLV it received in the echo reply message into the new echo request message. The process is terminated when the reply is from the egress T-PE or when a time out occurs.

The user can specify to display the result of the VCCV-trace for a fewer number of PW segments of the end-to-end MS-PW path. In this case, the **min-ttl** and **max-ttl** parameters are configured accordingly. However, the T-PE/S-PE node still probes all hops up to **min-ttl** to correctly build the FEC of the subset of segments.

Note that if the **saii-type-2** and **taii-type-2** parameters are specified this command for a FEC129 pseudowire, then these values are used by the vccv-ping echo request message instead of the saii and taii of the spoke SDP indexed by the **spoke-sdp-fec** parameter, or any saii and taii received in a switching point TLV for the pseudowire. Furthermore, the use must enter the saii and taii in accordance with the direction of pseudowire as seen from the node on which the **vccv-trace** command is executed. However, the values of the saii and taii sent in the echo request message are swapped with respect to the user-entered values to match the order in the installed FEC on the targeted node. The output of the command for a FEC129 type 2 pseudowire reflects the order of the saii and taii stored on the targeted node.

This command, when used with the **static** option, configures a VCCV-automated trace test for static MPLS-TP pseudowires used in a VLL service. VCCV trace for MPLS-TP pseudowires always uses the VCCV control word (associated channel header) with either an IPv4 channel type (0x0021) or on-demand CV message channel type (0x0025).

Note that **vccv-trace static** can only be initiated on a T-PE. Both the echo request and reply messages are send using the same, in-band, encapsulation. The target FEC stack contains a static PW FEC TLV. The contents of this TLV are populated based on the source Node ID, source global ID, and destination global ID and destination node ID taken from the pseudowire context.

The **target-fec-type** option allows the user to perform a vccv-trace to a segment of a MS-PW that does not have the same FEC type as the local segment from the T-PE where the **vccv-trace** command is issued. This is applicable for performing VCCV ping on an MS-PW consists of static PW FEC segments and dynamically signaled PW ID FEC segments.

Parameters

sdp-id:vc-id

Specifies that if a FEC 128 PW is being tested, then its VC ID must be indicated with this parameter. The VC ID needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

Values sdp-id: 1 to 32767

vc-id: 1 to 4294967295

reply-mode {ip-routed | control-channel}

Indicates to the far end, the method to send the reply message. The option **ip-routed** indicates an out-of-band reply mode using the vccv control channel. The option **control-channel** indicates an in-band reply mode using the vccv control channel.

Default control-channel

target-fec-type

Specifies the FEC type for a remote PW segment targeted by a VCCV Ping echo request. This parameter is used if VCCV Ping is used along a MS-PW where a static MPLS-TP PW

segment using the static PW FEC is switched to a T-LDP signaled segment using the PW ID FEC (FEC128), or vice versa, thus requiring the user to explicitly specify a target FEC that is different from the local segment FEC.

Values **pw-id-fec** — Indicates that FEC element for the remote target PW segment is of type PW ID (FEC128).

static-pw-fec — Indicates that FEC element for the remote target PW segment is of type Static PW FEC.

attachment-group-identifier

Specifies the attachment group identifier for the target FEC. This parameter is only valid in combination with the **target-fec-type static-pw-fec**.

Values 0 to 4,294,967,295

pw-path-id-saii *global-id:node-id:ac-id*

Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

Default 0

node-id — Specifies the node ID on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

pw-path-id-taii *global-id:node-id:ac-id*

Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

Default 0

node-id — Specifies the node ID of the far-end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

saii-type2 ***global-id:prefix:ac-id***

If a FEC129 AII Type 2 pseudowire is being tested, then the source attachment individual identifier (SAII) must be indicated.

The **saii-type2** parameter is mutually exclusive with the **sdp-id:vc-id** parameter.

global-id — Specifies the global ID of this T-PE node.

Values 1 to 4294967295

prefix — Specifies the prefix on this T-PE node that the spoke SDP is associated with.

ac-id — Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

taii-type2 ***global-id:prefix:ac-id***

Specifies that if a FEC129 AII Type 2 pseudowire is being tested, then the target attachment individual identifier (TAII) must be indicated. The **taii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

global-id — Specifies the global ID of the far end T-PE of the FEC129 pseudowire.

Values 0 to 4294967295

node-id — Specifies the node ID on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique TAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

spoke-sdp-fec-id

Specifies that if a FEC 129 PW is being tested, then its *spoke-sdp-fec-id* must be indicated with this parameter. The **spoke-sdp-fec-id** needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

spoke-sdp-fec is mutually exclusive with the *sdp-id:vc-id* parameter.

Values 1 to 4294967295

assoc-channel {ipv4 | non-ip}

Specifies the associated channel encapsulation format to use for the VCCV trace echo request and echo reply packet for a PW that uses the static PW FEC. An associated channel type of ipv4 must be used if a vccv-ping is performed to a remote segment of a different FEC type.

Values ipv4 – IPv4 encapsulation in an IPv4 pseudowire associated channel (channel type 0x0021)

non-ip – MPLS-TP encapsulation without UDP/IP headers, in pseudowire associated channel using channel type 0x025.

Default non-ip

src-ip-address *ipv4-address*

Specifies the 4-octet IPv4 address of the source node.

Values a.b.c.d

sender-src-address *ipv4-address*

Specifies the 4-octet IPv4 address of the node originating the VCCV trace.

Values a.b.c.d

remote-dst-address *ipv4-address*

Specifies the 4-octet IPv4 address of the far end node that is a target of the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

pw-id

Specifies the pseudowire ID to be used for performing a VCCV ping operation. The pseudowire ID is a non-zero 32-bit connection ID required by the FEC 128, as defined in RFC 8029, Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures.

Values 1 to 4294967295

pw-type

Specifies the PW type of the PW segment targeted on the far end node. This field must be included to populate the PW type field of the PW ID FEC in the FEC static TLV, when the far end FEC type is different form the local FEC type and the **target-fec-type** is **pw-id-fec**.

Values atm-cell (=3), atm-sdu (=2), atm-vcc (=9), atm-vpc (=10), cesopsn (=21), cesopsn-cas (=23), ether (=5), satop-e1 (=17), satop-t1 (=18), 1 to 65535

fc-name

Specifies the FC and profile parameters are used to indicate the forwarding class of the VCCV trace echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

The LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end router that receives the message request. The egress mappings of the egress network interface on the far-end router controls the

forwarding class markings on the return reply message. The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

The ToS byte is not modified. Table 164: vccv trace Request Packet and Behavior summarizes this behavior.

Table 164: vccv trace Request Packet and Behavior

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet{tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2}

	• ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

profile {in | out}

Specifies the profile state of the VCCV trace echo request packet.

Default out

interval-value

Specifies the interval parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 255

Default 1

no-response-count

Specifies the maximum number of consecutive VCCV trace echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL value.

Values 1 to 255

Default 5

max-vc-label-ttl

Specifies the TTL value for the VC label of the echo request message for the last hop of the MS-PW for which the results are to be displayed. This is expressed as a decimal integer. The outer label TTL is still set to the default regardless of the value of the VC label.

Values 1 to 255

Default 8

min-vc-label-ttl

Specifies the TTL value for the VC label of the echo request message for the first hop of the MS-PW for which the results are to be displayed. This is expressed as a decimal

integer. Note that the outer label TTL is still set to the default regardless of the value of the VC label.

Values 1 to 255

Default 1

probe-count

Specifies the number of VCCV trace echo request messages to send per TTL value.

Values 1 to 10

Default 1

octets

Specifies the size in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request pay-load is padded with zeros to the specified size. An OAM command is not failed if the user enters a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

timeout-value

Specifies the *timeout* parameter, in seconds, expressed as a decimal integer. This value is used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response are not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 3

Full Context

configure service epipe bgp-vpws ve-name ve-id

configure service epipe bgp-vpws remote-ve-name ve-id

Description

This command configures a ve-id for either the local VPWS instance when configured under the ve-name, or for the remote VPWS instance when configured under the remote-ve-name.

A single ve-id can be configured per ve-name or remote-ve-name. The ve-id can be changed without shutting down the VPWS instance. When the ve-name ve-id changes, BGP withdraws the previously advertised route and sends a route-refresh to all the peers which would result in reception of all the remote routes again. The old PWs are removed and new ones are instantiated for the new ve-id value.

When the remote-ve-name ve-id changes, BGP withdraws the previously advertised route and send a new update matching the new ve-id. The old pseudowires are removed and new ones are instantiated for the new ve-id value.

NLRIs received whose advertised ve-id does not match the list of ve-ids configured under the remote ve-id will not have a spoke SDP binding auto-created but will remain in the BGP routing table but not in the Layer 2 route table. A change in the locally configured ve-ids may result in auto-sdp-bindings either being deleted or created, based on the new matching results.

Each ve-id configured within a service must be unique.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPWS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default

no ve-id

Parameters

value

A two bytes identifier that represents the local or remote VPWS instance and is advertised through the BGP NLRI.

Values 1 to 65535

Platforms

All

configure service vpls bgp-vpls ve-name ve-id

Description

This command configures a ve-id. Just one ve-id can be configured per BGP VPLS instance. The VE-ID can be changed without shutting down the VPLS Instance. When the VE-ID changes, BGP is withdrawing its own previously advertised routes and sending a route-refresh to all the peers which would result in reception of all the remote routes again. The old pseudowires are removed and new ones are instantiated for the new VE-ID value.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPLS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default

no ve-id

Parameters

value

Specifies a two-byte identifier that represents the local instance in a VPLS and is advertised through the BGP NLRI. Must be lower or equal with the max-ve-id.

Values 1 to 65535

Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping version

Description

This command specifies the version of IGMP which is running on an MSAP. This object can be used to configure a router capable of running either value. For IGMP to function correctly, all routers on a LAN must be configured to run the same version of IGMP on that LAN.

When the **send-query** command is configured, all type of queries generated are of the configured **version**. If a report of a version higher than the configured version is received, the report gets dropped and a new "wrong version" counter is incremented.

If the **send-query** command is not configured, the **version** command has no effect. The version used on that SAP or SDP is the version of the querier. This implies that, for example, when there is a v2 querier, a v3 group or group-source specific query when a host wants to leave a certain group will never be sent.

Default

version 3

Parameters

version

Specifies the IGMP version.

This command specifies the IGMP version. If routers run different versions of IGMP, they will negotiate the lowest common version of IGMP that is supported by hosts on their subnet and operate in that version. For IGMP to function correctly, all routers on a LAN should be configured to run the same version of IGMP on that LAN.

For IGMPv3, a multicast router that is also a group member performs both parts of IGMPv3, receiving and responding to its own IGMP message transmissions as well as those of its neighbors.

Default

version 3

Parameters

version

Specifies the IGMP version number.

Values 1, 2, 3

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

version

Syntax

version *version*

no version

Context

[Tree] (config>service>pw-template>igmp-snooping version)

Full Context

configure service pw-template igmp-snooping version

Description

This command specifies the version of IGMP. This object can be used to configure a router capable of running either value. For IGMP to function correctly, all routers on a LAN must be configured to run the same version of IGMP on that LAN.

When the **send-query** command is configured, all type of queries generated are of the configured **version**. If a report of a version higher than the configured version is received, the report gets dropped and a new "wrong version" counter is incremented.

If the **send-query** command is not configured, the **version** command has no effect. The version used on that SAP or SDP is the version of the querier. This implies that, for example, when there is a v2 querier, a v3 group or group-source specific query when a host wants to leave a certain group is never sent.

Default

version 3

Parameters

version

Specifies the IGMP version.

Values 1, 2, 3

Platforms

All

Full Context

file version

Description

This command displays the version of an SR OS *.tim image file.

Parameters

file-url

Specifies the file name of the target file.

Values

local-url	[*cflash-id*/][*file-path*]
	up to 200 characters, including *cflash-id*
	directory length up to 99 characters each
remote-url	[{ftp://| tftp://}*login*:*pswd*@*remote-locn*/ [*file-path*]
	up to 247 characters
	directory length 199 characters each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses

video-interface

Syntax

video-interface *ip-address* [**create**]

no video-interface *ip-address*

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy video-interface)

Full Context

configure mcast-management multicast-info-policy video-policy video-interface

Description

This command creates a video interface policy context that correlates to the IP address assigned for a video interface. This interface is created in a subscriber service to which the multicast information policy is assigned. If the specified IP address does not correlate to a video interface ip address, the parameters defined within this context have no effect.

The **no** form of the command deletes the video interface policy context.

Parameters

ip-address

The IP address of a video interface provisioned within the context of a service to which the Multicast Information Policy is assigned. If the IP address does not match the IP address assigned to a video interface, the parameters defined within this context have no effect.

create

Mandatory keyword needed when creating a new video interface within the video policy.

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

video-interface

Syntax

video-interface *ip-int-name* [**create**]

Context

[Tree] (config>service>ies video-interface)

[Tree] (config>service>vprn video-interface)

Full Context

configure service ies video-interface

configure service vprn video-interface

Description

This command creates a video interface within the service. The video interface and associated IP addresses are the addresses to which clients within the service will send requests. The video interface must be associated with an ISA group using the video-sap command and have IP addresses for it to be functional.

The **no** form of the command deletes the video interface. The video interface must be administratively shut down before issuing the **no video-interface** command.

Parameters

ip-int-name

Specifies the name of the video interface, up to 32 characters. An interface name cannot be in the form of an IP address. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

create

This keyword is mandatory when creating a video interface.

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

Full Context

candidate view

Description

This command displays the candidate configuration along with line numbers that can be used for editing the candidate configuration.

Parameters

line

Displays the candidate configuration starting at the point indicated by the following options (the display is not limited to the current CLI context/branch).

