Displays IPv6 unicast parameters.

### **mt *mt-id-number***

Displays multi-topology parameters.

**Values** 0, 2

### **alternative**

Displays LFA details.

### **exclude-shortcut**

Displays the routes without shortcuts.

### **detail**

Displays detailed information.

### **flex-algo *flex-algo-id***

Displays the flexible algorithm aware forwarding path.

**Values** 128 to 255, all

### **flex-algo all**

Displays all the flexible algorithms-aware forwarding paths.

### **reachable**

Displays the reachable unicast routing table. When the status is not specified, the complete unicast routing table is displayed.

### **unreachable**

Displays the unreachable unicast routing table. When the status is not specified, the complete unicast routing table is displayed.

## Platforms

All

## Output

The following output is an example of IS-IS route unreachable information, and [Table 452: Output fields: IS-IS routes](#) describes the output fields.

### Output example

```
A:node-2>show>router>isis# routes status unreachable
```

```
=====
```

```
Rtr Base ISIS Instance 0 Route Table
```

```

Table 452: Output fields: IS-IS routes

Label	Description
Prefix or Prefix [Flags]	Displays the route prefix and mask
Algorithm	Displays the algorithm
Status	Displays the status
Level or Lvl	Displays the IS-IS level
NextHop	Displays the system ID of the next hop
Metric	Displays the metric of the route   <b>Note:</b> <ul style="list-style-type: none"> <li>For an unreachable route, the short table view shows UPA as the metric value.</li> <li>In the detailed view, the real metric value with (UPA) shows for an unreachable route and the status indicates Unreachable.</li> </ul>
Type	Displays the route type as either Internal or External
SPF Version or Ver.	Displays the SPF version that generated the route
SysID/Hostname	Displays the hostname for the specific <i>system-id</i>
MT	Displays the IS-IS topology for the route

Label	Description
AdminTag	Displays the number of administrative tags
SID[F]	<p>Displays the segment identifier flags of a Prefix-SID as defined by IETF segment routing</p> <p>R: Re-advertisement flag. If set, the prefix to which this Prefix-SID is attached has been propagated by the router either from another level (in other words, from level 1 to level 2 or the opposite) or from redistribution (for example, from another protocol).</p> <p>N: Node-SID flag. The N-Flag is set on Prefix-SIDs attached to a router loopback address.</p> <p>nP: no-PHP flag. If set, the penultimate hop must not pop the Prefix-SID before delivering the packet to the node that advertised the Prefix-SID</p> <p>E: Explicit-Null Flag. If set, any upstream neighbor of the Prefix-SID originator must replace the Prefix-SID with a Prefix-SID having an Explicit-NULL value (0 for IPv4 and 2 for IPv6) before forwarding the packet</p> <p>V: Value flag. If set, the Prefix-SID carries a value (instead of an index)</p> <p>L: Local Flag. If set, the value/index carried by the Prefix-SID has local significance</p>
No. of Routes	Displays the total number of routes

## routes

### Syntax

**routes** [*ip-prefix*[/*prefix-length*]] [**type**] [**detail**] [**alternative**] [**summary**] [**exclude-shortcut**] [**flex-algo** {*flex-algo-id* | **all**}]

### Context

**[Tree]** (show>router>ospf routes)

### Full Context

show router ospf routes

### Description

This command displays information about OSPF routes.

## Parameters

### *ip-prefix[/prefix-length]*

Displays information about the specified IP prefix and length.

### *flex-algo-id*

Displays information about the specified flexible algorithm identifier.

**Values** 128 to 255

### *type*

Displays information about the specified type.

**Values** intra-area, inter-area, external-1, external-2, nssa-1, nssa-2

### *detail*

Displays detailed information about the routes.

### *alternative*

Displays the level of protection per prefix (ref. show router OSPF routes alternative).

### *summary*

Displays summarized information about the routes.

### *exclude-shortcut*

Displays routes without shortcut, in the **show>router>ospf** context.

### *flex-algo*

Displays the OSPFv2 routes associated with a segment routing algorithm specified by the flexible algorithm identifier.

### *all*

Displays the OSPFv2 routes associated with all flexible algorithms.

## Platforms

All

## Output

The following output shows an example of OSPF routes information.

### Output Example

```
*A:Dut-C# show router ospf routes flex-algo 128

## routes

### Syntax

**routes** [*ip-prefix[/prefix-length]*] [**type**] [**detail**] [**alternative**] [**summary**] [**exclude-shortcut**]

### Context

[\[Tree\]](#) (show>router>ospf3 routes)

### Full Context

show router ospf3 routes

### Description

This command displays information about OSPF routes.

### Parameters

#### ***ip-prefix[/prefix-length]***

Displays information about the specified IP prefix and length.

#### **type**

Displays information about the specified type.

**Values** intra-area, inter-area, external-1, external-2, nssa-1, nssa-2

#### **detail**

Displays detailed information about the routes.

#### **alternative**

Displays the level of protection per prefix (ref. show router OSPF routes alternative).

**summary**

Displays summarized information about the routes.

**exclude-shortcut**

Displays routes without shortcut, in the **show>router>ospf** context.

**Platforms**

All

**Output**

The following output shows an example of OSPF information.

**Output Example**

```

## 25.56 routing

### routing

#### Syntax

```
routing [sub-domain sub-domain] [bsl bsl] [neighbor-prefix ip-address] [dest-prefix ip-address]
```

#### Context

[\[Tree\]](#) (show>router>bier routing)

#### Full Context

```
show router bier routing
```

#### Description

This command shows the BIER routing table.

#### Parameters

##### *sub-domain*

Specifies a sub-domain.

**Values** 0 to 255

##### *bsl*

Specifies a bit string length.

**Values** 256 to 1024

##### *ip-address*

Specifies a prefix in IP address format.

#### Platforms

All

## Output

The following output is an example of a BIER router table. [Table 453: Output fields: BIER routing](#) provides BIER routing field descriptions.

### Output Example

```
*A:Dut-A# show router bier routing sub-domain 0

Age	The tunnel age
Neighbor	The neighbor IP address

Label	Description
Nexthop	The next-hop IP address
Interface	The egress interface name for the programmed tunnel

## 25.57 rp

rp

### Syntax

rp [*family* | *ip-address*]

### Context

[\[Tree\]](#) (show>router>pim rp)

### Full Context

show router pim rp

### Description

This command displays the rendezvous point (RP) set information built by the router.

### Parameters

#### *family*

Displays information about RP family.

**Values** ipv4, ipv6

#### *ip-address*

Specifies the IP address of the RP.

### Platforms

All

### Output

The following output is an example of a PIM RP configuration.

### Output Example

```
A:ALA-1# show router pim rp
=====
PIM RP Set
=====
Group Address      RP Address      Type      Priority  Holdtime
-----
224.0.0.0/4       239.200.200.4  Dynamic   192      150
```

```

10.1.7.1      Static      1      N/A
-----
Group Prefixes : 1
=====
A:ALA-1#
A:ALA-1# show router pim rp 10.1.7.1
=====
PIM RP Set
=====
Group Address      RP Address      Type      Priority  Holdtime
-----
224.0.0.0/4       10.1.7.1       Static    1         N/A
-----
Group Prefixes : 1
=====
A:ALA-1#
    
```

Table 454: Output fields: PIM RP

Label	Description
Group Address	The multicast group address of the entry.
RP Address	The address of the Rendezvous Point (RP)
Type	Displays whether the entry was learned through the Bootstrap mechanism or if it was statically configured.
Priority	The priority for the specified group address. The higher the value, the higher the priority.
Holdtime	The value of the hold time present in the BSM message

## 25.58 rp-hash

### rp-hash

#### Syntax

**rp-hash** *ip-address*

#### Context

[\[Tree\]](#) (show>router>pim rp-hash)

#### Full Context

show router pim rp-hash

#### Description

This command hashes the RP for the specified group from the RP set.

## Parameters

### *ip-address*

Displays specific multicast group addresses.

## Platforms

All

## Output

The following output is an example of a PIM RP-Hash configuration. [Table 455: Output fields: RP hash](#) provides RP-Hash output field descriptions.

### Output Example

```
A:ALA-1# show router pim rp-hash 239.101.0.0
=====
PIM Group-To-RP mapping
=====
Group Address      RP Address      Type
-----
239.101.0.0       239.200.200.4  Bootstrap
=====
A:ALA-1#

A:ALA-1# show router pim rp-hash 239.101.0.6
=====
PIM Group-To-RP mapping
=====
Group Address      RP Address      Type
-----
239.101.0.6       239.200.200.4  Bootstrap
=====
A:ALA-1#
```

Table 455: Output fields: RP hash

Label	Description
Group Address	The multicast group address of the entry
RP Address	The address of the Rendezvous Point (RP)
Type	Specifies whether the entry was learned through the Bootstrap mechanism or if it was statically configured.

## 25.59 rpki-session

### rpki-session

#### Syntax

**rpki-session** [*ip-address*] [**detail**]

## Context

[\[Tree\]](#) (show>router>origin-validation rpki-session)

## Full Context

show router origin-validation rpki-session

## Description

This command displays RPKI session information.

## Parameters

### *ip-address*

Displays RPKI session information for the specified IP address.

### Values

ipv4-address: a.b.c.d

ipv6-address x:x:x:x:x:x:x

x:x:x:x:x:d.d.d.d

where:

x: [0 to FFFF]H

d: [0 to 255]D

interface: 32 chars max, and mandatory for link local addresses.

### detail

Displays the longer, more detailed version of the output.

## Platforms

All

## Output

The following output is an example of RPKI session information.

### Output Example

```
A:Dut-C# show router origin-validation rpki-session detail
=====

## 25.64 rtp-session

### rtp-session

#### Syntax

```
rtp-session [service service-id] [source ip-address] [detail [stats {rt-server | fcc-server}]]  
rtp-session [service service-id] summary
```

#### Context

[\[Tree\]](#) (show>video rtp-session)

#### Full Context

```
show video rtp-session
```

#### Description

This command displays video session information.

#### Parameters

##### **service** *service-id*

Displays video session information pertaining to the specified service ID.

**Values** 1 to 2148278317  
svc-name — a string up to 64 characters.

##### **source** *ip-address*

Displays session information for the specified IP address.

##### **detail**

The output displays detailed video session information.

##### **stats**

Displays video session statistics.

**Values** **rt-server** — Displays video session statistics for the RT server.  
**fcc-server** — Displays video session statistics for the FCC server.

##### **summary**

The output displays summarized video session information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-s

#### Output

The following output is an example of this command.

### Output Example

```
*A:Dut-C# show video rtp-session

## 25.65 rtr-advertisement

### rtr-advertisement

#### Syntax

```
rtr-advertisement [interface interface-name] [prefix ipv6-prefix[/prefix-length]]
```

```
rtr-advertisement [conflicts]
```

#### Context

[\[Tree\]](#) (show>router rtr-advertisement)

#### Full Context

```
show router rtr-advertisement
```

#### Description

This command displays router advertisement information.

If no command line arguments are specified, all routes are displayed, sorted by prefix.

#### Parameters

##### *interface-name*

Specifies the interface name, up to 32 characters.

##### *ipv6-prefix[/prefix-length]*

Displays routes only matching the specified *ip-address* and length and only applies to the 7750 SR and 7950 XRS.

##### Values

ipv6	ipv6-prefix[/pref*:	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	prefix-length:	1 to 128

Table 456: Output fields: router advertisement

Label	Description
Rtr Advertisement Tx/ Last Sent	The number of router advertisements sent and time since they were sent
Nbr Solicitation Tx	The number of neighbor solicitations sent and time since they were sent
Nbr Advertisement Tx	The number of neighbor advertisements sent and time since they were sent

Label	Description
Rtr Advertisement Rx	The number of router advertisements received and time since they were received
Nbr Advertisement Rx	The number of neighbor advertisements received and time since they were received
Max Advert Interval	The maximum interval between sending router advertisement messages
Managed Config	True — indicates that DHCPv6 has been configured
	False — indicates that DHCPv6 is not available for address configuration
Reachable Time	The time, in milliseconds, that a node assumes a neighbor is reachable after receiving a reachability confirmation
Retransmit Time	The time, in milliseconds, between retransmitted neighbor solicitation messages
Link MTU	The MTU number the nodes use for sending packets on the link
Rtr Solicitation Rx	The number of router solicitations received and time since they were received
Nbr Solicitation Rx	The number of neighbor solicitations received and time since they were received
Min Advert Interval	The minimum interval between sending ICMPv6 neighbor discovery router advertisement messages
Other Config	True — indicates there are other stateful configurations
	False — indicates there are no other stateful configurations
Router Lifetime	The router lifetime in seconds
Hop Limit	The current hop limit

**Router-Advertisement Conflicts Output** — The following output is an example of router advertisement conflicts, and [Table 457: Output fields: router advertisement conflicts](#) describes the fields.

### Output Example

```
show router rtr-advertisement conflicts

Router Lifetime	The router lifetime in seconds
Retransmit Time	The time, in milliseconds, between retransmitted neighbor solicitation messages
Hop Limit	The current hop limit
Link MTU	The MTU number the nodes use for sending packets on the link
ND Router-preference	High — indicates the router advertises a high router default gateway preference
	Medium — indicates the router advertises a medium default gateway preference
	Low — indicates the router advertises a low default gateway preference
MAC Addr to Use	The MAC address to use
Creation Origin	The creation origin

## 25.66 run-manual-spf

### run-manual-spf

#### Syntax

**run-manual-spf**

#### Context

[\[Tree\]](#) (tools>perform>router>isis run-manual-spf)

#### Full Context

tools perform router isis run-manual-spf

#### Description

This command runs the Shortest Path First (SPF) algorithm.

#### Platforms

All

### run-manual-spf

#### Syntax

**run-manual-spf [externals-only]**

#### Context

[\[Tree\]](#) (tools>perform>router>ospf run-manual-spf)

[\[Tree\]](#) (tools>perform>router>ospf3 run-manual-spf)

#### Full Context

tools perform router ospf run-manual-spf

tools perform router ospf3 run-manual-spf

#### Description

This command runs the Shorted Path First (SPF) algorithm.

#### Parameters

**externals-only**

Runs external only SPF.

## Platforms

All

## 26 s Commands – Part I

### 26.1 s-pmsi

#### s-pmsi

##### Syntax

**s-pmsi** [[**group-ip** *group-ip*][**source-ip** *source-ip*] **detail**]

**s-pmsi** [*mdSrcAddr* [**mdGrpAddr**]] [[**group-ip** *group-ip*] [**source-ip** *source-ip*] **detail**]

**s-pmsi** **ext-tunnel-id** *ext-tunnel-id* [**tunnel-id** *tunnel-id*] [[**group-ip** *group-ip*] [**source-ip** *source-ip*] **detail**]

**s-pmsi** **root-addr** *root-addr* [**lsp-id** *lsp-id*] [[**group-ip** *group-ip*] [**source-ip** *source-ip*] **detail**]

**s-pmsi** **bier-root-addr** *ip-address* [[**sub-domain** *sub-domain*] [**bfr-id** *bfr-id*] [**mpls-lbl** *mpls-lbl*] **detail**]

##### Context

[\[Tree\]](#) (show>router>pim s-pmsi)

##### Full Context

show router pim s-pmsi

##### Description

This command displays information about selective provider multicast service interfaces that are currently active.

##### Parameters

###### **group-ip**

Displays group IP address information.

###### **source-ip**

Displays source IP address information.

###### **mdSrcAddr**

Displays source address information of the multicast sender.

###### **mdGrpAddr**

Displays group address information of the multicast sender.

###### **ext-tunnel-id**

Displays information about the extended tunnel address.

###### **tunnel-id**

Displays information about the tunnel identifier.

**Values** 0 to 4294967295

**root-addr**

Displays information about the root address.

**isp-id**

Displays information about the specified LSP ID.

**Values** 0 to 4294967295

**sub-domain**

Displays information about the BIER sub-domain ID.

**bfr-id**

Displays information about the BIER-ID of the router.

**Values** 1 to 4096

**mpls-lbl**

Displays information about the specified MPLS service label.

**detail**

Displays detailed output.

**Platforms**

All

**Output**

The following output is an example of a PIM data MDT configuration. [Table 459: Output fields: PIM data MDT](#) provides PIM data MDT descriptions.

**Output Example PIM Selective Provider Tunnel**

```
*B:node-6# show router 100 pim s-pmsi

Table 459: Output fields: PIM data MDT

Label	Description
MD Grp Address	The IP multicast group address for which this entry contains information
MD Src Address	The source address of the multicast sender. The value is 0 if the type is configured as <b>starg</b> . The address of the Rendezvous Point (RP) displays if the type is configured as <b>starRP</b> .
MT Index	The index number
Num VP SGs	The VPN number

## s-pmsi

### Syntax

**s-pmsi** [**source** *mdSrcAddr*] [**group** *mdGrpAddr*] [**vprn-source** *vprnSrcAddr* **vprn-group** *vprnGrpAddr*]

### Context

**[Tree]** (clear>router>pim s-pmsi)

### Full Context

clear router pim s-pmsi

## Description

This command clears PIM selective provider multicast service interface cache.

## Parameters

### *mdSrcAddr*

Clears the specified source address used for Multicast Distribution Tree (MDT).

### *mdGrpAddr*

Clears the specified group address used for Multicast Distribution Tree (MDT).

### *vprnSrcAddr*

Clears the specified source address of the multicast sender.

### *vprnGrpAddr*

Clears the specified multicast group address.

## Platforms

## 26.3 saa

### saa

## Syntax

```
saa [test-name] [owner test-owner]
```

## Context

[\[Tree\]](#) (show saa)

## Full Context

```
show saa
```

## Description

This command displays information about the SAA test.

If no specific test is specified a summary of all configured tests is displayed.

If a specific test is specified then detailed test results for that test are displayed for the last three occurrences that this test has been executed, or since the last time the counters have been reset via a system reboot or clear command.

## Parameters

### *test-name*

Specifies the optional parameter is used to enter the name of the SAA test for which the information needs to be displayed. The test name must already be configured in the **config>saa>test** context.

### *test-owner*

Specifies the owner of an SAA operation, up to 32 characters. If a **test-owner** value is not specified, tests created by the CLI have a default owner "TIMOS CLI".

**Default** "TIMOS CLI"

## Platforms

All

## Output

The following output is an example of SAA test information. [Table 460: Output fields: SAA](#) describes the SAA test fields.

### Output Example

```

Trap generation	Specifies the trap generation for the SAA test.
Test runs since last clear	Specifies the total number of tests performed since the last time the tests were cleared.

Label	Description
Number of failed tests run	Specifies the total number of tests that failed.
Last test run	Specifies the last time a test was run.
Threshold type	Indicates the type of threshold event being tested, jitter-event, latency-event, or loss-event, and the direction of the test responses received for a test run:  in — inbound out — outbound rt — roundtrip
Direction	Indicates the direction of the event threshold, rising or falling.
Threshold	Displays the configured threshold value.
Value	Displays the measured crossing value that triggered the threshold crossing event.
Last event	Indicates the time that the threshold crossing event occurred.
Run #	Indicates what test run produced the specified values.

## saa

### Syntax

**saa-test** [*test-name* [**owner** *test-owner*]]

### Context

[Tree] (clear saa)

### Full Context

clear saa

### Description

This command clears the SAA results for the latest and the history for this test. If the test name is omitted, all the results for all tests are cleared.

### Parameters

#### **test-name**

Specifies the name of the SAA test. The test name must already be configured in the **config>saa>test** context.

#### **test-owner**

Specifies the owner of an SAA operation up to 32 characters.

**Default** If a **test-owner** value is not specified, tests created by the CLI have a default owner "TiMOS CLI".

## Platforms

All

## 26.4 saii-type2-using

### saii-type2-using

#### Syntax

```
saii-type2-using global-id[:prefix[:ac-id]]
```

#### Context

[\[Tree\]](#) (show>service saii-type2-using)

#### Full Context

```
show service saii-type2-using
```

#### Description

This command displays the SDP used by a spoke SDP FEC with a specified FEC129 Type 2 SAIL.

#### Parameters

**global-id[:prefix[:ac-id]]**

Specifies the switch-point information using SAIL-Type2.

Values	<global-id[:prefix*> : <global-id>[:<prefix>[:<ac-id>]]
global-id	1 to 4294967295
prefix	a.b.c.d   1 to 4294967295
ac-id	1 to 4294967295

## Platforms

All

## Output

The following output is an example of SAIL information.

### Output Example

```
*A:Dut-E# show service saii-type2-using 3:10.20.1.3:1
=====
```

```

## 26.5 sap

```
sap
```

### Syntax

```
sap {all | sap-id}
```

### Context

[\[Tree\]](#) (show>subscr-mgmt>errors sap)

### Full Context

```
show subscriber-mgmt errors sap
```

### Description

This command sorts all the subscriber errors by SAP.

### Parameters

**all**

Shows all errors starting with the lowest SAP index.

**sap-id**

Shows only the error of a specific SAP index.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### Output

The following output is an example of subscriber management errors listed by SAP.

### Output Example

```
A:BNG-2# show subscriber-mgmt errors sap all
=====
Subscriber management errors

**Table 461: Output fields: subscriber management SAP error** describes subscriber management SAP error output fields.

*Table 461: Output fields: subscriber management SAP error*

Field	Description
SAP	The SAP ID associated with the error
Time	The time this error was reported to the subscriber management errors subsystem
Service	The service ID associated with the error
MAC	The MAC address associated with the error
Error	The error that occurred on the SAP
Extra	Extra information about the error that occurred

## Context

**[Tree]** (show>service>id sap)

## Full Context

show service id sap

## Description

This command displays information for the SAPs associated with the service.

If no optional parameters are specified, a summary of all associated SAPs is displayed.

## Parameters

### *sap-id*

The ID that displays SAPs for the service.

### *detail*

Displays detailed information for the SAP. For **dist-cpu-protection**, **detail** includes the adapted operational rate parameters in the CLI output. The adapted Oper. parameters are only applicable if the policer is instantiated (for example, if the associated forwarding plane is operational, or for an interface if there is a physical port configured for the interface, or if the dynamic policers are allocated), otherwise values of 0 kb/s, and so on, are displayed.

### *static-isids*

Displays static ISIDs for the SAP.

### *range-id*

Specifies the range ID.

**Values** 1 to 4294967295

### *dist-cpu-protection*

Displays information about the distributed CPU protection policy and parameters associated with the SAP.

### *group-name*

Specifies the group name, up to 32 characters in length.

### *encap-id*

Specifies the encapsulation ID.

**Values** 0 to 16777215

### *encap-detail*

Displays encapsulation details for the specified encapsulation ID.

### *encap-stats*

Displays encapsulation statistics.

### *encap-group*

Displays the encapsulation group.

### *base*

Displays base information.

---

<b>dhcp</b>	Displays DHCP information.
<b>mc-ring</b>	Displays MC ring information.
<b>mcac</b>	Displays MCAC information.
<b>mrp</b>	Displays MRP information.
<b>qos</b>	Displays QoS information.
<b>sap-stats</b>	Displays SAP statistics.
<b>stats</b>	Displays statistics.
<b>stp</b>	Displays STP information.
<b>sub-mgmt</b>	Displays subscriber management information.
<b>ipsec-gw</b>	Displays IPSEC gateway information.
<b><i>circuit-id</i></b>	Specifies the circuit ID, up to 256 characters.
<b><i>ieee-address</i></b>	Specifies the IEEE address, up to 30 characters.
<b><i>remote-id</i></b>	Specifies the remote-ID, up to 256 characters.
<b>host-lockout-policy</b>	Displays the host lockout policy.
<b>summary</b>	Displays summary information.
<b><i>queue-id</i></b>	Specifies the queue ID. <b>Values</b> 1 to 32
<b>ingress</b>	Displays ingress information.
<b>egress</b>	Displays egress information.

**mfib**

Displays MFIB information.

**queue-group-redirection**

The output lists the queue group name and the instances configured in the related queue group redirect list. For each instance, the FP (for ingress) and port (for egress) is displayed. If there is a mismatch between the SAP and redirect list configuration and the queue group instance configuration, this is highlighted.

**ingress**

Displays information for the ingress policy.

**egress**

Displays information for the egress policy.

**Platforms**

All

**Output**

The following output is an example of SAP information, and [Table 462: Output fields: service ID SAP](#) describes the output fields.

**Output Example**

```
show service id "BD20023" sap lag-1:200 detail
```

```

Table 462: Output fields: service ID SAP

Label	Description
Service Access Points(SAP)	
Service Id	The service identifier.
SAP	The SAP and qtag.
Encap	The encapsulation type of the SAP.
Ethertype	Specifies an Ethernet type II Ethertype value.
Admin State	The administrative state of the SAP.
Oper State	The operating state of the SAP.
Flags	Specifies the conditions that affect the operating status of this SAP. Display output includes: ServiceAdminDown, SapAdminDown, Interface AdminDown, PortOperDown, PortMTUTooSmall, L2OperDown, SapIngress

Label	Description
	QoSMismatch, SapEgressQoSMismatch, RelearnLimitExceeded, RxProtSrc Mac, ParentIfAdminDown, NoSapPipeCelpAddr, SapParamMismatch, CemSap NoEcidOrMacAddr, StandByForMcRing, ServiceMTUTooSmall, NoSapEpipeRing Node.
Last Status Change	Specifies the time of the most recent operating status change to this SAP.
Last Mgmt Change	Specifies the time of the most recent management-initiated change to this SAP.
Admin MTU	The desired largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.
Oper MTU	The actual largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.
Restr MacUnpr Dst	The administrative and operational state of the restrict unprotected destination MAC (restrict-unprotected-dst) functionality.
Auto Learn Mac Prot	The administrative and operational state of the protected MAC auto learning (auto-learn-mac-protect) functionality.
RestMacProtSrc Act	The administrative and operational state of the restrict protected source MAC (restrict-protected-src) functionality.
FXC VLAN normalization mode	The Flexible Cross Connect (FXC) VLAN normalization mode
QOS	
Ingress qos-policy	The ingress QoS policy ID assigned to the SAP.
Egress qos-policy	The egress QoS policy ID assigned to the SAP.
Ingress Filter-Id	The ingress filter policy ID assigned to the SAP.
Egress Filter-Id	The egress filter policy ID assigned to the SAP.
Acct. Pol	The accounting policy ID assigned to the SAP.
Collect Stats	Specifies whether collect stats is enabled.
Dropped	The number of packets and octets dropped due to SAP state, ingress MAC or IP filter, same segment discard, bad checksum, etc.
Received Valid	The number of valid packets and octets received on the SAP.
Off. HiPrio	The number of high priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.
Off. LowPrio	The number of low priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.

Label	Description
Off. Uncolor	The number of uncolored packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.
Dro. HiPrio	The number of high priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
Dro. LowPrio	The number of low priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
For. InProf	The number of in-profile packets and octets (rate below CIR) forwarded by the ingress Qchip.
For. OutProf	The number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.
Dro. InProf	The number of in-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.
Dro. OutProf	The number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.
For. InProf	The number of in-profile packets and octets (rate below CIR) forwarded by the egress Qchip.
For. OutProf	The number of out-of-profile packets and octets (rate above CIR) forwarded by the egress Qchip.
Ingress TD Profile	The profile ID applied to the ingress SAP.
Egress TD Profile	The profile ID applied to the egress SAP.
Alarm Cell Handling	The indication that OAM cells are being processed.
AAL-5 Encap	The AAL-5 encapsulation type.
Mult Svc Site	Specifies the customer's multiservice site name.
I. Sched Pol	The ingress scheduler policy applied to the customer's multiservice site.
E. Sched Pol	The egress scheduler policy applied to the customer's multiservice site.
HW Agg Shaper Q Set	Whether the hardware aggregate shaper queue sets are in use.
HW Add Shpr QSet Sz	The size of the hardware aggregate shaper queue set.
HW Agg Shpr In-Use	Whether hardware aggregate shapers are in use.
LLF Admin State	Displays the Link Loss Forwarding administrative state.

Label	Description
LLF Oper State	Displays the Link Loss Forwarding operational state.
pw-port	<b>pw-id[:qtag1[.qtag2]] pw-id[:qtag1[.qtag2]] pw-2:1.1</b>
DHCP6	
LDRA	The state of the Lightweight DHCPv6 Relay Agent: <ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>
Interface Type	The LDRA interface type: <ul style="list-style-type: none"> <li>• client-facing</li> <li>• network-facing</li> <li>• N/A</li> </ul>
Interface-Id	The format for the Interface ID option: <ul style="list-style-type: none"> <li>• <b>ascii-tuple</b> system name   service ID   sap ID For example: pe1 3000 1/x1/1/c1/1:2000.10</li> <li>• <b>vlan-ascii-tuple</b> system name   service ID   sap ID   dot1p inner vlan   inner vlan ID For example: pe1 3000 1/x1/1/c1/1:2000.10 0 10</li> <li>• N/A</li> </ul>
Remote-Id	The format for the Remote ID option: <ul style="list-style-type: none"> <li>• <b>mac</b> The DHCPv6 client source MAC address encoded as six hexadecimal numbers</li> <li>• <b>ASCII string in remote-id field</b> The configured ascii encoded string</li> <li>• N/A</li> </ul>

The following output is an example of distributed CPU Protection Policer Output information.

[Table 463: Output fields: distributed CPU protection policer](#) describes distributed CPU Protection Policer output fields.

```

Table 463: Output fields: distributed CPU protection policer

Label	Description
Distributed CPU Protection Policy	The DCP policy assigned to the object.
Policer-Name	The configured name of the static policer
Card/FP	The card and FP identifier. FP identifies the instance of the FP (FastPath) chipset. Some cards have a single FP and some cards can contain multiple FPs (for example, an XCM can house multiple FPs via its two XMAs).
Policer-State	The state of the policer with the following potential values:
	Exceed — The policer has been detected as not conforming to the associated DCP policy parameters (for example, packets exceeded the configured rate and the DCP polling process identified this occurrence)
	Conform — The policer has been detected as conforming to the associated DCP policy parameters (rate)
	not-applicable — Newly-created policers or policers that are not currently instantiated. This includes policers configured on line cards that are not in service.
Protocols Mapped	A list of protocols that are configured to map to the particular policer.
Oper. xyz fields	The actual hardware may not be able to perfectly rate limit to the exact configured rate parameters in a DCP policy. In this case the configured rate parameters will be adapted to the closest supported rate. These adapted operational values are displayed in CLI when the <b>detail</b> keyword is included in the show command. The adapted Oper. parameters are only applicable if the policer is instantiated (for example, if the associated forwarding plane is operational, or for an interface if there is a physical port configured for the interface, or if the dynamic policers are allocated), otherwise values of 0 kb/s, and so on, are displayed.
	Oper. Kbps - The adapted "kilobits-per-second" value for DCP "kbps" rates
	Oper. MBS - The adapted "mbs size" value for DCP "kbps" rates
	Oper. Depth - The calculated policer bucket depth in packets (for DCP "packets" rates) or in bytes (for DCP "kbps" rates)

Label	Description
	Oper. Packets - The adapted "ppi" value for DCP "packets" rates
	Oper. Within - The adapted "within seconds" value for DCP "packets" rates
	Oper. Init. Delay - The adapted "initial-delay packets" value for DCP "packets" rates
Exceed-Count	The count of packets exceeding the policing parameters since the given policer was previously declared as conforming or newly-instantiated. This counter has the same behavior as the exceed counter in the DCP the log events, they are baselined (reset) when the policer transitions to conforming.
Detec. Time Remain	The remaining time in the detection-time countdown during which a policer in the exceed state is being monitored to see if it conforms again.
Hold-Down Remain	The remaining time in the hold-down countdown during which a policer is treating all packets as exceeding.
All Dyn-Plcr Alloc.	Indicates that all the dynamic enforcement policers have been allocated and instantiated for a given local-monitor.
Dyn-Policer Alloc.	Indicates that a dynamic policer has been instantiated.

## sap

### Syntax

**sap** *sap-id*

### Context

[\[Tree\]](#) (clear>service>id sap)

### Full Context

clear service id sap

### Description

This command clears information for the specified SAP.

### Parameters

***sap-id***

Specifies the physical port identifier portion of the SAP definition

## Platforms

All

sap

## Syntax

```
sap sap-id {all | cem | counters | stp | l2pt | mrp}  
sap sap-id encap-group group-name [member encap-id]
```

## Context

[\[Tree\]](#) (clear>service>statistics sap)

## Full Context

```
clear service statistics sap
```

## Description

This command clears SAP statistics for a SAP.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### **all**

Clears all SAP queue statistics and STP statistics.

### **counters**

Clears all queue statistics associated with the SAP.

### **stp**

Clears all STP statistics associated with the SAP.

### **l2pt**

Clears all L2PT statistics associated with the SAP.

### **mrp**

Clears all MRP statistics associated with the SAP.

### *group-name*

Specifies the group name, up to 32 characters.

### *encap-id*

Specifies the encapsulation ID.

**Values** 0 to 16777215

## Platforms

All

## sap

### Syntax

```
sap [sap-id] [level level] [primary-vlan-enabled vlan-id]  
sap port port-id [level level] [primary-vlan-enabled vlan-id]
```

### Context

[\[Tree\]](#) (show>eth-cfm>mip-instantiation sap)

### Full Context

```
show eth-cfm mip-instantiation sap
```

### Description

This command displays MIP creation information for SAPs.

### Parameters

#### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

#### *level*

Specifies the MIP instantiation level.

**Values** 0 to 7

#### *vlan-id*

Specifies the VLAN ID to display.

**Values** 1 to 4094, or all

#### *port-id*

Specifies the port ID.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## sap

### Syntax

```
sap sap-id [{ingress | egress}] [{detail | root-detail | thresholds | priority-info | depth}] [port port-id] [arbiter {name | root}]
```

### Context

[\[Tree\]](#) (show>qos>policer-hierarchy sap)

## Full Context

```
show qos policer-hierarchy sap
```

## Description

This command displays information about the policer hierarchy per SAP.

## Parameters

### *sap-id*

Displays information about the specified SAP.

### **ingress**

Displays ingress SAP information.

### **egress**

Displays egress SAP information.

### **detail**

Displays detailed information.

### **root-detail**

Displays detailed information about the arbiter root.

### **thresholds**

Displays the threshold, parenting, rate, and traffic information related to a policer.

### **priority-info**

Displays the threshold information related to the root arbiter.

### **depth**

Displays the bucket depth, parenting, rate, and traffic information related to a policer.

### **port-id**

Displays information about the specified port.

**Values** *slot/mda/port[.channel]*

### **name**

Displays information about the name of the QoS arbiter.

### **root**

Displays information about the arbiter root.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## Output

The following output is an example of SAP policer hierarchy information.

### Output Example

```

Table 464: Output fields: QoS policer hierarchy SAP

Label	Description
Policer Hierarchy - SAP	Displays the SAP ID
slot	Displays the slot number
(A)	An arbiter, an object that is configured in the policy
a3	Displays the name of the arbiter
(P)	Displays the policer name
[Level X Weight XX]	Displays the CIR level and weight configured in the policy
Assigned PIR	Displays the assigned PIR value
Offered	Displays the Offered PIR value
Consumed	Displays the amount of bandwidth consumed by the policer
Assigned FIR	Displays the assigned FIR based on weights of individual policers and the offered traffic

## sap

### Syntax

**sap** *sap-id* [**scheduler** *scheduler-name*] [{**ingress** | **egress**}] [**detail**]

**sap** *sap-id* **encap-group** *group-name* [**scheduler** *scheduler-name*] [**member** *encap-id*] [**detail**]

### Context

[\[Tree\]](#) (show>qos>scheduler-hierarchy sap)

### Full Context

show qos scheduler-hierarchy sap

## Description

This command displays the scheduler hierarchy per SAP.

## Parameters

### *sap-id*

Specifies the SAP assigned to the service.

**Values** The following values apply to the 7750 SR and 7950 XRS:

<i>sap-id</i>	null	[ <i>port-id</i>   <i>lag-id</i> ]
	dot1q	[ <i>port-id</i>   <i>lag-id</i> ]: <i>qtag1</i>
	qinq	[ <i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i> ]: <i>qtag1.qtag2</i>
	<i>port-id</i>	<i>slot/mda/port</i> [. <i>channel</i> ]
		<i>esat-id/slot/</i> <i>port</i>
	<i>esat</i>	keyword
	<i>id</i>	1 to 20
		<i>pxc-id.sub-port</i>
	<i>pxc</i>	keyword
	<i>id</i>	1 to 64
	<i>sub-port</i>	a, b
	<i>lag-id</i>	<i>lag-id</i>
		<i>lag</i> keyword
		<i>id</i> 1 to 800
	<i>qtag1</i>	0 to 4094
	<i>qtag2</i>	*, 0 to 4094

**Values** The following values apply to the 7750 SR only:

<i>sap-id</i>	null	[ <i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>aps-id</i> ]
	dot1q	[ <i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>aps-id</i> ]: <i>qtag1</i>
	qinq	[ <i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i> ]: <i>qtag1.qtag2</i>
	<i>cem</i>	<i>slot/mda/port.channel</i>
	<i>ima-grp</i>	[ <i>bundle-id</i> [: <i>vpi/vci</i>   <i>vpi</i>   <i>vpi1.vpi2</i> ]

port-id	<i>slot/mda/port[.channel]</i>
aps-id	<i>aps-group-id[.channel]</i>
aps	keyword
group-id	1 to 64
ccag-id	<i>ccag-id.path-id[cc-type]:cc-id</i>
ccag	keyword
id	1 to 8
path-id	a, b
cc-type	.sap-net, .net-sap
cc-id	0 to 4094
lag-id	lag-id
lag	keyword
id	1 to 800
qtag1	0 to 4094
qtag2	*, 0 to 4094
ipsec-id	<i>ipsec-id.[private   public]:tag</i>
ipsec	keyword
id	1 to 4
tag	0 to 4094

**Values** The following values apply to the 7450 ESS only:

<i>sap-id</i>	null	<i>[port-id   lag-id]</i>
dot1q		<i>[port-id   lag-id]:qtag1</i>
qinq		<i>[port-id   lag-id]:qtag1.qtag2</i>
port-id		<i>slot/mda/port[.channel]</i>
aps-id		<i>aps-group-id[.channel]</i>
aps	keyword	
group-id	1 to 64	
ccag-id		<i>ccag-id.path-id[cc-type]:cc-id</i>
ccag	keyword	
id	1 to 8	

	<i>path-id</i>	a, b
	<i>cc-type</i>	.sap-net, .net-sap
	<i>cc-id</i>	0 to 4094
lag-id	lag-id	
	lag	keyword
	<i>id</i>	1 to 800
qtag1	0. to 4094	
qtag2	*, 0 to 4094	

***scheduler-name***

The unique scheduler name created in the context of the scheduler policy

**ingress**

The keyword to display ingress SAP scheduler stats.

**egress**

The keyword to display egress SAP scheduler stats.

***group-name***

Specifies the name of the encap-group and can be up to 32 ASCII characters.

***encap-id***

Specifies the value of the single encap-id.

**Values** 1 to 16777215

**detail**

Displays detailed information.

**Platforms**

All

**Output**

The following output is an example of SAP scheduler hierarchy information, and [Table 465: Output fields: QoS scheduler hierarchy SAP](#) describes the SAP scheduler hierarchy fields.

**Output Example**

```

=====

Table 465: Output fields: QoS scheduler hierarchy SAP

Label	Description
Admin CIR/PIR	Specifies the configured value of CIR/PIR.
Assigned CIR/PIR	Specifies the PIR/CIR rate given to a member by that parent level.
Offered CIR/PIR	Specifies the offered load on that member.
Consumed CIR/PIR	Specifies the amount of scheduler bandwidth used by this member.
S	Displays the scheduler name and information.
Q	Displays the queue ID and information.

Label	Description
P	Displays the policer ID and information.

## sap

### Syntax

**sap** *sap-id* [**scheduler** *scheduler-name*] [{**ingress** | **egress**}]

**sap** *sap-id* **encap-group** *group-name* [**scheduler** *scheduler-name*] [**member** *encap-id*]

### Context

[\[Tree\]](#) (show>qos>scheduler-stats sap)

### Full Context

show qos scheduler-stats sap

### Description

This command displays information about the scheduler stats per SAP.

### Parameters

#### *sap-id*

Displays information about the SAP and encapsulation value used to identify the SAP.

**Values** The following values apply to the 7750 SR and 7950 XRS:

<i>sap-id</i>	null	[ <i>port-id</i>   <i>lag-id</i> ]
	dot1q	[ <i>port-id</i>   <i>lag-id</i> ]: <i>qtag1</i>
	qinq	[ <i>port-id</i>   <i>lag-id</i> ]: <i>qtag1.qtag2</i>
	lag-id	lag-id
	lag	keyword
	id	1 to 800
	qtag1	0 to 4094
	qtag2	*, 0 to 4094
	ipsec-id	ipsec- <i>id</i> . [ <b>private</b>   <b>public</b> ]: <i>tag</i>
	ipsec	keyword
	id	1 to 4
	tag	0 to 4094

**Values** The following values apply to the 7750 SR only:

<i>sap-id</i>	null	[ <i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>aps-id</i> ]
	dot1q	[ <i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>aps-id</i> ]: <i>qtag1</i>
	qinq	[ <i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i> ]: <i>qtag1.qtag2</i>
	cem	<i>slot/mda/port.channel</i>
	ima-grp	[ <i>bundle-id</i> [: <i>vpi/vci</i>   <i>vpi</i>   <i>vpi1.vpi2</i> ]
	port-id	<i>slot/mda/port[.channel]</i>
	aps-id	<i>aps-group-id[.channel]</i>
	aps	keyword
	group-id	1 to 64
	ccag-id	<i>ccag-id.path-id[cc-type]:cc-id</i>
	ccag	keyword
	id	1 to 8
	path-id	a, b
	cc-type	.sap-net, .net-sap
	cc-id	0 to 4094
	eth-tunnel	<i>eth-tunnel-id[:eth-tun-sap-id]</i>
	id:	1 to 1024
	eth-tun-sap-id	0 to 4094
	lag-id	<i>lag-id</i>
	lag	keyword
	id	1 to 800
	qtag1	0 to 4094
	qtag2	*, 0 to 4094
	ipsec-id	<i>ipsec-id.[private   public]:tag</i>

**Values** The following values apply to the 7450 ESS:

<i>sap-id</i>	null	[ <i>port-id</i>   <i>lag-id</i> ]
	dot1q	[ <i>port-id</i>   <i>lag-id</i> ]: <i>qtag1</i>
	qinq	[ <i>port-id</i>   <i>lag-id</i> ]: <i>qtag1.qtag2</i>

port-id	slot/mda/port[.channel]
aps-id	aps-group-id[.channel]
	aps keyword
	group-id 1 to 64
ccag-id	ccag-id.path-id[cc-type]:cc-id
	ccag keyword
	id 1 to 8
	path-id a, b]
	cc-type .sap-net, .net-sap]
	cc-id 0 to 4094
eth-tunnel	eth-tunnel-id[:eth-tun-sap-id]
	id: 1 to 1024
	eth-tun-sap-id 0 to 4094
lag-id	lag-id
	lag keyword
	id 1 to 800
qtag1	0. to 4094
qtag2	*, 0 to 4094

***scheduler-name***

Displays information about the specified schedule.

**ingress**

Display only the policy displayed on the ingress SAP.

**egress**

Display only the policy displayed on the egress SAP.

***group-name***

Specifies the name of the encap-group and can be up to 32 ASCII characters.

***encap-id***

Specifies the value of the single encap-id.

**Values** 1 to 16777215

**Platforms**

All

## Output

The following output is an example of scheduler-stats SAP information, and [Table 466: Output fields: QoS scheduler stats SAP](#) describes the scheduler-stats SAP fields.

### Output Example

ipsec-id	<i>ipsec-id.[private   public]:tag</i>	
	ipsec	keyword
	id	1 to 4
	tag	0 to 4094

**Values** The following values apply to the 7450 ESS:

null	<i>[port-id   lag-id]</i>	
dot1q	<i>[port-id   lag-id]:qtag1</i>	
qinq	<i>[port-id   lag-id]:qtag1.qtag2</i>	
port-id	slot/mda/port[.channel]	
aps-id	<i>aps-group-id[.channel]</i>	
	aps	keyword
	group-id	1 to 64
ccag-id	<i>ccag-id.path-id[cc-type]:cc-id</i>	
	ccag	keyword
	id	1 to 8
	path-id	a, b
	cc-type	.sap-net, .net-sap
	cc-id	0 to 4094

lag-id	lag-id		
	lag	keyword	
	id	1 to 800	
qtag1	0. to 4094		
qtag2	*, 0 to 4094		

### ***scheduler-name***

Displays the scheduler name.

**Values** Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### **ingress**

Display only the policy displayed on the ingress SAP.

### **egress**

Display only the policy displayed on the egress SAP.

## **Platforms**

All

## **sap**

## **Syntax**

**sap** *sap-id* **start** *mode* [**mac-swap**] [**mac** *ieee-address*] [**all**]

**sap** *sap-id* **stop**

## **Context**

[\[Tree\]](#) (tools>perform>service>id>loopback>eth sap)

## **Full Context**

tools perform service id loopback eth sap

## **Description**

This command places and removes the specific SAP in loopback mode for reflecting Ethernet traffic back in the direction of the received stream. This is only applicable to Ethernet-based SAPs.

## **Parameters**

***sap-id***

Specifies the SAP ID.

**Values**

null	<i>port-id</i>   <i>lag-id</i>	
dot1q	{ <i>port-id</i>   <i>lag-id</i> }:{ <i>qtag1</i>   <i>cp-conn-prof-id</i> }	
qinq	{ <i>port-id</i>   <i>lag-id</i> }:{ <i>qtag1</i>   <i>cp-conn-prof-id</i> }.{ <i>qtag2</i>   <i>cp-conn-prof-id</i> }	
	cp:	keyword
	conn-prof-id:	1..8000
port-id	slot/mda/port [.channel]	
	eth-sat-id	esat-id/slot/port
		esat: keyword
		id: 1 to 20
	pxc-id	pxc-id.sub-port
		pxc pxc-id.sub-port
		pxc: keyword
		id: 1 to 64
		sub-port: a, b
lag-id	<i>lag-id</i>	
	lag:	keyword
	id:	1..800
qtag1	0..4094	
qtag2	*   null   0..4094	

**start**

Keyword that places the sap in loopback mode.

**mode**

Keywords that specify the location on the loopback in relation to the SAP.

**Values** **ingress** — Traffic arriving at the sap-ingress will be reflected back out the same SAP.

**egress** — Traffic arriving at the sap-egress will be reflected back into the service in the direction of the original source.

**stop**

Removes the SAP from loopback mode.

### **mac-swap**

Enable source address and destination address swapping for the reflected packets when the arriving packet is unicast. Any broadcast and multicast packets arriving on a looped point will be dropped.

### **mac ieee-address**

Optionally configures the source MAC address used in the reflected packet when the arriving packet is a broadcast or multicast. This does not apply to arriving unicast packets.

6-byte unicast mac-address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

### **all**

Configured *ieee-address* is used as the source address for all reflected packets regardless of the arriving destination.

## **Platforms**

All

## **sap**

## **Syntax**

```
sap sap-id [arbiter {root | name}] [ingress | egress] [interval seconds] [repeat repeat] [absolute | rate]
```

## **Context**

[\[Tree\]](#) (monitor>qos>arbiter-stats sap)

## **Full Context**

```
monitor qos arbiter-stats sap
```

## **Description**

This command monitors arbiter statistics for a SAP.

## **Parameters**

### ***sap-id***

Specifies the physical port identifier portion of the SAP definition.

### ***name***

Specifies the name of the policer control policy arbiter, up to 32 characters. This parameter is mandatory if the SAP resides on a LAG in adapt-qoslink or port-fair mode.

### **root**

Specifies the arbiter to which this queue would be feeding.

### **ingress**

Displays *scheduler-name* statistics applied on the ingress SAP.

### **egress**

Displays *scheduler-name* statistics applied on the egress SAP.

### **seconds**

Configures the interval for each display in seconds.

**Values** 11 to 60

**Default** 11 seconds

### **repeat**

Configures the number of times the command is repeated.

**Values** 1 to 999

**Default** 10

### **absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### **rate**

Displays rate-per-second for each statistic instead of the delta.

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## **sap**

## **Syntax**

```
sap sap-id [scheduler scheduler-name] [ingress | egress] [interval seconds] [repeat repeat] [absolute | rate]
```

## **Context**

[\[Tree\]](#) (monitor>qos>scheduler-stats sap)

## **Full Context**

```
monitor qos scheduler-stats sap
```

## **Description**

Use this command to monitor scheduler statistics for a SAP at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified SAP. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### *scheduler-name*

Specifies an existing *scheduler-name*, up to 32 characters. Scheduler names are configured in the **config>qos>scheduler-policy>tier level** context. This parameter is mandatory if the SAP resides on a LAG in adapt-qoslink or port-fair mode.

### **ingress**

Displays *scheduler-name* statistics applied on the ingress SAP.

### **egress**

Displays *scheduler-name* statistics applied on the egress SAP.

### *seconds*

Configures the interval for each display in seconds.

**Values** 11 to 60

**Default** 11 seconds

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### **absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### **rate**

Displays rate-per-second for each statistic instead of the delta.

## Platforms

All

sap

## Syntax

**sap** *sap-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**sap** *sap-id* **encap-group** *group-name* [**member** *encap-id*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

## Context

[\[Tree\]](#) (monitor>service>id sap)

## Full Context

monitor service id sap

## Description

This command monitors statistics for a SAP associated with this service.

This command displays statistics for a specific SAP, identified by the *port-id* and encapsulation value, at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the SAP. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

Values		
null	<i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>aps-id</i>	
dot1q	<i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>aps-id</i>   <i>pw-id</i> :[qtag1   <b>cp</b> -conn-prof-id]	
qinq	<i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>pw-id</i> :[qtag1   <b>cp</b> -conn-prof-id].[qtag2   <b>cp</b> -conn-prof-id]

	<b>cp</b>	keyword
	<i>conn-prof-id</i>	1 to 8000
port-id	<i>slot/mda/port</i> [.channel] <i>esat-id/slot/port</i> <i>pxc-id.sub-port</i>	
aps-id	<i>aps-group-id</i> [.channel]	
	<b>aps</b>	keyword
	<i>group-id</i>	1 to 128
ccag-id	<b>ccag-id</b> . <i>path-id</i> [ <i>cc-type</i> ]: <i>cc-id</i>	
	<b>ccag</b>	keyword

	<i>id</i>	1 to 8
	<i>path-id</i>	a   b
	<i>cc-type</i>	.sap-net   .net-sap
	<i>cc-id</i>	1 to 4094
eth-tunnel	<b>eth-tunnel-id[:eth-tun-sap-id]</b>	
	<i>id</i>	1 to 1024
	<i>eth-tun-sap-id</i>	0 to 4094
lag-id	<b>lag-id</b>	
	<b>lag</b>	keyword
	<i>id</i>	1 to 800
pw-id	<b>pw-id</b>	
	<b>pw</b>	keyword
	<i>id</i>	1 to 10239
qtag1	*   0 to 4094	
qtag2	*   null   0 to 4094	
tunnel-id	<b>tunnel-id.private   public:tag</b>	
	<b>tunnel</b>	keyword
	<i>id</i>	1 to 16
	<i>tag</i>	0 to 4094

**port-id**

Specifies the physical port ID in the *slot/mda/port*, **esat-id/slot/ port** or **pxc-id.sub-port** format.

If the card in the slot has XMA/MDAs installed, the *port-id* must be in the *slot\_number/MDA\_number/port\_number* format. For example, 6/2/3 specifies port 3 on XMA/MDA 2 in slot 6.

**bundle-id**

Specifies the multilink bundle to be associated with this IP interface. The **bundle** keyword must be entered at the beginning of the parameter. This parameter applies to the 7750 SR.

The command syntax must be configured as follows:

bundle-id: **bundle**-type-slot-id/mda-slot.bundle-num

bundle-id value range: 1 to 128

For example:

```
*A:ALA-12>config# port bundle-ppp-5/1.1
```

```
*A:ALA-12>config>port# multilink-bundle
```

**bggrp-id**

Specifies the bundle protection group ID to be associated with this IP interface. The **bggrp** keyword must be entered at the beginning of the parameter. This parameter applies to the 7750 SR.

The command syntax must be configured as follows:

```
bggrp-id:                bggrp-type-bggrp-num
type:                    ima
bggrp-num value range:   1 to 1280
```

Example:

```
*A:ALA-12>config# port bggrp-ima-1
*A:ALA-12>config>service>vpls$ sap bggrp-ima-1
```

**qtag1, qtag2**

Specifies the encapsulation value used to identify the SAP on the port or sub-port. If this parameter is not specifically defined, the default value is 0.

<b>Values</b>	qtag1:	0 to 4094
	qtag2 :	*   0 to 4094

The values depends on the encapsulation type configured for the interface. [Table 468: qtag values by port and encapsulation type](#) describes the allowed values for the port and encapsulation types.

Table 468: qtag values by port and encapsulation type

Port Type	Encap-Type	Allowed Values	Comments
Ethernet	Null	0	The SAP is identified by the port.
Ethernet	Dot1q	0 to 4094	The SAP is identified by the 802.1Q tag on the port. Note that a 0 qtag1 value also accepts untagged packets on the dot1q port.
Ethernet	QinQ	qtag1: 0 to 4094 qtag2: 0 to 4094	The SAP is identified by two 802.1Q tags on the port. Note that a 0 qtag1 value also accepts untagged packets on the dot1q port.

**group-name**

Specifies the name of the encap group, up to 32 characters.

**encap-id**

Specifies the value of the encapsulation ID to be displayed.

**Values** 0 to 16777215

**seconds**

Configures the interval for each display, in seconds.

**Values** 11 to 60

**Default** 11

**repeat**

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

**absolute**

Displays absolute rate-per-second value for each statistic.

**rate**

Displays rate-per-second for each statistic instead of the delta.

**Platforms**

Table 469: Output fields: QoS SAP egress

Label	Description
Policy-Id	The ID that uniquely identifies the policy.
Scope	Exclusive — Specifies that this policy can only be applied to a single SAP. Template — Specifies that this policy can be applied to multiple SAPs on the router.
Description	A text string that helps identify the policy context in the configuration file.
Queue	
CIR Admin	Specifies the administrative Committed Information Rate (CIR) parameters for the queue. The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth.
CIR Oper	The operational value derived by computing the CIR value from the administrative CIR and PIR values and their corresponding adaptation rules.
CIR Rule	min — The operational CIR for the queue will be equal to or greater than the administrative rate specified using the rate command except where the derived operational CIR is greater than the operational PIR. If the derived operational CIR is greater than the derived operational PIR, the operational CIR will be made equal to the operational PIR. max — The operational CIR for the queue will be equal to or less than the administrative rate specified using the rate command. closest — The operational CIR for the queue will be the rate closest to the rate specified using the rate command without exceeding the operational CIR.
PIR Admin	Specifies the administrative Peak Information Rate (PIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues) or out an egress interface (for SAP egress queues).
PIR Oper	The administrative PIR specified by the user.
PIR Rule	min — The operational PIR for the queue will be equal to or greater than the administrative rate specified using the rate command. max — The operational PIR for the queue will be equal to or less than the administrative rate specified using the rate command.

Label	Description
	closest — The operational PIR for the queue will be the rate closest to the rate specified using the rate command.
CBS	def — Specifies that the CBS value reserved for the queue. value — Specifies the value to override the default reserved buffers for the queue.
MBS	def — Specifies that the MBS value is set by the def-mbs function. value — Specifies the value to override the default maximum size for the queue.
HiPrio	Specifies the percentage of buffer space for the queue, used exclusively by high-priority packets.
PIR Lvl/Wt	Specifies the priority level of the scheduler when compared to other child schedulers and queues vying for bandwidth on the parent schedulers during the above-CIR distribution phase of bandwidth allocation.  Weight defines the relative weight of this scheduler in comparison to other child schedulers and queues at the same level.
CIR Lvl/Wt	Specifies the level of hierarchy when compared to other schedulers and queues when vying for bandwidth on the parent scheduler. Weight defines the relative weight of this queue in comparison to other child schedulers and queues while vying for bandwidth on the parent scheduler.
Parent	Specifies the parent scheduler that governs the available bandwidth given the queue aside from the queue's PIR setting.
FC Name	Specifies the forwarding class queue mapping or dot1p marking is to be edited.
Queue-id	Specifies the <i>queue-id</i> that uniquely identifies the queue within the policy.
Explicit/Default	Explicit — Specifies the egress IEEE 802.1p (dot1p) bits marking for <i>fc-name</i> .  Default — Specifies that the default dot1p value (0) is used.
Service Association	
Service-Id	The unique service ID number that identifies the service in the service domain.
Customer-Id	Specifies the customer ID that identifies the customer to the service.

Label	Description
SAP	Specifies the Service Access Point (SAP) within the service where the policy is applied.
Mirror SAPs	
Mirror Dest	Specifies the mirror service ID that identifies the service in the service domain.
SAP	Specifies the Service Access Point (SAP) within the service where the SAP egress policy is applied.

## 26.7 sap-ingress

### sap-ingress

#### Syntax

**sap-ingress** [*policy-id*] [**association** | **match-criteria** | **detail**]

**sap-ingress summary**

#### Context

[\[Tree\]](#) (show>qos sap-ingress)

#### Full Context

show qos sap-ingress

#### Description

This command displays SAP ingress QoS policy information.

#### Parameters

##### *policy-id*

Displays information about the specific policy ID.

**Values** 1 to 65535

**Default** all SAP ingress policies

##### **detail**

Displays detailed policy information including policy associations.

##### **summary**

Displays SAP ingress policy summary.

## Platforms

All

## Output

The following output is an example of QoS SAP ingress information, and [Table 470: Output fields: QoS SAP ingress](#) describes the output fields.

### Output Example

```
*A:PE# show qos sap-ingress

Table 470: Output fields: QoS SAP ingress

Label	Description
Policy-Id	The ID that uniquely identifies the policy.

Label	Description
Scope	<p>Exclusive — Specifies that this policy can only be applied to a single SAP.</p> <p>Template - Specifies that this policy can be applied to multiple SAPs on the router.</p>
Description	A text string that helps identify the policy context in the configuration file.
Default FC	Specifies the default forwarding class for the policy.
Priority	Specifies the enqueueing priority when a packet is marked with a <i>dot1p-value</i> specified.
Criteria-type	<p>IP — Specifies that an IP criteria-based SAP ingress policy is used to select the appropriate ingress queue and corresponding forwarding class for matched traffic.</p> <p>MAC — Specifies that a MAC criteria-based SAP is used to select the appropriate ingress queue and corresponding forwarding class for matched traffic.</p>
Mode	Specifies the configured mode of the meter (trTcm or srTcm).
CIR Admin	Specifies the administrative Committed Information Rate (CIR) parameters for the queue. The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth.
CIR Oper	The operational value derived by computing the CIR value from the administrative CIR and PIR values and their corresponding adaptation rules.
CIR Rule	<p>min — The operational CIR for the queue will be equal to or greater than the administrative rate specified using the rate command.</p> <p>max — The operational CIR for the queue will be equal to or less than the administrative rate specified using the rate command.</p> <p>closest —The operational CIR for the queue will be the rate closest to the rate specified using the rate command without exceeding the operational CIR.</p>
PIR Admin	Specifies the administrative Peak Information Rate (PIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues) or out an egress interface (for SAP egress queues).
PIR Oper	The administrative PIR specified by the user.

Label	Description
PIR Rule	<p>min — The operational PIR for the queue will be equal to or greater than the administrative rate specified using the rate command.</p> <p>max — The operational PIR for the queue will be equal to or less than the administrative rate specified using the rate command.</p> <p>closest — The operational PIR for the queue will be the rate closest to the rate specified using the rate command.</p>
CBS	<p>def — Specifies the default CBS value for the queue.</p> <p>value — Specifies the value to override the default reserved buffers for the queue.</p>
MBS	<p>def — Specifies the default MBS value.</p> <p>value — Specifies the value to override the default MBS for the queue.</p>
HiPrio	Specifies the percentage of buffer space for the queue, used exclusively by high-priority packets.
PIR Lvl/Wt	<p>Specifies the priority level of the scheduler when compared to other child schedulers and queue vying for bandwidth on the parent schedulers during the above-CIR distribution phase of bandwidth allocation.</p> <p>Weight defines the relative weight of this scheduler in comparison to other child schedulers and queue at the same level.</p>
CIR Lvl/Wt	Specifies the level of hierarchy when compared to other schedulers and queue when vying for bandwidth on the parent scheduler. Weight defines the relative weight of this queue in comparison to other child schedulers and queue while vying for bandwidth on the parent scheduler.
Parent	Specifies the parent scheduler that governs the available bandwidth given the queue, aside from the queue's PIR setting.
Dot1p	Specifies the forwarding class or enqueueing priority when a packet is marked with a <i>dot1p-value</i> specified.
FC	Specifies the forwarding class overrides.
Priority	<p>The optional priority setting overrides the default enqueueing priority for the packets received on an ingress SAP that uses the policy that matches this rule.</p> <p>High — Specifies that the high enqueueing parameter for a packet increases the likelihood of enqueueing the packet when the ingress queue is congested.</p>

Label	Description
	Low — Specifies that the low enqueueing parameter for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested.
DSCP	Specifies the forwarding class or enqueueing priority when a packet is marked with the DiffServ Code Point (DSCP) value.
FC	Specifies one of the predefined forwarding classes in the system. When a packet matches the rule, the forwarding class is only overridden when the <b>fc</b> <i>fc-name</i> parameter is defined on the rule.
Priority	This parameter specifies the default enqueueing priority overrides for all packets received on an ingress SAP using this policy that matches this rule.  High — Specifies that the high enqueueing parameter for a packet increases the likelihood of enqueueing the packet when the ingress queue is congested.  Low — Specifies that the low enqueueing parameter for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested.
Prec	Specifies the forwarding class or enqueueing priority when a packet is marked with an IP precedence value ( <i>ip-prec-value</i> ).
UCastQ	Specifies the default unicast forwarding type queue mapping.
MCastQ	Specifies the overrides for the default multicast forwarding type queue mapping.
BCastQ	Specifies the default broadcast forwarding type queue mapping.
UnknownQ	Specifies the default unknown unicast forwarding type queue mapping.
Match Criteria	Specifies an IP or MAC criteria entry for the policy.
Entry	
Source IP	Specifies a source IP address range used for an ingress SAP QoS policy match.
Source Port	Specifies a source TCP or UDP port number or port range used for an ingress SAP QoS policy match.
Protocol	Specifies the IP protocol number to be used for an ingress SAP QoS policy match.
DSCP	Specifies a DiffServ Code Point (DSCP) name used for an ingress SAP QoS policy match.

Label	Description
Fragment	True — Configures a match on all fragmented IP packets. False — Configures a match on all non-fragmented IP packets.
FC	Specifies the entry's forwarding class.
Priority	Specifies the default enqueueing priority overrides for all packets received on an ingress SAP using this policy.
Src MAC	Specifies a source MAC address or range to be used as a Service Ingress QoS policy match.
Dst MAC	Specifies a destination MAC address or range to be used as a Service Ingress QoS policy match.
Dot1p	Specifies a IEEE 802.1p value to be used as the match.
Snap-pid	Specifies an IEEE 802.3 LLC SNAP Ethernet Frame PID value to be used as a Service Ingress QoS policy match.
Ethernet-type	Specifies an Ethernet type II Ethertype value to be used as a Service Ingress QoS policy match.
ESnap-oui-zero	Specifies an IEEE 802.3 LLC SNAP Ethernet Frame OUI zero or non-zero value to be used as a Service Ingress QoS policy match.
DSAP	Specifies an Ethernet 802.2 LLC DSAP value or range for an ingress SAP QoS policy match.
SSAP	Specifies an Ethernet 802.2 LLC DSAP value or range for an ingress SAP QoS policy match.
FC	Specifies the entry's forwarding class.
Priority	Specifies the default enqueueing priority overrides for all packets received on an ingress SAP using this policy.
Service Association	
Service-Id	The unique service ID number that identifies the service in the service domain.
Customer-Id	Specifies the customer ID that identifies the customer to the service.
SAP	Specifies the Service Access Point (SAP) within the service where the SAP ingress policy is applied.

## 26.8 sap-template

### sap-template

#### Syntax

**sap-template** *template-name* **idle-saps**

#### Context

[\[Tree\]](#) (clear>subscr-mgmt sap-template)

#### Full Context

clear subscriber-mgmt sap-template

#### Description

This command deletes any SAPs created with the specified SAP template that are no longer in use by any subscriber sessions.

#### Parameters

##### *template-name*

Specifies the name of a template, up to 256 characters, configured under **configure subscriber-mgmt sap-template**.

##### **idle-saps**

Keyword that specifies to delete any idle SAPs associated with this template.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 26.9 sap-using

### sap-using

#### Syntax

**sap-using** [ingress | egress]

#### Context

[\[Tree\]](#) (show>service sap-using)

#### Full Context

show service sap-using

## Description

Displays SAP information.

If no optional parameters are specified, the command displays a summary of all defined SAPs.

The optional parameters restrict output to only SAPs matching the specified properties.

## Parameters

### ingress

Specifies matching an ingress policy.

### egress

Specifies matching an egress policy.

### qos-policy *qos-policy-id*

The ingress or egress QoS Policy ID for which to display matching SAPs.

**Values** 1 to 65535

### filter *filter-id*

The ingress or egress Filter Policy ID for which to display matching SAPs.

**Values** 1 to 65535

### sap-id

Specifies the physical port identifier portion of the SAP definition.

**Values** The following values apply to the 7750 SR and 7950 XRS:

null	<i>[port-id   bundle-id   bpgrp-id   lag-id   aps-id]</i>
dot1q	<i>[port-id   bundle-id   bpgrp-id   lag-id   aps-id]:qtag1</i>
qinq	<i>[port-id   bundle-id   bpgrp-id   lag-id]:qtag1.qtag2</i>
cem	<i>slot/mda/port.channel</i>
ima-grp	<i>bundle-id[:vpi/vci   vpi   vpi1.vpi2]</i>
port-id	<i>slot/mda/port[.channel]</i>
aps-id	<b>aps-group-id</b> <i>id[.channel]</i>
	<b>aps</b> keyword
	<b>group-id</b> 1 to 128
ccag-id	<i>ccag-id.path-id[cc-type]:cc-id</i>
	<b>ccag</b> keyword
	<b>id</b> 1 to 8
	<b>path-id</b> a, b

	<i>cc-type</i>	.sap-net, .net-sap
	<i>cc-id</i>	0 to 4094
<i>lag-id</i>	<i>lag-id</i>	
	lag	keyword
	id	1 to 800
qtag1		0 to 4094
qtag2		*, 0 to 4094

The following values apply to the 7450 ESS:

<b>Values</b>	null	[ <i>port-id</i>   <i>lag-id</i> ]
	dot1q	[ <i>port-id</i>   <i>lag-id</i> ]: <i>qtag1</i>
	qinq	[ <i>port-id</i>   <i>lag-id</i> ]: <i>qtag1</i> . <i>qtag2</i>
	port-id	slot/mda/port[.channel]
	ccag-id	ccag-id. <i>path-id</i> [ <i>cc-type</i> ]: <i>cc-id</i>
	ccag	keyword
	<i>id</i>	1 to 8
	<i>path-id</i>	a, b
	<i>cc-type</i>	.sap-net, .net-sap
	<i>cc-id</i>	0 to 4094
	<i>lag-id</i>	<i>lag-id</i>
	lag	keyword
	<i>id</i>	1 to 800
	qtag1	0. to 4094
	qtag2	*, 0 to 4094

**interface**

Specifies matching SAPs with the specified IP interface.

**ip-addr**

The IP address of the interface for which to display matching SAPs.

**Values** 1.0.0.0 to 223.255.255.255

**ip-int-name**

The IP interface name for which to display matching SAPs.

## Platforms

All

## Output

The following output is an example of service SAP information, and [Table 471: Output fields: SAP](#) describes show service SAP output fields.

### Output Example

```

```

Table 471: Output fields: SAP

Label	Description
Port ID	The ID of the access port where the SAP is defined
Svc ID	The service identifier
SapMTU	The SAP MTU value
I.QoS	The SAP ingress QoS policy number specified on the ingress SAP
I.MAC/IP	The MAC or IP filter policy ID applied to the ingress SAP
E.QoS	The SAP egress QoS policy number specified on the egress SAP
E.Mac/IP	The MAC or IP filter policy ID applied to the egress SAP
A.Pol	The accounting policy ID assigned to the SAP
Adm	The desired state of the SAP
Opr	The actual state of the SAP

## sap-using

### Syntax

**sap-using** [msap] [dyn-script] [description]

**sap-using** [sap *sap-id*] [vlan-translation | anti-spoof] [description]

```
sap-using {ingress | egress} atm-td-profile td-profile-id  
sap-using {ingress | egress} filter any-filter-id  
sap-using {ingress | egress} qos-policy qos-policy-id [msap]  
sap-using etree  
sap-using eth-cfm squalch-ingress-levels [all | ctag-space] [sap sap-id]
```

## Context

[\[Tree\]](#) (show>service sap-using)

## Full Context

```
show service sap-using
```

## Description

This command displays SAP information.

If no optional parameters are specified, the command displays a summary of all defined SAPs.

The optional parameters restrict output to only SAPs matching the specified properties.

## Parameters

### ingress

Specifies matching an ingress policy.

### egress

Specifies matching an egress policy.

### *qos-policy-id*

The ingress or egress QoS Policy ID for which to display matching SAPs.

**Values** 1 to 65535

### *td-profile-id*

Displays SAPs using this traffic description for the 7750 SR only.

### *filter-id*

The ingress or egress filter policy ID for which to display matching SAPs.

**Values** 1 to 65535

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### dyn-script

Displays dynamic service SAPs information.

### msap

Displays MSAPs.

### vlan-translation

Displays VLAN translation information.

**anti-spoof**

Displays anti-spoof information.

**squelch-ingress-level**

Displays ETH-CFM squelching information of the type matching the service delimited configuration.

**all**

Displays all squelch ingress levels information regardless of type.

**ctag-space**

Displays all squelch-ingress-levels information that is skipping additional VLAN space.

**Platforms**

All

**Output**

The following output is an example of sap-using using information, and [Table 472: Output fields: service SAP](#) describes the output fields.

**Output Example**

```

Table 472: Output fields: service SAP

Label	Description
Port ID	The ID of the access port where the SAP is defined
Svc ID	The service identifier
Sap MTU	The SAP MTU value
Ing. QoS	The SAP ingress QoS policy number specified on the ingress SAP
Ing Fltr	The MAC or IP filter policy ID applied to the ingress SAP
Egr. QoS	The SAP egress QoS policy number specified on the egress SAP for the 7450 ESS and 7750 SR only
Egr. Fltr	The MAC or IP filter policy ID applied to the egress SAP
Adm	The administrative state of the SAP
Opr	The operational state of the SAP
SapId	The ID that displays SAPs for the service
Squelch Level	The CFM levels configured for silent discard

## sap-using

### Syntax

**sap-using** [ingress | egress] atm-td-profile *td-profile-id*

## Context

[\[Tree\]](#) (show>service sap-using)

## Full Context

show service sap-using

## Description

Displays **atm-td-profile** SAP information.

If no optional parameters are specified, the command displays a summary of all defined SAPs.

The optional parameters restrict output to only SAPs matching the specified properties.

## Parameters

### ingress

Specifies matching an ingress policy.

### egress

Specifies matching an egress policy.

### qos-policy *qos-policy-id*

The ingress or egress QoS Policy ID for which to display matching SAPs.

**Values** 1 to 65535

### filter *filter-id*

The ingress or egress Filter Policy ID for which to display matching SAPs.

**Values** 1 to 65535

### sap-id

Specifies the physical port identifier portion of the SAP definition.

**Values** The following values apply to the 7750 SR and 7950 XRS:

null	<i>[port-id   bundle-id   bpgrp-id   lag-id   aps-id]</i>
dot1q	<i>[port-id   bundle-id   bpgrp-id   lag-id   aps-id]:qtag1</i>
qinq	<i>[port-id   bundle-id   bpgrp-id   lag-id]:qtag1.qtag2</i>
cem	<i>slot/mda/port.channel</i>
ima-grp	<i>bundle-id[:vpi/vci   vpi   vpi1.vpi2]</i>
port-id	<i>slot/mda/port[.channel]</i>
aps-id	<i>aps-group-id[.channel]</i>
aps	keyword
group-id	1 to 64
ccag-id	<i>ccag-id.path-id[cc-type]:cc-id</i>

	<i>ccag</i>	keyword
	<i>id</i>	1 to 8
	<i>path-id</i>	a, b
	<i>cc-type</i>	.sap-net, .net-sap
	<i>cc-id</i>	0 to 4094
<i>lag-id</i>	<i>lag-id</i>	
	lag	keyword
	id	1 to 800
qtag1		0 to 4094
qtag2		*, 0 to 4094

The following values apply to the 7450 ESS:

Values		
	null	[ <i>port-id</i>   <i>lag-id</i> ]
	dot1q	[ <i>port-id</i>   <i>lag-id</i> ]: <i>qtag1</i>
	qinq	[ <i>port-id</i>   <i>lag-id</i> ]: <i>qtag1.qtag2</i>
	frame	[ <i>port-id</i> ]: <i>dlci</i>
	port-id	slot/mda/port[.channel]
	ccag-id	<i>ccag-id.path-id[cc-type]:cc-id</i>
	<i>ccag</i>	keyword
	<i>id</i>	1 to 8
	<i>path-id</i>	a, b
	<i>cc-type</i>	.sap-net, .net-sap
	<i>cc-id</i>	0 to 4094
	<i>lag-id</i>	<i>lag-id</i>
	lag	keyword
	<i>id</i>	1 to 800
	qtag1	0. to 4094
	qtag2	*, 0 to 4094
	dlci	16 to 1022

### interface

Specifies matching SAPs with the specified IP interface.

**ip-addr**

The IP address of the interface for which to display matching SAPs.

**Values** 1.0.0.0 to 223.255.255.255

**ip-int-name**

The IP interface name for which to display matching SAPs.

**td-profile-id**

Profile ID that identifies a specific profile to display.

**Platforms**

All

**Output**

The following output is an example of service SAP information, and [Table 473: Output fields: SAP](#) describes show service SAP output fields.

**Output Example**

```
A:ALA-48>config>service>ies# show service sap-using sap 1/3/2:244/1

```

Table 473: Output fields: SAP

Label	Description
Port ID	The ID of the access port where the SAP is defined.
Svc ID	The service identifier.
SapMTU	The SAP MTU value.
I.QoS	The SAP ingress QoS policy number specified on the ingress SAP.
I.MAC/IP	The MAC or IP filter policy ID applied to the ingress SAP.
E.QoS	The SAP egress QoS policy number specified on the egress SAP.
E.Mac/IP	The MAC or IP filter policy ID applied to the egress SAP.
A.Pol	The accounting policy ID assigned to the SAP.

Label	Description
Adm	The desired state of the SAP.
Opr	The actual state of the SAP.

## 26.10 sap-using aarp

### sap-using aarp

#### Syntax

**sap-using aarp** *aarp-id*

#### Context

[\[Tree\]](#) (show>service sap-using aarp)

#### Full Context

show service sap-using aarp

#### Description

This command displays SAP information for a specific AARP ID.

#### Parameters

***aarp-id***

Specifies the AARP ID.

**Values** 1 to 65535

#### Platforms

All

## 26.11 sap-using app-profile

### sap-using app-profile

#### Syntax

**sap-using app-profile** *app-profile-name*

## Context

[Tree] (show>service sap-using app-profile)

## Full Context

show service sap-using app-profile

## Description

This command displays information about SAPs using the specified application profile.

## Parameters

### *app-profile-name*

Specifies an existing application profile name created in the **config>app-assure>group>policy** context.

## Platforms

All

## Output

The following output is an example of the **sap-using app profile** command information.

### Output Example

```
*A:ALA-48# show service sap-using app-profile test
=====
Service Access Point Using Application Profile 'test'

## 26.12 sap-using transit-policy

### sap-using transit-policy

## Syntax

**sap-using transit-policy ip** *transit-ip-policy*

**sap-using transit-policy prefix** *transit-prefix-policy*

## Context

[Tree] (show>service sap-using transit-policy)

## Full Context

show service sap-using transit-policy

## Description

This command displays SAP information for a specific transit IP policy or transit prefix policy.