Values line, offset, **first**, **edit-point**, **last**

line	absolute line number
offset	relative line number to current edit point. Prefixed with '+' or '-'
first	keyword - first line
edit-point	keyword - current edit point
last	keyword - last line that is not 'exit'

Platforms

All

view

Syntax

view [*checkpoint-id* | **rescue** | **latest-rb**]

Context

[Tree] (admin>rollback view)

Full Context

admin rollback view

Description

This command displays the checkpoint.

Parameters

latest-rb

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

checkpoint-id

Indicates rollback checkpoint file to be viewed. Checkpoint-id of 1 corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.

Values 1 to 9

rescue

Displays the rescue configuration.

Platforms

All

view

Syntax

view {**bootup-cfg** | **active-cfg** | **candidate-cfg** | **latest-rb**| *checkpoint-id* | **rescue**}

Context

[Tree] (admin view)

Full Context

admin view

Description

The context to configure administrative system viewing parameters. Only authorized users can execute the commands in the **admin** context.

Parameters

bootup-cfg

Specifies the bootup configuration.

active-cfg

Specifies current running configuration.

candidate-cfg

Specifies candidate configuration.

latest-rb

Specifies the latest configuration.

checkpoint-id

Specifies a specific checkpoint file configuration.

Values 1 to 9

rescue

Specifies a rescue checkpoint configuration.

Platforms

All

view

Syntax

view *view-name* **subtree** *oid-value*

no view *view-name* [**subtree** *oid-value*]

Context

[Tree] (config>system>security>snmp view)

Full Context

configure system security snmp view

Description

This command configures a view. Views control the accessibility of a MIB object within the configured MIB view and subtree. Object identifiers (OIDs) uniquely identify MIB objects in the subtree. OIDs are organized hierarchically with specific values assigned by different organizations.

Once the subtree (OID) is identified, a mask can be created to select the portions of the subtree to be included or excluded for access using this particular view. See the **mask** command.

The view(s) configured with this command can subsequently be used in read, write, and notify commands which are used to assign specific access group permissions to created views and assigned to particular access groups.

Multiple subtrees can be added or removed from a view name to tailor a view to the requirements of the user access group.

A subtree statement matches (covers) any OID that is a descendant of the specified OID value. For example, the subtree 1.3.6.1 matches 1.3.6.1.x (for any value of x), 1.3.6.1.x.y (for any values of x & y), and so on.

Subtrees that are not covered by **view** statements are not accessible in the view.

Per RFC 2575, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP),* each MIB view is defined by two sets of view subtrees, the included view subtrees, and the excluded view subtrees (see the **included** and **excluded** parameters of the **mask** command). Every such view subtree, both the included and the excluded ones, are defined in this table. To determine if a particular object instance is in a particular MIB view, compare the object instance's OID with each of the MIB view's active entries in this table. If none match, then the object instance is not in the MIB view. If one or more match, then the object instance is included in, or excluded from, the MIB view according to the value of vacmViewTreeFamilyType in the entry whose value of vacmViewTreeFamilySubtree has the most sub-identifiers.

The **no view** *view-name* command removes a view and all subtrees.

The **no view** *view-name* **subtree** *oid-value* removes a sub-tree from the view name.

Parameters

view-name

Specifies a view name, up to 32 characters.

oid-value

Specifies the object identifier (OID) value for the *view-name*. This value, for example, 1.3.6.1.6.3.11.2.1, combined with the mask and include and exclude statements, configures the access available in the view.

It is possible to have a view with different subtrees with their own masks and include and exclude statements. This allows for customizing visibility and write capabilities to specific user requirements**.**

Full Context

configure service vprn ospf3 area virtual-link

configure service vprn ospf area virtual-link

Description

This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of this command deletes the virtual link.

Default

No virtual link is defined.

Parameters

router-id

The router ID of the virtual neighbor in IP address dotted decimal notation.

transit-area ***area-id***

The area-id specified identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

Platforms

All

virtual-link

Syntax

[**no**] **virtual-link** *router-id* **transit-area** *area-id*

Context

vlan

Syntax

vlan [*vlan-encap*]

Context

[Tree] (config>redundancy>mc>peer>mcr>l3ring>node>cv vlan)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify vlan

Description

This command specifies the VLAN tag of the SAP used for ring-node connectivity verification of this ring node. It is only meaningful if the value of is not zero.

The **no** form of this command reverts to the default.

Parameters

vlan-encap

Specifies the node cc VLAN IP.

Platforms

All

vlan

Syntax

vlan *tag*

no vlan

Context

[Tree] (config>subscr-mgmt>wlan-gw>ue-query vlan)

Full Context

configure subscriber-mgmt wlan-gw ue-query vlan

Description

This command enables matching on UEs, based on the VLAN tag within the tunnel, which typically used to indicate an SSID.

The **no** form of this command disables matching on the VLAN.

Default

no vlan

Parameters

tag

Specifies the VLAN tag.

Values 0 to 4096

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan

Syntax

vlan start [*value*] **end** [*value*] **retail-svc-id** *service-id*

no vlan start [*value*] **end** [*value*]

Context

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>retailer vlan)

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>retailer vlan)

Full Context

configure service vprn subscriber-interface group-interface wlan-gw retailer vlan

configure service ies subscriber-interface group-interface wlan-gw retailer vlan

Description

This command creates a mapping from a range of VLANs (appearing in the wlan-gw encapsulated Layer 2 frame) to a retail service ID.

The **no** form of this command removes the parameters from the configuration.

Parameters

start

Specifies the start VLAN tag of this range.

Values 0 to 4095

end

Specifies the end VLAN tag of this range.

Values 0 to 4095

retail-svc-id *service-id*

Specifies the identifier of the retail service to be used by default of a value in the retail service map of this interface.

Values 1 to 2147483650

svc-name: up to 64 characters

vlan

Syntax

vlan *vlan-encap*

no vlan

Context

[Tree] (config>redundancy>mc>peer>mcr>node>cv vlan)

Full Context

configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify vlan

Description

This command specifies the VLAN tag used for the Ring-node Connectivity Verification of this ring node. It is only meaningful if the value of service ID is not zero. A zero value means that no VLAN tag is configured.

Default

no vlan

Parameters

vlan-encap

Specifies the VLAN tag.

Values

vlan-encap:	dot1q	qtag, *
	qinq	qtag1.qtag2, qtag1.*, 0.*
	qtag	0 to 4094
	qtag1	1 to 4094
	qtag2	0 to 4094

Platforms

All

vlan

Syntax

vlan *vlan-id*

no vlan

Context

[Tree] (cfg>eth-cfm>domain>assoc>bridge vlan)

Full Context

configure eth-cfm domain association bridge-identifier vlan

Description

This command configures the bridge identifier primary VLAN ID. This is informational only, and no verification is done to ensure MEPs on this association are on the configured VLAN.

The **no** form of this command reverts to the default value.

Default

no vlan

Parameters

vlan-id

Specifies a VLAN ID monitored by MA.

Values 1 to 4094

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure application-assurance group url-filter icap vlan-id

Description

This command configures the VLAN ID on which the ISA-AA is expected to be emitting traffic mapping to a pre-configured aa-interface.

Default

no vlan-id

Parameters

service-port-vlan-id

Specifies the VLAN ID.

Values 1 to 4094

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan-id

Syntax

vlan-id *vlan-id*

no vlan-id

Context

[Tree] (config>app-assure>group>url-filter>web-service vlan-id)

Full Context

configure application-assurance group url-filter web-service vlan-id

Description

This command configures the VLAN ID on which the AA ISA emits the traffic mapping to a preconfigured AA interface.

The **no** form of this command removes the VLAN ID configuration.

Default

no vlan-id

Parameters

vlan-id

Specifies the VLAN ID to connect to the web service.

Values 1 to 4094

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan-id

Syntax

vlan-id *vlan-id*

no vlan-id

Context

[Tree] (config>test-oam>build-packet>header>dot1q vlan-id)

[Tree] (debug>oam>build-packet>packet>field-override>header>dot1q vlan-id)

Full Context

configure test-oam build-packet header dot1q vlan-id

debug oam build-packet packet field-override header dot1q vlan-id

Description

This command defines the Dot1Q VLAN ID to be used in the test Dot1Q header.

The **no** form of this command removes the VLAN ID value.

Parameters

vlan-id

Specifies the Dot1Q VLAN ID to be used in the test Dot1Q header.

Values 0 to 4095

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vlan-id

Syntax

vlan-id *service-port-vlan-id*

no vlan-id

Context

[Tree] (config>app-assure>group>cflowd>dir-exp vlan-id)

Full Context

configure application-assurance group cflowd direct-export vlan-id

Description

This command configures the VLAN ID on which the ISA-AA is expected to be emitting traffic.

The **no** form of this command removes the VLAN ID from the configuration.

Default

no vlan-id

Parameters

service-port-vlan-id

Specifies the VLAN ID of the service port.

Values 1 to 4094

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.46 vlan-mismatch-timeout

vlan-mismatch-timeout

Syntax

vlan-mismatch-timeout *seconds*

no vlan-mismatch-timeout

Context

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>authentication vlan-mismatch-timeout)

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>authentication vlan-mismatch-timeout)

Full Context

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range authentication vlan-mismatch-timeout

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range authentication vlan-mismatch-timeout

Description

This command configures the timeout value for the RADIUS proxy cache if a packet is received with a non-matching VLAN tag. The new timeout value is the lesser of the **vlan-mismatch-timeout** value and the currently remaining proxy cache timeout value.

The **no** form of this command disables the timeout behavior. The cache timeout value will remain unchanged.

Parameters

seconds

Specifies the timeout value for the RADIUS proxy cache, in seconds.

Values 5 to 60

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.47 vlan-range

vlan-range

Syntax

[**no**] **vlan-range** [*vlan-range*]

Context

[Tree] (config>service>vpls>stp>mst-instance vlan-range)

Full Context

configure service vpls stp mst-instance vlan-range

Description

This command specifies a range of VLANs associated with a certain mst-instance. This range applies to all SAPs of the M-VPLS.

Every VLAN range that is not assigned within any of the created **config>service>vpls>stp mst-instance** is automatically assigned to mst-instance 0. This instance is automatically maintained by the software and cannot be modified. Changing the VLAN range value can be performed only when the specified mst-instance is shutdown.

The **no** form of this command removes the **vlan-range** from the specified **config>service>vpls>stp mst-instance**.

Parameters

vlan-range

The first VLAN range specifies the left-bound (i.e., minimum value) of a range of VLANs that are associated with the M-VPLS SAP. This value must be smaller than (or equal to) the second VLAN range value. The second VLAN range specifies the right-bound (i.e., maximum value) of a range of VLANs that are associated with the M-VPLS SAP.

Values 1 to 4094 to 1 to 4094

Platforms

All

vlan-range

Syntax

vlan-range *from* [**to** *to*]

no vlan-range *from*

Context

[Tree] (config>connection-profile-vlan vlan-range)

Full Context

configure connection-profile-vlan vlan-range

Description

This command allows the user to configure different ranges in the connection-profile-vlan. The ranges have the following characteristics:

- Ranges can contain a single VID or start-and-end values. When the *to-vid* is not specified, the end vid value is the same as the start vid value.
- On the fly addition/removal of ranges is allowed.
- When removing an entry, the **no vlan-range** *vid* **to** *vid* must be configured by the user.
- Multiple ranges are allowed under the same connection-profile-vlan. No VLAN values should overlap within the same connection-profile-vlan.
- The index for connection-profile and connection-profile-vlan must be unique between the two. For example, if **connection-profile 100** is present, then **connection-profile-vlan 100** is disallowed.

Each connection-profile-vlan must be explicitly configured.

Parameters

from

Specifies the beginning of the **vlan-range** associated to the **connection-profile-vlan**.

Values 1 to 4094

to

Specifies the end of the **vlan-range** associated to the **connection-profile-vlan**. If not specified, the **vlan-range** is comprised of only the *from* VLAN ID.

Values 1 to 4094

Platforms

All

26.48 vlan-tag-ranges

vlan-tag-ranges

Syntax

vlan-tag-ranges

Context

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw vlan-tag-ranges)

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw vlan-tag-ranges)

Full Context

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges

Description

Commands in this context configure VLAN-to-retail-map parameters to map dot1q tags to the retail service ID. The WIFI AP inserts a dot1Q tag in the Layer 2 frame within the GRE tunnel to indicate the retail service provider for the subscriber.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.49 vlan-translation

vlan-translation

Syntax

vlan-translation {*vlan-id* | **copy-outer**}

no vlan-translation

Context

[Tree] (config>service>vpls>sap>ingress vlan-translation)

[Tree] (config>service>epipe>sap>ingress vlan-translation)

Full Context

configure service vpls sap ingress vlan-translation

configure service epipe sap ingress vlan-translation

Description

This command configures ingress VLAN translation. If enabled with an explicit VLAN value, the preserved VLAN ID is overwritten with this value. This setting is applicable to dot1q encapsulated ports. If enabled with the copy-outer keyword, the outer VLAN ID is copied to inner position on QinQ encapsulated ports. The feature is not supported on:

- Dot1q saps
- QinQ saps with qinq-vlan-translation
- Connection profile VLAN SAPs if the **copy-outer** option is configured

The **no** version of the command disables VLAN translation.

Default

no vlan-translation

Parameters

vlan-id

Specifies the VLAN id.

Values 0 to 4094

copy-outer

Specifies to use the outer VLAN id.

Platforms

All

26.50 vlan-vc-etype

vlan-vc-etype

Syntax

[Tree] (config>service>vpls>spoke-sdp vlan-vc-tag)

Full Context

configure service vpls mesh-sdp vlan-vc-tag

configure service vpls spoke-sdp vlan-vc-tag

Description

This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

Default

no vlan-vc-tag

Parameters

vlan-id

Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

Values 0 to 4094

Platforms

All

vlan-vc-tag

Syntax

vlan-vc-tag *vlan-id*

no vlan-vc-tag

Context

[Tree] (config>service>sdp>binding>pw-port vlan-vc-tag)

volume

Syntax
volume *credits* {**bytes** | **kilobytes** | **megabytes** | **gigabytes**}
no volume

Context
[Tree] (config>subscr-mgmt>diam-appl-plcy>gy>efh>interim-c volume)

Full Context
configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit volume

Description

This command configures the default volume interim credit that is allocated to all rating groups of a Diameter Gy session when Extended Failure Handling (EFH) is active and for which no default credit is configured at the category map category level.

The **no** form of this command resets the value to the default value.

Default

volume 500 megabytes

Parameters

credits

Specifies the amount of volume credit that is allocated by default to all rating groups of a Diameter Gy session when EFH is active.

Values 1 to 4294967295

bytes | kilobytes | megabytes | gigabytes

Specifies whether credits are in bytes, kilobytes, megabytes, or gigabytes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

26.59 volume-quota-direction

volume-quota-direction

Syntax

volume-quota-direction {both | ingress | egress}

no volume-quota-direction

Context

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dsm volume-quota-direction)

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dsm volume-quota-direction)

Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt volume-quota-direction

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt volume-quota-direction

Description

This command specifies whether volume quota is applied in the egress (downstream), ingress (upstream), or both directions. Configuration changes apply only to new DSM UEs and not to existing UEs.

Parameters

both

Enforces the volume quota on the packets ingressing and egressing the WLAN-GW combined.

ingress

Enforces the volume quota on packets ingressing the WLAN-GW from the UE (upstream).

egress

Enforces the volume quota on packets egressing the WLAN-GW to the UE (downstream).

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.60 volume-stats-type

volume-stats-type

Syntax

volume-stats-type {**ip** | **default**}

no volume-stats-type

Context

[Tree] (config>subscr-mgmt>sub-prof volume-stats-type)

Full Context

configure subscriber-mgmt sub-profile volume-stats-type

Description

This command enables the reporting of Layer 3 (IP) based subscriber host volume accounting data.

By default, subscriber host volume accounting data includes Layer 2 header octets and can be configured to include a fixed packet byte offset or last-mile encapsulation overhead.

The **no** form of this command reverts to the default.

Default

volume-stats-type default

Parameters

default

Specifies that the subscriber host volume accounting data is reported including the Layer 2 header octets and optional delta's introduced by configuration (for example: packet byte offset, last mile aware shaping, and so on).

ip

Specifies that the subscriber host volume accounting data reporting is based on Layer 3 (IP) packet sizes. This includes subscriber host ingress/egress queue and policer stats in snmp, CLI show commands, RADIUS and XML accounting, and Diameter Gx usage monitoring. RADIUS and Diameter (DCCA) based credit control volume quota are interpreted as Layer 3 (IP).

Platforms

26.61 vpls

vpls

Syntax

vpls *service-id* [**customer** *customer-id*] [**create**] [**vpn** *vpn-id*] [**m-vpls**] [**b-vpls** | **i-vpls**] [**etree**] [**name** *name*]

no vpls *service-id*

Context

[Tree] (config>service vpls)

Full Context

configure service vpls

Description

This command creates or edits a Virtual Private LAN Services (VPLS) instance. The **vpls** command is used to create or maintain a VPLS service. If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

A VPLS service connects multiple customer sites together acting like a zero-hop, Layer 2 switched domain. A VPLS is always a logical full mesh.

When a service is created, the **create** keyword must be specified if the **create** command is enabled in the **environment** context. When creating a service, you must enter the **customer** keyword and specify a *customer-id* to associate the service with a customer. The *customer-id* must already exist, having been created using the **customer** command in the **service** context. The *customer-id* must already exist having been created using the **customer** command in the service context. Once a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

To create a management VPLS on the 7450 ESS, the m-vpls keyword must be specified. See section **Hierarchical VPLS Redundancy** for an introduction to the concept of management VPLS.

Once a service is created, the use of the **customer** *customer-id* is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified will result in an error.

More than one VPLS service may be created for a single customer ID.

By default, no VPLS instances exist until they are explicitly created.

The **no** form of this command deletes the VPLS service instance with the specified *service-id*. The service cannot be deleted until all SAPs and SDPs defined within the service ID have been shut down and deleted, and the service has been shut down.

Parameters

service-id

Specifies unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: 64 characters maximum

customer *customer-id*

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

vpn vpn-id

Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN identification number

Values 1 to 2147483647

Default null (0)

create

Keyword used to create the service ID. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

m-vpls

Specifies a management VPLS

e-tree

Specifies a VPLS service as an E-Tree VPLS. E-Tree VPLS services have root and leaf attachment circuit (AC) and root leaf tag SAPs/SDP bindings for E-Tree interconnection. The access root AC SAP behaves as a SAP in non-E-tree VPLS services. The leaf AC SAP communicates only with root-connected services. Leaf and root AC SAPs behave externally the same as SAPs in non-E-Tree VPLS services.

The root AC SDP bind behaves as an SDP bind in non-E-tree VPLS services. The leaf AC SDP bind communicates only with root-connected services.

In the E-Tree VPLS, the root AC SAP/SDP bindings can communicate with other root and leaf AC SAP/SDP bind services locally and remotely. Root-originated traffic is marked internally with a root indication and the root is tagged externally on tag SAP/SDP binds. The leaf AC SAP/SDP bindings can communicate with other root SAP/SDP bindings locally and remotely. Leaf-originated traffic is marked internally with a leaf indication and tagged externally on leaf tag SAP/SDP bindings.

Any number of root or leaf AC SAPs can be used, up to the configured SAP limits in the E-Tree VPLS.

Network-side root leaf tag SAPs use additional SAP resources. These tag SAPs used two tags; one for root and one for leaf. Network-side tag SDPs use a hard coded tag of 1 for root and 2 for leaf. AC SDP bindings are designated as root or leaf SDP bindings but carry no tags marking traffic on the egress frames.

The E-Tree SAP type must be specified when the SAP is created. To change the SAP type, the SAP must be removed and recreated.

b-vpls | i-vpls

Creates a backbone-vpls or ISID-vpls

name name

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Platforms

All

vpls

Syntax

vpls *service-name*

no vpls

Context

[Tree] (config>service>ies>if vpls)

Full Context

configure service ies interface vpls

Description

The **vpls** command, within the IP interface context, is used to bind the IP interface to the specified service name (VPLS or I-VPLS).

The system does not attempt to resolve the service name provided until the IP interface is placed into the administratively up state (**no shutdown**). Once the IP interface is administratively up, the system will scan the available VPLS services that have the **allow-ip-int-bind** flag set for a VPLS service associated with the name. If the service name is bound to the service name when the IP interface is already in the administratively up state, the system will immediately attempt to resolve the given name.

If a VPLS service is found associated with the name and with the **allow-ip-int-bind** flag set, the IP interface is attached to the VPLS service allowing routing to and from the service virtual ports once the IP interface is operational.

A VPLS service associated with the specified name that does not have the **allow-ip-int-bind** flag set or a non-VPLS service associated with the name is ignored and will not be attached to the IP interface.

If the service name is applied to a VPLS service after the service name is bound to an IP interface and the VPLS service **allow-ip-int-bind** flag is set at the time the name is applied, the VPLS service is automatically resolved to the IP interface if the interface is administratively up or when the interface is placed in the administratively up state.

If the service name is applied to a VPLS service without the **allow-ip-int-bind** flag set, the system will not attempt to resolve the applied service name to an existing IP interface bound to the name. To rectify this condition, the flag must first be set and then the IP interface must enter or reenter the administratively up state.

While the specified service name may be assigned to only one service context in the system, it is possible to bind the same service name to more than one IP interface. If two or more IP interfaces are bound to the same service name, the first IP interface to enter the administratively up state (if currently administratively down) or to reenter the administratively up state (if currently administratively up) when a VPLS service is configured with the name and has the **allow-ip-int-bind** flag set is attached to the VPLS service. Only one IP interface is allowed to attach to a VPLS service context. No error is generated for the remaining non-attached IP interfaces using the service name.

Once an IP interface is attached to a VPLS service, the name associated with the service cannot be removed or changed until the IP interface name binding is removed. Also, the **allow-ip-int-bind** flag cannot be removed until the attached IP interface is unbound from the service name.

Unbinding the service name from the IP interface causes the IP interface to detach from the VPLS service context. The IP interface may then be bound to another service name or a SAP or SDP binding may be created for the interface using the **sap** or **spoke-sdp** commands on the interface.

VPRN Hardware Dependency

When a service name is bound to a VPRN IP interface, all SAPs associated with the VPRN service must be on hardware based on the FlexPath2 forwarding plane. Currently, these include the IOM3-XP and the various IMM modules. If any SAPs are associated with the wrong hardware type, the service name binding to the VPRN IP interface fails. Once an IP interface within the VPRN service is bound to a service name, attempting to create a SAP on excluded hardware fails.

IP Interface MTU and Fragmentation

A VPLS service is affected by two MTU values; port MTUs and the VPLS service MTU. The MTU on each physical port defines the largest Layer 2 packet (including all DLC headers and CRC) that may be transmitted out a port. The VPLS itself has a service level MTU that defines the largest packet supported by the service. This MTU does not include the local encapsulation overhead for each port (QinQ, Dot1Q, TopQ or SDP service delineation fields and headers) but does include the remainder of the packet. As virtual ports are created in the system, the virtual port cannot become operational unless the configured port MTU minus the virtual port service delineation overhead is greater than or equal to the configured VPLS service MTU. Thus, an operational virtual port is ensured to support the largest packet traversing the VPLS service. The service delineation overhead on each Layer 2 packet is removed before forwarding into a VPLS service. VPLS services do not support fragmentation and must discard any Layer 2 packet larger than the service MTU after the service delineation overhead is removed.

IP interfaces have a configurable up MTU that defines the largest packet that may egress the IP interface without being fragmented. This MTU encompasses the IP portion of the packet and does not include any of the egress DLC header or CRC. This MTU does not affect the size of the largest ingress packet on the IP interface. If the egress IP portion of the packet is larger than the IP interface MTU and the IP header do not fragment flag is not set, the packet is fragmented into smaller packets that will not exceed the configured MTU size. If the do not fragment bit is set, the packet is silently discarded at egress when it exceeds the IP MTU.

When the IP interface is bound to a VPLS service, the IP MTU must be at least 18 bytes less than the VPLS service MTU. This allows for the addition of the minimal Ethernet encapsulation overhead; 6 bytes for the DA, 6 bytes for the SA, 2 bytes for the Etype and 4 bytes for the trailing CRC. Any remaining egress virtual port overhead (Dot1P, Dot1Q, QinQ, TopQ or SDP) required above the minimum is known to be less than the egress ports MTU since the virtual port would not be operational otherwise.

If the IP interface IP MTU value is too large based on the VPLS service MTU, the IP interface will enter the operationally down state until either the IP MTU is adequately lowered or the VPLS service MTU is sufficiently increased.

The **no** form of this command on the IP interface is used to remove the service name binding from the IP interface. If the service name has been resolved to a VPLS service context and the IP interface has been attached to the VPLS service, the IP interface will also be detached from the VPLS service.

Parameters

service-name

The service-name parameter is required when using the IP interface vpls command and specifies the service name that the system will attempt to resolve to an **allow-ip-int-bind** enabled VPLS service associated with the name. The specified name is expressed as an ASCII string comprised of up to 32 characters. It does not need to already be associated

with a service and the system does not check to ensure that multiple IP interfaces are not bound to the same name.

26.65 vpls-sap-template

vpls-sap-template

Syntax

vpls-sap-template *name/id* **create**

[**no**] **vpls-sap-template** *name/id*

Context

[Tree] (config>service>template vpls-sap-template)

Full Context

configure service template vpls-sap-template

Description

This is the command used to create a SAP template to be used in a vpls-template. Only certain existing VPLS SAP attributes can be changed in the vpls-sap-template, not in the instantiated VPLS SAP

The following SAP attributes are set in the instantiated saps (no configuration allowed):

description: "Sap <sap-id> controlled by MVRP service <svc id>" – auto generated

shutdown: no shutdown

Parameters

name/id

Specifies the name in ASCII or the template ID

Values 1 to 2147483647

Platforms

All

26.66 vpls-template

vpls-template

Syntax

vpls-template *name/id* **create**

[**no**] **vpls-template** *name/id*

Context

[Tree] (config>service>template vpls-template)

Full Context

configure service template vpls-template

Description

This command is used to create a vpls-template to be used to auto-instantiate a range of VPLS services. Only certain existing VPLS attributes specified in the command reference section can be changed in the vpls-template, not in the instantiated VPLS. The following attributes are automatically set in the instantiated VPLSs (no template configuration necessary) and the operator cannot change these values.

vpn-id: none

description: "Service <svc id> auto-generated by control VPLS <svc-id>"

service-name: "Service <svc id>" (Auto-generated)

shutdown: no shutdown

Following existing attributes can be set by the user in the instantiated VPLSs:

[no] sap

All the other VPLS attributes are not supported.

Parameters

name/id

Specifies the name in ASCII or the template ID

Values name: ASCII string

Values ID: [1 to 2147483647]

Platforms

All

26.67 vpls-template-binding

vpls-template-binding

Syntax

vpls-template-binding *name/id*

no vpls-template-binding

Context

[Tree] (config>service>vpls>vpls-group vpls-template-binding)

Full Context

configure service vpls vpls-group vpls-template-binding

Description

This command configures the binding to a VPLS template to be used to instantiate pre-provisioned data VPLS using as input variables the service IDs generated by the vid-range command.