## Parameters

### *transit-ip-policy*

Specifies the transit IP policy ID.

**Values** 1 to 65535

### *transit-prefix-policy*

Specifies a transit prefix policy ID.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.13 saps

### saps

## Syntax

**saps** [**control-session** *acct-session-id*] [**port** *port-id*] [**dynsvc-policy** *policy-name*] [**summary**] [**sap** *sap-id*] [**svc-id** *service-id*]

## Context

[\[Tree\]](#) (show>service>dynsvc saps)

## Full Context

show service dynamic-services saps

## Description

This command displays Dynamic Services SAPs (instances) details.

### Note:

This command is not available in the MD-CLI.

## Parameters

### **summary**

Displays a summary view only.

**acct-session-id**

Specifies control session accounting session id.

**port-id**

Specifies Ethernet port.

**policy-name**

Specifies dynamic services policy.

**sap sap-id**

Specifies dynamic services SAP id.

**service-id**

The service ID of the dynamic service.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of dynamic service SAP information.

**Output Example**

```
# show service dynamic-services saps

Table 474: Output fields: dynamic services SAP describes Dynamic Services SAP fields.

Table 474: Output fields: dynamic services SAP

Output field	Description
SAP	The dynamic service SAP ID.
Acct session-ID	The dynamic service accounting session ID.
Acct session-ID control	The control channel accounting session ID.
Service	The dynamic service ID.
Dynamic Services policy	The policy referenced to setup the dynamic service.
Number of scripts executed	The number of times the script was executed for this dynamic service (setup, modify, revert or teardown).
Number of scripts w success	The number of times the script was executed successfully for this dynamic service.
Last script action	The setup, modify, revert, teardown.
Time of last script action	The timestamp of the last script action.
Parameters of last action	The content of the Dynamic Services Script Parameters attribute corresponding with the last action.
Status	RADIUS accounting is enabled or disabled.
Stats type	The type of statistics reported in accounting.
Update interval (minutes)	The time, in minutes, between Accounting Interim Update messages.

## 26.14 satellite

### satellite

#### Syntax

satellite

## Context

[\[Tree\]](#) (clear>system satellite)

## Full Context

clear system satellite

## Description

Commands in this context clear satellite information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## satellite

## Syntax

satellite

## Context

[\[Tree\]](#) (show>system satellite)

## Full Context

show system satellite

## Description

This command displays a list of configured satellites including information about the satellite's esat-ID or tsat-ID, satellite type, and state.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of satellite information.

### Output Example

```
A:Dut-A# show system satellite
=====

=====
A:sim1>show>cron
```

Table 475: Output fields: cron schedule

Label	Description
Schedule	Displays the schedule name.
Schedule owner	Displays the owner name of the action.
Description	Displays the schedule's description.
Administrative status	Enabled — The administrative status is enabled. Disabled — Administratively disabled.
Operational status	Enabled — The operational status is enabled. Disabled — Operationally disabled.

Label	Description
Action	Displays the action name.
Action owner	Displays the name of action owner.
Script	Displays the name of the script.
Script owner	Displays the name of the script.
Script owner	Displays the name of the of script owner.
Script source location	Displays the location of scheduled script.
Script results location	Displays the location where the script results have been sent.
Schedule type	Periodic — Displays a schedule which ran at a given interval. Calendar — Displays a schedule which ran based on a calendar. Oneshot — Displays a schedule which ran one time only.
Interval	Displays the interval between runs of an event.
Next scheduled run	Displays the time for the next scheduled run.
Weekday	Displays the configured weekday.
Month	Displays the configured month.
Day of Month	Displays the configured day of month.
Hour	Displays the configured hour.
Minute	Displays the configured minute.
Number of scheduled runs	Displays the number of scheduled sessions.
Last scheduled run	Displays the last scheduled session.
Number of scheduled failures	Displays the number of scheduled sessions that failed to execute.
Last scheduled failure	Displays the last scheduled session that failed to execute.
Last failure time	Displays the system time of the last failure.

## 26.16 scheduler-hierarchy

### scheduler-hierarchy

#### Syntax

**scheduler-hierarchy**

#### Context

[\[Tree\]](#) (show>qos scheduler-hierarchy)

#### Full Context

show qos scheduler-hierarchy

#### Description

This command displays scheduler-hierarchy information.

#### Platforms

All

## 26.17 scheduler-name

### scheduler-name

#### Syntax

**scheduler-name** *scheduler-name*

#### Context

[\[Tree\]](#) (show>qos scheduler-name)

#### Full Context

show qos scheduler-name

#### Description

This command displays the scheduler policies using the specified scheduler.

#### Parameters

***scheduler-name***

The name of a scheduler configured in the **config>qos>scheduler-policy>tier** context.

## Platforms

All

## Output

The following output is an example of scheduler name information.

### Output Example

```
A:ALA-12# show qos scheduler-name NetworkControl
=====
Scheduler : NetworkControl
=====
Scheduler Policy   : SLA1
Scheduler Policy   : alpha
Scheduler Policy   : beta
=====
A:ALA-12#
```

## 26.18 scheduler-policy

### scheduler-policy

#### Syntax

```
scheduler-policy [scheduler-policy-name] [ association | sap-ingress policy-id | sap-egress policy-id ]
scheduler-policy scheduler-policy-name { ingress | egress } queue-group queue-grp-name
```

#### Context

[\[Tree\]](#) (show>qos scheduler-policy)

#### Full Context

```
show qos scheduler-policy
```

#### Description

Use this command to display scheduler policy information.

#### Parameters

##### ***scheduler-policy-name***

The name of a scheduler policy configured in the **config>qos>scheduler-policy** context.

##### **association**

Displays the associations related to the specified scheduler name.

##### **sap-ingress** *policy-id*

Specifies the SAP ingress QoS policy information.

**sap-egress policy-id**

Specifies the SAP egress QoS policy information.

**{ingress | egress}**

Specifies the direction to display and are mutually exclusive.

**queue-grp-name**

Displays information for the specified queue group.

**Platforms**

All

**Output**

The following output is an example of scheduler policy information, and [Table 476: Output fields: QoS scheduler policy](#) describes the customer scheduler hierarchy fields.

**Output Example**

```
A:ALA-12# show qos scheduler-policy SLA1
=====
QoS Scheduler Policy
=====

Table 476: Output fields: QoS scheduler policy

Label	Description
Policy-Name	Specifies the scheduler policy name.
Description	Specifies a text string that helps identify the policy context in the configuration file.
Tier	Specifies the level of hierarchy that a group of schedulers are associated with.
Scheduler	Specifies the scheduler name.
Lvl/Wt	Specifies the priority level of the scheduler when compared to other child schedulers and queues vying for bandwidth on the

Label	Description
	parent schedulers during the above-CIR distribution phase of bandwidth allocation.  Weight defines the relative weight of this scheduler in comparison to other child schedulers and queues at the same level.
Cir Lvl/Wt	Specifies the level of hierarchy when compared to other schedulers and queues when vying for bandwidth on the parent scheduler. Weight defines the relative weight of this queue in comparison to other child schedulers and queues while vying for bandwidth on the parent scheduler.
PIR	Specifies the PIR rate.
CIR	Specifies the CIR rate.
Parent	Specifies the parent scheduler that governs the available bandwidth given the queue aside from the PIR setting of the queue.
Service-Id	Specifies the ID that uniquely identifies the policy.
Customer-Id	Specifies the ID that uniquely identifies the customer.
SAP	Specifies the Service Access Point (SAP) within the service where the policy is applied.
Multi Service Site	Specifies the multiservice site name.
Orphan Queues	Specifies the number of queues in an orphaned state.
Hierarchy	Displays the scheduler policy tree structure.

## 26.19 scheduler-stats

### scheduler-stats

#### Syntax

**scheduler-stats**

#### Context

**[Tree]** (clear>qos scheduler-stats)

#### Full Context

clear qos scheduler-stats

## Description

This command clears scheduler statistics.

## Platforms

All

## scheduler-stats

## Syntax

**scheduler-stats**

## Context

[\[Tree\]](#) (show>qos scheduler-stats)

## Full Context

show qos scheduler-stats

## Description

This command displays scheduler statistics information.

## Platforms

## 26.21 script

script

### Syntax

script

### Context

[\[Tree\]](#) (show>service>dynsvc script)

### Full Context

show service dynamic-services script

### Description

Commands in this context show dynamic services script information.

#### Note:

These commands are not available in the MD-CLI.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## script

## Syntax

```
script [script-name] [owner script-owner]
```

## Context

[\[Tree\]](#) (show>system>script-control script)

## Full Context

```
show system script-control script
```

## Description

This command displays script parameters.

## Parameters

### *script-name*

Displays information for the specified script. 32 characters maximum.

### *script-owner*

Displays information for the specified script owner. 32 characters maximum.

## Platforms

All

## Output

The following output is an example of show script command information, and [Table 477: Output fields: script](#) describes the output fields.

## Output Example

```

Table 478: Output fields: script policy

Label	Description
Script policy	Displays the name of the script policy.
Script policy owner	Displays the name of the script policy owner.
Administrative status	Enabled — Administrative status is enabled. Disabled — Administrative status is disabled.
Script	Displays the name of the script.
Script owner	Displays the name of the script owner.
Script source location	Displays the location of scheduled script.
Max running allowed	Displays the maximum number of allowed sessions.
Max completed run histories	Displays the maximum number of sessions previously run.
Max lifetime allowed	Displays the maximum amount of time the script may run.
Completed run histories	Displays the number of completed sessions.
Executing run histories	Displays the number of sessions in the process of executing.
Initializing run histories	Displays the number of sessions ready to run/queued but not executed.
Max time tun history saved	Displays the maximum amount of time to keep the results from a script run.
Last change	Displays the system time a change was made to the configuration.
Script start error	Displays the error found while executing the script.

Label	Description
Max row empire time	Reserved for SNMP.
Last application	Displays the last application used to execute the script.
Last auth. user account	Displays the last user used to execute the script. If no user is specified in "configure system cli-script authorization event-handler/cron" then the user is not specified.

## 26.25 sctp-filter

```
sctp-filter
```

### Syntax

```
sctp-filter sctp-filter-name
```

### Context

[\[Tree\]](#) (show>app-assure>group sctp-filter)

### Full Context

```
show application-assurance group sctp-filter
```

### Description

This command displays Stream Control Transmission Protocol (SCTP) filter information

### Parameters

***sctp-filter-name***

Specifies an SCTP filter, up to 256 characters. When a filter is specified, all traffic is examined as described in the tmnxBsxCtpFltrTable.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.26 sdp

```
sdp
```

### Syntax

```
sdp all | sdp-id:vc-id
```

### Context

[\[Tree\]](#) (show>subscr-mgmt>errors sdp)

### Full Context

```
show subscriber-mgmt errors sdp
```

### Description

This command sorts all the subscriber errors by SDP.

## Parameters

### all

Shows all errors beginning with the lowest SDP index.

### *sdp-id:vc-id*

Shows only the error of a specific SDP index.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

[Table 479: Output fields: subscriber management SDP error](#) describes subscriber management SDP error output fields.

*Table 479: Output fields: subscriber management SDP error*

Field	Description
SDP	The SDP ID associated with the error
Time	The time this error was reported to the subscriber management errors subsystem
Service	The service ID associated with the error
MAC	The MAC address associated with the error
Error	The error that occurred on the SDP
Extra	Extra information about the error that occurred

## sdp

## Syntax

**sdp** [*sdp-id* [:*vc-id*]] [**detail**]

**sdp far-end** {*ip-address* | *ipv6-address*} [**detail**]

**sdp** *sdp-id* [*vc-id*] **l2tpv3**

**sdp** *sdp-id* [:*vc-id*] **static-isids** [**range-id** *range-id*]

**sdp** *sdp-id* [:*vc-id*] **static-isids** **mfib**

**sdp** *sdp-id* [:*vc-id*] [**detail**] **vccv-bfd** [**session**]

**sdp** *sdp-id* [:*vc-id*] **mrp**

## Context

[\[Tree\]](#) (show>service>id sdp)

## Full Context

show service id sdp

## Description

Displays information for the SDPs associated with the service. If no optional parameters are specified, a summary of all associated SDPs is displayed.

## Parameters

### ***sdp-id*** [:vc-id]

Displays only information for the specified SDP ID.

**Values** sdp-id: 1 to 17407  
vc-id: 1 to 4294967295

**Default** all SDPs

### **detail**

Displays detailed SDP information.

### ***ip-address*** | ***ipv6-address***

Displays only SDPs matching with the specified far-end IP address. 64 characters maximum.

**Default** SDPs with any far-end IP address

### **l2tpv3**

Indicates that the user wants to display l2tpv3 specific information for SDPs that are of type l2tpv3.

### **static-isids**

Specifies the I-Component service IDs created on the SDP.

### ***range-id***

Displays the service using the specified I-component Service ID (ISID).

**Values** 1 to 4294967295

### **mfib**

Display MFIB related information. This parameter applies to the 7450 ESS or 7750 SR only.

### **vccv-bfd**

Displays detailed information about the VCCV BFD session for a spoke SDP.

### **session**

displays a summary of all VCCV sessions.

### **mrp**

Displays detailed MRP information.

## Platforms

All

## Output

The following command displays SDP information and [Table 480: Output fields: service ID SDP](#) describes the output fields.

```
show service id sdp
```

### Output Example

Table 480: Output fields: service ID SDP

Label	Description
Sdp Id	The SDP identifier.
Type	Indicates whether the SDP is a spoke or a mesh.
Split Horizon Group	Name of the split horizon group that the SDP belongs to.
VC Type	Displays the VC type: ether or vlan.
VC Tag	Displays the explicit dot1Q value used when encapsulating to the SDP far end.
I. Lbl	The VC label used by the far-end device to send packets to this device in this service by the SDP.
Admin Path MTU	The operating path MTU of the SDP is equal to the admin path MTU (when one is set) or the dynamically computed tunnel MTU, when no admin path MTU is set (the default case).
Oper Path MTU	The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.
Far End addr/Far End	Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.
Delivery	Specifies the type of delivery used by the SDP: GRE or MPLS.
Adm/Admin State	The administrative state of this SDP.
Adv Service MTU	Displays the configured advertise service MTU value (for Epipe services only).
Opr/Oper State	The operational state of this SDP.

Label	Description
I.Lbl/Ingress Label	The label used by the far-end device to send packets to this device in this service by this SDP.
E.Lbl/Egress Label	The label used by this device to send packets to the far-end device in this service by the SDP.
BFD Template	The BFD template name.
BFD-Enabled	The BFD enabled status.
BFD-Encap	The BFD encapsulation type.
BFD Fail Action	The BFD fail action.
BFD Oper State	The BFD operational state.
BFD WaitFor UpTimer	The BFD wait for up timer value.
Last Changed	The date and time of the most recent change to the SDP.
Signaling	Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.
Admin State	The administrative state of the keepalive process.
Oper State	The operational state of the keepalive process.
Hello Time	Specifies how often the SDP echo request messages are transmitted on this SDP.
Max Drop Count	Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.
Hello Msg Len	Specifies the length of the SDP echo request messages transmitted on this SDP.
Hold Down Time	Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.
I. Fwd. Pkts.	Specifies the number of forwarded ingress packets.
I. Dro. Pkts.	Specifies the number of dropped ingress packets.
E. Fwd. Pkts.	Specifies the number of forwarded egress packets.
Associated LSP List	When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.  If the SDP type is GRE, then the following message displays: SDP delivery mechanism is not MPLS.

## sdp

### Syntax

```
sdp sdp-id pw-port [pw-port-id]  
sdp sdp-id pw-port  
sdp sdp-id pw-port [pw-port-id] [ statistics ]  
sdp [consistent | inconsistent | na] egressifs  
sdp sdp-id keep-alive-history  
sdp far-end ip-address | ipv6-address keep-alive-history  
sdp [sdp-id] detail  
sdp far-end ip-address | ipv6-address detail
```

### Context

[\[Tree\]](#) (show>service sdp)

### Full Context

```
show service sdp
```

### Description

This command displays SDP information.

If no optional parameters are specified, a summary SDP output for all SDPs is displayed.

### Parameters

#### *sdp-id*

The SDP ID for which to display information.

**Values** 1 to 17407

**Default** All SDPs

#### *pw-port-id*

Displays the SAP identifier for PW-SAPs.

**Values** 1 to 10239

#### *ip-address*

Displays only SDPs matching with the specified far-end IP address.

**Default** SDPs with any far-end IP address

#### **detail**

Displays detailed SDP information.

**Default** SDP summary output

### keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

**Default** SDP summary output

### Platforms

All

### Output

The following output is an example of service SDP information.

### Output Example

```

sdp far-end {ip-address | ipv6-address} [detail]
```

### Context

[\[Tree\]](#) (show>service sdp)

### Full Context

```
show service sdp
```

### Description

This command displays information for the SDPs associated with the service.  
If no optional parameters are specified, a summary of all associated SDPs is displayed.

### Parameters

#### *sdp-id*

Specifies the SDP ID for which to display information.

**Values** 1 to 17407

**Default** All SDPs.

#### *pw-port-id*

Specifies the pseudo-wire port identifier.

**Values** 1 to 10239

#### **statistics**

Displays SDP statistics information.

**consistent**

Indicates that the network-domains for all the egress network interfaces that can carry traffic on this SDP are consistent.

**inconsistent**

Indicates that the network-domain for one or more egress network interfaces that can carry traffic on this SDP are inconsistent.

**na**

Indicates that there is no egress network interface that can carry traffic on this SDP.

**egressifs**

Indicates whether all the egress network interfaces that can carry traffic on this SDP are associated with the network-domain configured on this SDP.

**ip-address | ipv6-address**

Displays only SDPs matching with the specified far-end IP address up to 64 characters.

**Default** SDPs with any far-end IP address.

**keep-alive-history**

Displays the last fifty SDP keepalive events for the SDP.

**Default** SDP summary output.

**detail**

Displays detailed SDP information.

**Default** SDP summary output.

**Platforms**

All

**Output**

The following output is an example of SDP information, and [Table 481: Output fields: service SDP port](#) describes the output fields.

**Output Example**

```
*A:ALA-12>config>service# show service sdp 1 pw-port

Table 481: Output fields: service SDP port

Label	Description
SDP Id	The SDP identifier.
Adm MTU	Specifies the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.
Opr MTU	Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.
IP address	Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.
Adm	Admin State — Specifies the administrative state of the SDP.
Opr	Oper State — Specifies the operational state of the SDP.
Deliver	Specifies the type of delivery used by the SDP: GRE or MPLS.
Flags	Specifies the conditions that affect the operating status of this SDP.

Label	Description
Signal Signaling	Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.
Last Status Change	Specifies the time of the most recent operating status change to this SDP.

## sdp

### Syntax

```
sdp sdp-id pw-port [pw-port-id]  
sdp sdp-id pw-port  
sdp sdp-id pw-port pw-port-id [statistics]  
sdp [consistent | inconsistent | na] egressifs  
sdp sdp-id keep-alive-history  
sdp far-end {ip-address | ipv6-address} keep-alive-history  
sdp [sdp-id] [detail]  
sdp far-end {ip-address | ipv6-address} [detail]
```

### Context

[\[Tree\]](#) (show>service sdp)

### Full Context

```
show service sdp
```

### Description

This command displays information for the SDPs associated with the service.  
If no optional parameters are specified, a summary of all associated SDPs is displayed.

### Parameters

#### *sdp-id*

Specifies the SDP ID for which to display information.

**Values** 1 to 17407

**Default** All SDPs.

#### *pw-port-id*

Specifies the pseudo-wire port identifier.

**Values** 1 to 10239

**statistics**

Displays SDP statistics information.

**consistent**

Indicates that the network-domains for all the egress network interfaces that can carry traffic on this SDP are consistent.

**inconsistent**

Indicates that the network-domain for one or more egress network interfaces that can carry traffic on this SDP are inconsistent.

**na**

Indicates that there is no egress network interface that can carry traffic on this SDP.

**egressifs**

Indicates whether all the egress network interfaces that can carry traffic on this SDP are associated with the network-domain configured on this SDP.

**ip-address | ipv6-address**

Displays only SDPs matching with the specified far-end IP address. 64 characters maximum.

**Default** SDPs with any far-end IP address.

**keep-alive-history**

Displays the last fifty SDP keepalive events for the SDP.

**Default** SDP summary output.

**detail**

Displays detailed SDP information.

**Default** SDP summary output.

**Platforms**

All

**Output**

The following output is an example of SDP information.

**Output Example**

```

Table 482: Output fields: service SDP

Label	Description
SDP Id	The SDP identifier.
Adm MTU	Specifies the largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.
Opr MTU	Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.
IP address	Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.
Adm	Admin State — Specifies the state of the SDP.
Opr	Oper State — Specifies the operating state of the SDP.
Flags	Specifies all the conditions that affect the operating status of this SDP.
Signal	Signaling — Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.
Last Status Change	Specifies the time of the most recent operating status change to this SDP.
Last Mgmt Change	Specifies the time of the most recent management-initiated change to this SDP.
Number of SDPs	Specifies the total number of SDPs displayed according to the criteria specified.
Hello Time	Specifies how often the SDP echo request messages are transmitted on this SDP.
Deliver	Delivered — Specifies the type of delivery used by the SDP: GRE or MPLS.
Number of SDPs	Specifies the total number of SDPs displayed according to the criteria specified.
Hello Time	Specifies how often the SDP echo request messages are transmitted on this SDP.
Hello Msg Len	Specifies the length of the SDP echo request messages transmitted on this SDP.

Label	Description
Hello Timeout	Specifies the number of seconds to wait for an SDP echo response message before declaring a timeout.
Unmatched Replies	Specifies the number of SDP unmatched message replies.
Max Drop Count	Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.
Hold Down Time	Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.
TX Hello Msgs	Specifies the number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared.
Rx Hello Msgs	Specifies the number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared.
Associated LSP List	When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.  If the SDP type is GRE, then the following message displays: SDP delivery mechanism is not MPLS.

## sdp

### Syntax

```

sdp sdp-id pw-port [pw-port-id] [statistics]
sdp [consistent | inconsistent | na] egressifs
sdp sdp-id keep-alive-history
sdp far-end ip-address keep-alive-history
sdp [sdp-id] [detail]
sdp far-end ip-address [detail]
    
```

### Context

[\[Tree\]](#) (show>service sdp)

### Full Context

```
show service sdp
```

### Description

This command displays SDP information.

If no optional parameters are specified, a summary SDP output for all SDPs is displayed.

## Parameters

### *sdp-id*

The SDP ID for which to display information.

**Default** All SDPs.

**Values** 1 to 17407

### *far-end ip-address*

Displays only SDPs matching with the specified far-end IP address.

### *detail*

Displays detailed SDP information.

### *keep-alive-history*

Displays the last fifty SDP keepalive events for the SDP.

### *pw-port pw-port-id*

Displays the SAP identifier for PW-SAPs.

## Platforms

All

## Output

The following output is an example of SDP information.

[Table 483: Output fields: service SDP](#) describes the **show service SDP** output fields.

### Output Example

```
*A:Dut-D# show service id 1 sdp 17407:4294967294 detail

Table 483: Output fields: service SDP

Label	Description
SDP Id	Displays the SDP identifier.
Description	Displays a text string describing the SDP.
Admin Path MTU	Displays the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented. The default value of zero indicates that the path MTU should be computed dynamically from the corresponding MTU of the tunnel.
Opr Path MTU	Displays the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented. In order to be able to bind this SDP to a given service, the value of this object minus the control word size (if applicable) must be equal to or larger than the MTU of the service, as defined by its service MTU.
Far End	Displays the far end IP address.
Local End	Displays the local end IP address.
Delivery	Displays the type of delivery used by the SDP: GRE or MPLS.
IP address	Displays the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.
Adm Admin State	Displays the desired state of the SDP.
Opr Oper State	Displays the operating state of the SDP.
Flags	Displays all the conditions that affect the operating status of this SDP.
Signal Signaling	Displays the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.
Last Status Change	Displays the time of the most recent operating status change to this SDP.
Adv. MTU Over	Specifies whether the advertised MTU of a VLL spoke SDP bind includes the 14-byte Layer 2 header.
Last Mgmt Change	Displays the time of the most recent management-initiated change to this SDP.
KeepAlive Information	Displays Keepalive information.
Hello Time	Displays how often the SDP echo request messages are transmitted on this SDP.

Label	Description
Hello Msg Len	Displays the length of the SDP echo request messages transmitted on this SDP.
Hello Timeout	Displays the number of seconds to wait for an SDP echo response message before declaring a timeout.
Unmatched Replies	Displays the number of SDP unmatched message replies timer expired.
Max Drop Count	The maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.
Hold Down Time	The amount of time to wait before the keepalive operating status is eligible to enter the alive state.
TX Hello Msgs	The number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared.
Rx Hello Msgs	The number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared.
Associated LSP List	When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.  If the SDP type is GRE, the following message displays: SDP Delivery Mechanism is not MPLS.
Lsp Name	Displays the LSP name.
Time Since Last Transaction	Displays the time of the last transaction.
Signaling	Displays the signaling type.
Collect Stats	Specifies whether the agent collects accounting statistics for this SDP. When the value is true the agent collects accounting statistics on this SDP.
VLAN VC Etype	Displays the VLAN VC type.
BW Booking Factor	Displays the value used to calculate the max SDP available bandwidth. The value specifies the percentage of the SDP max available bandwidth for VLL call admission. When the value of is set to zero (0), no new VLL spoke SDP bindings with non-zero bandwidth are permitted with this SDP. Overbooking, >100% is allowed.
PBB Etype	Displays the Ethertype used in frames sent out on this SDP when specified as <b>vlan</b> for Provider Backbone Bridging frames.
Oper Max BW (kb/s)	Displays the operational bandwidth in kilobits per seconds (kb/s) available for this SDP. The value is determined by the sum of the bandwidth of all the RSVP LSPs used by the SDP.

Label	Description
Avail BW (kb/s)	Displays the bandwidth that is still free for booking by the SDP bindings on the SDP.
Net-Domain	Displays the network-domain name configured on this SDP. The default value of this object is the default network-domain.
Egr Interface	Indicates whether all the egress network interfaces that can carry traffic on this SDP are associated with the network-domain configured on this SDP.  not applicable: Indicates that there is no egress network interface that can carry traffic on this SDP.  consistent: Indicates that the network-domains for all the egress network interfaces that can carry traffic on this SDP are consistent.  inconsistent: Indicates that the network-domain for one or more egress network interfaces that can carry traffic on this SDP are inconsistent.
Revert Time	Specifies the time to wait before reverting back from LDP to the configured LSPs, after having failed over to LDP.
Revert Count Down	Indicates the timer countdown before reverting back from LDP on this SDP. The timer countdown begins after the first configured LSP becomes active.
Flags	Displays all the conditions that affect the operating status of this SDP.
Class Forwarding	Indicates the admin state of class-based forwarding on this SDP. When the value is true, class-based forwarding is enabled.
EnforceDSTELspFc	Specifies whether service manager must validate with RSVP the support of the FC by the LSP.
Default LSP	Specifies the LSP ID that is used as a default when class-based forwarding is enabled on this SDP. This object must be set when enabling class-based forwarding.
Multicast LSP	Displays the LSP ID that all multicast traffic will be forwarded on when class-based forwarding is enabled on this SDP. When this object has its default value, multicast traffic will be forwarded on an LSP according to its forwarding class mapping.
Number of SDPs	Displays the metric to be used within the Tunnel Table Manager for decision making purposes. When multiple SDPs going to the same destination exist, this value is used as a tie-breaker by Tunnel Table Manager users like MP-BGP to select route with lower value.

## sdp

### Syntax

**sdp** *sdp-id* **keep-alive**

**sdp** *sdp-id* **pw-port** *sdp-id*

### Context

[\[Tree\]](#) (clear>service>statistics sdp)

### Full Context

clear service statistics sdp

### Description

This command clears keep-alive statistics associated with the SDP ID.

### Parameters

**sdp-id**

The SDP ID for which to clear keepalive statistics.

**Values** 1 to 32767

**keep-alive**

Clears keep-alive information associated with the SDP ID. The keep-alive history is not cleared.

### Platforms

All

sdp

### Syntax

**sdp** [*sdp-id*[:*vc-id*]] [ **level** *leve*] [**primary-vlan-enabled** *vlan-id*]

### Context

[\[Tree\]](#) (show>eth-cfm>mip-instantiation sdp)

### Full Context

show eth-cfm mip-instantiation sdp

### Description

This command displays MIP creation information for SDP bindings.

### Parameters

**sdp-id**

Specifies the value identifying the SDP.

**Values** 1 to 32767

***vc-id***

Specifies the value identifying the virtual circuit identifier.

**Values** 1 to 4294967295

***level***

Displays the MD level of the maintenance point.

**Values** 0 to 7

***vlan-id***

Specifies the Dot1Q VLAN ID.

**Values** T0 to 4095, all

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**sdp**

**Syntax**

**sdp** *sdp-id:vc-id* [**test-service-id** *service-id*] **start**

**sdp** *sdp-id:vc-id* **stop**

**Context**

**[Tree]** (tools>perform>service>id>admin-lock>pw sdp)

**Full Context**

tools perform service id admin-lock pw sdp

**Description**

This command specifies the spoke SDP binding to which an administrative lock will be applied for the MPLS-TP pseudowire. The administrative lock can be placed on a spoke SDP that is bound to a VLL SAP, another spoke SDP or a VPLS interface. Once the pseudowire is locked it may be put into loopback mode. The command must be executed at both ends of the pseudowire or MS-PW represented by the spoke SDP. Test traffic can then be injected using a configured test SAP on an Epipe, Apipe or Cpipe.

**Parameters**

***sdp-id:vc-id***

Specifies the SDP-ID and VC-ID.

**Values** sdp-id 1 to 17407]  
vc-id1 to 4294967295]

***test-service-id***

Keyword that specifies the ID of a test service (SAP) to which the SDP is bound.

## Platforms

All

## sdp

## Syntax

**sdp** *sdp-id:vc-id* **start** *mode* [**mac-swap**] [**mac** *ieee-address*] [**all**]

**sdp** *sdp-id:vc-id* **stop**

## Context

[\[Tree\]](#) (tools>perform>service>id>loopback>eth sdp)

## Full Context

tools perform service id loopback eth sdp

## Description

This command places the specific MPLS SDP binding in loopback mode for reflecting Ethernet traffic back in the direction of the received stream. This is only applicable to MPLS SDP Bindings.

## Parameters

### *sdp-id:vc-id*

Specifies the SDP ID and VC-ID.

**Values** sdp-id 1 to 17407  
vc-id1 to 4294967295

### **start mode**

Specifies the loopback in relation to the MPLS SDP Binding.

**Values** **ingress** — Traffic arriving at the sap-ingress will be reflected back out the same **sap**.  
**egress** — Traffic arriving at the sap-egress will be reflected back into the service in the direction of the original source.

### **stop**

Keyword that removes the MPLS SD-binding from loopback mode.

### **mac-swap**

Enable source address and destination address swapping for the reflected packets when the arriving packet is unicast. Any broadcast and multicast packets arriving on a looped point will be dropped.

### **mac ieee-address**

Optionally configure the source MAC address used in the reflected packet when the arriving packet is a broadcast or multicast. This does not apply to arriving unicast packets.

**Values** 6-byte unicast mac-address in the form

XX:XX:XX:XX:XX:XX or XX-XX-XX-XX-XX-XX

### all

Configured `ieee-address` is used as the source address for all reflected packets regardless of the arriving destination.

### mac-swap

No swapping of MAC addresses are performed without specifying this option and any non-unicast destined packets will not be reflected back to the source.

## Platforms

All

## sdp

## Syntax

**sdp** *sdp-id:vc-id* {**start** | **stop**}

## Context

[\[Tree\]](#) (tools>perform>service>id>loopback>pw sdp)

## Full Context

tools perform service id loopback pw sdp

## Description

This command places or removes the specified MPLS-TP SDP binding in loopback mode for the purpose of an MPLS-TP pseudowire test service.

### Note:

The loopback is created at the PW level so everything under the PW label is looped back. It is recommended to configure an administrative lock for the MPLS-TP pseudowire for the specified test service prior to configuring the loopback.

## Parameters

### *sdp-id:vc-id*

Specifies the SDP-ID and VC-ID.

**Values**    sdp-id 1 to 17407  
              vc-id1 to 4294967295

### start

Keyword that places the specified MPLS-TP PW in loopback mode for the purpose of an MPLS\_TP PW test service.

### stop

Keyword that removes the SDP binding from the loopback mode for the MPLS-TP pseudowire test service.

## Platforms

All

## sdp

## Syntax

```
sdp {sdp-id [:vc-id] | far-end ip-address} [interval seconds] [repeat repeat] [absolute | rate]
```

## Context

[\[Tree\]](#) (monitor>service>id sdp)

## Full Context

monitor service id sdp

## Description

This command monitors statistics for an SDP binding associated with this service.

## Parameters

### *sdp-id*

Specifies the SDP identifier.

**Values** sdp-id: 1 to 17407  
vc-id: 1 to 4294967295

### *ip-address*

Specifies the system address of the far-end router for the SDP in dotted decimal notation. The string may be up to 32 characters.

### *seconds*

Configures the interval for each display, in seconds.

**Values** 11 to 60

**Default** 11

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays absolute rate-per-second value for each statistic.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

## Platforms

All

## Output

## 26.29 sdp-using

### sdp-using

#### Syntax

**sdp-using etree**

**sdp-using node-id** *node-id* [**global-id** *global-id*]

**sdp-using aarp** *aarpID*

**sdp-using app-profile** *app-profile-name*

```
sdp-using far-end {ip-address | ipv6-address}  
sdp-using [sdp-id[:vc-id]]  
sdp-using transit-policy ip transit-ip-policy  
sdp-using transit-policy prefix transit-prefix-policy
```

## Context

[\[Tree\]](#) (show>service sdp-using)

## Full Context

```
show service sdp-using
```

## Description

This command displays services using SDP or far-end address options.

## Parameters

### *node-id*

Specifies the node ID.

**Values** a.b.c.d, 1 to 4294967295

### *global-id*

Specifies the global ID.

**Values** 1 to 4294967295

### *aarpID*

Specifies the AARP instance ID.

**Values** 1 to 65535

### *app-profile-name*

32 characters max.

### *sdp-id*

Displays only services bound to the specified SDP ID.

**Values** 1 to 17407

### *vc-id*

The virtual circuit identifier.

**Values** 1 to 4294967295

### *ip-address*

Displays only services matching with the specified far-end IP address. 64 characters maximum.

**Default** Services with any far-end IP address.

**ipv6-address**

Displays only services matching with the specified far-end IPv6 address. 64 characters maximum.

**transit-ip-policy**

Specifies a transit IP policy ID.

**Values** 1 to 65535

**transit-prefix-policy**

Specifies a transit prefix policy ID.

**Values** 1 to 65535

**Platforms**

All

**Output**

The following output is an example of SDP using information, and [Table 484: Output fields: service SDP using](#) describes the output fields.

```

## Context

[\[Tree\]](#) (show>service>id segment-routing-v6)

## Full Context

```
show service id segment-routing-v6
```

## Description

This command displays SRv6 service information.

## Parameters

### *instance*

Specifies the instance ID for display.

**Values** 1 to 2

### *locator-name*

Specifies the locator name for display, up to 64 characters.

### **end-dt4**

Displays the End.DT4 function associated with the SRv6 instance in the service.

### **end-dt6**

Displays the End.DT6 function associated with the SRv6 instance in the service.

### **end-dt46**

Displays the End.DT46 function associated with the SRv6 instance in the service.

### **end-dx2**

Displays the End.DX2 function associated with the SRv6 instance in the service.

### **end-dt2u**

Displays the End.DT2U function associated with the SRv6 instance in the service.

### **end-dt2m**

Displays the End.DT2M function associated with the SRv6 instance in the service.

### **destinations**

Specifies that all destinations for display are included.

### *esi*

Specifies a 10-byte ESI by which to filter the displayed information. For example, ESI-0 | ESI-MAX or 00-11-22-33-44-55-66-77-88-99 with any of these separators ('-',':',' ').

### *ms-locator-name*

Specifies the micro-segment locator name for display, up to 64 characters.

### **udt4**

Displays the uDT4 function associated with the SRv6 instance in the service.

**udt6**

Displays the uDT6 function associated with the SRv6 instance in the service.

**udt46**

Displays the uDT46 function associated with the SRv6 instance in the service.

**udx2**

Displays the uDX2 function associated with the SRv6 instance in the service.

**udt2u**

Displays the uDT2U function associated with the SRv6 instance in the service.

**udt2m**

Displays the uDT2M function associated with the SRv6 instance in the service.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

**Output**

**Output Example**

[Table 485: Output fields: SRv6 instance](#) describes the SRv6 instance field descriptions.

Use the following command to display SRv6 instance and destination information.

```
show service id "bd-1900-srv6" segment-routing-v6 instance 1 destinations
```

```
=====

Table 485: Output fields: SRv6 instance

Field	Description
Locator	The locator name
Type	The type
Function	The function
SID	The segment ID
Status	The status
Instance	The instance
Mcast	The multicast value
TEP Address	The tunnel endpoint IP address
Segment Id	The segment ID
L2 PBR	The layer 2 policy based routing value
EvpnStatic	The EVPN static value
SupBcasDom	The Sup BCast Domain value
Num MACs	The number of MACs
Number of TEP, SID	The total number of TEP and SIDs

Field	Description
No Matching Entries	The number of matching entries

## 26.37 selective-fib-log

### selective-fib-log

#### Syntax

**selective-fib-log**

#### Context

**[Tree]** (tools>dump>router selective-fib-log)

#### Full Context

tools dump router selective-fib-log

#### Description

This command configures the dump tools for selective FIB log information for a specific IOM.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

#### Output

The following output is an example of selective FIB log information.

#### Output Example

```
*A:Dut-C# /tools dump router selective-fib-log
1 : 2020/01/08 13:32:59.100 : Creating Base router
2 : 2020/01/08 13:32:59.101 : Adding port system to if=system Base router
2 : 2020/01/08 13:32:59.103 : Creating management router
3 : 2020/01/08 13:32:59.103 : Creating vpls-management instance
4 : 2020/01/08 13:32:59.103 : Adding port A/1 to if=management management router
4 : 2020/01/08 13:40:55.404 : Adding port 1/1/5 to if=ip-10.10.5.5 Base router
4 : 2020/01/08 13:40:55.407 : Adding port 2/1/6 to if=ip-10.10.7.7 Base router
4 : 2020/01/08 13:40:55.411 : Adding port 2/1/2 to if=ip-10.10.11.11 Base router
4 : 2020/01/08 13:40:55.414 : Adding port 2/1/2 to if=ip-10.10.13.13 Base router
4 : 2020/01/08 13:40:55.417 : Adding port 2/1/2 to if=ip-10.10.15.15 Base router
4 : 2020/01/08 13:40:55.420 : Adding port 1/1/1 to if=ip-10.10.17.18 Base router
4 : 2020/01/08 13:40:55.423 : Adding port 1/1/3 to if=ip-10.10.21.22 Base router
4 : 2020/01/08 13:40:55.427 : Adding port 2/1/3 to if=ip-10.10.23.24 Base router
4 : 2020/01/08 13:40:55.430 : Adding port 2/1/4 to if=ip-10.10.25.26 Base router
4 : 2020/01/08 13:40:55.433 : Adding port 1/1/2 to if=ip-10.10.27.28 Base router
4 : 2020/01/08 13:40:55.436 : Adding port 2/1/1 to if=ip-10.10.31.31 Base router
4 : 2020/01/08 13:40:55.440 : Adding port 3/1/3 to if=ip-10.10.39.40 Base router
4 : 2020/01/08 13:40:55.443 : Adding port 3/1/1 to if=ip-10.10.43.44 Base router
4 : 2020/01/08 13:40:55.446 : Adding port 3/1/2 to if=ip-10.10.45.45 Base router
4 : 2020/01/08 13:40:55.449 : Adding port 2/2/2 to if=ip-10.10.47.47 Base router
```

```
4 : 2020/01/08 13:40:55.453 : Adding port 2/2/1 to if=ip-10.10.49.49 Base router
4 : 2020/01/08 13:40:55.456 : Adding port 1/1/4 to if=ip-10.10.61.61 Base router
4 : 2020/01/08 13:40:55.459 : Adding port 2/1/5 to if=ip-10.10.63.63 Base router
4 : 2020/01/08 13:40:55.465 : Creating router 10105151

## 26.38 send-force-renew

### send-force-renew

#### Syntax

**send-force-renew** *ip-address*

#### Context

**[Tree]** (tools>perform>router>dhcp>server send-force-renew)

### Full Context

tools perform router dhcp local-dhcp-server send-force-renew

### Description

This command sends a DHCP FORCERENEW message on behalf of the DHCP server to the DHCP client with specified IP address. A DHCP lease with the specified IP address must exist in the DHCP server.

### Parameters

#### *ip-address*

Specifies the DHCP client's IP address in dotted notation a.b.c.d.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 26.39 sensor-group

### sensor-group

### Syntax

**sensor-group** *name*

**sensor-group**

### Context

[\[Tree\]](#) (show>system>telemetry sensor-group)

### Full Context

show system telemetry sensor-group

### Description

This command displays the sensor group information.

### Parameters

#### *name*

Specifies the sensor group name, up to 32 characters.

### Platforms

All

### Output

The following output is an example of telemetry sensor group information and [Table 486: Output fields: sensor group](#) describes the output fields.

### Output Example

```
# show system telemetry sensor-group
=====
Telemetry sensor-groups
=====
Name                                     Valid   Invalid
                                     paths   paths
-----
miro                                     1       0
-----
No. of Telemetry sensor-groups: 1
=====
```

Table 486: Output fields: sensor group

Label	Description
Name	Displays the name of the telemetry sensor group name.
Valid paths	Displays the number of valid sensor group paths.
Invalid paths	Displays the number of invalid sensor group paths.
No. of Telemetry sensor-groups	Displays the total number of telemetry sensor groups.

## 26.40 server

server

### Syntax

**server all**

**server capability**

**server prefix** *ip-prefix/prefix-length*

**server**

### Context

**[Tree]** (show>test-oam>twamp server)

### Full Context

show test-oam twamp server

### Description

This command displays TWAMP server information.

## Parameters

### all

Displays all server information.

### ip-prefix/prefix-length

Specifies the IP address prefix of the TWAMP server.

#### Values

ipv4-address:	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D

### capability

Displays the modes referenced or supported by the TWAMP server, with an RFC reference where those modes are defined.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of TWAMP server information.

### Output Example

```

Table 487: Output fields: server statistics describes server stats show command output fields.

Table 487: Output fields: server statistics

Field	Description
RX Discover Packets	The number of discover packets received by the DHCP server instance
Rx Request Packets	The number of request packets received by the DHCP server instance.
Rx Release Packets	The number of released packets received by the DHCP server instance
Rx Decline Packets	The number of declined packets received by the DHCP server instance
Rx Inform Packets	The number of inform packets received by the DHCP server instance

Field	Description
Tx Offer Packets	The number of offer packets sent by the DHCP server instance
Tx Ack Packets	The number of DHCP ACK packets sent by the DHCP server instance
Tx Nak Packets	The number of DHCP NAK packets sent by the DHCP server instance
Tx Forcerenew Packets	The number of DHCP force renew packets sent by the server instance
Client Ignored Offers	The number of DHCP offer packets sent by the DHCP server instance that were ignored by clients
Leases Timed Out	The number of leases timed out
Dropped Bad Packet	The number of dropped of DHCP packets received that were corrupt
Dropped Invalid Type	The number of DHCP packets received that had an invalid message type
Dropped No User Database	The number of DHCP packets dropped because the value of this server instance is not equal to the default value and a local user database with that name could not be found
Dropped Unknown Host	The number of DHCP packets dropped from hosts which were not found in the user database
Dropped User Not Allowed	The number of DHCP packets dropped from hosts which are found in the user database, but which have no address or pool specified
Dropped Lease Not Ready	The number of DHCP packets dropped by the server instance before the lease database was ready
Dropped Lease Not Found	The number of DHCP packets dropped by the server instance because no (valid) lease was found
Dropped Not Serving Pool	The number of DHCP packets dropped by the server instance because there were no more free addresses in the pool
Dropped Invalid User	The number of DHCP packets dropped by the server instance because the MAC address of the sender or the option 82 didn't match the host lease state
Dropped Overload	The number of DHCP packets dropped by the server instance because they were received more than the server instance can handle

Field	Description
Dropped Persistence Overload	The number of DHCP packets dropped by the server instance because they were received in more than the DHCP persistence system can handle. If this occurs, only releases and declines are still processed.
Dropped Generic Error	The number of DHCP packets dropped by the server instance because of a generic error
Dropped Destined To Other	The number of DHCP requests dropped by the server instance because the (broadcast) request was not destined to this server
Dropped Address Unavailable	The number of DHCP requests dropped by the server instance because the requested address is not available
Dropped Max Leases Reached	The number of DHCP packets dropped by the server instance because the maximum number of leases was reached
Dropped Server Shutdown	The number of DHCP packets dropped by the server instance during server instance shutdown
Dropped No Subnet for Fixed IP	The number of DHCP packets dropped by the server instance for user-db hosts with a fixed address because the subnet to which the address belongs is not configured

## server-stats

### Syntax

**server-stats**

### Context

[\[Tree\]](#) (clear>router>dhcp6>server server-stats)

[\[Tree\]](#) (clear>router>dhcp>server server-stats)

### Full Context

clear router dhcp6 local-dhcp-server server-stats

clear router dhcp local-dhcp-server server-stats

### Description

This command clears all local DHCP or DHCPv6server statistics.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 27 s Commands – Part II

### 27.1 server-tls-profile

#### server-tls-profile

##### Syntax

**server-tls-profile** [*server-tls-profile*]  
**server-tls-profile** *server-tls-profile* **association**

##### Context

[\[Tree\]](#) (show>system>security>tls server-tls-profile)

##### Full Context

show system security tls server-tls-profile

##### Description

This command displays TLS server profile information.

##### Parameters

###### ***server-tls-profile***

Specifies the name of a TLS server profile for which to display information, up to 32 characters.

##### Platforms

All

### 27.2 servers

#### servers

##### Syntax

**servers**  
**servers all**

## Context

[\[Tree\]](#) (show>router>dhcp servers)

[\[Tree\]](#) (show>router>dhcp6 servers)

## Full Context

show router dhcp servers

show router dhcp6 servers

## Description

This command lists the local DHCP or DHCP6 servers.

## Parameters

**all**

Displays a complete list of local DHCP or DHCP6 servers.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of local DHCP or DHCP6 server information.

### Output Example

```
*A:ALA-49>show>router>dhcp# servers
=====
Overview of DHCP Servers
=====
Active Leases:      0
Maximum Leases:    159744

Router              Server                               Admin State
-----
Router: Base        base_router_dhcp_server             outOfService
Service: 3          s1                                   inService
=====

## 27.3 service

service

### Syntax

service

### Context

[\[Tree\]](#) (clear service)

### Full Context

clear service

### Description

Commands in this context clear services commands.

### Platforms

All

service

### Syntax

service

### Context

[\[Tree\]](#) (show service)

### Full Context

show service

### Description

Commands in this context display services related information.

### Platforms

All

## service

### Syntax

**service**

### Context

[\[Tree\]](#) (tools>perform service)

[\[Tree\]](#) (tools>dump service)

### Full Context

tools perform service

tools dump service

### Description

Commands in this context configure and view tools for service debugging.

### Platforms

All

## service

### Syntax

**service** *service-id*

### Context

[\[Tree\]](#) (show>ipsec service)

### Full Context

show ipsec service

### Description

This command displays service specific IPsec configuration.

### Parameters

*service-id*

The VPRN service ID or service name.

**Values**    *service-id*: 1 to 2147483647  
              *svc-name*: up to 64 characters maximum

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of the **service** command.

```
show ipsec service 100
```

## Output Example

```
=====
Service-specific IPsec configurations
=====
Reverse Route Override: any-idi
=====
```

## service

### Syntax

**service**

### Context

[\[Tree\]](#) (monitor service)

### Full Context

monitor service

### Description

Commands in this context configure criteria to monitor specific service SAP criteria.

## Platforms

All

## service

### Syntax

**service** *service-id* [**security-policy-id** *security-policy-id*]

### Context

[\[Tree\]](#) (show>ipsec>security-policy service)

### Full Context

show ipsec security-policy service

## Description

This command displays service security policy information.

## Parameters

### *service-id*

Specifies the service ID.

**Values**    *service-id*: 1 to 2148278386  
              *svc-name*: Up to 64 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 27.4 service-activation-testhead

### service-activation-testhead

## Syntax

**service-activation-testhead**

## Context

[\[Tree\]](#) (show>test-oam service-activation-testhead)

## Full Context

show test-oam service-activation-testhead

## Description

Commands in this context display service activation testhead information.

The **service-test** command shows the results and configuration for one Y.1564 service activation test run.

The **service-tests** command shows a list of all available Y.1564 service activation tests.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

### service-activation-testhead

## Syntax

**service-activation-testhead service-test all**

**service-activation-testhead service-test *name* [ run *run-number* ]**

## Context

[\[Tree\]](#) (clear>test-oam service-activation-testhead)

## Full Context

clear test-oam service-activation-testhead

## Description

This command clears the results of all previous executions for the specified service test.

## Parameters

### all

Keyword used to specify the deletion of all reports.

### name

Specifies the service test name, up to 64 characters, for which to clear results.

### run

Specifies a particular instance of the service test for which to clear results.

**Values** 1 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 27.5 service-name-using

### service-name-using

## Syntax

service-name-using [detail]

## Context

[\[Tree\]](#) (show>service service-name-using)

## Full Context

show service service-name-using

## Description

This command displays the services defined on the system, ordered by name.

## Parameters

### detail

This parameter displays all of the services configured on the system along with their descriptions and administrative and operational states.

## Platforms

All

## Output

The following shows an example of **service name-using** information.

[Table 488: Output fields: service name using](#) describes the show command output fields.

### Output Example

```
*A:PE-1# show service service-name-using

Total BIER Service Reserved Labels	Displays the total BIER service reserved labels

## 27.7 service-test

### service-test

#### Syntax

**service-test** *service-test-name* **run** *run-number*

#### Context

[\[Tree\]](#) (show>test-oam>sath service-test)

#### Full Context

show test-oam service-activation-testhead service-test

#### Description

This command displays the results and configuration for the specified Y.1564 service activation test run.

## Parameters

### **service-test-name**

Specifies the service test name, up to 64 characters.

### **run-number**

Specifies a particular instance of the service test for which to display results.

**Values** 1 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## Output

The following outputs are examples of service test configuration information, and [Table 490: Output fields: service test](#) describes the output fields:

Table 490: Output fields: service test

Label	Description
Description	Displays the service test or service stream description
Oper State	running — the specified service test or service stream is running  passed — the specified service test or service stream is complete and has passed
Start Time	Displays the date and time that the specified service test or service stream was started
End Time	Displays the date and time that the specified service test or service stream was completed
Stream Run Type	Sequential — the streams are run consecutively Parallel — the streams are run in parallel
Acct Policy	Displays the accounting policy
Acct Policy Status	Displays the accounting policy status
Completion Notif'n	disabled — the service test completion notification is disabled  enabled — the service test completion notification is enabled
Source MEP	Displays the source MEP
MEP Domain	Displays the MEP domain
MEP Assoc.	Displays MEP associations

Label	Description
Source SAP	Displays the source SAP
Source MAC	Displays the source MAC address
Dest MAC	Displays the destination MAC address
Pattern (Dec)	Displays the data pattern, in decimal notation
Pattern (Hex)	Displays the data pattern, in hexadecimal notation
C-Tag Dot1p	Displays the C-tag dot1p priority value for the VLAN
C-Tag DEI	true — the C-tag DEI is enabled false — the C-tag DEI is disabled
S-Tag Dot1p	Displays the S-tag dot1p priority value for the VLAN
S-Tag DEI	true — the S-tag DEI is enabled false — the S-tag DEI is disabled
Frm Size Tmpl	Displays the frame size template, in bytes
Frm Sequence	Displays the frame sequence
Frame Size a	Displays the frame size, in bytes, for template a
Frame Size b	Displays the frame size, in bytes, for template b
Frame Size c	Displays the frame size, in bytes, for template c
Frame Size d	Displays the frame size, in bytes, for template d
Frame Size e	Displays the frame size, in bytes, for template e
Frame Size f	Displays the frame size, in bytes, for template f
Frame Size g	Displays the frame size, in bytes, for template g
Frame Size h	Displays the frame size, in bytes, for template h
Frame Size u	Displays the frame size, in bytes, for template u
Config Tx Cir	Displays the transmitted CIR configured
Config Tx Pir	Displays the transmitted PIR configured
Acp Crit Tmpl.	Displays the acceptance criteria template
Test Types	Displays the configured test type
Compleat Notif	enabled — the stream completion trap is enabled disabled — the stream completion trap is disabled

Label	Description
Test Duration	Displays the duration, in minutes and seconds, of the test for the service streams
Time Left	Displays the amount of time left to the test for the service stream
Frms Injected	Displays the total number of frames injected
Frms Received	Displays the total number of frames received
Min Delay (us)	Displays the minimum delay
Max Delay (us)	Displays the maximum delay
Avg. Delay (us)	Displays the average delay
Min Delay Var. (us)	Displays the minimum delay variation
Max Delay Var. (us)	Displays the maximum delay variation
Avg. Delay Var. (us)	Displays the average delay variation
M-factor (kbps)	Displays the M-factor, in kb/s
Criteria	thruput (kbps) — the throughput, in kb/s FLR — the frame loss ratio (FLR) Delay (us) — the delay time Delay Var. (us) — the delay variation
Acceptable	Displays the allowed values for the criteria
Configured	Displays the configured values for the criteria
M-factor	Displays the m-factor for the criteria
Measured	Displays the measured values for the criteria
Result	Pass — the test has passed for the specific criteria Fail — the test has failed for the specific criteria

## 27.8 service-tests

### service-tests

#### Syntax

**service-tests** [*service-test-name*]

## Context

**[Tree]** (show>test-oam>sath service-tests)

## Full Context

show test-oam service-activation-testhead service-tests

## Description

This command displays the run summary for one or all Y.1564 service activation tests.

## Parameters

### **service-test-name**

Specifies the service test name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## Output

The following output is an example of service test configuration information, and [Table 491: Output fields: service tests](#) describes the output fields.

### Output example

```
show test-oam service-activation-testhead service-tests

## 27.9 service-using

### service-using

#### Syntax

```
service-using [epipe] [ies] [vpls] [vprn] [ mirror] [apipe] [fpipe] [ipipe] [cpipe] [ etree] [b-vpls] [i-vpls]  
[m-vpls] [ sdp sdp-id] [customer customer-id] [creation creation-origin]
```

#### Context

[\[Tree\]](#) (show>service service-using)

#### Full Context

```
show service service-using
```

#### Description

This command displays the services matching certain usage properties. Not all syntax options are available for each router type.

If no optional parameters are specified, all services defined on the system are displayed.

#### Parameters

##### **epipe**

Displays Epipe services.

##### **ies**

Displays IES services.

##### **vpls**

Displays VPLS services.

##### **vprn**

Displays VPRN services.

##### **mirror**

Displays mirror services.

##### **apipe**

Displays Apipe services.

##### **fpipe**

Displays Fpipe services.

##### **ipipe**

Displays Ipipe services.

##### **cpipe**

Displays Cpipe services.

**etree**

Displays etree services.

**b-vpls**

Specifies the B-component instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature. It represents the multi-point tunneling component that multiplexes multiple customer VPNs (ISIDs) together. It is similar to a regular VPLS instance that operates on the backbone MAC addresses.

**i-vpls**

Specifies the I-component instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature. It identifies the specific VPN entity associated to a customer multipoint (E-LAN) service. It is similar to a regular VPLS instance that operates on the customer MAC addresses.

**m-vpls**

Specifies the M-component (managed VPLS) instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature.

**sdp-id**

Displays only services bound to the specified SDP ID.

**Values** 1 to 17407

**Default** Services bound to any SDP ID.

**customer-id**

Displays services only associated with the specified customer ID.

**Values** 1 to 2147483647

**Default** Services associated with any customer.

**creation-origin**

Specifies the method by which the service was created.

**Values** manual, multi-segment-p-w, dyn-script

**Platforms**

All

**Output**

The following output is an example of service using information, and [Table 492: Output fields: service using](#) describes the output fields.

**Output Example**

```
*A:ALA-12# show service service-using customer 10

**services vc-type** *vc-type* **vc-id** *vc-id* [ **detail**] [**service-id** *service-id*] [**session** *ip-addr[label-space]*]

#### Context

[\[Tree\]](#) (show>router>ldp>bindings services)

#### Full Context

show router ldp bindings services

#### Description

This command displays LDP service FEC bindings.

#### Parameters

##### **vc-type** *vc-type*

Displays information about the VC type associated with this service FEC.

ethernet, vlan, mirror, frdpci, atmsdu, atmcell, atmvc, atmvcpc, ipipe, satop-e1, satop-t1, cesopsn, cesopsn-cas

##### **vc-id** *vc-id*

Displays information about the VC ID associated with this service FEC.

##### **saii** *global-id:prefix:ac-id*

Specifies the a SAI (Source Attachment Individual Identifier).

**Values** <number>:<number> | <a.b.c.d>:<number>

##### **taii**

Specifies the TAI ID, up to 256 characters, associated with this service FEC.

##### **svc-fec-type**

Specifies the FEC type.

**Values** fec128, fec129

**agi agi**

Specifies the Attachment Group identifier TLV associated with this service FEC.

**Values** <ip-addr:comm-val> | <2byte-asnumber:ext-comm-val> | <4byte-asnumber:comm-val> ip-addr - a.b.c.d comm-val - [0 to 65535] 2byte-asnumber - [1 to 65535] ext-comm-val - [0 to 4294967295] 4byte-asnumber - [1 to 4294967295] null - means all value is 0

**detail**

Displays detailed information.

**service-id**

Specifies the service ID number to display.

**Values** 1 to 2147483647

**svc-fec-type**

Specifies the FEC type.

**Values** fec128, fec129

**session ip-addr**

displays configuration information about LDP sessions.

**label-space**

Specifies the label space identifier that the router is advertising on the interface.

**Values** 0 to 65535

**Platforms**

All

## 27.11 session

### session

**Syntax**

**session** [*user-name user-name*] [ **sub-ppp-type** {oe | ol2tp}] [**interface** *ip-int-name* | *ip-address*] [**inter-dest-id** *intermediate-destination-id*] [**no-inter-dest-id**] [**ip-address** *ip-prefix*[/*prefix-length*]] [**port** *port-id*] [**sap** *sap-id*] [**termination-type** *ppp-session-type*] [**mlppp**] [**steering-profile** *steering-profile*] [**circuit-id** *circuit-id*] [**remote-id** *remote-id*]

**session** [*user-name user-name*] [ **circuit-id** *circuit-id*] [**remote-id** *remote-id*] **detail**

**session** [*user-name user-name*] [ **circuit-id** *circuit-id*] [**remote-id** *remote-id*] **statistics**

## Context

[\[Tree\]](#) (show>service>id>ppp session)

## Full Context

```
show service id ppp session
```

## Description

This command displays PPP session information.

## Parameters

### *user-name*

Displays session information about the PPP user name.

### *sub-ppp-type*

Displays session information about the sub PPP type.

**Values** oe, ol2tp

### *ip-int-name*

Displays session information about the specified interface.

### *ip-address*

Displays session information about the IP address.

### *intermediate-destination-id*

Displays session information about the intermediate destination identifier, up to 32 characters, which is encoded in the identification strings.

### *no-inter-dest-id*

Displays session information about no intermediate destination ID.

### *ip-prefix/prefix-length*

Displays session information about the specified IP address and mask.

### *port-id*

Displays session information about the specified port.

### *sap-id*

Displays session information about the specified SAP.

### *ppp-session-type*

Displays session information about the specified PPP session type.

**Values** local, wholesale-local, retail-local, l2tp

### *mlppp*

Displays session information about MLPPP.

### *steering-profile*

Displays session information about the specified steering profile, up to 32 characters.

### *circuit-id*

Displays session information about the specified circuit ID, up to 256 characters.

**remote-id**

Displays session information about the specified remote ID, up to 256 characters.

**detail**

Displays detailed session information.

**statistics**

Displays PPP session statistics.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of service PPP session information.

**Output Example**

```
show service id 1000 ppp session detail
```

```

Table 493: Output fields: service PPP session describes PPP session field information.

Table 493: Output fields: service PPP session

Field	Description
User-Name	The user name
Description	The description
Up Time	The time of the last modification
Type	The PPP type
Termination	The termination type

Field	Description
IP/L2TP-Id/If-Id	The IP/L2TP or IF ID
MC-Standby	The MC standby
Session Time Left	The time remaining for the session timeout
LCP State	The LCP open/closed state
IPCP State	The IP CP open/closed state
IPv6CP State	The IPv6 CP open/closed state
PPP MTU	The PPP MTU value
PPP Auth-Protocol	The PPP authentication protocol
PPP User-Name	The PPP user name
Subscriber-interface	The subscriber interface name
Group-interface	The group interface name
IP Origin	The IP origin
DNS Origin	The DNS origin
NBNS Origin	The NBNS origin
Subscriber	The subscriber identification string
Sub-Profile-String	The subscriber profile name
SLA-Profile-String	The SLA profile name
SPI group ID	The SPI group ID
ANCP-String	The value of the ancp-string received from either the DHCP or the RADIUS server
Int-Dest-Id	Intermediate destination identifier received from the RADIUS server
App-Profile-String	The application profile string
Category-Map-Name	The value of the category map name received from the RADIUS server
Acct-Session-Id	The accounting session ID
Sap-Session-Index	The sap session index of the PPP session
IP Address	The IP address
Primary DNS	The primary DNS server

Field	Description
Secondary DNS	The secondary DNS server
Primary NBNS	The primary NBNS server
Secondary NBNS	The secondary NBNS server
Address-Pool	The IP address pool used to search for an IP address for this session
IPv6 Prefix	The IPv6 prefix
IPv6 Prefix Origin	The origin of the IPv6 prefix
IPv6 Prefix Pool	The DHCP server pool from which the IPv6 prefix is allocated
IPv6 Del.Pfx.	The IPv6 delegated prefix
IPv6 Del.Pfx. Origin	The origin of the IPv6 delegated prefix
IPv6 Del.Pfx. Pool	The DHCP server pool from which the delegated prefix is allocated
IPv6 Address	The IPv6 address
IPv6 Address Origin	The origin of the IPv6 address
IPv6 Address Pool	The DHCP server pool from which the address is allocated
Primary IPv6 DNS	The primary IPv6 DNS server
Secondary IPv6 DNS	The secondary IPv6 DNS server
Router adv. policy	The router advertisement policy
Ignoring DF bit	The true/false status of ignoring DF bit
Radius sub-if prefix	The RADIUS subscriber interface prefix
Circuit-Id	The circuit ID of the PPP session
Remote-Id	The remote ID of the PPP session
Radius Session-TO	The value to interpret the session timeout VSA from RADIUS
Radius Class 1	The Class attribute returned by the RADIUS server in an Access-Accept message
Radius User-Name	The User-Name attribute returned by the RADIUS server in an Access-Accept message
Logical-Line-Id	The logical line ID

Field	Description
Subscriber Host Limit Overrides and SLA Profile Instance Host Limit Overrides: (only shown when overrides are active)	
ipv4-arp	The total number of IPv4 ARP hosts limit
ipv4-dhcp	The total number of IPv4 DHCP hosts limit
ipv4-ppp	The total number of IPv4 PPP hosts limit
ipv4-overall	The total number of IPv4 hosts limit
ipv6-pd-ipoe-dhcp	The total number of IPv6 IPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-ppp-dhcp	The total number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-overall	The total number of IPv6 DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-wan-ipoe-dhcp	The total number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ipoe-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-ppp-dhcp	The total number of IPv6 PPPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ppp-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-overall	The total number of IPv6 WAN hosts limit
ipv6-overall	The total number of IPv6 hosts limit
lac-overall	The total number of L2TP LAC hosts limit
overall	The total number of subscriber hosts limit
Subscriber Session Limit Overrides and SLA Profile Instance Session Limit Overrides: (only shown when overrides are active)	
ipoe	The total number of IPoE sessions limit
ppoe-local	The total number of PPPoE local terminated sessions (PTA) limit
ppoe-lac	The total number of PPPoE L2TP LAC sessions limit
ppoe-overall	The total number of PPPoE sessions limit
l2tp-lns	The total number of L2TP LNS sessions limit

Field	Description
l2tp-lts	The total number of L2TP LTS sessions limit
l2tp-overall	The total number of L2TP sessions limit
overall	The total number of subscriber sessions limit
Managed Routes	
Status	The installation status
Metric	The metric value
Tag	The tag value
Pref	The preference value
Number of session	The number of sessions returned from the search criteria

## session

### Syntax

**session connection-id** *connection-id* [{**detail** | **ppp-statistics**}]

**session** [{**detail** | **ppp-statistics**}] [**session-id** *session-id*] [**state** *session-state*] [**peer** *ip-address*] [**group** *group-name*] [**assignment-id** *assignment-id*] [**local-name** *local-host-name*] [**remote-name** *remote-host-name*] [**tunnel-id** *tunnel-id*] [**service** *service-id*] [**interface** {*ip-int-name* | *ip-address*}] [**ip-prefix** *ip-prefix/mask*]

**session** [{**detail** | **ppp-statistics**}] [**state** *session-state*] [**peer** *ip-address*] [**group** *group-name*] [**assignment-id** *assignment-id*] [**local-name** *local-host-name*] [**remote-name** *remote-host-name*] [**control-connection-id** *connection-id*] [**service** *service-id*] [**interface** {*ip-int-name* | *ip-address*}]

### Context

[\[Tree\]](#) (show>router>l2tp session)

### Full Context

show router l2tp session

### Description

This command displays L2TP session operational information.

### Parameters

#### **connection-id**

Specifies the identification number for a Layer Two Tunneling Protocol connection.

**Values** 1 to 429496729

**detail**

Displays detailed L2TP session information.

**ppp-statistics**

Displays PPP statistics for the session.

**session-id**

Specifies the identification number for a Layer Two Tunneling Protocol session.

**Values** 1 to 65535

**session-state**

Specifies the values to identify the operational state of the L2TP session.

**Values** closed, closed-by-peer, established, idle, wait-reply, wait-tunnel

**ip-address**

Specifies the IP address of the peer.

**Values** The following values apply to the 7750 SR:

ipv4-address a.b.c.d (host bits must be 0)

ipv6-address x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface: 32 characters maximum, mandatory for link local addresses

**Values** The following values apply to the 7450 ESS:

ipv4-address: a.b.c.d (host bits must be 0)

**group-name**

Specifies a string to identify a Layer Two Tunneling Protocol Tunnel group.

**assignment-id**

Specifies a string that distinguishes this Layer Two Tunneling Protocol tunnel.

**local-host-name**

Specifies the host name used by this system during the authentication phase of tunnel establishment.

**remote-host-name**

Specifies a string that is compared to the host name used by the tunnel peer during the authentication phase of tunnel establishment.

**tunnel-id**

Specifies the local identifier of this Layer Two Tunneling Protocol tunnel, when L2TP version 2 is used.

**Values** 1 to 65535

**service-id**

Specifies the service identification number.

**ip-int-name**

Specifies the IP interface name.

**ip-address**

Specifies the IPv4 or IPv6 addresses.

**ip-prefix/mask**

Specifies information for the specified IP prefix and mask length.

**connection-id**

Specifies an identification number for a Layer Two Tunneling Protocol session.

**Values** 1 to 429496729

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of L2TP session operational information.

**Output Example**

```
*A:Dut-C# show router l2tp session

## session

### Syntax

```
session [interface ip-int-name | ip-address | sap sap-id] [session-id session-id] [mac ieee-address] [ip-address ip-address[/ mask]] [port port-id] [no-inter-dest-id | inter-dest-id intermediate-destination-id] [steering-profile steering-profile] [router-advertisement-policy policy-name] [fragmentation state] [detail | statistics]  
  
session l2tp-connection-id connection-id [detail | statistics]
```

### Context

[\[Tree\]](#) (show>service>id>pppoe session)

### Full Context

```
show service id pppoe session
```

### Description

This command displays PPPoE session information.

### Parameters

#### ***ip-int-name***

Specifies the IP interface name.

#### ***ip-address***

Specifies the IP address of the PPPoE session.

**sap-id**

Specifies the SAP ID.

**session-id**

Specifies the ID of the PPPoE session.

**ieee-address**

Specifies the MAC address of the PPPoE session.

**port-id**

Specifies the port ID.

**no-inter-dest-id**

Displays the information of PPPoE sessions that do not have an intermediate destination ID associated.

**intermediate-destination-id**

Specifies the intermediate destination ID.

**steering-profile**

Specifies the name of the steering profile, up to a maximum of 32 characters.

**policy-name**

Specifies the name of the router advertisement policy, up to a maximum of 32 characters.

**state**

Specifies the fragmentation state.

**Values** active, inactive

**detail**

Displays detailed information.

**statistics**

Displays statistics about the PPPoE session.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following outputs are examples of PPPoE session information and [Table 494: Output fields: service PPPoE session](#) describes the output fields.

**Note:** The output varies depending on the configuration and functionality of the operational data within the PPPoE session, therefore not all fields appear in the output example.