The **no** form of this command removes the binding and deletes the related VPLS instances. The command will fail if any of the affected VPLS instances have either a provisioned SAP or an active MVRP declaration/registration or if the related vpls-group id is in no shutdown state. Any changes to the vpls-template-binding require the vpls-group to be in shutdown state.

Default

no vpls-template-binding

Parameters

name/id

Specifies the name or the ID of the VPLS template

Values 1 to 1024

no vpn-domain

Context

[Tree] (config>service>vprn>ospf vpn-domain)

Full Context

configure service vprn ospf vpn-domain

Description

This command specifies type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID. This applies to VPRN instances of OSPF only. An attempt to modify the value of this object will result in an inconsistent value error when is not a VPRN instance. The parameters are mandatory and can be entered in either order. This command is not applicable in the **config>service>vprn>ospf3** context.

This command is not supported in OSPF3.

Default

no vpn-domain

Parameters

id

Specifies the OSPF VPN domain in the "xxxx.xxxx.xxxx" format. This is exchanged using BGP in the extended community attribute associated with a prefix. This object applies to VPRN instances of OSPF only.

type

Specifies the type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID.

Values 0005, 0105, 0205, 8005

26.71 vpn-family-policy

vpn-family-policy

Syntax

vpn-family-policy *policy-name*

no vpn-family-policy

Context

[Tree] (config>router>bgp>next-hop-resolution vpn-family-policy)

Full Context

configure router bgp next-hop-resolution vpn-family-policy

Description

This command specifies the VPN family policy that is applied when filtering routes for consideration for next-hop resolution process for EVPN and IP-VPN families.

This policy is supported by the following families:

- VPN-IPv4 and VPN-IPv6
- EVPN (all routes types 1-6, although AD per-ES and AD per-EVI routes are always shown as resolved)
- MCAST-VPN-IPv4 and MCAST-VPN-IPv6

In a VPN family policy:

- only prefix-lists are used to match the next hop of a resolving route. No other policy qualifiers are supported.
- the route resolving the next hop is accepted or rejected

  In other words, if an imported route's next hop is resolved by route N (N is the preferred entry in tunnel-table for MPLS or the longest prefix match in the route-table for VXLAN), and route N is rejected by vpn-family-policy, then the route next hop is unresolved. This is irrespective of the existence of a route M that could potentially resolve the next hop in the tunnel-table or route-table.

The **no** form of this command removes the VPN family policy.

Default

no vpn-family-policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

26.72 vpn-gre-source-ip

vpn-gre-source-ip

Syntax

vpn-gre-source-ip *ip-address*

no vpn-gre-source-ip

Context

[Tree] (config>service>system vpn-gre-source-ip)

Full Context

configure service system vpn-gre-source-ip

Description

This command configures a single system-wide alternate source IPv4 address of the GRE tunnels in all VPRN services using the **auto-bind-tunnel** or an explicit SDP binding (**config**>**service**>**vprn**>**spoke-sdp**) with a tunnel of encapsulation GRE.

A change to the value of the **vpn-gre-source-ip** parameter can be performed without disabling the service. Once the new value is configured, the system address is not used in services which bind to the GRE tunnel.

The primary IPv4 address of any local network IP interface, loopback or otherwise, may be used.

The address of the following interfaces are not supported, and the configuration is rejected:

- unnumbered network IP interface
- IES interface
- VPRN interface
- CSC VPRN interface

The **vpn-gre-source-ip** parameter value adheres to the following rules:

- This single source address counts towards the maximum of 15 distinct address values per system that are used by all GRE SDPs under the **config**>**service**>**sdp**>**local-end** context and all L2oGRE SDPs under the **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** context.
- The same source address can be used in both **vpn-gre-source-ip** and **config**>**service**>**sdp**>**local-end** contexts.
- The same source address cannot be used in both **vpn-gre-source-ip** and **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** contexts because an address configured for a L2oGRE SDP matches an internally created interface which is not available to other applications.
- The **vpn-gre-source-ip** address, when different from system, need not match the primary address of an interface which has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

The **no** form of the command reverts to the default value.

Default

vpn-gre-source-ip ip-address (System interface primary IPv4 address)

Parameters

ip-address

Specifies the IPv4 address (a.b.c.d).

Full Context

configure router bgp add-paths vpn-ipv4

configure router bgp group add-paths vpn-ipv4

configure router bgp group neighbor add-paths vpn-ipv4

Description

This command configures the add-paths capability for VPN-IPv4 routes. By default, add-paths is not enabled for VPN-IPv4 routes.

The maximum number of paths per VPN-IPv4 NLRI to send is the configured send-limit, which is a mandatory parameter. The capability to receive multiple paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for VPN-IPv4 routes, causing sessions established using add-paths for VPN-IPv4 to go down and come back up without the add-paths capability.

Default

no vpn-ipv4

Parameters

send-limit

Specifies the maximum number of paths per VPN-IPv4 NLRI that are allowed to be advertised to add-paths peers (the actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules). If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each VPN-IPv4 NLRI if the peer has signaled support for receiving multiple add paths. If the router has not installed any of the routes in its FIB then all BGP add-paths qualify for advertisement.

Values 1 to 16, none, multipaths

receive

Specifies that the router negotiates the add-paths receive capability for VPN-IPv4 routes with its peers.

none

Specifies that the router does not negotiate the add-paths receive capability for VPN-IPv4 routes with its peers.

Platforms

vport

Syntax

vport *name* [**create**]

no vport *name*

Context

[Tree] (config>port>ethernet>access>egress vport)

Full Context

configure port ethernet access egress vport

Description

This command configures a scheduling node, referred to as virtual port, within the context of an egress Ethernet port. The Vport scheduler operates either like a port scheduler with the difference that multiple Vport objects can be configured on the egress context of an Ethernet port, or it can be an aggregate rate when an egress port-scheduler policy is applied to the port.

The Vport is always configured at the port level even when a port is a member of a LAG.

When a port scheduler policy is applied to a Vport the following command is used:

```
config>port>ethernet>access>egress>vport>port-scheduler-policy
port-scheduler-policy-name
```

The CLI will not allow the user to apply a port scheduler policy to a Vport if one has been applied to the port. Conversely, the CLI will not allow the user to apply a port scheduler policy to the egress of an Ethernet port if one has been applied to any Vport defined on the access egress context of this port. The **agg-rate**, along with an egress port-scheduler, can be used to ensure that a given Vport does not oversubscribe the port's rate.

SAP and subscriber host queues can be port-parented to a Vport scheduler in a similar way they port-parent to a port scheduler or can be port-parented directly to the egress port-scheduler if the **agg-rate** is used.

When the Vport uses an aggregate rate, the following command is used:

configure>port>ethernet>access>egress>vport>agg-rate-limit

The **no** form of this command removes the Vport name from the configuration.

Parameters

name

Specifies the name of the Vport scheduling node and can be up to 32 ASCII characters. This does not need to be unique within the system but is unique within the port or a LAG.

26.78 vprn

vprn

Syntax

vprn *service-id* [**name** *name*] [**customer** *customer-id*] [**create**]

no vprn *service-id*

Context

[Tree] (config>service vprn)

Full Context

configure service vprn

Description

This command creates or edits a Virtual Private Routed Network (VPRN) service instance.

If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

VPRN services allow the creation of customer-facing IP interfaces in the same routing instance used for service network core routing connectivity. VPRN services require that the IP addressing scheme used by the subscriber must be unique between it and other addressing schemes used by the provider and potentially the entire Internet.

IP interfaces defined within the context of an VPRN service ID must have a SAP created as the access point to the subscriber network.

When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

When a service is created, the use of the **customer** *customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error.

Multiple VPRN services are created to separate customer-owned IP interfaces. More than one VPRN service can be created for a single customer ID. More than one IP interface can be created within a single VPRN service ID. All IP interfaces created within an VPRN service ID belongs to the same customer.

The **no** form of this command deletes the VPRN service instance with the specified *service-id*. The service cannot be deleted until all the IP interfaces and all routing protocol configurations defined within the service ID have been shut down and deleted.

Parameters

service-id

Specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every 7750 SR on which this service is defined.

Values

service-id: 1 to 2147483648

svc-name: 64 characters maximum

customer-id

Specifies an existing customer identification number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

name name

This parameter configures an optional VPRN name, up to 64 characters, which adds a name identifier to a given vprn to then use that vprn name in configuration references as well as display and use vprn names in show commands throughout the system. This helps the service provider/administrator to identify and manage vprn within the SR OS platforms.

All services are required to assign a service ID to initially create a service. However, either the service ID or the service name can be used to identify and reference a given service once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the service-id as the name.

Service names may not begin with an integer (0 to 9).

create

Keyword used to create a service ID. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

All

[**no**] **vprn** *service-id* **network-interface** *ip-int-name*

[**no**] **vprn** *service-id* **subscriber-interface** *ip-int-name* **group-interface** *ip-int-name*

Context

[Tree] (config>cflowd>collector>exp-filter>if-list>svc vprn)

Full Context

configure cflowd collector export-filter interface-list service vprn

Description

This command configures which VPRN service interfaces' flow data is being sent to this collector.

The **no** form of the command removes the values from the configuration.

Parameters

service-id

Specifies the unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every SR OS on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: 64 characters maximum

interface ip-int-name

Specifies the name of an IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters and must start with a letter. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

network-interface ip-int-name

Specifies the name of a network interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

subscriber-interface ip-int-name

Specifies an interface name of a subscriber interface. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

group-interface ip-int-name

Specifies an interface name of a group interface. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

Syntax

vprn *service-id* **ofc-loopback** *ip-address*

no vprn

Context

[Tree] (config>open-flow>of-switch>of-controller vprn)

Full Context

configure open-flow of-switch of-controller vprn

Description

This command specifies the *service-id* of the VPRN to use for the OpenFlow control channel. The loopback address for the OF control channel in the VPRN is specified using the **ofc-loopback** option.

The **no** form of this command reverts the control channel to using base routing.

Parameters

service-id

Specifies the service ID for a VPRN instance.

Values {*service-id* | *service-name*}

service-id: 1 to 2147483647

service-name: up to 64 characters (*service-name* is an alias for input only. The *service-name* gets replaced with an id automatically by SR OS in the configuration).

ip-address

Specifies the loopback IP address in the VPRN for the OpenFlow channel to the controller.

Values ip-address: a.b.c.d

Platforms

All

vprn

Syntax

vprn *service-id*

no vprn

Context

[Tree] (config>system>security>vprn-aaa-server vprn)

Full Context

configure system security vprn-aaa-server vprn

Description

This command configures TACACS+ or RADIUS servers in a VPRN to be used for AAA by that VPRN and by sessions in VPRNs without a AAA server configured.

The **no** form of this command disables the use of servers in a VPRN.

Default

no vprn

Parameters

service-id

Specifies the VPRN server for AAA to use for sessions in VPRNs without a AAA server.

Values *service-id*: 1 to 2147483648

svc-name: 64 characters maximum

Full Context

configure router mpls lsp vprn-auto-bind

configure router mpls lsp-template vprn-auto-bind

Description

This command determines whether the associated names LSP can be used or not as part of the auto-bind feature for VPRN services. By default, a names LSP is available for inclusion to be used for the auto-bind feature.

By configuring the command vprn-auto-bind exclude, the associated LSP will not be used by the auto-bind feature within VPRN services.

The **no** form of this command resets the flag back to the default value.

Default

vprn-auto-bind include

Parameters

include

Allows an associated LSP to be used by auto-bin for vprn services

exclude

Disables the use of the associated LSP to be used with the auto-bind feature for VPRN services.

Platforms

All

26.81 vprn-local

vprn-local

Syntax

vprn-local [{**none** | **all** | **vc-only**}]

Context

[Tree] (config>router>ttl-propagate vprn-local)

Full Context

configure router ttl-propagate vprn-local

Description

This command configures the TTL propagation for locally generated packets which are forwarded over a MPLS LSPs in all VPRN service contexts.

For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP traceroute in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance.

Default

vprn-local vc-only

Parameters

none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

vprn-network-exceptions

Syntax

vprn-network-exceptions *number seconds*

no vprn-network-exceptions

Context

[Tree] (config>system>security vprn-network-exceptions)

Full Context

configure system security vprn-network-exceptions

Description

This command configures the rate to limit the processing of packets with label TTL expiry received within an LSP shortcut, or within all VPRN instances in the system, and from all network IP interfaces. This includes labeled user and control plane packets, ping and traceroute packets within GRT and VPRN, and ICMP replies. Packets over the configured rate are dropped.

This feature does not rate limit MPLS and service OAM packets (vprn-ping, vprn-trace, lsp-ping, lsp-trace, vccv-ping, and vccv-trace).

The **no** form of this command disables the rate limiting of the reply to these packets.

Parameters

number

Specifies the number limit of MPLS exception messages.

Values 10 to 10,000

seconds

Specifies the rate limit of MPLS exception messages, in seconds.

Values 1 to 60

Platforms

All

26.83 vprn-next-hop

vprn-next-hop

Syntax

vprn-next-hop *ip-address*

no vprn-next-hop

Context

[Tree] (config>service>system>bgp-evpn>eth-seg vprn-next-hop)

Full Context

configure service system bgp-evpn ethernet-segment vprn-next-hop

Description

This command configuresthe IPv4 or IPv6 address associated with an Ethernet Segment (ES). A virtual ES using this VPRN next-hop association represents a Layer 3 ES as described in *draft-sajassi-bess-evpn-ip-aliasing*. This IP address must be installed in the route table of the VPRN service identified by the EVI so that the Auto-Discovery per-ES or EVI routes for the ES are advertised. Only one VPRN next hop is supported per ES.

The **no** form of this command removes the IPv4 or IPv6 address association.

Default

no vprn-next-hop

Parameters

ip-address

Specifies the IPv4 or IPv6 address associated with an Ethernet Segment.