**Output**

```
show service id 20 pppoe session
```

```

Table 494: Output fields: service PPPoE session

Field	Description
Sap Id	The SAP ID
Mac Address	The MAC address
Sid	The SID number
Up Time	The time of the last modification
Type	The PPPoE type
IP/L2TP-Id/If-Id	The IP/L2TP or IF ID
MC-Standby	The MC standby
Session Time Left	The time remaining for the session timeout
LCP State	The LCP open/closed state
IPCP State	The IP CP open/closed state
IPv6CP State	The IPv6 CP open/closed state
PPP MTU	The PPP MTU value
PPP Auth-Protocol	The PPP authentication protocol
PPP User-Name	The PPP user name
Subscriber-interface	The subscriber interface name
Group-interface	The group interface name
IP Origin	The IP origin
DNS Origin	The DNS origin
NBNS Origin	The NBNS origin
Subscriber	The subscriber identification string
Sub-Profile-String	The subscriber profile name
SLA-Profile-String	The SLA profile name
SPI group ID	The SPI group ID
ANCP-String	The value of the ancp-string received from either the DHCP or the RADIUS server
Int-Dest-Id	Intermediate destination identifier received from the RADIUS server

Field	Description
App-Profile-String	The application profile string
Category-Map-Name	The value of the category map name received from the RADIUS server
Acct-Session-Id	The accounting session ID
Sap-Session-Index	The sap session index of the PPP session
IP Address	The IP address
Primary DNS	The primary DNS server
Secondary DNS	The secondary DNS server
Primary NBNS	The primary NBNS server
Secondary NBNS	The secondary NBNS server
Address-Pool	The IP address pool used to search for an IP address for this session
IPv6 Prefix	The IPv6 prefix
IPv6 Prefix Origin	The origin of the IPv6 prefix
IPv6 Prefix Pool	The DHCP server pool from which the IPv6 prefix is allocated
IPv6 Del.Pfx.	The IPv6 delegated prefix
IPv6 Del.Pfx. Origin	The origin of the IPv6 delegated prefix
IPv6 Del.Pfx. Pool	The DHCP server pool from which the delegated prefix is allocated
IPv6 Address	The IPv6 address
IPv6 Address Origin	The origin of the IPv6 address
IPv6 Address Pool	The DHCP server pool from which the address is allocated
Primary IPv6 DNS	The primary IPv6 DNS server
Secondary IPv6 DNS	The secondary IPv6 DNS server
Router adv. policy	The router advertisement policy
Ignoring DF bit	The true/false status of ignoring DF bit
Radius sub-if prefix	The RADIUS subscriber interface prefix
L2TP Router Name	The L2TP router name

Field	Description
L2TP Group Name	The L2TP group name
L2TP Assignment ID	The L2TP assignment ID
L2TP LAC Frag FPE id	The L2TP LAC fragmentation FPE ID
L2TP LAC Frag Action	The L2TP LAC fragmentation action
L2TP LAC Frag State	The L2TP LAC fragmentation state
L2TP Steering Profile	The LAC steering profile name
L2TP Steering State	The LAC steering state type
Circuit-Id	The circuit ID of the PPP session
Remote-Id	The remote ID of the PPP session
Radius Session-TO	The value to interpret the session timeout VSA from RADIUS
Radius Class	The Class attribute returned by the RADIUS server in an Access-Accept message
Radius User-Name	The User-Name attribute returned by the RADIUS server in an Access-Accept message
Logical-Line-Id	The logical line ID
Keepalive Origin	LCP Keepalive Interval and Multiplier parameters are by default obtained from the ppp-policy configuration and can be overridden with parameters obtained from RADIUS, Diameter Gx or local user database. This field indicates the origin of the LCP Keepalive parameters for this session:  Policy = values configured in the subscriber-mgmt ppp-policy for PPPoE PTA sessions or l2tp group context for L2TP LNS sessions.  Ludb = values from the local user database Radius = values from RADIUS authentication Diameter Gx = values from Diameter Gx
Keepalive Interval	The time interval in seconds at which LCP echo requests are transmitted for the PPP session
Keepalive Multiplier	The number of LCP keepalive messages that can be missed before the PPP session is brought down
Subscriber Host Limit Overrides and SLA Profile Instance Host Limit Overrides: (only shown when overrides are active)	

Field	Description
ipv4-arp	The total number of IPv4 ARP hosts limit
ipv4-dhcp	The total number of IPv4 DHCP hosts limit
ipv4-ppp	The total number of IPv4 PPP hosts limit
ipv4-overall	The total number of IPv4 hosts limit
ipv6-pd-ipoe-dhcp	The total number of IPv6 IPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-ppp-dhcp	The total number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-overall	The total number of IPv6 DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-wan-ipoe-dhcp	The total number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ipoe-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-ppp-dhcp	The total number of IPv6 PPPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ppp-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-overall	The total number of IPv6 WAN hosts limit
ipv6-overall	The total number of IPv6 hosts limit
lac-overall	The total number of L2TP LAC hosts limit
overall	The total number of subscriber hosts limit
Subscriber Session Limit Overrides and SLA Profile Instance Session Limit Overrides: (only shown when overrides are active)	
ipoe	The total number of IPoE sessions limit
ppoe-local	The total number of PPPoE local terminated sessions (PTA) limit
ppoe-lac	The total number of PPPoE L2TP LAC sessions limit
ppoe-overall	The total number of PPPoE sessions limit
l2tp-lns	The total number of L2TP LNS sessions limit
l2tp-lts	The total number of L2TP LTS sessions limit
l2tp-overall	The total number of L2TP sessions limit

Field	Description
overall	The total number of subscriber sessions limit
Managed Routes	
Status	The installation status
Metric	The metric value
Tag	The tag value
Pref	The preference value
Number of session	The number of sessions returned from the search criteria

## session

### Syntax

**session connection-id** *connection-id* **eth-tunnel-statistics**

### Context

[\[Tree\]](#) (clear>router>l2tp session)

### Full Context

clear router l2tp session

### Description

This command clears L2TP session data.

### Parameters

**connection-id**

Specifies the L2TPv3 connection ID.

**eth-tunnel-statistics**

Clears the Ethernet tunnel statistics associated with the specified session.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## session

### Syntax

**session stop** *connection-id*

## Context

[\[Tree\]](#) (tools>perform>router>l2tp session)

## Full Context

tools perform router l2tp session

## Description

This command configures performance tools for a specified L2TP session.

## Parameters

### stop

Stops the performance tools for a specified L2TP session.

### connection-id

Specifies the L2TPv3 connection ID.

**Values** 1 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## session

## Syntax

**session** [**sap** *sap-id*] [**mac** *ieee-address*] [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**interface** *ip-int-name* | *ip-address*] [**inter-dest-id** *intermediate-destination-id*] [**no-inter-dest-id**] [**ip-address** *ip-prefix[/prefix-length]*] [**port** *port-id*] [**subscriber** *sub-ident-string*] [**sap-session-id** *sap-session-index*] [**detail**] [**wholesaler** *service-id*] [**router-advertisement-policy** *policy-name*]

## Context

[\[Tree\]](#) (show>service>id>ipoe session)

## Full Context

show service id ipoe session

## Description

This command displays the identified IpoE session details active on the specified service instance.

## Parameters

### sap-id

Specifies the physical port identifier portion of the SAP definition.

***ieee-address***

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

***circuit-id***

Specifies the circuit ID, up to 127 characters.

***remote-id***

Specifies that information that goes into the remote-id sub-option in the DHCP relay packet, up to 255 characters.

***ip-int-name***

Specifies the name of the IP interface, up to 32 characters.

***ip-address[/prefix-length]***

Specifies information for the specified IP address and mask.

***no-inter-dest-id***

Displays the information about no intermediate destination ID.

***port-id***

Displays information about the specified port ID.

***sap-session-index***

Displays sap-session-index information.

***service-id***

Specifies the service ID of the wholesaler.

<b>Values</b>	<i>service-id:</i>	1 to 2147483647
---------------	--------------------	-----------------

***intermediate-destination-id***

Specifies the intermediate destination identifier which is encoded in the identification strings up to 32 characters.

***sub-ident-string***

Specifies an existing subscriber identification profile.

***detail***

Displays all IPoE session details.

***policy-name***

Specifies the name of the router advertisement policy, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of service IPoE session information.

Table 495: Output fields: service IPoE session describes IPoE session field information.

Table 495: Output fields: service IPoE session

Field	Description
SAP Id	The SAP ID of the IPoE session
Mac Address	The MAC address of the IPoE session
Up Time	The time of the last modification
MC-Stdbby	The number of SAPs defined on this service on a port which is in multi-chassis standby mode
SAP	The SAP ID of the IPoE session
Circuit-Id	The circuit ID of the IPoE session
Remote-Id	The remote ID of the IPoE session
Session Key	The session key used for this IPoE session to group subscriber hosts
MC-Standby	The number of SAPs defined on this service on a port which is in multi-chassis standby mode
Subscriber-interface	The subscriber interface name
Group-interface	The group interface name
Up Time	The time of the last modification
Session Time Left	The time remaining for the session timeout

Field	Description
Last Auth Time	The date and time of the last authentication
Min Auth Intvl (left)	The minimum interval between two consecutive authentication attempts for the same ARP host
Persistence Key	The key value that is used to track this in the persistence file
Subscriber	The subscriber identification string
Sub-Profile-String	The subscriber profile name
SLA-Profile-String	The SLA profile name
ANCP-String	The value of the ancp-string received from either the DHCP or the RADIUS server
Int-Dest-Id	Intermediate destination identifier received from the RADIUS server
App-Profile-String	The application profile string
Category-Map-Name	The value of the category map name received from the RADIUS server
Acct-Session-Id	The accounting session ID
Sap-Session-Index	The sap session index of the PPP session
IP Address	The IP address
IP Origin	The origin of the source IP address used for connectivity verification
Primary DNS	The primary DNS server
Secondary DNS	The secondary DNS server
Primary NBNS	The primary NBNS server
Secondary NBNS	The secondary NBNS server
Address-Pool	The IP address pool used to search for an IP address for this session
IPv6 Prefix	The IPv6 prefix
IPv6 Prefix Origin	The origin of the IPv6 prefix
IPv6 Prefix Pool	The DHCP server pool from which the SLAAC prefix is allocated
IPv6 Del.Pfx.	The IPv6 delegated prefix

Field	Description
IPv6 Del.Pfx. Origin	The origin of the IPv6 delegated prefix
IPv6 Del.Pfx. Pool	The DHCP server pool from which the delegated prefix is allocated
IPv6 Address	The IPv6 address
IPv6 Address Origin	The origin of the IPv6 address
IPv6 Address Pool	The DHCP server pool from which the address is allocated
Primary IPv6 DNS	The primary DNS server
Secondary IPv6 DNS	The secondary DNS server
Radius Session-TO	The value to interpret the session timeout VSA from RADIUS
Radius Class	The Class attribute returned by the RADIUS server in an Access-Accept message
Radius User-Name	The User-Name attribute returned by the RADIUS server in an Access-Accept message
Subscriber Host Limit Overrides and SLA Profile Instance Host Limit Overrides:	
ipv4-arp	The total number of IPv4 ARP hosts limit
ipv4-dhcp	The total number of IPv4 DHCP hosts limit
ipv4-ppp	The total number of IPv4 PPP hosts limit
ipv4-overall	The total number of IPv4 hosts limit
ipv6-pd-ipoe-dhcp	The total number of IPv6 IPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-ppp-dhcp	The total number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-overall	The total number of IPv6 DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-wan-ipoe-dhcp	The total number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ipoe-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-ppp-dhcp	The total number of IPv6 PPPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ppp-slaac	The total number of IPv6 PPPoE SLAAC WAN hosts limit

Field	Description
ipv6-wan-overall	The total number of IPv6 WAN hosts limit
ipv6-overall	The total number of IPv6 hosts limit
lac-overall	The total number of L2TP LAC hosts limit
overall	The total number of subscriber hosts limit
Subscriber Session Limit Overrides and SLA Profile Instance Session Limit Overrides:	
ipoe	The total number of IPoE sessions limit
ppoe-local	The total number of PPPoE local terminated sessions (PTA) limit
ppoe-lac	The total number of PPPoE L2TP LAC sessions limit
ppoe-overall	The total number of PPPoE sessions limit
l2tp-lns	The total number of L2TP LNS sessions limit
l2tp-lts	The total number of L2TP LTS sessions limit
l2tp-overall	The total number of L2TP sessions limit
overall	The total number of subscriber sessions limit
Number of session	The number of sessions returned from the search criteria

## session

### Syntax

**session** [*name trace-name*] [*detail*]

**session sap** *sap-id* **mac** *ieee-address* [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**username** *user-name*] [*detail*]

### Context

[\[Tree\]](#) (show>call-trace>ppp session)

[\[Tree\]](#) (show>call-trace>ipoe session)

### Full Context

show call-trace ppp session

show call-trace ipoe session

### Description

This command displays call trace information for the active session.

Configuring this command with specified session filters, displays information for the specified trace job only.

## Parameters

### **detail**

Displays detailed information.

### **sap-id**

Specifies the SAP ID that identifies a session.

### **ieee-address**

Specifies a MAC address that identifies a session.

### **circuit-id**

Specifies a circuit ID that identifies a session, up to 255 characters.

### **remote-id**

Specifies a remote ID that identifies a session, up to 255 characters.

### **trace-name**

Specifies the name of the trace, up to 32 characters, that triggered the job.

### **user-name**

Specifies the user name, up to 32 characters, that identifies a PPPoE session.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of call trace information for the active IPoE session.

### Output Example

```
Node # show call-trace ipoe session
=====
Call trace IPoE session
=====
IEEE address      Status          No. of messages
Trace name
-----
00:02:00:00:00:19  running        10
  default
-----
No. of call trace IPoE debug jobs: 1
=====

Node# show call-trace ipoe session detail
=====
Call trace IPoE session
=====
SAP ID           : 4/1/ 2
IEEE address: 00:02:00:00:00:19

Size limit     : 10 MB                               Time limit   : 86400 sec
Live output
-----
Destination     : none
```

```

Statistics
-----
Started          : 2017/01/11 15:34:08UTC
No. of captured msgs : 10
Size of captured msgs : 2575 B
=====
    
```

**Table 496: Output fields: call trace IPoE session** describes call trace IPoE session output fields.

*Table 496: Output fields: call trace IPoE session*

Field	Description
IEEE address	The IEEE address of the equipment to match by this trace
Status	The status of the trace session
No. of messages	The number of messages from the trace session
Trace name	The name of the trace profile
Size limit	The maximum data volume generated by a single call trace job to the output, in megabytes
Time limit	The maximum duration of a single call trace job, in seconds
Live output	The live output destination for trace logs
Destination	The destination address of the trace logs
Started	The date and time the trace began
No. of captured msgs	The number of captured messages
Size of captured msgs	The size of the captured messages

## session

### Syntax

**session sap** *sap-id* **mac** *ieee-address*

**session sap** *sap-id* **mac** *ieee-address* **circuit-id** *circuit-id* [**remote-id** *remote-id*] [**user-name** *user-name*]

**session sap** *sap-id* **mac** *ieee-address* [**circuit-id** *circuit-id*] **remote-id** *remote-id* [**user-name** *user-name*]

**session sap** *sap-id* **mac** *ieee-address* [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] **user-name** *user-name*

### Context

**[Tree]** (clear>call-trace>ipoe session)

**[Tree]** (clear>call-trace>pppoe session)

## Full Context

```
clear call-trace ipoe session  
clear call-trace pppoe session
```

## Description

This command clears the trace job identified by this session.

This command does not affect any of the debug trace commands, and new jobs can still be executed for other sessions.

After a session is cleared, tracing for the session will not be restarted by any configured trace. Only explicitly starting a new trace with the **trace-existing-sessions** parameter can restart tracing for the session.

## Parameters

### *circuit-id*

Specifies a circuit ID, up to 255 characters, that identifies a session.

### *ieee-address*

Specifies a MAC address that identifies a session.

### *remote-id*

Specifies a remote ID, up to 255 characters, that identifies a session

### *sap-id*

Specifies the SAP ID that identifies a session.

### *user-name*

Specifies the user name, up to 32 characters, that identifies a session.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## session

## Syntax

```
session [family] [summary | detail] ip-addr[label-space]
```

## Context

[\[Tree\]](#) (show>router>ldp>bindings session)

## Full Context

```
show router ldp bindings session
```

## Description

This command displays LDP FEC bindings by matching peer LSR ID.

## Parameters

### ***detail***

Displays detailed information.

### ***summary***

Displays information in a summarized format.

### ***family***

Displays either IPv4 or IPv6 LDP session information.

### ***ip-addr***

displays configuration information about LDP sessions.

### ***label-space***

Specifies the label space identifier that the router is advertising on the interface.

**Values** 0 to 65535

## Platforms

All

## session

## Syntax

**session** [*ip-addr* [*label-space*]] **local-addresses** [**sent** | **rcv**] **ip-addr** *ip-address*

**session** [*ip-addr* [*label-space*]] [*session-type*] [**state** *state*] [**summary** | **detail**] [**community** *community*]

**session** [*ip-addr* [*label-space*]] **local-addresses** [**sent** | **rcv**] [*family*]

**session** [*ip-addr* [*label-space*]] [**sent** | **rcv**] **overload** [**fec-type** *fec-type*]

**session** [**sent** | **rcv**] **overload** [ **fec-type** *fec-type*] [*family*] [ **community** *community*]

**session statistics** [*packet-type*] [*session-type*] [*family*]

**session** [*session-type*] [**state** *state*] [**summary** | **detail**] [*family*] [**community** *community*]

## Context

[\[Tree\]](#) (show>router>ldp session)

## Full Context

show router ldp session

## Description

This command displays configuration information about LDP sessions.

## Parameters

### *ip-addr*

Specifies the IP address of the LDP peer.

### *label-space*

Specifies the label space identifier that the router is advertising on the interface.

**Values** 0 to 65535

### *statistics*

Specifies the statistics for a targeted peer.

### *packet-type*

Specifies the packet type.

**Values** hello, keepalive, init, label, notification, address, capability

### *session-type*

Specifies to display the session type.

**Values** link, targeted, both

### *state*

Specifies to display the current operational state of the adjacency.

**Values** up - Established down - Initialized, OpenRecv, OpenSent, Nonexistent

### *summary*

Displays information in a summarized format.

### *detail*

Displays detailed information including the community and if a local LSR ID is advertised.

### *local-addresses*

Specifies the local address information.

### *ip-address*

Specifies the IPv4 or IPv6 address.

**Values** <ip-address> : ipv4-address - a.b.c.d ipv6-address - x:x:x:x:x:x  
(eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D

### *overload*

Specifies the overload information.

### *fec-type*

Specifies the specified FEC type.

**Values** ipv4-prefixes, ipv6-prefixes, ipv4-p2mp, ipv6-p2mp, svc-fec128, svc-fec129

### *family*

Displays either IPv4 or IPv6 active LDP information.

**Values** ipv4, ipv6

**community**

The string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

**Platforms**

All

**Output**

Table 497: Output fields: LDP session describes the LDP session output fields.

Table 497: Output fields: LDP session

Label	Description
Peer LDP Id	The IP address of the LDP peer.
Adj Type	The adjacency type between the LDP peer and LDP session is targeted.
	Link — Specifies that this adjacency is a result of a link hello. Targeted — Specifies that this adjacency is a result of a targeted hello.
State	Established — Specifies that the adjacency is established.
	Trying — Specifies that the adjacency is not yet established.
Msg Sent Mesg Sent	The number of messages sent.
Msg Rcvd Mesg Rcvd	The number of messages received.
Up Time	The amount of time the adjacency has been enabled.
Session Community	Specifies the LDP community associated with a session.
Local LSR ID Advertised	Specifies if a local LSR ID is advertised.

**Output Example**

## session

### Syntax

**session** *ip-addr* [*label-space*] [**statistics**]

**session** *ip-addr* [*label-space*] **overload** [**fec-type** **p2mp** | **prefixes** *sub-type* *sub-type*]

**session** *ip-addr*[*label-space*] **overload** [**fec-type** *svc-fec128* | *svc-fec129*]

## Context

[\[Tree\]](#) (clear>router>ldp session)

## Full Context

clear router ldp session

## Description

This command restarts or clears statistics for LDP sessions.

## Parameters

### *ip-address*

Clears the IP address of the session

### *label-space*

Specifies the label space identifier that the router is advertising on the interface.

**Values** 0 to 65535

### *statistics*

Clears only the statistics for a session.

### **overload**

Clears overload information.

### **fec-type**

Clears the specified FEC type.

**Values** p2mp, svc-fec128, svc-fec129

### **session** *ip-addr*[*label-space*]

Specifies the IP address and label space identifier.

**Values** <*ip-addr*[*label-spa*\*> : *ipv4-address*:*label-space*  
*ipv6-address* [*label-space*]  
*label-space* — [0 to 65535]

## Platforms

All

## session

## Syntax

**session** *ip-addr*[*label-space*] [**connection** | **peer** | **adjacency**]

## Context

[\[Tree\]](#) (tools>dump>router>ldp session)

## Full Context

tools dump router ldp session

## Description

This command dumps information for an LDP session.

## Parameters

### ***ip-addr***[*label-space*]

Dumps information for the specified IP address and label space identifier.

**Values** ip-addr[*label-spa\**]: ipv4-address:label-space ipv6-address[*label-space*]  
label-space - [0 to 65535]

### **connection**

Filters output for connection information.

### **peer**

Filters output for peering information.

### **adjacency**

Filters output for adjacency information.

## Platforms

All

## session

## Syntax

**session** *lsp-index* *lsp-index* [*path-lspid* *path-lspid*] [**detail**]

**session** *lsp-name* *lsp-name* [*path-lspid* *path-lspid*] [**detail**]

**session** *lsp-path* [**detail**]

**session** *lsp-path* **prefix** *ip-prefix* *lprefix-length* [**src** *ip-address* *llocal-link* *address*] [**detail**]

**session** *sr-policy* [**detail**]

**session** *sr-policy* **prefix** *ip-prefix* *lprefix-length* [**src** *ip-address* *llocal-link* *address*] [**detail**]

## Context

[\[Tree\]](#) (show>router>bfd>seamless-bfd session)

## Full Context

show router bfd seamless-bfd session

## Description

This command displays Seamless-BFD session information.

## Parameters

### **isp-index** *isp-index*

Specifies the LSP index.

**Values** 0 to 4294967295

### **path-ispid** *path-ispid*

Specifies the path LSP ID.

**Values** 0 to 4294967295

### **detail**

Displays detailed information.

### **isp-name** *isp-name*

Displays information about the specified LSP name, up to 64 characters.

### **isp-path**

Keyword to display information by LSP path.

### **prefix**

Keyword to display information by far-end prefix.

### **sr-policy**

Keyword to display information by SR policy.

### **ip-prefix/prefix-length**

Specifies an IP prefix for which to display Seamless-BFD session information, and the length of the prefix.

**Values** *ipv4-prefix* — a.b.c.d (host bits must be zero)  
*ipv4-prefix-length* — 0 to 32  
*ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x — 0 to FFFF (hexadecimal)  
d — 0 to 255 (decimal)  
*ipv6-prefix-length* — 0 to 128

### **ip-address/link-local-address**

Specifies the source IP address for which to display Seamless-BFD session information.

**Values** *ipv4-address* — a.b.c.d  
*ipv6-address* — x:x:x:x:x:x:x[-interface]  
x:x:x:x:x:d.d.d.d[-interface]  
x — 0 to FFFF (hexadecimal)  
d — 0 to 255 (decimal)

interface — mandatory for link local address, up to 32 characters

## Platforms

All

## Output

The following output is an example of BFD session information and [Table 498: Output fields: MPLS seamless BFD session](#) describes Seamless-BFD session output fields.

### Output Example

```
# show router bfd seamless-bfd session lsp-index 70000
=====
Legend:

Table 498: Output fields: MPLS seamless BFD session

Label	Description
Session Id	Specifies the session ID
State	Specifies the session state (Up/Down)
Tx Pkts	Specifies the number of packets transmitted
Rx Pkts	Specifies the number of packets received
Rem Addr/Info/ SdpId:VcId	Specifies the session remote endpoint address information
Multipl	Specifies the multiplier
Tx Intvl	Specifies the transmit interval

Label	Description
Rx Intvl	Specifies the receive interval
Protocols	Specifies the protocol that the session is bound to
Type	Specifies the BFD type cpm-np — Specifies to use CPM network processor
LAG Port	Specifies the LAG Port
LAG ID	Specifies the LAG ID
No. of BFD sessions	Specifies the number of BFD sessions
Prefix	Specifies the prefix
Local Address	Specifies the local address
LSP Name	Specifies the LSP name
LSP Index	Specifies the LSP index
Path LSP ID	Specifies the path LSP ID
Fec Type	Specifies the FEC type
Return Path	Specifies the return path label for the S-BFD packet
Oper State	Specifies the operational state (Up/Down)
Protocols	Specifies the protocol used
Up Time	Specifies the up time
Up Transitions	Specifies the number of up transitions
Down Time	Specifies the down time
Down Transitions	Specifies the number of down transitions
Version Mismatch	Specifies the number of version mismatches
Local Discr	Specifies the local Discr information
Local State	Specifies the local state (Up/Down)
Local Diag	Specifies the local diag information
Local Mode	Specifies the local mode
Local Min Tx	Specifies the local Min Tx value
Local Mult	Specifies the local Mult value

Label	Description
Last Sent (ms)	Specifies the last sent forwarding information
Local Min Rx	Specifies the local Min Rx value
Type	Specifies the session endpoint type
Remote Discr	Specifies the remote Discr value
Remote State	Specifies the remote state (Up/Down)
Remote Diag	Specifies the remote diagnostic value
Remote Mode	Specifies the remote mode
Remote Min Tx	Specifies the remote minimum transmit value
Remote Mult	Specifies the remote multiplier
Remote C-flag	Specifies the remote C-flag value
Last Recv (ms)	Specifies the last received value
Remote Min Rx	Specifies the remote minimum receive value

## Context

[\[Tree\]](#) (show>router>bfd session)

## Full Context

```
show router bfd session
```

## Description

This command displays information for existing BFD sessions.

## Parameters

### **detail**

Displays detailed session information.

### **lsp-rsvp**

Displays BFD sessions on an RSVP LSPs.

### **head**

Optional keyword to limit the output to BFD sessions at the head end of LSPs.

### **tail**

Optional keyword to limit the output to BFD sessions at the tail end of LSPs.

### **ipv4**

Optional keyword to limit the output to IPv4-based BFD sessions.

### **ipv6**

Optional keyword to limit the output to IPv6-based BFD sessions.

### **lag-id**

Limits the output to micro-BFD sessions associated with the specified LAG ID.

### **port-id**

Limits the output to micro-BFD sessions associated with the specified port ID.

### **lsp-ldp**

Displays BFD sessions on an LDP LSPs.

### **ip-address**

Limits the output to BFD sessions with the specified IPv4 or IPv6 addresses.

### **link-local-address**

Limits the output to BFD sessions with the specified IPv6 link-local addresses.

### ***ip-prefix/prefix-length***

Displays IPv4 or IPv6 addresses of the BFD sessions.

**Values** The following values apply to the 7750 SR and 7950 XRS:

ipv4-prefix	a.b.c.d (host bits must be 0)	
ipv4-prefix-length	0 to 32	
ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D
ipv6-prefix-length	0 to 128	

### ***lsp-name***

Limits the output to BFD sessions associated with the specified LSP.

### ***tunnel-id***

Limits the output to BFD sessions associated with the specified tunnel ID.

### ***lsp-id***

Limits the output to BFD sessions associated with the specified LSP ID.

### ***mpls-tp***

Optional keyword to limit the output to BFD sessions on MPLS-TP LSPs.

### ***cc-only***

Optional keyword to limit the output to CC BFD sessions on MPLS-TP LSPs.

### ***cc-cv***

Optional keyword to limit the output to CV BFD sessions on MPLS-TP LSPs.

### ***interface-name***

Limits the output to the BFD session for the specified interface.

### ***rsvp-session-name***

Limits the output to the BFD session for the specified RSVP session.

### ***summary***

Displays summary session information for the router.

### ***type***

Limits the output to BFD sessions associated with the specified type.

**Values** iom, central, cpm-np

## **Platforms**

All

## Output

The following output is an example of BFD session information, and [Table 499: Output fields: BFD session](#) describes the fields.

Table 499: Output fields: BFD session

Label	Description
State	Displays the administrative state for this BFD session
Protocol	Displays the active protocol
Tx Intvl	Displays the interval, in milliseconds, between the transmitted BFD messages to maintain the session
Tx Pkts	Displays the number of transmitted BFD packets
Rx Intvl	Displays the expected interval, in milliseconds, between the received BFD messages to maintain the session
Rx Pkts	Displays the number of received packets
Mult	Displays the integer used by BFD to declare when the neighbor is down

## session

### Syntax

**session** [*session-type*] [**from** *ip-address* [**to** *ip-address*]] [**lsp-name** *session-name*] [**status** {**up** | **down**}] [**detail**] [**interface** *ip-int-name*]

## Context

[\[Tree\]](#) (show>router>rsvp session)

## Full Context

```
show router rsvp session
```

## Description

This command shows RSVP session information.

## Parameters

### ***session-type***

Specifies the session type.

**Values** originate, transit, terminate, detour, detour-transit, detour-terminate, bypass-tunnel

### ***from ip-address***

Specifies the IP address of the originating router.

### ***to ip-address***

Specifies the IP address of the egress router.

### ***session-name***

Specifies the name, up to 160 characters in length, of the LSP used in the path. "\*" can be used as a wildcard character.

### ***status up***

Specifies to display a session that is operationally up.

### ***status down***

Specifies to display a session that is operationally down.

### ***detail***

Displays detailed information.

### ***ip-int-name***

Specifies the name of an existing MPLS interface.

If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The **interface** option filters the display to include all RSVP sessions that use this interface name as "In Interface" or as "Out Interface".

## Platforms

All

## Output

The following output is an example of RSVP session information.

[Table 500: Output fields: RSVP session](#) describes RSVP session output fields.

Table 500: Output fields: RSVP session

Label	Description
From	The IP address of the originating router.
To	The IP address of the egress router.
Tunnel ID	The IP address of the tunnel's ingress node supporting this RSVP session.
LSP ID	The ID assigned by the agent to this RSVP session.
Name	The administrative name assigned to the RSVP session by the agent.
State	Down — The operational state of this RSVP session is down. Up — The operational state of this RSVP session is up.

**Output Example**

```
*A:SRU4>show>router>rsvp# session

## session

### Syntax

```
session src-ip ip-address dst-ip ip-address
```

### Context

[\[Tree\]](#) (clear>router>bfd session)

### Full Context

```
clear router bfd session
```

### Description

This command clears BFD sessions.

### Parameters

**src-ip** *ip-address*

Specifies the address of the local endpoint of this BFD session.

**dst-ip *ip-address***

Specifies the address of the remote endpoint of this BFD session.

**Platforms**

All

**session**

**Syntax**

**session all**

**session client *srcAddr***

**Context**

[\[Tree\]](#) (clear>video>id session)

**Full Context**

clear video id session

**Description**

This command clears session information.

**Parameters**

**all**

Clears all sessions.

**client *srcAddr***

Clears information for the client source address.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s

**session**

**Syntax**

**session all [rt-server] [fcc-server]**

**session client *srcAddr* [rt-server] [ fcc-server]**

**Context**

[\[Tree\]](#) (clear>video>statistics>id session)

**Full Context**

clear video statistics id session

## Description

This command clears video statistics for a particular channel.

## Parameters

### **all**

Clears statistics for all sessions.

### **rt-server**

Clears all RET server related statistics.

### **fcc-server**

Clears all FCC server related statistics.

### **client *srcAddr***

Clears statistics for the specified source address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s

## session

## Syntax

```
session session-name [{all | base | bin-group | event-mon | meas-interval}]
```

## Context

[\[Tree\]](#) (show>oam-pm session)

## Full Context

```
show oam-pm session
```

## Description

Show the configuration and status information for an OAM Performance Monitoring session.

## Parameters

### ***session-name***

Specifies the session name up to 32 characters.

### **all**

Displays all attributes.

### **base**

Specifies the base configuration option for the session.

### **bin-group**

Specifies the associated bin group and its attributes.

### **event-mon**

Configures event monitoring and last TCA.

## meas-interval

Configures event monitoring and last TCA.

## Platforms

All

## Output

The following output is an example of OAM-PM configuration information.

### Output Example

```
show oam-pm session "vpls1000-PM-YL4-1/1/9:1000.1000" all
-----

Table 501: Output fields: TWAMP-Light Test

Label	Description
Test ID	The numerical value, between 0 to 2147483647, that is assigned to the protocol-specific test
Admin State	The administrative state of the test Up – The test has been enabled by configuration Down – The test has not been enabled by configuration
Oper State	The operational state of the test Up – The test is administratively up and currently transmitting, attempting to transmit packets, or ready to transmit packets Down – The test is administratively down or an OAM-PM session configured with <b>session-type on-demand</b> has not been enabled using the global CLI <b>oam oam-pm session start</b> command
CHLI Threshold	Displays the Consecutive High Loss Interval (CHLI) threshold
FLR Threshold	Displays the Frame Loss Ratio (FLR) threshold for the test
Interval	Displays the test interval, in milliseconds, between the received messages to maintain the session
Record Stats	Displays the type of statistics recorded for the TWAMP-Light test
IPv6 UDP Checksum 0	Displays whether the processing of received IPv6 UDPchecksum 0 packets is allowed or disallowed
Detectable Tx Error	Displays the detected error condition that may prevent the test packet from being sent
Session Sender ID	Displays the session sender identifier (value, between 1 to 65535)

## session

### Syntax

**session** [**sap** *sap-id*] [**interface** *ip-int-name* | *ip-address*] [**mac** *ieee-address*] [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**inter-dest-id** *intermediate-destination-id*] [**no-inter-dest-id**] [**ip-address** *ip-prefix[/prefix-length]*] [**port** *port-id*] [**subscriber** *sub-ident-string*] [**sap-session-id** *sap-session-index*]

**session all**

### Context

[\[Tree\]](#) (clear>service>id>ipoe session)

### Full Context

clear service id ipoe session

## Description

This commands clears all identified IPoE sessions for the specified service instance. All associated subscriber hosts are deleted from the system.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### *ip-int-name*

Specifies the name of the IP interface up to 32 characters.

### *ieee-address*

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

### *circuit-id*

Specifies the circuit ID up to 127 characters.

### *remote-id*

Specifies that information that goes into the remote-id sub-option in the DHCP relay packet, up to 255 characters.

### *ip-address[/prefix-length]*

Specifies information for the specified IP address and mask.

### *no-inter-dest-id*

Displays the information about no intermediate destination ID.

### *intermediate-destination-id*

Specifies the intermediate destination identifier which is encoded in the identification strings up to 32 characters.

### *port-id*

Displays information about the specified port ID.

### *sap-session-index*

Displays sap-session-index information.

### *service-id*

Specifies the service ID of the wholesaler.

#### Values

<i>service-id</i> :	1 to 2147483647
<i>svc-name</i> :	64 characters maximum

### *sub-ident-string*

Specifies an existing subscriber identification profile.

### *service-id*

Specifies information for the specified service ID.

#### Values

<i>service-id</i> :	1 to 2147483647
---------------------	-----------------

*svc-name*: 64 characters maximum

#### **detail**

Displays all IPoE session details.

#### **all**

clears all active IPoE sessions for the specified service instance.

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## **session**

### **Syntax**

#### **session default-tunnel**

**session** [**sap** *sap-id*] [**mac** *mac-address*] [**local-session-id** *local-id*] [**remote-session-id** *remote-id*]  
[**detail**]

### **Context**

[\[Tree\]](#) (show>subscr-mgmt>pfc session)

### **Full Context**

show subscriber-mgmt pfc session

### **Description**

This command displays information on PFCP sessions, including the default session. By default, all sessions are shown; filters can be applied to reduce the number of sessions or select a specific session.

### **Parameters**

#### **default-tunnel**

Specifies that session information for the default tunnel is displayed.

#### **detail**

Specifies that associated forwarding information is displayed.

#### **local-id**

Specifies a local PFCP Session ID, up to 20 characters, which displays information for that local session ID.

#### **remote-id**

Specifies a remote PFCP session ID, up to 20 characters, which displays information for that remote session ID.

#### **mac-address**

Specifies the MAC address associated with the session, in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx, which displays information associated with the specified MAC address.

**sap-id**

Specifies the SAP ID associated with the session.

### session

#### Syntax

**session** *lsp-path* [*lsp-index* *lsp-index*] [*path-lspid* *path-lspid*] [*prefix* *ip-prefix* / *prefix-length*] [*src* *ip-address* | *ipv6* *address*]

**session** *lsp-path* **all**

```
session sr-policy [lsp-index lsp-index] [path-lspid path-lspid] [prefix ip-prefix | prefix-length] [src ip-address | ipv6 address]
```

```
session sr-policy all
```

## Context

[\[Tree\]](#) (clear>router>bfd>seamless-bfd session)

## Full Context

```
clear router bfd seamless-bfd session
```

## Description

This command clears Seamless-BFD (S-BFD) session information.

## Parameters

### **lsp-path**

Keyword to clear the S-BFD sessions for the LSP path.

### **sr-policy**

Keyword to clear the S-BFD sessions for the SR policy.

### **all**

Keyword to clear all S-BFD sessions.

### **lsp-index** *lsp-index*

Specifies the LSP index.

**Values** 0 to 4294967295

### **path-lspid** *path-lspid*

Specifies the path LSP ID.

**Values** 0 to 4294967295

### **prefix**

Keyword to clear information by far-end prefix.

### **ip-prefix/prefix-length**

Specifies an IP prefix for which to clear S-BFD session information, and the length of the prefix.

**Values** *ipv4-prefix* — a.b.c.d (host bits must be zero)  
*ipv4-prefix-length* — 0 to 32  
*ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x — 0 to FFFF (hexadecimal)  
d — 0 to 255 (decimal)  
*ipv6-prefix-length* — 0 to 128

### ***ip-address* | *ipv6-address***

Specifies the IP address for which to clear S-BFD session information.

**Values**    *ipv4-address* — a.b.c.d  
              *ipv6-address* — x:x:x:x:x:x:x[-interface]  
                                  x:x:x:x:x:d.d.d.d[-interface]  
              x — 0 to FFFF (hexadecimal)  
              d — 0 to 255 (decimal)  
              interface — mandatory for link local address, up to 32 characters

### **Platforms**

All

## session

### **Syntax**

**session** *session-name*

### **Context**

[\[Tree\]](#) (monitor>oam-pm session)

### **Full Context**

monitor oam-pm session

### **Description**

This command monitors the raw measurement interval for the specified session and test.

### **Platforms**

All

### **Output**

The following output is an example of raw session measurement information.

### **Output Example**

```
monitor oam-pm session "eth-pm-service-4" dmm

## session

### Syntax

**session** *ldp-id* [*ldp-id*] [*interval seconds*] [*repeat repeat*] [*absolute* | *rate*]

### Context

[\[Tree\]](#) (monitor>router>ldp session)

### Full Context

monitor router ldp session

### Description

This command displays statistical information for LDP sessions at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified LDP session(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *ldp-id*

Specifies the IP address of the LDP session to display. Up to five IP addresses can be specified in a single statement.

<b>Values</b>	ipv4-address	label-space	
	ipv6-address	[label-space]	
		label-space	0 to 65535
	ipv4-address	a.b.c.d	
	ipv6-address	x:x:x:x:x:x (16 eight-bit pieces)	
		x:x:x:x:x:d.d.d.d	
		x: [0 to FFFF] H	
		d: [0 to 255] D	

### *seconds*

Configures the interval for each display, in seconds.

<b>Values</b>	3 to 60
<b>Default</b>	10 seconds

### *repeat*

Configures how many times the command is repeated.

<b>Values</b>	1 to 999
<b>Default</b>	10

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

## Platforms

All

## Output

The following output is an example of LDP session information.

### Output Example

```
A:ALA-103>monitor>router>ldp# session 10.10.10.104 interval 3 repeat 3 absolute
=====
Monitor statistics for LDP Session 10.10.10.104
```

```

```

## session

### Syntax

**session imsi** *imsi* **apn** *apn-string*

**session** [**peer-address** *ip-address*] [**router** *router-instance*] [**remote-control-teid** *teid*] [**local-control-teid** *teid*] [**detail**]

**session imsi** *imsi*

### Context

[\[Tree\]](#) (show>subscr-mgmt>gtp>s11 session)

### Full Context

show subscriber-mgmt gtp s11 session

### Description

This command displays GTP S11 session information.

### Parameters

#### *imsi*

Specifies the IMSI (International Mobile Subscriber Identity) of this UE.

#### *apn-string*

Specifies the APN (Access Point Name), up to 100 characters.

#### *ip-address*

Specifies the IP address.

**Values** *ipv4-address* — a.b.c.d  
*ipv6-address* — x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x - [0 to FFFF]H  
d - [0 to 255]D  
length: 0 to 128

#### *router-instance*

Specifies the identifier of the virtual router instance where the GTP tunnel is terminated.

**Values** *router-name* | *vprn-svc-id*  
*router-name* — "Base"

*vprn-svc-id* — 1 to 2147483647

**remote-control-teid *teid***

Specifies the remote control plane Tunnel Endpoint Identifier (TEID).

**Values** 1 to 4294967295

**local-control-teid *teid***

Specifies the local control plane TEID.

**Values** 1 to 4294967295

**detail**

Displays detailed information.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of GTP S11 session information.

**Output Example**

```
Node# show subscriber-mgmt gtp s11 session
=====
GTP S11 sessions
=====

**session**

**Syntax**

**session** *session-name*

**Context**

[\[Tree\]](#) (show>oam-pm>stats session)

### Full Context

```
show oam-pm statistics session
```

### Description

This command selects the session for the statistical display.

### Parameters

***session-name***

Specifies the session name, up to 32 characters.

### Platforms

All

## 27.12 session-filter

### session-filter

### Syntax

```
session-filter
```

```
session-filter session-filter-name
```

### Context

[\[Tree\]](#) (show>app-assure>group session-filter)

### Full Context

```
show application-assurance group session-filter
```

### Description

This command displays session filter information.

### Parameters

***session-filter-name***

Specifies a session-filter-name up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### Output

The following output is an example of the **session-filter** command information.

## Output Example

```
show application-assurance group <aa-group-id>[:<partition>] session-filter <filter-  
name>  
# session-filter<filter-id>

## 27.13 session-parameters

### session-parameters

#### Syntax

```
session-parameters [family] [community community]
```

```
session-parameters peer-ip-address
```

#### Context

```
[Tree] (show>router>ldp session-parameters)
```

#### Full Context

```
show router ldp session-parameters
```

#### Description

This command displays LDP peer information.

#### Parameters

##### ***peer-ip-address***

Specify the peer IP address.

##### ***family***

Displays either IPv4 or IPv6 active LDP information.

**Values**    ipv4, ipv6

**community**

The string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

**Platforms**

All

**Output**

Table 502: Output fields: LDP session parameters describes the LDP session-parameters output.

Table 502: Output fields: LDP session parameters

Label	Description
Peer	The IP address of the peer.
TTL security	Enabled — LDP peering sessions protected. Disabled — LDP peering sessions unprotected.
Min-TTL-Value	Displays the minimum TTL value for an incoming packet.
Auth	Enabled — Authentication using MD5 message based digest protocol is enabled. Disabled — No authentication is used.

**Output Example**

Example with community RED:

```
*A:SRU4# show router ldp session-parameters 10.20.1.1

## 27.14 sessions

### sessions

#### Syntax

**sessions** [*group name*] **neighbor** *ip-address*] [*port port-number*] [*association*] [*statistics*]

#### Context

**[Tree]** (show>service>id>gsmf sessions)

## Full Context

```
show service id gsmp sessions
```

## Description

This command displays GSMP sessions information.

## Parameters

### group

A GSMP group defines a set of GSMP neighbors which have the same properties.

### name

Specifies a GSMP group name is unique only within the scope of the service in which it is defined.

### ip-address

Specifies the ip-address of the neighbor.

### port

Specifies the neighbor TCP port number use for this ANCP session.

**Values** 0 to 65535

### association

Displays to what object the ANCP-string is associated.

### statistics

Displays statistics information about an ANCP session known to the system.

## Platforms

All

## Output

The following output is an example of GSMP sessions information.

### Output Example

This show command gives information about the open TCP connections with DSLAMs.

```

```

The following table describes service ID GSMP sessions output fields:

*Table 503: Output fields: service ID GSMP sessions*

Label	Description
Port	The port ID number
Ngbr-IpAddr	The neighbor IP address
Gsmp-Group	The GSMP group ID
State	The GSMP state of this TCP connection
Peer Instance	The unique GSMP ID for each end of the GSMP connection
Peer Port	The unique GSMP ID for each end of the GSMP connection
Peer Name	The unique GSMP ID for each end of the GSMP connection

Label	Description
timeouts	The number of successive timeouts for this session
Peer Timer	The GSMP keepalive timer
Capabilities	The ANCP capabilities negotiated for this session
Conf Capabilities	The ANCP capabilities configured for this session
Priority Marking	The priority marking configured for this session
Local Addr	The IP address used by the box's side of the TCP connection
Conf. Local Addr.	The configured IP address used by the box's side of the TCP connection
Sender Instance	The instance sent to the neighbor in this session
Sender Port	The port sent to the neighbor in this session
Sender Name	The name sent to the neighbor in this session
Max. Timeouts	The maximum number of successive timeouts configured for this session
Sender Timer	The timeout value that is announced toward the neighbor. The neighbor uses this timeout value while waiting for an acknowledgment from this system.

**Note:**

The association command gives an overview of each ANCP string received from this session.

## Context

[\[Tree\]](#) (tools>dump>nat sessions)

## Full Context

tools dump nat sessions

## Description

This command dumps ISA sessions.

## Parameters

### **icmp**

Specifies to dump only ICMP information.

### **ieee-address**

Specifies a MAC address, using the format xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

### **ip-address**

Specifies an IPv4 or IPv6 address.

**Values** *ipv4-address* — a.b.c.d  
*ipv6-address* — x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x — 0 to FFFF (in hexadecimal)  
d — 0 to 255 (in decimal)

### **ipv4-address**

Specifies an IPv4 address.

**Values** a.b.c.d

### **ipv6-address**

Specifies an IPv6 address.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x — 0 to FFFF (in hexadecimal)  
d — 0 to 255 (in decimal)

### **mda-id**

Specifies an MDA ID.

**Values** *slot/mda*

### **nat-group-id**

Specifies a NAT group ID.

**Values** 1 to 4

***policy-name***

Specifies a policy name, up to 32 characters maximum.

***port-number***

Specifies a port number.

**Values** 0 to 65535

***router-instance***

Specifies a router name or service ID.

***tcp***

Specifies to dump only TCP information.

***udp***

Specifies to dump only UDP information.

***upnp***

Specifies to dump only UPNP information.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of this command.

## sessions

### Syntax

```
sessions [test-family {ethernet | ip | mpls}]
sessions [test-family {ethernet | ip | mpls}] detectable-rx-errors
sessions [test-family {ethernet | ip | mpls}] detectable-tx-errors
sessions [test-family {ethernet | ip | mpls}] event-mon
sessions [test-family {ethernet | ip | mpls}] streaming delay
```

### Context

[\[Tree\]](#) (show>oam-pm sessions)

### Full Context

```
show oam-pm sessions
```

### Description

This command shows a summary of the OAM Performance Monitoring sessions.

### Parameters

#### **test-family**

Shows all sessions that match the specified test family type when an optional filter is included.

#### **ethernet**

Specifies Ethernet session types.

#### **ip**

Specifies IP session types.

#### **mpls**

Specifies MPLS session types.

#### **event-mon**

Specifies a summary of all event monitoring and current state for each session.

#### **detectable-rx-errors**

Specifies to display all MPLS sessions with a reported non-successful return code. The results of all return codes, other than "success", are included. When a return code is not available it is reported as "none". Sessions with a successful return code are filtered and not displayed in the list. This is specific to **test-family mpls** only.

**detectable-tx-errors**

Specifies to provide a summary of tests with detectable transmission errors that prevent the test from sending packets. Not all errors are detectable.

**streaming delay**

Displays all sessions with an assigned delay template.

**Platforms**

All

**Output**

The following output is an example of OAM-PM session summary information.

**Output Example**

```

show oam-pm sessions

## 27.15 set-epoch-value

### set-epoch-value

#### Syntax

**set-epoch-value** *value*

#### Context

[\[Tree\]](#) (tools>perform>router>pcp-server set-epoch-value)

#### Full Context

tools perform router pcp-server set-epoch-value

#### Description

This command sets the epoch value for a specified PCP server.

#### Parameters

***value***

Specifies the epoch value.

**Values** 0 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 27.16 set-fabric-speed

### set-fabric-speed

#### Syntax

**set-fabric-speed** *fabric-speed*

#### Context

[\[Tree\]](#) (tools>perform>system set-fabric-speed)

#### Full Context

tools perform system set-fabric-speed

#### Description

This command configures the fabric speed. This command is necessary to define the mode of operation for the system.

#### Default

set-fabric-speed none (for the 7750 SR-7s/14s FP4 and 7950 XRS systems)

set-fabric-speed fabric-speed-d (or the 7750 SR-7s/14s FP5 systems)

set-fabric-speed fabric-speed-a (for the other 7750 SR and 7450 ESS systems)

#### Parameters

##### *fabric-speed*

Specifies the fabric speed of the system.

**Values** fabric-speed-a — Sets the chassis to operate at the following speeds using N+1 switch fabric redundancy:

- up to 100 Gb/s per slot for the 7450 ESS-7/12 and the 7750 SR-7/12
- up to 200 Gb/s per slot for the 7750 SR-12e

This permits a mixture of FP2- and FP3-based cards to co-exist.

fabric-speed-b — Sets the chassis to operate at the following speeds using N+1 switch fabric redundancy:

- up to 200 Gb/s per slot for the 7450 ESS-7/12 and the 7750 SR-7/12

- up to 400 Gb/s per slot for the 7750 SR-12e

All cards in the system are required to be FP3-based (FP3 IMM or newer). The system does not support any FP2-based cards when the chassis is set to **fabric-speed-b**.

**fabric-speed-c** — Sets the use of both FP3- and FP4-based cards and is compatible with SFM6 for the 7750 SR-7/12/12e and 7450 ESS-7/12. This speed is mandatory if FP4 cards are used. The performance of FP3 cards is the same as **fabric-speed-b**. For the 7950 XRS 20/20e this parameter enables the use of both FP3- and FP4-based cards and is compatible with **sfm2-x20s**. The performance of FP3 cards is the same as the **none** parameter.

**fabric-speed-d** — Sets the use of FP4- and FP5-based cards and is compatible with **sfm2-s** for the 7750 SR-7s and 7750 SR-14s. This speed is mandatory if FP5 cards are used.

**none** — For a 7950 XRS-20/20e, enables use of only FP3 cards. For 7750 SR-7s/14s, enables the use of only FP4 cards.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 27.17 set-role

### set-role

#### Syntax

```
set-role {extension | master | standalone}
```

#### Context

[\[Tree\]](#) (tools>perform>chassis set-role)

#### Full Context

```
tools perform chassis set-role
```

#### Description

This command sets the role of the 7950 XRS chassis from which the command is invoked.

- When run on a standalone chassis this will update the EEPROM on the (one) Chassis backplane.
- Master and Extension chassis are blocked if any SFMs are configured as type **sfm-x20** (must be **sfm-x20-b**). The following message displays:
- When the **extension** option is specified, the chassis will immediately reboot as part of the command. The following warning and prompt will be provided:

```
WARNING: You are about to provision the chassis as an XRS-40 Extension chassis.
```

```
This chassis will immediately reboot after the command is executed. No CLI shell is available directly on an Extension chassis. An Extension chassis will not completely boot up unless it is properly cabled to and controlled by an XRS-40 Master chassis. Do you wish to proceed (yes/no) ?
```

- When the **master** option is specified, the chassis will immediately reboot as part of the command. The Operational mode is not changed until a reboot is performed. The following warning and prompt will be provided:

```
WARNING: You are about to provision the chassis as an XRS-40 Master chassis. This chassis will immediately reboot after the command is execute
```

```
Do you wish to proceed (yes/no) ?
```

- When the **master** or **extension** options are specified and the chassis has any SFM slots with a configured type of sfm-x20, then the command will fail with the following message:

```
Configured sfm-type of sfm-x20 is not compatible with XRS-40 mode operation.
```

If you want to change the role of the chassis anyways, you can deconfigure the SFMs and then change the role.

## Platforms

7950 XRS

## 27.18 set-trim-mode

### set-trim-mode

#### Syntax

```
set-trim-mode set-trim-mode
```

#### Context

```
[Tree] (tools>perform>system set-trim-mode)
```

#### Full Context

```
tools perform system set-trim-mode
```

#### Description

This command should only be used with authorized direction of Nokia technical support.

#### Parameters

***set-trim-mode***

Specifies the trim operating mode for the system.

**Values** trim-mode-a, trim-mode-b

### Platforms

7450 ESS, 7750 SR-7/12/12e

## 27.19 sflow

### sflow

#### Syntax

sflow

#### Context

[\[Tree\]](#) (show sflow)

#### Full Context

show sflow

#### Description

This command displays the primary and backup receiver statistics, the mapping configuration and a summary of how many ports and SAPs have sFlow enabled.

### Platforms

7750 SR, 7750 SR-s, 7950 XRS

#### Output

The following output is an example of sFlow information. [Table 504: Output fields: sFlow](#) describes the show sFlow output fields.

#### Output Example

```
*B:bkvm10# show sflow
=====
sFlow Status
=====
Receiver           : pat

ingress      policer 12     broadcast
-----
No. of sFlow counter mappings: 6
-----
=====
    
```

Table 504: Output fields: sFlow

Label	Description
<b>sFlow Status</b>	
Receiver	Displays the configured name for the sFlow receiver.
Max Data Size	The configured maximum data size for sFlow UDP packets.
IP Addr Primary	The primary IP address and destination port for sFlow receiver.
IP Addr Backup	The backup IP address and destination port for sFlow receiver.
Packets Sent	The number of packets sent successfully to the primary or backup receiver destination, since the destination was configured, CPM card HA switchover, or system reboot.
Packet Errors	The number of packets that could not be sent to the primary or backup receiver destination because of an error, since the destination was configured, CPM card HA switchover, or system reboot. An example of an error is destination IP not reachable.
Last Packet Sent	Displays the date and time of the last packet sent.
<b>Counter Pollers</b>	
Port	Displays the port on which sFlow is enabled.

Label	Description
No. of SAPs	The number of SAPs on the port with sFlow enabled.
No. of sFlow counter pollers	The number of sFlow counter pollers.
<b>Counter Mappings</b>	
Direction	Displays the direction of traffic (ingress or egress) the map entry applies to.
Policer/Queue	Displays the policer or queue instance being mapped by sFlow map.
Traffic type	Displays the type of sFlow traffic statistics (unicast, multicast or broadcast) that the policer/queue maps to.
No. of sFlow counter mappings	The number of entries in the sFlow ingress and egress counter map.

## 27.20 sfm

### sfm

#### Syntax

**sfm** *sfm-name* [**force**]

#### Context

[\[Tree\]](#) (clear sfm)

#### Full Context

clear sfm

#### Description

This command resets the SFM.

#### Parameters

***sfm-name***

Specifies the SFM identifier.

**Values** 1 to 16 (7950 XRS)  
 1 to 8 (7750-SR-14s)  
 1, 2 (all other platforms)

**force**

Performs the reset without a confirmation prompt.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

**sfm**

**Syntax**

**sfm** [*sfm-name*] [**detail**]

**sfm** [*sfm-name*] **icport** [**down**] [**degraded**]

**Context**

[\[Tree\]](#) (show sfm)

**Full Context**

show sfm

**Description**

This command displays SFM status information.

**Parameters**

***sfm-name***

Specifies the SFM identifier.

**Values** 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16

**icport**

Displays interconnect port information.

**down**

Displays interconnect ports that are not operational.

**degraded**

Displays interconnect ports that are associated with fabric degradation.

**detail**

Displays detailed information about the SFM.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

**Output**

See the following output examples:

- [Output Example: show sfm](#)

### Output Fields: show sfm

[Table 505: Output fields: SFM](#) describes output fields for the **show sfm** command.

Table 505: Output fields: SFM

Label	Description
Slot	The number of the slot in which the SFM is installed.
Provisioned Type Equipped Type (if different)	The SFM type provisioned.
Admin State	The administrative state.
Operational State	The operational state.

Label	Description
<b>Hardware Data</b>	
Part number	The SFM part number.
CLEI code	The SFM CLEI code.
Serial number	The SFM serial number.
Manufacture date	The date the SFM was manufactured.
Manufacturing deviations	Specifies any manufacturing deviations.
Manufacturing assembly number	The SFM assembly number.
Administrative state	Specifies the administrative state of the SFM.
Operational state	Specifies the operational state of the SFM.
Time of last boot	Indicates the time stamp of the last system restart.
Current alarm state	Indicates the current alarm state.
<b>Inter Chassis SFM Interconnect</b>	
SFM Interconnect Port	Port number of the interconnect port.
oper state	Up — The SFM is administratively up. Down — The SFM is administratively down.
Misconnect Info	Only displayed if the oper state is <b>invalid-connection</b> .
SFF Status	The SFF status
fabric degrade state	Indicates state.

## 27.21 sfm-interco-test

### sfm-interco-test

#### Syntax

**sfm-interco-test** [sfm x]

#### Context

**[Tree]** (tools>perform>system>inter-chassis sfm-interco-test)

## Full Context

```
tools perform system inter-chassis sfm-interco-test
```

## Description

Use this command to run inter-chassis SFM loopback tests for the 7950 XRS.

Run on an out-of-service standalone chassis that will later become the Extension chassis of an XRS-40 system. The out of service chassis (Chassis 1 – future Master chassis) must be connected by means of SFM interconnect links (cable bundles) before this test is run. This test operates without requiring any XCMs in either chassis, but they can be present.

The test should not be initiated from Chassis 1.

The following conditions must be satisfied for the test to be permitted:

- The system must be in standalone mode; error message:

```
The test can only be performed on a standalone system
```

- The system must have only XRS-40 compatible SFMs provisioned; error message:

```
The chassis can not have SFMs with a configured type of sfm-x20s-b  
when performing the test
```

- All provisioned SFMs must be operational; error message:

```
All provisioned SFMs must be operational before performing the test
```

- The same test cannot be running in another session (that is, only one test can be executed at a time); error message:

```
The test is already in-progress in another session
```

Other notes (which are also relayed to the operator when the test is attempted):

- All provisioned XCMs will be reset at the start of the test and will be held in the *booting* state until the test has completed.
- All SFMs will be cleared when the operator exits the test. This will trigger a reset of the XCMs and the standby CPM.

## Platforms

7950 XRS

## Output

The following output is an example of SFM interconnection test information.

### Output Example

```
*A:Dut-A# tools perform system inter-chassis sfm-interco-test  
WARNING: This test is intended for an out-of-service standalone chassis that is  
going to later become the extension chassis of an XRS-40 system.
```

At the start of the test, all provisioned IOMs will be reset and will be held in the 'booting' state until the test has completed.

While the test is running avoid altering this system or the attached system (e.g. do not shutdown, clear, or remove the CPMs/SFMs/IOMs and do not issue CPM switchovers)

Once testing has completed all SFMs in this system will be cleared.

Do you wish to proceed (y/n)? y  
 Clearing provisioned IOMs ...

=====
```

```
Correct any mis-cabling and replace any suspected faulty equipment. Press Q to
quit the test or any other key to run the test again. q
Test complete, clearing the SFMs to return them to normal operational state.
Done. Exiting test.
```

## 27.22 sgt-qos

### sgt-qos

#### Syntax

**sgt-qos**

#### Context

[\[Tree\]](#) (show>router sgt-qos)

#### Full Context

show router sgt-qos

#### Description

This command displays QoS information for self-generated traffic. In the output, "none" means that the default values for each application are used, not that there is no value set. For a list of application defaults, refer to "QoS for Self-Generated (CPU) Traffic on Network Interfaces" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide*.

#### Platforms

All

## 27.23 sham-link

### sham-link

#### Syntax

**sham-link** [*interface-name*] [*detail*]

**sham-link** *interface-name* **remote** *ip-address* [*detail*]

## Context

[\[Tree\]](#) (show>router>ospf sham-link)

## Full Context

```
show router ospf sham-link
```

## Description

This command displays OSPFv2 sham-link neighbor information.

## Parameters

### *interface-name*

Displays only the sham link identified by this interface name, up to 32 characters.

### *remote*

Displays sham-link information for the sham link identified by the specified remote IP address.

### *ip-address*

Displays only the sham link identified by this IP address.

## Platforms

All

## Output

The following output is an example of OSPFv2 sham-link neighbor information and [Table 506: Output fields: OSPF sham links](#) describes the output fields.

## Output Example

```
show router 1 ospf sham-link detail

Table 508: Output fields: SHCV policy

Label	Description
Description	Displays the SHCV policy description
Last management change	Displays the date and time when the policy was last changed
<b>VPLS</b>	SHCV parameters applicable for VPLS services
IPv4 source address	Displays the IPv4 source address (sender IP address) used in SHCV ARP requests sent to host addresses learned using DHCP snooping in a VPLS service

Label	Description
Source MAC address	Displays the source MAC address used in SHCV ARP requests sent to host addresses learned using DHCP snooping in a VPLS service
<b>Layer 3</b>	SHCV parameters applicable for Layer 3 services
Source IP address origin	Displays the source IP address origin: <ul style="list-style-type: none"> <li>interface = use the interface MAC and IP address as source addresses for SHCV ARP requests on regular IES or VPRN interfaces</li> <li>vrrp = use the VRRP MAC and IP address as source addresses for SHCV ARP requests on regular IES or VPRN interfaces when in SRRP master state</li> </ul>
Unnumbered source IP address	Displays the IPv4 source address (sender IP address) used in SHCV ARP requests for unnumbered hosts
<b>Periodic</b>	SHCV parameters applicable for periodic and OAM checks
Administrative state	Displays the administrative state for periodic and OAM checks (enabled, disabled)
Action	Displays the action for unsuccessful checks: <ul style="list-style-type: none"> <li>alarm = raise an event</li> <li>remove = raise an event and delete the subscriber host from the system</li> </ul>
Interval (minutes)	Displays the interval between subsequent periodic checks
Retry count	Displays the number of SHCV check retries when no response is received within the retry timeout interval
Retry timeout (s)	Displays the time to wait for an SHCV check response before the next retry or execution of the SHCV unsuccessful check action
<b>Triggered</b>	SHCV parameters applicable for triggered checks
<i>ip-conflict</i>	SHCV parameters applicable for checks triggered by an IP conflict: a new host with different MAC address and same IP address as an existing host active on the same SAP
Administrative state	Displays the administrative state for ip-conflict triggered checks (enabled, disabled)
Retry count	Displays the number of SHCV check retries when no response is received within the retry timeout interval
Retry timeout (s)	Displays the time to wait for an SHCV check response before the next retry or deletion of the existing host from the system

Label	Description
<i>host-limit-exceeded</i>	SHCV parameters applicable for checks triggered by a host limit exceeded event
Administrative state	Displays the administrative state for host-limit-exceeded triggered checks (enabled, disabled)
Retry count	Displays the number of SHCV check retries when no response is received within the retry timeout interval
Retry timeout (s)	Displays the time to wait for an SHCV check response before the next retry or deletion of the unresponsive existing host from the system
<i>inactivity</i>	SHCV parameters applicable for checks triggered by an inactivity detection
Administrative state	Displays the administrative state for host-limit-exceeded triggered checks (enabled, disabled)
Retry count	Displays the number of SHCV check retries when no response is received within the retry timeout interval
Retry timeout (s)	Displays the time to wait for an SHCV check response before the next retry or deletion of the unresponsive inactive host from the system
mobility	SHCV parameters applicable for checks triggered by a mobility event: a new host with same MAC address and same IP address as an existing host active on a different SAP
Administrative state	Displays the administrative state for mobility triggered checks (enabled, disabled)
Retry count	Displays the number of SHCV check retries when no response is received within the retry timeout interval
Retry timeout (s)	Displays the time to wait for an SHCV check response before the next retry or deletion of the existing host from the system
mac-learning	SHCV parameters applicable for checks triggered for mac learning of IP only static hosts
Administrative state	Displays the administrative state for mac-learning triggered checks (enabled, disabled)
Retry count	Displays the number of SHCV check retries when no response is received within the retry timeout interval
Retry timeout (s)	Displays the time to wait for an SHCV check response before the next retry

## 27.27 sid-egress-stats

### sid-egress-stats

#### Syntax

```
sid-egress-stats adj [interface-name]  
sid-egress-stats adj-set [id]  
sid-egress-stats all  
sid-egress-stats node [ip-prefix[/ prefix-length]]
```

#### Context

**[Tree]** (clear>router>isis sid-egress-stats)

#### Full Context

```
clear router ospf sid-egress-stats
```

```
clear router isis sid-egress-stats
```

#### Description

This command clears the IS-IS or OSPF egress SID statistics.

#### Parameters

##### adj

Clears the egress statistics of the adjacency SID specified by the corresponding interface name. Clears all adjacency SIDs egress statistics if no adjacency SID is specified.

##### *interface-name*

Clears the SID egress statistics for the interface specified by this interface name up to 32 characters.

##### adj-set

Clears the egress statistics of the adjacency set specified by the corresponding ID. Clears all adjacency sets egress statistics if no adjacency set is specified.

##### *id*

Clears the SID egress statistics for the identifier specified for this adjacency set.

**Values** 0 to 4294967295

##### all

Clears all the SID egress statistics.

##### node

Clears the egress statistics for the node SID specified by the corresponding prefix. Clears all node SIDs egress statistics if no node SID is specified.

### ***ip-prefix[/prefix-length]***

Clears the IP prefix and prefix length of the node SID.

- Values**    ipv4-prefix:
- a.b.c.d (host bits must be 0)
- ipv4-prefix-length: [0 to 32]

### **Platforms**

**sid-egress-stats node** [*ip-prefix[/ prefix-length]*]

### **Context**

**[Tree]** (clear>router>ospf3 sid-egress-stats)

### **Full Context**

clear router ospf3 sid-egress-stats

### **Description**

This command clears the OSPF3 egress SID statistics.

### **Parameters**

#### **adj**

Clears the egress statistics of the adjacency SID specified by the corresponding interface name. Clears all adjacency SIDs egress statistics if no adjacency SID is specified.

#### ***interface-name***

Clears the SID egress statistics for the interface specified by this interface name up to 32 characters.

#### **all**

Clears all the SID egress statistics.

#### **node**

Clears the egress statistics for the node SID specified by the corresponding prefix. Clears all node SIDs egress statistics if no node SID is specified.

### ***ip-prefix[/prefix-length]***

Clears the IP prefix and prefix length of the node SID.

- Values**    ipv4-prefix:

- a.b.c.d (host bits must be 0)
- ipv4-prefix-length: [0 to 32]
- ipv6-prefix:
- x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

## Full Context

show router ospf sid-stats

show router isis sid-stats

## Description

This command displays information about IGP SIDs statistics.

## Parameters

### *interface-name*

Displays only the SID statistics identified by this interface name up to 32 characters.

### *id*

Displays the adjacency set ID.

**Values** 0 to 4294967295

### *ip-prefix[/prefix-length]*

Displays information for the specified IP prefix and prefix length.

**Values** ipv4-prefix:  
• a.b.c.d (host bits must be 0)  
ipv4-prefix-length: [0 to 32]

### *algo-id*

Displays the algorithm identifier.

**Values** 0 to 255

### *adj*

Displays the ingress and egress statistics, if any, of the adjacency SID specified by the corresponding interface name. Displays statistics for all adjacency SIDs if none is specified.

### *adj-set*

Displays the ingress and egress statistics, if any, of the adjacency set specified by its associated ID. Displays statistics for all adjacency sets if none is specified.

### *node*

Displays the ingress and egress statistics, if any, of the node SID specified by the corresponding prefix. Displays statistics for all node SIDs if none is specified.

### *algo*

Displays statistics for the specified algorithm identifier.

### *summary*

Displays statistics indices usage for SID statistics.

## Platforms

All

## Output

The following outputs are examples of SID statistics information and [Table 509: Output fields: SID statistics adjacency set](#) describes the output fields.

### Output Example

The **show router ospf sid-stats adj** command displays statistics for adjacency SIDs.

```

=====
Label          : 20001                Type           : adjacency
Prefix         : 10.1.2.2/32
Interface      : to_Dut-B
Ingress Oper State: enabled          Egress Oper State : enabled
Ingress Octets : 0                  Egress Octets     : 0
Ingress Packets : 0                  Egress Packets    : 0
...
=====
    
```

The **show router ospf sid-stats adj-set** command displays statistics for adjacency set SIDs.

```

=====
Label          : 20001                Type           : adjacencySet
Prefix         : 2.1.20.10/32
Adjacency-set  : 23
Ingress Oper State: enabled          Egress Oper State : enabled
Ingress Octets : 0                  Egress Octets     : 0
Ingress Packets : 0                  Egress Packets    : 0
...
=====
    
```

The **show router ospf sid-stats node** command displays statistics for the specified algorithm.

Table 509: Output fields: SID statistics adjacency set

Label	Description
Label	The ILM MPLS label corresponding to the SID.
Type	The type of the SID.
Prefix	The prefix corresponding to the node SID, or the IP address of the neighbor (adjacency SID) or the destination IP associated to the adjacency set.
Interface	The OSPF interface.
Ingress Oper State	Indicates if ingress statistics are enabled or disabled, or if no statistics index is allocated to that SID (no resources).
Egress Oper State	Indicates if egress statistics are enabled or disabled, or if no statistics index is allocated to that SID (no resources).
Ingress Octets	The number of octets received on ingress for that SID.
Egress Octets	The number of octets sent on egress for that SID.
Ingress Packets	The number of packets received on ingress for that SID.

Label	Description
Egress Packets	The number of packets sent on egress for that SID.

## sid-stats

### Syntax

**sid-stats adj** [*interface-name*]  
**sid-stats node** [*ip-prefix*[/ *prefix-length*]]  
**sid-stats summary**

### Context

[\[Tree\]](#) (show>router>ospf3 sid-stats)

### Full Context

show router ospf3 sid-stats

### Description

This command displays information about IGP SIDs statistics.

### Parameters

#### adj

Displays the ingress and egress statistics, if any, of the adjacency SID specified by the corresponding interface name. Displays statistics for all adjacency SIDs if none is specified.

#### *interface-name*

Displays only the SID statistics identified by this interface name up to 32 characters.

#### node

Displays the ingress and egress statistics, if any, of the node SID specified by the corresponding prefix. Displays statistics for all node SIDs if none is specified.

#### *ip-prefix*[/*prefix-length*]

Displays information for the specified IP prefix and prefix length.

**Values** ipv4-prefix:  
• a.b.c.d (host bits must be 0)  
ipv4-prefix-length: [0 to 32]

#### summary

Displays stat indices usage for SID statistics.

### Platforms

All

## Output

The following outputs are an example of SID statistics information

### Output Example

The **show router ospf3 sid-stats adj** command displays statistics for adjacency SIDs.

```

=====
Label           : 20001                Type           : adjacency

**Table 510: Output fields: SLA profile** describes subscriber management SLA profile output fields.

*Table 510: Output fields: SLA profile*

Field	Description
Name	The Service Level Agreement (SLA) profile name
Description	The user provided description of this policy
Number of SLA Profiles	The total number of SLA profiles configured on this node
Control plane(s)	The SLA profile controlled by local control plane or CUPS control plane
Host Limits	The configured maximum number of hosts per SLA profile instance

Field	Description
Session Limits	The configured maximum number of sessions per SLA profile instance
Ingress Qos-Policy	The ingress QoS policy ID
Egress Qos-Policy	The egress QoS policy ID
Ingress Queuing Type	The queuing type
Ingress Filter-Id	The ingress IP filter
Egress Filter-Id	The egress IP filter
Last Mgmt Change	The time and date of the most recent management-initiated change
Queue	The ingress queue ID
Rate	The SLA profile queue rate
CIR	The CIR rate
HiPrio	The number of high priority packets as determined by the SLA profile ingress QoS policy
CBS	The amount of reserved buffer space (in bytes) for the policer
MBS	The amount of buffer space (in bytes) allowed for the policer

## 27.34 slm

```
slm
```

## Syntax

```
slm lmm [interval seconds] [repeat repeat] [absolute | rate]
```

## Context

[\[Tree\]](#) (monitor>oam-pm>session slm)

## Full Context

```
monitor oam-pm session slm
```

## Description

This command monitors the Ethernet Synthetic Loss Measurement (SLM) statistics for the specified test's raw measurement interval.

## Parameters

### *seconds*

Specifies the time interval, in seconds.

**Values** 3 to 60

**Default** 10

### *repeat*

Specifies the number of times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Specifies that the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Specifies that the rate-per-second is displayed.

**Default** delta

Table 511: Output fields: QoS slope policy

Label	Description
Policy	The ID that uniquely identifies the policy.
Description	A string that identifies the policy context in the configuration file.
Time Avg	The weighting between the previous shared buffer average utilization result and the new shared buffer utilization.
Slope Parameters	
Start Avg	Specifies the RED slope position for the shared buffer average utilization value where the packet discard probability starts to increase above zero.
Max Avg	Specifies the percentage of the shared buffer space for the buffer pool at which point the drop probability becomes one, expressed as a decimal integer.
Admin State	Enabled The administrative status of the RED slope is enabled. Disabled The administrative status of the RED slope is disabled.
Max Prob.	Specifies the RED slope position for the maximum non-one packet discard probability value before the packet discard probability rises directly to one.

smet

### Syntax

**smet** [hunt | detail] [rd rd] [community comm-id] [tag tag] [next-hop next-hop] [aspath-regex reg-exp] [originator-ip ip-address | ipv6-address]

### Context

[\[Tree\]](#) (show>router>bgp>routes>evpn smet)

## Full Context

```
show router bgp routes evpn smet
```

## Description

This command displays BGP-EVPN SMET routes.

## Parameters

### hunt

Displays entries for the specified route.

### detail

Displays detailed information.

### rd

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

### comm-id

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val | ext-comm | well-known-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as the following:  
*type:{ ip-address:comm-val1 | as-number1:comm-val2 | as-number2:comm-val1 }*  
where:
  - *as-number1* — 0 to 65535
  - *comm-val1* — 0 to 65535
  - **type** — target, origin
  - *ip-address* — a.b.c.d
  - *comm-val2* — 0 to 4294967295
  - *as-number2* — 0 to 4294967295
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise |**

### tag

Specifies the SMET route tag.

**Values** 0to 4294967295 | MAX-ET

### next-hop

Specifies the IPv4 or IPv6 BGP next-hop address.

Values		
ipv4-address:		a.b.c.d
ipv6-address:		x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

### **reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

### **ip-address | ipv6-address**

Specifies the originator IPv4 or IPv6 address, up to 64 characters.

## **Platforms**

All

## **27.37 snippets**

### **snippets**

#### **Syntax**

**snippets [detail]**

**snippets name snippet-name [instance snippet-instance] [detail]**

#### **Context**

[\[Tree\]](#) (show>service>dynsvc>script snippets)

#### **Full Context**

show service dynamic-services script snippets

#### **Description**

This command displays the dynamic services snippets information. A snippet is the name of a set of Python functions to create, modify or destroy configuration; for example: a snippet called 'vprn' to create, modify, or destroy VPRN services.

The CLI output generated by a single dynamic service python function call is a snippet instance.

#### **Note:**

This command is not available in the MD-CLI.

## Parameters

### detail

Displays dynamic services snippet information.

### *snippet-name*

Specifies the snippet name.

### *snippet-instance*

Specifies the snippet instance.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of dynamic service snippets.

### Output Example

```
# show service dynamic-services script snippets
=====
Dynamic Services Snippets
=====

## Output

### SNMP Trap Group Output

[Table 513: Output fields: SNMP trap group](#) describes SNMP trap group output fields.

*Table 513: Output fields: SNMP trap group*

Label	Description
Log-ID	The log destination ID for an event stream.
Address	The IP address of the trap receiver.
Port	The destination UDP port used for sending traps to the destination, expressed as a decimal integer.
Version	Specifies the SNMP version format to use for traps sent to the trap receiver. Valid values are <code>snmpv1</code> , <code>snmpv2c</code> , <code>snmpv3</code> .
Community	The community string required by <b>snmpv1</b> or <b>snmpv2c</b> trap receivers.
Security-Level	The required authentication and privacy levels required to access the views on this node.
Replay	Indicates whether or not the replay parameter has been configured, enabled or disabled, for the trap-target address.
Replay from	Indicates the sequence ID of the first missed notification that will be replayed when a route is added to the routing table by which trap-target address can be reached. If no notifications are waiting to be replayed this field shows n/a.
Last Replay	Indicates the last time missed events were replayed to the trap-target address. If no events have ever been replayed this field shows never.

## snmp-trap-group

### Syntax

`snmp-trap-group [log-id-or-log-name]`

### Context

[\[Tree\]](#) (show>log snmp-trap-group)

=====
A:SetupCLI>config>log>snmp-trap-group#
```

*Table 514: Output fields: SNMP trap group*

Label	Description
Log-ID/Name	The log destination ID or name for an event stream.
Address	The IP address of the trap receiver,

Label	Description
Port	The destination UDP port used for sending traps to the destination, expressed as a decimal integer.
Version	Specifies the SNMP version format to use for traps sent to the trap receiver. Valid values are <code>snmpv1</code> , <code>snmpv2c</code> , <code>snmpv3</code> .
Community	The community string required by <b>snmpv1</b> or <b>snmpv2c</b> trap receivers.
Security-Level	The required authentication and privacy levels required to access the views on this node.
Replay	Indicates whether or not the replay parameter has been configured, enabled or disabled, for the trap-target address.
Replay from	Indicates the sequence ID of the first missed notification that will be replayed when a route is added to the routing table by which trap-target address can be reached. If no notifications are waiting to be replayed this field shows n/a.
Last Replay	Indicates the last time missed events were replayed to the trap-target address. If no events have ever been replayed this field shows never.

## 27.40 sntp

sntp

### Syntax

sntp

### Context

[\[Tree\]](#) (show>system sntp)

### Full Context

show system sntp

### Description

This command displays SNTP protocol configuration and state.

### Platforms

All

## Output

The following output is an example of SNTP information, and [Table 515: Output fields: system SNTP](#) describes the output fields.

### Output Example

```
A:ALA-1# show system sntp
=====
SNTP
=====
SNTP Server          Version          Preference       Interval
-----
10.10.20.253        3                Preferred        64
=====
A:ALA-1#
```

Table 515: Output fields: system SNTP

Label	Description
SNTP Server	The SNTP server address for SNTP unicast client mode.
Version	The SNTP version number, expressed as an integer.
Preference	Normal — When more than one time server is configured, one server can be configured to have preference over another. Preferred — Indicates that this server has preference over another.
Interval	The frequency, in seconds, that the server is queried.

## 27.41 sockets

**software-repository** [*repository-name*]

#### Context

[\[Tree\]](#) (show>system software-repository)

#### Full Context

show system software-repository

#### Description

This command displays software repository information.

#### Parameters

***repository-name***

Specifies the software repository name, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 27.43 source

### source

#### Syntax

**source** [*ip-address/mask*] [**type** {**configured** | **dynamic** | **both**}] [**detail**]

#### Context

[\[Tree\]](#) (show>router>msdp source)

#### Full Context

show router msdp source

## Description

This command displays the discovery method for the multicast source.

## Parameters

*ip-address/mask*

Specifies the source IP address and mask.

**Values** *ip-address* — a.b.c.d  
*mask* — 1 to 32

### **configured**

Keyword to display user-created sources.

### **dynamic**

Keyword to display dynamically created sources.

### **both**

Keyword to display both user-configured and dynamically created sources.

### **detail**

Keyword to display detailed MSDP source information.

## Platforms

All

## 27.44 source-active

### source-active

## Syntax

```
source-active [{group ip-address | local | originator ip-address | peer ip-address | source ip-address |  
group ip-address source ip-address}] [detail]
```

## Context

[\[Tree\]](#) (show>router>msdp source-active)

## Full Context

```
show router msdp source-active
```

## Description

This command displays SA messages accepted by MSDP.

## Parameters

**group** *ip-address*

Displays information about the specified group IP address.

**local**

Keyword to display information about local source-active messages.

**originator** *ip-address*

Displays information about the specified originator IP address.

**peer** *ip-address*

Displays information about the specified peer IP address.

**source** *ip-address*

Displays information about the specified source IP address.

**group** *ip-address*

Displays information about the specified group IP address.

**detail**

Keyword to display detailed MSDP source-active information.

## Platforms

## 27.45 source-active-rejected

### source-active-rejected

#### Syntax

```
source-active-rejected [peer-group name] [ group ip-address] [source ip-address] [originator ip-address] [peer ip-address]
```

#### Context

[\[Tree\]](#) (show>router>msdp source-active-rejected)

#### Full Context

```
show router msdp source-active-rejected
```

#### Description

This command displays SA messages rejected by MSDP.

#### Parameters

**peer-group** *name*

Displays information about rejected SA messages for the specified peer group.

**group** *ip-address*

Displays information about the specified group IP address.

**source** *ip-address*

Displays information about the source address of the source active entry that is rejected.

**originator** *ip-address*

Displays information about the specified originator IP address.

**peer** *ip-address*

Displays information about the peer from which this rejected source active entry was last received.

#### Platforms

All

#### Output

The following output is an example of MSDP rejected source active information, and [Table 517: Output fields: MSDP source active rejected](#) describes the output fields.

## spf

### Syntax

**spf** [*lfa*]

### Context

[\[Tree\]](#) (show>router>ospf spf)

[\[Tree\]](#) (show>router>ospf3 spf)

### Full Context

show router ospf spf

show router ospf3 spf

### Description

This command displays statistics of shortest-path-first (SPF) calculations.

## Parameters

### ifa

Displays Loop-Free Alternate (LFA) next-hop information.

## Platforms

All

## Output

SPF Output Fields

[Table 519: Output fields: SPF](#) describes SPF output fields.

*Table 519: Output fields: SPF*

Label	Description
Total SPF Runs	The total number of SPF runs triggered by new or updated LSAs.
Last Full SPF run @	The date and time when the last full SPF was run.
Last Full SPF Time	The duration, in seconds, of the last full SPF calculation. Last Full SPF Time = Intra SPF Time + Inter SPF Time + Extern SPF Time + RTM Updt Time.
Intra SPF Time	The duration, in seconds, of the Intra-area phase of the last SPF calculation.
Inter SPF Time	The duration, in seconds, of the Inter-area phase of the last SPF calculation.
Extern SPF Time	The duration, in seconds, of the External phase of the last SPF calculation.
RTM Updt Time	The duration, in seconds, of the RTM update phase of the last SPF calculation.
Min/Avg/Max Full SPF Time	Min The minimum time, in seconds, used to perform a full SPF calculation. Avg The average time, in seconds, of all the full SPF calculations performed by this OSPF router. Max The maximum time, in seconds, used to perform a full SPF calculation.
Total Sum Incr SPF Runs	The total number of incremental SPF runs triggered by new or updated type-3 and type-4 summary LSAs.

Label	Description
Total Ext Incr SPF Runs	The total number of incremental SPF runs triggered by new or updated type-5 external LSAs.

### Output Example

```
*A:Dut-C# show router ospf spf

Table 520: Output fields: IS-IS SPF log describes the IS-IS SPF log output fields.

Table 520: Output fields: IS-IS SPF log

Label	Description
When	Displays the timestamp when the SPF run started on the system.
Duration	Displays the time (in hundredths of a second) required to complete the SPF run.
L1 Nodes	Displays the number of Level 1 nodes involved in the SPF run.
L2 Nodes	Displays the number of Level 2 nodes involved in the SPF run.
Event Count	Displays the number of SPF events that triggered the SPF calculation.
Type	Displays the SPF type, Reg (regular) or Lfa (loop free alternative).
Trigger LSP	Displays the LSP that triggered the SPF run.
Reason	Displays the reason(s) for the SPF run. NEWADJ: An adjacency changed. NEWLSP: A new LSP was received. NEWAREA: An area changed. NEWREACH: A prefix changed. ECMPCHANGED: An ECMP path changed. NEWMETRIC: A prefix metric changed.

Label	Description
	RESTART: The graceful restart exited. LSPEXPIRED: An LSP expired. DBCHANGED: The LSP database was cleared by an administrator. LSPCONTENT: The content of an LSP changed. NEWPREF: The external route preference changed. NEWNLPID: The routed protocols (IPv4 or IPv6) changed. MANUALREQ: An SPF calculation was requested by an administrator. ADMINTAGCHANGED: An administrative tag changed. TUNNELCHANGED: An MPLS tunnel changed.

## 27.51 spmsi-ad

### spmsi-ad

#### Syntax

**spmsi-ad** [**hunt** | **detail**] [**rd** *rd*] [**community** *comm-id*] [**tag** *tag*] [**next-hop** *next-hop*] [**aspath-regex** *reg-exp*] [**originator-ip** *ip-address* | *ipv6-address*]

#### Context

[\[Tree\]](#) (show>router>bgp>routes>evpn spmsi-ad)

#### Full Context

show router bgp routes evpn spmsi-ad

#### Description

This command displays BGP-EVPN SPMSI AD routes.

#### Parameters

##### hunt

Displays entries for the specified route.

##### detail

Displays detailed information.

##### rd

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

##### comm-id

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm*]  
 where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as the following:  
*type*:{ *ip-address:comm-val1* | *as-number1:comm-val2* | *as-number2:comm-val1* }  
where:
  - *as-number1* — 0 to 65535
  - *comm-val1* — 0 to 65535
  - **type** — target, origin
  - *ip-address* — a.b.c.d
  - *comm-val2* — 0 to 4294967295
  - *as-number2* — 0 to 4294967295
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** |

### **tag**

Specifies the SPMSI AD route tag.

**Values** 0 to 4294967295 | MAX-ET

### **next-hop**

Specifies the IPv4 or IPv6 BGP next-hop address.

**Values**

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

### **reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

### **ip-address | ipv6-address**

Specifies the originator IPv4 or IPv6 address, up to 64 characters.

## **Platforms**

All

## 27.52 spoke-sdp

### spoke-sdp

#### Syntax

**spoke-sdp** *sdp-id[:vc-id]* {**all** | **counters** | **stp** | **l2pt** | **mrp**}

#### Context

[\[Tree\]](#) (clear>service>statistics>id spoke-sdp)

#### Full Context

clear service statistics id spoke-sdp

#### Description

This command clears statistics for the spoke SDP bound to the service.

#### Parameters

##### *sdp-id*

The spoke SDP ID for which to clear statistics

**Values** 1 to 17407

##### *vc-id*

The virtual circuit ID on the SDP ID to be reset

**Values** 1 to 4294967295

##### **all**

Clears all queue statistics and STP statistics associated with the SDP

##### **counters**

Clears all queue statistics associated with the SDP

##### **stp**

Clears all STP statistics associated with the SDP

##### **l2pt**

Clears all L2PT statistics associated with the SDP

##### **mrp**

Clears all MRP statistics associated with the SDP

#### Platforms

All

## spoke-sdp

### Syntax

```
spoke-sdp sdp-id:vc-id ingress-vc-label  
spoke-sdp sdp-id:vc-id l2tpv3  
spoke-sdp sdp-id:vc-id vccv-bfd {session | statistics}
```

### Context

[\[Tree\]](#) (clear>service>id spoke-sdp)

### Full Context

```
clear service id spoke-sdp
```

### Description

This command clears and resets the spoke SDP bindings for the service.

### Parameters

#### *sdp-id*

The spoke SDP ID to be reset.

**Values** 1 to 17407

#### *vc-id*

The virtual circuit ID on the SDP ID to be reset.

**Values** 1 to 4294967295

#### **ingress-vc-label**

Specifies to clear the ingress VC label.

#### **l2tpv3**

Specifies to clear the session mismatch flag on the spoke-SDP binding after the flag was set to true by a detected mismatch between the configured parameters and the received parameters.

#### **vccv-bfd**

Specifies to clear the following information related to VCCV BFD on the spoke-sdp.

#### **session**

Clears session information.

#### **statistics**

Clears spoke SDP statistics.

### Platforms

## 27.53 spoke-sdp-fec

### spoke-sdp-fec

#### Syntax

**spoke-sdp-fec** [1 to 4294967295]

#### Context

[\[Tree\]](#) (show>service>id spoke-sdp-fec)

#### Full Context

show service id spoke-sdp-fec

#### Description

This command displays spoke-SDP FEC information.

#### Parameters

##### detail

Displays detailed information.

#### Platforms

All

#### Output

The following output is an example of spoke-SDP FEC information.

#### Output Example

```
=====
Service Spoke-SDP FEC Information
=====
Spoke-Sdp-Fec-Id      : 1                Admin State      : enabled

## 27.54 spoke-sdp-fec-using

### spoke-sdp-fec-using

#### Syntax

```
spoke-sdp-fec-using [spoke-sdp-fec-id spoke-sdp-fec-id] [saii-type2 global-id:prefix:ac-id] [taii-type2  
global-id:prefix:ac-id] [path name] [expired]
```

#### Context

[\[Tree\]](#) (show>service spoke-sdp-fec-using)

#### Full Context

```
show service spoke-sdp-fec-using
```

#### Description

Displays the SDPs used by spoke-sdp-fecs at this node.

#### Parameters

##### *spoke-sdp-fec-id*

Specifies the spoke-SDP FEC ID for which to show SDP information.

**Values** 1 to 4294967295

##### *global-id*

Specifies the SAII or TAII global ID.

**Values** 1 to 4294967295

##### *prefix*

Specifies the SAII or TAII prefix.

**Values** a.b.c.d, 1 to 4294967295

##### *ac-id*

Specifies the SAII or TAII AC ID.

**Values** 1 to 4294967295

##### *name*

Specifies the path name. 32 characters maximum.

##### **expired**

Displays information for expired SDPs.

#### Platforms

All

## Output

The following output is an example of spoke-SDP information.

### Output Example

```
*A:Dut-C# show service spoke-sdp-fec-using

## 27.55 squelch-ingress-levels

### squelch-ingress-levels

#### Syntax

**squelch-ingress-levels** [all | ctag-space] [ sdp-id[:vc-id]]

#### Context

**[Tree]** (show>service>sdp-using>eth-cfm squelch-ingress-levels)

#### Full Context

show service sdp-using eth-cfm squelch-ingress-levels

#### Description

This command displays the squelch ingress levels associated with SDP bindings.

## Parameters

### *sdp-id[:vc-id]*

Specifies the SDP ID and virtual circuit ID on the SDP ID.

**Values** sdp-id: 1 to 32767  
vc-id: 1 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 27.56 sr-adj-sets

### sr-adj-sets

## Syntax

**sr-adj-sets** [*adjacency-set-id*] [**detail**]

## Context

[\[Tree\]](#) (show>router>isis sr-adj-sets)

## Full Context

show router isis sr-adj-sets

## Description

This command displays IS-IS SR adjacency set log information.

## Parameters

### *adjacency-set-id*

Displays SR adjacency set ID information.

**Values** 1 to 4294967295

### **detail**

Displays detailed SR adjacency set information.

## Platforms

All

## Output

The following output is an example of **sr-adj-sets** log information.

### Output Example

```
*A:Dut-C# show router isis sr-adj-sets

Neighbor System Id	Displays the neighbor system ID.
No. of SR Adjacency Sets	Displays the number of SR adjacency sets.

## 28 s Commands – Part III

### 28.1 sr-adjacencies

#### sr-adjacencies

##### Syntax

**sr-adjacencies** [*ip-int-name* | *ip-address*] [**detail**]

##### Context

**[Tree]** (tools>dump>router>isis sr-adjacencies)

##### Full Context

tools dump router isis sr-adjacencies

##### Description

This command displays IS-IS SR adjacency information.

##### Parameters

###### *ip-int-name*

Specifies the IP interface name. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

###### *ip-address*

Specifies the interface's IP address.

**Values** a.b.c.d

##### Platforms

All

#### sr-adjacencies

##### Syntax

**sr-adjacencies** [*ip-int-name* | *ip-address*] [**detail**]

**sr-adjacencies** [**remote** *ip-address*] [**detail**]

## Context

**[Tree]** (tools>dump>router>ospf sr-adjacencies)

**[Tree]** (tools>dump>router>ospf3 sr-adjacencies)

## Full Context

tools dump router ospf sr-adjacencies

tools dump router ospf3 sr-adjacencies

## Description

This command displays OSPFv2 or OSPFv3 SR adjacency information.

## Parameters

### *ip-int-name*

Specifies the IP interface name. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### *ip-address*

Specifies the interface's IP address.

**Values** a.b.c.d

## Platforms

All

## Output

### Output Example

```

## 28.2 sr-database

### sr-database

#### Syntax

```
sr-database [sid sid] [prefix ip-address] [nh-type {sr | bgp | rsvp}] [ipv4-unicast | ipv6-unicast] [algo algo-id] [detail]
```

#### Context

[\[Tree\]](#) (tools>dump>router>isis sr-database)

#### Full Context

tools dump router isis sr-database

#### Description

This command displays IS-IS SR database information.

#### Parameters

##### *sid*

Displays information for the specific segment identifier.

**Values** 0 to 524287

##### *ip-address*

Specifies the IP address in dotted decimal notation.

**Values** ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x [eight 16-bit pieces]
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

**sr**

Displays information for SR next-hop route.

**bgp**

Displays information for BGP next-hop route.

**rsvp**

Displays information for RSVP next-hop route.

**ipv4-unicast**

Displays IPv4 unicast parameters.

**ipv6-unicast**

Displays IPv6 unicast parameters.

**algo *algo-id***

Filters information based on the specific algorithm only.

**Values** 0 to 255

**detail**

Displays detailed IS-IS SR database information.

**Platforms**

All

**Output**

The following outputs are examples of IS-IS SR database information, and [Table 523: Output fields: IS-IS SR database](#) describes the output fields.

**Output Example**

```
*A:Dut-E# tools dump router isis sr-database

Table 523: Output fields: IS-IS SR database

Label	Description
Label	The ILM MPLS label corresponding to the SID

Label	Description
Prefix	The route prefix and mask
Metric	Interface metric for Level 1 and Level 2; if none are set to 0

## sr-database

### Syntax

**sr-database** [*sid sid*] [**prefix** *ip-address*] [**nh-type** {**sr** | **ldp** | **rsvp**}] [**algo** *algo-id*] [**detail**]

### Context

[\[Tree\]](#) (tools>dump>router>ospf sr-database)

### Full Context

tools dump router ospf sr-database

### Description

This command displays OSPFv2 SR database information.

### Parameters

#### *sid*

Displays information for the specific segment identifier.

**Values** 0 to 524287

#### *ip-address*

Specifies the IP address in dotted decimal notation.

**Values** ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x [eight 16-bit pieces]
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

#### *algo-id*

Displays the OSPFv2 database information for the specified algorithm identifier.

**Values** 0 to 255

### Platforms

All

## Output

The following output is an example of OSPFv2 SR database information.

### Output Example

```
*A:Dut-C# tools dump router ospf sr-database

## 28.3 sr-label

sr-label

### Syntax

sr-label

### Context

[\[Tree\]](#) (show>router>bgp sr-label)

### Full Context

show router bgp sr-label

### Description

This command displays BGP SR label information.

### Platforms

All

## 28.4 sr-lfa-coverage

sr-lfa-coverage

### Syntax

sr-lfa-coverage [flex-algo {*flex-algo-id* | all}]

### Context

[\[Tree\]](#) (show>router>isis sr-lfa-coverage)

### Full Context

show router isis sr-lfa-coverage

### Description

This command displays IS-IS SR LFA coverage information. This corresponds to the coverage provided by the various LFA algorithms for SR-ISIS tunnel, SR-TE LSP, and LDP FEC if the **fast-reroute backup-sr-tunnel** option is enabled. The LFA algorithms activate the backup next hops in the following preference order:

1. TI-LFA
2. LFA

### 3. R-LFA

#### Parameters

**flex-algo *flex-algo-id***

Displays SR LFA coverage information for the specified algorithm.

**Values** 128 to 255

**all**

Displays all the flexible algorithms that are configured.

**Values** 128 to 255, all

#### Platforms

All

#### Output

The following output is an example of SR LFA coverage information, and [Table 524: Output fields: IS-IS SR LFA coverage](#) describes the output fields.

#### Output Example

```
*A:Dut-C>config>router>isis# show router isis 0 sr-lfa-coverage
=====
Rtr Base ISIS Instance 0 SR LFA Coverage
=====
MT-ID  SidType  Level  Proto      LFA      RLFA      TILFA      Coverage
-----
      node-sid      4      40%      6(60%)   0(0%)    10/10(100%)
      adj-sid      0(0%)   2(100%)  0(0%)    2/2(100%)
=====
```

#### Output Example

```
A:Dut-A# show router isis 0 sr-lfa-coverage flex-algo 128
=====
Rtr Base ISIS Instance 0 Flex-Algo 128 SR LFA Coverage
=====
MT-ID  SidType  Level  Proto  LFA      RLFA      TILFA      Coverage
-----

=====
```

[Table 524: Output fields: IS-IS SR LFA coverage](#) describes the IS-IS SR LFA coverage output fields.

Table 524: Output fields: IS-IS SR LFA coverage

Label	Description
MT-ID	Displays the MT identification
SidType	Displays the SID type
Level	Displays the level
Proto	Displays the protocol
LFA	Displays the LFA
RLFA	Displays the RLFA
TIFLA	Displays the TI-LFA
Coverage	Displays the percentage of coverage

## sr-lfa-coverage

### Syntax

**sr-lfa-coverage** [**area** *area-id*] [**flex-algo** { *flex-algo-id* | **all**}]

### Context

[\[Tree\]](#) (show>router>ospf sr-lfa-coverage)

### Full Context

show router ospf sr-lfa-coverage

### Description

This command displays the details of the OSPF SR LFA coverage. This corresponds to the coverage provided by the various LFA algorithms for SR-OSPF tunnel, SR-TE LSP, and LDP FEC if **fast-reroute backup-sr-tunnel** option is enabled. The LFA algorithms activate the backup next hops using the preference order:

1. TI-LFA
2. LFA
3. R-LFA

### Parameters

**area** *area-id*

Displays all interfaces configured in this area.

**Values** ip-address — a.b.c.d

area — 0 to 4294967295

**flex-algo *flex-algo-id***

Displays the OSPF SR LFA coverage details for the specified segment routing algorithm.

**Values** 128 to 255

**flex-algo all**

Displays the OSPF SR LFA coverage details for all segment routing algorithms.

**Platforms**

All

**Output**

The following output is an example of OSPF SR LFA coverage, and [Table 525: Output fields: OSPF SR LFA coverage](#) describes the output fields.

**Output Example**

```
*A:Dut-C# show router ospf sr-lfa-coverage flex-algo 128
=====
Rtr Base OSPFv2 Instance 0 Flex-Algo 128 SR LFA Coverage
=====
SidType      Area          LFA          RLFA         TILFA        Coverage
-----
node-sid     0.0.0.0       2(100%)     0(0%)        0(0%)        2/2(100%)
=====
*A:Dut-C#
```

Table 525: Output fields: OSPF SR LFA coverage

Label	Description
SidType	Displays the SID type.
Area	Displays the OSPF area.
LFA	Displays the LFA.
RLFA	Displays the RLFA.
TIFLA	Displays the TI-LFA.
Coverage	Displays the percentage of coverage.

**sr-lfa-coverage**

**Syntax**

**sr-lfa-coverage** [**area** *area-id*]

## Context

[\[Tree\]](#) (show>router>ospf3 sr-lfa-coverage)

## Full Context

show router ospf3 sr-lfa-coverage

## Description

This command displays the details of the OSPF SR LFA coverage. This corresponds to the coverage provided by the various LFA algorithms for SR-OSPF tunnel, SR-TE LSP, and LDP FEC if **fast-reroute backup-sr-tunnel** option is enabled. The LFA algorithms activate the backup next hops using the preference order:

1. TI-LFA
2. LFA
3. R-LFA

## Parameters

**area** *area-id*

Displays all interfaces configured in this area.

**Values** ip-address — a.b.c.d  
 area — 0 to 4294967295

## Platforms

All

## Output

### Output Example

```
*A:Dut-C>>config>router>ospf3# show router ospf3 0 sr-lfa-coverage
=====
Rtr Base OSPFv3 Instance 0 SR LFA Coverage
=====
SidType      Area          LFA           RLFA          TILFA         Coverage
-----
node-sid     0.0.0.1       4 (40%)       6 (60%)       0 (0%)        10/10 (100%)
adj-sid      0.0.0.1       0 (0%)        2 (100%)      0 (0%)        2/2 (100%)
=====
```

The following table describes the OSPF SR LFA coverage output fields.

Table 526: Output fields: OSPF3 SR LFA coverage

Label	Description
SidType	Displays the SID type.
Area	Displays the OSPF area.

Label	Description
LFA	Displays the LFA.
RLFA	Displays the RLFA.
TIFLA	Displays the TI-LFA.
Coverage	Displays the percentage of coverage.

## 28.5 sr-lfa-info

### sr-lfa-info

#### Syntax

```
sr-lfa-info [ipv4-unicast | ipv6-unicast | mt mt-id-number] [prefix ip-prefix[/prefix-length]] [algo algo-id]  
[detail]
```

#### Context

[\[Tree\]](#) (show>router>isis sr-lfa-info)

#### Full Context

```
show router isis sr-lfa-info
```

#### Description

This command displays IS-IS SR LFA information.

#### Parameters

##### **ipv4-unicast**

Keyword used to display IPv4 unicast parameters.

##### **ipv6-unicast**

Keyword used to display IPv6 unicast parameters.

##### **mt-id-number**

Displays the MT ID parameters.

**Values** 0 | 2 | 3 | 4

##### **ip-prefix/prefix-length**

Displays the specified IP prefix.

**Values** *ipv4-prefix* — a.b.c.d (host bits must be 0)

*ipv4-prefix-length* — 0 to 32

*ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d  
 x — 0 to FFFF (hexadecimal)  
 d — 0 to 255 (decimal)  
*ipv6-prefix-length* — 0 to 128

**algo-id**

Filters information based on the specific algorithm only.

**Values** 0 | 128 to 255

**detail**

Displays detailed information.

**Platforms**

All

**Output**

The following output is an example of SR LFA information, and [Table 527: Output fields: IS-IS SR LFA information](#) describes the output fields.

**Output Example**

```
show router isis sr-lfa-info prefix 192.0.2.2/32 algo 253

#### Full Context

```
tools perform router mpls sr-te-cspf
```

#### Description

This command computes and returns one or more SR-TE paths and corresponding label stack to a specific destination router and with the specified constraints.

By default, or when the user specifies the value of **ip-to-label** for the **path-computation-method** parameter, MPLS passes the **to** path and the **from** parameters to TE-DB, which converts the list of hops into a label stack by scanning the TE database for adjacency and node SID information that belongs to the router or link identified by each hop address. If the conversion is successful, the TE database returns the actual selected hop SIDs plus labels, as well as the configured path hop addresses that were used as the input for this conversion. None of the TE constraint parameters are used in this path computation method.

When the user specifies the value of **local-cspf** for the **path-computation-method** parameter, MPLS passes all parameters of the **tools** command, including the TE constraint parameters. In this case, a full CSPF is run using these parameters.

When the user runs this **tools** command without specifying a path name, CSPF returns the set of candidate ECMP paths. When the user specifies a path name, CSPF returns a single path, which is selected randomly similar to a configured SR-TE LSP, with the **path-computation-method local-cspf** command enabled.

#### Parameters

##### to *ip-address*

Specifies the destination address.

**Values** a.b.c.d

**path *path-name***

Specifies the path name, up to 64 characters.

**from *ip-address***

Specifies the originating IP address.

**Values** a.b.c.d

***path-computation-method path-computation-method***

Specifies the path computation method of the LSP path.

**Values** ip-to-label, local-cspf

***hop-limit limit***

Specifies the maximum number of hops for the path.

**Values** 0 to 255

**exclude-bitmap *bitmap***

Specifies a bit-map of the admin groups that should be excluded in the path computation. Accepted in decimal, hex, or binary.

**Values** 0 to 4294967295

**include-bitmap *bitmap***

Specifies a bit-map of the admin groups that should be included in the path. Accepted in decimal, hex, or binary.

**Values** 0 to 4294967295

**metric-type-te**

Specifies the use of the TE metric to optimize the path. By default, the link IGP metric is used.

This parameter is deprecated. When used, it is automatically translated to **metric-type te** and an INFO message is displayed that the parameter is deprecated and **metric-type te** should be used instead.

**local-sr-protection**

Specifies the local LFA protection desired for the CSPF computed explicit path with adjacency SIDs.

**Values** none, preferred, mandatory

**label-stack-reduction**

Specifies to apply label stack reduction to the CSPF computed explicit path with adjacency SIDs.

***max-sr-labels label-stack-size***

Specifies the maximum label stack size of the CSPF computed path with or without label stack reduction.

**Values** 1 to 11

**exclude-address** *ip-addr*

Specifies a list of up to eight IP addresses that should be excluded in the path computation.

**Values** a.b.c.d

**exclude-node** *excl-node-id*

Specifies a list of up to eight addresses that should be excluded during the path computation.

**Values** a.b.c.d

**skip-interface** *interface-name*

Specifies an interface name, up to 32 characters, that should be skipped during the path computation.

**metric-type** *metric-type*

Specifies the metric type.

**Values** **igp** — Specifies use of the IGP metric.  
**te** — Specifies use of the traffic-engineering metric. This is the default metric type.  
**delay** — Specifies computation delay metrics.

**delay-metric-limit** *delay-metric-limit*

This parameter is valid for **metric-type delay** only and specifies the upper limit of the delay for a path, in microseconds. If **metric-type delay** and **delay-metric-limit** are specified, this command returns the lowest latency path that satisfies the **delay-metric-limit**. If **metric-type delay** is specified and the **delay-metric-limit** is not, the lowest latency path through the network is returned.

**Values** 1 to 16777215

**Platforms**

All

## 28.11 sr-te-lsp

### sr-te-lsp

**Syntax**

**sr-te-lsp** [*lsp-name*] [**status** {**up** | **down**}] [**detail**] **path** [*path-name*] [**auto-lsp** {**all** | **mesh-p2p-srte** | **one-hop-p2p-srte** | **on-demand-p2p-srte**}] [**family** *family*]

## Context

[\[Tree\]](#) (show>router>mpls sr-te-lsp)

## Full Context

show router mpls sr-te-lsp

## Description

This command displays SR-TE LSP information.

## Parameters

### *lsp-name*

Specifies the SR-TE LSP name, up to 64 characters.

### status

Keyword used to filter the output based on the status of the SR-TE LSP.

**Values** up, down

### detail

Keyword used to display detailed information.

### *path-name*

Specifies the SR-TE LSP path name, up to 64 characters.

### auto-lsp

Keyword used to display the type of automatic LSP.

**Values** all, mesh-p2p-srte, one-hop-p2p-srte, on-demand-p2p-srte

### *family*

Displays the family of IP addresses.

**Values** ipv4, ipv6

### count

Keyword used to display the total number of SR-TE LSPs.

**to {ip-address | ipv6-address}**

Keyword used to display the IPv4 or IPv6 address of the egress router for the LSP.

**egress-stats**

Keyword used to display the traffic statistics for the specified SR-TE LSP or for all SR-TE LSPs if none is explicitly specified. Traffic statistics are provided for primary path, secondary path if any, and secondary standby paths, if any. Statistics are preserved across switchover only for primary and secondary standby paths.

**mbb**

Keyword used to display make-before-break (MBB) information.

**activepath**

Keyword used to display the SR-TE active paths, which are candidate paths selected as the best paths by the SR policy make-before-break (MBB) information.

**dns**

Keyword used to display reverse DNS resolution of actual and explicit hop information.

**Platforms**

All

**Output**

The following outputs are examples of MPLS SR-TE LSP information. The associated tables describe the output fields.

**Output Example**

The following outputs apply to an SR-TE LSP for which the path is computed using the local SR-TE CSPF method.

Table 529: Output fields: MPLS SR-TE-LSP detail

Label	Description
LSP Name	The name of the LSP
LSP Type	The type of the LSP
LSP Tunnel ID	The tunnel ID number for the LSP used in the interaction with PCC/PCE
LSP Index	The LSP index used for indexing the LSP in the MIB table shared with the RSVP-TE LSP
TTM Tunnel Id	The tunnel ID number for the tunnel representing the LSP in the tunnel table
From	The IP address for the ingress router for the LSP
To	The IP address for the egress router for the LSP
Admin State	The administrative state of the LSP
Oper State	The operational state of the LSP
LSP Up Time	The length of time the LSP has been operational
LSP Down Time	The amount of time the LSP has been down
Transitions	The number of transitions that have occurred for the LSP
Path Changes	The number of times the path has changed
Retry Limit	The number of attempts that the software makes to reestablish the LSP after it has failed
Retry Timer	The time, in seconds, for LSP reestablishment attempts after LSP failure
Hop Limit	The maximum number of hops that an LSP can traverse, including the ingress and egress routers
Negotiated MTU	The size of the maximum transmission unit (MTU) that is negotiated during establishment of the LSP
PathCompMethod	pce — PCE path computation method is configured local-cspf — Local CSPF path computation method is configured none — No computation method is configured
FallbkPathComp	none — No fallback method is configured

Label	Description
	local-cspf — Local CSPF fallback is configured
Metric	The cost of the TE path for the LSP
Local Sr Protection	The local LFA protection wanted for the CSPF computed explicit path with adjacency SIDs
Label Stack Reduction	The label stack reduction applied to the CSPF computed explicit path with adjacency SIDs
Load Bal Wt	The load balance weight value
Include Grps	The included groups. None indicates that no groups are included
Exclude Grps	The excluded groups. None indicates that no groups are excluded
Egress Stats	The traffic statistics for the specified SR-TE LSP or for all SR-TE LSPs if none is explicitly specified. Traffic statistics are provided for primary path, secondary path, if any, and secondary standby paths, if any. Statistics are preserved across switch over for primary and secondary standby paths
BFD Template	The BFD template name
BFD Ping Intvl	The BFD ping interval
BFD Enable	The operational state of the BFD on the LSP
BFD Failure-action	The failure action that is configured for the BFD LSP
WaitForUpTimer	The BFD wait for up timer value
ReturnPathLabel	The return path label added to the MPLS label to the bottom of the label stack for S-BFD. With this configured, the S-BFD packet returns to the initiator through the MPLS return path
Revert Timer	The length of time before a named LSP using the secondary path to revert to the primary path
Next Revert In	The next revert interval
Entropy Label	The enabled or disabled status for the entropy label
Oper Entropy Label	Indicates that the entropy label is in use
Negotiated EL	Indicates if the entropy label is negotiated for the LSP
Override Tunnel ELC	The enabled or disabled status of the override tunnel ELC

Label	Description
VRPNAutoBind	The enabled or disabled status for VRPN autobind
IGP Shortcut	The enabled or disabled status for IGP shortcut
BGP Shortcut	The enabled or disabled status for BGP shortcut
IGP LFA	The enabled or disabled status for IGP LFA
BGPTransTun	The enabled or disabled status for BGP transport tunnels
Oper Metric	The enabled or disabled status of the operational metric
PCE Report	The enabled or disabled status of PCE report
PCE Control	The enabled or disabled status of PCE control
Max SR Labels	The maximum label stack size of the computed path with or without label stack reduction
Additional FRR Labels	The additional FRR labels value that the router is configured to take into account during TI-LFA
Path Profile	The path profile value for the LSP
Admin Tags	The administrative tag names. None indicates that there are no tags.
Primary (a)	The preferred path for the LSP
Up Time	The total time in increments that the LSP path has been operational
Bandwidth	The amount of bandwidth in Mb/s reserved for the LSP path
Secondary	The alternate path that the LSP uses if the primary path is not available
Downtime	The time that the LSP has been down
Bandwidth	The amount of bandwidth in Mb/s reserved for the LSP path

Table 530: Output fields: MPLS SR-TE-LSP path detail

Label	Description
LSP Name	The name of the LSP
Path LSP ID	The path LSP ID
From	The IP address for the ingress router for the LSP
To	The IP address for the egress router for the LSP
Admin State	The administrative state of the LSP
Oper State	The operational state of the LSP
Path Name	The name of the LSP path
Path Type	The type of LSP path
Path Admin	The administrative state of the LSP path
Path Oper	The operational state of the LSP path
Path Up Time	The length of time the LSP path has been operational
Path Down Time	The length of time the LSP path has been down
Retry Limit	The number of attempts that the software makes to reestablish the path after it has failed
Retry Timer	The time, in seconds, for path reestablishment attempts after LSP failure

Label	Description
Retry Attempt	The number of retry attempts
Next Retry In	The next retry value
PathCompMethod	The path computation method for the specific LSP pce — PCE path computation method is configured local-cspf — Local CSPF path computation method is configured none — No computation method is configured
OperPathCompMethod	The operational state of the path computation method pce — PCE path computation method is configured local-cspf — Local CSPF path computation method is configured none — No computation method is configured
MetricType	The cost of the TE path for the specific LSP
Oper MetricType	The operational state of cost of the TE path
LocalSrProt	The local LFA protection for the CSPF computed explicit path with adjacency SIDs
Oper LocalSrProt	The operational state of LFA protection for the CSPF computed explicit path with adjacency SIDs
LabelStackRed	The label stack reduction applied to the CSPF computed explicit path with adjacency SIDs
Oper LabelStackRed	The operational state of the label stack reduction applied to the CSPF computed explicit path with adjacency SIDs
Bandwidth	The amount of bandwidth in Mb/s to be reserved
Oper Bandwidth	The operational state of the bandwidth
Hop Limit	The maximum number of hops for the path
Oper HopLimit	The operational state of the maximum number of hops for the path
Setup Priority	The setup priority value to use for the path
Oper SetupPriority	The operational state of the setup priority value for the path
Hold Priority	The hold priority to use for the path
Oper HoldPriority	The operational state of the hold priority for the path

Label	Description
PCE Updt ID	The update ID
PCE Updt State	The update state
PCE Upd Fail Code	The update failure code
PCE Report	The enabled or disabled status of PCE report
Oper PCE Report	The operational state of the PCE report
PCE Control	The enabled or disabled status of PCE control
Oper PCE Control	The operational state of PCE control
Include Groups	The included groups. None indicates that no groups are included
Oper IncludeGroups	The operational state of the included groups
Exclude Groups	The excluded groups. None indicates that no groups are included
Oper ExcludeGroups	Oper ExcludeGroups
Last Resignal	The last resignal time
IGP/TE Metric	The IGP or TE metric value
Oper Metric	The operational metric value
Oper MTU	The largest service frame size that can be transmitted to the far-end router without requiring the packet to be fragmented
Path Trans	The path transmission value
Degraded	The degraded status
Failure Code	The reason code for in-progress MBB value. A value of none indicates that no failure has occurred.
Failure Node	The IP address of the node in the LSP path at which the in-progress MBB failed. When no failure has occurred this value is none.
Explicit Hops	The explicit configured hops for an LSP path
Actual Hops	The actual hops an LSP path takes
Record Label	The record label value
BFD Configuration and State	
Template	Indicates if the BFD template configured

Label	Description
Ping Interval	The BFD ping interval value
Enable	Indicates if BFD is enabled
State	The state of BFD
ReturnPathLabel	The return path label to add to the MPLS label on the bottom of the label stack for S-BFD. When configured, the S-BFD packet returns to the initiator through the MPLS return path.
BFD Source Addr	The BFD source address
WaitForUpTimer	The BFD wait for up timer value
OperWaitForUpTimer	The operational state of the wait for up timer value
WaitForUpTmLeft	The length of time remaining for the wait for up timer
StartFail Rsn	The start fail RSN value

### Output Example

The following outputs apply to an SR-TE auto-LSP for which the path is computed by the hop-to-label translation method.

```
*A:Phoenix 199# show router mpls sr-te-lsp "sr-te-level2-mesh-192.168.48.223-716805" detail

=====
```

**Table 531: Output fields: MPLS SR-TE LSP** describes the MPLS SR-TE LSP count statistics output fields.

*Table 531: Output fields: MPLS SR-TE LSP*

Label	Description
LSP Name	The name of the LSP used in the path.
Adm State	Down — The path is administratively disabled.

Label	Description
	Up — The path is administratively enabled.
PathCompMethod	pce — PCE path computation method is configured. local-cspf — Local CSPF path computation method is configured.
FallbkPathComp	none — No fallback method is configured. local-cspf — Local CSPF fallback is configured.
Retry Limit	The number of attempts that the software should make to reestablish the LSP after it has failed.
Hop Limit	The maximum number of hops that an LSP can traverse, including the ingress and egress routers.
Retry Timer	The time in seconds, for LSP re-establishment attempts after an LSP failure.
LSP Up Time	The total time in increments that the LSP path has been operational.
LSP Down Time	The total time in increments that the LSP path has not been operational.
SR-TE LSPs	Displays the number of SR-TE LSPs
Mesh SR-TE LSPs	Displays the number of mesh SR-TE LSPs
One Hop-P2P SR-TE LSPs	Displays the number of one-hop SR-TE LSPs
PCE Init SR-TE LSPs	Displays the number of PCE initiated SR-TE LSPs

### Output Example

The following outputs apply to a router-controlled or to a PCC-controlled SR-TE LSP for which the path is computed using the hop-to-label transition method.

**Table 532: Output fields: MPLS SR-TE LSP egress statistics** describes the MPLS SR-TE LSP egress statistics output fields.

*Table 532: Output fields: MPLS SR-TE LSP egress statistics*

Label	Description
LSP Name	The name of the LSP for which the statistics are provided
Admin State	The administrative state of the LSP
Path Name	The path name of the LSP
StatsOperState	Indicates whether the system is able to allocate a statistical index to that specific path
Aggregate Pkts	The number of packets recorded by the statistical index for that path
Aggregate Octets	The number of octets recorded by the statistical index for that path
Tot.Aggr Pkts	The sum of packets over all paths of the LSP
Tot.Aggr Octets	The sum of octets over all paths of the LSP
Packet Rate	The packet rate for the LSP (across all paths, for all FCs in/out-of profile) expressed in packets per second

Label	Description
Bit Rate	The bit rate for the LSP (across all paths, for all FCs in/out-of profile) expressed in Mb/s

## 28.12 sr-te-lsp-egress-stats

### sr-te-lsp-egress-stats

#### Syntax

```
sr-te-lsp-egress-stats lsp-name
```

#### Context

[\[Tree\]](#) (clear>router>mpls sr-te-lsp-egress-stats)

#### Full Context

```
clear router mpls sr-te-lsp-egress-stats
```

#### Description

This command clears or resets the egress statistics for MPLS SR-TE LSP.

#### Parameters

*lsp-name*

Specifies the LSP to clear, up to 64 characters.

#### Platforms

All

### sr-te-lsp-egress-stats

#### Syntax

```
sr-te-lsp-egress-stats lsp lsp-name [interval seconds] [repeat repeat] [absolute| rate] [bits ]
```

#### Context

[\[Tree\]](#) (monitor>router>mpls sr-te-lsp-egress-stats)

#### Full Context

```
monitor router mpls sr-te-lsp-egress-stats
```

## Description

This command monitors MPLS SR-TE LSP Egress Statistics.

## Parameters

### *lsp-name*

Specifies the LSP name.

**Values** 64 characters maximum

### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

### *bits*

Displays output value in bits.

## Platforms

All

## 28.13 src-access-list

### src-access-list

## Syntax

**src-access-list** [*list-name*]

## Context

**[Tree]** (show>system>security>snmp src-access-list)

## Full Context

show system security snmp src-access-list

## Description

This command displays source access lists and the hosts for each. Including the *list-name* parameter modifies the output show only the specified **src-access-list**.

## Platforms

All

## Output

The following output is an example of SR access list information.

[Table 533: Output fields: source access list](#) describes the source access list output fields.

### Output Example

```
A:ALA-1# show system security snmp src-access-list
=====
Source Access Lists
=====

```

Table 533: Output fields: source access list

Label	Description
List Name	Displays the name of the <b>src-access-list</b> .
Host Name	Displays the name of the <b>src-host</b> .
Host Address	Displays the IP address of the <b>src-host</b> .

Label	Description
Total Access Lists	Displays the total number of source access lists.

## 28.14 src-bmac-lsb

### src-bmac-lsb

#### Syntax

**src-bmac-lsb**

#### Context

**[Tree]** (tools>dump>redundancy src-bmac-lsb)

#### Full Context

tools dump redundancy src-bmac-lsb

#### Description

This command dumps PBB source Backbone MAC address LSB information.

#### Platforms

All

## 28.15 srlg-database

### srlg-database

#### Syntax

**srlg-database** [**router-id** *ip-address*] [**interface** *ip-address*]

#### Context

**[Tree]** (show>router>mpls srlg-database)

#### Full Context

show router mpls srlg-database

#### Description

This command displays MPLS SRLG database information.

## Parameters

### **router-id** *ip-address*

Specifies a 32-bit integer uniquely identifying the router in the Autonomous System. By convention to ensure uniqueness, this may default to the value of one of the router's IPv4 host addresses, represented as a 32-bit unsigned integer, if IPv4 is configured on the router. The **router-id** can be either the local one or some remote router.

### **interface** *ip-address*

Specifies the IP address of the interface.

## Platforms

All

## 28.16 srlg-group

### srlg-group

## Syntax

**srlg-group** [*name*]

## Context

[\[Tree\]](#) (show>router>if-attribute srlg-group)

## Full Context

show router if-attribute srlg-group

## Description

This command displays SRLG statistics.

## Parameters

### *name*

Displays entries that are associated with the specified SRLG name, up to 32 characters.

## Platforms

All

## Output

The following output is an example of SRLG statistics, and [Table 534: Output fields: SRLG](#) describes the fields.

## Output Example

```
B:CORE2# show router if-attribute srlg-group
=====
```

```
Interface Srlg Groups

Label	Description
Group Name	The name of the SRLG
Group Value	The integer value of the SRLG
Penalty Weight	The penalty weight that is assigned to the SRLG
No. of Groups	The total number of displayed SRLGs

## 28.17 srrp

```
srrp
```

### Syntax

```
srrp
```

### Context

[\[Tree\]](#) (clear>router srrp)

### Full Context

```
clear router srrp
```

### Description

Commands in this context clear and reset SRRP virtual router instances.

### Platforms

All

## srrp

### Syntax

```
srrp [srrp-id [detail]]
```

### Context

[\[Tree\]](#) (show srrp)

### Full Context

```
show srrp
```

### Description

This command displays information related to the SRRP.

### Parameters

#### srrp-id

Specifies the SRRP ID.

**Values** 1 to 4294967295

#### detail

Displays detailed information.

### Platforms

All

## 28.18 srrp-sync-database

## srrp-sync-database

### Syntax

```
srrp-sync-database [instance instance-id] [ peer ip-address]
```

### Context

[\[Tree\]](#) (tools>dump>redundancy>multi-chassis srrp-sync-database)

### Full Context

```
tools dump redundancy multi-chassis srrp-sync-database
```

### Description

This command dumps SRRP database information and applies to the 7450 ESS.

## Parameters

### *ip-address*

Specifies the peer's IP address.

- Values**    ipv4-address: a.b.c.d  
              ipv6-address:
- x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x – [0 to FFFF] H
  - d – [0 to 255] D

### *instance-id*

Dumps information for the specified Subscriber Router Redundancy Protocol instance configured on this system.

- Values**    1 to 4294967295

## Platforms

All

## 28.19 ssh

### ssh

## Syntax

**ssh** [**detail** | **server-lists** | **client-lists** | **server-public-keys**]

## Context

[\[Tree\]](#) (show>system>security ssh)

## Full Context

show system security ssh

## Description

This command displays all SSH sessions and the SSH status and fingerprint. The type of SSH application (CLI, SCP, SFTP, or NETCONF) is indicated for each SSH connection.

## Parameters

### **detail**

Keyword to display detailed information.

**server-lists**

Keyword to display the lists of cipher, MAC, KEX, and host key algorithms allowed by the SSH server.

**client-lists**

Keyword to display the lists of cipher, MAC, KEX, and host key algorithms allowed by the SSH client.

**server-public-keys**

Keyword to display the SSH server public keys.

**Platforms**

All

**Output**

The following outputs are examples of SSH information, and [Table 535: Output fields: ssh](#) describes the output fields.

**Output example (show system security ssh)**

```

Table 535: Output fields: ssh

Label	Description
Administrative State	Enabled — The administrative state of the SSH server is enabled Disabled — The administrative state of the SSH server is disabled
Operational State	Up — The operational state of the SSH server is up Down — The operational state of the SSH server is down
Preserve Key	Enabled — preserve-key is enabled Disabled — preserve-key is disabled
Key-re-exchange	The maximum amount of time and the maximum number of megabytes to be transmitted before a key re-exchange is initiated by the server
SSH Protocol Version 2	Enabled — SSH2 is enabled Disabled — SSH2 is disabled

Label	Description
Host Key Fingerprints	The key fingerprint is the server identity. If a client attempts and fails to verify the key fingerprint of the server, the client session is disconnected.
Connection	The IP address of the connected routers (remote client)
ConnectionID	The connection ID
Username	The name of the user
ConnectionStatus	The connection status
Version	The SSH version
KEX	KEX algorithm negotiated between SR OS SSH server and SSH client
Cipher	Cipher algorithm negotiated between SR OS SSH server and SSH client
MAC	MAC algorithm negotiated between SR OS SSH server and SSH client
HostKey	Host key algorithm negotiated between SR OS SSH server and SSH client
SessionID	The session ID
ChannelID	The channel ID
ServerName	The server name
ChannelStatus	The channel status
Number of SSH connections	The total number of SSH connections
Number of SSH sessions	The total number of active SSH sessions

ssid

### Syntax

ssid

## Context

[\[Tree\]](#) (show>subscr-mgmt>wlan-gw ssid)

## Full Context

```
show subscriber-mgmt wlan-gw ssid
```

## Description

This command displays SSID information.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 28.21 ssm-translate

### ssm-translate

## Syntax

```
ssm-translate
```

```
ssm-translate interface interface-name
```

## Context

[\[Tree\]](#) (show>router>igmp ssm-translate)

## Full Context

```
show router igmp ssm-translate
```

## Description

This command displays IGMP SSM translate configuration information.

## Parameters

***interface-name***

Specifies the IP interface name, up to 32 characters.

## Platforms

All

## Output

The following output is an example of SSM translate information. [Table 536: Output fields: IGMP](#) provides IGMP field descriptions.

### Output Example

```

=====
IGMP SSM Translate Entries
=====
Group Range          Source          Interface
-----
<239.1.1.1 - 239.1.1.2>  10.1.1.1      -
<239.1.1.1 - 239.1.1.5>  00.1.1.2      ies-abc
=====
    
```

Table 536: Output fields: IGMP

Label	Description
Group Range	The address ranges of the multicast groups for which this router can be an RP.
Source	The unicast address that sends data on an interface.
SSM Translate Entries	The total number of SSM translate entries.

## ssm-translate

### Syntax

**ssm-translate**

**ssm-translate interface** *interface-name*

### Context

[\[Tree\]](#) (show>router>mld ssm-translate)

### Full Context

show router mld ssm-translate

### Description

This command displays MLD SSM translate configuration information.

### Parameters

***interface-name***

Specifies the IP interface name, up to 32 characters.

### Platforms

## 28.23 standby-ip-addresses

### standby-ip-addresses

#### Syntax

**standby-ip-addresses**

#### Context

[\[Tree\]](#) (show>subscr-mgmt>vrgw>brg>gateway standby-ip-addresses)

#### Full Context

show subscriber-mgmt vrgw brg gateway standby-ip-addresses

#### Description

This command shows associated home-aware pool standby IP addresses.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 28.24 start

### start

#### Syntax

**start**

#### Context

[\[Tree\]](#) (tools>perform>router>l2tp>group>tunnel start)

#### Full Context

tools perform router l2tp group tunnel start

#### Description

This command triggers an attempt to start the control connection for a specified L2TP tunnel.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## start

### Syntax

**start** *route-downloader-name* [**force**]

### Context

[\[Tree\]](#) (tools>perform>aaa>route-downloader start)

### Full Context

tools perform aaa route-downloader start

### Description

This command causes the download process to start immediately. If an ongoing download is already in progress then no further action is needed, except if the **force** keyword is added. In case the **force** keyword is added, then the current download is aborted and a new one is immediately restarted. If aborting the current download, the internal route table should not be emptied or cleared.

### Parameters

#### *route-downloader-name*

Specifies the route downloader name, up to 32 characters.

#### **force**

Causes the current download to be aborted and a new one is immediately restarted.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 28.25 static

## static

### Syntax

**static** [**sap** *sap-id* | **sdp** *sdp-id:vc-id*]

### Context

[\[Tree\]](#) (show>service>id>mld-snooping static)

### Full Context

show service id mld-snooping static

## Description

This command displays MLD snooping static group membership data.

## Platforms

All

## Output

The following output is an example of MLD snooping static group membership information.

### Output Example

```
*A:rbae_C# show service id 1 mld-snooping static
=====
MLD Snooping Static Source Groups for service 1
-----

=====
*A:rbae_C#
```

## static

### Syntax

```
static [sap sap-id | sdp sdp-id:vc-id]
```

### Context

[\[Tree\]](#) (show>service>id>igmp-snooping static)

### Full Context

```
show service id igmp-snooping static
```

## Description

This command displays information on static IGMP snooping source groups for the VPLS service.

## Parameters

**sap** *sap-id*

Displays static IGMP snooping source groups for a specific SAP.

**sdp** *sdp-id*

Displays the IGMP snooping source groups for a specific spoke or mesh SDP.

**Values** 1 to 17407

**vc-id**

The virtual circuit ID on the SDP ID for which to display information.

**Default** For mesh SDPs only, all VC IDs.

**Values** 1 to 4294967295

**Platforms**

All

**Output**

**Output Example**

```
*A:ALA-1>show>service>id>snooping# static
=====
IGMP Snooping Static Source Groups for SAP 1/1/2
-----

```

Table 538: Output fields: IGMP snooping source groups describes the show output fields.

Table 538: Output fields: IGMP snooping source groups

Label	Description
Source	Displays the IP source address used in IGMP queries.
Group	Displays the static IGMP snooping source groups for a specified SAP.

**static**

**Syntax**

**static** [*ip-int-name* | *ip-address*]

## Context

[\[Tree\]](#) (show>router>igmp static)

## Full Context

show router igmp static

## Description

This command displays static IGMP, (\*,G) and (S,G) information.

## Parameters

### *ip-int-name*

Displays information associated with the specified IP interface name, up to 32 characters.

### *ip-address*

Displays information associated with the specified IP address.

## Platforms

All

## Output

The following output is an example of IGMP static information. [Table 539: Output fields: IGMP static](#) provides static IGMP field descriptions.

### Output Example

```
*A:ALA-BA# show router 100 igmp static
=====
IGMP Static Group Source

Table 540: Output fields: MLD static

Label	Description
Source	The entries which represents a source address from which receivers are interested/not interested in receiving multicast traffic.
Group	The IP multicast group address for which this entry contains information.
Interface	The interface name.

## static

### Syntax

**static** [head-end {local | ip-address}] [ color color] [end-point { ipv4-address | ipv6-address}] [preference preference-id] [distinguisher distinguisher-id]

**static summary**

### Context

**[Tree]** (show>router>seg-rt>sr-policies static)

### Full Context

show router segment-routing sr-policies static

### Description

This command displays the traffic statistics of all or a filtered set of the static policies, or displays summary parameters.

## Parameters

### **head-end local**

Filters on local head end.

### **head-end ip-address**

Filters on the head end IP address value.

**Values** a.b.c.d

### **color**

Filters on the color.

**Values** 0 to 4294967295

### **ipv4-address | ipv6-address**

Filters on the end-point IPv4 or IPv6 address.

**Values** ipv4-address — a.b.c.d  
ipv6-address — x:x:x:x:x:x:x (eight 16-bit pieces) or x:x:x:x:x:d:d:d  
x — [0 to FFFF]H  
d — [0 to 255]D

### **preference-id**

Filters on the preference ID.

**Values** 0 to 4294967295

### **distinguisher-id**

Filters on the distinguisher ID.

**Values** 0 to 4294967295

### **summary**

Displays the summary information of the static policies.

## Platforms

All

## Output

The following output is an example of traffic statistics for the static policies.

### Output Example Information for Static Policies

## 28.26 static-arp

### static-arp

#### Syntax

```
static-arp [{ip-int-name | ip-address | mac ieee-mac-address}]
```

#### Context

[\[Tree\]](#) (show>router static-arp)

## Full Context

```
show router static-arp
```

## Description

This command displays the router static ARP table sorted by IP address. If no options are present, all ARP entries are displayed.

## Parameters

### *ip-int-name*

Only displays static ARP entries associated with the specified IP interface name.

### *ip-address*

Only displays static ARP entries associated with the specified IP address.

### *ieee-mac-address*

Only displays static ARP entries associated with the specified MAC address.

## Platforms

All

## Output

**Static ARP Table Output** — The following output is an example of static ARP table information, and [Table 541: Output fields: static ARP](#) describes the output fields.

### Output Example

```
A:ALA-A# show router static-arp
=====

```

Table 541: Output fields: static ARP

Label	Description
IP Address	The IP address of the static ARP entry
MAC Address	The MAC address of the static ARP entry
Age	The age of the ARP entry. Static ARPs always have 00:00:00 for the age
Type	Inv — the ARP entry is an inactive static ARP entry (invalid) Sta — the ARP entry is an active static ARP entry
Interface	The IP interface name associated with the ARP entry
No. of ARP Entries	The number of ARP entries displayed in the list

## 28.27 static-host

### static-host

#### Syntax

**static-host** [**sap** *sap-id*] [**wholesaler** *service-id*] [**port** *port-id*][**inter-dest-id** *intermediate-destination-id*]  
 [**detail**] [**mac** *ieee-address*] [**ip-address** *ip-prefix* /*prefix-length*]

**static-host** [**sap** *sap-id* ][**wholesaler** *service-id* ][**port** *port-id*] **no-inter-dest-id** [**detail**]

**static-host summary**

#### Context

[\[Tree\]](#) (show>service>id static-host)

## Full Context

```
show service id static-host
```

## Description

This command displays static hosts configured on this service.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### *intermediate-destination-id*

Specifies the intermediate destination identifier which is encoded in the identification strings up to 32 characters.

### **summary**

Displays summary static host information.

### **detail**

Displays detailed static host information.

### *service-id*

The service ID of the wholesaler.

**Values** 1 to 2147483647

### *ieee-address*

Specifies the MAC address.

### *ip-prefix[/prefix-length]*

Specifies the IP address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of service static host information.

### Output Example

```
*A:ALA-48# show service id 88 static-host
=====
Static Hosts for service 88
=====

## 28.28 static-lsp

### static-lsp

#### Syntax

**static-lsp** [*lsp-name*]

**static-lsp** {**transit** | **terminate**}

**static-lsp** **count**

#### Context

[\[Tree\]](#) (show>router>mpls static-lsp)

#### Full Context

show router mpls static-lsp

#### Description

This command displays MPLS static LSP information.

#### Platforms

All

#### Output

The following output is an example of MPLS static LSP information.

[Table 542: Output fields: MPLS static LSP](#) describes the MPLS static LSP output fields.

*Table 542: Output fields: MPLS static LSP*

Label	Description
Lsp Name	The name of the LSP used in the path up to 64 characters in length.
To	The system IP address of the egress router for the LSP.
Next Hop	The system IP address of the next hop in the LSP path.
In I/F	The ingress interface.
Out Label	The egress interface.
Out I/F	The egress interface.
Adm	Down — The path is administratively disabled. Up — The path is administratively enabled.

Label	Description
Opr	Down — The path is operationally down. Up — The path is operationally up.
LSPs	The total number of static LSPs.

### Output Example

## 28.29 static-policy

```
static-policy
```

### Syntax

```
static-policy  
static-policy name [detail]
```

### Context

[\[Tree\]](#) (show>router>seg-rt>sr-policies static-policy)

### Full Context

```
show router segment-routing sr-policies static-policy
```

### Description

This command displays information about all static policies or the specified static policy.

### Parameters

#### *name*

Specifies the name of the static policy, up to 64 characters.

#### *detail*

Displays detailed information about the static policy.

### Platforms

All

### Output

The following outputs are examples of information for a specified static policy.

#### Output Example Information for a Specific Static Policy

```
*A:Dut-C# show router segment-routing sr-policies static-policy "a1"  
=====
```

## 28.30 static-route

### static-route

#### Syntax

**static-route** [*family*] [*{ip-prefix/prefix-length | preference preference | [ next-hop ip-address | tag tag]}*] [**detail**]

## Context

[\[Tree\]](#) (show>router static-route)

## Full Context

show router static-route

## Description

This command displays the static entries in the routing table. If no options are present, all static routes are displayed sorted by prefix.

## Parameters

### *family*

Specifies the type of routing information to be distributed by this peer group.

- Values**
- ipv4** — Displays only those BGP peers that have the IPv4 family enabled and not those capable of exchanging IP-VPN routes.
  - ipv6** — Displays the BGP peers that are IPv6 capable.
  - mcast-ipv4** — Displays the BGP peers that are IPv4 multicast capable.
  - mcast-ipv6** — Displays the BGP peers that are IPv6 multicast capable.

### *ip-prefix/prefix-length*

Displays static routes only matching the specified *ip-prefix* and *mask*.

- Values** The following values apply to the 7750 SR and 7950 XRS:
- |                     |                                     |
|---------------------|-------------------------------------|
| ipv4-prefix:        | a.b.c.d (host bits must be 0)       |
| ipv4-prefix-length: | 0 to 32                             |
| ipv6-prefix:        | x:x:x:x:x:x:x (eight 16-bit pieces) |
|                     | x:x:x:x:x:d.d.d.d                   |
| x:                  | [0 to FFFF]H                        |
| d:                  | [0 to 255]D                         |
| ipv6-prefix-length: | 0 to 128                            |

- Values** The following values apply to the 7450 ESS:
- |                     |                               |
|---------------------|-------------------------------|
| ipv4-prefix:        | a.b.c.d (host bits must be 0) |
| ipv4-prefix-length: | 0 to 32                       |

### *preference*

Only displays static routes with the specified route preference.

- Values** 0 to 65535

**ip-address**

Only displays static routes with the specified next hop IP address.

**Values** The following values apply to the 7750 SR and 7950 XRS:

```

    ipv4-address:  a.b.c.d (host bits must be 0)
    ipv6-address:  x:x:x:x:x:x:x (eight 16-bit
                   pieces)
                   x:x:x:x:x:d.d.d.d
                   x:                                [0 to FFFF]H
                   d:                                [0 to 255]D
    
```

**Values** The following values apply to the 7450 ESS:

ipv4-address: a.b.c.d (host bits must be 0)

**tag**

Displays the tag used to add a 32-bit integer tag to the static route. The tag is used in route policies to control distribution of the route into other protocols.

**Values** 1 to 4294967295

**detail**

Displays detailed static routes information.

**Platforms**

All

**Output**

**Static Route Output** — The following output is an example of static route information, and [Table 543: Output fields: static route](#) describes the fields.

**Output Example**

```

Table 543: Output fields: static route

Label	Description
IP Addr/mask	The static route destination address and mask
Pref	The route preference value for the static route
Metric	The route metric value for the static route
Type	BH — the static route is a black hole route; the nexthop for this type of route is black-hole ID — the static route is an indirect route, where the nexthop for this type of route is the non-directly connected next hop NH — the route is a static route with a directly connected next-hop; the next-hop for this type of route is either the next-hop IP address or an egress IP interface name
Nexthop	The next hop for the static route destination
Protocol	The protocol through which the route was learned
Interface	The egress IP interface name for the static route n/a — indicates there is no current egress interface because the static route is inactive or a black hole route
Active	N — the static route is inactive; for example, the static route is disabled or the next hop IP interface is down Y — the static route is active
No. of Routes	The number of routes displayed in the list
Backup Nexthop	The backup next hop for the static route destination
Backup Tag	The tag value used for the static route when the primary next hop fails and the backup next hop is active
Backup Status	The status of the backup next hop

## static-route

### Syntax

**static-route ldp-sync-status**

## Context

[Tree] (tools>dump>router static-route)

## Full Context

tools dump router static-route

## Description

This command enables the synchronization status that static route keeps track of LDP interfaces.

## Parameters

### ldp-sync-status

Specifies the LDP synchronization status.

## Platforms

All

## Output

The following output is an example of static route information.

### Output Example

```
*A:Dut-C# tools dump router static-route ldp-sync-status
=====
Sync Status of LDP interfaces

## 28.33 statistics

### statistics

#### Syntax

**statistics** [**interface** *ip-int-name* | *ip-address*]

#### Context

[\[Tree\]](#) (show>router>dhcp statistics)

#### Full Context

show router dhcp statistics

#### Description

This command displays statistics for DHCP Relay and DHCP snooping.

If no IP address or interface name is specified, all configured interfaces are displayed.

If an IP address or interface name is specified, only data regarding the specified interface is displayed.

#### Parameters

***ip-int-name* | *ip-address***

Displays statistics for the specified IP interface.

**Values** ip-int-name: 32 chars max  
ip-address: a.b.c.d

#### Platforms

All

#### Output

The following command displays DHCP statistics information, and [Table 544: Output fields: DHCP statistics](#) describes the output fields.

```
show router dhcp statistics
```

#### Output Example

```
=====

```

Table 544: Output fields: DHCP statistics

Label	Description
Rx Packets	The number of packets received from the DHCP clients
Tx Packets	The number of packets transmitted to the DHCP clients
Rx Malformed Packets	The number of malformed packets received from the DHCP clients
Rx Untrusted Packets	The number of untrusted packets received from the DHCP clients
Client Packets Discarded	The number of packets received from the DHCP clients that were discarded
Client Packets Relayed	The number of packets received from the DHCP clients that were forwarded
Client Packets Snooped	The number of packets received from the DHCP clients that were snooped
Client Packets Proxied (RADIUS)	The number of client packets proxied through RADIUS
Client Packets Proxied (Diameter)	The number of client packets proxied through Diameter
Client Packets Proxied (User-Db)	The number of client packets proxied through User-Db
Client Packets Proxied (Lease-Split)	The number of client packets proxied through a lease split
Server Packets Discarded	The number of packets received from the DHCP server that were discarded

Label	Description
Server Packets Relayed	The number of packets received from the DHCP server that were forwarded
Server Packets Snooped	The number of packets received from the DHCP server that were snooped
DHCP RELEASES Spoofed	The number of spoofed DHCP releases
DHCP FORCERENEWs Spoofed	The number of spoofed FORCERENEW messages
Client packets streamed	The number of client packets streamed
Routed Subnet Transparent Forwarded	
Client Packets (BOOTREQUEST)	The number of DHCP client packets (BOOTREQUEST) received on a subscriber interface with the source IP in a routed subnet that is associated with a routed IPoE session or host. The <b>routed-subnet-transparent-forwarding</b> command must be configured in the routing instance.
Server Packets (BOOTREPLY)	The number of DHCP server packets (BOOTREPLY) received on a subscriber interface with the source IP in a routed subnet that is associated with a routed IPoE session or host. The <b>routed-subnet-transparent-forwarding</b> command must be configured in the routing instance.
Other Opcode Packets	<p>The number of DHCP packets (Opcode field that are different from BOOTREQUEST and BOOTREPLY) received on a subscriber interface with the source IP in a routed subnet associated with a routed IPoE session or host. The <b>routed-subnet-transparent-forwarding</b> command must be configured in the routing instance.</p> <p> <b>Note:</b> When transparent forwarding is enabled, the system does not check if the DHCP packet is valid and therefore packets with an Opcode field different from BOOTREQUEST and BOOTREPLY are forwarded.</p>

## statistics

Client packets forwarded         : 0
Client packets dropped           : 0
Server packets snooped           : 0
Server packets forwarded         : 0
Server packets dropped           : 0
=====
    
```

Table 545: Output fields: DHCP6 statistics describes DHCP6 output statistics.

Table 545: Output fields: DHCP6 statistics

Field	Description
Client Packets Dropped	The number of DHCPv6 client packets snooped on SAP ingress and dropped, for example: DHCPv6 client packet received on an LDRA enabled network-facing SAP
Client Packets Forwarded	The number of DHCPv6 client packets snooped on SAP ingress and forwarded
Client Packets Snooped	The number of DHCPv6 client packets snooped on SAP ingress
Server Packets Dropped	The number of DHCPv6 server packets snooped on SAP ingress and dropped, for example: DHCPv6 server packet received on an LDRA enabled client-facing SAP
Server Packets Forwarded	The number of DHCPv6 server packets snooped on SAP ingress and forwarded
Server Packets Snooped	The number of DHCPv6 server packets snooped on SAP ingress

## statistics

### Syntax

**statistics** [[**sap** *sap-id*] | [**sdp** *sdp-id:vc-id*] | [**interface** *interface-name*]]

### Context

[\[Tree\]](#) (show>service>id>dhcp statistics)

### Full Context

show service id dhcp statistics

### Description

This command displays DHCP relay statistics.

## Parameters

### *ip-int-name*

Displays DHCP statistics on the specified interface.

### *interface-name*

Displays DHCP statistics for the specified interface name.

### *sap-id*

Displays DHCP statistics for the specified SAP.

## Platforms

All

## Output

The following output is an example of DHCP statistics information.

### Output Example

```
*A:ALA-48# show service id 88 dhcp statistics interface SpokeTerm
=====
DHCP Statistics for interface SpokeTerm
=====
Rx Packets                : 0
Tx Packets                : 0
Rx Malformed Packets     : 0
Rx Untrusted Packets     : 0
Client Packets Discarded  : 0
Client Packets Relayed    : 0
Client Packets Snooped    : 0
Client Packets Proxied (RADIUS) : 0
Client Packets Proxied (Lease-Split) : 0
Server Packets Discarded  : 0
Server Packets Relayed    : 0
Server Packets Snooped    : 0
DHCP RELEASEs Spoofed    : 0
DHCP FORCERENEWs Spoofed : 0
=====
*A:ALA-48#
```

[Table 546: Output fields: DHCP statistics interface](#) describes DHCP statistics output fields.

*Table 546: Output fields: DHCP statistics interface*

Field	Description
Rx Packets	The number of received packets
Tx Packets	The number of transmitted packets
Rx Malformed	The number of malformed packets received
Rx Untrusted Packets	The number of untrusted packets received
Client Packets Discarded	The number of client packets discarded
Client Packets Relayed	The number of client packets relayed

Field	Description
Client Packets Snooped	The number of client packets snooped
Client Packets Proxied (RADIUS)	The number of client packets proxied through RADIUS
Client Packets Proxied (Lease-Split)	The number of client packets proxied through a lease split
Server Packets Discarded	The number of discarded server packets
Server Packets Relayed	The number of relayed server packets
Server Packets Snooped	The number of snooped server packets
DHCP RELEASEs Spoofed	The number of spoofed DHCP releases
DHCP FORCERENEWs Spoofed	The number of spoofed FORCERENEW messages

## statistics

### Syntax

#### **statistics**

**statistics interface** {*ip-int-name* | *ip-address*}

**statistics sap** *sap-id*

### Context

[\[Tree\]](#) (show>service>id>ppp statistics)

### Full Context

show service id ppp statistics

### Description

This command displays PPP statistics.

### Parameters

#### ***ip-int-name***

Displays information about the specified interface, up to 32 characters.

#### ***ip-address***

Displays information about the specified IP address.

**Values** a.b.c.d

### ***sap-id***

Displays information for the specified SAP.

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## statistics

### **Syntax**

**statistics**

**statistics frag-stats**

**statistics map-domain** *domain-name* **mapping-rule** *rule-name*

### **Context**

[\[Tree\]](#) (clear>nat>map statistics)

### **Full Context**

clear nat map statistics

### **Description**

This command clears MAP statistics.

### **Parameters**

#### ***domain-name***

Clears MAP statistics for the specified domain name, up to 32 characters.

#### ***rule-name***

Clears MAP statistics for the specified mapping rule name, up to 32 characters.

### **Platforms**

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S,  
7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

## statistics

### **Syntax**

**statistics** *[{ip-address | ip-int-name}]*

### **Context**

[\[Tree\]](#) (clear>router>dhcp statistics)

## Full Context

```
clear router dhcp statistics
```

## Description

This command clears statistics for DHCP statistics.

If no IP address or interface name is specified, then statistics are cleared for all configured interfaces.

If an IP address or interface name is specified, then only data regarding the specified interface is cleared.

## Parameters

### *ip-int-name*

Clears DHCP statistics for the specified interface name.

### *ip-address*

Clears DHCP statistics for the specified IP address.

## Platforms

All

```
statistics
```

## Syntax

```

```
statistics
```

## Syntax

```
statistics
```

```
statistics interface ip-int-name | ipv6-address
```

```
statistics sap sap-id
```

## Context

[\[Tree\]](#) (clear>service>id>dhcp6 statistics)

## Full Context

clear service id dhcp6 statistics

## Description

This command clears DHCPv6 statistics for interfaces and VPLS SAPs.

## Parameters

### *ip-int-name*

Clears DHCPv6 statistics for the specified interface name.

### *ipv6-address*

Clears DHCPv6 statistics for the specified IP address.

### *sap-id*

Clears DHCPv6 statistics for the specified VPLS SAP.

## Platforms

All

## statistics

## Syntax

**statistics** [{**sap** *sap-id* | **sdp** *sdp-id:vc-id* | **interface** { *ip-address* | *ip-int-name*}]

## Context

[\[Tree\]](#) (clear>service>id>dhcp statistics)

## Full Context

clear service id dhcp statistics

## Description

This command clears DHCP statistics.

## Parameters

### *sap-id*

Clears the specified SAP information.

### *sdp-id*

The specified SDP to be cleared.

**Values** 1 to 17407

***vc-id***

Specifies the virtual circuit ID on the SDP ID to be cleared.

**Values** 1 to 4294967295

***ip-address***

Specifies the interface IP address.

**Values** a.b.c.d

***ip-int-name***

Specifies the interface name, up to 32 characters.

**Platforms**

All

Table 547: Output fields: dynamic services script statistics

Output field	Description
Description	The name of the script.
Counter	The number of times the script executed.
python scripts with 0 retries due to timeout	The number of retries due to timeouts.
setup	The setup script action.

Output field	Description
	jobs launched — The number of times the setup jobs launched. jobs handled — The number of times the setup jobs were handled. success — The number of times the setup jobs were successful. syntax error — The number of setup syntax errors. execution failed — The number of times the setup failed.
teardown	The teardown script action. jobs launched — The number of times the teardown jobs launched. jobs handled — The number of times the teardown jobs were handled. success — The number of times the teardown jobs were successful. syntax error — The number of teardown syntax errors.

## statistics

### Syntax

**statistics iom** (*slot* | all) [host | session | subscriber | summary] [non-zero-value-only]  
**statistics mda** (*mda* | all) [host | session | subscriber | summary] [non-zero-value-only]  
**statistics port** (*port-id* | all) [host | session | subscriber | summary] [non-zero-value-only]  
**statistics pw-port** (*pw-port* | all) [host | session | subscriber | summary] [non-zero-value-only]  
**statistics system** (*pw-port* | all) [host | session | subscriber | summary] [non-zero-value-only]  
**statistics service** (*svc-id* | all) [host | session | summary] [non-zero-value-only]  
**statistics service** {*svc-id*} subscriber-interface { *sub-itf* | all} [host | session | summary] [non-zero-value-only]  
**statistics service** {*svc-id*} group-interface { *grp-itf* | all} [host | session | summary] [non-zero-value-only]  
**statistics sla-profiles**  
**statistics sub-profiles**  
**statistics system** [host | session | subscriber | summary] [non-zero-value-only]

### Context

**[Tree]** (show>subscr-mgmt statistics)

## Full Context

show subscriber-mgmt statistics

## Description

This command displays enhanced subscriber management statistics per port, PW port, MDA, IOM, system, service, subscriber interface, or group interface.

For each statistic, a current value and peak value is displayed. The peak value is the highest generated value since the last reset as a result of a system boot or the **clear subscriber-mgmt peakvalue-stats** command.

### Note:

The user can execute the **clear subscriber-mgmt peakvalue-stats** command to reset the peak values.

## Parameters

### **iom slot**

Displays specified IOM slot information.

### **mda mda**

Displays specified slot and mda information.

### **port port-id**

Specifies to display information for both the physical port ID and LAG.

### **pw-port pw-port**

Specifies to display information for a pseudowire port ID.

**Values** 1 to 10239

### **all**

Displays statistics of all IOM or MDA or port or pseudowire port in the system

### **host**

Displays v4/v6 host statistics only.

### **session**

Displays PPPoX/LAC/LNS session statistics only.

### **sla-profiles**

Displays the current and historical statistics for SLA profiles.

### **service svc-id**

Displays the current and historical statistics for service level profiles.

**Values** 1 to 2148278386 | *svc-name*: up to 64 characters

### **sub-profiles**

Displays the current and historical statistics for subscriber profiles.

### **subscriber**

Displays subscriber statistics only.

**subscriber-interface *sub-ift***

Displays specified subscriber interface level statistics, up to 32 characters.

**group-interface *grp-ift***

Displays specified group-interface level statistics, up to 32 characters.

**summary**

Displays summary statistics only.

**non-zero-value-only**

Displays only non-zero value counters.

The following tables describe the counters available in the **show subscriber management statistics** command output.