Values ipv4-address - a.b.c.d

ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0..FFFF]H

d - [0..255]D

[Tree] (config>saa>test>type vprn-ping)

Full Context

oam vprn-ping

configure saa test type vprn-ping

Description

This command performs a VPRN ping and applies only to the 7750 SR and 7950 XRS.

Parameters

service-id

Specifies the VPRN service ID to diagnose or manage.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **configure saa test type vprn-ping service** *service-name* variant can be used in all configuration modes.

Values 1 to 2147483647

service-name

Specifies the VPRN service name to diagnose or manage, up to 64 characters.

source *ip-address*

Specifies an unused IP address in the same network that is associated with the VPRN.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

destination *ip-address*

Specifies the IP address to be used as the destination for performing a VPRN ping operation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

fc-name

Specifies the forwarding class of the MPLS echo request encapsulation.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

Default out

size

Specifies the OAM request packet size in bytes, expressed as a decimal integer.

Values 1 to 9786

Default 72

vc-label-ttl

Specifies the TTL value in the VC label for the OAM request, expressed as a decimal integer.

Values 1 to 255

Default 255

send-count

Specifies the number of messages to send. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

Values 1 to 100

Default 1

return-control

Specifies the response to come on the control plane.

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response was not received. Any response received after the request times out is silently discarded.

Values 1 to 100

Default 5

interval

Specifies the interval time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

vprn-trace

Syntax

vprn-trace {*service-id* | **service** *service-name*} **source** *ip-address* **destination** *ip-address* [**fc** *fc-name* [**profile** {**in** | **out**}]] [**size** *size*] [**min-ttl** *min-vc-label-ttl*] [**max-ttl** *max-vc-label-ttl*] [**probe-count** *send-count*] [**return-control**] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (oam vprn-trace)

[Tree] (config>saa>test>type vprn-trace)

Full Context

oam vprn-trace

configure saa test type vprn-trace

Description

This command is used to perform a VPRN trace.

Parameters

service-id

Specifies the VPRN service ID to diagnose or manage.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **configure saa test type vprn-trace service** *service-name* variant can be used in all configuration modes.

Values 1 to 2147483647

service-name

Specifies the VPRN service name to diagnose or manage, up to 64 characters.

source *ip-address*

Specifies the IP address for the source IP address in dotted decimal notation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

destination *ip-address*

Specifies the IP address to be used as the destination for performing an vprn-trace operation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

fc-name

Specifies the forwarding class of the MPLS echo request encapsulation.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

Default out

size

Specifies the OAM request packet size in bytes.

Values 1 to 9786

Default 1

min-vc-label-ttl

Specifies the minimum TTL value in the VC label for the trace test.

Values 1 to 255

Default 1

max-vc-label-ttl

Specifies the maximum TTL value in the VC label for the trace test.

Values 1 to 255

Default 4

send-count

Specifies the number of OAM requests sent for a TTL value.

Values 1 to 10

Default 1

return-control

Specifies the OAM reply to a data plane OAM request be sent using the control plane instead of the data plane.

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response was not received. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 3

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

26.86 vprn-transit

vprn-transit

Syntax

vprn-transit [{**none** | **all** | **vc-only**}]

Context

[Tree] (config>router>ttl-propagate vprn-transit)

Full Context

configure router ttl-propagate vprn-transit

Description

This command configures the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in all VPRN service contexts. For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP trace-route in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN service instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]

- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance

Default

vprn-transit vc-only

Parameters

none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

Full Context

configure service vprn bgp-evpn mpls vrf-export

configure service vprn bgp-ipvpn mpls vrf-export

configure service vprn bgp-ipvpn segment-routing-v6 vrf-export

Description

This command configures route policies that control how routes are exported from the local VRF to other VRFs on the same or remote PE routers (using MP-BGP). Route policies are configured in the **config>router>policy-options** context.

The **vrf-export** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route.

Only one of the 15 objects referenced by the **vrf-export** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-export** commands are issued, the last command entered overrides the previous command.

Aggregate routes are not advertised using MP-BGP protocols to the other MP-BGP peers.

The **no** form of this command removes all route policy names from the **vrf-export** list.

Default

no vrf-export

Parameters

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Up to 14 policies may be entered.

configure service vprn mvpn vrf-export

Description

This command specifies the export policy to control MVPN routes exported from the local VRF to other VRFs on the same or remote PE routers.

Default

vrf-export unicast

Parameters

unicast

Specifies to use unicast VRF export policy for the MVPN.

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string up to 255 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

plcy-or-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes. Up to 14 policies can be specified in a single statement.

configure service vprn bgp-evpn mpls vrf-import

configure service vprn bgp-ipvpn segment-routing-v6 vrf-import

configure service vprn bgp-ipvpn mpls vrf-import

Description

This command configures route policies that control how VPN-IP and EVPN-IFL routes exported by other VRFs, on the same or remote PEs, are imported into the local VRF. Route policies are configured in the **config>router>policy-options** context.

The **vrf-import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route

Only one of the 15 objects referenced by the **vrf-import** command is allowed to be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR,

NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-import** commands are issued, the last command entered overrides the previous command.

The **no** form of this command removes all route policy names from the import list

Note:
Unless the preference value is changed by the policy, BGP-VPN and EVPN-IFL routes imported with a **vrf-import** policy have the preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs on the same router.

Default

no vrf-import

Parameters

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

configure service vprn bgp-evpn mpls vrf-target

configure service vprn bgp-ipvpn mpls vrf-target

configure service vprn bgp-ipvpn segment-routing-v6 vrf-target

Description

This command provides a simplified method to configure the route target added to advertised routes or compared against received routes from other VRFs on the same or remote PE routers (using MP-BGP).

BGP-VPN and EVPN-IFL routes imported with a VRF target policy use the BGP preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs in the same router.

Specified VRF import or VRF export policies override the VRF target policy.

The **no** form of this command removes the VRF target policy.

Default

no vrf-target

Parameters

ext-comm

Specifies an extended BGP community in the *type:x:y* format. The value *x* can be an integer or IP address. The *type* can be the target or origin. *y* can be 16-bit integers.

Values

<ext-community>	: target:{<ip-addr:comm-val> | <2byte-asnumber:ext-comm-val> | <4byte-asnumber:comm-val>}	
	ip-addr:	a.b.c.d
	comm-val:	[0 to 65535]

2byte-asnumber:	[0 to 65535]
ext-comm-val:	[0 to 4294967295]
4byte-asnumber:	[0 to 4294967295]

import *ext-community*

Specifies communities allowed to be received from remote PE neighbors.

export *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

configure service vprn mvpn vrf-target

Description

This command specifies the route target to be added to the advertised routes or compared against the received routes from other VRFs on the same or remote PE routers. vrf-import or vrf-export policies override the vrf-target policy.

The **no** form of this command removes the vrf-target.

Default

no vrf-target

Parameters

unicast

Specifies to use unicast vrf-target ext-community for the multicast VPN.

ext-comm

An extended BGP community in the **type**:**x**:**y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers.

Values target:{*ip-address*:*comm-val* | *2byte-asnumber:ext-comm-val* | 4byte-asnumber:comm-val}

ip-address:	a.b.c.d
comm-val:	0 to 65535
2byte-asnumber:	1 to 65535
4byte-asnumber	0 to 4294967295

import *ext-community*

Specifies communities allowed to be accepted from remote PE neighbors.

export *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

Full Context

configure service ies interface ipv6 vrrp

configure service ies interface vrrp

Description

This command configures the router to create or edit a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. The **vrrp** *virtual-router-id* command is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shutdown to remove the virtual router instance.

Parameters

virtual-router-id

Specifies a virtual router ID or an ID that can be modified on the IP interface.

Values 1 to 255

owner

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Keyword used to identify this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

Context

[Tree] (config>service>vprn>if vrrp)

Full Context

configure service vprn interface vrrp

Description

This command creates or edits a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. One, both, or none may be defined as owner. The nodal context of **vrrp** *virtual-router-id* is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shut down in order to remove the virtual router instance.

Parameters

virtual-router-id

Specifies a new virtual router ID or one that can be modified on the IP interface.

Values 1 to 255

owner

Identifies this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. Once created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Identifies this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operational-up), or the **init** state (if the interface is operational-down). The **passive** keyword is not required when entering the *vrid* for editing purposes. Once a *vrid* on an IP interface is created as **passive**, the

parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with specified operation group.

Context

[Tree] (config>router>if>ipv6 vrrp)

[Tree] (config>router>if vrrp)

Full Context

configure router interface ipv6 vrrp

configure router interface vrrp

Description

This command creates the context to configure a VRRP virtual router instance. A virtual router is defined by its virtual router identifier (VRID) and a set of IP addresses.

The optional **owner** keyword indicates that the **owner** controls the IP address of the virtual router and is responsible for forwarding packets sent to this IP address. The **owner** assumes the role of the master virtual router.

All other virtual router instances participating in this message domain must have the same *vrid* configured and cannot be configured as **owner**. Once created, the **owner** keyword is optional when entering the *vrid* for configuration purposes.

A *vrid* is internally associated with the IP interface. This allows the *vrid* to be used on multiple IP interfaces while representing different virtual router instances.

For IPv4, up to four VRRP VRID nodes can be configured on a router interface. Each virtual router instance can manage up to 16 backup IP addresses. For IPv6, only one VRID can be configured on a router interface.

The optional **passive** keyword indicates that a *vrid* can be configured as **passive**, in which case, the VRRP advertisement messages are suppressed on transmission and reception, and all routers configured with the same *vrid* become master. Passive *VRIDs* can exceed the limit of four VRRP VRID nodes on a router interface.

The **no** form of the command removes the specified *vrid* from the IP interface. This terminates VRRP participation and deletes all references to the *vrid* in conjunction with the IP interface. The *vrid* does not need to be shut down to remove the virtual router instance.

Default

no vrrp — No VRRP virtual router instance is associated with the IP interface.

Parameters

virtual-router-id

The virtual router ID for the IP interface expressed as a decimal integer.

Values 1 to 255

owner

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Keyword used to identify this virtual router instance as **passive**, therefore owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove the parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

Context

[Tree] (config>fwd-path-ext>fpe vxlan)

Full Context

configure fwd-path-ext fpe vxlan

Description

This command informs the system about the cross-connect type that is required for non-system IPv4 and IPv6 VXLAN termination. Internally, it triggers the automatic creation of two internal IP interfaces in the PXC ports and enables those internal interfaces to process and terminate VXLAN.

If no parameters are used, the VXLAN termination occurs in the base router; however, when the FPE is used for static VXLAN termination (no BGP-EVPN services), non-system IPv4 and IPv6 VXLAN can be terminated in a VPRN service. In this case, the VPRN router instance or service name must be configured with the **vxlan-termination** command.

The **no** form of this command disables the cross-connect type from the configuration.

Default

no vxlan-termination

Parameters

router-name

Specifies the router instance for VXLAN termination.

Values *router-name*: *router-name* or *vprn-svc-id*

router-name	"Base"
vprn-svc-id	1 to 2147483647

Default Base

service-name

Specifies the service name that identifies the VPRN for VXLAN termination, up to 64 characters.

Context

[Tree] (config>service>vpls>allow-ip-int-bind vxlan-ipv4-tep-ecmp)

Full Context

configure service vpls allow-ip-int-bind vxlan-ipv4-tep-ecmp

Description

This command enables and disables ECMP on VXLAN IPv4 destinations for R-VPLS services. When this command is enabled, packets entering a VPRN connected to an R-VPLS that is terminating on a VXLAN IPv4 destination are looked up in the routing table. If the next hop is a VXLAN IPv4 TEP, the packets are distributed based on per-flow load-balancing.

This command can only be used in FP3- (or higher) routers. R-VPLS per-flow load-balancing for VXLAN IPv6 destinations works by default without this command.

The **no** version of this command reverts the process to the default behavior of per-remote VTEP load-balancing.

Default

no vxlan-ipv4-tep-ecmp

vxlan-ping test-id *test-id* **service** *vpls-service-id* **dest-vni** *vxlan-network-id* **outer-ip-destination** *ipv4-address* [**outer-ip-source-udp** *udp-port-number*] [**outer-ip-ttl** *time-to-live*] [**inner-l2** *ieee-address*] [**inner-ip-source** *ipv4-address*] [**inner-ip-destination** *ipv4-address*] [**i-flag-on**] [**end-system** *ieee-address*] [**send-count** *packets*] [**interval** *interval-time*] [**timeout** *timeout-time*] [**padding** *tlv-size* [**reflect-pad**]] [**fc** *fc-name*] [**profile** { **in** | **out**}] [**reply-mode** {**overlay** | **udp**}]

Context

[Tree] (oam vxlan-ping)

Full Context

oam vxlan-ping

Description

Operational command used to validate the VXLAN Tunnel Endpoint (VXLAN) connectivity between peers.

Parameters

test-id

Specifies a value to identify the originator handle of the specific request. Each active test requires a unique test identifier.

Values 1 to 2147483647

vpls-service-id

Specifies the VPLS service used to launch the request and by extension pick up the source VNI information.

Values *service-id*: 1 to 2147483647

svc-name: up to 64 characters

vxlan-network-id

Specifies the target Vxlan network identifier on the terminating VTEP.

Values 1 to 16777215

outer-ip-destination *ipv4-address*

Specifies the IPv4 address of the terminating VTEP.

Values a.b.c.d

udp-port-number

Optional outer source UDP port number.

Values 1 to 65535

Default System-generated UDP port number

time-to-live

Specifies the optional outer time to live.

Values 1 to 255

Default 255

inner-l2 *ieee-address*

Specifies the destination MAC address used in the inner VXLAN header.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Default 00:00:00:00:00:00

inner-ip-source *ipv4-address*

Specifies the inner source IPv4 address.