The following terminology is used to indicate applicability of the stats:

- ESM — Enhanced Subscriber Management. Subscriber traffic forwarded via subscriber queues. Enabled with SAP **sub-sla-mgmt** in no shutdown state
- BSM — Basic Subscriber Management. Subscriber traffic forwarded via SAP queues. SAP sub-sla-mgmt must be in shutdown state. For DHCP, dhcp lease-populate or dhcp6-relay lease-populate must be enabled to count the leases. For IPv4, if anti-spoof is enabled on the SAP, a subscriber host is instantiated.
- Routed CO — IES or VPRN service with subscriber interface and group interface constructs
- Bridged CO — VPLS service with DHCPv4 lease management enabled (lease-populate)
- regular interface — IES or VPRN interface (none subscriber-interface or group-interface)
- Host (also subscriber host) — A resource in the system that is used for traffic forwarding and security related actions. The creation of a subscriber host entry is linked to anti-spoof being enabled on a SAP. For ESM, anti-spoof is mandatory and hence every connected {IP/MAC} consumes by default a subscriber host entry. A DHCP6 IA-PD can also be modeled as a managed route. In this case, no subscriber host is instantiated. For BSM, anti-spoof is optional on regular interfaces. An IPv4 static-host and DHCPv4 lease do not result in a subscriber host instantiation when anti-spoof is disabled on the SAP.

Table 548: Output fields: host and protocol statistics

Section	Counter	Counts	Applies to
IPv4	PPP Hosts - IPCP	IPv4 local terminated PPP hosts (PTA, LNS)	ESM, Routed CO
	IPOE Hosts - DHCP	DHCPv4 hosts (lease states)	ESM, Routed CO, Bridged CO
	IPOE Hosts - ARP	ARP hosts	ESM, Routed CO, Bridged CO

Section	Counter	Counts	Applies to
	IPOE Hosts – Static	IPv4 static hosts	ESM, Routed CO, Bridged CO
	IPOE Mngd Hosts – Data-trig	Data triggered IPv4 hosts	ESM, Routed CO
	IPOE Mngd Hosts – AAA	vRGW managed static IPv4 addresses: IPv4 static hosts created via RADIUS (Alc-Reserved-Addresses)	ESM, Routed CO
	IPOE Mngd Hosts – GTP	IPv4 GTP access host	ESM, Routed CO
	IPOE Mngd Hosts – Bonding	IPv4 hosts associated with an internal IpoE session of a connection bonding subscriber context	ESM, Routed CO
	IPOE Hosts BSM - DHCP	DHCPv4 hosts (lease states: anti-spoof and lease-populate enabled)	BSM, Routed CO, Bridged CO, regular interface
	IPOE Hosts BSM – Static	IPv4 static hosts (with anti-spoof enabled)	BSM, Routed CO, Bridged CO, regular interface
	IPOE BSM - DHCP	DHCPv4 lease states (with lease-populate enabled, no anti-spoof)	BSM, Routed CO, Bridged CO, regular interface
	IPOE BSM – Static	IPv4 static hosts (no anti-spoof)	BSM, Routed CO, Bridged CO, regular interface
IPv6	PPP Hosts – SLAAC	Local terminated IPv6 wan-host – SLAAC (PTA, LNS)	ESM, Routed CO
	PPP Hosts - DHCP6 (NA)	Local terminated IPv6 wan-host (PTA, LNS) – DHCP6 IA-NA leases over PPP	ESM, Routed CO
	PPP Hosts - DHCP6 (PD)	Local terminated IPv6 pd-host (PTA, LNS) – DHCP6 IA-PD leases over PPP (excluding PD as managed route)	ESM, Routed CO
	PPP Mngd Routes - DHCP6 (PD)	IPv6 (PTA, LNS) – DHCP6 IA-PD leases over PPP (PD as managed route only)	ESM, Routed CO
	IPOE Hosts – SLAAC	IPv6 wan-host – SLAAC	ESM, Routed CO

Section	Counter	Counts	Applies to
	IPOE Hosts - DHCP6 (NA)	IPv6 wan-host – DHCP6 IA-NA leases	ESM, Routed CO
	IPOE Hosts - DHCP6 (PD)	IPv6 pd-host – DHCP6 IA-PD leases (excluding PD as managed route)	ESM, Routed CO
	IPOE Mngd Routes - DHCP6 (PD)	IPv6 – DHCP6 IA-PD leases (PD as managed route only)	ESM, Routed CO
	IPOE Hosts – Static (WAN)	IPv6 static hosts with prefix-length equal to /128	ESM, Routed CO
	IPOE Hosts – Static (Pfx)	IPv6 static hosts with prefix-length shorter than /128	ESM, Routed CO
	IPOE Mngd Hosts – Data-trig (Pfx)	Data triggered IPv6 Prefix host (prefix length shorter than /128)	ESM, Routed CO
	IPOE Mngd Hosts – Data-trig (Pfx)	Data triggered IPv6 Prefix host (prefix length shorter than /128)	ESM, Routed CO
IPv6 (Cont)	IPOE Mngd Routes – Data-trig (Pfx)	Data triggered IPv6 Prefix (prefix length shorter than /128) modeled as a managed route	ESM, Routed CO
	IPOE Mngd Hosts - AAA	(currently unused)	Not applicable
	IPOE Mngd Hosts – GTP (SLAAC)	IPv6 (SLAAC) GTP Access host	ESM, Routed CO
	IPOE Mngd Hosts - Bonding	IPv6 hosts associated with an internal IpoE session of a connection bonding subscriber context..	ESM, Routed CO
	IPOE BSM - DHCP6 (NA)	IPv6 – DHCP6 IA-NA leases (lease-populate)	BSM, regular interface
	IPOE BSM - DHCP6 (PD)	IPv6 – DHCP6 IA-PD leases (lease-populate)	BSM, regular interface
Total	PPP Hosts	Local terminated PPP hosts (PTA, LNS)	ESM
	IPOE Hosts	Total IPv4 and IPv6 IPOE hosts	ESM
	IPv4 Hosts	Total IPv4 hosts, PPP (PTA, LNS) and IPOE	ESM
	IPv6 Hosts	Total IPv6 hosts, PPP (PTA, LNS) and IPOE	ESM

Section	Counter	Counts	Applies to
	IPv6 PD Mngd Routes	Total DHCP6 IA-PD leases modeled as a managed route. PPP (PTA, LNS) and IPOE	ESM
	L2TP LAC Hosts	L2TP LAC hosts – single host per single or dual stack PPP session  Counter also increases for outgoing LTS sessions.	ESM, Routed CO
	L2TP LNS Hosts	L2TP LNS hosts – single host per single or dual stack PPP session	ESM, Routed CO
	Internal Hosts	Subscriber hosts for internal use. For example, LNS redirect hosts (for LTS, an LNS redirect host is also instantiated).  The internal LNS redirect host only counts against the system limit and not against the per line card limit.	ESM
Total (Cont)	Non-Sub-Traffic L2-Hosts	A host on a single subscriber SAP in a VPLS service that enables non-IP traffic to be forwarded using the specified SLA profile instance queues.  Host on a single subscriber SAP attached to an IES or VPRN group-interface that enables traffic normally forwarded using the SAP queues to flow using the specified SLA profile instance queues.  <b>configure&gt;service&gt;vpls</b> <i>service-id</i> <b>&gt;sap</b> <i>sap-id</i> <b>&gt;sub-sla-mgmt single-sub-parameters&gt;non-sub-traffic sub-profile</b> <i>sub-profile-name</i> <b>sla-profile</b> <i>sla-profile-name</i> [ <b>subscriber</b> <i>sub-ident-string</i> ] [ <b>app-profile</b> <i>app-profile-name</i> ]	ESM, Routed CO, Bridged CO
	DHCP leases	Total number of DHCPv4 lease states	ESM, BSM
	DHCPv6 leases	Total number of DHCPv6 lease states	ESM, BSM
	Subscriber Hosts	Counter displayed in the output of <b>show&gt;subscriber-mgmt&gt;statistics</b> [ <b>iom</b>   <b>mda</b>   <b>port</b>   <b>pw-port</b> ]	ESM
	System Hosts Scale	Counter displayed in the output of <b>show&gt;subscriber-mgmt&gt;statistics system</b>	ESM

Section	Counter	Counts	Applies to
		This counter matches the number of hosts accounted for in the system wide limit.	

Table 549: Output fields: PPP session statistics

Section	Counter	Counts	Applies to
Local	PPP Sessions - PPPoE	Local terminated PPPoE sessions (PTA)	ESM, Routed CO
	PPP Sessions - PPPoEoA	Local terminated PPPoEoA sessions (PTA)	ESM, Routed CO
	PPP Sessions - PPPoA	Local terminated PPPoA sessions (PTA)	ESM, Routed CO
	PPP Sessions - L2TP (LNS)	Local terminated PPP sessions (L2TP LNS)	ESM, Routed CO
LAC	PPP Sessions - PPPoE	Tunneled PPPoE session (L2TP LAC)	ESM, Routed CO
	PPP Sessions - PPPoEoA	Tunneled PPPoEoA session (L2TP LAC)	ESM, Routed CO
	PPP Sessions - PPPoA	Tunneled PPPoA session (L2TP LAC)	ESM, Routed CO
	PPP Sessions - L2TP (LTS)	Tunneled PPP session (L2TP LTS)	ESM, Routed CO
Total	PPP Sessions - established	PPP sessions that are established (at least one active host attached) – PTA/LAC/LTS/LNS	ESM, Routed CO
	PPP Sessions - in setup	PPP sessions in setup (session created, host setup in progress) – PTA/LAC/LTS/LNS	ESM, Routed CO
	PPP Sessions - local	Local terminated PPPoX sessions (PTA, L2TP LNS)	ESM, Routed CO
	PPP Sessions - LAC	Tunneled PPPoX session (L2TP LAC, L2TP LTS)	ESM, Routed CO
L2TP	L2TP Tunnels - originator	Number of L2TP Tunnels originated on this node. (LAC/LTS)	ESM, Routed CO
	L2TP Tunnels - receiver	Number of L2TP Tunnels terminated on this node. (LNS/LTS)	ESM, Routed CO

Section	Counter	Counts	Applies to
	Total L2TP Tunnels	Number of L2TP Tunnels originated or terminated on this node.	ESM, Routed CO

Table 550: Output fields: IPoE session statistics

Section	Counter	Counts	Applies to
Total	IPOE Sessions - established	IPoE sessions that are established (at least one active host attached).	ESM, Routed CO
	IPOE Sessions- in setup	IPoE sessions in setup (session created, host setup in progress).	ESM, Routed CO

Table 551: Output fields: subscriber statistics

Section	Counter	Counts	Applies to
Total	Subscribers	Total number of active subscribers.	ESM, Routed CO, Bridged CO

Table 552: Output fields: subscriber management statistics summary

Section	Counter	Counts
Hosts	IPv4	Total IPv4 hosts
	IPv6	Total IPv6 hosts
Sessions	PPP	Total PPP sessions established
	IPOE	Total IPOE sessions established
Subscribers		Total number of active subscribers

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following outputs are examples of subscriber management statistics information.

### Output Example

```
A:PE-1# show subscriber-mgmt statistics port 1/1/4 summary
=====
SubMgmt Statistics
=====
Port Id          |      Hosts      |      Sessions   |      Subscribers
                 | IPv4  IPv6     | PPP   IPOE     |
-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
1/1/4            |      2      2   |      1     1   |      2 (Curr)
                 |      3      3   |      1     2   |      3 (Peak)
```

**Output Example**

```

## statistics

### Syntax

**statistics sub-profile** {*sub-profile-name* | **all**}

**statistics sla-profile** {*sla-profile-name* | **all**}

### Context

**[Tree]** (clear>subscriber-mgmt statistics)

### Full Context

clear subscriber-mgmt statistics

## Description

This command clears the current and historical statistics.

## Parameters

### ***sub-profile-name***

Clears the statistics for a specific subscriber profile, limited to 32 characters.

### **sub-profile all**

Clears all subscriber profile statistics.

### ***sla-profile-name***

Clears the statistics for a specific SLA profile, limited to 32 characters.

### **sla-profile all**

Clears all SLA profile statistics.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## statistics

## Syntax

```
statistics interface subscriber-interface [ id srrp-id ]
```

## Context

[\[Tree\]](#) (clear>router>srrp statistics)

## Full Context

```
clear router srrp statistics
```

## Description

This command clears statistics for SRRP instances.

## Parameters

### ***subscriber-interface***

Specifies an existing subscriber interface name up to 32 characters.

### ***srrp-id***

Specifies an existing SRRP ID.

**Values** 1 to 4294967295

## Platforms

All

## statistics

### Syntax

statistics

### Context

[\[Tree\]](#) (clear>service statistics)

### Full Context

clear service statistics

### Description

This command clears the statistics for a service.

### Platforms

## statistics

### Syntax

statistics [*policy name*] [*sap sap-id*]

### Context

[\[Tree\]](#) (show>service>id>auth statistics)

### Full Context

show service id authentication statistics

### Description

This command displays session authentication statistics for this service.

### Parameters

#### *policy name*

Specifies an existing authentication policy name.

#### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### Platforms

All

## Output

The following output is an example of service authentication statistics information

### Output Example

```
*A:ALA-48# show service id 700 authentication statistics
=====
Authentication Statistics for service 700
=====
Client Packets Authenticate Fail   : 0
Client Packets Authenticate Ok    : 0

## statistics

### Syntax

**statistics** [**evpn-mpls** | **sap** *sap-id* | **sdp** *sdp-id:vc-id* | **vxlan vtep** *ip-address vni vni*]

### Context

**[Tree]** (show>service>id>igmp-snooping statistics)

### Full Context

show service id igmp-snooping statistics

### Description

This command displays IGMP snooping statistics for the VPLS service.

### Parameters

#### **evpn-mpls**

Displays IGMP snooping statistics for EVPN-MPLS destinations

#### **sap-id**

Displays IGMP snooping statistics for a specific SAP

#### **sdp-id**

Displays the IGMP snooping statistics for a specific spoke or mesh SDP

**Values** 1 to 17407

#### **vc-id**

The virtual circuit ID on the SDP ID for which to display information

**Default** For mesh SDPs only, all VC IDs.

**Values** 1 to 4294967295

**vxlan vtep ip-address vni <1..16777215>**

Displays the IGMP snooping entries associated with a specific VXLAN binding, given by the VXLAN Termination Endpoint (VTEP) and VXLAN Network Identifier (VNI). This parameter only applies to the 7450 ESS or 7750 SR.

**vni**

The VXLAN Network Identifier (VNI) for which to display information. This parameter only applies to the 7450 ESS or 7750 SR.

**Values** 1 to 16777215

Table 553: Output fields: IGMP statistics

Label	Description
IGMP Interface Statistics	Lists the IGMP statistics for a particular interface.
Message Type	Queries — The number of IGMP general queries transmitted or received on this interface.
	Report — The total number of IGMP V1, V2, or V3 reports transmitted or received on this interface.

Label	Description
	Leaves — The total number of IGMP leaves transmitted on this interface.
Received	The total number of IGMP packets received on this interface.
Transmitted	The total number of IGMP packets transmitted from this interface.
General Interface Statistics	The general IGMP statistics.
Bad Length	The total number of IGMP packets with bad length received on this interface.
Bad Checksum	The total number of IGMP packets with bad checksum received on this interface.
Unknown Type	The total number of IGMP packets with unknown type received on this interface.
Drops	The total number of IGMP packets dropped on this interface.
Rx Non Local	The total number of IGMP packets received from a non-local sender.
Rx Wrong Version	The total number of IGMP packets with wrong versions received on this interface.
Policy Drops	The total number of IGMP packets dropped by import policies on this interface.
No Router Alert	The total number of IGMPv3 packets received on this interface which did not have the router alert flag set.
Rx Bad Encodings	The total number of IGMP packets with bad encodings received on this interface.
Rx Pkt Drops	The total number of IGMP receive packet drops on this interface.
Local Scope Pkts	The total number of IGMP packets with local scope received on this interface.
Resvd Scope Pkts	The total number of IGMP packets with reserved scope received on this interface.
MCAC Policy Drops	The total number of IGMP packets dropped by MCAC policies on this interface.

## statistics

### Syntax

**statistics all**

**statistics sap** *sap-id*

**statistics sdp** *sdp-id:vc-id*

**statistics vxlan vtep** *ip-address vni vni-id*

### Context

[\[Tree\]](#) (clear>service>id>mld-snooping statistics)

### Full Context

clear service id mld-snooping statistics

### Description

This command clears MLD snooping statistics.

### Parameters

#### *sap-id*

Clears MLD snooping statistics for the specified SAP.

#### *sdp-id*

Clears MLD snooping statistics associated with the specified SDP. For a spoke-SDP, the VC ID must be specified; for a mesh SDP, the VC ID is optional.

**Values** 1 to 17407

#### *vni-id*

Clears the MLD snooping statistics for the specified VXLAN VNI id.

**Values** 1 to 16777215

#### *ip-address*

Specifies a specific configured static egress VTEP to clear the MLD snooping statistics associated only with the VTEP.

### Platforms

All

## statistics

### Syntax

**statistics**

## Context

[\[Tree\]](#) (clear>service>id>authentication statistics)

## Full Context

clear service id authentication statistics

## Description

This command clears session authentication statistics for this service.

## Platforms

All

## statistics

## Syntax

**statistics** {**evpn-mpls** | **all** | **sap** *sap-id* | **sdp** *sdp-id:vc-id* | **vxlan vtep** *ip-address vni vni-id*}

## Context

[\[Tree\]](#) (clear>service>id>igmp-snooping statistics)

## Full Context

clear service id igmp-snooping statistics

## Description

This command clears IGMP snooping statistics for the VPLS service.

## Parameters

### **all**

Clears the IGMP snooping information for all port objects in the service

### **evpn-mpls**

Clears IGMP snooping statistics for EVPN-MPLS destinations

### **sap-id**

Clears the IGMP snooping information on the specified SAP

### **sdp-id**

Clears only IGMP snooping entries associated with the specified mesh SDP or spoke-SDP. For a spoke-SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

**Values** 1 to 17407

### **vc-id**

Clears statistics for the specified virtual circuit ID on the SDP ID

**Default** For mesh SDPs only, all VC IDs

**Values** 1 to 4294967295

**vxlan vtep ip-address vni <1..16777215>**

Clears the IGMP snooping statistics associated with a specific VXLAN destination given by the VXLAN Termination Endpoint (VTEP) and VXLAN Network Identifier (VNI). This parameter only applies to the 7450 ESS or 7750 SR.

**vni-id**

Displays information for the specified VXLAN Network Identifier (VNI). This parameter only applies to the 7450 ESS or 7750 SR.

**Values** 1 to 16777215

**statistics** {all | ipv4 | ipv6 | mac}  
**statistics group** *grp-address*

**Context**

[\[Tree\]](#) (clear>service>id>mfib statistics)

**Full Context**

clear service id mfib statistics

## Description

This command clears multicast FIB statistics for the VPLS service.

## Parameters

### **all**

Clears all statistics for the service ID

### **ipv4**

Clears IPv4 address statistics for the service ID

### **ipv6**

Clears IPv6 address statistics for the service ID

### **mac**

Clears MAC address statistics for the service ID

### **grp-address**

Specifies an IGMP multicast group address that receives data on an interface

## Platforms

All

## statistics

## Syntax

**statistics** [**evpn-mpls** | **sap** *sap-id* | **sdp** *sdp-id:vc-id* | **vxlan vtep** *ip-address vni vni-id*] [**family**]

## Context

[\[Tree\]](#) (clear>service>id>pim-snooping statistics)

## Full Context

clear service id pim-snooping statistics

## Description

This command clears PIM snooping statistics for the specified SAP or SDP.

## Parameters

### **sap-id**

Clears PIM snooping statistics for the specified SAP

### **sdp-id:vc-id**

Clears PIM statistics for the specified SDP. For a spoke-SDP, the VC ID must be specified; for a mesh SDP, the VC ID is optional.

**Values** 1 to 17407

**family**

Displays either IPv4 or IPv6 information

**Values**    ipv4 or ipv6

**evpn-mpls**

Clears PIM snooping statistics for EVPN-MPLS destinations

**Platforms**

All

**statistics**

**Syntax**

**statistics** [**summary**] [**sap** *sap-id*]

**Context**

[[Tree](#)] (show>service>id>host-connectivity-verify statistics)

VRRP Global Statistics
=====
VR Id Errors      : 0          Version Errors    : 0
Checksum Errors  : 0
```

Table 555: Output fields: VRRP statistics

Label	Description
VR Id Errors	Displays the number of virtual router ID errors
Version Errors	Displays the number of version errors
Checksum Errors	Displays the number of checksum errors

## statistics

### Syntax

**statistics**

**statistics interface** *interface-name* [**vrid** *virtual-router-id*]

**statistics interface** *interface-name* **vrid** *virtual-router-id* **ipv6**

### Context

[\[Tree\]](#) (clear>router>vrrp statistics)

### Full Context

clear router vrrp statistics

### Description

This command clears statistics for VRRP instances on an IP interface or VRRP priority control policies.

### Parameters

***interface-name***

Clears the VRRP statistics for all VRRP instances on the specified IP interface.

***virtual-router-id***

Clears the VRRP statistics for the specified VRRP instance on the IP interface.

**Default** All VRRP instances on the IP interface.

**Values** 1 to 255

**ipv6**

Clears IPv6 statistics for the specified interface.

### Platforms

All

## statistics

### Syntax

**statistics** [*ip-addr* | *ip-int-name*]

### Context

[\[Tree\]](#) (show>router>rip statistics)

### Full Context

show router rip statistics

### Description

Display Interface level statistics for the RIP protocol.

If no IP address or interface name is specified, then all configured RIP interfaces are displayed.

If an IP address or interface name is specified, then only data regarding the specified RIP interface is displayed.

### Parameters

***ip-addr* | *ip-int-name***

Displays statistics for the specified IP interface.

**Values** ip-int-name: 32 chars max  
ip-address: a.b.c.d

### Platforms

All

### Output

The following output is an example of RIP statistics information, and [Table 556: Output fields: RIP statistics](#) describes the output fields.

### Output Example

```

*A:ALA-12#
    
```

Table 556: Output fields: RIP statistics

Label	Description
Learned Routes	The number of RIP-learned routes exported to RIP neighbors.
Timed Out Routes	The number of routes that have been timed out.
Current Memory	The amount of memory used by this RIP router instance.
Maximum Memory	The amount of memory allocated for this RIP router instance.
Interface	Displays the name of each interface configured in RIP and associated RIP statistics.
Primary IP	The interface IP address.
Update Timer	The current setting of the RIP update timer value expressed in seconds.
Timeout Timer	The current RIP timeout timer value expressed in seconds.
Flush Timer	The number of seconds after a route has been declared invalid that it is flushed from the route database.
Updates Sent	Total — The total number of RIP updates that were sent. Last 5 Min — The number of RIP updates that were sent in the last 5 minutes. Last 1 Min — The number of RIP updates that were sent in the last 1 minute.
Triggered Updates	Total — The total number of triggered updates sent. These updates are sent before the entire RIP routing table is sent. Last 5 Min — The number of triggered updates that were sent in the last 5 minutes. Last 1 Min — The number of triggered updates that were sent in the last 1 minute.
Bad Packets Received	Total — The total number of RIP updates received on this interface that were discarded as invalid. Last 5 Min — The number of RIP updates received on this interface that were discarded as invalid in the last 5 minutes.

Label	Description
	Last 1 Min — The number of RIP updates received on this interface that were discarded as invalid in the last 1 minute.
RIPv1 Updates Received	Total — The total number of RIPv1 updates received. Last 5 Min — The number of RIPv1 updates received in the last 5 minutes. Last 1 Min — The number of RIPv1 updates received in the last 1 minute.
RIPv1 Updates Ignored	Total — The total number of RIPv1 updates ignored. Last 5 Min — The number of RIPv1 updates ignored in the last 5 minutes. Last 1 Min — The number of RIPv1 updates ignored in the last 1 minute.
RIPv1 Bad Routes	Total — The total number of bad routes received from the peer. Last 5 Min — The number of bad routes received from the peer in the last 5 minutes. Last 1 Min — The number of bad routes received from the peer in the last minute.
RIPv1 Requests Received	Total — The total number of times the router received RIPv1 route requests from other routers. Last 5 Min — The number of times the router received RIPv1 route requests from other routers in the last 5 minutes. Last 1 Min — The number of times the router received RIPv1 route requests from other routers in the last 1 minute.
RIPv1 Requests Ignored	Total — The total number of times the router ignored RIPv1 route requests from other routers. Last 5 Min — The number of times the router ignored RIPv1 route requests from other routers in the last 5 minutes. Last 1 Min — The number of times the router ignored RIPv1 route requests from other routers in the last 1 minute.
RIPv2 Updates Received	Total — The total number of RIPv2 updates received. Last 5 Min — The number of RIPv2 updates received in the last 5 minutes. Last 1 Min — The number of RIPv2 updates received in the last minute.
RIPv2 Updates Ignored	Total — The total number of RIPv2 updates ignored. Last 5 Min — The number of RIPv2 updates ignored in the last 5 minutes. Last 1 Min — The number of RIPv2 updates ignored in the last minute.
RIPv2 Bad Routes	Total — The total number of bad routes received from the peer. Last 5 Min — The number of bad routes received from the peer in the last 5 minutes. Last 1 Min — The number of bad routes received from the peer in the last minute.

Label	Description
RIPv2 Requests Received	<p>Total — The total number of times the router received RIPv2 route requests from other routers.</p> <p>Last 5 Min — The number of times the router received RIPv2 route requests from other routers in the last 5 minutes.</p> <p>Last 1 Min — The number of times the router received RIPv2 route requests from other routers in the last minute.</p>

### Full Context

clear router bfd statistics

## Description

This command clears BFD statistics.

## Parameters

### **all**

Clears all statistics for the BFD instance.

### **dst-ip *ip-address***

Clears statistics about the specified destination IPv4 or IPv6 address.

### ***ip-prefix/prefix-length***

Clears statistics for the specified IP prefix.

**Values**    *ipv4-prefix* — a.b.c.d  
              *ipv4-prefix-length* — 0 to 32  
              *ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)  
              x:x:x:x:x:d.d.d.d  
              x — 0 to FFFF (hexadecimal)  
              d — 0 to 255 (decimal)  
              *ipv6-prefix-length* — 0 to 128

### **lsp-id [0..4294967295]**

Clears statistics about the specified LSP ID.

### **lsp-ldp head**

Clears statistics for the head of the LSP LDP link.

### **lsp-ldp tail**

Clears statistics for the tail of the LSP LDP link.

### **lsp-rsvp {head | tail}**

Clears statistics about the specified link type.

### **mpls-tp *lsp-name***

Clears statistics about the specified MPLS TP LSP.

### **p2mp-interface *interface-name***

Clears statistics about the specified P2MP interface.

### **path {working | protect}**

Clears statistics about the working or protect path.

### **rsvp-session-name [256 chars max]**

Clears statistics about the specified RSVP session.

### **src-ip *ip-address***

Clears statistics about the specified source IPv4 or IPv6 address.

### **tunnel-id [0..4294967295]**

Clears statistics about the specified tunnel ID.

clear video statistics

### Description

This command clears video related statistics.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s

## statistics

### Syntax

**statistics**

### Context

**[Tree]** (show>router>bier statistics)

### Full Context

show router bier statistics

### Description

This command displays BIER statistics.

### Platforms

All

## statistics

### Syntax

**statistics group-interface [fwd-service service-id] ip-in-name**

**statistics group-interface all**

**statistics host ip-address**

### statistics host all

**statistics** [**interface** *ip-int-name* | *ip-address*]

### Context

[\[Tree\]](#) (clear>router>igmp statistics)

### Full Context

clear router igmp statistics

### Description

This command clears IGMP statistics on a specified interface or IP address.

#### Note:

An interface, group, and source cannot be specified at the same time.

### Parameters

#### **group-interface** *interface-name*

Clears the IGMP statistics on the specified group interface.

#### **group-interface** all

Clears the IGMP statistics on all group interfaces.

#### **service-id**

Specifies the service ID.

**Values**    service-id: 1 to 2148278386  
              svc-name: up to 64 characters.

#### **host** *ip-address*

Clears the IGMP statistics on the specified host.

#### **host** all

Clears the IGMP statistics on all hosts.

#### **interface** *ip-int-name*

Clears the IGMP statistics on the specified interface.

#### **interface** *ip-address*

Clears the IGMP statistics on the specified IP address.

### Platforms

All

## statistics

### Syntax

**statistics** **policy** *policy-name* [**bundle** *bundle-name*] [ **protocol** {**igmp** | **pim** | **igmpSnpG** | **mld**}]

## statistics

### Context

[\[Tree\]](#) (show>router>mcac statistics)

### Full Context

show router mcac statistics

### Description

This command displays MCAC statistics.

### Parameters

#### *policy-name*

Specifies an existing multicast CAC (MCAC) policy name.

#### *bundle-name*

Displays statistics for the specified existing multicast bundle name.

#### **protocol {igmp | pim | igmpSnpng | mld}**

Displays statistics for the specified applicable protocol.

**Values** igmp, pim, igmpSnpng, mld

### Platforms

All

## statistics

### Syntax

**statistics** [*ip-int-name* | *ipv6-address*]

**statistics ipsec-interface** *ip-int-name*

### Context

[\[Tree\]](#) (show>router>mld statistics)

### Full Context

show router mld statistics

### Description

This command displays MLD statistics information.

### Parameters

#### *ip-int-name*

Displays information associated with the specified IP interface name, up to 32 characters.

**ipv6-address**

Displays information associated with the specified IPv6 address.

**ipsec-interface ip-int-name**

Displays information associated with the specified dynamic name for the MLD-enabled child\_SA.

**Platforms**

All

**Output**

The following output is an example of MLD statistics information. [Table 558: Output fields: MLD statistics](#) provides statistical MLD field descriptions.

**Output Example**

```
*A:ALA-BA# show router mld statistics

Table 558: Output fields: MLD statistics

Label	Description
MLD Interface Statistics	The MLD statistics for a particular interface.

Label	Description
Message Type	<p>Queries — The number of MLD general queries transmitted or received on this interface.</p> <p>Report — The total number of MLD V1 or V2 reports transmitted or received on this interface.</p> <p>Dones — The total number of MLD dones transmitted on this interface.</p>
Received	The total number of MLD packets received on this interface.
Transmitted	The total number of MLD packets transmitted from this interface.
General Interface Statistics	The general MLD statistics.
Bad Length	The total number of MLD packets with bad length received on this interface.
Bad Checksum	The total number of MLD packets with bad checksum received on this interface.
Unknown Type	The total number of MLD packets with unknown type received on this interface.
Bad Receive If	The total number of MLD packets incorrectly received on this interface.
Rx Non Local	The total number of MLD packets received from a non-local sender.
Rx Wrong Version	The total number of MLD packets with wrong versions received on this interface.
Policy Drops	The total number of MLD packets dropped by import policies on this interface.
No Router Alert	The total number of MLD packets received on this interface which did not have the router alert flag set.
Rx Bad Encodings	The total number of MLD packets with bad encodings received on this interface.
Rx Pkt Drops	The total number of MLD receive packet drops on this interface.
Local Scope Pkts	The total number of MLD packets with local scope received on this interface.
Resvd Scope Pkts	The total number of MLD packets with reserved scope received on this interface.
MCAC Policy Drops	The total number of MLD packets dropped by MCAC policies on this interface.

## statistics

### Syntax

**statistics group-interface** [**fwd-service** *service-id*] *ip-int-name*

**statistics group-interface all**

**statistics host** *ipv6-address*

**statistics host all**

**statistics** [*ip-int-name* | *ipv6-address*]

**statistics ipsec-interface** *ip-int-name*

### Context

[\[Tree\]](#) (clear>router>mld statistics)

### Full Context

clear router mld statistics

### Description

This command clears MLD statistics parameters.

### Parameters

#### ***service-id***

Clears the MLD statistics for the service ID.

**Values** service-id: 1 to 2148278386  
svc-name: up to 64 characters.

#### **group-interface** *interface-name*

Clears the MLD statistics on the specified group interface.

#### **group-interface all**

Clears the MLD statistics on all group interfaces.

#### **host all**

Clears the MLD statistics on all hosts.

#### **host** *ipv6-address*

Clears the MLD statistics on the specified host.

#### ***ip-int-name***

Clears statistics for the specified MLD interface name.

#### ***ipv6-address***

Clears statistics for the specified MLD IPv6 address.

#### **ipsec-interface** *ip-int-name*

Clears statistics information for the specified dynamic name for the MLD-enabled child\_SA.

## statistics

### Syntax

**statistics** [*peer ip-address*]

### Context

[\[Tree\]](#) (clear>router>msdp statistics)

### Full Context

clear router msdp statistics

## Description

This command clears IP address statistics of the peer to which Multicast Source Discovery Protocol (MSDP) source-active (SA) requests for groups matching this entry's group range were sent.

## Parameters

### *ip-address*

Clears the statistics of the specified IP address.

## Platforms

All

## statistics

## Syntax

**statistics** [*ip-int-name* | *mt-int-name* | *ip-address* | *mpls-if-name*] [*family*]

## Context

[\[Tree\]](#) (show>router>pim statistics)

## Full Context

show router pim statistics

## Description

This command displays statistics for a particular PIM instance.

## Parameters

### *ip-int-name*

Displays interface information associated with the specified IP interface name.

### *mt-int-name*

Displays information about the default core group address of the Multicast Distribution Tree (MDT) for the VPRN instance. The Multicast Tunnel (MT) interface for a VPRN is created when this object is set to a valid group address.

**Syntax:** *vprn-id-mt-grp-ip-address*

### *ip-address*

Displays interface information associated with the specified IP address.

### *mpls-if-name*

Displays information about the specified MPLS interface name.

**Syntax:** *mpls-if-index*

### *family*

Displays statistics information for the specified family.

**Values** ipv4, ipv6

## Platforms

All

## Output

The following output is an example of PIM statistics information. [Table 560: Output fields: PIM statistics](#) provides PIM statistics output field descriptions

### Output Example

Table 560: Output fields: PIM statistics

Label	Description
PIM Statistics	The section listing the PIM statistics for a particular interface
Message Type	The type of message. Hello — The number of PIM hello messages received or transmitted Join Prune — The number of PIM join prune messages received or transmitted Asserts — The number of PIM assert messages received or transmitted Register — The number of register messages received or transmitted Null Register — The number of PIM null register messages received or transmitted Register Stop — The number of PIM register stop messages received or transmitted BSM — The number of PIM Bootstrap messages (BSM) received or transmitted Candidate RP Adv — The number of candidate RP advertisements Auto-RP Announce — The number of auto-RP announce (224.0.1.39) messages received or transmitted Auto-RP Mapping — The number of auto-RP mapping (224.0.1.40) messages received or transmitted

Label	Description
Message Type	<p>PIM DM Grafts — The number of PIM graft messages received or transmitted</p> <p>PIM DM Graft Acks — The number of PIM graft acknowledgment messages received or transmitted</p> <p>Total Packets — The total number of packets transmitted and received.</p>
Received	The number of messages received
Transmitted	The number of multicast data packets transmitted
Rx Errors	The total number of receive errors
General Interface Statistics	The section listing the general PIM interface statistics
Register TTL Drop	The number of multicast data packets which could not be encapsulated in Register messages because the time to live (TTL) was zero
Tx Register MTU Drop	The number of Bootstrap messages received on this interface but were dropped
Rx Invalid Register	The number of invalid PIM register messages received
Rx Neighbor Unknown	The number of PIM messages (other than hello messages) which were received and were rejected because the adjacency with the neighbor router was not already established
Rx Bad Checksum Discard	The number of PIM messages received, and which were discarded because of bad checksum
Rx Bad Encoding	The number of PIM messages with bad encodings received
Rx Bad Version Discard	The number of PIM messages with bad versions received
Rx CRP No Router Alert	The number of candidate-rp advertisements (C-RP-Adv) received, and which had no router alert option set
Rx Invalid Join Prune	The number of invalid PIM join prune messages received
Rx Unknown PDU Type	The number of packets received with an unsupported PIM type
Join Policy Drops	The number of times the join policy match resulted in dropping PIM join-prune message or one of the source group contained in the message
Register Policy Drops	The number of times the register policy match resulted in dropping PIM register message

Label	Description
Bootstrap Import Policy Drops	The number of Bootstrap messages received that were dropped because of Bootstrap import policy
Bootstrap Export Policy Drops	The number of Bootstrap messages that were not transmitted because of Bootstrap export policy.
Source Group Statistics	The section listing the source group statistics
(S,G)	The number of entries in which the type is (S,G)
(* ,G)	The number of entries in which the type is (* ,G)
(* ,*,RP)	The number of entries in which the type is (* , * , rp)

## statistics

### Syntax

**statistics** [*family*]

**statistics** [**interface** *ip-int-name* | **mt-int-name** | **int-ip-address**] [*family*]

**statistics** [**group** *grp-ip-address*] [**source** *ip-address*] [*family*]

### Context

**[Tree]** (clear>router>pim statistics)

### Full Context

clear router pim statistics

### Description

This command clears PIM statistics on a specified interface or IP address.

**Note:**

An interface and group or source cannot be specified at the same time.

### Parameters

***ip-int-name***

Clears PIM statistics on the specified interface.

***ip-address***

Clears PIM statistics on the specified IP address.

***mt-int-name***

Clears the default core group address of the Multicast Distribution Tree (MDT) for the VPRN instance. The Multicast Tunnel (MT) interface for a VPRN is created when this object is set to a valid group address.

**syntax:** *vprn-id-mt-grp-ip-address*

**grp-ip-address**

When only the group address is specified and no source is specified, (\*,G) statistics are cleared. When the group address is specified along with the source address, then the (S,G) statistics are reset to zero.

**ip-address**

When the source address is specified along with the group address, then the (S,G) statistics are reset to zero.

**family**

Clears statistics family information.

**Values**    ipv4, ipv6

**Platforms**

All

statistics

**Syntax**

**statistics**

**Context**

[\[Tree\]](#) (show>router>p2mp-sr-tree statistics)

**Full Context**

show router p2mp-sr-tree statistics

**Description**

This command displays P2MP SR tree statistics.

**Platforms**

All

**Output**

The following output is an example of P2MP SR tree statistics information.

**Note:**

The "Programming failures" count in tree SID statistics are not High Availability (HA) compatible and are reset upon an activity switch of the CPMs.

**Output Example**

```
A:node-2>show>router>p2mp-sr-tree# statistics

Table 561: Output fields: ETH-CFM statistics

Label	Description
Rx Count	The ETH-CFM CPU receive rate, in PPS
Tx Count	The ETH-CFM CPU transmit rate, in PPS
Dropped Congestion	The number of valid or supported ETH-CFM packets not processed by the CPU as a result of resource contention
Discard Error	The number of ETH-CFM packets that did not pass validation

## statistics

### Syntax

**statistics session *session-name* dm meas-interval { 5-mins | 15-mins | 1-hour | 1-day | raw } interval-number *interval-number* [ all | bins | summary ]**

**statistics session *session-name* dmm meas-interval { 5-mins | 15-mins | 1-hour | 1-day | raw } interval-number *interval-number* [ all | bins | summary ]**

**statistics session *session-name* lmm meas-interval { 5-mins | 15-mins | 1-hour | 1-day | raw } interval-number *interval-number***

**statistics session *session-name* slm meas-interval { 5-mins | 15-mins | 1-hour | 1-day | raw } interval-number *interval-number***

**statistics session *session-name* twamp-light meas-interval { 5-mins | 15-mins | 1-hour | 1-day | raw } interval-number *interval-number* delay [ all | bins | summary ]**

### Context

[\[Tree\]](#) (show>oam-pm statistics)

### Full Context

show oam-pm statistics

### Description

This command shows the delay statistics for the specified test using the parameters specified.

## Parameters

### ***session-name***

Identifies the session to be queried.

### **dm**

Specifies that the delay test is from the MPLS test family and is using dm style measurements for the delay.

### **dmm**

Specifies that the delay test is from the Ethernet test family and is using dmm style measurements for the delay.

### **lmm**

Specifies the loss test is from the Ethernet test family and is using lmm style measurements for the loss.

### **slm**

Specifies that the loss test is from the Ethernet test family and is using slm style measurements for the loss.

### **twamp-light**

Specifies that the delay test is from the IP test family and is using twamp-light style measurements for the delay.

### **meas-interval**

Identifies the measurement interval to query for the statistics. When **raw** is specified, the interval number is not to be included because there is only one raw cumulative bin.

**Values** 5-mins, 15-mins, 1-hour, 1-day, raw

### ***interval-number***

Specifies the numerical reference that indicates the position from the latest sample window. The number 1 is the most recent with all higher numbers being that position in the past from current.

**Values** 1 to 97

### **[all | bins | summary]**

Specifies a keyword to filter the output.

### **delay**

Indicates that the statistics being queried are for delay. TWAMP-Light PDUs carry both delay and loss informational elements and it is not clear from only the test type name which statistic the operator requires.

### **loss**

Indicates the statistics being queried are for loss. TWAMP-Light PDUs carry both delay and loss informational elements and it is not clear from only the test type name which statistic the operator requires. This keyword is specific to twamp-light.

### Syntax

**statistics**

### Context

[\[Tree\]](#) (clear>eth-cfm statistics)

### Full Context

clear eth-cfm statistics

### Description

This command clears the eth-cfm statistics counters maintained in clearEthCfmStatistics.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## statistics

### Syntax

**statistics**

**statistics interface** {*ip-int-name* | *ip-address*}

**statistics policy** *name*

### Context

[\[Tree\]](#) (show>router>authentication statistics)

### Full Context

show router authentication statistics

### Description

This command displays interface or policy authentication statistics.

### Parameters

***ip-int-name* | *ip-address***

Specifies an existing interface name or IP address.

**Values** ip-int-name: 32 characters maximum  
ip-address: a.b.c.d

***name***

Specifies an existing policy name.

## Platforms

All

## Output

**Authentication Statistics Output** — The following output is an example of authentication statistics, and [Table 562: Output fields: authentication statistics](#) describes the fields.

### Output Example

```
A:ALU-3>show>router>auth# statistics
=====
Authentication Global Statistics
=====
Client Packets Authenticate Fail      : 0
Client Packets Authenticate Ok       : 12
=====
```

Table 562: Output fields: authentication statistics

Label	Description
Client Packets Authenticate Fail	The number of packets that failed authentication
Client Packets Authenticate Ok	The number of packets that were authenticated

## statistics

### Syntax

**statistics** [*interface ip-int-name* | *ip-address*]

### Context

[\[Tree\]](#) (clear>router>authentication statistics)

### Full Context

clear router authentication statistics

### Description

This command clears authentication statistics.

### Parameters

***ip-int-name***

Clears the authentication statistics for the specified interface name. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### ***ip-address***

Clears the authentication statistics for the specified IP address.

Rx Hellos	The total number of OSPF Hello packets received on all OSPF enabled interfaces.
Tx Hellos	The total number of OSPF Hello packets transmitted on all OSPF enabled interfaces.
Rx DBDs	The total number of OSPF database description packets received on all OSPF enabled interfaces.
Tx DBDs	The total number of OSPF database description packets transmitted on all OSPF enabled interfaces
Rx LSRs	The total number of OSPF Link State Requests (LSRs) received on all OSPF enabled interfaces.
Tx LSRs	The total number of OSPF Link State Requests (LSRs) transmitted on all OSPF enabled interfaces.
Rx LSUs	The total number of OSPF Link State Update (LSUs) received on all OSPF enabled interfaces.
Tx LSUs	The total number of OSPF Link State Update (LSUs) transmitted on all OSPF enabled interfaces.
Rx LS Acks	The total number of OSPF Link State Acknowledgments (LSAs) received on all OSPF enabled interfaces.
New LSAs Recvd	The total number of new OSPF Link State Advertisements received on all OSPF enabled interfaces.
New LSAs Orig	The total number of new OSPF Link State Advertisements originated on all OSPF enabled interfaces.
Ext LSAs Count	The total number of OSPF External Link State Advertisements.
No of Areas	The number of areas configured for this OSPF instance.
Total SPF Runs	The total number of incremental SPF runs triggered by new or updated LSAs.

Label	Description
Ext SPF Runs	The total number of incremental SPF runs triggered by new or updated type-5 external LSAs.
Retransmits	The total number of OSPF Retransmits transmitted on all OSPF enabled interfaces.
Discards	The total number of OSPF packets discarded on all OSPF enabled interfaces.
Bad Networks	The total number of OSPF packets received on all OSPF enabled interfaces with invalid network or mask.
Bad Virt Links	The total number of OSPF packets received on all OSPF enabled interfaces that are destined to a virtual link that does not exist.
Bad Areas	The total number of OSPF packets received on all OSPF enabled interfaces with an area mismatch.
Bad Dest Addr	The total number of OSPF packets received on all OSPF enabled interfaces with the incorrect IP destination address.
Bad Auth Types	The total number of OSPF packets received on all OSPF enabled interfaces with an invalid authorization type.
Auth Failures	The total number of OSPF packets received on all OSPF enabled interfaces with an invalid authorization key.
Bad Neighbors	The total number of OSPF packets received on all OSPF enabled interfaces where the neighbor information does not match the information this router has for the neighbor.
Bad Pkt Types	The total number of OSPF packets received on all OSPF enabled interfaces with an invalid OSPF packet type.
Bad Lengths	The total number of OSPF packets received on all OSPF enabled interfaces with a total length not equal to the length given in the packet itself.
Bad Hello Int.	The total number of OSPF packets received on all OSPF enabled interfaces where the hello interval given in packet was not equal to that configured for the respective interface.
Bad Dead Int.	The total number of OSPF packets received on all OSPF enabled interfaces where the dead interval given in the packet was not equal to that configured for the respective interface.
Bad Options	The total number of OSPF packets received on all OSPF enabled interfaces with an option that does not match those configured for the respective interface or area.

Label	Description
Bad Versions	The total number of OSPF packets received on all OSPF enabled interfaces with bad OSPF version numbers.
Tx Failures	Transmitted OSPF packets that are dropped due to resource shortage.

## statistics

### Syntax

**statistics**

### Context

[\[Tree\]](#) (clear>router>ospf3 statistics)

[\[Tree\]](#) (clear>router>ospf statistics)

### Full Context

clear router ospf3 statistics

clear router ospf statistics

### Description

This command clears all neighbor, router, interface, SPF and global statistics of this OSPF instance.

### Platforms

All

## statistics

### Syntax

**statistics** [*ipv6-address* | *ip-int-name*]

### Context

[\[Tree\]](#) (show>router>ripng statistics)

### Full Context

show router ripng statistics

### Description

This command displays the interface level statistics for the RIPng protocol.

If no IPv6 address or interface name is specified, then all configured RIPng interfaces are displayed.

If an IPv6 address or interface name is specified, then only data regarding the specified RIPng interface is displayed.

### Parameters

*ipv6-address* | *ip-int-name*

Displays statistics for the specified IPv6 interface.

### Platforms

All

### Output

The following output are examples of RIPng statistics information.

#### Output Example

```
*A:Dut-C>config>router>if# show router ripng statistics

## statistics

### Syntax

**statistics**

**statistics manager all**

**statistics manager** *manager-name*

### Context

[\[Tree\]](#) (clear>system>management-interface>remote-management statistics)

### Full Context

clear system management-interface remote-management statistics

### Description

This command clears the statistics for remote management managers. If the command is run without specifying the **manager**, the statistics for all remote managers are cleared.

### Parameters

#### **manager**

Keyword to specify that clears statistics only for a specific manager.

#### **manager-name**

Specifies the configured name of the manager, up to 64 characters, for which the statistics are cleared.

#### **all**

Clears statistics for all managers.

### Platforms

All

## statistics

### Syntax

**statistics lsp-path** [**lsp-index** *lsp-index*] [**path-lspid** *path-lspid*] [**prefix** *ip-prefix|prefix-length*] [**src** *ip-address | ipv6 address*]

**statistics lsp-path all**

**statistics sr-policy** [**lsp-index** *lsp-index*] [**path-lspid** *path-lspid*] [**prefix** *ip-prefix|prefix-length*] [**src** *ip-address | ipv6 address*]

**statistics sr-policy all**

### Context

**[Tree]** (clear>router>bfd>seamless-bfd statistics)

### Full Context

clear router bfd seamless-bfd statistics

### Description

This command clears BFD statistics.

### Parameters

#### **lsp-path**

Keyword to clear the S-BFD statistics for LSP path.

#### **sr-policy**

Keyword to clear the S-BFD statistics for SR policy.

#### **all**

Keyword to clear all S-BFD statistics.

#### **lsp-index** *lsp-index*

Specifies the LSP index.

**Values** 0 to 4294967295

#### **path-lspid** *path-lspid*

Specifies the path LSP ID.

**Values** 0 to 4294967295

### **prefix**

Keyword to clear information by far-end prefix.

### **ip-prefix/prefix-length**

Specifies an IP prefix for which to clear S-BFD statistics, and the length of the prefix.

**Values** *ipv4-prefix* — a.b.c.d (host bits must be zero)  
*ipv4-prefix-length* — 0 to 32  
*ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x — 0 to FFFF (hexadecimal)  
d — 0 to 255 (decimal)  
*ipv6-prefix-length* — 0 to 128

### **ip-address | ipv6-address**

Specifies the IP address for which to clear S-BFD statistics.

**Values** *ipv4-address* — a.b.c.d  
*ipv6-address* — x:x:x:x:x:x:x[-interface]  
x:x:x:x:x:d.d.d.d[-interface]  
x — 0 to FFFF (hexadecimal)  
d — 0 to 255 (decimal)  
interface — mandatory for link local address, up to 32 characters

## **Platforms**

All

## statistics

## **Syntax**

**statistics** [*interval seconds*] [*repeat repeat*] [*absolute | rate*]

## **Context**

[\[Tree\]](#) (monitor>router>isis statistics)

## **Full Context**

monitor router isis statistics

## **Description**

This command displays statistical IS-IS traffic information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified router statistics. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

## Platforms

All

## Output

The following output is an example of ISIS statistics.

### Output Example

```
A:ALA-12>monitor>router>isis# statistics interval 3 repeat 2 absolute

```

## statistics

### Syntax

**statistics** [*interval seconds*] [*repeat repeat*] [*absolute | rate*]

### Context

[\[Tree\]](#) (monitor>router>ldp statistics)

### Full Context

monitor router ldp statistics

### Description

Monitor statistics for LDP instance at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the LDP statistics. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

## Platforms

All

## Output

The following output is an example of LDP statistics information.

### Output Example

```
A:ALA-12>monitor>router>ldp# statistics interval 3 repeat 3 absolute

## statistics

### Syntax

**statistics** [*interval seconds*] [*repeat repeat*] [*absolute*| *rate*]

### Context

[\[Tree\]](#) (monitor>eth-cfm statistics)

### Full Context

monitor eth-cfm statistics

### Description

This command monitors control plane traffic statistics.

### Parameters

#### **seconds**

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10

***repeat***

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

***absolute***

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

***rate***

Displays rate-per-second for each statistic instead of the delta.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**statistics**

**Syntax**

**statistics all**

**statistics neighbor** *ip-address* [**port** *port-number*]

**Context**

[\[Tree\]](#) (clear>service>id>gsmp statistics)

**Full Context**

clear service id gsmp statistics

**Description**

This command clears General Switch Management Protocol (GSMP) statistics.

**Parameters**

**all**

Clears all GSMP related statistics.

***ip-address***

Specifies the IP address.

**Values** a.b.c.d. (unicast address only)

***port-number***

Specifies port number.

**Values** 0 to 65535

## 28.36 status

## status

## Syntax

status

## Context

[\[Tree\]](#) (show>call-trace status)

## Full Context

show call-trace status

## Description

This command gives a router-wide overview of call-trace operational data, such as number of configured profile, number of jobs and status of the compact flash.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of call trace status information.

### Output Example

```

=====
Call trace status
=====
No. of trace profiles: 1
No. of trace jobs   : 0
-----
Primary CF         : CF1           Max files number   : 200
CF1 state          : enabled        CF1 volume limit   : 1000 MB
CF2 state          : enabled        CF2 volume limit   : 1000 MB
    
```

[Table 566: Output fields: call trace status](#) describes call trace status output field information.

*Table 566: Output fields: call trace status*

Field	Descriptions
No. of trace profiles	The number of profiles configured in the system
No. of trace jobs	The number of trace jobs
Primary CF	The compact flash card to be used as the primary local storage location to save the generated call trace log files
Max files number	The cumulative number of call trace log files present on all cflash cards on the active CPM that are being used for local storage has reached the limit
CF1 state	The status of a call trace job on CF2. "running" indicates the job is active and is tracing events triggered by the host being monitored. "finished" indicates the job has already finished and is not tracing events generated by the host anymore.
CF1 volume limit	The data volume limit for the CF1 call trace job
CF2 state	The status of a call trace job on CF2. "running" indicates the job is active and is tracing events triggered by the host being monitored. "finished" indicates the job has already

Field	Descriptions
	finished and is not tracing events generated by the host anymore.
CF2 volume limit	The data volume limit for the CF2 call trace job

## status

### Syntax

**status**

### Context

[\[Tree\]](#) (show>router>igmp status)

### Full Context

show router igmp status

### Description

This command displays IGMP status information.

If IGMP is not enabled, the following message appears:

```
A:NYC# show router igmp status
MINOR: CLI IGMP is not configured.
A:NYC#
```

### Platforms

All

### Output

The following output is an example of IGMP status information. [Table 567: Output fields: IGMP status](#) provides IGMP status field descriptions.

### Output Example

```
*A:ALA-BA# show router 100 igmp status
=====
IGMP Status
=====
Admin State           : Up
Oper State            : Up
Query Interval        : 1024
Last Member Query Interval : 1024
Query Response Interval : 1023
Robust Count          : 10
=====
*A:ALA-BA#
```

Table 567: Output fields: IGMP status

Label	Description
Admin State	The administrative status of IGMP.
Oper State	The current operating state of this IGMP protocol instance on this router.
Query Interval	The frequency at which IGMP query packets are transmitted.
Last Member Query Interval	The maximum response time inserted into group-specific queries sent in response to leave group messages, and is also the amount of time between group-specific query messages.
Query Response Interval	The maximum query response time advertised in IGMPv2 queries.
Robust Count	The number of times the router will retry a query.

Table 568: Output fields: LDP status

Label	Description
Created at	The date and time when the LDP instance was created.
Last Change	The date and time when the LDP instance was last modified.
Admin State	Up — The LDP is administratively enabled. Down — The LDP is administratively disabled.
Oper State	Up — The LDP is operationally enabled. Down — The LDP is operationally disabled.
Up Time	The time, in hundredths of seconds, that the LDP instance has been operationally up.
Oper Down Reason	The reason for the operational down status.

Label	Description
Oper Down Events	The number of times the LDP instance has gone operationally down since the instance was created.
Tunn Down Damp Time	Indicates the value configured by <b>tunnel-down-damp-time</b> .
Weighted ECMP	Indicates whether weighted ecmp is enabled or not.
Label Withdraw Del*	Indicates the value configured by <b>label-withdrawal-delay</b> .
Implicit Null Label	Indicates whether implicit null is supported.
Short. TTL Local	Indicates whether <b>shortcut-local-ttl-propagate</b> is enabled or not.
Short. TTL Transit	Indicates whether <b>shortcut-transit-ttl-propagate</b> is enabled or not.
ConsiderSysIPByPol*	Whether <b>consider-system-ip-in-gep</b> is enabled.
Imp Ucast Policies	Lists the applied import unicast policies, if any. Up to five import policies can be specified.
Exp Ucast Policies	Lists the applied export unicast policies, if any. Up to five import policies can be specified.
Imp Mcast Policies	Lists the applied import multicast policies, if any. Up to five import policies can be specified.
Tunl Exp Policies	Lists the applied tunnel export policies, if any. Up to five import policies can be specified.
FRR	Indicates whether Fast ReRoute is enabled or not.
Mcast Upstream FRR	Indicates whether multicast upstream fast reroute has been enabled or not.
Mcast Upst ASBR FRR	Indicates whether multicast upstream fast reroute has been enabled or not at ASBR.
MP MBB Time	Indicates the value configured by <b>mp-mbb-time</b> .
Aggregate Prefix	Indicates whether aggregate-prefix-match has been enabled or not.
Agg Prefix Policies	Lists the policies for the aggregate prefix match, if any. Up to five aggregate prefix policies can be specified.
Class Forwarding	Indicates whether class forwarding is in the enabled or disabled mode. Enabled modes are (lsr, ler, or lsr-and-ler).
Legacy LSR Interop	Indicates whether legacy LSR interoperability has been enabled or not.
Entropy Label Capa*	Indicates whether the support for entropy label is enabled or not.
Generate Basic FEC	Indicates whether generate-basic-fec-only has been enabled or not.

Label	Description
Resolve Via Mcast *	Indicates whether the route for the root address of P2MP FECs will be resolved using the unicast routing table or the multicast routing table.
Capabilities	
Dynamic	Indicates whether LDP supports changing capabilities dynamically using the LDP Capability message, or only in the Initialization message.
P2MP	Indicates whether LDP supports exchanging P2MP FECs.
IPv4 Prefix Fec	Indicates whether LDP supports exchanging IPv4 Prefix FECs.
IPv6 Prefix Fec	Indicates whether LDP supports exchanging IPv6 Prefix FECs.
Service Fec128	Indicates whether LDP supports exchanging basic pseudowire service FECs.
Service Fec129	Indicates whether LDP supports exchanging generalized pseudowire (PWE3) service FECs.
MP MBB	Indicates whether MP MBB is enabled or not.
Overload	Indicates whether LDP supports sending and receiving overload notification messages (Nokia vendor extension).
Unrecognized Notif*	Indicates whether LDP supports receiving notification messages with an unrecognized status; required for the end-of-lib feature (RFC 5919).

show router mpls status

### Description

This command displays MPLS operation information.

### Platforms

All

## Output

The following output is an example of MPLS status information.

[Table 569: Output fields: MPLS status](#) describes MPLS status output fields.

### Output Example

```
# show router mpls status

=====

PCE Init SR-TE LSPs	0	N/A	N/A

Table 569: Output fields: MPLS status

Label	Description
Admin Status	Down — MPLS is administratively disabled. Up — MPLS is administratively enabled.
Oper Status	Down — MPLS is operationally down. Up — MPLS is operationally up.
Oper Down Reason	Specifies the operational down cause.
FRR Object	Enabled — Specifies that Fast reroute object is signaled for the LSP. Disabled — Specifies that Fast reroute object is not signaled for the LSP.
Resignal Timer	Enabled — Specifies that the resignal timer is enabled for the LSP. Disabled — Specifies that the resignal timer is disabled for the LSP.
Hold Timer	Displays the amount of time that the ingress node holds before programming its data plane and declaring the LSP up to the service module.
Next Resignal	Specifies the next resignal value.
Srlg Frr	Enabled — Specifies that SRLG Fast reroute is signaled for the LSP. Disabled — Specifies that SRLG Fast reroute is not signaled for the LSP.
Srlg Frr Strict	Enabled — Specifies that SRLG Fast reroute strict is signaled for the LSP. Disabled — Specifies that SRLG Fast reroute strict is not signaled for the LSP.
Admin Group Frr	Enabled — Specifies that the administrative group Fast reroute is signaled for the LSP. Disabled — Specifies that the administrative group Fast reroute is not signaled for the LSP.
Dynamic Bypass	Enabled — Specifies that dynamic bypass is enabled. Disabled — Specifies that dynamic bypass is disabled.
User Srlg Database	Enabled — Specifies that user SRLG databases are enabled. Disabled — Specifies that user SRLG databases are disabled.
BypassResignalTimer	Enabled — Specifies that the bypass resignal timer is enabled. Disabled — Specifies that the bypass resignal timer is disabled.
BypassNextResignal	Specifies the bypass next resignal value.
LeastFill Min Thd	Specifies the least fill minimum threshold percentage value.
LeastFill Reopti Thd	Specifies the least fill re-optimization threshold percentage value.

Label	Description
Local TTL Prop	Enabled — Specifies that local TTL property is enabled. Disabled — Specifies that local TTL property is disabled.
Transit TTL Prop	Enabled — Specifies that transit TTL property is enabled. Disabled — Specifies that transit TTL property is disabled.
P2mp TTL Prop	Enabled — Specifies that the uniform mode of operation is configured for RSVP P2MP LSPs. Disabled — Specifies that the pipe mode of operation is configured for RSVP P2MP LSPs.
AB Sample Multiplier	Specifies the AB sample multiplier value.
AB Adjust Multiplier	Specifies the AB adjust multiplier value.
Exp Backoff Retry	Enabled — Specifies that Exp Backoff retry is enabled. Disabled — Specifies that Exp Backoff is disabled.
CSPF On Loose Hop	Enabled — Specifies that CSPF On Loose Hop is enabled. Disabled — Specifies that CSPF On Loose Hop is disabled.
Lsp Init RetryTimeout	Specifies the LSP Init RetryTimeout seconds value.
MBB Pref Current Hops	Enabled — Specifies that MBB Pref Current Hops is enabled. Disabled — Specifies that MBB Pref Current Hops is disabled.
Logger Event Bundling	Enabled — Specifies that Logger Event Bundling is enabled. Disabled — Specifies that Logger Event Bundling is disabled.
Retry on IGP Overload	Enabled — Specifies that Retry on IGP Overload is enabled. Disabled — Specifies that Retry on IGP Overload is disabled.
Resignal on IGP Overload	Enabled — Specifies that Resignal on IGP Overload is enabled. Disabled — Specifies that Resignal on IGP Overload is disabled.
P2mp Resignal Timer	Enabled — Specifies that the P2MP Resignal Timer is enabled. Disabled — Specifies that the P2MP Resignal Timer is disabled.
P2mp Next Resignal	Specifies the P2MP Next Resignal Timer value.
Sec FastRetryTimer	Enabled — Specifies that the Sec Fast RetryTimer is enabled. Disabled — Specifies that the Sec Fast RetryTimer is disabled.
Static LSP FR Timer	Specifies the Static LSP FR Timer seconds value.
P2P Max Bypass Association	Specifies the P2P Max Bypass Association value.

Label	Description
P2PActPathFastRetry	Enabled — Specifies that the P2P ActPath Fast Retry is enabled. Disabled — Specifies that the P2P ActPath Fast Retry is disabled.
P2MP S2L Fast Retry	Enabled — Specifies that the P2MP S2L Fast Retry is enabled. Disabled — Specifies that the P2MP S2L Fast Retry is disabled.
In Maintenance Mode	No — Specifies that the system is not in maintenance mode. Yes — Specifies that the system is in maintenance mode.
MplsTp	Enabled — Specifies that MPLS TP is enabled. Disabled — Specifies that MPLS TP is disabled.
Next Available Lsp Index	Specifies the next available LSP index value.
Entropy Label RSVP-TE	Enabled — Specifies that Entropy Label RSVP-TE is enabled. Disabled — Specifies that Entropy Label RSVP-TE is disabled.
Entropy Label SR-TE	Enabled — Specifies that Entropy Label SR-TE is enabled. Disabled — Specifies that Entropy Label SR-TE is disabled.
PCE Report RSVP-TE	Enabled — Specifies that PCE Report RSVP-TE is enabled. Disabled — Specifies that PCE Report RSVP-TE is disabled.
PCE Report SR-TE	Enabled — Specifies that PCE Report SR-TE is enabled. Disabled — Specifies that PCE Report SR-TE is disabled.
PCE Init LSP	Enabled — Specifies that PCE Init LSP is enabled. Disabled — Specifies that PCE Init LSP is disabled.
PCE Init SR-TE	Enabled — Specifies that PCE Init LSP SR-TE is enabled. Disabled — Specifies that PCE Init LSP SR-TE is disabled.
PCE Init SR-TE Admin State	Up — Specifies that the PCE Init SR-TE Admin State is up. Down — Specifies that the PCE Init SR-TE Admin State is down.
PCE Init SR-TE Oper State	Up — Specifies that the PCE Init SR-TE Operational State is up. Down — Specifies that the PCE Init SR-TE Operational State is down.
PCE Init SR-TE Oper Dn Rsn	Specifies the reason for the PCE Init SR-TE Operationally down.
LSP History	Enabled — Specifies that the LSP history is enabled. Disabled — Specifies that the LSP history is disabled.
LSP History Recording	Enabled — Specifies that the LSP history recording is enabled.

Label	Description
	Disabled — Specifies that the LSP history recording is disabled.
LSP Self Ping Timeout	Specifies the LSP Self Ping timeout value.
LSP Self Ping Interval	Specifies the LSP Self Ping interval value.
LSP Self Ping RSVP TE	Specifies the status of LSP Self Ping RSVP TE.
Originate	Specifies the number of originations for the various LSP types.
Transit	Specifies the number of transits for the various LSP types.
Terminate	Specifies the number of terminations for the various LSP types.

## status

### Syntax

**status**

### Context

[\[Tree\]](#) (show>router>mpls>mpls-tp status)

### Full Context

show router mpls mpls-tp status

### Description

This command displays MPLS-TP system configuration information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### Output

The following output is an example of MPLS TP status information .

### Output Example

```
*A:mlstp-dutA# show router mpls mpls-tp status
=====
MPLS-TP Status
=====
Admin Status   : Up
Global ID      : 42
Tunnel Id Min  : 1
Node ID        : 0.0.3.233
Tunnel Id Max  : 4096
=====
```

## status

### Syntax

**status**

### Context

[\[Tree\]](#) (show>router>rsvp status)

### Full Context

show router rsvp status

### Description

This command displays RSVP status.

### Platforms

### Output

The following output is an example of RSVP status information.

[Table 570: Output fields: RSVP status](#) describes RSVP status output fields.

*Table 570: Output fields: RSVP status*

Label	Description
Admin Status	Down — RSVP is administratively disabled. Up — RSVP is administratively enabled.
Oper Status	Down — RSVP is operationally down. Up — RSVP is operationally up.
Keep Multiplier	Displays the <b>keep-multiplier number</b> used by RSVP to declare that a reservation is down or the neighbor is down.
Refresh Time	Displays the <b>refresh-time</b> interval (in s), between the successive Path and Resv refresh messages.
Message Pacing	Enabled — RSVP messages, specified in the <b>max-burst</b> command, are sent in a configured interval, specified in the <b>period</b> command. Disabled — Message pacing is disabled. RSVP message transmission is not regulated.
Pacing Period	Displays the time interval (in ms), when the router can send the specified number of RSVP messages specified in the <b>rsvp max-burst</b> command.

Label	Description
Max Packet Burst	Displays the maximum number of RSVP messages that are sent in the specified period under normal operating conditions.
Soft Preemption Timer	Displays the time (in s), a node holds on to a reservation for which it has triggered the soft preemption procedure.
Rapid Retransmit	Displays the value of the rapid retransmission interval.
Rapid Retry Limit	Displays the rapid retry limit.
Graceful Shutdown	Specifies whether graceful shutdown of the RSVP node is enabled.
Dark Bandwidth	Indicates the status of the dark bandwidth accounting application.
DBw Sample Intv	Displays the configured dark bandwidth sampling interval.
DBw Up Threshold	Displays the configured dark bandwidth up threshold.
DBw Down Threshold	Displays the configured dark bandwidth down threshold.
DBw Multiplier	Displays the configured dark bandwidth multiplier.
DBw Sample Multp	Displays the configured dark bandwidth sample multiplier.

### Output Example

```

B:# show router rsvp status

```

### Context

[\[Tree\]](#) (show>app-assure>group status)

### Full Context

```
show application-assurance group status
```

### Description

This command displays system statistics.

### Parameters

#### **isa mda-id**

Displays information about the specified AA ISA.

**Values** mda-id: slot/mda: slot: 1 to 10, mda: 1 or 2

#### **cflowd**

Displays cflowd status information.

#### **detail**

Displays detailed status information.

#### **cpu [sample-period seconds]**

Displays DPU utilization info about the specified AA ISA. The **isa mda-id** must be specified. The sample period can be specified within a range of 1 5 seconds (default 1s).

**Values** 1 to 5

**overload**

Displays the overload status.

**qos count**

Displays information about queue statistics. The **isa mda-id** must be specified.

**qos pools**

Displays information about AA related pool utilization. The **isa mda-id** must be specified.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of status information.

**Output Example**

```
*A:Dut-C# show application-assurance group 1 status

## status

### Syntax

#### status

## Context

[\[Tree\]](#) (show>router>mld status)

## Full Context

show router mld status

## Description

This command displays MLD status information.

If MLD is not enabled, the following message appears:

```
A:NYC# show router mld status
MINOR: CLI MLD is not configured.
A:NYC#
```

## Platforms

All

## Output

The following output is an example of MLD status information [Table 572: Output fields: MLD status](#) provides MLD status field descriptions.

### Output Example

```
*A:ALA-BA# show router mld status
=====
MLD Status
=====
Admin State           : Up
Oper State            : Up
Query Interval        : 125
Last Listener Query Interval : 1
Query Response Interval : 10
Robust Count          : 2
=====
*A:ALA-BA#
```

Table 572: Output fields: MLD status

Label	Description
Admin State	The administrative status of MLD.
Oper State	The current operating state of this MLD protocol instance on this router.
Query Interval	The frequency at which MLD query packets are transmitted.
Last Listener Query Interval	The maximum response time inserted into group-specific queries sent in response to leave group messages, and is also the amount of time between group-specific query messages.

Label	Description
Query Response Interval	The maximum query response time advertised in MLDv2 queries.
Robust Count	The number of times the router will retry a query.

## status

### Syntax

**status**

### Context

[\[Tree\]](#) (show>router>msdp status)

### Full Context

show router msdp status

### Description

This command displays MSDP status information.

### Platforms

All

### Output

The following output is an example of MSDP status information, and [Table 573: Output fields: MSDP status](#) describes the output fields.

#### Output example

```
A:node-2# show router msdp status
=====
MSDP Status
=====
Admin State                : Up

```

A: node-2#

Table 573: Output fields: MSDP status

Label	Description
Admin State	The administrative state
Local Address	The local IP address
Active Src Limit	The active source limit
Act Src Lim Excd	The active source limit which has been exceeded
Number of Peers	The number of peers
Num. Peers Estab	The number of peers established
Num. Source Active	The number of active sources
Policies	The policy to export source active state from the source active list into MSDP
Data Encapsulation	The RP using MSDP to encapsulate multicast data received in MSDP register messages inside forwarded MSDP SA messages - enabled or disabled
Rate	The receive message rate
Time	The receive message time
Threshold	The number of MSDP messages that can be processed before the MSDP message rate-limiting function is activated
RPF Table	The name of the RPF table
Last msdp Enabled	The time the last MSDP was triggered

## status

### Syntax

**status** [**detail**] [*family*]

### Context

[\[Tree\]](#) (show>router>pim status)

### Full Context

show router pim status

## Description

This command displays PIM status. The Oper Status reflects the combined operational status of IPv4 or IPv6 PIM protocol status. If both are down, then Oper Status is reflected as down. If IPv4 or IPv6 reflects up, the Oper Status reflects up.

If PIM is not enabled, the following message appears:

```
A:NYC# show router pim status
MINOR: CLI PIM is not configured.
A:NYC#
```

## Parameters

### detail

Displays detailed status information.

### family

Displays status information for the specified family.

**Values** ipv4, ipv6

## Platforms

All

## Output

The following output is an example of a PIM status configuration. [Table 574: Output fields: PIM status](#) provides PIM status output field descriptions.

### Output Example

```
A:dut-d# show router pim status
=====
PIM Status ipv4

    =====
A:dut-d#
    
```

Table 574: Output fields: PIM status

Label	Description
Admin State	The administrative status of PIM.
Oper State	The current operating state of this PIM protocol instance.
BSR State	The state of the router with respect to the Bootstrap mechanism.
Address	The address of the elected Bootstrap router.
Expiry Time	The time remaining before the router sends the next Bootstrap message.
Priority	The priority of the elected Bootstrap router. The higher the value, the higher the priority.
Hash Mask Length	The hash mask length of the Bootstrap router.
Up Time	The time since the current E-BSR became the Bootstrap router.
RPF Intf towards	The RPF interface towards the elected BSR. The value is zero if there is no elected BSR in the network.
Address	The address of the candidate BSR OS.
Expiry Time	The time remaining before the router sends the next Bootstrap message.
Auto-RP	Displays if auto-RP functionality is enabled or disabled.
Priority	The priority of the Bootstrap router. The higher the value, the higher the priority.
Hash Mask Length	The hash mask length of the candidate Bootstrap router.
Up Time	The time since becoming the Bootstrap router.

Label	Description
Admin State	The administrative status of CRP.
Oper State	The current operating state of the C-RP mechanism.
Address	The local RP address.
Priority	The CRP's priority for becoming a rendezvous point (RP). A 0 value is the highest priority.
Holdtime	The hold time of the candidate RP. It is used by the Bootstrap router to time out the RP entries if it does not listen to another CRP advertisement within the holdtime period.
Policy	The PIM policies for a particular PIM instance.
Default Group	The default core group address.
RPF Table	The route table used for RPF check.
MC-ECMP-Hashing	Displays whether hash-based multicast balancing of traffic over ECMP links is enabled or disabled.
SSM S,G Scaling (up to 256K)	The status of PIM SSM scaling.

```

Table 575: Output fields: cflowd status

Label	Description
Cflowd Admin Status	The desired administrative state for this cflowd remote collector host
Cflowd Oper Status	The current operational status of this cflowd remote collector host
Active Flow Timeout	The maximum amount of time, in minutes, before an active flow will be exported; if an individual flow is active for this amount of time, the flow is exported and a new flow is created
Inactive Flow Timeout	Inactive flow timeout in seconds
Template Retransmit	The time in seconds before template definitions are sent
Cache Size	The maximum number of active flows to be maintained in the flow cache table
Overflow	The percentage number of flows to be flushed when the flow cache size has been exceeded
Analyze GRE	Displays whether cflowd analysis of the inner IP packet in a sampled GRE packet that is transiting the local router is enabled or disabled
Analyze L2TPv2	Displays whether cflowd looking for and analyzing the inner IP header of an L2TPv2 frame is enabled or disabled
Analyze IPV4overV6	Displays whether cflowd looking for and analyze the inner IPv4 header of IPv4overIPv6 frames that include MAP-E as well as DS-Lite and SAM traffic is enabled or disabled
Sample Rate	The rate at which traffic is sampled and forwarded for cflowd analysis: one (1) — all packets are analyzed 1000 (default) — every 1000th packet is analyzed
Active Flows	The current number of active flows being collected

Label	Description
Total Pkts Rcvd	The total number of packets sampled and forwarded for cflowd analysis
Total Pkts Dropped	The total number of packets dropped
Aggregation Info:	
Type	The type of data to be aggregated and to the collector
Status	enabled — specifies that the aggregation type is enabled
	disabled — specifies that the aggregation type is disabled
Sent	The number of packets with flow data sent to the associated collector
Open	This counter shows the number of partially filled packets which have some flow data but are not yet filled or have been timed out (60 seconds maximum)
Error	This counter increments when there was an error during exporting of the collector packet; the most common reason will be a UDP unreachable destination for the configured collector
Overflow events	The number of times the active cache overflowed
Dropped Flows	Total number of flows dropped due to cache overflow events

## status

### Syntax

**status**

### Context

[\[Tree\]](#) (show>router status)

### Full Context

show router status

### Description

This command displays the router status.