Values a.b.c.d

Default System IPv4 Address

inner-ip-destination *ipv4-address*

Specifies the inner destination IPv4 address. Must be in the range 127/8.

Values 127.0.0.0 to 127.0.0.8

Default 127.0.0.1

i-flag-on

Sets the VNI Validation bit to 1, indicating that the OAMPDU contains a valid VNI.

Default i-flag set to "0” which prevents the OAMPDU form being forwarded beyond the terminating VTEP.

end-system *ieee-address*

Optional command to include the sub TLV to validate an end system MAC address in the FDB. Only one MAC address may be included.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Default 00:00:00:00:00:00

packets

Specifies the number of VXLAN ping requests to transmit.

Values 1 to 1024

Default 1

interval-time

Specifies the probe interval, in seconds.

Values 0.1, 1 to 10

Default 1

timeout-time

Specifies the packet time out value, in seconds.

Values 1 to 10

Default 5

tlv-size

Specifies whether to include the Pad TLV and specifies the number of octets that defines the entire size of the pad TLV, including the type (2B), the length field (2B), the padding (variable).

Values 0, 5 to 2000

Default 0

reflect-pad

Instructs the responder to include the pad-tlv in the echo response. This option is not supported when the reply mode is "UDP”.

fc-name

Indicates the forwarding class that is exposed to the QoS policy as input into generating the outer CoS.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Defines the frame's disposition that is exposed to the QoS policy as input into generating the outer CoS.

Default in

reply-mode {overlay | udp}

Instructs the responder how to route the VXLAN response.

Values **udp**: responds using UDP over the IP network. The default must be changed if the VTEP uses anything other than an IPv4 System Address as the source.

overlay: responds using the VXLAN overlay for the service

Default udp

[Tree] (config>service>epipe vxlan-src-vtep)

Full Context

configure service vpls vxlan-src-vtep

configure service epipe vxlan-src-vtep

Description

This command enables the router to use the configured IP address as the tunnel source IP address (source VTEP) when originating VXLAN-encapsulated frames for this service. This IP address is also used to set the BGP NLRI next hop in EVPN route advertisements for the service.

Default

no vxlan-src-vtep

Parameters

ip-address

Specifies the non-system IPv4 address that terminates VXLAN for a service.

ipv6-address

Specifies the IPv6 address that terminates VXLAN for a service.

Platforms

All

26.100 vxlan-vni

Full Context

configure qos sap-ingress ip-criteria entry match vxlan-vni

configure qos sap-ingress ipv6-criteria entry match vxlan-vni

Description

This command configures a VXLAN or VXLAN GPE VNI to be used as a SAP QoS policy match criterion. A range of VNIs to be matched can be specified by including the keyword **range** with a *start* and *end* VNI. This command requires the **type** to be set to **vxlan-vni** in the related **ip-criteria** or **ipv6-criteria** context.

See Virtual Network Identifier (VNI) Classification for the list of restrictions for this command.

Default

no vxlan-vni

Parameters

eq *vxlan-vni-id*

Specifies the VXLAN or VXLAN GPE VNI to be matched in the SAP ingress QoS classification. The VNI can be specified in any of the available formats but is always shown in decimal.

Values 1 to 16777215 (Decimal)
0x1 to 0xFFFFFF (Hexadecimal)
[0b1 to 0b111111111111111111111111] (Binary)

range *startend*

Identifies a range of VNIs to be used as matching criteria. The *start* value must be lower than the *end* value. The VNI can be specified in any of the available formats but is always shown in decimal.

Values 1 to 16777215 (Decimal)
0x1 to 0xFFFFFF (Hexadecimal)
[0b1 to 0b111111111111111111111111] (Binary)

no vxlan-vtep-range

Context

[Tree] (config>router>isa-svc-chain vxlan-vtep-range)

Full Context

configure router isa-service-chaining vxlan-vtep-range

Description

This command specifies the address range to be used as the local VXLAN VTEP on the ISA for service chaining. The system allocates one address for each ISA in the NAT group out of the specified range. The allocated address appears as /32 or /128 routes in the global routing table with the route type **nat**.

The **no** form of this command removes the IP or IPv6 addresses from the configuration.

Parameters

start

Specifies the start address of the VXLAN VTEP range.

end

Specifies the end address of the VXLAN VTEP range.

ip-address

Specifies an IPv4 address start and end range.

Values ipv4-address - a.b.c.d

ipv6-address

Specifies an IPv6 address start and end range

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0..FFFF]H

no vxlan-vtep-range

Context

[Tree] (config>router>vrgw>lanext vxlan-vtep-range)

Full Context

configure router vrgw lanext vxlan-vtep-range

Description

This command specifies the address range to be used as the local VXLAN VTEP on the ISA for HLE services. The system allocates one address for each ISA in the WLAN GW group out of the specified range. The allocated address appears as /32 or /128 routes in the global routing table with the route type **nat**.

The **no** form of this command removes the values from the configuration.

Parameters

start

Specifies the start of the VXLAN VTEP range.

end

Specifies the end of the VXLAN VTEP range.

ip-address* | *ipv6-address

Specifies the range of VXLAN VTEP addresses.

Values <ip-address| ipv6-address : ipv4-address - a.b.c.d
ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d

27.1 wa-shared-high-wmark

wa-shared-high-wmark

Syntax

wa-shared-high-wmark *percent*

no wa-shared-high-wmark

Context

[Tree] (config>isa>aa-grp>qos>egress>to-sub wa-shared-high-wmark)

[Tree] (config>isa>aa-grp>qos>egress>from-sub wa-shared-high-wmark)

Full Context

configure isa application-assurance-group qos egress to-subscriber wa-shared-high-wmark

configure isa application-assurance-group qos egress from-subscriber wa-shared-high-wmark

Description

This command configures the high watermark for the weighted average utilization of the shared buffer space in the **from-subscriber** buffer pool for each ISA. When a buffer pool is not in the overload state and the wa-shared buffer utilization for an ISA crosses above the high watermark value in the ISA **from-subscriber** buffer pool enters an overload state and an overload notification is raised.

The **no** form of this command reverts to the default.

Default

wa-shared-high-wmark max

Parameters

percent

Specifies the weighted average shared buffer utilization high watermark.

Values 1 to 100, **max** percent (disabled)

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

27.2 wa-shared-low-wmark

wa-shared-low-wmark

Syntax

wa-shared-low-wmark *percent*

no wa-shared-low-wmark

Context

[Tree] (config>isa>aa-grp>qos>egress>to-sub wa-shared-low-wmark)

Full Context

configure isa application-assurance-group qos egress from-subscriber wa-shared-low-wmark

configure isa application-assurance-group qos egress to-subscriber wa-shared-low-wmark

Description

This command configures the low watermark for the weighted average utilization of the shared buffer space in the **from-subscriber** buffer pool. When a buffer pool is in an overloaded state and the wa-shared buffer utilization for an ISA drops below low watermark value ISA **from-subscriber** buffer pool leaves the overload state and a is sent to indicate the overload state has cleared.

The **no** form of this command reverts to the default.

Default

wa-shared-low-wmark 0

Parameters

percent

Specifies the weighted average shared buffer utilization low watermark.

Values 0 to 99

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

27.3 wait

wait

Syntax

wait *seconds*

Context

[Tree] (bof wait)

Full Context

bof wait

Description

This command configures a pause, in seconds, at the start of the boot process which allows system initialization to be interrupted at the console.

When system initialization is interrupted the operator is allowed to manually override the parameters defined in the boot option file (BOF).

Only one **wait** command can be defined in the BOF.

Default

wait 3

Parameters

seconds

Specifies the time to pause at the start of the boot process, in seconds.

Values 1 to10

Platforms

All

27.4 wait-for-up-timer

wait-for-up-timer

Syntax

wait-for-up-timer *seconds*

no wait-for-up-timer

Context

Full Context

configure router mpls lsp primary bfd wait-for-up-timer

configure router mpls lsp-template bfd wait-for-up-timer

configure router mpls lsp secondary bfd wait-for-up-timer

configure router mpls lsp bfd wait-for-up-timer

Description

This command configures the time to wait for a BFD to come up in seconds. This timer is applicable to SR-TE LSPs, including auto-LSPs and PCE-initiated LSPs, as well as RSVP-TE LSPs. In case of SR-TE LSPs, this timer takes effect if BFD does not come up, or BFD goes from up to down. The timer is started when BFD is first enabled on a path or BFD transitions from up to down. When the timer expires if BFD is not yet come up, then the path is torn down by removing it from the TTM and the IOM and the retry timer is started.

In case of RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up on the original path
- the initial administrative enable of an LSP
- signaling retry of non-standby secondary paths

The **no** form of this command sets the timer to its default value.

Default

no wait-for-up-timer

Parameters

seconds

Specifies the BFD wait for up timer in seconds.

Values 0 to 60

Default 4

Platforms

All

- configure router mpls lsp secondary bfd wait-for-up-timer

configure service epipe spoke-sdp bfd wait-for-up-timer

configure service vpls spoke-sdp bfd wait-for-up-timer

configure service ies interface spoke-sdp bfd wait-for-up-timer

Description

This command configures the time interval, in seconds, that is used to wait for a BFD session to come up.

This command is triggered when a spoke-SDP is first administratively enabled and a VCCV BFD session transitions from up to down. The command is required to allow time for BFD sessions to come up, and for BFD to settle before selecting the active spoke-SDP to use in a redundant set. In the case where a VCCV BFD session is bouncing, the timer prevents excessive flapping of the operational state of a spoke-SDP.

The **no** form of this command disables the timer.

Default

no wait-for-up-timer

Parameters

seconds

Specifies the wait interval, in seconds, for the BFD up timer.

Values 1 to 60

Platforms

All

27.5 wait-to-restore

wait-to-restore

Syntax

wait-to-restore *interval*

no wait-to-restore

Context

[Tree] (config>router>mpls>mpls-tp>protection-template wait-to-restore)

Full Context

configure router mpls mpls-tp protection-template wait-to-restore

Description

This command configures the WTR timer. It determines how long to wait until the active path of an MPLS-TP LSP is restored to the working path following the clearing of a defect on the working path. It is applicable to revertive mode, only.

Default

wait-to-restore 300

Parameters

interval

Specifies the WTR timer interval in 1 second increments.

Values 0 to 720 seconds

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

27.7 warm-standby

warm-standby

Syntax

warm-standby

Context

[Tree] (config>redundancy>multi-chassis>peer warm-standby)

Full Context

configure redundancy multi-chassis peer warm-standby

Description

This command enables Oversubscribed Multi-Chassis Redundancy (OMCR) model where subscriber hosts are synchronized between the two chassis only in the control plane and are kept there (as part of the Multi-Chassis Synchronization (MCS) state) until the switchover occurs. Link or nodal failure will trigger the switchover at which point the subscriber hosts are being fully instantiated in the control and the forwarding plane. This approach allows oversubscription of the resources in the central standby (or protecting) node that is backing-up several active nodes. The total number of protected subscribers in the OMCR cluster exceeds the forwarding capacity of the protecting node. This is achievable by not fully occupying the resources for the subscriber hosts until the failure occurs.

The restoration times depend on the amount of the subscriber hosts that are affected by the switchover and it is related to the time needed for the full instantiation of the subscribers in the forwarding plane.

Although this command is configured on a peer level, the warm-standby property is a nodal characteristic. In other words, mixing of N:1 and 1:1 (hot standby) mode in the central standby node is not supported. Consequently all peers on the central standby node must be configured for warm-standby (N:1), or all peers must be configured for hot-standby (1:1) by omitting the warm-standby keyword from the configuration.

The peer of the central backup node is not aware of the redundancy model supported. In in other words, the peer of the central-backup node does not know whether it peers with a warm-standby peer or host-standby-peer.

27.9 watchdog-timer

watchdog-timer

Syntax

watchdog-timer *seconds*

no watchdog-timer

Context

[Tree] (config>aaa>diam>node>peer watchdog-timer)

Full Context

configure aaa diameter node peer watchdog-timer

Description

Watchdog messages are used to verify liveliness of a Diameter peer. A single watchdog message is sent to a peer in case that no traffic is received from it within a configured watchdog-timer. This watchdog request message solicits a watchdog answer message from the peer. If no traffic (watchdog answer or otherwise) is received from the peer in response to watchdog request while the watchdog timer is running, the peer ise put in suspicious state and a peer failover routine is triggered.

The peer closes after it has been in suspicious mode for the duration of one more watchdog-timer interval without receiving any traffic from it.

After the peer is recovered, it takes three successful exchanges of diameter watchdog messages (DWR/DWA) for the peer to become used again in Diameter forwarding. This behavior is described in RFC 3539, §3.4.1, *Authentication, Authorization and Accounting (AAA) Transport Profile*).

This command is not applicable to legacy implementations of Diameter base in the SR OS.

The **no** form of this command removes the watchdog timer value from the configuration.

Default

watchdog-timer 30

Parameters

seconds

Specifies the device watchdog timer, in seconds, used on all connections by this peer.

Values 1 to 1000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service vprn subscriber-interface wlan-gw pool-manager watermarks

configure service ies subscriber-interface wlan-gw pool-manager watermarks

Description

This command configures the watermarks used to determine if a new prefix should be allocated or an old prefix should be removed. A new prefix is allocated when the total usage level for the ISA reaches the high watermark. A prefix is freed if no addresses are currently in use and the usage level without this prefix would be below the low watermark.

The **no** form of this command resets the watermarks to its default values of 95% high and 90% low.

Default

watermarks high 95 low 90

Parameters

high-percentage

Specifies the high watermark.

Values 80 to 99

low-percentage

Specifies the low watermark. The value must be lower than the high percentage value.