### Platforms

All

## Output

**Router Status Output** — The following output is an example of router status information.

There are multiple instances of OSPF. OSPF-0 is persistent. OSPF-1 through OSPF-31 are present when that specific OSPF instance is configured.

### Output Example

```
*A:Dut-C# show router status
=====
Router Status (Router: Base)
=====
-----
Admin State                                Oper State
-----
Router                                    Up
OSPFv2                                    Not configured

**VPRN TTL Propagation and ICMP Tunneling**—The following output is an example of TTL propagation and ICMP tunneling configurations in a VPRN service. The TTL propagation has been specified as local and all for VPRN service 5001.

**Output Example**

```
*A:Dut-A# configure service vprn 5001 ttl-propagate local all
*A:Dut-A# show router 5001 status
```

```

Table 576: Output fields: IS-IS status

Label	Description
ISIS Cfg System Id	Displays the configured IS-IS system ID
ISIS Oper System Id	Displays the operational IS-IS system ID

Label	Description
ISIS Cfg Router Id	Displays the configured IS-IS router ID
ISIS Oper Router Id	Displays the operational IS-IS router ID
ISIS Cfg IPv6 Router Id	Displays the configured IS-IS IPv6 router ID
ISIS Oper IPv6 Router Id	Displays the operational IS-IS IPv6 router ID
ASN	Displays the Autonomous System Number (ASN) the IGP uses when the IS-IS Traffic Engineering Database (TEDB) export is enabled. The ASN value represents either the ASN from the confederation AS, or the router AS if confederations are not configured.
Admin State Oper State	Displays one of the following: <ul style="list-style-type: none"> <li>• Up — IS-IS is administratively up</li> <li>• Down — IS-IS is administratively down</li> </ul>
Ipv4 Routing	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — IPv4 routing is enabled</li> <li>• Disabled — IPv4 routing is disabled</li> </ul>
Ipv6 Routing	Displays one of the following: <ul style="list-style-type: none"> <li>• Disabled — IPv6 routing is disabled</li> <li>• Enabled, Native — IPv6 routing is enabled</li> <li>• Enabled, Multi-topology — Multi-topology TLVs for IPv6 routing is enabled</li> </ul>
Mcast Ipv4 Routing	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — Multicast is enabled</li> <li>• Disabled — Multicast is disabled</li> <li>• Native — Multicast in IS-IS MT0 is enabled</li> <li>• Multi-topology — Multicast in IS-IS MT3 (IPv4) is enabled</li> </ul>
Mcast Ipv6 Routing	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — Multicast is enabled</li> <li>• Disabled — Multicast is disabled</li> <li>• Native — Multicast in IS-IS MT0 is enabled</li> <li>• Multi-topology — Multicast in IS-IS MT4 (IPv6) is enabled</li> </ul>
Last Enabled	Displays the date and time when IS-IS was last enabled in the router

Label	Description
Level Capability	Displays the routing level for the IS-IS routing process
Authentication Check	Displays one of the following: <ul style="list-style-type: none"> <li>• True — All IS-IS mismatched protocol packets are rejected</li> <li>• False — Authentication is performed on received IS-IS protocol packets but mismatched packets are not rejected</li> </ul>
Auth Keychain	Displays the authentication keychain name used by IS-IS for the session when enabled
Authentication Type	Displays the authentication method used to verify the authenticity of packets sent by neighboring routers on an IS-IS interface
CSNP-Authentication	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — Complete Sequence Number Packet (CSNP) authentication is enabled</li> <li>• Disabled — CSNP authentication is disabled</li> </ul>
HELLO-Authentication	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — Hello packet authentication is enabled</li> <li>• Disabled — Hello packet authentication is disabled</li> </ul>
PSNP-Authentication	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — Partial Sequence Number Packet (PSNP) authentication is enabled</li> <li>• Disabled — PSNP authentication is disabled</li> </ul>
Traffic Engineering	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — TE is enabled for the router</li> <li>• Disabled — TE is disabled so that TE metrics are not generated and are ignored when received by this node</li> </ul>
Oper IPv6 TE Router Id	Displays the value of the IS-IS IPv6 TE Router ID TLV (TLV 140) defined by RFC 6119. The IPv6 TE Router ID is configured using the <b>configure router ipv6-te-router-id interface name</b> command. By default, the system IPv6 address is used when IPv6 TE is enabled.
Graceful Restart	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — Graceful restart is enabled for this instance of IS-IS on the router</li> <li>• Disabled — Graceful restart capability is disabled for this instance of IS-IS on the router</li> </ul>
GR Helper Mode	Displays if GR helper mode is configured

Label	Description
Overload-On-Boot Timeout	Displays if the overload-on-boot timeout is configured
Overload Max-Metric	Displays if overload max metric is configured
Overload-On-Boot Max-Metric	Displays if the overload-on-boot maximum metric is configured
Overload Include Locators	Displays if overload include locators is enabled
Ovl Export Interlevel	Displays if overload export interlevel is configured
Ovl Export External	Displays if overload export external is configured
Ovl FIB Error Notify Only	Displays if overload notification only is configured: <ul style="list-style-type: none"> <li>• Disabled — Indicates the router will go into overload mode when the overload condition is reached.</li> <li>• Enabled — Indicates the router will not go into overload mode when the overload condition is reached and instead will only advertise a notification.</li> </ul>
Ovl FIB Error Retry	Displays the amount of time in seconds until the router periodically retries to program the FIB during the gracious overload condition
LSP Lifetime	Displays the LSP lifetime value
LSP Min Remaining Lifetime	Displays the LSP minimum remaining lifetime information
LSP Refresh Half Interval	Displays the LSP refresh half interval
LSP Wait (ms)	Displays the max, initial, and initial wait times
LSP MTU Size	Displays the LSP Maximum Transmission Unit (MTU) size
L1 LSP MTU Size	Displays the level 1 LSP MTU size
L2 LSP MTU Size	Displays the level 2 LSP MTU size
L1 MAX LSP MTU Size	Displays the level 1 maximum LSP MTU size
L2 MAX LSP MTU Size	Displays the level 2 maximum LSP MTU size
Adjacency Check	Displays the adjacency check configuration
L1 Auth Keychain or L2 Auth Keychain	Displays if authentication keychain is enabled

Label	Description
L1 Auth Type or L2 Auth Type	Displays if the authentication type is configured
L1 CNSP-Authentication or L2 CSNP-Authentication	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — Complete Sequence Number Packet (CSNP) authentication is enabled</li> <li>• Disabled — CSNP authentication is disabled</li> </ul>
L1 HELLO-Authentication or L2 HELLO-Authentication	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — Hello packet authentication is enabled</li> <li>• Disabled — Hello packet authentication is disabled</li> </ul>
L1 PSNP-Authentication or L2 PSNP-Authentication	Displays one of the following: <ul style="list-style-type: none"> <li>• Enabled — Partial Sequence Number Packet (PSNP) authentication is enabled</li> <li>• Disabled — PSNP authentication is disabled</li> </ul>
L1 Preference or L2 Preference	Displays the preference
L1 Ext. Preference or L2 Ext. Preference	Displays the external preference
L1 Wide Metrics or L2 Wide Metrics	Displays if the wide metrics features is enabled
L1 LSDB Overload or L2 LSDB Overload	Displays if the Link-State Database (LSDB) overload is enabled
L1 LSPs or L2 LSPs	Displays the number of LSPs
L1 Default Metric or L2 Default Metric	Displays the default metric
L1 IPv6 Def Metric or L2 IPv6 Def Metric	Displays the IPv6 default metric
L1 Mcast IPv4 Def Metric or L2 Mcast IPv4 Def Metric	Displays the multicast IPv4 default metric
L1 Mcast IPv6 Def Metric or L2 Mcast IPv6 Def Metric	Displays the multicast IPv6 default metric
L1 Adv Router Cap or L2 Adv Router Cap	Displays if the advanced router capacity is enabled for the level

Label	Description
L1 Bier Template or L2 Bier Template	Displays if the Bit Indexed Explicit Replication (BIER) template is enabled
L1 Total Exp Routes or L2 Total Exp Routes	Displays the total exp routes for the level
All-L1-Mac_Addr (Cfg) or All-L2-MacAddr (Cfg)	Displays the MAC addresses for the level
Last SPF	Displays the last shortest path first (SPF) calculation time
SPF Wait (ms)	Displays the SPF wait time before doing another calculation
Muti-topology	Displays if multi-topology is enabled
IPv6-Unicast MT2	Displays if IPv6 unicast MT2 is enabled
IPv4-Multicast MT3	Displays if IPv4 multicast MT3 is enabled
IPv6-Multicast MT4	Displays if IPv6 multicast MT4 is enabled
Area Addresses	Displays the area addresses
Standard Multi-Instance	Displays if a standard multi-instance is enabled
IID TLV	Displays if the Instance ID TLV is enabled
Prefix TLV	Displays if the Prefix Attributes TLV is enabled
Export Policies	Displays if there are export policies
Import Policies	Displays if there are import policies
LFA Policies	Displays if there are Loop-Free Alternate policies
Multicast Import	Displays if there is a multicast import
Advertise-Passive-Only	Displays if advertise passive only is enabled
Ignore Attached Bit	Displays if ignore attached bit is enabled
Suppress Attached Bit	Displays if suppress attached bit is enabled
Default Route Tag	Displays the default route tag if one exists
Rib Prio List High	Displays the Routing Information Base (RIB) high priority list
Rib Prio Tag High	Displays the RIB high priority tag

Label	Description
Ldp Sync Admin State	Displays if the IGP-LDP synchronization feature is enabled on all interfaces participating in the OSPF routing protocol
LDP-over-RSVP	Displays if LDP over RSVP is enabled
IGP-Shortcut	Displays if Interior Gateway Protocol (IGP) shortcuts are enabled
IPv4 IGP SC Tunn-Nhop	Displays if IPv4 IGP shortcut tunnel next hop is enabled
IPv6 IGP SC Tunn-Nhop	Displays the IPv6 IGP shortcut tunnel next hop is enabled
SRv4 IGP SC Tunn-Nhop	Displays if the SRv4 IGP shortcut tunnel next hop is enabled
SRv6 IGP SC Tunn-Nhop	Displays if the SRv6 IGP shortcut tunnel next hop is enabled
Advertise-Tunnel-Link	Displays if advertise tunnel link is enabled
Export Limit	Displays the export limit
Exp Lmt Log Percent	Displays the export limit log percentage
Loopfree-Alternate	Displays if Loop-Free Alternate (LFA) is enabled in this IS-IS instance
Remote-LFA	Displays if remote LFA is enabled
Max PQ Cost	Displays the maximum PQ cost
Remote-LFA (node-protect)	Displays if remote LFA is enabled
Max PQ Nodes (node-protect)	Displays the maximum PQ nodes
LFA NH Template	Displays if the LFA Next-Hop (NH) template is applied for the configured LFA policies
Augment-route-table	Displays if the augment route table feature is enabled
TI-LFA	Displays if Topology-Independent Loop-Free Alternate (TI-LFA) is enabled
Max SR FFR Labels	Displays the maximum Segment Routing Fast Reroute (SR FRR) labels
TI-LFA (node-protect)	Displays if TI-LFA node protect is enabled
L1 LFA	Displays if level 1 LFA is included

Label	Description
L2 LFA	Displays if level 2 LFA is included
Advertise Router Cap	Displays the advertise router capacity
Hello Padding L1 Hello Padding L2 Hello Padding	Displays if Hello padding is enabled
Ignore Lsp Errors	Displays if ignoring LSP errors is enabled
Ignore Narrow Metric	Displays if ignoring narrow metric is enabled
Reference Bandwidth	Displays the reference bandwidth
Ucast Import Disable	Displays the Ucast import disable configuration information
Segment Routing	Displays if Segment Routing is enabled
Segment Routing MT2	Displays if Segment Routing MT2 is enabled.
Flex Algo	Displays if Flexible Algorithms are up
Mapping Server	Displays if the mapping server is up
Purge Originator Id	Displays if purge originator ID is enabled
Class Based Forwarding	Displays if class based forwarding is enabled
Entropy Label	Displays if the entropy label is enabled
Override ELC	Displays if override ELC is enabled
Micro loop avoidance	Displays if micro-loop avoidance is enabled and the Forwarding Information Base (FIB) delay
UPA Received Processing	Displays if Unreachable Prefix Announcement (UPA) processing is enabled. When enabled, this allows processing of received UPAs from other routers. When disabled, received UPAs are handled briefly with normal IGP routes and ignored by the router.
UPA Lifetime	Displays the amount of time a UPA is advertised
UPA Metric	Displays the metric to an advertised UPA
UPA Max Number Advertised	Displays the maximum number of UPAs the router can advertise

## status

### Syntax

**status**

### Context

[\[Tree\]](#) (show>router>ospf3 status)

[\[Tree\]](#) (show>router>ospf status)

### Full Context

show router ospf3 status

show router ospf status

### Description

Displays the general status of OSPF.

### Platforms

All

### Output

OSPF Status Output Fields

[Table 577: Output fields: OSPF status](#) describes the command output fields for OSPF status.

*Table 577: Output fields: OSPF status*

Label	Description
OSPF Router Id	A 32-bit integer uniquely identifying the router in the Autonomous System. The SR OS system defaults to the System IP address or if not configured the 32 least significant bits of the system MAC address.
OSPF Version	The current version number of the OSPF protocol is 2.
OSPF Admin Status	Disabled — Denotes that the OSPF process is disabled on all interfaces. Enabled — Denotes that the OSPF process is active on at least one interface.
OSPF Oper Status	Disabled — Denotes that the OSPF process is not operational on all interfaces. Enabled — Denotes that the OSPF process is operational on at least one interface.
Preference	The route preference for OSPF internal routes.

Label	Description
External Preference	The route preference for OSPF external routes.
Backbone Router	False — This variable indicates that this router is not configured as an OSPF back bone router.  True — This variable indicates that this router is configured as an OSPF back bone router.
Area Border Router	False — This router is not an area border router.  True — This router is an area border router.
AS Border Router	False — This router is not configured as an Autonomous System border router.  True — This router is configured as an Autonomous System border router.
OSPF Ldp Sync Admin Status	Indicates whether the IGP-LDP synchronization feature is enabled or disabled on all interfaces participating in the OSPF routing protocol.

### Output Example

```
*A:Dut-A>config>service# show router ospf status

## status

### Syntax

**status**

### Context

[\[Tree\]](#) (show>router>isis>srv6 status)

### Full Context

show router isis segment-routing-v6 status

### Description

This command displays the IS-IS SRv6 status.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## status

### Syntax

status

### Context

[\[Tree\]](#) (show>subscr-mgmt status)

### Full Context

show subscriber-mgmt status

### Description

Commands in this context display subscriber management status information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## status

### Syntax

status

### Context

[\[Tree\]](#) (show>app-assure>group>aa-sub>um status)

### Full Context

show application-assurance group aa-sub usage-monitor status

### Description

This command displays the usage monitor status.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## status

### Syntax

status

## Context

[\[Tree\]](#) (show>router>bier status)

## Full Context

show router bier status

## Description

This command displays the BIER status.

## Platforms

All

## Output

The following output is an example of BIER status information, and [Table 578: Output fields: BIER status](#) describes the output fields.

### Output Example

```
# show router bier status
=====
BIER Status
=====
Admin State      : Up           Oper State      : Up
FRR State        : Disabled    BFD State       : Disabled
Service-reserved-label-block: [NA | name of reserved block]
=====
```

Table 578: Output fields: BIER status

Label	Description
Admin State	Displays the administrative state
Oper State	Displays the operational state
FRR State	Displays the FRR state
BFD State	Displays the BFD state
Service-reserved-label-block	Displays the service reserved label block name

## 29 s Commands – Part IV

### 29.1 steering-profile

#### steering-profile

##### Syntax

**steering-profile** *steering-profile-name*

##### Context

[\[Tree\]](#) (show>subscr-mgmt steering-profile)

##### Full Context

show subscriber-mgmt steering-profile

##### Description

This command displays steering profile information.

##### Parameters

***steering-profile-name***

Specifies an existing steering profile name.

##### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### 29.2 sticky-dest

#### sticky-dest

##### Syntax

**sticky-dest**

##### Context

[\[Tree\]](#) (tools>dump>filter>resources sticky-dest)

## Full Context

```
tools dump filter resources sticky-dest
```

## Description

This command displays information about resources pertaining to sticky destinations timers.

## Platforms

All

## Output

The following output is an example of sticky destination filter action information.

### Output Example

```
=====
Filter action - Sticky-dest resources
=====
Used   : 1
Free   : 2047
Total  : 2048
=====
```

## 29.3 sticky-leases

### sticky-leases

#### Syntax

```
sticky-leases [hostname]
```

#### Context

[\[Tree\]](#) (show>router>dhcp>server sticky-leases)

#### Full Context

```
show router dhcp local-dhcp-server sticky-leases
```

#### Description

This command shows either all sticky leases or a single specific sticky lease created under the specified DHCP server.

#### Parameters

**hostname**

Specifies the name of the host for which an entry is created.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of sticky lease information

### Output Example

```
Node# show router dhcp local-dhcp-server "dhcp_server" sticky-leases
=====
DHCP Server Sticky Leases
=====
Hostname                               IP address
-----
test_lease                             10.0.0.1
-----
No. of Matching Entries: 1
=====
```

[Table 579: Output fields: sticky leases](#) describes the sticky leases field descriptions.

Table 579: Output fields: sticky leases

Field	Description
Hostname	The name of the sticky host
IP address	The IP address of the sticky host
No. of Matching Entries	The total numbers of entries matching the command criteria

## sticky-leases

### Syntax

**sticky-leases** *hostname* [*hostname*]

**sticky-leases** *hostname-prefix* [*hostname-prefix*]

### Context

**[Tree]** (clear>router>dhcp>server sticky-leases)

### Full Context

clear router dhcp local-dhcp-server sticky-leases

### Description

This command clears sticky leases.

## Parameters

### *hostname*

Clears information about the name of the host for which an entry is cleared.

### *hostname-prefix*

Clears information about the sub-string of all host names starting with that sub-string.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 29.4 stop

```
stop
```

### Syntax

```
stop
```

### Context

[\[Tree\]](#) (tools>perform>router>l2tp>group stop)

### Full Context

```
tools perform router l2tp group stop
```

### Description

This command triggers an attempt to immediately stop all the L2TP connections within the specified L2TP tunnel group.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
stop
```

### Syntax

```
stop
```

### Context

[\[Tree\]](#) (tools>perform>router>l2tp>group>tunnel stop)

[\[Tree\]](#) (tools>perform>router>l2tp>tunnel stop)

### Full Context

```
tools perform router l2tp group tunnel stop
```

tools perform router l2tp tunnel stop

### Description

This command triggers an attempt to immediately stop all the L2TP connections within the specified L2TP tunnel.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

stop

### Syntax

**stop** [*script-policy-name*] [**owner** *script-policy-owner*] [**all**]

### Context

[\[Tree\]](#) (tools>perform>system>script-control>script-policy stop)

### Full Context

tools perform system script-control script-policy stop

### Description

This command stops the execution of scripts.

### Parameters

#### ***script-policy-name***

Specifies to only stop scripts with the specified script-policy, up to 32 characters.

#### ***script-policy-owner***

Specifies to only stop scripts that are associated with script-policies with the specified owner, up to 32 characters.

**Default** TiMOS CLI

#### **all**

Specifies to stop all running scripts.

### Platforms

All

## 29.5 stp

```
stp
```

### Syntax

```
stp [detail]
```

### Context

[\[Tree\]](#) (show>service>id stp)

### Full Context

```
show service id stp
```

### Description

Displays information for the spanning tree protocol instance for the service.

### Parameters

**detail**

Displays detailed information.

### Platforms

All

### Output

The following output is an example of service STP information.

#### Output Example

```
A:ALA-12# show service id 1 stp
=====
Spanning Tree Information
=====
VPLS Spanning Tree Information
-----
RSTP Admin State   : Up                RSTP Oper State   : Down

**Table 580: Output fields: service ID STP** describes show service-id STP output fields:

*Table 580: Output fields: service ID STP*

Label	Description
RSTP Admin State	The administrative state of the Rapid Spanning Tree Protocol instance associated with this service
Core Connectivity	The connectivity status to the core
RSTP Oper State	The operational state of the Rapid Spanning Tree Protocol instance associated with this service. This field is applicable only when STP is enabled on the router.
Bridge-id	The MAC address used to identify this bridge in the network.
Hold Time	The interval length during which no more than two Configuration BPDUs shall be transmitted by this bridge
Bridge fwd delay	The speed of bridge state changes when moving toward the forwarding state
Bridge Hello time	The amount of time between the transmission of Configuration BPDUs
Bridge max age	The maximum age of spanning tree protocol information learned from the network on any port before it is discarded. This is the actual value that this bridge is currently using.

Label	Description
Bridge priority	The priority of the spanning tree protocol instance associated with this service
Topology change	Topology change is currently in progress.
Last Top. change	The time (in hundredths of a second) since the last time a topology change was detected by the Spanning Tree Protocol instance associated with this service
Top. change count	The total number of topology changes detected by the Spanning Tree Protocol instance associated with this service since the management entity was last reset or initialized
Root bridge-id	The Root bridge-id
Root path cost	The Root path cost
Root forward delay	The Root forward delay
Root hello time	The Root hello time
Root max age	The Root maximum age
Root priority	The Root priority level
Root port	The Root port number
SAP Identifier	The SAP identifier
RSTP State	The RSTP state
STP Port State	The STP port state
BPDU encap	The BPDU encapsulation
Port Number	The port number
Priority	The priority level
Cost	The cost
Fast Start	The fast start state
Designated Port	The designated port
Designated Bridge	The designated bridge
Sap/Spoke Id	The SAP or spoke ID
Oper-State	The operational state
Prune-State	The prune state
Port-State	The port state

Label	Description
Managed by Service	The managed service
Managed by Sap/ spoke	The managed SAP or spoke

## 29.7 sub-ident-policy

## sub-ident-policy

### Syntax

**sub-ident-policy** [*sub-ident-policy-name* [ **association** ]]

**sub-ident-policy** *sub-ident-policy-name* **script** { **primary** | **secondary** | **tertiary**}

### Context

[\[Tree\]](#) (show>subscr-mgmt sub-ident-policy)

### Full Context

show subscriber-mgmt sub-ident-policy

### Description

This command displays subscriber identification policy information.

## Parameters

### ***sub-ident-policy-name***

Specifies an existing subscriber identification policy name.

### **association**

Displays information configured with the specified *sub-ident-policy-name*.

### **script {primary | secondary | tertiary}**

Displays information for the specified identification script.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of subscriber management subscriber identification policy information.

**Table 581: Output fields: subscriber identification policy** describes subscriber identification policy output fields.

*Table 581: Output fields: subscriber identification policy*

Field	Description
Name	The subscriber identification policy name
Description	The user provided description of this policy
Number of Subscriber Identification Policies	The total number of subscriber identification policies configured on the node
Sub Profile Map	The subscriber profile used to define the aggregate QoS for all hosts within a subscriber context

Field	Description
Key	The key that defines the auto-generated subscriber identification key for PPP hosts.
Sub profile	A list of subscriber identification profiles
SLA profile	A list of SLA profiles
Admin State	The administrative state of the Python scripts
Oper State	The operational state of the Python scripts
Script Name	The Python policy script name
SAP Associations	The subscriber identification policy SAP associations
Service-Id	The service ID associated with the subscriber identification policy
SAP	The SAP ID associated with the subscriber identification policy
URL	The URL of the script to change the Python message
Admin State	The admin state of the script
Oper State	The operational state of the script
Primary Script	Information about the primary Python script
Secondary Script	Information about the secondary Python script

## 29.8 sub-mcac

### sub-mcac

#### Syntax

**sub-mcac** [**subscriber** *sub-ident-string*] [**policy** *sub-mcac-policy-name*]

#### Context

[\[Tree\]](#) (show>service>active-subscribers sub-mcac)

#### Full Context

show service active-subscribers sub-mcac

#### Description

This command displays active subscriber MCAC information.

## Parameters

### ***sub-ident-string***

Specifies the subscriber identification string, up to 32 characters.

### ***sub-mac-policy-name***

Specifies the subscriber MAC policy name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of active subscriber MCAC information.

### Output Example

```
*A:eng-BNG-2# show service active-subscribers sub-mcac
=====
Active Subscribers Sub-MCAC
=====
Subscriber                : user_1
MCAC-policy               : sub-mcac-policy-01 (inService)
In use mandatory bandwidth : 10
In use optional bandwidth  : 10
Available mandatory bandwidth : 1000
Available optional bandwidth : 100
-----
Number of Subscribers: 1
=====
```

## 29.9 sub-mcac-policy

### sub-mcac-policy

#### Syntax

**sub-mcac-policy**

**sub-mcac-policy** *policy-name* **association**

**sub-mcac-policy** *policy-name*

#### Context

**[Tree]** (show>subscr-mgmt sub-mcac-policy)

#### Full Context

show subscriber-mgmt sub-mcac-policy

## Description

This command displays subscriber MCAC policy information.

## Parameters

### *policy-name*

Specifies the subscriber MCAC policy name, up to 32 characters.

### **association**

Displays information associated with the subscriber MCAC policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## 29.10 sub-profile

### sub-profile

## Syntax

```
sub-profile [sub-profile-name [association]]
```

## Context

[\[Tree\]](#) (show>subscr-mgmt sub-profile)

## Full Context

```
show subscriber-mgmt sub-profile
```

## Description

This command displays subscriber profile information.

## Parameters

### *sub-profile-name*

Specifies an existing subscriber profile name.

### **association**

Displays the association information configured with the specified *sub-profile-name*.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of subscriber profile information.

## Output Example

```
# show subscriber-mgmt sub-profile "sub-profile-10"

**Table 582: Output fields: subscriber profile** describes subscriber management profile field descriptions.

*Table 582: Output fields: subscriber profile*

Field	Description
Name	The subscriber profile name
Description	The user provided description of this policy
Control plane(s)	The subscriber profile controlled by the local control plane or CUPS control plane
I. Sched. Policy	The ingress scheduler policy assigned to the ingress subscriber profile
E. Sched. Policy	The egress scheduler policy assigned to the egress subscriber profile
E. Agg Rate Limit	The egress aggregate rate limit
E. Min Resv Bw	The egress minimum reserved bandwidth
I. Policer Ctrl	The ingress policer control status
E. Policer Ctrl	The egress policer control status
I. vport-hashing	The ingress vport-hashing status
I. sec-sh-hashing	The ingress security sh hashing status
Q Frame-Based Ac*	The Q frame-based accounting status
Acct. Policy	The number of accounting policies associated with this subscriber profile
ANCP Pol.	The ANCP policy
Accu-stats-pol	The accu-stats policy
HostTrk Pol.	The HostTrk policy
IGMP Policy	The IGMP policy
MLD Policy	The MLD policy
PIM Policy	The PIM policy
Sub. MCAC Policy	The subscriber MCAC policy

Field	Description
NAT Policy	The NAT policy
Host Limits	The configured maximum number of hosts per subscriber associated with this subscriber profile
Session Limits	The configured maximum number of sessions per subscriber associated with this subscriber profile
Number of Subscriber Profiles	The total number of subscriber profiles configured on this node
Ingress Scheduler Overrides	Information about ingress scheduler overrides for the subscriber profile
Scheduler	The scheduler name
Rate	The scheduler rate
CIR	The CIR rate allowed for this scheduler
Egress Scheduler Overrides	Information about egress scheduler overrides for the subscriber profile
Key	The lookup key in the map
SLA Profile	Information about the SLA profile map
Collect Stats	The accounting statistics collected on this subscriber profile.
Last Mgmt Change	The time of the most recent management-initiated change

## 29.11 sub-services

### sub-services

#### Syntax

```
sub-services [id service-id] [sap sap-id] [ip ip-prefix/prefix-length] [mac ieee-address] [pppoe-session-id pppoe-session-id] [sub-service-name sub-service-name] [sub-service-type sub-service-type] [summary | associations]
```

#### Context

tunnel-id	<b>tunnel-id.private</b>   <i>public:tag</i> <b>tunnel</b> <i>id</i> <i>tag</i>	keyword 1 to 16 0 to 4094
eth-sat-id	<b>esat-id/slot/port</b> <b>esat</b> <i>id</i>	keyword 1 to 20
pxc-id	<b>pxc-id.sub-port</b> <b>pxc</b> <i>id</i> <i>sub-port</i>	keyword 1 to 64 a, b

**ip-prefix/ip-prefix-length**

Specifies information for the specified IP prefix and mask length.

- Values** *ipv4-prefix* — a.b.c.d  
*ipv4-prefix-length* — 0 to 32  
*ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x — [0..FFFF]H  
 d — [0..255]D  
*ipv6-prefix-length* — 0 to 128

**ieee-address**

Specifies the MAC address.

- Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx (cannot be all zeros)

**pppoe-session-id**

Specifies the PPPoE session ID.

- Values** 0 to 65535

***sub-service-name***

Specifies the subscriber service name, up to 255 characters.

***sub-service-type***

Specifies the subscriber service type, up to 255 characters.

**summary**

Displays summary information.

**associations**

Displays information associated with the subscriber service.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 29.12 subnet-ext-stats

### subnet-ext-stats

**Syntax**

**subnet-ext-stats** *ip-address[/mask]*

**subnet-ext-stats pool** *pool-name*

**Context**

[\[Tree\]](#) (show>router>dhcp>server subnet-ext-stats)

**Full Context**

show router dhcp local-dhcp-server subnet-ext-stats

**Description**

This command displays extended statistics per DHCPv4 subnet in local DHCPv4 server.

The following statistics are included in output:

- The number of stable leases in the subnet
- The number of provisioned address in the subnet
- The number of used address in the subnet
- The number of free address in the subnet
- The percentage of used address
- The percentage of free address

For each statistic (except for Provisioned Addresses), there is current value and peak value, peak value is the highest value since subnet creation or last reset via the **clear router *rt-id* dhcp local-dhcp-server *svr-name* subnet-ext-stats** command.

When parameter pool is used, the statistics of each subnet in the pool are displayed.

## Parameters

### *ip-address[/mask]*

Specifies the subnet and mask.

### *pool-name*

Specifies the name of local DHCPv4 server pool.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of subnet extended statistics information.

### Output Example

```
show router 500 dhcp local-dhcp-server "d4" subnet-ext-stats 239.10.10.0/24
=====
Extended statistics for subnet 239.10.10.0/24
=====
-----
Current      Peak      TimeStamp
-----
Local:
Stable Leases      1          1          01/07/2013 19:38:36
Provisioned Addresses 101
Used Addresses      1          1          01/07/2013 19:38:36
Free Addresses      100        100        01/07/2013 19:38:36

-----
Number of entries      1
=====
```

[Table 583: Output fields: extended subnet statistics](#) describes extended subnet statistics output field descriptions.

*Table 583: Output fields: extended subnet statistics*

Field	Descriptions
Current	The current statistics for the subnet
Peak	The peak statistics for the subnet
TimeStamp	The timestamp for the last reset
Stable Leases	The number of stable leases
Provision Addresses	The number of provisioned addresses in this subnet
Used Addresses	The number of used addresses in this subnet
Free Address	The number of free addresses in this subnet
Used Pct	The percentage of addresses in this subnet in use

Field	Descriptions
Free Pct	The percentage of addresses in this subnet currently unused
Last Reset Time	The time of the last reset
Number of entries	The total number of entries

## subnet-ext-stats

### Syntax

**subnet-ext-stats** *ip-address[/mask]*

**subnet-ext-stats** pool *pool-name*

### Context

**[Tree]** (clear>router>dhcp>server subnet-ext-stats)

### Full Context

clear router dhcp local-dhcp-server subnet-ext-stats

### Description

This command clears extended subnet statistics.

### Parameters

***ip-address[/mask]***

Clears the specified IP address and mask.

***pool-name***

Clears statistics for the specified pool name.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 29.13 subnet-stats

### subnet-stats

### Syntax

**subnet-stats** *ip-address[/mask]*

**subnet-stats** pool *pool-name*

## Context

**[Tree]** (show>router>dhcp>server subnet-stats)

## Full Context

show router dhcp local-dhcp-server subnet-stats

## Description

This command displays subnet statistics.

## Parameters

***ip-address[/mask]***

Specifies the subnet and mask.

***pool-name***

Specifies the name of local DHCPv4 server pool.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of subnet statistics information.

### Output Example

```
*A:SUB-Dut-A# show router dhcp local-dhcp-server dhcpS2 subnet-stats pool P00L2
=====
Statistics for pool P00L2
=====
Subnet                Free          Offered       Stable
                    FRPending    RemPending   Declined
-----
10.0.0.0/8            16384         0             0

=====
*A:SUB-Dut-A#
```

[Table 584: Output fields: subnet statistics pool](#) describe the fields for subnet stats pool output.

*Table 584: Output fields: subnet statistics pool*

Field	Description
Subnet	The subnet address
Free	The number of addresses in this subnet that are free
Offered	The number of leases in this subnet that are in state <b>offered</b>

Field	Description
Stable	The number of leases in this subnet that are in state <b>stable</b>
FRPending	The number of leases in this subnet that are in state <b>force RenewPending</b>
RemPending	The number of leases in this subnet that are in state <b>removePending</b>
Declined	The number of addresses in this subnet that are declined
No. of entries	The total number of entries

## 29.14 subscribe-to

### subscribe-to

#### Syntax

**subscribe-to** *log-id* *log-id*

#### Context

[\[Tree\]](#) (tools>perform>log subscribe-to)

#### Full Context

tools perform log subscribe-to

#### Description

This command subscribes the current CLI session to the specified CLI log. Log events for the specified log will be output in the current CLI session until the CLI session closes or an unsubscribe-from command is used.

#### Parameters

***log-id***

Specifies the log ID for which subscription is requested.

**Values** 1 to 101

#### Platforms

All

## 29.15 subscriber

### subscriber

#### Syntax

```
subscriber sub-ident-string sap sap-id sla-profile sla-profile-name [scheduler scheduler-name] [spi-sharing-type spi-sharing-type] [spi-sharing-id spi-sharing-id]  
subscriber sub-ident-string [scheduler scheduler-name] [ingress | egress]
```

#### Context

[\[Tree\]](#) (clear>qos>scheduler-stats subscriber)

#### Full Context

```
clear qos scheduler-stats subscriber
```

#### Description

This command clears scheduler stats by subscriber.

#### Parameters

##### ***sub-ident-string***

Clears information for the specified subscriber name.

##### ***sap-id***

Clears information for the specified SAP.

##### ***sla-profile-name***

Clears information for the specified SLA profile name.

##### ***scheduler-name***

Clears information for the specified scheduler.

##### ***spi-sharing-type***

Clears information for sessions with the specified SPI sharing type.

**Values** per-group, per-session-ipoe, per-session-ppp

##### ***spi-sharing-id***

Clears information for sessions with the specified SPI sharing type and sharing identifier.  
The SPI group identifier is:

- an identifier when the sharing type is per-group
- an internal PPP or IPoE sharing identifier when the sharing type is a per-PPP or per-IPoE session

**Values** 0 to 4294967295

### **egress**

Clears egress information for the subscriber.

### **ingress**

Clears ingress information for the subscriber.

## **Platforms**

All

## subscriber

### **Syntax**

**subscriber** *sub-ident-string*

### **Context**

[\[Tree\]](#) (clear>service>statistics subscriber)

### **Full Context**

clear service statistics subscriber

### **Description**

This command clears the statistics for a particular subscriber.

### **Parameters**

***sub-ident-string***

Clears statistics for the specified subscriber identification string.

## **Platforms**

All

## subscriber

### **Syntax**

**subscriber** *sub-ident-string*

**subscriber** *sub-ident-string* **detail**

**subscriber** *sub-ident-string* **mirror**

**subscriber** *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**spi-sharing-type** *spi-sharing-type*]  
[**spi-sharing-id** *spi-sharing-id*]

**subscriber** *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**spi-sharing-type** *spi-sharing-type*]  
[**spi-sharing-id** *spi-sharing-id*] **detail**

**subscriber** *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**spi-sharing-type** *spi-sharing-type*]  
[**spi-sharing-id** *spi-sharing-id*] **mirror**

## Context

[\[Tree\]](#) (show>service>active-subscribers subscriber)

## Full Context

show service active-subscribers subscriber

## Description

This command displays active subscriber information for a subscriber.

## Parameters

### *sub-ident-string*

Displays the subscriber ID of the active subscriber, up to 32 characters.

### *sap-id*

Displays the physical port identifier portion of the SAP definition.

### *sla-profile-name*

Displays the existing SLA profile name, up to 32 characters.

### *spi-sharing-type*

Displays subscriber information for sessions with the specified SPI sharing type.

**Values** per-group, per-session-ipoe, per-session-ppp

### *spi-sharing-id*

Displays subscriber information for sessions with the specified SPI sharing type and sharing identifier. The SPI group ID is:

- a group id when sharing type is per-group
- an internal PPP or IPoE sharing id when the sharing type is per-PPP or per-IPoE session

**Values** 0 to 4294967295

### *detail*

Displays detailed output.

### *mirror*

Displays mirrored output.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of subscriber information for active subscribers.

### Output Example

```
*A:eng-BNG-2# show service active-subscribers subscriber "user_1"  
=====
```

Active Subscribers

```
=====

## subscriber

### Syntax

```
subscriber sub-ident-string [{ingress | egress}] [{detail | root-detail | thresholds | priority-info | depth}]
      [port port-id] [arbiter {name | root}]
```

### Context

[\[Tree\]](#) (show>qos>policer-hierarchy subscriber)

### Full Context

```
show qos policer-hierarchy subscriber
```

### Description

This command displays information about the policer hierarchy per subscriber.

### Parameters

#### ***sub-ident-string***

Displays information about the specified subscriber.

#### **ingress**

Displays ingress information about the specified subscriber.

#### **egress**

Displays egress information about the specified subscriber.

#### **detail**

Displays detailed information.

#### **root-detail**

Displays detailed information about the arbiter root.

#### **thresholds**

Displays threshold, parenting, rate, and traffic information related to a policer.

#### **priority-info**

Displays threshold information related to the root arbiter.

**depth**

Displays bucket depth, parenting, rate, and traffic information related to a policer.

**port-id**

Displays information about the specified port.

**Values** *slot/mda/port[.channel]*

**name**

Displays information about the named QoS arbiter.

**root**

Displays information about the arbiter root.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

**subscriber**

**Syntax**

**subscriber** *sub-ident-string* [**scheduler** *scheduler-name*] [{**ingress** | **egress**}] [**detail**]

**subscriber** *sub-ident-string* **sla-profile** *sla-profile-name* **sap** *sap-id* [**scheduler** *scheduler-name*] [**detail**]  
[ **spi-sharing-type** *spi-sharing-type*] [ **spi-sharing-id** *spi-sharing-id*]

**Context**

[\[Tree\]](#) (show>qos>scheduler-hierarchy subscriber)

**Full Context**

show qos scheduler-hierarchy subscriber

**Description**

This command displays the scheduler hierarchy per subscriber.

**Parameters**

***sub-ident-string***

Displays the subscriber identification policy name.

***scheduler-name***

Displays the scheduler name.

**ingress**

Displays ingress SAP subscriber scheduler stats.

**egress**

Displays egress SAP subscriber scheduler stats.

**detail**

Displays detailed information.

***sla-profile-name***

Displays information for the specified sla-profile-name.

***spi-sharing-type***

Displays subscriber scheduler hierarchy information for sessions with the specified SLA Profile Instance sharing type.

**Values** per-group, per-session-ipoe, per-session-ppp

***spi-sharing-id***

Displays subscriber scheduler hierarchy information for sessions with the specified SLA Profile Instance sharing type and sharing identifier. The spi-sharing-id is:

- a group id when sharing type is per-group
- an internal PPP or IPoE sharing id when the grouping type is per-PPP or per-IPoE-session

**Platforms**

All

**Output**

The following output is an example of QoS scheduler hierarchy subscriber information, and [Table 585: Output fields: QoS scheduler hierarchy subscriber](#) describes the QoS scheduler hierarchy subscriber fields.

**Output Example**

Table 585: Output fields: QoS scheduler hierarchy subscriber

Label	Description
Legend	Admin CIR/PIR: Specifies the configured value of CIR/PIR. Assigned CIR/PIR: Specifies the PIR/CIR rate given to a member by that parent level. Offered CIR/PIR: Specifies the offered load on that member. Consumed CIR/PIR: Specifies the amount of scheduler bandwidth used by this member.
PIR	Specifies the PIR rate.
CIR	Specifies the CIR rate.
S	Displays the scheduler name.
Q	Displays the queue ID and information.

## subscriber

### Syntax

**subscriber** *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**scheduler** *scheduler-name*] [**spi-sharing-type** *spi-sharing-type*] [**spi-sharing-id** *spi-sharing-id*]  
**subscriber** *sub-ident-string* [**scheduler** *scheduler-name*] [{**ingress** | **egress**}]

## Context

[\[Tree\]](#) (show>qos>scheduler-stats subscriber)

## Full Context

show qos scheduler-stats subscriber

## Description

This command displays scheduler statistics information.

## Parameters

### *sub-ident-string*

Specifies an existing SLA profile string.

### *scheduler-name*

Specifies an existing scheduler name.

### *ingress*

Display only the policy displayed on ingress.

### *egress*

Display only the policy displayed on egress.

### *sla-profile-name*

Displays information for the specified sla-profile-name.

### *spi-sharing-type*

Displays subscriber scheduler hierarchy information for sessions with the specified SLA Profile Instance sharing type.

**Values** per-group, per-session-ipoe, per-session-ppp

### *spi-sharing-id*

Displays subscriber scheduler hierarchy information for sessions with the specified SLA Profile Instance sharing type and sharing identifier. The spi-sharing-id is:

- a group id when sharing type is per-group
- an internal PPP or IPoE sharing id when the sharing type is per-PPP or per-IPoE-session

Table 586: Output fields: QoS scheduler statistics subscriber

Label	Description
Scheduler	Displays the scheduler policy name.
Forwarded Packets	Displays the number of packets forwarded.
Forwarded Octet	Displays the number of octets forwarded.

## subscriber

### Syntax

**subscriber** *sub-indent-string* [**egress**] [**detail**]

### Context

[\[Tree\]](#) (show>qos>agg-rate subscriber)

### Full Context

show qos agg-rate subscriber

### Description

This command displays the H-QoS aggregate rate limit per subscriber.

### Parameters

#### **sub-indent-string**

Specifies the subscriber identification string of the subscriber.

#### **egress**

Displays egress SAP customer scheduler stats.

#### **detail**

Displays detailed information.

## Platforms

All

## Output

The following output is an example of H-QoS aggregate rate limit per subscriber, and [Table 587: Output fields: H-QoS aggregate rate limit per subscriber](#) describes the H-QoS aggregate rate limit per subscriber fields.

### Output Example

```
*A:PE1# show qos agg-rate subscriber "sub1" egress
=====
Aggregate Rate Information - Subscriber sub1
=====
-----
Root (Egr)
| slot(1)
|   AdminRate           : 1000
|   OperRate            : 0
|   Limit Unused Bandwidth : disabled
|   OnTheWireRates      : false
|   LastMileOnTheWireRates : false
|
|--(Q) : Sub=sub1:basic-sla 1->1/1/1:1->1 (Port 1/1/1)
|
=====
*A:PE#
```

Table 587: Output fields: H-QoS aggregate rate limit per subscriber

Label	Description
AdminRate	Displays the configured aggregate rate in the subscriber profile.
OperRate	Displays the actual downstream rate.
Limit Unused Bandwidth	Indicates whether the <b>limit-unused-bandwidth</b> command is enabled to protect against exceeding the aggregated bandwidth
OnTheWireRates	Indicates whether the displayed rates are on-the-wire rates.
LastMileOnTheWireRates	Indicates whether the displayed rates are on-the-wire rates for the last mile only.

## subscriber

### Syntax

```
subscriber sub-ident-string sap sap-id sla-profile sla-profile-name [repeat repeat] [absolute | rate]
[base]
```

**subscriber** *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**repeat** *repeat*] [**absolute** | **rate**]  
**egress-policer-id** *egress-policer-id*

**subscriber** *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**repeat** *repeat*] [**absolute** | **rate**]  
**egress-queue-id** *egress-queue-id*

**subscriber** *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**repeat** *repeat*] [**absolute** | **rate**]  
**ingress-policer-id** *ingress-policer-id*

**subscriber** *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**repeat** *repeat*] [**absolute** | **rate**]  
**ingress-queue-id** *ingress-queue-id*

## Context

**[Tree]** (monitor>service subscriber)

## Full Context

monitor service subscriber

## Description

This command monitors statistics for a subscriber.

## Parameters

### sub-ident-string

Specifies an existing subscriber identification profile to monitor, up to 32 characters.

### sap-id

Specifies the physical port identifier portion of the SAP definition.

### Values

null	<i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>aps-id</i>
dot1q	<i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>aps-id</i>   <i>pw-id</i> : <i>[qtag1]</i> <b>cp-conn-prof-id</b>
qinq	<i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>pw-id</i> : <i>[qtag1]</i> <b>cp-conn-prof-id</b> . <i>[qtag2]</i>   <b>cp-conn-prof-id</b>

	<b>tunnel</b>	keyword
	<i>id</i>	1 to 16
	<i>tag</i>	0 to 4094

***sla-profile-name***

Specifies an existing SLA profile. The name can be a maximum of 32 characters long.

***seconds***

Configures the interval for each display, in seconds.

**Values** 11 to 60

**Default** 11

***repeat***

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

**absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**Default** mode delta

**rate**

Displays rate-per-second for each statistic instead of the delta.

**base**

Monitor base statistics.

***egress-policer-id***

Monitors statistics for the policer.

**Values** 1 to 63

***egress-queue-id***

Monitors statistics for this queue.

**Values** 1 to 8

***ingress-policer-id***

Monitors statistics for this policer.

**Values** 1 to 63

***ingress-queue-id***

Monitors statistics for this queue.

**Values** 1 to 32

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of subscriber-information.

**Output Example**

```

## subscriber

### Syntax

```

subscriber sub-ident-string [arbiter {root | name}] [ingress | egress] [interval seconds] [repeat repeat]
    [absolute | rate]
    
```

### Context

[\[Tree\]](#) (monitor>qos>arbiter-stats subscriber)

### Full Context

```

monitor qos arbiter-stats subscriber
    
```

### Description

This command monitors arbiter statistics for a subscriber.

### Parameters

#### ***sub-ident-string***

Specifies an existing subscriber identification policy name, up to 32 characters.

#### ***name***

Specifies the name of the policer control policy arbiter.

**root**

Specifies the arbiter to which this queue would be feeding.

**ingress**

Displays arbiter name statistics applied on the ingress SAP.

**egress**

Displays arbiter name statistics applied on the egress SAP.

**seconds**

Configures the interval for each display in seconds.

**Values** 11 to 60

**Default** 11 seconds

**repeat**

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

**absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Displays rate-per-second for each statistic instead of the delta.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## subscriber

**Syntax**

**subscriber** *sub-ident-string* [**scheduler** *scheduler-name*] [**ingress** | **egress**] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**subscriber** *sub-ident-string* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] **sap** *sap-id* **sla-profile** *sla-profile-name*

**Context**

[\[Tree\]](#) (monitor>qos>scheduler-stats subscriber)

**Full Context**

monitor qos scheduler-stats subscriber

## Description

This command monitors scheduler statistics for a subscriber.

## Parameters

### *sub-ident-string*

Specifies an existing subscriber identification policy name, up to 32 characters.

### *scheduler-name*

Specifies an existing QoS scheduler policy name, up to 32 characters. Scheduler names are configured in the **config>qos>scheduler-policy>tier** level context.

### **ingress**

Displays *scheduler-name* statistics applied on the ingress SAP.

### **egress**

Displays *scheduler-name* statistics applied on the egress SAP.

### *seconds*

Configures the interval for each display in seconds.

**Values** 11 to 60

**Default** 11 seconds

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### **absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### **rate**

Displays rate-per-second for each statistic instead of the delta.

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### *sla-profile-name*

Specifies the SLA profile belonging to the subscriber host, up to 32 characters.

## Platforms

All

## subscriber

### Syntax

```
subscriber sub-ident-string [arbiter {name | root}] [ingress | egress]
```

### Context

[\[Tree\]](#) (clear>qos>arbiter-stats subscriber)

### Full Context

```
clear qos arbiter-stats subscriber
```

### Description

This command clears the arbiter statistics per subscriber.

### Parameters

#### *sub-ident-string*

Specifies the subscriber identification policy name, up to 32 characters.

#### *name*

Specifies the arbiter name, up to 32 characters.

#### *root*

Specifies the arbiter root, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## subscriber

### Syntax

```
subscriber id subscriber-id [statistics]
```

```
subscriber all [statistics]
```

### Context

[\[Tree\]](#) (clear>subscr-mgmt>host-tracking subscriber)

### Full Context

```
clear subscriber-mgmt host-tracking subscriber
```

### Description

This command clears the host tracking data for a subscriber.

## Parameters

### ***subscriber-id***

Specifies subscriber ID, up to 32 characters.

### **all**

Clears all host tracking data.

### **statistics**

Clears statistical host tracking information for the specified subscriber ID.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## subscriber

## Syntax

```
subscriber sub-ident-string [arbiter name | root] [ingress | egress]
```

## Context

[\[Tree\]](#) (show>qos>arbiter-stats subscriber)

## Full Context

```
show qos arbiter-stats subscriber
```

## Description

This command displays the arbiter statistics per subscriber.

## Parameters

### ***sub-ident-string***

Displays information about the specified subscriber, up to 32 characters for the 7950 XRS and VSR platforms and up to 64 characters for all other platforms.

### ***name***

Specifies the arbiter name, up to 32 characters.

### ***root***

Specifies the arbiter root, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## subscriber

## Syntax

```
subscriber sub-ident-string [sla-profile sla-profile-name] [ingress | egress] [detail] [port port-id]
```

## Context

[\[Tree\]](#) (show>qos>policer subscriber)

## Full Context

show qos policer subscriber

## Description

This command displays the policer statistics per port.

## Parameters

### *sub-ident-string*

Displays information about the specified subscriber, up to 32 characters for the 7950 XRS and VSR platforms and up to 64 characters for all other platforms.

### *sla-profile-name*

Specifies the queue group name, up to 32 characters.

### *port-id*

Displays information about the specified port.

Values	slot/mda/port		
	eth-sat-id	<b>esat-id/slot/port</b>	
		<b>esat</b>	keyword
		<i>id</i>	1 to 20
	pxc-id	<b>pxc-id.sub-port</b>	
		<b>pxc</b>	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## 29.16 subscriber-hosts

### subscriber-hosts

## Syntax

**subscriber-hosts**

## Context

[\[Tree\]](#) (clear>service>id subscriber-hosts)

## Full Context

clear service id subscriber-hosts

## Description

Commands in this context clear information for a particular subscriber host.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## subscriber-hosts

## Syntax

**subscriber-hosts** [**sap** *sap-id*] [**ip** *ip-prefix/prefix-length*] [**mac** *ieee-address*] [**sub-profile** *sub-profile-name*] [**sla-profile** *sla-profile-name*] [**app-profile** *app-profile-name*] [**wholesaler** *service-id*] [**address-origin** *address-origin*] [**detail**] [**statistics**] [**spi-sharing-type** *spi-sharing-type*] [**spi-sharing-id** *spi-sharing-id*]

## Context

[\[Tree\]](#) (show>service>id subscriber-hosts)

## Full Context

show service id subscriber-hosts

## Description

This command displays subscriber host information.

## Parameters

### **sap-id**

Specifies the physical port identifier portion of the SAP definition.

### **ip-prefix/prefix-length**

Shows information for the specified IP address and mask.

**Values** *ipv4-prefix* — a.b.c.d (host bits must be 0)  
*ipv4-prefix-length* — 0 to 32  
*ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x — [0..FFFF]H  
d — [0..255]D  
*ipv6-prefix-length* — 0 to 128

### ***ieee-address***

Displays information only for the specified 48-bit MAC address. The MAC address can be expressed in the form *aa:bb:cc:dd:ee:ff* or *aa-bb-cc-dd- ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers.

### ***sub-profile-name***

Displays an existing subscriber profile name to be associated with the static subscriber host. The subscriber profile is configured in the **config>subscr-mgmt>sub-profile** context.

### ***sla-profile-name***

Displays subscriber host information for hosts with the specified SLA profile name.

### ***app-profile-name***

Specifies an existing SLA app profile name, up to 32 characters.

### ***service-id***

Specifies the ID that uniquely identifies a service.

**Values** service-id: 1 to 214748364  
svc-name: string, up to 64 characters.

### ***address-origin***

Specifies an address origin.

**Values** aaa, dynamic, static, bonding

### ***detail***

Displays detailed information.

### ***statistics***

Displays the HTTP redirect statistics for the host. The redirect statistics are divided into HTTP GET and HTTP response for redirection.

### ***spi-sharing-type***

Displays subscriber host information for hosts with the specified SPI sharing type.

**Values** per-group, per-session-ipoe, per-session-ppp

### ***spi-sharing-id***

Displays subscriber host information for hosts with the specified SPI sharing type and sharing identifier. The SPI group ID is:

- a sharing ID when the sharing type is per-group
- an internal PPP or IPoE sharing ID when the sharing type is per-PPP or per-IPoE session

**Values** 0 to 4294967295

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of subscriber host information.

### Output Example

```

The following table describes **show service-id subscriber hosts** output fields:

Table 588: Output fields: service ID subscriber hosts

Label	Description
Sap	The physical port identifier portion of the SAP definition.

Label	Description
IP Address	The IP address
MAC Address	The MAC address
PPPoE-SID	The PPPoE-SID of the originating subscriber
Origin Subscriber	The ID of the originating subscriber
Fwding State	The forwarding state
Number of subscriber hosts	The number of subscriber hosts

## 29.17 subscriber-identification

### subscriber-identification

#### Syntax

**subscriber-identification**

#### Context

[\[Tree\]](#) (show>router>nat subscriber-identification)

#### Full Context

show router nat subscriber-identification

#### Description

This command displays the NAT subscriber identification information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### subscriber-identification

#### Syntax

**subscriber-identification subscriber-string** *subscriber-string*

#### Context

[\[Tree\]](#) (clear>nat subscriber-identification)

#### Full Context

clear nat subscriber-identification

### Description

This command clears NAT subscriber identification information.

### Parameters

#### *subscriber-string*

Specifies the subscriber identification string, up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 29.18 subscriber-mgmt

### subscriber-mgmt

#### Syntax

**subscriber-mgmt**

#### Context

[\[Tree\]](#) (clear subscriber-mgmt)

#### Full Context

clear subscriber-mgmt

#### Description

This command enables the context to clear subscriber management data.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### subscriber-mgmt

#### Syntax

**subscriber-mgmt**

#### Context

[\[Tree\]](#) (tools>perform subscriber-mgmt)

#### Full Context

tools perform subscriber-mgmt

## Description

This command enables tools to control subscriber management.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
subscriber-mgmt
```

## Syntax

```
subscriber-mgmt
```

## Context

[\[Tree\]](#) (tools>dump subscriber-mgmt)

## Full Context

```
tools dump subscriber-mgmt
```

## Description

Commands in this context display subscriber management resources.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
subscriber-mgmt
```

## Syntax

```
subscriber-mgmt
```

## Context

[\[Tree\]](#) (show subscriber-mgmt)

## Full Context

```
show subscriber-mgmt
```

## Description

Commands in this context display subscriber management statistics.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 29.19 subscriber-using

### subscriber-using

#### Syntax

```
subscriber-using [service-id service-id] [sap-id sap-id] [interface ip-int-name] [ip ip-address[/mask]]  
  [mac ieee-address] [sub-profile sub-profile-name] [sla-profile sla-profile-name] [app-profile app-  
  profile-name] [port port-id] [no-inter-dest-id | inter-dest-id intermediate-destination-id]
```

#### Context

[\[Tree\]](#) (show>service subscriber-using)

#### Full Context

```
show service subscriber-using
```

#### Description

This command displays selective subscriber information using specific options.

#### Parameters

##### ***service-id***

Specifies the ID that uniquely identifies a service.

##### ***sap-id***

Displays the physical port identifier portion of the SAP definition.

##### ***ip-int-name***

Shows DHCP statistics on the specified interface.

##### ***port-id***

Indicates the SAP or SDP for which this entry contains information.

##### ***ip-address***[/*mask*]

Shows information for the specified IP address and mask.

##### ***ieee-address***

Displays information only for the specified 48-bit MAC address. The MAC address can be expressed in the form *aa:bb:cc:dd:ee:ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers.

##### ***sub-profile-name***

Displays an existing subscriber profile name to be associated with the static subscriber host. The subscriber profile is configured in the **config>subscr-mgmt>sub-profile** context.

##### ***sla-profile-name***

Specifies an existing SLA profile name.

**app-profile-name**

Displays the profile of the specified application.

**intermediate-destination-id**

Indicates the intermediate destination identifier received from either the DHCP or RADIUS server, or the local user database.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of selective subscriber information.

**Output Example**

```

**Table 589: Output fields: subscriber using service ID** describes subscriber using a specified service ID field descriptions.

*Table 589: Output fields: subscriber using service ID*

Field	Description
Subscriber	The subscriber name
Sub Profile	The subscriber profile name

Field	Description
Matching Subscribers	The number of subscribers matching the search criteria

## 29.20 subscription

### subscription

#### Syntax

**subscription** *subscription-id* [**paths**]

**subscription**

#### Context

[\[Tree\]](#) (show>system>telemetry>grpc subscription)

#### Full Context

show system telemetry grpc subscription

#### Description

This command displays the active telemetry gRPC subscriptions.

#### Parameters

##### *subscription-id*

Specifies the unique subscription ID or number that is assigned by the SR OS gRPC server to each active telemetry subscription.

##### **paths**

Keyword that indicates that the **show** command output includes all paths with the respective subscription ID information.

#### Platforms

All

#### Output

The following output is an example of the telemetry gRPC subscription information, and [Table 590: Output fields: telemetry gRPC subscription](#) describes the output fields.

#### Output Example

```

Table 590: Output fields: telemetry gRPC subscription

Label	Description
Subscription id	Displays the subscription ID
User	Displays name of the user who started the subscription
Destination	Displays the destination IP address
Port	Displays the destination port
Subscription mode	once — Short-lived subscription that transmits a single sample

Label	Description
	stream — Long-lived subscription that transmits a sample at every interval
Encoding	Displays the encoding method used for telemetry notifications: bytes, json, json-ietf, proto
Notification count	Displays the notification count
Context count	Displays the context count
Notification bundling	Display the state of notification bundling. When enabled, additional statistics are displayed.
Path	Display the subscribed path
Path mode	Displays the path mode: on-change, sample, target-defined
Heartbeat interval	Displays the heartbeat interval
Finished samples	Displays the number of finished samples
Deferred samples	Displays the number of deferred samples
Total collection time	Displays the total collection time
Min collection time	Displays the minimum collection time
Avg collection time	Displays the average collection time
Max collection time	Displays the maximum collection time
No. of paths	Displays the total number of paths

## subscription

### Syntax

**subscription** *subscription-name* [destinations | paths | scale-paths]

**subscription**

### Context

[\[Tree\]](#) (show>system>telemetry>persistent subscription)

## Full Context

show system telemetry persistent subscription

## Description

This command displays the active persistent subscriptions.

## Parameters

### *subscription-name*

Specifies the subscription name, up to 32 characters.

### *destinations*

Indicates that the output includes all destinations with the respective subscription name.

### *paths*

Indicates that the output includes all paths with the respective subscription name.

### *scale-paths*

Indicates that the output includes all scale paths with the respective subscription name.

## Platforms

All

## Output

The following output is an example of persistent subscription fields and [Table 591: Output fields: persistent subscription](#) describes the output fields.

### Output Example

```

Table 591: Output fields: persistent subscription

Label	Description
Subscription Name	Displays the name of the persistent subscription.
Administrative State	Enabled — The administrative state of the persistent subscription is enabled. Disabled — The administrative state of the persistent subscription is disabled.
Operational State	Up — The operational state of the persistent subscription is up. Down — The operational state of the persistent subscription is down. Transition — The persistent subscription is waiting for the <b>delay-on-boot</b> timer to expire.
No. of persistent Telemetry subscriptions	Displays the number of persistent telemetry subscriptions.
Oper Down Reason	Displays the reason for the operational down state.
Subscription Id	Displays the subscription ID.
Description	Displays the description information of the subscription.
Sensor Group	Displays the sensor group name.
Destination Group	Displays the destination group name.
Path Mode	Displays the path mode.
Sample Interval	Displays the sample interval.
Encoding	json — The encoding method used for telemetry notifications. bytes — The encoding method used for telemetry notifications.
Destination	Displays the destination IP address.
Port	Displays the destination port.
Router Instance	Displays the router instance.
Establishment Time	Displays the date and time of the destination establishment.
Retry Count	Displays the number of missed TCP keepalive probes before closing a TCP connection.

Label	Description
Operational Qos	Displays the QoS marking type.
Notification Count	Displays the notification count.
Total Notification Co*	Displays the total notification count.
No. of destinations	Displays the total number of configured destinations.
Path	Displays the path name.
Finished Samples	Displays the number of finished samples.
Deferred Samples	Displays the number of deferred samples.
Total Collection Time	Displays the total collection time.
Min Collection Time	Displays the minimum collection time.
Avg Collection Time	Displays the average collection time.
Max Collection Time	Displays the maximum collection time.
No. of paths	Displays the total number of configured paths.

## 29.21 subscriptions

### subscriptions

#### Syntax

**subscriptions**

#### Context

**[Tree]** (tools>dump>log subscriptions)

#### Full Context

tools dump log subscriptions

#### Description

This command displays the list of CLI logs to which each CLI session is currently subscribed.

## Platforms

All

## Output

The following is an output example.

### Output Example

```

=====
CLI log subscriptions of all CLI sessions
=====
Session ID      : 6

Table 595: Output fields: DHCP6 summary describes DHCP6 summary output fields.

Table 595: Output fields: DHCP6 summary

Label	Description
Interface Name	The name of the router interface
ARP Populate	ARP populate is enabled or disabled
Used/Provided	The number of used and provided DHCP leases
Info Option	Option 82 processing enabled or disabled on the interface
Admin State	The administrative state

## summary

### Syntax

**summary** [**interface** *interface-name* | **saps**]

### Context

[\[Tree\]](#) (show>service>id>dhcp summary)

### Full Context

show service id dhcp summary

### Description

This command displays DHCP configuration summary information.

### Parameters

#### *interface-name*

Displays information for the specified IP interface.

**Values** 32 characters maximum.

#### **saps**

Displays SAPs per interface.

### Platforms

All

### Output

The following output is an example of DHCP summary information, and [Table 596: Output fields: service ID DHCP summary](#) describes the output fields.

### Output Example

```
A:ALA-49# show service id 1 dhcp summary
=====
DHCP Summary, service 1
=====
Interface Name      Arp      Used/      Info      Admin
  SapId/Sdp         Populate Provided      Option    State

```

Table 596: Output fields: service ID DHCP summary

Label	Description
Sap/Sdp	The configuration identification, expressed by a string containing "card/mda/port:/logical-id".
Snoop	Yes — The packets received from the DHCP clients were snooped. No — The packets received from the DHCP clients were not snooped.
Used/Provided	Used — The number of lease-states that are currently in use on a specific interface, that is, the number of clients on that interface got an IP address by DHCP. This value is always less than or equal to the 'Provided' field. Provided — The lease-populate value that is configured for a specific interface.
Arp Reply Agent	Displays whether or not there is proper handling of received ARP requests from subscribers.
Info Option	Keep — The existing information is kept on the packet and the router does not add any additional information. Replace — On ingress, the existing information-option is replaced with the information-option from the router. Drop —The packet is dropped and an error is logged.
Admin State	Indicates the administrative state.

### Description

This command displays a host connectivity verification summary.

### Parameters

***sap-id***

Specifies the SAP ID to show statistics for.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## summary

### Syntax

```
summary [all] [dns]  
summary [family family] [ group name] [dns]  
summary [family family] [ neighbor ip-address] [dns]
```

### Context

[\[Tree\]](#) (show>router>bgp summary)

### Full Context

```
show router bgp summary
```

### Description

This command displays a summary of BGP neighbor information.

If confederations are not configured, that information is not displayed in the command output.

The "State" field displays the global BGP operational state. The valid values are:

- Up — BGP global process is configured and running.
- Down — BGP global process is administratively shutdown and not running.
- Disabled — BGP global process is operationally disabled. The process must be restarted by the operator. For example, if a BGP peer is operationally disabled, the state in the summary table shows the state 'Disabled'.

### Parameters

#### **all**

Displays BGP peers in all instances.

#### **family**

Specifies the type of routing information to be distributed by the BGP instance.

**Values** ipv4, vpn-ipv4, ipv6, mcast-ipv4, vpn-ipv6, l2-vpn, mdt-safi, ms-pw, mvpn-ipv4, flow-ipv4, route-target, mcast-vpn-ipv4, mvpn-ipv6, flow-ipv6, evpn, mcast-ipv6, label-ipv4, label-ipv6, bgp-ls, mcast-vpn-ipv6, sr-policy-ipv4, sr-policy-ipv6, flow-vpn-ipv4, flow-vpn-ipv6

#### **name**

Specifies the group name up to 32 characters.

#### **ip-address**

Specifies the IPv4 or IPv6 address

**Values** *ipv4-address* — a.b.c.d  
*ipv6-address* — x:x:x:x:x:x:x[-interface]  
x:x:x:x:x:d.d.d.d[-interface]

- x — 0 to FFFF (hexadecimal)
- d — 0 to 255 (decimal)
- interface — mandatory for link local address, up to 32 characters

**dns**

Displays the reverse DNS resolution of BGP neighbor.

**Platforms**

All

**Output**

The following output is an example of BGP summary information, and [Table 598: Output fields: BGP summary](#) describes the output fields.

**Output Example**

```

Table 598: Output fields: BGP summary

Label	Description
BGP Router ID	The local BGP router ID
AS	The configured autonomous system number
Local AS	The configured local AS setting, if not configured it is the same as the system AS
BGP Admin State	Down — BGP is administratively disabled Up — BGP is administratively enabled
BGP Oper State	Down — BGP is operationally disabled Up — BGP is operationally enabled
Confederation AS	The configured confederation AS

Label	Description
Current Internal Groups	The current number of internal BGP peer groups. BGP peers are grouped within the BGP software to optimize the building of UPDATE messages towards peers with a similar configuration. An internal group is not the same as a configured BGP peer group.
Max Internal Groups	The maximum number of internal BGP peer groups that existed at any point since the last restart of BGP. BGP peers are grouped within the BGP software to optimize the building of UPDATE messages towards peers with a similar configuration. An internal group is not the same as a configured BGP peer group.
Member Confederations	The configured members of the BGP confederation
Number of Peer Groups	The total number of configured BGP peer groups
Number of Peers	The total number of configured BGP peers
Total BGP Active Routes	The total number of BGP routes used in the forwarding table
Total BGP Routes	The total number of BGP routes learned from BGP peers
Total BGP Paths	The total number of unique sets of BGP path attributes learned from BGP peers
Total Path Memory	Total amount of memory used to store the path attributes
Total Suppressed Routes	Total number of suppressed routes due to route damping
Total History Routes	Total number of routes with history due to route damping
Total Decayed Routes	Total number of decayed routes due to route damping
Neighbor	BGP neighbor address
Name	DNS name of the BGP neighbor
AS (Neighbor)	BGP neighbor autonomous system number
PktRcvd	Total number of packets received from the BGP neighbor
PktSent	Total number of packets sent to the BGP neighbor
InQ	The number of BGP messages to be processed
OutQ	The number of BGP messages to be transmitted

Label	Description
Up/Down	The amount of time that the BGP neighbor has either been established or not established depending on its current state
State Recv/Actv/Sent	The BGP neighbor's current state (if not established) or the number of received routes, active routes and sent routes (if established)

### Description

This command displays a summary of the LDP active bindings.

### Parameters

#### ***ip-address***

Specifies the IPv4 or IPv6 address.

#### **Values**

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

#### ***family***

Specifies the address family.

**Values** ipv4, ipv6

**port-id**

Specifies the port ID.

**Values**

*slot[/mda[/port]]* or *slot/mda/port [.channel]*

aps-id **aps-group-id**[.channel]

**aps** keyword

*group-id* 1 to 128

eth-sat-id **esat-id**[/slot/[u]port]

**esat** keyword

*id* 1 to 20

*u* keyword for up-link port

pxc-id **pxc-id.sub-port**

**pxc** keyword

*id* 1 to 64

*sub-port* a to b

**tunnel-id**

Specifies the tunnel ID.

**Values** 0 to 4294967295

**Platforms**

All

Advertise Route Tag : N.A.
=====
    
```

Table 601: Output fields: IS-IS summary address

Label	Description
Address or Summary Address	Displays the IP address
Level	Displays the IS-IS level from which the prefix is summarized
Tag	Displays the tag number or displays as None if no tag number exists
Algo or Algorithm	Displays the flexible algorithm number if it exists
UPA	Displays if the summary is configured for the originating UPA when suddenly a summary member route disappears
Advertise Unreachable	Displays if advertise unreachable is enabled
Match Route Tag	When configured, displays the match route tag if it is applicable. When advertise unreachable is enabled, but no route tag is configured, this field displays as None. When advertise unreachable is disabled, this field displays as N.A.
Advertise Route Tag	When configured, displays the advertise route tag. When advertise unreachable is enabled, but no route tag is configured this field displays as None. When advertise unreachable is disabled, this field displays as N.A.

## 29.24 svlan-statistics

### svlan-statistics

#### Syntax

**svlan-statistics port *port-id* all-svlans**

**svlan-statistics port *port-id* svlan *tag***

#### Context

**[Tree]** (show>subscr-mgmt svlan-statistics)

#### Full Context

show subscriber-mgmt svlan-statistics

#### Description

This command displays S-VLAN statistics.

#### Parameters

##### *port-id*

Specifies the physical port ID in the *slot/mda/port* format of the S-VLAN.

##### Values

*slot/mda/port*

lag-id

*lag-id*

lag

keyword

id

1 to 800

pw-id

*pw-id*

id

1 to 32767

##### **all-svlans**

Displays statistics for all S-VLANs on the port.

##### **svlan**

Displays information about the S-VLAN.

##### **tag**

Specifies a valid S-VLAN identifier.

**Values** 0 to 4095

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of S-VLAN statistics information.

The collected statistics per outer VLAN tag, including the number of subscriber hosts is captured in the output.

### Output Example

```
*A:Dut-C# show subscriber-mgmt svlan-statistics port 1/1/2 all-svlans
=====
Subscriber VLAN statistics for port 1/1/2 vlan 51
=====
-----
Ingress                Egress
-----
IP packets              5                5
Bytes in IP packets    670              670
Last cleared           12/18/2020 10:03:48
-----
Number of active subscriber hosts : 1
=====
Subscriber VLAN statistics for port 1/1/2 vlan 113

## svlan-statistics

### Syntax

**svlan-statistics port** *port-id* **all-svlans**

**svlan-statistics port** *port-id* **svlan tag**

### Context

[\[Tree\]](#) (clear>subscr-mgmt svlan-statistics)

### Full Context

clear subscriber-mgmt svlan-statistics

### Description

This command clears Subscriber-VLAN statistics.

### Parameters

#### **port-id**

Specifies the physical port ID in the *slot/mda/port* format of the S-VLAN.

#### **all-svlans**

Clears statistics for all S-VLANs on the port.

#### **svlan**

Clears information associated with the S-VLAN.

#### **tag**

Specifies a valid S-VLAN identifier.

**Values** 0 to 4095

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 29.25 switch-fabric

### switch-fabric

#### Syntax

**switch-fabric** [**exclude-sfm** *sfm-list*]

**switch-fabric high-bandwidth-multicast**

**switch-fabric failure-recovery**

#### Context

[\[Tree\]](#) (show>system switch-fabric)

#### Full Context

show system switch-fabric

#### Description

This command displays switch fabric information. When an MDA is not provisioned in an XCM, no information is displayed relating to that MDA. To display the forwarding capacity and multicast planes corresponding to that MDA, regardless of whether an XMA is equipped, an **mda-type** must be provisioned for that MDA.

#### Parameters

##### ***sfm-list***

Specifies the SFMs to exclude from the displayed switch fabric information, in the format of a comma separated list of SFM numbers from 1 to 16, depending on the platform.

**Values** *sfm-name* [,*sfm-name*...]

where *sfm-name* can be 1 to 16

##### **high-bandwidth-multicast**

Specifies that MDA information about the switch-fabric plane's high bandwidth multicast traffic tap allocation is displayed.

##### **failure-recovery**

Specifies to display information about the automatic switch fabric recovery process. The SFMs are listed in numerical order and are only shown when the recovery process is in progress or it has completed.

#### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-e, 7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## Output

The following outputs are examples of switch fabric information, and the tables describe the output fields.

- [Output Example show system switch-fabric](#); [Table 602: Output fields: switch fabric](#)
- [Output Example show system switch-fabric exclude-sfm](#); [Table 602: Output fields: switch fabric](#)
- [Output Example show system switch-fabric high-bandwidth-multicast](#); [Table 603: Output fields: switch fabric high bandwidth multicast](#)
- [Output Example show system switch-fabric failure-recovery \(7750 SR\)](#); [Table 604: Output fields: switch fabric failure recovery](#)

### Output Example show system switch-fabric

```
*A:DUT-A# show system switch-fabric

```

Table 603: Output fields: switch fabric high bandwidth multicast describes the switch fabric high-bandwidth multicast output fields.

Table 603: Output fields: switch fabric high bandwidth multicast

Label	Description
Slot/FP	Displays either the FP (uniquely identified by an IOM number and FP number) or a CPM letter.
Cap Min	Displays the minimum forwarding capacity of the slot and XMA/MDA as a percentage.
Cap Max	Displays the maximum forwarding capacity of the slot and XMA/MDA as a percentage.

Label	Description
Hbm	Displays high-bandwidth multicast traffic information, which can be used to avoid overlapping planes on FPs that have a lot of multicast ingress traffic.
Grp	Displays high-bandwidth multicast groups for each FP.
Planes Hi   Lo	Displays plane information. When 2 FPs are in a different group, no plane overlap occurs.

**Output Example show system switch-fabric failure-recovery (7750 SR)**

Table 604: Output fields: [switch fabric failure recovery](#) describes the automatic switch fabric recovery process output fields.

Table 604: Output fields: switch fabric failure recovery

Label	Description
Admin State	Displays the administrative state, enabled or disabled.
Oper State	Displays the current operational state: <ul style="list-style-type: none"> <li>• disabled</li> <li>• holdDown</li> <li>• ready</li> <li>• recoveryInProgress</li> <li>• detectedDisabled</li> <li>• detectedHoldDown</li> <li>• detectedXRS40Migration</li> <li>• detectedSFMUpgradePending</li> </ul>
SFM Slot	Displays the fabric slot within a chassis in the system.
State	Displays the stage of the automatic switch fabric recovery process.

Label	Description
Time	Displays the date and time of the stage.

## switch-fabric

### Syntax

**switch-fabric**

### Context

[\[Tree\]](#) (tools>perform>system switch-fabric)

### Full Context

tools perform system switch-fabric

### Description

This command performs switch fabric operations.

### Platforms

7450 ESS, 7750 SR-7, 7750 SR-12e, 7950 XRS

## 29.26 switch-path

## switch-path

### Syntax

**switch-path** [**isp** *isp-name*] [**path** *path-name*]

### Context

[\[Tree\]](#) (tools>perform>router>mpls switch-path)

### Full Context

tools perform router mpls switch-path

### Description

Use this command to move from a standby (or an active secondary) to another standby of the same priority. If a new standby path with a higher priority or a primary path comes up after the **tools perform** command is executed, the path re-evaluation command runs and the path is moved to the path specified by the outcome of the re-evaluation.

## Parameters

### *lsp-name*

Specifies an existing LSP name, up to 64 characters in length.

### *path-name*

Specifies the path name to which to move the specified LSP.

## Platforms

All

## 29.27 sync

sync

## Syntax

**sync** [**peer** *ip-address*]

**sync peer** *ip-address* **detail**

**sync** [**peer** *ip-address*] **statistics**

## Context

[\[Tree\]](#) (show>redundancy>multi-chassis sync)

## Full Context

show redundancy multi-chassis sync

## Description

This command displays synchronization information.

## Parameters

### *ip-address*

Shows peer information about the specified IP address.

- |               |                                     |
|---------------|-------------------------------------|
| <b>Values</b> | ipv4-address: a.b.c.d               |
|               | ipv6-address:                       |
|               | • x:x:x:x:x:x (eight 16-bit pieces) |
|               | • x:x:x:x:x:d.d.d.d                 |
|               | • x – [0 to FFFF] H                 |
|               | • d – [0 to 255] D                  |

### **detail**

Displays detailed peer information.

**statistics**

Displays peer statistics.

## 29.28 sync-database

### sync-database

#### Syntax

```
sync-database [peer ip-address] [ port port-id | lag-id] [ sync-tag sync-tag] [application application]  
[detail] [ type type]
```

#### Context

[\[Tree\]](#) (tools>dump>redundancy>multi-chassis sync-database)

#### Full Context

```
tools dump redundancy multi-chassis sync-database
```

#### Description

This command dumps MCS database information.

#### Parameters

##### ***ip-address***

Specifies the peer's IP address.

##### ***port-id* | *lag-id***

Indicates the port or LAG ID to be synchronized with the multi-chassis peer.

**Values** *slot/mda/port* or *lag-lag-id*

##### ***sync-tag***

Specifies a synchronization tag to be used while synchronizing this port with the multi-chassis peer.

##### ***application***

Specifies a particular multi-chassis peer synchronization protocol application.

Values	
dhcp-server:	local dhcp server (7450 ESS and 7750 SR only)
igmp:	Internet group management protocol
igmp-snooping:	igmp-snooping
mc-ring:	multi-chassis ring
mld-snooping:	multicast listener discovery-snooping
srrp:	simple router redundancy protocol (7450 ESS and 7750 SR only)
sub-host-trk:	subscriber host tracking (7450 ESS and 7750 SR only)
sub-mgmt:	subscriber management (7450 ESS and 7750 SR only)

#### **type**

Indicates the locally deleted or alarmed deleted entries in the MCS database per multi-chassis peer.

**Values** alarm-deleted, local-deleted

#### **detail**

Displays detailed information.

### **Platforms**

All

## sync-database

### **Syntax**

**sync-database** [**peer** *ip-address*] [**port** *port-id* | *lag-id*] [**sync-tag** *sync-tag*] [**application** *application*]  
[**detail**] [**type** *type*]

**sync-database** [**peer** *ip-address*] [**sdp** *sdp-id*] [**sync-tag** *sync-tag*] [**application** *application*] [**detail**] [**type** *type*]

### **Context**

[\[Tree\]](#) (tools>dump>redundancy>multi-chassis sync-database)

### **Full Context**

tools dump redundancy multi-chassis sync-database

### **Description**

This command dumps multi-chassis sync database information.

## Parameters

### *ip-address*

Dumps the specified address of the multi-chassis peer.

- Values**
- ipv4-address: a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x: [0 to FFFF]H
    - d: [0 to 255]D

### *port-id*

Dumps the specified port ID of the multi-chassis peer.

- Values**
- |                        |               |            |
|------------------------|---------------|------------|
| <i>port-id, lag-id</i> | slot/mda/port |            |
|                        | lag-id        | lag-id     |
|                        | lag           | keyword    |
|                        | id            | 1 to 800   |
|                        | pw-id         | pw-id      |
|                        | pw            | keyword    |
|                        | id            | 1 to 32767 |

### *lag-id*

Dumps the specified Link Aggregation Group (LAG) on this system.

- Values**
- |                        |               |            |
|------------------------|---------------|------------|
| <i>port-id, lag-id</i> | slot/mda/port |            |
|                        | lag-id        | lag-id     |
|                        | lag           | keyword    |
|                        | id            | 1 to 800   |
|                        | pw-id         | pw-id      |
|                        | pw            | keyword    |
|                        | id            | 1 to 32767 |

### *sync-tag*

Dumps the synchronization tag used while synchronizing this port with the multi-chassis peer up to 32 characters in length.

### **application**

Dumps the specified application information that was synchronized with the multi-chassis peer.

<b>Values</b>	
dhcp-server	local DHCP server
igmp	internet group management protocol
igmp-snooping	IGMP snooping
mc-ring	multi-chassis ring
l2tp	L2TP
mld	multicast listener discovery
mld-snooping	multicast listener discovery snooping
srrp	simple router redundancy protocol
sub-host-trk	subscriber host tracking
sub-mgmt-ipoe	subscriber management for IPoE
sub-mgmt-pppoe	subscriber management for PPPoE
mc-ipsec	multi-chassis IPsec
python	Python cache
diameter-proxy	diameter proxy
pim-snpg-sap	protocol independent multicast snooping for SAP
pim-snpg-sdp	protocol independent multicast snooping for SDP

### **detail**

Displays detailed information.

### **type**

Displays information for the specified type.

**Values** alarm-deleted, local-deleted, global-deleted, omcr-standby, omcr-alarmed

### **sdp-id**

Displays information for the specified SDP ID.

**Values** 1 to 32767

## **Platforms**

All

## Output

The following output is an example of sync database information.

### Output Example

```
A:Dut-C# tools dump redundancy multi-chassis sync-database application

<ip-address>           : a.b.c.d
<port-id|lag-id>       : slot/mda/port or lag-<lag-id>
<sync-tag>             : [32 chars max]
<application>         : dhcp-server    - local dhcp server
                       igmp             - internet group management protocol
                       igmp-snooping    - igmp-snooping
                       mc-ring          - multi-chassis ring
                       mld              - multicast listener discovery
                       mld-snooping     - multicast listener discovery-snooping
                       srrp             - simple router redundancy protocol
                       sub-host-trk     - subscriber host tracking
                       sub-mgmt-ipoe    - subscriber management for IPoE
                       sub-mgmt-pppoe  - subscriber management for PPPoE
                       mc-ipsec        - multi-chassis IPsec
<detail>               : - displays detailed information
<type>                 : alarm-deleted|local-deleted|global-deleted|
                       omcr-standby|omcr-alarmed
```

## sync-database

### Syntax

**sync-database peer** *ip-address* **all** **application** *application*

**sync-database peer** *ip-address* **port** { *port-id* | *lag-id* } [**sync-tag** *sync-tag*] **application** *application*

**sync-database peer** *ip-address* **sdp** *sdp-id* [**sync-tag** *sync-tag*] **application** *application*

**sync-database peer** *ip-address* **sync-tag** *sync-tag* **application** *application*

### Context

[\[Tree\]](#) (clear>redundancy>multi-chassis sync-database)

### Full Context

clear redundancy multi-chassis sync-database

### Description

This command clears multi-chassis sync database information.

### Parameters

#### *ip-address*

Clears the specified address of the multi-chassis peer.

- Values**
- ipv4-address: a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x:x (eight 16-bit pieces)

- x:x:x:x:x:d.d.d.d
- x – [0 to FFFF] H
- d – [0 to 255] D

**port-id**

Clears the specified port ID of the multi-chassis peer.

**Values** slot/mdalport

**lag-id**

Clears the specified Link Aggregation Group (LAG) on this system.

**Values** lag-lag-id

**all**

Clears all ports and synchronization tags.

**sync-tag**

Clears the synchronization tag used while synchronizing this port with the multi-chassis peer. The synchronization tag can be up to 32 characters.

**sdp-id**

Specifies the SDP identifier.

**Values** 1 to 32767

**application**

Clears the specified application information that was synchronized with the multi-chassis peer.

**Values** The following are values for the 7750 SR and 7950 XRS:

all:	All supported applications
dhcp-server:	local dhcp server
igmp:	internet group management protocol
igmp-snooping:	igmp-snooping
mc-ring:	multi-chassis ring
mld-snooping:	multicast listener discovery-snooping
srrp:	simple router redundancy protocol
sub-host-trk	subscriber host tracking
sub-mgmt:	subscriber management

**Values** The following are values for the 7450 ESS:

all	All supported applications
igmp-snooping	igmp-snooping
mc-ring	multi-chassis ring
mld-snooping	multicast listener discovery-snooping
sub-host-trk	subscriber host tracking
sub-mgmt	subscriber management

## Platforms

## 29.29 sync-database-reconcile

### sync-database-reconcile

#### Syntax

**sync-database-reconcile** [**peer** *ip-address*] [**port** *port-id* | *lag-id* [**sync-tag** *sync-tag*]] [**application** *application*]

**sync-database-reconcile** [**peer** *ip-address*] [**sdp** *sdp-id* [**sync-tag** *sync-tag*]] [**application** *application*]

#### Context

[\[Tree\]](#) (tools>perform>redundancy>multi-chassis sync-database-reconcile)

#### Full Context

tools perform redundancy multi-chassis sync-database-reconcile

#### Description

This command provides the parameters to reconcile MCS database entries.

#### Parameters

##### ***ip-address***

Specifies the IP address (in the form of a.b.c.d).

##### ***port-id***

Specifies the port ID in the slot/MDA/port format.

##### ***lag-id***

Specifies the LAG ID.

**Values** lag-id: ***lag-id***

lag: keyword

id: 1 to 200

***syn-tag***

Specifies the syn tag up to 32 characters.

***application***

Specifies the application.

**Values** dhcp-server — Specifies the local DHCP server  
igmp — Specifies the Internet group management protocol  
igmp-snooping — Specifies igmp-snooping  
mc-ring — Specifies multi-chassis ring  
l2tp — Specifies L2TP  
mld — Specifies multicast listener discovery  
mld-snooping — Specifies multicast listener discovery-snooping  
srrp — Specifies simple router redundancy protocol  
sub-host-trk — Specifies subscriber host tracking  
sub-mgmt-ipoe — Specifies subscriber management for IPoE  
sub-mgmt-pppoe — Specifies subscriber management for PPPoE  
mc-ipsec — Specifies multi-chassis IPsec  
python — Specifies Python cache  
diameter-proxy — Specifies diameter proxy  
pim-snpg-sap — Specifies protocol independent multicast snooping for SAPs  
pim-snpg-sdp — Specifies protocol independent multicast snooping for SDPs

***sdp-id***

Specifies the SDP ID.

**Values** 1 to 17407

**Platforms**

All

## 29.30 sync-if-timing

### sync-if-timing

#### Syntax

**sync-if-timing**

#### Context

[\[Tree\]](#) (show>system>satellite>eth-sat sync-if-timing)

#### Full Context

show system satellite eth-sat sync-if-timing

#### Description

This command displays synchronous interface timing operational information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

#### Output

The following output is an example of Ethernet satellite synchronous interface timing information where it is the default case of using the first two uplink ports as sources into the satellite. [Table 608: Output fields: system satellite timing](#) describes the fields.

```
show system satellite eth-sat 1 sync-if-timing

Table 608: Output fields: system satellite timing

Label	Description
System Status	Indicates the system status
System Quality Level	Indicates the quality level being generated by the system clock
Quality Level Selection	Indicates the quality level selection status
Current Frequency Offset (ppm)	Indicates the offset that is applied within the central clock to align the local oscillator to the frequency of the selected input reference. The units for this value are parts per million (ppm).  This value should not be misinterpreted as an indicator of the frequency accuracy of the output of the central clock.  If the central clock is locked to a true Primary Reference Clock or Stratum 1 frequency reference, this value should report a number within the range [-5, +5] ppm.
Reference Input 1/2	
Admin Status	down — Indicates <b>ref1</b> or <b>ref2</b> configuration is administratively shutdown

Label	Description
	up — Indicates <b>ref1</b> or <b>ref2</b> configuration is administratively enabled  diag — Indicates the reference has been forced using the <b>force-reference</b> command
Rx Quality Level	Indicates the QL value received on the interface <ul style="list-style-type: none"> <li>• inv — SSM received on the interface indicates an invalid code for the interface type</li> <li>• unknown — No QL value was received on the interface</li> </ul>
Quality Level Override	Indicates whether the QL value used to determine the reference was configured directly by the user
Qualified for Use	Indicates whether the reference has been qualified to be used as a source of timing for the node
Not Qualified Due To	Indicates the reason why the reference has not been qualified
Selected for Use	Indicates whether the method is presently selected
Not Selected Due To	Indicates the reason why the method is not selected: <ul style="list-style-type: none"> <li>• disabled</li> <li>• not qualified</li> <li>• previous failure</li> <li>• LOF</li> <li>• AIS-L</li> <li>• validating</li> <li>• on standby</li> <li>• ssm quality</li> </ul>
Source Port	Identifies the source port for the reference

## sync-if-timing

### Syntax

**sync-if-timing** [*cpm-slot*]

### Context

[\[Tree\]](#) (show>system sync-if-timing)

### Full Context

show system sync-if-timing

## Description

This command displays synchronous interface timing operational information.

## Parameters

### *cpm-slot*

Specifies the system CPM slot.

**Values** standby, A, B

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of sync-if-timing information, and [Table 609: Output fields: system timing](#) describes the output fields.

### Output Example

The following system example shows:

- **sync-if timing**, or
- **sync-if-timing "A"** when the SETS reference on the active CPM-A locks to BITS A, or
- **sync-if-timing "B"** when the SETS reference on the active CPM-B locks to BITS A

### Note:

The following output applies only to the 7750 SR-1e/2e/3e and 7950 XRS-16/20/40 platforms.

```
*A:Dut-B# show system sync-if-timing or show system sync-if-timing "A"

Table 609: Output fields: system timing

Label	Description
System Status CPM A/B	<p>Indicates the present status of the synchronous timing equipment subsystem (SETS).</p> <p>Not Present — Only shown on systems without central clocks</p> <p>Master Freerun — The clock is in free-run because it hasn't had a qualified input reference to lock to</p> <p>Master Holdover — The clock was locked to an input reference but has lost all qualified input references and is in holdover.</p> <p>Master Locked — The clock is locked to an input reference</p>

Label	Description
	Acquiring — The clock is training to a qualified input reference.
Reference Input Mode	Revertive — Indicates that for a re-validated or a newly validated reference source which has a higher priority than the currently selected reference has reverted to the new reference source.  Non-revertive — The clock cannot revert to a higher priority clock if the current clock goes offline.
Quality Level Selection	Indicates whether the ql-selection command has been enabled or disabled. If this command is enabled, then the reference is selected first using the QL value, then by the priority reference order. If this command is not enabled, then the reference is selected by the priority reference order.
Reference Selected	Indicates which reference has been selected: <ul style="list-style-type: none"> <li>• ref1, ref2 — (for all chassis)</li> <li>• BITS A, BITS B:                             <ul style="list-style-type: none"> <li>– 7450 ESS-7/12</li> <li>– 7750 SR-7/12</li> <li>– 7750 SR-12e</li> <li>– 7750 SR-1e/2e/3e</li> <li>– 7750 SR-a4/8</li> <li>– 7950 XRS-16/20</li> <li>– 7950 XRS-40</li> </ul> </li> <li>• BITS C, BITS D - (7950 XRS-40)</li> </ul>
	<ul style="list-style-type: none"> <li>• Mate CPM (BITS A), Mate CPM (BITS B) — <b>show&gt;system&gt;sync-if-timing&gt; standby:</b> <ul style="list-style-type: none"> <li>– 7450 ESS-7/12</li> <li>– 7750 SR-7/12</li> <li>– 7750 SR-12e</li> <li>– 7750 SR-1e/2e/3e</li> <li>– 7750 SR-a4/8</li> <li>– 7950 XRS-16/20</li> <li>– 7950 XRS-40</li> </ul> </li> <li>• Mate CPM (BITS A), Mate CPM (BITS B) — <b>show&gt;system&gt;sync-if-timing:</b> <ul style="list-style-type: none"> <li>– 7450 ESS-7/12</li> <li>– 7750 SR-7/12</li> <li>– 7750 SR-12e</li> </ul> </li> </ul>

Label	Description
	<ul style="list-style-type: none"> <li>– 7750 SR-a4/8</li> <li>• Mate CPM (none) - <b>show&gt;system&gt;sync-if-timing&gt;standby</b> when standby locked to active which is freerun or holdover - (for all chassis)</li> <li>• Mate CPM (ref1), Mate CPM (ref2) - <b>show&gt;system&gt;sync-if-timing&gt;standby</b> when standby locked to active which is locked to ref1 or ref2:                             <ul style="list-style-type: none"> <li>– 7750 SR-7/12</li> <li>– 7450 ESS-7/12</li> <li>– 7750 SR-12e</li> <li>– 7750 SR-1e/2e/3e</li> <li>– 7750 SR-a4/8</li> <li>– 7950 XRS-16/20/40</li> </ul> </li> </ul>
System Quality Level	Indicates the quality level being generated by the system clock.
Current Frequency Offset	<p>This value indicates the offset that is applied within the central clock to align the local oscillator to the frequency of the selected input reference. The units for this value are parts per million (ppm).</p> <p>This value should not be misinterpreted as an indicator of the frequency accuracy of the output of the central clock.</p> <p>If the central clock is locked to a true Primary Reference Clock or Stratum 1 frequency reference, this value should report a number within the range [-5, +5] ppm.</p>
Input Minimum Quality Level	The configured minimum acceptable QL to consider for use by the central clock.
Wait to Restore Timer	The configured timeout to use for the Wait to Restore timer.
Reference Order	ref1, ref2, bits — Indicates that the priority order of the timing references.
Reference Mate CPM	Data within this block represents the status of the timing reference provided by the Mate CPM. This will be the BITS input from the standby CPM.
Admin Status	<p>down — The <b>ref1</b> or <b>ref2</b> configuration is administratively shutdown.</p> <p>up — The <b>ref1</b> or <b>ref2</b> configuration is administratively enabled.</p> <p>diag — Indicates the reference has been forced using the force-reference command.</p>

Label	Description
Quality Level Override	Indicates whether the QL value used to determine the reference was configured directly by the user.
Rx Quality Level	Indicates the QL value received on the interface. <ul style="list-style-type: none"> <li>• inv — SSM received on the interface indicates an invalid code for the interface type.</li> <li>• unknown — No QL value was received on the interface.</li> </ul>
Qualified for Use	Indicates whether the reference has been qualified to be used as a source of timing for the node.
Not Qualified Due To	Indicates the reason why the reference has not been qualified: <ul style="list-style-type: none"> <li>• disabled</li> <li>• LOS</li> <li>• OOPIR</li> <li>• OOF</li> </ul>
Selected for Use	Indicates whether the method is presently selected.
Not Selected Due To	Indicates the reason why the method is not selected: <ul style="list-style-type: none"> <li>• disabled</li> <li>• not qualified</li> <li>• previous failure</li> <li>• LOF</li> <li>• AIS-L</li> <li>• validating</li> <li>• on standby</li> <li>• ssm quality</li> </ul>
Source Port	Identifies the Source port for the reference.
Interface Type	The interface type configured for the BITS port.
Framing	The framing configured for the BITS port.
Line Coding	The line coding configured for the BITS port.
Line Length	The line length value of the BITS output.
Output Admin Status	down — The BITS output is administratively shutdown. up — The BITS output is administratively enabled.
Output Minimum Quality Level	The configured minimum acceptable QL to use for the BITSout signal.

Label	Description
Output Source	The source to be used to provide the signal on the BITS output port. line reference — unfiltered recovered line reference. internal clock — filtered node clock output.
Output Reference Selected	The reference selected as the source for the BITS output signal (ref1, ref2, or PTP).
Output Squelch	Indicates whether the squelch function for BITSout is enabled or disabled.
TX Quality Level	QL value for BITS output signal.

## sync-if-timing

### Syntax

**sync-if-timing** {ref1 | ref2 | bits | bitsa | bitsb | gnss | gnssa | gnssb | synce | syncea | synceb }

### Context

[\[Tree\]](#) (clear>system sync-if-timing)

### Full Context

clear system sync-if-timing

### Description

This command individually clears (re-enables) a previously failed reference. As long as the reference is one of the valid options, this command is always executed. An inherent behavior enables the revertive mode which causes a reevaluation of all available references.

The timing options may vary depending on the platform because not all options are supported on all platforms.

This command also clears the Wait-to-Restore state of the reference so that it can be selected.

### Parameters

#### ref1

Clears the first timing reference.

#### ref2

Clears the second timing reference.

#### bits

Clears the bits timing reference on the CPM.

**bitsa**

Clears the BITS port timing reference of CPM A for redundant systems with a BITS port on each CPM.

**bitsb**

Clears the BITS port timing reference of CPM B for redundant systems with a BITS port on each CPM.

**gnss**

Clears the GNSS port timing reference. This keyword is only supported on 7750 SR single-slot FP5 platforms.

**gnssa**

Clears the GNSS port timing reference for the CPM in slot A. This keyword is only supported on 7750 SR-2se platforms.

**gnssb**

Clears the GNSS port timing reference for the CPM in slot B. This keyword is only supported on 7750 SR-2se platforms.

**sync**

Clears the SyncE/1588 port timing reference. This keyword is only supported on single slot systems.

**sync**

Clears the SyncE/1588 port of the CPM A timing reference. This keyword is only supported on platforms supporting redundant CPM.

**sync**

Clears the SyncE/1588 port of the CPM B timing reference. This keyword is only supported on platforms supporting redundant CPM.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## sync-if-timing

**Syntax**

**sync-if-timing** *reference*

**Context**

**[Tree]** (clear>system>satellite>eth-sat sync-if-timing)

**Full Context**

clear system satellite eth-sat sync-if-timing

**Description**

This command clears (re-enables) a previously failed reference on the Ethernet satellite.

## Parameters

### *reference*

Specifies to clear the first or second timing reference.

**Values** ref1, ref2

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 29.31 synchronization

### synchronization

## Syntax

synchronization

## Context

[\[Tree\]](#) (show>redundancy synchronization)

## Full Context

show redundancy synchronization

## Description

This command displays redundancy synchronization times.

## Platforms

All

## Output

The following output is an example of redundancy synchronization information, and [Table 610: Output fields: synchronization](#) describes the output fields.

## Output Example

```
A:ALA-1>show>redundancy# synchronization
=====
Synchronization Information
=====
Standby Status           : disabled
Last Standby Failure     : N/A
Standby Up Time          : N/A
Failover Time            : N/A
Failover Reason          : N/A
Boot/Config Sync Mode    : None
Boot/Config Sync Status  : No synchronization
Last Config File Sync Time : Never
Last Boot Env Sync Time  : Never
```

```
=====
A:ALA-1>show>redundancy#
```

Table 610: Output fields: synchronization

Label	Description
Standby Status	Displays the status of the standby CPM.
Last Standby Failure	Displays the timestamp of the last standby failure.
Standby Up Time	Displays the length of time the standby CPM has been up.
Failover Time	Displays the timestamp when the last redundancy failover occurred causing a switchover from active to standby CPM. If there is no redundant CPM card in this system or no failover has occurred since the system last booted, the value will be 0.
Failover Reason	Displays a text string giving an explanation of the cause of the last redundancy failover. If no failover has occurred, an empty string displays.
Boot/Config Sync Mode	Displays the type of synchronization operation to perform between the primary and secondary CPMs after a change has been made to the configuration files or the boot environment information contained in the boot options file (BOF).
Boot/Config Sync Status	Displays the results of the last synchronization operation between the primary and secondary CPMs.
Last Config File Sync Time	Displays the timestamp of the last successful synchronization of the configuration files.
Last Boot Env Sync Time	Displays the timestamp of the last successful synchronization of the boot environment files.

## 29.32 syslog

### syslog

#### Syntax

**syslog** [*syslog-id*]

#### Context

**[Tree]** (show>log syslog)

## Full Context

show log syslog

## Description

This command displays syslog event log destination summary information or detailed information on a specific syslog destination.

## Parameters

### *syslog-id*

Displays detailed information on the specified syslog event log destination.

**Values** 1 to 10

## Platforms

All

## Output

The following output is an example of syslog information, and [Table 611: Output fields: log syslog](#) describes the output fields.

### Output example: syslog summary

```
A:node-2# show log syslog

=====
Syslog Target Hosts
=====
Syslog Name
Id      Ip Address          Port      Sev Level
      Below Level Drop  Facility  Prefix
      TLS Profile
-----
Sunnyvale Server
1       10.1.1.2           514      emergency
      0                  local7    yes
Naperville Server
2       192.168.0.10      514      info
      0                  local7    yes
=====
```

Table 611: Output fields: log syslog

Label	Description
Syslog Name	The syslog name for the syslog destination
Id	The syslog ID for the syslog destination
Ip Address	The IP address of the syslog target host

Label	Description
Port	The configured port number used when sending Syslog messages
Sev Level	The Syslog message severity level threshold
Below Level Drop	A count of messages not sent to the syslog collector target because the severity level of the message was above the configured severity. The higher the level, the lower the severity.
Facility	The facility code for messages sent to the syslog target host
Prefix	Yes — A log prefix was prepended to the Syslog message sent to the syslog host No — A log prefix was not prepended to the Syslog message sent to the syslog host
TLS Profile	The TLS profile name

The following output is an example of syslog information, and [Table 612: Output fields: log syslog ID](#) describes the output fields.

**Output example: syslog ID 1 summary**

```
A:node-2# show log syslog 1
```

```
=====
Syslog target 1 name Sunnyvale Server
=====
```

```
IP Address      : 10.1.1.2
Port            : 514
Log-ids         : none
Prefix         : TMNX

TIMESTAMP Format : millisecond
=====
```

*Table 612: Output fields: log syslog ID*

Label	Description
IP Address	The IP address of the syslog target host
Port	The configured port number used when sending Syslog messages
Log-ids	Events are directed to this destination
Prefix	The prefix string prepended to the Syslog message

Label	Description
Facility	The facility code for messages sent to the syslog target host
Severity Level	The Syslog message severity level threshold
Prefix	Yes — A log prefix was prepended to the Syslog message sent to the syslog host No — A log prefix was not prepended to the Syslog message sent to the syslog host
Below Level Drop	A count of the messages not sent to the syslog collector target because the severity level of the message was above the configured severity. The higher the level, the lower the severity.
Description	The syslog server description
TLS Profile Name	The TLS profile name
HOSTNAME	A string-based name used for the syslog HOSTNAME field instead of an IP address
TIMESTAMP Format	The timestamp format used for the syslog TIMESTAMP field: <ul style="list-style-type: none"> <li>• standard – the standard HH:MM:SS format is being used</li> <li>• millisecond – a format of HH:MM:SS.sss is being used. The 3 additional fractional second digits provide millisecond granularity.</li> </ul>

## syslog

### Syntax

**syslog**

### Context

[\[Tree\]](#) (show>service>nat syslog)

### Full Context

show service nat syslog

### Description

This command enters the connect to display NAT syslog information

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 29.33 syslog-export-policy

### syslog-export-policy

#### Syntax

**syslog-export-policy** *name* **associations**

**syslog-export-policy** *name*

**syslog-export-policy**

#### Context

[Tree] (show>service>nat>syslog syslog-export-policy)

#### Full Context

show service nat syslog syslog-export-policy

#### Description

This command displays information about syslog export policies.

#### Parameters

***name***

Displays information about the specified NAT syslog export policy.

**associations**

Displays where the **syslog-export-policy** is configured.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of syslog export policy information.

#### Output Example

```
*SR-0S-NODE-1# show service nat syslog syslog-export-policy <name>
=====
NAT syslog policy
=====
Description

**Table 613: Output fields: syslog export policy** displays syslog export policy field descriptions.

*Table 613: Output fields: syslog export policy*

Field	Description
Description	Displays the description for the syslog export policy.
Facility	Displays information about the facility. Valid values: kernel, user, mail, systemd, auth, syslogd, printer, netnews, uucp, cron, authpriv, ftp, ntp, logaudit, localert, cron2, local0, local1, local2, local3, local4, local5, local6, local7
Log prefix	Displays information about the log prefix.
Max tx delay (deciseconds)	Displays the time waited to aggregate multiple events into a single log message (event aggregation).
MTU	Displays information about the IP MTU of the syslog frame.
Rate limit (pps)	Displays the rate limit imposed on syslog frames sent toward the collector.
Severity level	Displays the syslog severity level. Valid values: emergency, alert, critical, error, warning, notice, info, debug
Includes	Displays the optional fields related to the flow that can be included in the flow log message.
Last management change	Displays the time and date of the last configuration change.
Router	Displays the routing instance from which the collector is reachable.

Field	Description
Source IP address	Displays the source IP address of the syslog frame.
Administrative state	Displays the administrative state of the collector.
Destination port	Displays the destination port of the collector.
IP address	Displays the IP address of the collector.
Syslog export policy	Displays the syslog export policy associated with this NAT policy.
No. of syslog export policies	Displays the number of syslog export policies configured in the system.

## 29.36 system-filter

### system-filter

#### Syntax

**system-filter** [chained-to]

## Context

[Tree] (show>filter system-filter)

## Full Context

show filter system-filter

## Description

This command shows system filter information.

## Parameters

### chained-to

Displays filters that chain to a given system filter.

## Platforms

All

## Output

**No Parameters Specified** — When no parameters are specified, the output is grouped for IPv4 and IPv6, and displays information about the active system filter and all filters with scope **system**.

The following output is an example of system filter information when no parameters are specified.

### Output Example

```
*A:Dut-C>show>filter# system-filter
=====
IP system filters
=====
Filter-Id                Active
-----
100                      Yes
65535                    No
-----
No. of IP system filters (total / active): 2 / 1
=====

=====
IPv6 system filters
=====
Filter-Id                Active
-----
No Matching Entries
-----
No. of IPv6 system filters (total / active): 0 / 0
=====
```

**With chained-to Option Specified** — The following output is an example of system filter information when the **chained-to** option is specified.

```
*A:Dut-C>show>filter# system-filter chained-to
=====
IP filters that chain to the active IP system filter
=====
```

```
3          4          5          6
5:23      6:24
-----
No. of IP filters that chain to the active IP system filter: 6
=====
IPv6 filters that chain to the active IPv6 system filter
=====
No Matching Entries
-----
No. of IPv6 filters that chain to the active IPv6 system filter: 0
=====
```

## 29.37 system-info

### system-info

#### Syntax

**system-info**

#### Context

[\[Tree\]](#) (show>eth-cfm system-info)

#### Full Context

show eth-cfm system-info

#### Description

This command displays system-level ETH-CFM information states.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

#### Output

The following output is an example of system-level ETH-CFM information.

#### Output Example

```
show eth-cfm system-info
=====
CFM System State Information
=====
ETH-CCM Grace-Period      : Inactive
=====
```

## 29.38 system-statistics

### system-statistics

#### Syntax

**system-statistics data-trigger**

#### Context

[\[Tree\]](#) (clear>subscr-mgmt system-statistics)

#### Full Context

clear subscriber-mgmt system-statistics

#### Description

This command clears subscriber statistics at the system level.

#### Parameters

**data-trigger**

Clears data trigger statistics for all data trigger enabled SAPs in the system.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### system-statistics

#### Syntax

**system-statistics**

#### Context

[\[Tree\]](#) (clear>nat system-statistics)

#### Full Context

clear nat system-statistics

#### Description

This command clears NAT statistics at the system level.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 30 t Commands

### 30.1 tacplus

#### tacplus

##### Syntax

**tacplus** *server-index*

##### Context

**[Tree]** (clear tacplus)

##### Full Context

clear tacplus

##### Description

This command clears the TACACS+ server state.

##### Parameters

***server-index***

Specifies the index for the TACACS+ server.

**Values** 1 to 5

##### Platforms

All

### 30.2 taii-type2-using

#### taii-type2-using

##### Syntax

**taii-type2-using** *global-id[:prefix[:ac-id]]*

##### Context

**[Tree]** (show>service taii-type2-using)

## Full Context

```
show service taii-type2-using
```

## Description

This command displays switch-point information using TAI.

## Parameters

***global-id[:prefix[:ac-id]]***

Specifies the switch-point information using SAll-Type2.

### Values

<global-id[:prefix*>	: <global-id>[:<prefix>[:<ac-id>]]
global-id	1 to 4294967295
prefix	a.b.c.d   1 to 4294967295
ac-id	1 to 4294967295

## Platforms

All

## Output

The following output is an example of service switch-point information using TAI information.

### Output Example

```
*A:Dut-E# show service taii-type2-using 6:10.20.1.6:1
=====
Service Switch-Point Information
=====
SvcId      Oper-SdpBind      TAII-Type2

```

## 30.3 tail

### tail

#### Syntax

**tail** [*lsp-id lsp-id*] [*tunnel-id tunnel-id*] [**source-address** *ip-address*]

**tail ldp prefix** *ip-prefix/prefix-length* [**source-address** *ip-address*]

**tail statistics**

## Context

**[Tree]** (tools>dump>test-oam>lsp-bfd tail)

## Full Context

tools dump test-oam lsp-bfd tail

## Description

This command dumps information for BFD sessions on LSPs.

## Parameters

### *lsp-id*

Specifies an LSP for which to dump information.

**Values** 1 to 65535

### *tunnel-id*

Specifies a tunnel for which to dump information.

**Values** 1 to 65535

### *ip-address*

Specifies an IP address for which to dump information.

**Values** *ipv4-address* — a.b.c.d  
*ipv6-address* — x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x — 0 to FFFF (hexadecimal)  
d — 0 to 255 (decimal)

### *ldp*

Dumps LDP information.

### *ip-prefix/prefix-length*

Specifies a source IP prefix for which to dump information, and the prefix length.

**Values** <*ipv4-prefix*>/32 | <*ipv6-prefix*>/128  
*ipv4-prefix* — a.b.c.d  
*ipv4-prefix-length* — 0 to 32  
*ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x — 0 to FFFF (hexadecimal)  
d — 0 to 255 (decimal)  
*ipv6-prefix-length* — 0 to 128

### *statistics*

Displays global statistics for BFD-on-LSP sessions terminated by LSP tail-ends.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of tail information.

### Output Example

```
A:bkvm33>tools>dump>test-oam>lsp-bfd# tail
-----

## 30.4 targ-peer

### targ-peer

#### Syntax

**targ-peer** [*ip-address*] [**detail**]

**targ-peer** [**detail**] *family*

**targ-peer resource-failures** [*family*]

**Context**

[\[Tree\]](#) (show>router>ldp targ-peer)

**Full Context**

show router ldp targ-peer

**Description**

This command displays configuration information for the targeted LDP peers.

**Parameters**

***ip-address***

Specifies the IP address of a targeted LDP peer for which to display information.

<b>Values</b>	ipv4-address -a.b.c.d
	ipv6-address:           x:x:x:x:x:x:x
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

**detail**

Displays detailed configuration information.

***family***

Specifies a peer family for which to display information.

<b>Values</b>	ipv4 or ipv6
---------------	--------------

**resource-failures**

Displays resource failure information for targeted LDP peers.

**Platforms**

All

**Output**

The following outputs are examples of LDP targeted peer information, and [Table 614: Output fields: LDP targeted peer](#) describes the output fields.

**Output Example**

```
*A:Dut-A# show router ldp targ-peer
=====

```

The following table describes the LDP targeted peer output fields.

*Table 614: Output fields: LDP targeted peer*

Label	Description
Peer	The IP address of the peer.
Adm	Up — The LDP is administratively enabled. Down — The LDP is administratively disabled.
Opr	Up — The LDP is operationally enabled. Down — The LDP is operationally disabled.
Hello Fctr	The value by which the hello timeout should be divided to give the hello time, for example, the time interval (in s), between LDP hello messages. LDP uses

Label	Description
	hello messages to discover neighbors and to detect loss of connectivity with its neighbors.
Hold Time	The hello time or hold time. The time interval (in seconds) that LDP waits before declaring a neighbor to be down. Hello timeout is local to the system and is sent in the hello messages to a neighbor.
KA Fctr	The value by which the keepalive timeout is divided to calculate the keepalive time, for example, the time interval (in seconds) between LDP keepalive messages. LDP keepalive messages are sent to keep the LDP session from timing out when no other LDP traffic is being sent between the neighbors.
KA Time	The time interval (in seconds) that LDP waits before tearing down a session. If no LDP messages are exchanged during this time interval, the LDP session is torn down. Generally, the value is configured to be 3 times the keepalive time (the time interval between successive LDP keepalive messages).
Active Adjacencies	The number of active adjacencies (established sessions) associated with the LDP instance.
Auth	Enabled — Authentication using MD5 message-based digest protocol is enabled. Disabled — No authentication is used.
Passive Mode	The mode used to set up LDP sessions. This value is only applicable to targeted sessions and not to LDP interfaces. True — LDP responds only when it gets a connect request from a peer and will not attempt to actively connect to its neighbors. False — LDP actively tries to connect to its peers.
Auto Created	Specifies that a targeted peer was automatically created through service manager. For an LDP interface, this value is always false.
Creator	autorx — The autorx is the creator. autotx — The autotx is the creator.
No. of Peers	The total number of LDP peers.
Tunneling	Enabled — Tunneling is enabled. Disabled — No tunneling is used.
LSP	The LSP name.

## 30.5 targ-peer-template

### targ-peer-template

#### Syntax

**targ-peer-template** [*peer-template*] [**community** *community*]

#### Context

[\[Tree\]](#) (show>router>ldp targ-peer-template)

#### Full Context

show router ldp targ-peer-template

#### Description

This command displays the configured parameters of a targeted peer-template.

#### Parameters

##### *peer-template*

Specifies a targeted peer template on this virtual router that participates in the LDP protocol up to 32 characters.

##### *community*

The string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

#### Platforms

All

#### Output

##### Output Example

```
*A:SRU4>config>router>ldp>egr-stats>fec-pfx# show router ldp targ-peer-template

## 30.7 targeted-auto-rx

### targeted-auto-rx

#### Syntax

**targeted-auto-rx hold-time** *seconds*

## Context

[\[Tree\]](#) (clear>router>ldp targeted-auto-rx)

## Full Context

```
clear router ldp targeted-auto-rx
```

## Description

This command clears unneeded automatic T-LDP sessions on all applicable nodes. The operator must run this command during a specific time window on all nodes on which **auto-rx** is configured. The operator must also ensure that the configured **hold-time** value should be longer than the hello-timer value plus the time required to run the **clear** command on all applicable nodes. The configured **hold-time** value must be a non-zero value.

When the hold timer for this command is in progress, the operator can display the remaining timeout value by using the **tools dump router ldp timers** command.

This **clear** command is not synchronized to the standby CPM. Consequently, if the operator configures this command with a large **hold-time** value and a CPM switchover occurs during this time, the operator must reconfigure this **clear** command on the newly active CPM.

## Parameters

### **hold-time**

Specifies the time window during which this command must be run on all applicable nodes.

### *seconds*

Specifies the hold timer value in seconds.

## Platforms

All

## 30.8 tcp

tcp

## Syntax

**tcp sessions**

**tcp settings**

**tcp statistics**

## Context

[\[Tree\]](#) (tools>dump>system>cpm-http-redirect tcp)

## Full Context

```
tools dump system cpm-http-redirect tcp
```

## Description

This command displays the system level TCP session state information of the **cpm-http-redirect optimized-mode** for currently opened sessions. Specifically, the following are displayed:

- New: Syn received and Syn-Ack not sent
- SYN: Syn-Ack sent and waiting for Ack
- ESTABLISHED: Ack received and waiting for data
- FIN: FIN sent and waiting for Fin-Ack
- Delete: Sum of all currently open connections at this time, representing the connections to be deleted
- HTTP Response dropped: communication error; the redirect failed to be sent to the TCP layer

All current sessions are counted both in the state where they belong, such as 'New', 'Syn', 'Established', 'Fin', and in the sum 'Delete' count.

## Parameters

### sessions

Specifies system level TCP session state information of the **cpm-http-redirect in optimized-mode**.

### settings

Specifies system level TCP session settings of the **cpm-http-redirect in optimized-mode**. These settings can be further controlled using **tools perform** commands.

### statistics

Specifies system level TCP statistics of the **cpm-http-redirect optimized-mode** for all sessions.

## Platforms

All

## Output

The following output is an example of the sessions information.

### Output Example

```
A# tools dump system cpm-http-redirect tcp sessions
=====
CPM HTTP Redirect TCP session information
=====
TCP sessions in new state           : 0
TCP sessions in state SYN           : 0
TCP sessions in state ESTABLISHED   : 0
TCP sessions in state FIN           : 0
TCP sessions in delete state        : 0
=====
```

The following output is an example of the settings information.

### Output Example

```
Dut-A# tools dump system cpm-http-redirect tcp settings
data-retransmissions 1
```

```
data-timeout 20
established-timeout 100
fin-ack-retransmissions 1
fin-ack-timeout 15
max-connections 500
max-connections-per-host 20
max-hosts 500
syn-ack-retransmissions 1
syn-ack-timeout 20
```

The following output is an example of the statistics information.

### Output Example

```
A# tools dump system cpm-http-redirect tcp statistics
=====
CPM HTTP Redirect TCP statistics (only nonzero values shown)
=====
Packets forwarded                : 25
TCP segments received            : 8
Not a TCP segment                : 17
Packets offered to redirect      : 2
SYN received                     : 2
FIN,ACK received                 : 2
ACK received                     : 4
Valid TCP packets received       : 8
Received packets                 : 25
Received packets with a connection : 8
Connection creations             : 2
Connection deletions             : 2
SYN processed                    : 2
SYN,ACK processed                : 2
SYN,ACK with data processed      : 2
FIN,ACK processed                : 2
FIN,ACK with wrong sequence number : 2

## 30.9 tcp-optimizer

### tcp-optimizer

#### Syntax

```
tcp-optimizer tcp-optimizer-name [isa mda-id]
```

#### Context

```
[Tree] (show>app-assure>group tcp-optimizer)
```

#### Full Context

```
show application-assurance group tcp-optimizer
```

#### Description

This command displays the TCP optimizer information.

## Parameters

### *tcp-optimizer-name*

Specifies the name of the TCP validation policy, up to 32 characters.

### *mda-id*

Specifies the slot number of an adapter card, in the format *slot/mda*.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of an AA group TCP optimizer policy, and [Table 615: Output fields: AA group TCP optimizer policy and ISA MDA](#) describes the output fields.

### Output Example

```
A:node-2# show application-assurance group 1 tcp-optimizer "T01"
=====
Application Assurance Group 1 tcp-optimizer "T01"
=====
Description           : tcp-optimizer T01
TCP Stack              : tcp-westwood
Initial CWND Size     : 9 MSS
Initial SS Thresh     : 48751 KB
DACK Timeout          : 200 ms
Session Filter Ref    : Yes
Network RTT Threshold : None
High CPU backoff      : Yes

Cumulative Session Statistics
Active Sessions       : 0
Optimized Sessions   : 0
Unoptimized Sessions : 0
Abandoned Sessions   : 0

```

*Table 615: Output fields: AA group TCP optimizer policy and ISA MDA*

Label	Description
Description	The description of the TCPO
TCP Stack	The stack of the TCP
Initial CWND Size	The initial congestion window size
Initial SS Thresh	The initial Slow Start threshold
DACK Timeout	The delayed acknowledgment timeout
Session Filter Ref	The session filter reference

Label	Description
Network RTT Threshold	The network Round Trip Time threshold
High CPU backoff	The configuration of the <b>configure application-assurance group tcp-optimizer high-cpu-backoff</b> command.
Buffer Utilization	The number of the buffers used
Session Filter Ref	The name of session filter that contains a reference to this TCPO policy
Cumulative Session Statistics	The summary of total stats related to TCPO
Active Sessions	The number of TCP sessions currently being optimized
Optimized Sessions	The number of TCP sessions that were optimized
Unoptimized Sessions	The number of TCP sessions that were not optimized due to various reasons (for example, unsupported options)
Abandoned Sessions	The number of TCP sessions that TCPO was started and later stopped before the session was terminated
Unsupported Packet	The number of TCP sessions that contained unsupported packets such as Fragmented SYN, a SYN that contains data, IPv6 extension headers, unsupported TCP options (fast-open and MP-TCP)
Packet Error	The number of TCP sessions that had packet errors
Inactivity	The number of TCP sessions that timed out due to inactivity
Existing Sessions	The number of TCP sessions that were not optimized since AA did not see the initial TCP handshake
No Buffers	The number of TCP packets that were not optimized due to lack of buffers
Low Network RTT	The number of TCP packets that were not optimized due to low network RTT
Resource Exhaustion	The number of TCP sessions that were either abandoned or not optimized because of resource exhaustion
Other	The number of TCP packets that were not optimized due other reasons such as Simultaneous open (both sides send a SYN), Ack-number mismatch in the SYN/ACK, additional traffic following the SYN, before the SYN/ACK, configuration change between SYN and SYN/ACK, received a RST after sending the SYN
Octets Received	The number of TCP octets /bytes received by TCPO policy

Label	Description
Packets Received	The number of TCP packets received by TCPO policy
Octets Transmitted	The number of TCP octets /bytes received by TCPO policy
Retransmitted	The number of TCP octets /bytes transmitted by TCPO policy
Packets Transmitted	The number of TCP packets transmitted by TCPO policy
Retransmitted	The number of TCP packets retransmitted by TCPO policy

## 30.10 tcp-performance

### tcp-performance

#### Syntax

**tcp-performance fields**

#### Context

[\[Tree\]](#) (show>app-assure>cflowd tcp-performance)

#### Full Context

show application-assurance cflowd tcp-performance

#### Description

This command displays the fields in the AA cflowd TCP performance template.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of AA cflowd TCP performance template fields, and [Table 616: Output fields: TCP performance template](#) describes the output fields.

#### Output Example

```
show application-assurance cflowd tcp-performance fields

=====
Fields for Application Assurance cflowd tcp-performance template

## 30.11 tcp-session-parameters

### tcp-session-parameters

#### Syntax

**tcp-session-parameters**

**tcp-session-parameters** [*family*]

**tcp-session-parameters** [**keychain** *keychain*]

**tcp-session-parameters** [*transport-peer-ip-address*]

#### Context

[\[Tree\]](#) (show>router>ldp tcp-session-parameters)

#### Full Context

show router ldp tcp-session-parameters

#### Description

This command displays information about the TCP transport session of an LDP peer.

#### Parameters

##### *family*

Specifies the family type.

**Values** ipv4, ipv6

##### **keychain** *keychain*

Specifies the authentication keychain name up to 32 characters in length.

### ***transport-peer-ip-address***

Specifies the source of the transport address.

**Values** <transport-peer-ip\*> : ipv4-address - a.b.c.d ipv6-address -  
x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d  
- [0 to 255]D

## 30.12 tcp-validate

### tcp-validate

#### Syntax

**tcp-validate** *tcp-validate-name* [*isa mda-id*]

#### Context

[\[Tree\]](#) (show>app-assure>group tcp-validate)

#### Full Context

show application-assurance group tcp-validate

#### Description

This command displays TCP validation policy information.

When the *mda-id* parameter is included, only TCP validation policy information for the specified adapter card is displayed.

#### Parameters

##### **tcp-validate-name**

Specifies the name of the TCP validation policy. 32 characters maximum.

##### **mda-id**

Specifies the slot number of an adapter card, in the format *slot/mda*.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of TCP validation policy information.

### Output Example

```
A:NOK# show application-assurance group 1 tcp-validate "test" isa 1/1
=====
Application Assurance Group 1 tcp-validate "test"

## 30.13 te-database

### te-database

#### Syntax

**te-database** [*adv-router adv-router*] [*neighbor neighbor*] [*detail*]

#### Context

[\[Tree\]](#) (tools>dump>router te-database)

#### Full Context

tools dump router te-database

#### Description

Commands in this context dump the traffic engineering database.

#### Parameters

##### *adv-router*

Dumps the attributes of a specified traffic engineering database advertising router.

**Values** ip-address, isis-system-id

##### *neighbor*

Dumps the neighbor of a traffic engineering database advertising router.

**Values** ip-address, isis-system-id

##### *detail*

Specifies additional detailed traffic engineering database information.

#### Platforms

All

#### Output

The following output is an example of traffic engineering database information.

#### Output Example

```
*A:Dut-F# tools dump router te-database

## 30.19 tests

### tests

## Syntax

```
tests [session session-name] [test-id test-id] [test-type {dm | dmm | lmm | slm | twamp-light}]
```

## Context

[\[Tree\]](#) (show>oam-pm tests)

## Full Context

show oam-pm tests

## Description

This command displays a list of OAM-PM test types and associated test IDs. The output provides an ordered list by type and ID to help locate available test IDs that may be configured within a specific type. Filters are available to refine the output to the operational need. Multiple filters can be included to further refine the output. The combination of the filters is an AND function. All filters must be true to provide tests output.

## Parameters

### *session-name*

Filters output by session name, up to 32 characters.

### *test-id*

Filters output by test ID.

**Values** 0 to 2147483647

### *test-type*

Filters output by test type.

**Values** dm, dmm, lmm, slm, twamp-light

## Platforms

All

## Output

The following output is an example of OAM-PM test type and test ID information. [Table 618: Output fields: OAM-PM tests](#)Ported FID-7893.x content from IXR describes test fields.

### Output Example

```

Table 618: Output fields: OAM-PM tests

Label	Description
Test Type	The OAM-PM protocol specific test
Test ID	The numerical value, between 0 to 2147583647, that is assigned to the protocol specific test.  The <b>(auto)</b> tag appears if the test ID was automatically assigned.
Admin	The administrative state of the test  Up – The test has been enabled by configuration  Down – The test was not enabled by configuration
Oper	The operational state of the test  Up – The test is administrative Up and currently transmitting, attempting to transmit packets, or ready to transmit packets  Down – The test is administratively down or an oam-pm session has been configured with <b>session-type on-</b>

Label	Description
	<b>demand</b> and has not been enabled using the global CLI <b>oam oam-pm session start</b> command
TxE	no – There has been no error detected yes – The has been an error detected
Sess Type	The session type, <b>proactive</b> and <b>on-demand</b>
Session	The name of the session, up to 32 characters

## 30.20 tethering

### tethering

#### Syntax

**tethering detail**

#### Context

**[Tree]** (tools>dump>app-assure>group tethering)

#### Full Context

tools dump application-assurance group tethering

#### Description

This command displays AA current subscribers' tethering statistics.

#### Parameters

**detail**

Specifies detailed tethering statistics.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of tethering information.

#### Output Example

```
tools dump application-assurance group 1:1 tethering detail
=====
Application-Assurance tethering detail - Group 1:1
=====
          TTL           Expected      Flow Count
```

```

Table 619: Output fields: system thresholds

Label	Description
Variable	Displays the variable OID.
Alarm Id	Displays the numerical identifier for the alarm.
Last Value	Displays the last threshold value.
Rising Event Id	Displays the identifier of the RMON rising event.
Threshold	Displays the identifier of the RMON rising threshold.
Falling Event Id	Displays the identifier of the RMON falling event.
Threshold	Displays the identifier of the RMON falling threshold.
Sample Interval	Displays the polling interval, in seconds, over which the data is sampled and compared with the rising and falling thresholds.
SampleType	Displays the method of sampling the selected variable and calculating the value to be compared against the thresholds.
Startup Alarm	Displays the alarm that may be sent when this alarm is first created.
Owner	Displays the owner of this alarm.
Description	Displays the event cause.
Event Id	Displays the identifier of the threshold event.
Last Sent	Displays the date and time the alarm was sent.
Action Type	<p>log — An entry is made in the RMON-MIB log table for each event occurrence.</p> <p>trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations, which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.</p> <p>both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.</p> <p>none — No action is taken.</p>
Owner	Displays the owner of the event.

#### Context

[\[Tree\]](#) (show>isa>stats>ip-tunnel-stats throughput)

#### Full Context

show isa statistics ip-tunnel-stats throughput

#### Description

This command displays throughput statistics for the specified tunnel types and scope.

The following scopes are supported:

- per ISA
- per tunnel group
- per system

The statistics include the following information:

- total packet per second (encapsulated and decapsulated)
- encapsulated packets per second
- decapsulated packets per second
- total bits per second (encapsulated and decapsulated) in Mibits/s

- encapsulated bits per second in Mibits/s
- decapsulated bits per second in Mibits/s

Syntax notes:

- 1 Mibits/s, equals  $2^{20}$  bits per second
- The bits per second counter is an integer which is a rounded down value from the measured value.

The system collects stats every 10 minutes for last the 24 hour per the wall clock. A current value is also included in the output. The value is an average derived value of 10 minutes. The start time indicates the starting timestamp of measurement. The sampling duration indicates the duration of measurement.

## Parameters

### ***tunnel-type***

Displays the type of tunnel.

**Values** gre, ip-in-ip, l2tpv3

### ***mda***

Displays the ISA ID.

**Values** slot/mda

### ***tunnel-group-id***

Displays the ID of the tunnel group.

**Values** 1 to 16

### ***type***

Displays the type of breakdown counter.

**Values** bidir-pps, bidir-bps, encap-pps, encap-bps, decap-pps, decap-bps

### ***count***

Displays the number historical values to be included in the output.

**Values** 1 to 24

### ***minutes***

Displays the number of minutes of historical values to be included in output.

**Values** 1 to 1440

### ***current***

Displays only the current values.

### ***esa-vm***

Displays the ID of the configured ESA and ESA VM.

**Values**

esa-vm:	<i>esa-id/vm-id</i>	
	<i>esa-id</i>	1 to 16

*vm-id* 1 to 4

**show-oid**

Specifies to include the SNMP object identifier (OID) and the instance ID for the latest historical value in the output.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of the **show isa statistics throughput ip-tunnel-stats** command.

**Output Example**

```
show>isa>stats>ip-tunnel-stats# throughput tunnel-type gre tunnel-group 1

## Context

[\[Tree\]](#) (show>isa>stats>ipsec-stats throughput)

## Full Context

```
show isa statistics ipsec-stats throughput
```

## Description

This command displays IPsec throughput statistics for the specified scope.

The system collects statistics every 10 minutes for the last 24 hours per wall clock. A current value is included in the output.

This command supports following the scopes:

- per system
- per ISA
- per tunnel group
- per IPsec GW

The statistics include:

- The number of bidirectional encrypted and decrypted per second
- The number of encrypted packets per second
- The number of decrypted packets per second
- The number of bidirectional (encrypted and decrypted) bits per second (in Mibits/s)
- The number of bidirectional encrypted bits per second (in Mibits/s)
- The number of bidirectional decrypted bits per second (in Mibits/s)

Syntax notes:

- 1 Mibits/s equals 2<sup>20</sup> bits per second
- The bits per second counter is an integer, which is a value rounded down from the measured value.

## Parameters

### *mda*

Displays information about the specified ISA.

**Values** slot/mda

### *tunnel-group-id*

Displays information about the specified tunnel group ID.

**Values** 1 to 16

### *name*

Displays information about the name of the IPsec GW up to 32 characters in length.

### *count*

Displays information about the number of historical values to be included in the output.

**Values** 1 to 24

### *min*

Displays information about the number of minutes of historical values to be included in output.

**Values** 1 to 1440

### *current*

Displays information about the current value.

### *show-oid*

Displays information about include SNMP OID and instance ID for the latest historical value in the output, for a specified type of counter.

### *esa-vm*

Displays the ID of the configured ESA and ESA VM.

<b>Values</b>	esa-vm:	<i>esa-id/vm-id</i>	
		<i>esa-id</i>	1 to 16
		<i>vm-id</i>	1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of the **show isa statistics ipsec-stats throughput** command.

### Output Example

```
show>isa>stats>ipsec-stats# throughput tunnel-group 1
=====
STATISTICS FOR ISA TUNNEL GROUP 1
```

```

## 30.24 time

### time

#### Syntax

time

#### Context

[\[Tree\]](#) (show>system time)

#### Full Context

show system time

#### Description

This command displays the system time and zone configuration parameters.

#### Platforms

All

#### Output

The following output is an example of system time information, and [Table 620: Output fields: system time](#) describes the output fields.

#### Output Example

```
A:ALA-1# show system time
=====
Date & Time
=====
Current Date & Time : 2006/05/05 23:03:13    DST Active      : yes
Current Zone       : PDT                   Offset from UTC : -7:00
-----
Non-DST Zone      : PST                   Offset from UTC : -8:00
Zone type         : standard
-----
DST Zone          : PDT                   Offset from Non-DST : 01:00
Starts           : first sunday in april 02:00
Ends             : last sunday in october 02:00
=====
A:ALA-1#

A:ALA-1# show system time (with no DST zone configured)
=====
Date & Time
=====
Current Date & Time : 2006/05/12 11:12:05    DST Active      : no
Current Zone       : APA                   Offset from UTC : -8:00
-----
Non-DST Zone      : APA                   Offset from UTC : -8:00
Zone Type         : non-standard
```

```
-----
No DST zone configured
=====
A:ALA-1#
```

Table 620: Output fields: system time

Label	Description
Date & Time	The system date and time using the current time zone.
DST Active	Yes — Daylight Savings Time is currently in effect. No — Daylight Savings Time is not currently in effect.
Zone	The zone names for the current zone, the non-DST zone, and the DST zone if configured.
Current Time Zone	Indicates the process currently controlling the system time. SNTP, NTP, PTP or NONE.
Zone type	Non-standard — The zone is user-defined. Standard — The zone is system defined.
Offset from UTC	The number of hours and minutes added to universal time for the zone, including the DST offset for a DST zone.
Offset from Non-DST	The number of hours (always 0 to 1) and minutes (0 to 59) added to the time at the beginning of Daylight Saving Time and subtracted at the end Daylight Saving Time.
Starts	The date and time Daylight Saving Time begins.
Ends	The date and time Daylight Saving Time ends.

## time

### Syntax

### Full Context

show time

### Description

This command displays the current day, date, time and time zone.

The time is displayed either in the local time zone or in UTC depending on the setting of the root level **time-display** command for the console session.

### Platforms

All

### Output

The following output is an example of time information.

#### Output Example

```
A:ALA-49# show time
Tue Oct 31 12:17:15 GMT 2006
```

## 30.25 timers

### timers

#### Syntax

```
timers [session ip-addr[label-space]]
```

#### Context

[\[Tree\]](#) (tools>dump>router>ldp timers)

#### Full Context

```
tools dump router ldp timers
```

#### Description

This command dumps information for LDP timers.

#### Platforms

All

## 30.26 tls

### tls

#### Syntax

```
tls
```

## Context

[\[Tree\]](#) (show>system>security tls)

## Full Context

show system security tls

## Description

Commands in this context display TLS-related information.

## Platforms

All

## 30.27 top-active-meps

### top-active-meps

## Syntax

**top-active-meps** [{**rx-sort** | **tx-sort**}] [**clear**]

## Context

[\[Tree\]](#) (tools>dump>eth-cfm top-active-meps)

## Full Context

tools dump eth-cfm top-active-meps

## Description

This command displays and optionally clears the most active MEPs on the system.

## Default

top-active-meps

## Parameters

### **rx-sort**

Sorts in the RX direction.

### **tx-sort**

Sorts in the TX direction.

### **clear**

Clears the current counters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 30.28 top-flows

### top-flows

#### Syntax

**top-flows** *protocols* [**clear**]

#### Context

[\[Tree\]](#) (tools>dump>cflowd top-flows)

#### Full Context

tools dump cflowd top-flows

#### Description

This command displays the top 20 (highest traffic volume) flows for IPv4, IPv6 or MPLS traffic types collected since the cflowd top-flow table was last cleared or initialized.

#### Platforms

All

#### Output

The following output is an example of cflowd top flow information, and [Table 621: Output fields: tools dump cflowd top flows](#) describes the output fields.

#### Output Example

```

1          2          3          4          5          6          7          8

```

Table 621: Output fields: tools dump cflowd top flows

Label	Description
Ingress	Displays the ingress interface ID
Src IP	Displays the source IP address of the flow (IPv4 or IPv6)
Egress	Displays the egress interface ID
Dest IP	Displays the destination IP address of the flow (IPv4 or IPv6)
Pr Proto	Displays the protocol type for flow
TOS	Displays the Type-of-Service/DSCP butts filed markings
Flgs	Displays the protocol flag markings
Pkts	Displays the total number of packets sampled for this flow (since stats were last cleared)
vRtr-ID	Displays the vRouter context the flow was sample in
S-Port Src Port	Displays the source protocol port number
Msk	Displays the route prefix length for route to source IP address
AS	Displays the Autonomous Systems number for the source route (the AS is either originating AS or peer AS depending on cflowd configuration)
D-Port Dst Port	Displays the destination protocol port number
Msk	Displays the route prefix length for route to destination IP address (Forwarding route)
AS	Displays the Autonomous Systems number for the destination route (the AS is either originating AS or peer AS depending on cflowd configuration)
Nexthop	Displays the next-hop address used to forward traffic associated with the flow

Label	Description
Avg pkt size	Displays the average packet size of a sampled traffic associated with this flow (total number of packets sampled/total number of packets sampled)
Active	Displays the number of seconds the flow has been active

## 30.29 top-protocols

### top-protocols

#### Syntax

**top-protocols** *protocols* [**clear**]

#### Context

[\[Tree\]](#) (tools>dump>cflowd top-protocols)

#### Full Context

tools dump cflowd top-protocols

#### Description

This command displays the summary information for the top 20 protocol traffic seen in the cflowd cache. All statistics are calculated based on the data collected since the last clearing of the cflowd stats with clear keyword for this command.

If the **clear** optional keyword is given, then the top-flows are displayed, and then this cache is cleared.

#### Platforms

All

#### Output

The following output is an example of cflowd top protocol traffic information, and [Table 622: Output fields: tools dump cflowd top protocols](#) describes the output fields.

#### Output Example

```
SR# tools dump cflowd top-protocols

The top 20 IPv4 protocols seen by cflowd are:
  Current Time: 08/29/2011 15:36:15
Last Cleared Time: 08/29/2011 15:35:08
Protocol ID      Total  Flows  Packets  Bytes  Packets  Duration  % Total
-----      Flows  /Sec   /Flow   /Pkt   /Sec     /Flow    Bandwidth
-----
UDP              2      0      6      100     0        6        75%
pr1              1      0      6       64     0        6        24%
```

TOTALS	3	0	6	88	0	6	100%
--------	---	---	---	----	---	---	------

Table 622: Output fields: tools dump cflowd top protocols

Label	Description
Protocol ID	Displays the IPv4 or IPv6 protocol type; this will either print the well-known protocol name or the decimal protocol number
Total Flows	Displays the total number of flows recorded since the last clearing of cflowd statistics with this protocol type.
Flows/Sec	Displays the average number of flows detected for the associated protocol type (Total flows/number of seconds since last clear)
Packets/Flow	Displays the average number of packets per flow (Total number of packets/total flows)
Bytes/Pkts	Displays the average number of bytes per packet for the associated protocol type (Total number of bytes for the associated protocol/total number of packets seen for the associated protocol)
Packets/Sec	Displays the average number of packets seen for the associated protocol type (Number of packets/time since last clear)
Duration/Flow	Displays the average lifetime of a flow for the associated protocol type (Number of seconds since last clear/total flows)
Bandwidth Total (%)	Displays the percentage of bandwidth consumed by the associated protocol type (Total protocol bytes/total bytes of all flows)

### 30.30 topology

#### topology

##### Syntax

**topology** [ipv4-unicast | ipv6-unicast | ipv4-multicast | ipv6-multicast | mt *mt-id-number*] [ lfa] [detail]  
 [flex-algo {flex-algo-id | all}]

## Context

[\[Tree\]](#) (show>router>isis topology)

## Full Context

```
show router isis topology
```

## Description

This command shows IS-IS topology information.

## Parameters

### **ipv4-unicast**

Displays IPv4 unicast parameters.

### **ipv6-unicast**

Displays IPv6 unicast parameters.

### **ipv4-multicast**

Displays IPv4 multicast parameters.

### **ipv6-multicast**

Displays IPv6 multicast parameters.

### **mt *mt-id-number***

Displays multi-topology parameters.

**Values** 0, 2, 3, 4

### **lfa**

Displays loop free alternative (LFA) information. This information corresponds to the backup next hops for IP links and nodes written in RTM by the base LFA feature.

### **detail**

Displays detailed topology information.

### **flex-algo *flex-algo-id***

Displays information about the specified algorithm only based on the *flex-algo-id* filter.

**Values** 128 to 255

### **all**

Displays topology information for all the flexible algorithms.

## Platforms

All

## Output

The following output is an example of router IS-IS topology output, and [Table 623: Output fields: IS-IS topology](#) describes the output fields.

### Output Example

LFA Interface	Displays the LFA interface name.
LFA Nexthop	Displays the LFA nexthop IP address.

## 30.31 tp-interface

### tp-interface

#### Syntax

**tp-interface** *interface-num* [**clear**]

#### Context

[\[Tree\]](#) (tools>dump>router>mpls tp-interface)

#### Full Context

tools dump router mpls tp-interface

#### Description

This command displays MPLS-TP interface information.

#### Parameters

##### *interface-num*

specifies the MPLS-TP interface

**Values** 1 to 4294967295

##### *clear*

clears statistics after reading

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

#### Output

The following output is an example of MPLS TP interface information.

#### Output Example

```
1-2 (1/1/3) : State Up, Cnt/Tm - Dn: 1/000 00:30:11.150, Up 1/000 00:30:15.160
MEP: ifNum 1 (Validate: Y), ais: Y (txCnt 0)
ais - Flags: 0x1 (R), Timers:
```

## 30.32 tp-lsp

tp-lsp

### Syntax

**tp-lsp** [*lsp-name*] [**status** { **up** | **down**}] [**from** *ip-address* | **to** *ip-address*] [**detail**]

**tp-lsp** [*lsp-name*] **path** [**protecting** | **working**] [**detail**]

**tp-lsp** [*lsp-name*] **protection**

### Context

[\[Tree\]](#) (show>router>mpls tp-lsp)

### Full Context

show router mpls tp-lsp

### Description

This command displays TP LSP information.

### Parameters

#### *lsp-name*

Specifies the LSP name up to 64 characters in length. '\*' is accepted as a wild card character.

#### **path**

Displays LSP path information.

#### **protection**

Displays LSP protection information.

#### **up | down**

Specifies the state of the LSP.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### Output

The following output is an example of MPLS TP LSP information.

### Output Example

```
*A:mlstp-dutA# show router mpls tp-lsp

### 30.33 tp-lsp-egress-stats

#### tp-lsp-egress-stats

##### Syntax

**tp-lsp-egress-stats** *lsp* *lsp-name* [*interval seconds*] [*repeat repeat*] [*absolute | rate*]

##### Context

[\[Tree\]](#) (monitor>router>mpls tp-lsp-egress-stats)

##### Full Context

monitor router mpls tp-lsp-egress-stats

##### Description

This command monitors MPLS TP LSP egress statistics.

##### Parameters

###### *lsp-name*

Specifies the LSP name, up to 64 characters.

###### *repeat*

Specifies how many times the command is repeated.

**Values** 1 to 999

**Default** 10

###### *seconds*

Specifies the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

**absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Displays rate-per-second for each statistic instead of the delta.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 30.34 tp-lsp-ingress-stats

### tp-lsp-ingress-stats

**Syntax**

**tp-lsp-ingress-stats** *lsp* *lsp-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**Context**

[\[Tree\]](#) (monitor>router>mpls tp-lsp-ingress-stats)

**Full Context**

monitor router mpls tp-lsp-ingress-stats

**Description**

This command monitors MPLS TP LSP ingress statistics.

**Parameters**

***lsp-name***

Specifies the LSP name, up to 64 characters.

***repeat***

Specifies how many times the command is repeated.

**Values** 1 to 999

**Default** 10

***seconds***

Specifies the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

**absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Displays rate-per-second for each statistic instead of the delta.

**Platforms**

All

## 30.35 tp-tunnel

### tp-tunnel

**Syntax**

**tp-tunnel** *lsp-name* [**clear**]

**tp-tunnel id** *tunnel-id* [**clear**]

**Context**

[\[Tree\]](#) (tools>dump>router>mpls tp-tunnel)

**Full Context**

tools dump router mpls tp-tunnel

**Description**

This command displays MPLS-TP tunnel information.

**Parameters**

***lsp-name***

specifies the LSP name, up to 64 characters

***id tunnel-id***

specifies the tunnel ID

**Values** 1 to 61440

***clear***

clears statistics after reading

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**Output**

The following output is an example of MPLS TP interface information.

## Output Example

```

## tp-tunnel

### Syntax

**tp-tunnel**

### Context

[\[Tree\]](#) (tools>perform>router>mpls tp-tunnel)

### Full Context

tools perform router mpls tp-tunnel

### Description

Commands in this context perform Linear Protection operations on an MPLS-TP LSP.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 30.36 trace

trace

### Syntax

trace [**name** *trace-name*]

### Context

[\[Tree\]](#) (show>call-trace trace)

[\[Tree\]](#) (show>call-trace>ipoe trace)

### Full Context

show call-trace trace

show call-trace ipoe trace

### Description

This command displays information about all traces and associated parameters that are currently enabled on the system. Including the *trace-name* parameter limits the output to the specified trace only.

### Parameters

***trace-name***

Specifies the name of the trace to be displayed.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### Output

The following output is an example of call trace information.

### Output Example

```
Node# show call-trace ipoe trace
=====
Call trace trace
=====
Trace name   : default                               Type       : ipoe
SAP ID      :
IEEE address: 00:02:00:00:00:19
Maximum jobs: 1
=====
```

[Table 624: Output fields: call trace IPoE trace](#) describes call trace IPoE trace output fields.

Table 624: Output fields: call trace IPoE trace

Field	Description
Trace name	The name of the trace profile
Type	The type of the call trace
SAP ID	The SAP ID of the session to match by this trace
IEEE address	The IEEE address of the session that matches this trace
Maximum jobs	The maximum number of call trace jobs that are started by this trace

## trace

### Syntax

**trace** *trace-name*

### Context

**[Tree]** (clear>call-trace trace)

**[Tree]** (clear>call-trace>ipoe trace)

### Full Context

clear call-trace trace

clear call-trace ipoe trace

### Description

This command clears all trace jobs started by the specified trace. This command does not affect the trace command itself, and new jobs can still be executed for new sessions.

After a session is cleared, tracing for the session will not be restarted by any configured trace. Only explicitly starting a new trace with the **trace-existing-sessions** parameter can restart tracing for the session.

### Parameters

***trace-name***

Specifies the configured name, up to 32 characters, of the trace.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 30.37 trace-profile

### trace-profile

#### Syntax

**trace-profile** [detail]

**trace-profile** *profile-name*

#### Context

**[Tree]** (show>call-trace trace-profile)

#### Full Context

show call-trace trace-profile

#### Description

This command provides an overview of all configured profiles or details of a specific profile. If the detail option is specified the full information for all configured profiles are displayed.

#### Parameters

##### detail

Displays detailed trace profile information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of call-trace trace-profile information.

#### Output Example

```
Node# show call-trace trace-profile "default"
=====
Call-trace  trace profile
=====
Profile name      : default
Description       : none
Live output      : none
Format           : pcap
Size limit       : 10 MB
Time limit       : 86400 secs
-----
Number of profiles : 1
=====
```

## 30.38 traffic-capture

### traffic-capture

#### Syntax

**traffic-capture detail url** *file-url*

**traffic-capture status**

#### Context

[\[Tree\]](#) (tools>dump>app-assure>group traffic-capture)

#### Full Context

tools dump application-assurance group traffic-capture

#### Description

This command displays application-assurance traffic-capture information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 30.39 traffic-forward

### traffic-forward

#### Syntax

**traffic-forward tunnel-type** *tunnel-type* [ **type** *type*] **isa** *mda*

**traffic-forward tunnel-type** *tunnel-type* [ **type** *type*] **esa-vm** *esa-id/vm-id*

#### Context

[\[Tree\]](#) (show>isa>stats>ip-tunnel-stats traffic-forward)

#### Full Context

show isa statistics ip-tunnel-stats traffic-forward

#### Description

This command displays traffic forward statistics for the specified tunnel-type on the specified ISA.

The statistics includes the following information:

- The number of bidirectional (encapsulated and decapsulated) packets

- The number of encapsulated packets
- The number of decapsulated packets
- The number of bidirectional (encapsulated and decapsulated) kilobytes
- The number of kilobytes for encapsulated traffic
- The number of kilobytes for decapsulated traffic

In the output, 1 kilobyte equals 210 bytes.

## Parameters

### *tunnel-type*

Displays the type of the tunnel.

**Values** gre, ip-in-ip, l2tpv3

### *mda*

Displays the ISA ID.

**Values** slot/mda

### *type*

Displays the type of breakdown counter.

**Values** bidir-pkts, bidir-kbs, encap-pkts, encap-kbs, decap-pkts, decap-kbs

### *esa-vm*

Displays the ID of the configured ESA and ESA VM.

**Values**

esa-vm:	<i>esa-id/vm-id</i>	
	<i>esa-id</i>	1 to 16
	<i>vm-id</i>	1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of the **show router statistics ip-tunnel-stats traffic-forward** command.

### Output Example

```
show>isa>stats>ip-tunnel-stats# traffic-forward tunnel-type gre isa 1/2
=====
STATISTICS FOR ISA 1/2

## traffic-forward

### Syntax

```
traffic-forward [type type] esa-vm esa-id/vm-id
traffic-forward [type type] gateway name
traffic-forward [type type] isa mda
traffic-forward [type type] gateway name dynamic-tunnel ip-address:port
traffic-forward [type type] tunnel ipsec-tunnel-name
```

### Context

[\[Tree\]](#) (show>isa>stats>ipsec-stats traffic-forward)

### Full Context

```
show isa statistics ipsec-stats traffic-forward
```

### Description

This command displays traffic forward statistics of the specified scope.