Context

[Tree] (config>service>nat>up-nat-policy>port-block-extensions watermarks)

Full Context

configure service nat up-nat-policy port-block-extensions watermarks

Description

This command configures the extended port block watermarks used to monitor utilization of the port block space per outside IP in a NAT pool reserved for extended port blocks. Configure extended port blocks in addition to the initial port blocks optionally allocated to each NAT subscriber.

The high and low thresholds are configured in percentages of the total extended port blocks per outside IP in a NAT pool. Both values represent extended port-block utilization or occupancy per outside IP in a NAT pool.

Note: For the system to generate these events, you must enable the NAT event ID 2045 using the configuration in the log event-control.

The **no** form of this command reverts the watermarks to the default value.

Default

no watermarks

Parameters

high-percentage

Specifies the high threshold value in the percentages of the total extended port-block space per outside IP in a NAT pool .

Values 1 to 100

low-percentage

Specifies the low threshold value in the percentage of the total extended port-block space per outside IP in a NAT pool.

Values 0 to 99

27.14 weekday

weekday

Syntax

weekday {*weekday-number* [..*weekday-number*] | *day-name* [..*day-name*] | **all**}

no weekday

Context

[Tree] (config>system>cron>sched weekday)

Full Context

configure system cron schedule weekday

Description

This command specifies which days of the week that the schedule will fire on. Multiple days of the week can be specified. When multiple days are configured, each of them will cause the schedule to occur. If a weekday is configured without configuring the month, weekday, day-of-month, and minute, the event will not execute.

Using the **weekday** command as well as the **day-of month** command will cause the script to run twice. For example, consider that today is Monday January 1. If Tuesday January 5 is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified weekday from the configuration.

Default

no weekday

Parameters

weekday-number

Specifies a weekday number.

Values 1 to 7 (maximum 7 weekday-numbers)

day-name

Specifies a day by name.

Values sunday, monday, tuesday, wednesday, thursday, friday, saturday (maximum 7 weekday names)

all

Specifies all days of the week.

Syntax

weight *weight*

no weight

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>seg-list weight)

Full Context

configure router segment-routing sr-policies static-policy segment-list weight

Description

This command associates a weight value with a segment list of a statically-defined segment routing policy to achieve weighted ECMP behavior. Weight is an optional parameter.

When any segment-list in the active policy has a weight greater than 1, traffic matching the policy is load-balanced across the segment lists according to their relative weight values.

The **no** form of this command reverts to the default value.

Default

weight 1

Parameters

weight

Specifies the weight value.

Values 1 to 4294967295

Platforms

All

27.16 weight-down

weight-down

Syntax

[**no**] **weight-down** *lag-ports-down-weight*

Context

[Tree] (config>vrrp>policy>priority-event>lag-port-down weight-down)

Full Context

configure vrrp policy priority-event lag-port-down weight-down

Description

This command creates a context to configure an event set threshold within a lag-port-down priority control event. The weight-down command defines a sub-node within the lag-port-down event and is uniquely identified with the lag-ports-down-weight parameter. Each weight-down node within the same lag-port-

down event node must have a unique lag-ports-down-weight value. Each weight-down node has its own priority command that takes effect whenever that node represents the current threshold. A single LAG can use either weight-based (**weight-down**) or port-based (**number-down**) thresholds. The weight-based thresholds are required for correct operation on mixed port-speed LAGs, but can be used for non mixed port-speed LAGs as well. The weights for the **weight-down** node are normalized from the **hash-weight** values of the LAG member ports to fit a 1 to 64 range for 64-link capable LAGs and a 1 to 32 range for other LAGs.

The total number of sub-nodes (uniquely identified by the lag-ports-down-weight parameter) allowed in the system is 2048.

A **weight-down** node is not required for each possible number of ports that could be down. The active threshold is always the closest lower threshold.

The **no** form of the command deletes the event set threshold. The threshold may be removed at any time. If the removed threshold is the current active threshold, the event set thresholds must be re-evaluated after removal.

Default

no weight-down

Parameters

lag-ports-down-weight

The total weight of LAG ports down to create a set event threshold. This is the active threshold when the weight of down ports in the LAG equals or exceeds *lag-ports-down-weight*, but does not equal or exceed the next highest configured *lag-ports-down-weight*.

Values 1 to 64 (for 64-link capable LAGs)

1 to 32 (for other LAGs)

configure service vprn bgp-evpn segment-routing-v6 evpn-link-bandwidth weighted-ecmp

configure service vpls bgp-evpn ip-route-link-bandwidth weighted-ecmp

Description

This command enables the processing of the EVPN link bandwidth extended community when installing an ECMP set for an EVPN IP-Prefix route in the VPRN route-table.

Flows to an IP Prefix received with a weight and a zero ESI value are sprayed according to the weight. If the EVPN IP Prefix route received with the weight has a non-zero ESI, the weight is divided into the number of PEs attached to the Ethernet Segment (and rounded up if the result is not an integer).

This command also enables the weighted ECMP functionality for BGP CEs where the weight is configured with the **evpn-link-bandwidth add-to-received-bgp** command.

The **no** form of this command disables EVPN link bandwidth extended community.

weighted-ecmp

Syntax

weighted-ecmp [**strict**]

no weighted-ecmp

Context

[Tree] (config>service>vprn weighted-ecmp)

Full Context

configure service vprn weighted-ecmp

Description

This command enables weighted load-balancing for IS-IS, OSPF, and static ECMP routes in the VPRN instance. Weighted ECMP can be performed when all next hops are configured with non-zero load-balancing weights. Weighted ECMP support for IS-IS, OSPF, and static ECMP routes applies to both IPv4 and IPv6.

The **no** form of this command restores regular ECMP spraying of packets to IS-IS, OSPF and static route destinations.

Default

no weighted-ecmp

Parameters

strict

Enables strict enforcement for a load balancing weight to be configured on each interface withing a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or

next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

Full Context

configure router ldp weighted-ecmp

Description

This command enables weighted ECMP on LDP using RSVP LSPs or SR-TE LSPs. LDP labeled packets are sprayed across the RSVP or SR-TE LSP ECMP in proportion to the configured **load-balancing-weight** of LSPs.

The **no** form of this command removes weighted ECMP.

Default

no weighted-ecmp

Platforms

All

weighted-ecmp

Syntax

weighted-ecmp [**strict**]

no weighted-ecmp

Context

[Tree] (config>router weighted-ecmp)

Full Context

configure router weighted-ecmp

Description

This command enables the weighted load-balancing, or weighted ECMP, over MPLS LSP.

When this command is enabled, packets of IGP, BGP, and static route prefixes resolved to a set of ECMP tunnel next-hops are sprayed proportionally to the weights configured for each MPLS LSP in the ECMP set.

Weighted load-balancing over MPLS LSP is supported in the following forwarding contexts:

- IGP prefix resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- BGP prefix with the BGP next-hop resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- Static route prefix resolved to an indirect next-hop, which itself is resolved to a set of equal-metric MPLS LSPs in TTM. The user can allow automatic selection or specify the names of the equal-metric MPLS LSPs in TTM to be used in the ECMP set.
- Static route prefix resolved to an indirect next-hop, which is resolved to IGP shortcuts in RTM.
- BGP prefix with a BGP next-hop resolved to a static route, which resolves to a set of tunnel next-hops toward an indirect next-hop in RTM or TTM.
- BGP prefix resolving to another BGP prefix, whose next-hop is resolved to a set of ECMP tunnel next-hops with a static route in RTM or TTM or to IGP shortcuts in RTM.

IGP computes the normalized weight for each prefix tunnel next-hop. IGP updates the route in RTM with the set of tunnel next-hops and normalized weights. RTM downloads the information to IOM for inclusion in the FIB.

If one or more LSPs in the ECMP set of a prefix do not have a weight configured, the regular ECMP spraying for the prefix will be performed.

The weight assigned to an LSP impacts only the forwarding decision, not the routing decision. In other words, it does not change the selection of the set of ECMP tunnel next-hops of a prefix when more next-hops exist than the value of the router **ecmp** option. Once the set of tunnel next-hops is selected, the LSP weight is used to modulate the amount of packets forwarded over each next-hop. It also does not change the hash routine, but only the spraying of the flows over the tunnel next-hops is modified to reflect the normalized weight of each tunnel next-hop.

The **no** form of this command resumes regular ECMP spraying of packets of IGP, BGP, and static route prefixes over MPLS LSP.

Default

no weighted-ecmp

Parameters

strict

Enables strict enforcement for a load balancing weight to be configured on each interface withing a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

This command defines the size of the window using a 100ms base *deciseconds*. The time value is converted to a number of symbols for the underlying medium. Errors are accumulated until the end of the window. At the end of the window, the actual errors are compared to the thresholds to determine if a threshold has been crossed. There is no mid-window threshold checking. The window represents a unique non-overlapping period of time.

Parameters

deciseconds

Specifies the number of 100ms increments in increments of 10 (full seconds).

Values 10 to 600

Default 10

Platforms

All

27.25 window-integrity

window-integrity

Syntax

window-integrity *percentage*

no window-integrity

Context

[Tree] (config>oam-pm>streaming>delay-template window-integrity)

Full Context

configure oam-pm streaming delay-template window-integrity

Description

This command specifies the integrity of the sample window. A percentage value that suggests the measurement has enough samples (integrity) to be considered representative for that sample window. The configured percentage considers the interval of the test PDUs, and the length of the sample window to determine the number of packets required in the sample.

(((window-integrity %) x (sample-window length (s) x pps per test (interval)).

Ensure that the percentage and the combination of sample window and packet per second per test interval produces the desired results.

If the number of samples in the sample window are equal to or greater than the computed number of required samples, then the value has integrity and the suspect flag is set to false for that streamed result.

If the count is less than the computed number of required samples, then the suspect flag is set to true for that streamed result.

Regardless of the integrity, the average values are streamed. It is up to the higher level systems to interrogate the suspect flag and determine if the value that is set should be used, discarded, or reported separately.

The **no** form of this command reverts to the default.

Default

window-integrity 50

Parameters

percentage

Specifies the window integrity percentage.

Values 1 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

window-integrity

Syntax

window-integrity *percent*

no window-integrity

Context

[Tree] (config>test-oam>link-meas>template>asw window-integrity)

Full Context

configure test-oam link-measurement measurement-template aggregate-sample-window window-integrity

Description

This command determines whether the aggregate sample window is integral based on the number of samples received from the sample window, comparing the number of samples to the percentage configured.

The configured percentage translates to a required sample window count that must be included in the aggregate sample window. The range is from 0 to 100. The number of samples is computed as follows:

(window-integrity (%)) x (((aggregate-sample-window length (s)) / (sample-window length (s)))

For an aggregate sample window that does not reach the integrity, the value is not considered as representative and is used for threshold comparison.

If the number of samples in the aggregate sample window are equal to or greater than the computed number of required samples, the sample window has integrity and the aggregate sample window result is compared to configured sample window thresholds.

If the count is less than the computed number of required samples, the aggregate sample window does not have integrity and the aggregate sample window results are compared to configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

The **no** form of this command disables integrity checking.

Default

window-integrity 0

Parameters

percent

Specifies the percentage of successful sent and received request-response pairs.

Zero indicates any amount of integrity is acceptable for report to the routing engine.

Values 0 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

window-integrity

Syntax

window-integrity *percent*

no window-integrity

Context

[Tree] (config>test-oam>link-meas>template>sw window-integrity)

Full Context

configure test-oam link-measurement measurement-template sample-window window-integrity

Description

This command specifies the integrity of the sample window. A percentage value indicates when the sample window has enough samples to be considered representative for that window (integrity). The configured percentage considers the interval of probes and the length of the sample window to determine the number of packets required in the sample:

(window-integrity (%)) x (((sample-window length (s)) / pps per test (interval)))

Ensure that the percentage and the combination of sample window and the packet-per- second per test interval produces the desired results.

If the number of samples in the sample window are equal to or greater than the computed number of required samples, the sample window has integrity and the sample window result is compared to the configured sample window thresholds.

If the count is less than the computed number of required samples, the sample window does not have integrity and the sample window results are not compared to configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

The **no** form of this command disables integrity checking.

Default

window-integrity 0

Parameters

percent

Specifies the percentage of successful sent and received request-response pairs.

A value of 0 indicates any amount of integrity acceptable for report to the routing engine.

Values 0 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure subscriber-mgmt wlan-gw ue-query wlan-gw-group

Description

This command enables matching on UEs, based on the WLAN-GW group ID and, optionally, the specific ISA member they are installed on.

The **no** form of this command disables matching on the WLAN-GW group.

Default

no wlan-gw-group

Parameters

wlan-gw-group-id

Specifies the WLAN-GW group ID.

Values 1 to 4

member-id

Specifies the ISA member ID within the group.

Values 1 to 255

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

wlan-gw-group

Syntax

wlan-gw-group *group-id* [**create**] [**redundancy** *unit*]

no wlan-gw-group *group-id*

Context

[Tree] (config>isa wlan-gw-group)

Full Context

configure isa wlan-gw-group

Description

This command creates a WLAN GW group that contains a set of ISAs to be used in WLAN-GW functionality. A WLAN-GW group can also be used where a NAT group is expected. The WLAN-GW group ID shares the same number space with the NAT group.

At most, one WLAN-GW group may be configured.

The optional redundancy parameter determines the provisioning and redundancy mode.

- IOM mode

  A whole IOM is added to the group. The IOM must be fully provisioned with BB ISA modules. In IOM mode, when a single ISA fails, the entire IOM is considered to have failed and all subscribers are recovered on a backup IOM.

- ISA mode

  BB ISA modules are added separately with no restriction put on other MDAs in the IOM. When a single ISA fails, a backup ISA will try to recover as many subscribers as possible but may run out of resources

(for example, queues, policers, host entries) during the recovery process. It is recommended to pair ISAs with MDAs and services that do not consume many IOM resources.

The **no** form of this command removes the group.

Parameters

group-id

Specifies WLAN Gateway Integrated Service Adaptor (ISA) Groups.

Values 1 to 4

unit

Specifies the provisioning and redundancy mode.

Values mda or iom

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service vpls wlan-gw wlan-gw-group

Description

This command configures a WLAN-GW group to be used as an endpoint within the VPLS. This feature is used in conjunction with the **configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dynamic-service** command for a VPRN service and the **configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dynamic-service** command for an IES service.

The **no** form of the command removes the WLAN-GW group as the endpoint.

See "Dynamic VPLS service" in the *7450 ESS, 7750 SR, and VSR Triple Play Service Delivery Architecture Guide* for more information about the dynamic VPLS service feature.

Parameters

nat-group-id

Specifies the NAT group ID of the WLAN-GW group to be used as an endpoint.

Values 1 to 4

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

27.29 working-circuit

working-circuit

Syntax

working-circuit *port-id* [**number** *number*]

no work-circuit [**number** *number*]

Context

[Tree] (config>port>aps working-circuit)

Full Context

configure port aps working-circuit

Description

This command configures a physical port that will act as the working circuit for this APS group. The working circuit port must contain only the default configuration and cannot be part of another APS group. The working circuit must be created before the protection circuit.

When a port is a working circuit of an APS group, the configuration available under **config>port** *port-id* context (including submenus) is not allowed for that port unless it is a part of the noted exceptions.

When a port is being configured as a working circuit of an APS group, all common configuration as described above and all service configurations related to the APS port is operationally inherited by the

working circuit from the aps- *group-id*. If the working circuit cannot inherit that configuration, for example, due to resource limitations, the configuration attempt fails and an error is returned to the user.

Before a working circuit can be removed from an APS group, the working circuit port must be shutdown. The inherited configuration for the circuit and APS operational commands for that circuit are not preserved when the circuit is removed from the APS group.

Note that all configurations for aps-*group-id* under the **config>port** context and its submenus and all configuration for services that use this aps- *group-id* is preserved as a non-activated configuration since the APS group no longer has any physical circuits assigned.

The **no** form of this command removes the working-circuit. The working circuit can only be removed from the configuration after the protect circuit has been removed.

Parameters

port-id

Specifies the physical port that will act as the working circuit for this APS group in the following format:

port-id	*slot*/*mda*/*port*		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

number

Specifies the APS channel number; value is 1 or 2.

Modifying Hold-Down Timer Values

Note that for APS configurations, the **config>port>sonet-sdh hold-time down** and **config>port>sonet-sdh hold-time up** default values are 100 ms and 500 ms respectively. But, if there is a large difference in the transmission delay between the APS working () and protect line (**config>port>aps protect-circuit**), it is highly recommended that you increase the default timer on the working line accordingly with the transmission delay present on the protect line.

The following output shows an example of the timers on POS interfaces.

27.30 working-tp-path

working-tp-path

Syntax

[**no**] **working-tp-path**

Context

[Tree] (config>router>mpls>lsp working-tp-path)

Full Context

configure router mpls lsp working-tp-path

Description

This command creates or edits the working path for an MPLS-TP LSP. At least one working path (but not more than one working path) must be created for an MPLS-TP LSP. If MPLS-TP linear protection is also configured, then this is the path that is used as the default working path for the LSP, and it must be created prior to the protect path. The working-tp-path can only be deleted if no protect-tp-path exists for the LSP.

The following commands are applicable to the working-tp-path: **lsp-num, in-label, out-label, mep, shutdown**.

Default

no working-tp-path

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

27.32 wrap-around

wrap-around

Syntax

[**no**] **wrap-around**

Context

[Tree] (config>filter>log wrap-around)

Full Context

configure filter log wrap-around

Description

This command configures a memory filter log to log until full or to store the most recent log entries (circular buffer).

Specifying **wrap-around** configures the memory filter log to store the most recent filter log entries (circular buffer). When the log is full, the oldest filter log entries are overwritten with new entries.

The **no** form of the command configures the memory filter log to accept filter log entries until full. When the memory filter log is full, filter logging for the log filter ID ceases.

Default

wrap-around

no wred-queue

Context

[Tree] (config>qos>sap-egress>queue wred-queue)

Full Context

configure qos sap-egress queue wred-queue

Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

  This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out-of-profile and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus-profile and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

This is only supported on FP3 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the

pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's MBS parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's CBS parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shutdown (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue is automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used. If the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for a SAP egress queue, the queue **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the WRED queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default

no wred-queue

Parameters

slope-policy-name

Specifies an existing slope policy that is used to override the default WRED slope policy.

mode

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** — uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue — each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This is supported on both FP2- and higher-based hardware and requires **slope-usage default**.

Default native

slope-usage

Specifies congestion control to be used.

Values **default** — maps the inplus, in, out, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low — maps the out and exceed-profile traffic to the low and exceed WRED slopes with the inplus and in-profile traffic using the MBS drop tail. This is only supported for **native** mode.

Default exceed-low

[Tree] (config>qos>qgrps>egr>qgrp>queue wred-queue)

Full Context

configure qos queue-group-templates egress queue-group queue wred-queue

Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

  This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus and in-profile traffic uses the MBS drop

tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

Native hardware WRED is supported on FP3- and higher-based hardware and is ignored on FP2 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's **mbs** parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's **cbs** parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shut down (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue will be automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used, and if the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for an egress queue group queue, the queue pool and drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the wred-queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default

no wred-queue

Parameters

slope-policy-name

Specifies an existing slope policy that is used to override the default WRED slope policy.

mode {native | pool-per-queue}

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** - Each queue uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue - Each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This requires **slope-usage default**.

Default native

slope-usage {default | exceed-low}

Specifies the type of congestion control to be used.

Values **default** - Maps the inplus-profile, in-profile, out-of-profile, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low - Maps the out-of-profile and exceed-profile traffic to the low and exceed WRED slopes, with the inplus-profile and in-profile traffic using the MBS drop tail. This option is only supported for **native** mode.

Full Context

configure system security management-interface classic-cli write-algorithm

Description

This command specifies how encrypted configuration secrets are output from the system. For example, how encrypted secrets are displayed in the output of the info command, and how they are written to the saved configuration file.

The **no** form of this command reverts to the default value.

Default

write-algorithm hash2

Parameters

hash

Specifies hash. Use this option to transport a phrase between modules and nodes. In this case the read-algorithm should be **hash** as well.

hash2

Specifies hash2 which is module-specific.

custom

Specifies the custom encryption to management interface.

cleartext

Specifies that the phrase is displayed as cleartext everywhere.

27.37 wrr-group

wrr-group

Syntax

wrr-group *group-id* **sched-class** *class-id*

wrr-group *group-id* **unattached**

no wrr-group *group-id*

Context

[Tree] (config>qos>hs-attachment-policy wrr-group)

Full Context

configure qos hs-attachment-policy wrr-group

Description

This command defines how the specified group ID is attached to the scheduler. A WRR group may have one of two attachment states:

- directly attached to a scheduler class
- unattached

A WRR group provides a weighted scheduling context for its member queues, collapsing the queues into a single scheduling class.

The following WRR membership restrictions apply:

- Two groups are supported: WRR-group 1 and WRR-group 2.
- Up to six of the eight queues can become members of WRR groups (the sum of the membership of both groups cannot exceed six queues). All six queues can be placed in a single WRR group or they can be spread between the two groups.
- All queues within a group must have contiguous queue IDs.
- When both groups are configured to have queue members, the queue IDs in group 1 must be lower than the queue IDs in group 2.

The **queue** *queue-id* attachment command is used to define WRR group membership.

The **no** form of the command reverts to the default unattached attachment state for the group ID.

Default

wrr-group group-id unattached

Parameters

group-id

Specifies the WRR group identifier. The *group-id* parameter is required when executing the **wrr-group** attachment command.

Values 1, 2

sched-class

Specifies a direct attachment between the WRR group and one of the six scheduling classes. The **sched-class** and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **wrr-group** attachment command is executed.

class-id

Specifies the scheduling class associated with this WRR group. The **sched-class** keyword specifies the attachment between the group ID and one of the six scheduling classes. A value of 1 through 6 must accompany the **sched-class** keyword representing the WRR group's attached scheduling class. Only one queue or WRR group can be attached to a given scheduling class. If another queue or a WRR group is currently attached to the specified scheduling class, the **wrr-group** attachment command fails and the current attachment for the *group-id* is unchanged.

Values 1 to 6

unattached

Indicates that the group ID is not attached to any scheduling class or WRR group. Queues that are members of the unattached WRR group do not forward any packets. The **sched-class** and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **wrr-group** attachment command is executed.

configure card xiom

Description

This command configures an XIOM in one of the slots of an XCM. An XIOM can be used instead of an XMA and operates as a carrier module to support MDA-s modules.

Parameters

xiom-slot

Specifies the XIOM identifier.

Values x1 or x2

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

28.15 xiom-type

xiom-type

Syntax

xiom-type *xiom-type* [**level** *xiom-level*]

no xiom-type

Context

[Tree] (config>card>xiom xiom-type)

Full Context

configure card xiom xiom-type

Description

This command adds an XIOM to the device configuration for the slot. The XIOM type can be preprovisioned, which means that the XIOM does not have to be installed in the chassis.

An XIOM must be provisioned before an MDA-s, connector, or port can be configured.

An XIOM can only be provisioned in a slot that is vacant. No other XIOM or XMA can be provisioned (configured) for that particular slot. To reconfigure a slot position, use the **no** form of this command to remove the current information.

An XIOM can only be provisioned in a slot if the XIOM type is allowed in the slot. An error message is generated if an attempt is made to provision an XIOM type that is not allowed.

If an XIOM is inserted that does not match the configured XIOM type for the slot, then a log event and a facility alarm are raised. The alarm is cleared when the correct XIOM type is installed or the configuration is modified.

A log event and a facility alarm are raised if an administratively enabled XIOM is removed from the chassis. The alarm is cleared when the correct XIOM type is installed or the configuration is modified. A log event is issued when a XIOM is removed that is administratively disabled.

XIOMs are controlled by hardware and software licensing. For these cards, the license level must be provisioned in addition to the XIOM type. An XIOM cannot become operational unless the provisioned license level matches the license level of the card installed into the slot. The set of license levels varies by XIOM type.

The provisioned license level controls aspects related to connector provisioning and the consumption of hardware egress queues and egress policers. Changes to the provisioned license level may be blocked if a configuration exists that would not be permitted with the new target license level.

If the license level is not specified, the level is set to the highest license level for that XIOM.

The **no** form of this command removes the XIOM from the configuration.

Parameters

xiom-type

Specifies the type of XIOM to be configured and installed in the slot. Values for this attribute vary by platform and release. The release notes include a listing of all supported xiom-types and their CLI strings. In addition, the command can be queried to check which xiom-types are relevant for the active platform type.

xiom-level

Specifies the license level of the XIOM, up to 32 characters. Possible values vary by XIOM type.

Platforms

30.1 zone

zone

Syntax

zone {*std-zone-name* | *non-std-zone-name*} [*hh* [*:mm*]]

no zone

Context

[Tree] (config>system>time zone)

Full Context

configure system time zone

Description

This command sets the time zone and/or time zone offset for the device.

The SR-series router OS supports system-defined and user-defined time zones. The system-defined time zones are listed in the Time Zones section.

For user-defined time zones, the zone and the UTC offset must be specified.

The **no** form of the command reverts to the default of Coordinated Universal Time (UTC). If the time zone in use was a user-defined time zone, the time zone will be deleted. If a **dst-zone** command has been configured that references the zone, the summer commands must be deleted before the zone can be reset to UTC.

Default

zone UTC 00

Parameters

std-zone-name

Specifies the standard time zone name. The standard name must be a system-defined zone in the Time Zones section. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining **start-date**, **end-date** and **offset** parameters do not need to be provided unless it is necessary to override the system defaults for the time zone.

For system-defined time zones, a different offset cannot be specified. If a new time zone is needed with a different offset, the user must create a new time zone. Note that some system-defined time zones have implicit summer time settings which causes the

switchover to summer time to occur automatically; configuring the **config>system>time dst-zone** command is not required.

A user-defined time zone name is case-sensitive and can be up to 5 characters in length.

Values A user-defined value can be up to 5 characters or one of the following values: GMT, WET, CET, EET, EEST, MSK, MSD, AST, NST, EST, CST, MST, PST, HST, AKST, AWST, ACST, AEST, NZST, UTC

non-std-zone-name

Specifies the non-standard time zone name. The name can be up to 5 characters.

hh [:mm]

Specifies the hours and minutes offset from UTC time, expressed as integers. Some time zones do not have an offset that is an integral number of hours. In these instances, the *minutes-offset* must be specified. For example, the time zone in Pirlanngimpi, Australia UTC + 9.5 hours.

Values hours: -11 to 12 minutes: 0 to 59

Default hours: 0 minutes: 0

Platforms

30.2 zone-channel

zone-channel

Syntax

zone-channel *mcast-address* **source** *ip-address* **adi-channel-name** *channel-name*

no zone-channel *mcast-address* **source** *ip-address*

Context

[Tree] (config>service>vprn>video-interface>channel zone-channel)

[Tree] (config>service>ies>video-interface>channel zone-channel)

Full Context

configure service vprn video-interface channel zone-channel

configure service ies video-interface channel zone-channel

Description

This command configures zone-channel parameters or ad insertion. The channel configuration along with the zone-channel configuration associates a network channel to a zone-channel and builds the store and forward relationship.

Parameters

mcast-address

Specifies the IP multicast group address for which this entry contains information.

source *ip-address*

Specifies the type of address to be used for a source address.

adi-channel-name *channel-name*

Specifies the name for this zone channel.