This command supports following scopes:

- per system
- per ISA
- per tunnel group
- per IPsec GW

The statistics include:

- The number of bidirectional encrypted and decrypted packets
- The number of encrypted packets
- The number of decrypted packets per second
- The number of bidirectional (encrypted and decrypted) in kilobytes
- The number of bidirectional encrypted bits in kilobytes

- The number of bidirectional decrypted bits in kilobytes

1 kilobyte equals 2<sup>10</sup> bytes

The start time indicates the starting timestamp of the measurement. The sampling duration indicates the duration of the measurement.

## Parameters

### *esa-vm*

Displays the ID of the configured ESA and ESA VM.

Values	esa-vm:	<i>esa-id/vm-id</i>	
		<i>esa-id</i>	1 to 16
		<i>vm-id</i>	1 to 4

### *name*

Displays information about the name of the IPsec GW up to 32 characters in length.

### *mda*

Displays information about the specified ISA.

Values	slot/mda
--------	----------

### *tunnel-group-id*

Displays information about the specified tunnel group ID.

Values	1 to 16
--------	---------

### *ip-address:port*

Displays information about the IP address and port of the peer for dynamic tunneling.

### *ipsec-tunnel-name*

Specifies the name of the static LAN-to-LAN tunnel up to 32 characters in length.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of the **show isa stats ipsec-stats traffic forward isa** command.

### Output Example

```
show>isa>stats>ipsec-stats# traffic-forward isa 1/2

## 30.40 traffic-statistics

### traffic-statistics

#### Syntax

**traffic-statistics** prefix *ip-prefix/ip-prefix-length*

**traffic-statistics** family *family*

**traffic-statistics**

#### Context

[\[Tree\]](#) (show>router>bgp traffic-statistics)

#### Full Context

show router bgp traffic-statistics

#### Description

This command displays BGP-LU traffic statistics.

## Parameters

### prefix *ip-prefix/ip-prefix-length*

Displays statistics for the specified prefix.

- Values**
- ipv4-prefix:
    - a.b.c.d
  - ipv4-prefix-length:
    - 0 to 32
  - ipv6-prefix:
    - x:x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x - [0 to FFFF]H
    - d - [0 to 255]D
  - ipv6-prefix-length:
    - 0 to 128

### family *family*

Displays statistics for the specified address family.

- Values** label-ipv4, label-ipv6

## Platforms

All

## Output

The following output is an example of traffic statistics information.

### Output Example

```
=====
BGP Router ID:10.20.1.2      AS:100      Local AS:100
=====
-----
Prefix : 100.1.1.1/32
NextHop : 10.10.12.1
Ingress Label : 19105
Ingress Oper State : Unknown
Ingress packets : 366992      Ingress Octets : 96885888
Egress Label : 19105
Egress Oper State : Unknown
Egress packets : 0      Egress Octets : 0
-----
-----
```

## traffic-statistics

### Syntax

```
traffic-statistics prefix ip-prefix/ip-prefix-length [ingress | egress]  
traffic-statistics family {label-ipv4 | label-ipv6} [ingress | egress]  
traffic-statistics [ingress | egress]
```

### Context

[\[Tree\]](#) (clear>router>bgp traffic-statistics)

### Full Context

```
clear router bgp traffic-statistics
```

### Description

This command clears BGP-LU traffic statistics.

### Parameters

#### prefix *ip-prefix/ip-prefix-length*

Clears statistics for the specified prefix.

<b>Values</b>	ipv4-prefix: <ul style="list-style-type: none"><li>• a.b.c.d</li></ul> ipv4-prefix-length: <ul style="list-style-type: none"><li>• 0 to 32</li></ul> ipv6-prefix: <ul style="list-style-type: none"><li>• x:x:x:x:x:x:x (eight 16-bit pieces)</li><li>• x:x:x:x:x:d.d.d.d</li><li>• x - [0 to FFFF]H</li><li>• d - [0 to 255]D</li></ul> ipv6-prefix-length: <ul style="list-style-type: none"><li>• 0 to 128</li></ul>
---------------	---

#### ingress

Clears statistics on ingress data-path.

#### egress

Clears statistics on egress data-path.

#### family label-ipv4 | label-ipv6

Clears statistics for the specified address family.

## Platforms

All

## traffic-statistics

### Syntax

**traffic-statistics prefix** *ip-prefix/ip-prefix-length* [**interval** *seconds*] [**repeat** *repeat*] [**absolute| rate**]

### Context

[\[Tree\]](#) (monitor>router>bgp traffic-statistics)

### Full Context

monitor router bgp traffic-statistics

### Description

This command monitors BGP traffic statistics.

### Parameters

**prefix** *ip-prefix/ip-prefix-length*

Clears statistics for the specified prefix.

- Values**
- ipv4-prefix:
    - a.b.c.d
  - ipv4-prefix-length:
    - 0 to 32
  - ipv6-prefix:
    - x:x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x - [0 to FFFF]H
    - d - [0 to 255]D
  - ipv6-prefix-length:
    - 0 to 128

**seconds**

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10

**repeat**

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

**absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Displays rate-per-second for each statistic instead of the delta.

**Platforms**

All

## 30.41 traffic-type

### traffic-type

**Syntax**

**traffic-type detail**

**traffic-type ip-family**

**traffic-type ip-protocol**

**traffic-type tls-family**

**Context**

[\[Tree\]](#) (show>app-assure>group traffic-type)

**Full Context**

show application-assurance group traffic-type

**Description**

This command displays per traffic type statistics.

**Parameters**

**detail**

Displays detailed statistics.

**ip-family**

Displays IP family statistics.

**ip-protocol**

Displays IP protocol statistics.

### tls-family

Displays TLS family statistics.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### Output

The following output is an example of traffic type information.

#### Output Example

```
*A:Dut-C>show>app-assure>group# traffic-type ip-family

## 30.42 transform

### transform

#### Syntax

**transform** [*transform-id*]

#### Context

[\[Tree\]](#) (show>ipsec transform)

## Full Context

show ipsec transform

## Description

This command displays information of the specified IPsec transform or lists all configured IKE transform information when the IKE transform ID is not specified.

## Parameters

**transform-id**

Specifies an IPsec transform entry.

**Values** 1 to 2048

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of the **show ipsec transform** command.

### Output Example

```
NODE# show ipsec transform
=====
IPSEC TRANSFORMS
=====
TRANSFORMID   ESPAUTH          ESPENCRYPTION    PFS              IPSEC

## 30.43 transit-ip-policy

### transit-ip-policy

#### Syntax

**transit-ip-policy** *ip-policy-id*

**transit-ip-policy summary**

**transit-ip-policy** *ip-policy-id summary*

## Context

[\[Tree\]](#) (show>app-assure>group transit-ip-policy)

## Full Context

show application-assurance group transit-ip-policy

## Description

This command displays transit IP policy information.

## Parameters

### *ip-policy-id*

Displays information for the specified IP policy.

**Values** 1 to 65535

### *summary*

Displays summarized information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 30.44 transit-path

### transit-path

## Syntax

**transit-path** [*path-name*] [**detail**]

## Context

[\[Tree\]](#) (show>router>mpls>mpls-tp transit-path)

## Full Context

show router mpls mpls-tp transit-path

## Description

This command displays MPLS-TP tunnel information.

## Parameters

### *path-name*

Specifies the path name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of MPLS OAM transit path information.

### Output Example

```
A:mplstp-dutC# show router mpls mpls-tp transit-path
<path-name>
  "tp-32"  "tp-33"  "tp-34"  "tp-35"  "tp-36"  "tp-37"  "tp-38"  "tp-39"

## 30.45 transit-prefix-policy

### transit-prefix-policy

#### Syntax

**transit-prefix-policy** *transit-prefix-policy-id*

**transit-prefix-policy summary**

**transit-prefix-policy** *transit-prefix-policy-id* **summary**

#### Context

[\[Tree\]](#) (show>app-assure>group transit-prefix-policy)

#### Full Context

show application-assurance group transit-prefix-policy

#### Description

This command displays transit prefix policy information.

#### Parameters

##### ***transit-prefix-policy-id***

Displays information for the specified transit prefix policy.

**Values** 1 to 65535

##### **summary**

Displays summarized information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 30.46 transport-mode

### transport-mode

#### Syntax

**transport-mode tunnel-type** {gre} [**saved-key**] **esa-vm** *esa-id/vm-id*

**transport-mode tunnel-type** {gre} **isa** *mda* [**saved-key**]

**transport-mode tunnel-type** {gre} **tunnel-name** *tunnel-name* [**saved-key**]

## Context

[\[Tree\]](#) (clear>ipsec transport-mode)

## Full Context

clear ipsec transport-mode

## Description

This command clears transport-mode tunnels data.

## Parameters

### *tunnel-name*

Clears data associated with the specified tunnel, up to 32 characters.

### *mda*

Clears all static tunnels terminated on the specified ISA.

### *saved-key*

Clears the saved IKE and ESP keys for the specified tunnel.

### *esa-vm*

Displays the ID of the configured ESA and ESA VM.

### Values

esa-vm:	<i>esa-id/vm-id</i>	
	<i>esa-id</i>	1 to 16
	<i>vm-id</i>	1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 30.47 trap-suppress

```
trap-suppress
```

## Syntax

```
trap-suppress number-of-traps time-interval
```

## Context

[\[Tree\]](#) (tools>perform>router>mpls trap-suppress)

## Full Context

```
tools perform router mpls trap-suppress
```

## Description

This command modifies thresholds for trap suppression. The *time-interval* parameter is used to suppress traps after a certain number of traps have been raised within the *time-interval* period of time. By executing this command, there will be no more than *number-of-traps* within *time-interval*.

## Parameters

### *number-of-traps*

Specifies to the number of traps raised within a period of time before suppression occurs.

**Values** 100 to 1000, in multiples of 100

### *time-interval*

Specifies the period of time before trap-suppression can occur, depending upon the number of traps received in that period of time.

**Values** 1 to 300

## Platforms

All

## 30.48 trust-anchor-profile

### trust-anchor-profile

## Syntax

**trust-anchor-profile** [*trust-anchor-profile*] **association**

**trust-anchor-profile** [*trust-anchor-profile*]

## Context

[\[Tree\]](#) (show>ipsec trust-anchor-profile)

## Full Context

show ipsec trust-anchor-profile

## Description

This command displays trust anchor profile information.

## Parameters

### *trust-anchor-profile*

Specifies the trust anchor profile name up to 32 characters in length.

### **association**

Displays information for which this trust anchor profile is associated.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of the **show ipsec trust-anchor-profile** command.

### Output Example

```
*A:Dut-A# show ipsec trust-anchor-profile

## 30.49 ts-list

### ts-list

## Syntax

**ts-list** [*list-name*]

**ts-list** *list-name* **association**

**ts-list** *list-name* **local-entry** [1 to 32]

**ts-list** *list-name* **remote-entry** [1 to 32]

**ts-list** *list-name* {**local** | **remote**}

## Context

**[Tree]** (show>ipsec ts-list)

## Full Context

show ipsec ts-list

## Description

This command displays IPsec traffic-selector list (TS-list) information.

Entering this command without a parameter will list all configured TS-lists.

Entering this command with the **association** parameter will list all IPsec gateways that use the specified TS-list.

Entering this command with the **local** or **local-entry** parameter will list all or specified local entries of the specified TS-list.

Entering this command with the **remote** or **remote-entry** parameter will list all or specified remote entries of the specified TS-list.

## Parameters

### ***list-name***

The traffic-selector list name.

### **association**

Displays all associations of the TS-list.

### **local-entry** [1 to 32]

The entry ID of a local entry.

### **remote-entry** [1 to 32]

The entry ID of a remote entry.

### **local**

Displays all local entries.

### **remote**

Displays all remote entries.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of TS-list information.

### Output Example

```
show ipsec ts-list

```

## Context

[\[Tree\]](#) (show>router>l2tp tunnel)

## Full Context

show router l2tp tunnel

## Description

This command displays L2TP tunnel operational information.

## Parameters

### statistics

Displays L2TP tunnel statistics.

### detail

Displays detailed L2TP tunnel information.

### ip-address

Displays information for the specified peer IP address.

**Values** The following values apply to the 7750 SR:

ipv4-address a.b.c.d (host bits must be 0)

ipv6-address x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface: 32 characters maximum, mandatory for link local addresses

**Values** The following values apply to the 7450 ESS:

ipv4-address: a.b.c.d (host bits must be 0)

### tunnel-state

Displays the operational state of the L2TP session.

**Values** closed, closed-by-peer, draining, drained, established, established-idle, idle, wait-reply, wait-conn

### remote-tunnel-id

Displays information for the specified remote tunnel ID.

### group-name

Displays L2TP tunnel information for the specified tunnel group.

### assignment-id

Specifies a string that distinguishes this Layer Two Tunneling Protocol tunnel.

***local-host-name***

Specifies a local host name used by this system.

***remote-host-name***

Specifies a remote host name used by this system.

***policy-name***

Displays the RADIUS accounting policy.

***bl-state***

Displays the denylist state of the L2TP session.

***fo-state***

Displays the failover state of the L2TP session.

***recovery-state***

Displays the recovery state of the L2TP session.

***recovery-method***

Displays the recovery method of the L2TP session.

***srrp-instance***

Specifies the SRRP instance identification.

**Values** 0 to 4294967295

***behavior***

Specifies the control message behavior.

**Values** handle, forward-to-mcs-peer

***transport-type***

Specifies that IP or UDP should be used as the transport type for the L2TP session.

**Values** ip, udp

***remote-connection-id***

Displays information for the specified remote connection ID.

***tunnel-id***

Displays information for the specified ID of a L2TP tunnel. In L2TP version 2, it is the 16-bit tunnel ID.

**Values** 1 to 65535

***connection-id***

Specifies the identification number for a Layer Two Tunneling Protocol connection.

**Values** 1 to 429496729

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

## tunnel

### Syntax

**tunnel** *tunnel-name*

### Context

[\[Tree\]](#) (clear>router>l2tp>group tunnel)

### Full Context

clear router l2tp group tunnel

### Description

This command clears L2TP tunnel data.

### Parameters

*tunnel-name*

Clears L2TP tunnel data associated with the specified tunnel, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## tunnel

### Syntax

**tunnel** *connection-id*

### Context

[\[Tree\]](#) (clear>router>l2tp tunnel)

### Full Context

clear router l2tp tunnel

### Description

This command clears L2TP data.

### Parameters

*connection-id*

Specifies the L2TP tunnel connection ID.

**Values** 1 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel

### Syntax

**tunnel** *tunnel-name*

### Context

[\[Tree\]](#) (tools>perform>router>l2tp tunnel)

[\[Tree\]](#) (tools>perform>router>l2tp>group tunnel)

### Full Context

tools perform router l2tp tunnel

tools perform router l2tp group tunnel

### Description

Commands in this context configure performance tools for a specified L2TP tunnel.

### Parameters

***tunnel-name***

Specifies the L2TP tunnel name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel

### Syntax

**tunnel** *ipsec-tunnel-name*

**tunnel**

**tunnel count**

**tunnel state** *state*

### Context

[\[Tree\]](#) (show>ipsec tunnel)

## Full Context

show ipsec tunnel

## Description

This command displays IPsec tunnel information.

## Parameters

### *ipsec-tunnel-name*

Specifies the name of the tunnel up to 32 characters.

### *state*

Specifies one of up, down, or limited

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## tunnel

## Syntax

**tunnel** *ipsec-tunnel-name* [**temp-mtu**]

**tunnel** *esa-vm* *esa-id/vm-id* [**saved-key**]

**tunnel** *isa* *mda* [**saved-key**]

**tunnel** *ipsec-tunnel-name* [**saved-key**]

**tunnel** *ipsec-tunnel-name* [**stats**] [**saved-key**]

## Context

[\[Tree\]](#) (clear>ipsec tunnel)

## Full Context

clear ipsec tunnel

## Description

This command clears static IPsec tunnel states.

## Parameters

### *ipsec-tunnel-name*

Specifies the name of the IPsec tunnel, up to 32 characters. If the **stats**, **saved-key** or **temp-mdu** parameters are not specified, the IPsec tunnel is cleared.

### *saved-key*

Clears the saved IKE and ESP keys for the specified tunnel.

### *temp-mtu*

Clears the temporary MTU from MTU propagation for the specified tunnel.

### **stats**

Clears the statistics counter for the specified tunnel.

### **mda**

Clears all static tunnels terminated on the specified ISA.

### **esa-vm**

Displays the ID of the configured ESA and ESA VM.

Values		
esa-vm:	<i>esa-id/vm-id</i>	
	<i>esa-id</i>	1 to 16
	<i>vm-id</i>	1 to 4

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## **tunnel**

### **Syntax**

**tunnel** [**type** {*rx* | *tx*}] [**prefix** *ip-address*] [**tunnel-id** *tunnel-id*]

**tunnel** [**prefix** *ip-address*] [**tunnel-id** *tunnel-id*] **leaf**

### **Context**

[\[Tree\]](#) (show>router>bier tunnel)

### **Full Context**

show router bier tunnel

### **Description**

This command shows the BIER tunnel table used for MVPN.

### **Parameters**

#### ***ip-address***

Specifies a prefix in IP address format.

#### ***tunnel-id***

Specifies a tunnel identifier.

**Values** 0 to 4294967295

#### **leaf**

Specifies that the tunnel leaves are displayed.

## Platforms

All

## Output

The following output is an example of a BIER tunnel table. [Table 625: Output fields: BIER tunnel](#) provides BIER tunnel table descriptions.

### Output Example

```
*A:Dut-A# show router bier tunnel prefix 10.20.1.3

Table 625: Output fields: BIER tunnel

Label	Description
Tunnel-id	The tunnel ID allocated for this tunnel
Type	The tunnel type, indicated if it is a terminating tunnel or an originating one

Label	Description
Oper	The operational status of the tunnel
No. of Leaves	The number of leaves associated with the tunnel if the tunnel type is tx or BFIR. This field represents the number of leafs associated with it.  If the tunnel type is rx or BFER, this field is zero.
BFR Prefix	The BFR prefix associated with the root of the tunnel
Bfr-ID	The BFR ID associated with the root of the tunnel
Mpls Label	If the tunnel type is tx or BFIR, this field represents the egress VPRN label allocated.  If the tunnel type is rx or BFER, this field represents the ingress VPRN label allocated by the root.
Sub-domain	The sub-domain associated with the root of the tunnel

## tunnel

### Syntax

**tunnel** [tunnel-id tunnel-id] [ type { rx | tx}]

**tunnel** [tunnel-id tunnel-id] leaf [root-addr root-addr] [tree-id tree-id]

### Context

[Tree] (show>router>p2mp-sr-tree tunnel)

### Full Context

show router p2mp-sr-tree tunnel

### Description

This command displays details about the P2MP tunnel.

### Parameters

#### *tunnel-id*

Specifies a tunnel identifier.

**Values** 0 to 4294967295

#### *type*

Specifies a tunnel type.

**Values** rx, tx

**root-addr**

Displays the root address.

**Values** a.b.c.d

**tree-id**

Specifies a tree identifier.

**Values** 0 to 4294967295

**leaf**

Specifies that the tunnel leaves are displayed.

**Platforms**

All

**Output**

The following output is an example of a P2MP SR tree tunnel table. [Table 626: Output fields: P2MP SR tree tunnel](#) provides the P2MP SR tree tunnel table descriptions.

**Output Example**

```
A:swsim100>file cf3:\ # show router p2mp-sr-tree tunnel
=====

```

Table 626: Output fields: P2MP SR tree tunnel

Label	Description
Tunnel-Id	The tunnel ID allocated for this tunnel
Type	The tunnel type, indicated if it is a terminating tunnel or an originating one
Oper	The operational status of the tunnel
Num Leaves	The number of leaves associated with the tunnel
Treeld	The tree ID associated with the root of the tunnel
RootAddr	The address associated with the root of the tunnel

Label	Description
SvcId	The service identifier

## tunnel

### Syntax

**tunnel** [*in-label in-label*]

### Context

**[Tree]** (tools>dump>router>sr tunnel)

### Full Context

tools dump router segment-routing tunnel

### Description

This command displays segment routing tunnel information.

### Parameters

***in-label***

Specifies the filter to match against the ingress label.

**Values** 0 to 4294967295

### Platforms

All

### Output

The following outputs are examples of segment routing tunnel operational information, and the following table describes the output fields.

### Output Example

```
*A:Dut-F# tools dump router segment-routing tunnel

Table 627: Output fields: tunnel group

Label	Description
ISA Group	The ISA group ID
Admin State	The administrative state of the tunnel group
Oper state	The operational state of the tunnel group
Responder-Only	The tunnel setup under the specified tunnel group
Non-Active Members	The non-active ESA and ESA VM
Required Active Qty	The number of the required active members
Active Members	The active ESA and ESA VM
Reassembly (msecs)	The time of reassembly
ISA Chassis	The number of ISA chassis

Label	Description
Oper Flags	The operational status flag of the tunnel
Grp IPsec Tnls	The number of group IPsec tunnels
Grp IPsec Max Tnls	The maximum number of group IPsec tunnels
Grp IP Tunnels	The number of group IP tunnels
Grp IP Max Tunnels	The maximum number of group IP tunnels
ISA Scale Mode	The number of tunnels on each ISA of the tunnel group
Statistics Collection	Specifies whether statistics collection is enabled
CPU Usage	Specifies whether the CPU usage of all the processes and protocols is enabled
Gw Traffic Forward	Specifies whether the traffic forwarded on the GW is enabled
IGP-Shared	Identifies a local node as a shared SID and is programmed in an ILM as such. An ILM can only be programmed once and has a single owner. When a node SID is shared, a local duplicate may exist between instances and the ISIS, OSPF, and OSPF3 protocols.

## tunnel

### Syntax

**tunnel** [{*ip-address* | *ipv6-address*}] [**detail**]

**tunnel** [{*ip-address* | *ipv6-address*}] **egress-stats**

### Context

[\[Tree\]](#) (show>router>rib-api tunnel)

### Full Context

show router rib-api tunnel

### Description

This command displays RIB-API tunnel information.

### Parameters

#### *ip-address*

Specifies the IPv4 address of the RIB-API tunnel up to 64 characters.

#### *ipv6-address*

Specifies the IPv6 address of the RIB-API tunnel up to 64 characters.

### detail

Displays detailed RIB-API tunnel information.

### egress-stats

Displays egress statistics of all instances for the specified RIB-API tunnel.

## Platforms

All

## Output

The following output is an example of RIB-API tunnel information.

### Output Example

```
show router rib-api tunnel 10.20.1.5 egress-stats
=====

## tunnel

### Syntax

```
tunnel {ip-address | ipv6-address} preference preference client-tag client-tag egress-stats
```

### Context

[\[Tree\]](#) (clear>router>rib-api tunnel)

### Full Context

```
clear router rib-api tunnel
```

## Description

Clears the egress statistics of the specified RIB-API tunnel.

## Parameters

### *ip-address*

Specifies the IPv4 address of the RIB-API tunnel up to 64 characters.

### *ipv6-address*

Specifies the IPv6 address of the RIB-API tunnel up to 64 characters.

### *preference*

Specifies the preference of the specified RIB-API entry.

**Values** 0 to 4294967295

### *client-tag*

Specifies the client tag of the specified RIB-API entry.

**Values** 0 to 4294967295

### *egress*

Specifies to clear the egress statistics.

## Platforms

All

## tunnel

## Syntax

```
tunnel {ip-address | ipv6-address}
```

## Context

[\[Tree\]](#) (tools>dump>router>rib-api tunnel)

## Full Context

```
tools dump router rib-api tunnel
```

## Description

This command configures the dump tools for RIB-API tunnel.

## Parameters

### *ip-address*

Specifies the IPv4 address of the RIB-API tunnel, up to 64 characters.

### *ipv6-address*

Specifies the IPv6 address of the RIB-API tunnel, up to 64 characters.

## Platforms

All

## Output

The following output is an example of RIB-API tunnel route information.

### Output Example

## tunnel

### Syntax

**tunnel** *gre-tunnel-name* **stats**

**tunnel** *gre-tunnel-name* **temp-mtu**

### Context

[\[Tree\]](#) (clear>ip tunnel)

### Full Context

clear ip tunnel

## Description

This command clears IP tunnel statistics.

## Parameters

### ***gre-tunnel-name***

Specifies the GRE tunnel name, up to 32 characters.

### **stats**

Clears the statistics counter for the specified tunnel.

### **temp-mtu**

Clears temporary MTU values from the MTU propagation for the specified tunnel.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## tunnel

## Syntax

```
tunnel {ip-address | ipv6-address} preference preference client-tag client-tag egress-stats [ interval seconds] [ repeat repeatf] [{absolute | rate}]
```

## Context

[\[Tree\]](#) (monitor>router>rib-api tunnel)

## Full Context

monitor router rib-api tunnel

## Description

This command monitors the egress statistics of the specified RIB-API tunnel.

## Parameters

### ***ip-address***

Specifies the IPv4 address of the RIB-API tunnel up to 64 characters.

### ***ipv6-address***

Specifies the IPv6 address of the RIB-API tunnel up to 64 characters.

### ***preference***

Specifies the preference of the specified RIB-API entry.

**Values** 0 to 4294967295

### ***client-tag***

Specifies the client tag of the specified RIB-API entry.

**Values** 0 to 4294967295

**egress-stats**

Specifies to monitor the egress statistics of the specified RIB-API tunnel.

**seconds**

Configures the interval for each display in seconds.

**Values** 3 to 60

**repeat**

Configures how many times the command is repeated.

**Values** 1 to 999

**absolute**

Displays the absolute statistics of the specified RIB-API tunnel.

**rate**

Displays the rate-per-second statistics of the specified RIB-API tunnel.

**Platforms**

All

tunnel

**Syntax**

**tunnel** *name* [**destinations** | **sessions**]

**Context**

[\[Tree\]](#) (show>system>grpc-tunnel tunnel)

**Full Context**

show system grpc-tunnel tunnel

**Description**

This command displays gRPC tunnel information.

**Parameters**

***name***

Specifies the gRPC tunnel name, up to 32 characters.

**destinations**

Specifies to display gRPC tunnel destinations.

**sessions**

Specifies to display gRPC tunnel sessions.

**Platforms**

All

## Output

The following output is an example of system gRPC tunnel tunnel information.

[Table 629: Output fields: system gRPC tunnel name](#) describes system gRPC tunnel tunnel output fields.

### Output example

```
*A:dut-c# show system grpc-tunnel tunnel

=====
gRPC-Tunnel tunnels
=====
Name                               Admin   Oper   Sessions
-----
t1                                   Enabled Up      0
-----
No. of tunnels: 1
=====
Please provide output example
```

Table 628: Output fields: system gRPC tunnel tunnel

Label	Description
Name	Displays the name of the tunnel.
Admin	Specifies the administrative state (Enabled, Disabled).
Oper	Specifies the operational state (Up, Down, Tran).
Sessions	Displays the number of sessions of the tunnel.
No. of tunnels	Displays the number of tunnels.

### Output example

```
*A:dut-c# show system grpc-tunnel tunnel "t1"

=====
gRPC-Tunnel tunnel
=====
Name                               : t1

Operational State                   : Up
Oper Down Reason                    :
Description                         : (Not Specified)
Destination Group                   : dg1
Operational Target Name              : dut-c
=====
```

Table 629: Output fields: system gRPC tunnel name

Label	Description
Name	Displays the name of the tunnel.

Label	Description
Administrative State	Specifies the administrative state (Enabled, Disabled).
Operational State	Specifies the operational state (Up, Down, Transition).
Oper Down Reasons	Displays the reason for the operational down state.
Description	Displays the description of the tunnel.
Destination Group	Displays the destination group of the tunnel.
Operational Target Name	Displays the operational target name of the tunnel.

## tunnel

### Syntax

**tunnel count**

**tunnel** *ip-tunnel-name*

**tunnel state** *state*

**tunnel**

### Context

[\[Tree\]](#) (show>ip tunnel)

### Full Context

show ip tunnel

### Description

This command displays IP related tunnel information.

### Parameters

***ip-tunnel-name***

Specifies the IP tunnel name, up to 32 characters.

***state***

Specifies the IP tunnel state.

**Values** up, down

### Platforms

All

## 30.51 tunnel-encryption

### tunnel-encryption

#### Syntax

```
tunnel-encryption encryption-group group-name [peer ip-address] [detail] [mka-session]
tunnel-encryption encryption-group group-name [peer ip-address] [statistics] [mka-session]
tunnel-encryption [detail] [mka-session]
tunnel-encryption [statistics] [mka-session]
```

#### Context

[\[Tree\]](#) (show>anysec tunnel-encryption)

#### Full Context

```
show anysec tunnel-encryption
```

#### Description

Commands in this context display tunnel encryption information.

#### Parameters

##### *group-name*

Specifies the encryption group name, up to 32 characters.

##### *ip-address*

Specifies the IPv4 or IPv6 address.

##### Values

ip-address:	ipv4-address - a.b.c.d
ipv6-address :	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

##### **detail**

Keyword to specify the detailed tunnel encryption group information.

##### **mka-session**

Keyword to specify MKA session information.

##### **statistics**

Keyword to specify MKA statistical information.

## Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

## Output

The following output is an example of the tunnel encryption information, and [Table 630: Output fields: tunnel encryption](#) describes the output fields.

### Output Example

```
# show anysec tunnel-encryption detail

Encrypted Packets	The number of encrypted packets
Encrypted Octets	The number of encrypted octets

Label	Description
rxSCSecyStats	
Rx SCI	The receive SCI value
Delay Packets	The number of delayed packets
Not Valid Packets	The number of invalid packets
Unchecked Packets	The number of unchecked packets
OK Packets	The number of OK packets
Decrypted Octets	The number of decrypted octets

## 30.52 tunnel-group

### tunnel-group

#### Syntax

**tunnel-group** *tunnel-group-id* **association** **mda** *mda-id*

**tunnel-group** *tunnel-group-id* **association** **esa-vm** *esa-id/vm-id*

**tunnel-group** *tunnel-group-id* [**detail**]

**tunnel-group** [*tunnel-group-id*]

#### Context

[\[Tree\]](#) (show>isa tunnel-group)

#### Full Context

show isa tunnel-group

#### Description

Commands in this context display tunnel information.

#### Parameters

##### association

Keyword that displays association applicable to the specified tunnel group.

##### esa-vm

Displays information about the configured ESA and ESA VM.

#### Values

*esa-vm:* *esa-id/vm-id*

*esa-id* 1 to 16

*vm-id* 1 to 4

*mda-id*

Displays information about the specified ISA.

**Values** slot/mda

**detail**

Keyword that displays detailed ESA VM information.

*tunnel-group-id*

Displays information about the specified tunnel group ID.

**Values** 1 to 16

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of the tunnel group information, and [Table 631: Output fields: tunnel group](#) describes the output fields.

## tunnel-interface

### Syntax

```
tunnel-interface [ip-int-name | mt-int-name | int-ip-address] [group [grp-ip-address] source ip-address]
    [type {starstarrp | starg | sg}] [detail] [family]
```

### Context

[\[Tree\]](#) (show>router>pim tunnel-interface)

### Full Context

```
show router pim tunnel-interface
```

### Description

This command displays PIM tunnel interface information.

### Parameters

#### *ip-int-name*

Displays information about the specified IP interface name, up to 32 characters.

#### *mt-int-name*

Displays information about the Multicast Tunnel (MT) interface for a VPRN.

**Values** *vprn-id-mt-grp-ip-address*

**int-ip-address**

Displays information about the interface IPv4 or IPv6 address.

**grp-ip-address**

Displays information about the IP multicast group address, or 0.

**ip-address**

Displays information about the source or RP IPv4 or IPv6 address.

**type**

Displays information about the type of entry.

**Values** starstarrp, starg, sg

**detail**

Displays detailed interface information.

**family**

Displays family information.

**Values** ipv4, ipv6

**Platforms**

All

**Output**

The following output is an example of PIM tunnel interface information.

**Output Example**

## 30.54 tunnel-isa

### tunnel-isa

#### Syntax

**tunnel-isa**

#### Context

[\[Tree\]](#) (show>isa>stats tunnel-isa)

#### Full Context

show isa statistics tunnel-isa

#### Description

Commands in this context display tunnel ISA statistics including ISA CPU usage and memory allocation failure rates.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 30.55 tunnel-member-pool

### tunnel-member-pool

#### Syntax

**tunnel-member-pool** [*name*]

**tunnel-member-pool** *name* detail

#### Context

[\[Tree\]](#) (show>isa tunnel-member-pool)

#### Full Context

show isa tunnel-member-pool

#### Description

This command displays a list of configured tunnel member pools.

## Parameters

*name*

Specifies the tunnel member pool name, up to 32 characters.

**detail**

Keyword that displays detailed information about the specified tunnel member pool.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of tunnel member pool information, and [Table 632: Output fields: tunnel member pool](#) describes the output fields.

### Output Example

```
*A:node-2>show isa tunnel-member-pool "DS_memberPool" detail

Label	Description
ISA Tunnel Member Pool	The name of the ISA tunnel member pool
Description	The text description for the tunnel member pool
High Availability	The HA configuration of the tunnel member pool
Associated Tunnel Grps	The name of the tunnel groups this pool is associated with
Member	The ISA or ESA members associated with this tunnel member pool
Active In Group	The tunnel group that the MDA is active in
Last Config Change	The date and time of the last configuration change

Label	Description
Weight	The weight of the ESA VM for tunnel load balancing
Hash Slots	The number of hash slots
Number of Configured Entries	The number of configured entries
Number of Active Entries	The number of active entries

## 30.56 tunnel-qos

### tunnel-qos

#### Syntax

**tunnel-qos** [**detail**]

**tunnel-qos remote-ip** *ip-address* [**local-ip** *ip-address*] [**detail**]

#### Context

[\[Tree\]](#) (show>router>wlan-gw tunnel-qos)

#### Full Context

show router wlan-gw tunnel-qos

#### Description

This command displays tunnel-QoS resource information.

#### Parameters

##### *ip-address*

Specifies the IPv4 address of the access point that is the source IPv4 address in the tunnel header of received packets.

##### Values

ipv4-address: a.b.c.d

ipv6-address : x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

**ip-address**

Specifies the IPv4 address of this system that is the destination IPv4 address in the tunnel header of received packets.

**Values**

ipv4-address: a.b.c.d  
 ipv6-address : x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x - [0 to FFFF]H  
 d - [0 to 255]D

**detail**

Displays detailed information.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of soft GRE tunnel QoS information.

**Output Example**

```
*A:Dut-C# show router 50 wlan-gw soft-gre-tunnel-qos
=====

#### Context

[\[Tree\]](#) (show>isa>stats>ipsec-stats tunnel-setup-rate)

#### Full Context

show isa statistics ipsec-stats tunnel-setup-rate

#### Description

This command displays IPsec tunnel setup rate statistics of the specified scope.

The system collects statistics every hour for the last 24 hour period per wall clock. A current value is also included in the output.

This command supports following scopes:

- per system
- per ISA

- per tunnel group
- per IPsec GW

The statistics include the following setup rates:

- static tunnel
- dynamic LAN-to-LAN tunnel
- remote access tunnel
- all types of tunnel

The start time indicates the starting timestamp of measurement. The sampling duration indicates the duration of measurement.

## Parameters

### ***name***

Displays information about the name of the IPsec GW up to 32 characters in length.

### ***mda***

Displays information about the specified ISA.

**Values** slot/mda

### ***tunnel-group-id***

Displays information about the specified tunnel group ID.

**Values** 1 to 16

### ***count***

Displays information for the number of statistics intervals to be displayed (starting with the most recent).

**Values** 1 to 24

### ***minutes***

Displays information about the specified period covered by the statistics to be displayed (starting with the most recent).

**Values** 1 to 1440

### ***type***

Displays information about the specified tunnel type associated with this IPsec GW.

**Values** all, sl2l, dl2l, ra

### ***current***

Displays information about the current statistic value. The values of count and minutes are ignored by the system once this parameter is specified.

### ***show-oid***

Displays information about the OID of the current statistical value.

### ***esa-vm***

Displays the ID of the configured ESA and ESA VM.

Values	esa-vm:	esa-id/vm-id	
		esa-id	1 to 16
		vm-id	1 to 4

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 30.59 tunnel-table

### tunnel-table

#### Syntax

**tunnel-table summary** [ipv4 | ipv6]

**tunnel-table** [*ip-prefix/mask*] [ **protocol** *protocol*] [**alternative**] [ **ipv4** | **ipv6**] [**detail**] [ **instance** *instance-id*]

**tunnel-table mpls-tp**

**tunnel-table** [*ip-prefix/mask*] **sdp** *sdp-id*

#### Context

[\[Tree\]](#) (show>router tunnel-table)

#### Full Context

show router tunnel-table

#### Description

This command displays tunnel table information.

Auto-bind GRE tunnels are not displayed in the **show** command output. GRE tunnels are not the same as SDP tunnels that use the GRE encapsulation type. When the **auto-bind-tunnel** command is used when configuring a VPRN service, it means the MP-BGP NH resolution is referring to a core routing instance for IP reachability. For a VPRN service this object specifies the lookup to be used by the routing instance if no SDP to the destination exists.

#### Parameters

##### summary

Displays summary tunnel table information.

##### *ip-prefix/mask*

Displays the specified destination IP address and mask of the table tunnel.

**Values** for ipv4-prefix: a.b.c.d (host bits must be 0)

for ipv4-prefix-le: 0 to 32

for ipv6-prefix:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

for ipv6-prefix-le: 0 to 128

### **ipv4**

Displays only tunnel table information for IPv4 addresses.

### **ipv6**

Displays only tunnel table information for IPv6 addresses.

### **protocol**

Displays LDP protocol information.

**Values** bgp, bgp-epe, fpe, isis, ldp, mpls-fwd-policy, ospf, ospf3, rib-api, rsvp, sdp, sr-policy, sr-te, srv6-isis, srv6-policy, udp

**Note:**

It is possible that a specific platform only supports a subset of the above protocol values.

### **alternative**

Displays backup route details.

### **detail**

Displays detailed information.

### **instance-id**

Specifies the IGP instance of the tunnel table

**Values** For isis — 0 to 127  
For ospf — 0 to 31  
For ospfv3 —  
• 0 to 31 (when ospfv3 is used for IPv6)  
• 64 to 95 (when ospfv3 is used for IPv4)

**Note:**

It is possible that a specific platform only supports a subset of the above values.

### **mpls-tp**

Displays MPLS TP tunnel table information.

### **sdp-id**

Displays information pertaining to the specified SDP.

**Values** 1 to 17407

## Platforms

All

## Output

The following outputs are examples of tunnel table information, and [Table 633: Output fields: tunnel table](#) describes the output fields.

### Output Example

Table 634: Output fields: tunnel table protocol detail

Label	Description
Destination	The destination address and mask of the route
NextHop	The next hop for the destination of the route
Tunnel Flags	The flags set for this tunnel
Age	The tunnel age
CBF Classes	The Class-Based Forwarding (CBF) classes for the tunnel
Owner	The tunnel owner
Encap	The tunnel encapsulation type
Tunnel ID	The tunnel (SDP) identifier
Preference	The route preference for routes learned from the configured peer or peers
Tunnel Label	The tunnel label
Tunnel Metric	The route metric value for the route
Tunnel MTU	The maximum transmission unit (MTU) of the tunnel
Max Label Stack	The maximum number of labels that can be added onto an existing MPLS header
LSP Weight	The LSP weight

## 30.60 tunnel-template

### tunnel-template

#### Syntax

**tunnel-template** [*ipsec-template-identifier*]

**tunnel-template** *ipsec-template-identifier* **association** [ **all**]

#### Context

[\[Tree\]](#) (show>ipsec tunnel-template)

#### Full Context

show ipsec tunnel-template

#### Description

This command displays IPsec tunnel template information.

#### Parameters

***ipsec template identifier***

Displays an existing IPsec tunnel template ID.

**Values** 1 to 2048

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of the **show ipsec tunnel-template** command.

#### Output Example

```
*A:ALA-48>config>ipsec# show ipsec tunnel-template 1
=====
IPsec Tunnel Template
=====
Id      Trnsfrm1  Trnsfrm2  Trnsfrm3  Trnsfrm4  ReverseRoute  ReplayWnd
-----
1       1         none      none      none      useSecurityPolicy 128
-----
Number of templates: 1
=====
*A:ALA-48>config>ipsec#
```

## 30.61 tunnels

### tunnels

#### Syntax

**tunnels** [**local-ip** *ip-address*] [**remote-ip** *ip-address*] [**isa-group** *wlan-gw-group-id*] [**member** [1 to 255]] [**summary**] [**detail**]

**tunnels** **local-ip** *ip-address* **remote-ip** *ip-address* **ue**

#### Context

[\[Tree\]](#) (show>router>wlan-gw tunnels)

#### Full Context

show router wlan-gw tunnels

#### Description

This command displays tunnel operation information.

#### Parameters

##### *ip-address*

Specifies the local IP address of this system that is the destination IP address in the tunnel header of received packets.

##### Values

ip-address: ipv4-address - a.b.c.d  
ipv6-address : x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x - [0 to FFFF]H  
d - [0 to 255]D

##### *ip-address*

Specifies the remote IP address of the access point that is the source IP address in the tunnel header of received packets.

##### Values

ip-address: ipv4-address - a.b.c.d  
ipv6-address : x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x - [0 to FFFF]H

d - [0 to 255]D

**wlan-gw-group-id**

Specifies the identifier of the WLAN gateway ISA group that terminates GRE for this group interface.

**Values** 1 to 4

**member**

Specifies the identifier of this WLAN gateway ISA group member.

**Values** 1 to 255

**summary**

Displays a summary of the specified parameter.

**detail**

Displays detailed information.

**ue**

Displays information for the specified User Equipment.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of WLAN-GW tunnel information.

**Output Example**

**Note:**

The remote/local IP addresses are locally generated for VLAN tunnels.

```
show router 50 wlan-gw tunnels
=====
Access Point tunnels
=====
Remote IP address      : fe80::3e8f:ffff:fe00:1901
Local IP address      : fe80::ff:fe02:202
ISA group ID          : 1
ISA group member ID   : 4
Time established      : 2015/01/07 17:42:01
Number of UE          : 1
Access Point MAC      : 00:00:00:00:00:05
AP MAC learn failed   : false
Encapsulation         : vlan
VLAN tag 1            : 1000
VLAN tag 2            : (None)
-----
No. of tunnels: 1
=====
```

## tunnels

### Syntax

```
tunnels [router router-name] [remote-ip ip-address] [local-ip ip-address] [encapsulation encap [encap]  
  [qtag1 qtag] [qtag2 qtag] [ap-sap sap-id] [min-num-ue minimum] [max-num-ue maximum] [ap-  
mac-learn-failed { true | false}] [get-num-results] [addr-family family] [ue-type ue-type [ue-type]]
```

### Context

[\[Tree\]](#) (show>subscr-mgmt>wlan-gw tunnels)

### Full Context

```
show subscriber-mgmt wlan-gw tunnels
```

### Description

This command displays all the WLAN-GW tunnels matching the specified criteria. Unlike the similar command in the **show>router>vprn** context, this command also includes information on tunnels containing ISA-only UEs such as migrant, DSM and I2-wholesale.

### Parameters

#### ***router-name***

Specifies the name or ID of the router where the tunnel terminates.

#### ***ip-address***

Specifies the IPv4 or IPv6 address indicating one, or both, of the tunnel endpoint IP addresses.

#### ***encap***

Specifies up to three tunnel encapsulation types, for example GRE, L2TP, or VLAN.

#### ***qtag***

Specifies the Q-tags specifying the I2-ap-delimiting tags.

#### ***sap-id***

Specifies the SAP-ID of the I2-ap SAP.

#### ***minimum***

Specifies the minimum number of UEs on the tunnel, after applying the UE type filter.

#### ***maximum***

Specifies the maximum number of UEs on the tunnel, after applying the UE type filter.

#### **ap-mac-learn-failed true | false**

Filters the results to display only tunnels that have learned the AP-MAC (**false**) or have not learned the AP-MAC (**true**).

#### **get-num-results**

Displays the total number of tunnels at the end of each tunnel record.

#### ***family***

Specifies the tunnel's IP family type (IPv4 or IPv6).

### **ue-type**

Filters up to five display based on the presence of specified UE types and is used in conjunction with **min-num-ue** and **max-num-ue**.

**Values** migrant, dsm, l2w, esm, or xcon

### **Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

### **Output**

The following output is an example of WLAN-GW tunnels.

#### **Output Example**

```
Node# show subscriber-mgmt wlan-gw tunnels
=====
Access Point tunnels
=====
Router                : 50

## **30.62 twamp**

twamp

### **Syntax**

twamp

## Context

[\[Tree\]](#) (show>test-oam twamp)

## Full Context

show test-oam twamp

## Description

Commands in this context display TWAMP information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## twamp

## Syntax

twamp

## Context

[\[Tree\]](#) (clear>test-oam twamp)

## Full Context

clear test-oam twamp

## Description

This command clears Two-Way Active Measurement Protocol statistics.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## twamp

## Syntax

twamp

## Context

[\[Tree\]](#) (tools>dump>test-oam twamp)

## Full Context

tools dump test-oam twamp

## Description

This command dumps TWAMP information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 30.63 twamp-light

```
twamp-light
```

### Syntax

```
twamp-light
```

### Context

[\[Tree\]](#) (show>test-oam>twamp twamp-light)

### Full Context

```
show test-oam twamp twamp-light
```

### Description

Commands in this context display TWAMP-Light information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

```
twamp-light
```

### Syntax

```
twamp-light
```

### Context

[\[Tree\]](#) (show>service>id twamp-light)

[\[Tree\]](#) (show>router twamp-light)

### Full Context

```
show service id twamp-light
```

```
show router twamp-light
```

### Description

This command displays TWAMP Light reflector information for either the base router or a specific service.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of TWAMP Light information, and [Table 635: Output fields: TWAMP light](#) describes the output fields.

### Output Example

```

show router twamp-light
-----
TWAMP-Light Reflector

172.16.1.0/24         Process all 172.16.1.0 TWAMP
                       Light packets
-----
No. of TWAMP-Light Reflector Prefixes: 2
-----
    
```

Table 635: Output fields: TWAMP light

Label	Description
TWAMP Light Reflector	
Admin State	The administrative state of the reflector Up — The server or prefix is administratively enabled ( <b>no shutdown</b> ) in configuration

Label	Description
	Down — The server or prefix is administratively disabled ( <b>shutdown</b> ) in configuration
UDP Port	The UDP port that the reflector is listening on for test packets
IPv6 UDP Checksum 0	The processing of received IPv6 UDP checksum 0 packets is either allowed or disallowed
Up Time	The time since the server process was started, measured in days (d), hours, minutes, and seconds
Test Frames Received	The total number of TWAMP Light test packets received from session senders on the reflector
Test Frames Sent	The total number of TWAMP Light test packets transmitted by the reflector to session senders
Prefix	A list of prefixes from which the reflector allows TWAMP Light tests
Description	The configured description for the prefix

## twamp-light

### Syntax

**twamp-light** [*interval seconds*] [*repeat repeat*] [*absolute | rate*] [*delay | loss*]

### Context

[\[Tree\]](#) (monitor>oam-pm>session twamp-light)

### Full Context

monitor oam-pm session twamp-light

### Description

This command monitors the IP Two Way Active Measurement Protocol Light (TWAMP Light) statistics for the specified test's raw measurement interval.

### Parameters

#### *seconds*

Specifies the time interval, in seconds.

**Values** 3 to 60

**Default** 10

### **repeat**

Specifies the number of times the command is repeated.

**Values** 1 to 999

**Default** 10

### **absolute**

Specifies that the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

### **rate**

Specifies that the rate-per-second is displayed.

**Default** delta

### **delay**

Specifies the delay metrics are displayed.

**Default** delay

### **loss**

Specifies the loss metrics are displayed.

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## **twamp-light**

### **Syntax**

**twamp-light**

### **Context**

[\[Tree\]](#) (show>oam-pm>stats>session twamp-light)

### **Full Context**

show oam-pm statistics session twamp-light

### **Description**

This command selects the session's TWAMP-light test for the statistical display.

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 31 u Commands

### 31.1 ue

```
ue
```

#### Syntax

```
ue [ieee-address] [detail]
```

#### Context

[\[Tree\]](#) (show>call-trace>wlan-gw ue)

#### Full Context

```
show call-trace wlan-gw ue
```

#### Description

This command gives an overview of either all traces or a specific trace on the WLAN-GW.

#### Parameters

##### *ieee-address*

Displays information about the MAC address of this UE.

##### **detail**

Displays detailed information about the job.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of traces of the UE being monitored.

#### Output Example

```
Node# show call-trace hosts
=====

## ue

### Syntax

**ue** [*vlan qtag*] [*mpls-label label*] [*retail-svc-id service-id*] [*ssid service-set-id*] [*previous-access-point ip-address*] [*bd bridge-id*]

**ue mac** *ieee-address* [*bd bridge-id*]

### Context

[\[Tree\]](#) (show>subscr-mgmt>wlan-gw ue)

### Full Context

show subscriber-mgmt wlan-gw ue

### Description

This command displays User Equipment (UE) information.

### Parameters

#### *qtag*

Displays information about the VLAN Q-tag present in the traffic received from this UE.

**Values** 1 to 4095

#### *label*

Displays information about the MPLS label present in the traffic received from this UE.

#### *service-id*

Specifies an existing service ID. If no *svc-id* is specified then it indicates that the interface is a network interface in the Base router instance.

**Values** {*id* | *svc-name*}

*id*: 1 to 2147483647

*svc-name*: Specifies an existing service name, up to 64 characters (*svc-name* is an alias for input only. The *svc-name*

gets replaced with an id automatically by SR OS in the configuration)

**service-set-id**

Displays information about the Service Set ID (SSID) of this UE.

**ip-address**

Displays information about the IP address of the previous Access Point (AP) of this UE.

**bridge-id**

Displays specified HLE bridge domain information of this UE.

**Values** 1 to 4294967295

**ieee-address**

Displays information about the MAC address of this UE.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of WLAN-GW information.

**Output Example**

```
System# show subscriber-mgmt wlan-gw ue
=====

## 31.2 uefi-vars

### uefi-vars

#### Syntax

**uefi-vars** *cpm-slot*

#### Context

**[Tree]** (tools>dump>system>security>secure-boot uefi-vars)

#### Full Context

tools dump system security secure-boot uefi-vars

#### Description

This command displays the secure-boot Unified Extensible Firmware Interface (UEFI) variables.

#### Parameters

***cpm-slot***

Specifies the CPM slot.

**Values** A, B

#### Platforms

7750 SR-1, 7750 SR-s, 7950 XRS-20e

## 31.3 un-sid

### un-sid

#### Syntax

**un-sid** [**mt** {0 | 2}] [**prefix** *ipv6-prefix[/prefix-length]*] [**adv-router** *system-id | hostname*] [**algo** *algo-id*]

#### Context

[\[Tree\]](#) (show>router>isis>srv6 un-sid)

#### Full Context

show router isis segment-routing-v6 un-sid

#### Description

This command displays IS-IS SRv6 uN SIDs.

#### Parameters

##### *ipv6-prefix[/prefix-length]*

Displays routes only matching the specified IP address and length.

**Values** *ipv6-prefix[/prefix]*: x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x: [0 to FFFF]H  
d: [0 to 255]D  
*prefix-length*: 1 to 128

##### *system-id | hostname*

Displays information for the specific IS-IS advertising router. The host name can be up to 38 characters.

##### *algo-id*

Displays information for the specified algorithm.

**Values** 0 to 255

#### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

#### Output

[Table 636: Output fields: uN SID](#) describes the uN SID output fields.

Use the following command to display uN SID information.

```
show router isis segment-routing-v6 un-sid
```

### Output example

## 31.4 uni

uni

### Syntax

```
uni [port-id]
```

### Context

[\[Tree\]](#) (show>elmi uni)

### Full Context

```
show elmi uni
```

## Description

This command displays information about E-LMI mode, status, number of EVCs (SAPs) configured on the port for all of the ports on the service router.

## Parameters

### *port-id*

Displays UNI information for the specified port.

**Values** *slot/mda/port*

## Platforms

All

## Output

The following output is an example of elmi uni information.

### Output example: show elmi uni

```
*A:Dut-C# show elmi uni
=====

## 31.5 unicast

### unicast

#### Syntax

**unicast** [**router** *router-instance* | **service-name** *service-name*]

#### Context

[\[Tree\]](#) (show>system>ptp unicast)

#### Full Context

show system ptp unicast

#### Description

This command displays unicast negotiation information.

#### Parameters

##### **router-instance**

Displays the information for the specified router instance.

**Values**    router-name – Base  
              vprn-svc-id – 1 to 2147483647

##### **service-name**

Specifies the service name, up to 64 characters, that is used to identify the router instance.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

#### Output

The following command displays Unicast information and [Table 637: Output fields: PTP unicast](#) describes the output fields.

```
show system ptp unicast
```

```

### unknown-origin

#### Syntax

**unknown-origin**

#### Context

[\[Tree\]](#) (show>subscr-mgmt>errors unknown-origin)

#### Full Context

show subscriber-mgmt errors unknown-origin

#### Description

This command lists errors of an unknown origin. Errors shown do have a corresponding SAP ID or a SDP ID.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 31.7 unreachable-route-table

### unreachable-route-table

#### Syntax

**unreachable-route-table***[ip-prefix[/prefix-length]] [ipv4 | ipv6] [longer | exact] [protocol protocol-name] [instance instance-id] [all]*

#### Context

[\[Tree\]](#) (show>router unreachable-route-table)

## Full Context

show router unreachable-route-table

## Description

This command displays the unreachable route table.

## Parameters

### *ip-prefix[/prefix-length]*

Displays routes only matching the specified IP address and length.

#### Values

ipv4-address/prefix:	ipv4-address	a.b.c.d (host bits must be 0)
ipv4-prefix-length		0 to 32
ipv6-address/prefix:	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x [0 to FFFF]H d [0 to 255]D
prefix-length		1 to 128

### **ipv4**

Displays information for IPv4.

### **ipv6**

Displays information for IPv6.

### **longer**

Displays information for the longer configuration.

### **exact**

Displays information for the exact configuration.

### **protocol-name**

Displays information for the referenced protocol.

### **instance-id**

Displays information for the referenced instance.

### **all**

Displays information for all of the unreachable routes.

## Platforms

All

## Output

The following output is an example of unreachable route table information, and [Table 639: Output fields: unreachable route table](#) describes the output fields.

### Output example

## 31.8 unreachable-routes

### unreachable-routes

#### Syntax

**unreachable-routes originated** [family] [prefix ip-prefix[/prefix-length]]

**unreachable-routes originated mt** mt-id-number [prefix ip-prefix[/prefix-length]]

#### Context

**[Tree]** (show>router>isis unreachable-routes)

#### Full Context

show router isis unreachable-routes

## Description

This command displays the unreachable routes originated by the router. The output can be filtered using family or IP prefix criteria.

## Parameters

### family

Keyword to display information about unreachable IPv6 or IPv4 unicast routes.

**Values** ipv4-unicast | ipv6-unicast

### ip-prefix/prefix-length

Displays the unreachable routes based on a specific IP prefix, or a specific IP prefix and prefix length.

<b>Values</b>	ipv4-address/prefix:	ipv4-address	a.b.c.d (host bits must be 0)
	ipv4-prefix-length		0 to 32
<b>Values</b>	ipv6-address/prefix:	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
			x:x:x:x:x:d.d.d.d
			x [0 to FFFF]H
			d [0 to 255]D
	prefix-length		1 to 128

### mt-id-number

Displays the unreachable routes based on a specific Multitopology (MT) ID number.

**Values** 0 | 2

## Platforms

All

## Output

The following output is an example of unreachable-routes information, and [Table 640: Output fields: unreachable routes](#) describes the output fields.

### Output example

Time	Displays the current UPA lifetime counting down and is a value between 0 to 1800 seconds
SysID/Hostname	Displays the unreachable route information for a system ID or hostname
MT	Displays the unreachable route information for an MT ID
Lvl/Type	Displays the unreachable route information for a level or type
SpfVersion	Displays the unreachable route information for an SPF version
No. of Routes	Displays the number of routes

## 31.9 unsubscribe-from

### unsubscribe-from

#### Syntax

**unsubscribe-from** *log-id* *log-id*

#### Context

**[Tree]** (tools>perform>log unsubscribe-from)

#### Full Context

tools perform log unsubscribe-from

#### Description

This command cancels the subscription of the current CLI session to the specified CLI log.

## Parameters

### *log-id*

Specifies the log ID from which cancellation is requested.

**Values** 1 to 101

## Platforms

All

## 31.10 update-path

### update-path

## Syntax

```
update-path {lsp lsp-name path current-path-name new-path new-path-name}
```

## Context

[\[Tree\]](#) (tools>perform>router>mpls update-path)

## Full Context

```
tools perform router mpls update-path
```

## Description

This command enables you to instruct MPLS to replace the path of a primary or secondary LSP. The primary or secondary LSP path is indirectly identified via the *current-path-name* value. The same path name cannot be used more than once in a given LSP name.

This command applies to both CSPF LSP and to a non-CSPF LSP. This command will only work when the specified *current-path-name* has the adaptive option enabled. The adaptive option can be enabled at the LSP level or the path level.

The new path must have been configured in the CLI or provided via SNMP. The CLI command for entering the path is

```
configure router mpls path path-name
```

The command fails if any of the following conditions exist:

- The specified *current-path-name* of this LSP does not have the adaptive option enabled.
- The specified *new-path-name* value does not correspond to a previously defined path.
- The specified *new-path-name* value exists but is being used by any path of the same LSP, including this one.

When you execute this command, MPLS performs the following procedures:

- MPLS performs a single MBB attempt to move the LSP path to the new path.
- If the MBB is successful, MPLS updates the new path

- MPLS writes the corresponding NHLFE in the data path if this path is the current backup path for the primary.
- If the current path is the active LSP path, it updates the path and writes the new NHLFE in the data path that causes traffic to switch to the new path.
- If the MBB is not successful, the path retains its current value.
- The update-path MBB has the same priority as the manual re-signal MBB.

## Platforms

## 31.11 uplink

### uplink

#### Syntax

**uplink**

**uplink mgw-address-cache [arec] [snaptr] [srv]**

**uplink mgw-address-cache apn *apn-domain-string***

#### Context

[\[Tree\]](#) (show>router>gtp uplink)

#### Full Context

show router gtp uplink

#### Description

This command displays operational information related to the usage of GTP uplink interfaces (Gn, S2a, S2b) in this routing context.

#### Parameters

**arec**

Displays A-records.

**snaptr**

Displays Straightforward-NAPTR information.

**srv**

Displays SRV records.

***apn-domain-string***

Specifies the Access Point Name (APN) of this DNS cache entry.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of GTP uplink information.

### Output example

```
Node# show router 10 gtp uplink mgw-address-cache
=====
Mobile Gateway address cache
=====
APN : full.dotted.apn.apn.epc.mnc010.mcc206.3gppnetwork.org

No. of cache entries: 1
No. of Mobile gateways: 1
=====
```

## uplink

### Syntax

**uplink**

**uplink session imsi** *imsi* *apn* *apn-string*

**uplink session** [**peer-address** *ip-address*] [**router** *router-instance*] [**remote-control-teid** *teid*] [**local-control-teid** *teid*] [**detail**]

**uplink session imsi** *imsi*

### Context

[\[Tree\]](#) (show>subscr-mgmt>gtp uplink)

### Full Context

show subscriber-mgmt gtp uplink

### Description

This command displays box-wide operational information related to the GTP uplink interfaces (Gn, S2a, S2b).

### Parameters

***imsi***

Specifies the IMSI (International Mobile Subscriber Identity) of this UE.

***apn-string***

Specifies the APN (Access Point Name).

**ip-address**

Specifies the IP address of the Mobile Gateway (PGW or GGSN).

**router-instance**

Specifies the identifier of the virtual router instance where the GTP tunnel is terminated.

**remote-control-teid teid**

Specifies the remote control plane Tunnel Endpoint Identifier (TEID).

**local-control-teid teid**

Specifies the local control plane TEID.

**detail**

Displays detailed information.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of GTP uplink information

**Output Example**

```
Node# show subscriber-mgmt gtp uplink session detail
=====
GTP sessions

### Full Context

```
clear nat upnp-mappings
```

## Description

This command removes UPnP mappings for the specified subscriber. If **protocol** and **outside-port** are not specified, all UPnP mappings for the subscriber are removed.

## Parameters

**subscriber** *sub-ident-string*

clears mappings for the specified subscriber.

**protocol** {**tcp** | **udp**}

Clears the mappings for the specified protocol.

**outside-port** *port-number*

Clears mappings for the specified outside-port.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 31.14 upnp-policy

### upnp-policy

## Syntax

**upnp-policy** *policy-name*

**upnp-policy** *policy-name* **statistics**

**upnp-policy**

## Context

[\[Tree\]](#) (show>service>upnp upnp-policy)

## Full Context

show service upnp upnp-policy

## Description

This command displays upnp-policy related information.

Without any parameters the system outputs a list of configured UPnP policies.

## Parameters

**policy-name**

The system displays the configuration of the specified policy.

**statistics**

The system displays statistics for the specified policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of this command.

### Output example

```

show service upnp upnp-policy

## 31.15 upnp-policy-statistics

### upnp-policy-statistics

#### Syntax

**upnp-policy-statistics** *policy-name*

#### Context

[\[Tree\]](#) (clear>nat upnp-policy-statistics)

#### Full Context

clear nat upnp-policy-statistics

#### Description

This command clears UPnP policy statistics.

#### Parameters

***policy-name***

Clears UPnP policy statistics for the specified policy.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 31.16 uptime

### uptime

#### Syntax

**uptime**

## Context

[\[Tree\]](#) (show uptime)

## Full Context

show uptime

## Description

This command displays the time since the system started.

## Platforms

All

## Output

The following output is an example of uptime information, and [Table 641: Output fields: uptime](#) describes the output field.

### Output example

```
A:ALA-1# show uptime
System Up Time      : 11 days, 18:32:02.22 (hr:min:sec)

A:ALA-1#
```

Table 641: Output fields: uptime

Label	Description
System Up Time	Displays the length of time the system has been up in days, hr:min:sec format.

## 31.17 url-filter

### url-filter

## Syntax

**url-filter** [*url-filter-name*]

**url-filter** *url-filter-name* **isa** *mda-id/esa-vm-id* [**detail**]

**url-filter** *url-filter-name* **web-service** [**profile** *profile-name*]

## Context

[\[Tree\]](#) (show>app-assure>group url-filter)

## Full Context

show application-assurance group url-filter

## Description

This command displays information about the configured url-filter policy along with some associated raw statistics. These output statistics are:

- Vlan Id: VLAN ID used by the aa interfaces
- Admin Status: Up / Down
- Oper Status: Up / Down
- Oper Flags: adminDown, no-aa-if, aa-if-down, icap-server-down
- Default Action: default policy action taken by the url-filter
- ICAP HTTP Redirect: HTTP redirect Policy
- AQP Referenced: Yes/No
- HTTP Request: Number of subscriber HTTP requests
- HTTP Errors: Impossible to send an ICAP request, this can be caused by either no TCP connection available, associated flow with a drop action due to another aqp policy, system resource exhausted
- ICAP Request: Number of ICAP request sent
- ICAP Errors: ICAP request timeout, unexpected ICAP response, internal TCP errors.
- Custom-x-header: Name of the custom-x-header, if configured. If it is not configured, the value is "Not Specified".

In addition to these counters the system counts the type of action taken by the url-filter policy (allow, block, redirect, default) as well as the type of responses received from the icap server (allow, block, redirect, late).

## Parameters

### *url-filter-name*

Specifies the name of the url-filter policy.

### *mda-id/esa-vm-id*

Specifies the mda-id/esa-vm-id reference of the ISA card.

### *detail*

Specifies detailed statistics related to the ISA card.

### *profile-name*

Specifies the name of a configured profile for web service, up to 256characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of url-filter information, and [Table 642: Output fields: web service URL filter](#) describes the output fields.

Table 642: Output fields: web service URL filter

Label	Description
Category-set-id	The ID of the category set used for URL categorization.
Description	The description of the web-service profile.
Profile Name	The name of the web-service profile.
Blocked Categories	The blocked categories for the web-service profile.
Allowed Categories	The allowed categories for the web-service profile.

Label	Description
Category Id	The ID of the blocked or allowed category.
Category Name	The name of the blocked or allowed category.

## 31.18 url-list

### url-list

#### Syntax

`url-list url-list-name`

#### Context

[\[Tree\]](#) (show>app-assure>group url-list)

#### Full Context

show application-assurance group url-list

#### Description

This command displays information about the configured URL list.

#### Parameters

*url-list-name*

Specifies the name of the URL list.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output are examples of show URL list information, and [Table 643: Output fields: URL list](#) describes the URL list show command output fields.

#### Output example

```
# show application-assurance group 1 url-list "allow-list1"
=====
Application Assurance Group 1 url-list "allow-list1"
=====
Description : Default Url-list object
Size : standard
Host Expressions : enabled
Admin Status : Up
Oper Status : Up
Oper Flags : <none>
File deployed to ISAs : Yes
```

```

-----
Upgrade Statistics
-----
Last Success : 06/19/2020 02:57:06
Deployed
File Name : cf1:/expr_15000.vm.only.expr
URL Entries : 15000 (100.00% full)
URL Characters : 249390 ( 5.08% full)
URL Host Expr Entries: 15000 (100.00% full)
Blank/Comment Lines : 60519
Last Attempt : 06/19/2020 02:57:06
Result : Success
    
```

Table 643: Output fields: URL list

Label	Description
Description	The description of the URL list
Size	[standard   extended] Size parameter for the URL list
Host Expressions	If the host is enabled or disabled
Admin Status	[Up   down] - Administrative status of the URL list
Oper Status	[Up   down] - Operational status of the URL list
Oper Flags	[admin-down   file-does-not-exist  invalid-file-format   too-many-urls   switch-over-error]
File Deployed to ISA	[Yes   No] - This flag describes if the file located in the compact flash is the one deployed in the ISA, in the event the file is overwritten and before the admin upgrade command is used this flag will display "No".
<b>Upgrade Statistics</b>	
Last Success	Last time the list was successfully upgraded
File Name	File name for the last successful upgrade
URL Entries	Number of URLs loaded at the last success and percentage to full
URL Characters	Number of characters loaded at the last success and percentage to full
URL Host Expr Entries	URL host expression entries
Blank/CommentLines	Number of blank or commented out lines
Last Attempt	Last time the operator tried to upgrade the list
Result	[Success   Failure]. Result of the last upgrade
File Name	File name for the last upgrade attempt

## 31.19 usage-monitor

### usage-monitor

#### Syntax

```
usage-monitor app-group [app-group-name] count
usage-monitor application [application-name] count
usage-monitor charging-group [charging-group-name] count
usage-monitor count
usage-monitor status
```

#### Context

[\[Tree\]](#) (show>app-assure>group>aa-sub usage-monitor)

#### Full Context

```
show application-assurance group aa-sub usage-monitor
```

#### Description

This command displays per-subscriber usage-monitoring statistics.

#### Parameters

***app-group-name***

Specifies an application group name, up to 32 characters.

***application-name***

Specifies an application name, up to 32 characters.

***charging-group-name***

Specifies a charging group name, up to 32 characters.

**count**

Displays counters.

**status**

Displays the status.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 31.20 user

```
user

```

Table 644: Output fields: system security user

Label	Description
User ID	The name of a system user.
<b>Users</b>	
New Pwd	y — The user must change their password at the next login. n — The user does not need to change their password at the next login.
Access Permissions	The user can access: bt — Bluetooth cc — console port CLI fp — FTP gr — gRPC li — LI nc — NETCONF sp — SCP/SFTP sn — SNMP sc — SSH CLI tc — Telnet CLI
Password Expires	The number of days after which the user must change their password.
Login Attempts	The number of times that the user has attempted to log in, irrespective of whether the login succeeded or failed.
Failed Logins	The number of unsuccessful login attempts.
Local Conf	y — Password authentication is based on the local password database. n — Password authentication is not based on the local password database.
Number of users	The total number of listed users.
<b>User Configuration Detail</b>	
new pw required	yes — The user must change their password at the next login. no — The user does not need to change their password at the next login.
cannot change pw	yes — The user does not have the ability to change their password.

Label	Description
	no — The user has the ability to change their password.
home directory	The local home directory for the user for both console and FTP access.
restricted to home	yes — The user is not allowed to navigate to a directory higher in the directory tree on the home directory device. no — The user is allowed to navigate to a directory higher in the directory tree on the home directory device.
save when restricted	Whether configuration save operations are allowed when the user is restricted to home.
login exec file	The user's login exec file which executes whenever the user successfully logs in to a console session.
profile	The security profiles associated with the user.
locked-out	Whether the user is currently locked out, and, if they are locked out, how much time remains before the user can attempt to log into the node again.
<b>SNMP Parameters</b>	
auth protocol	The SNMPv3 authentication protocol.
auth key	The SNMPv3 authentication key.
privacy protocol	The SNMPv3 privacy protocol.
privacy protocol	The SNMPv3 privacy key.
group	The group for which the protocols apply.
<b>Currently Failed Login Attempts</b>	
Remaining Login Attempts	The number of login attempts remaining before the user is locked out.
Remaining Lockout Time (min:sec)	The number of minutes and seconds remaining until the lockout expires and the user can attempt to log in again.

With the introduction of the PKI on an SR OS (SSH server) the authentication process can be done via PKI or password. The SSH client usually authenticates via PKI and password if PKI is configured on the client. In this case, the PKI takes precedence over the password in most clients.

All client authentications are logged and display in the **show>system>security>user detail**. The following table lists the rules where pass and fail attempts are logged.

Table 645: Pass/fail login attempts

Authentication order	Client (such as, PuTTY)	Server (such as SR OS)		CLI show system security attempts (SR OS)	
	Private key programmed	Public key configured	Password configured	Logins attempts	Failed logins
1. Public Key	Yes	Yes	N/A	Increment	
2. Password	Yes	Yes (No match between client and server. Go to password.)	Yes	Increment	
	Yes	No	Yes	Increment	
	No	N/A	Yes	Increment	
	No	N/A	No		Increment
1. Public Key (only)	Yes	Yes	N/A	Increment	
	Yes	Yes (No match between client and server. Go to password.)			Increment
	Yes		N/A		Increment
	No		N/A		Increment

```

Table 646: Output fields: users

Label	Description
User	The user name.
Type	The user is authorized this access type.
From	The originating IP address.
Login time	The time the user logged in.
Idle time	The amount of idle time for a specific login.
Number of users	Displays the total number of users logged in.

## 31.22 utilization

### utilization

#### Syntax

**utilization** [detail]

#### Context

[\[Tree\]](#) (show>chassis>power-management utilization)

#### Full Context

show chassis power-management utilization

#### Description

This command displays power management utilization.

#### Parameters

**detail**

Displays detailed breakdown of devices.

#### Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

#### Output

The following output is an example of power management utilization information, and [Table 647: Output fields: chassis power management utilization](#) describes the output fields.

#### Output example: show chassis power-management utilization

```
*A:Dut-A# show chassis power-management utilization
=====
Chassis Power Utilization
=====
                SUPPLY                PEAK DEMAND
Power Capacity  : 22000.00 Watts      Fan           : 695.00 Watts ( 3%)

*A:DUT-A#
    
```

*Table 647: Output fields: chassis power management utilization*

Label	Description
SUPPLY	
Power Capacity	Indicates the total amount of power available to the chassis.
Safety Level	Specifies the configured Power Safety Level, which is a percentage of the worst case power consumption level.
Alert Level	Specifies the configured power level in watts, which causes the system to raise an alarm if the available power level drops below a set level.
DEMAND	
Fan	Specifies the amount of power used for the fan tray indicated.
IO Module	Specifies the amount of power used for the IO Module indicated.
CPM Module	Specifies the amount of power used for the CPM indicated.
Fabric Module	Specifies the amount of power used for the SFM indicated.
MDA Module	Specifies the amount of power used for the line card indicated.
Current Util.	Specifies the total amount of power used for all system elements.
Peak Util.	Specifies peak utilization starting from bootup.

## 32 v Commands

### 32.1 vas-filter

#### vas-filter

##### Syntax

**vas-filter** *name* [**entry** [*entry*]]

**vas-filter**

##### Context

[\[Tree\]](#) (show>subscr-mgmt>isa-svc-chain vas-filter)

##### Full Context

show subscriber-mgmt isa-service-chaining vas-filter

##### Description

This command displays VAS filter information.

##### Parameters

***name***

Displays information about the specified name of the VAS filter.

***entry***

Displays information about the specified VAS filter entry

**Values** 0 to 4294967295

##### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

##### Output

The following output is an example of VAS filter information.

##### Output Example

```
show subscriber-mgmt isa-service-chaining vas-filter "foo"
=====
ISA Service Chaining - VAS Filter "vas-filter"
=====
Description           : (Not Specified)
-----
```

```

Entry                : 1
Admin State         : in-service
Description         : (Not Specified)
Match
  Protocol           : udp
  Foreign IP         : 12.1.1.1/24
  Foreign Port       : 2000
Action upstream
  Fail Action        : forward
Forwarding
  Forward IP         : 40.1.0.1
  Service            : 11
  ESI                : N/A
Network Service Header
  Service Path       : 32
  Service Index      : 2

  Meta Data          : 0xaabbccdd
Action downstream
  Fail Action        : forward
Forwarding
  Forward IP         : 30.1.0.1
  Service            : 11
  ESI                : N/A
Network Service Header
  Service Path       : 32
  Service Index      : 2
  Insert Sub-Id      : disabled
  Meta Data          : 0xaabbccdd
    
```

Table 648: Output fields: service chaining VAS filter

Label	Description
Description	The text string describing the VAS filter
Entry	The ID of the entry in the VAS filter
Admin State	The administrative state of the entry in the VAS filter
Match	Protocol — The IP protocol to match in this entry of the VAS filter Foreign IP — The foreign IP address to match in this entry of the VAS filter Foreign Port — The foreign port to match in this entry of the VAS filter
Action	upstream — Indicates the upstream direction for the action in the VAS filter entry downstream — Indicates the downstream direction for the action in the VAS filter entry
Fail Action	Forwarding IP — The forwarding Service Function IP address for the action in a VAS filter entry Service — The forwarding service for the action in a VAS filter entry

Label	Description
	ESA — The ESI for the action in a VAS filter entry
Network Service Header	Service Path — The path ID used to construct an NSH (Network Service Header) for the action in a VAS filter entry
	Service Index — The service ID used to construct an NSH for the action in a VAS filter entry
	Insert Sub-ID disabled — The subscriber ID is not inserted with meta data to construct an NSH for the action in a VAS filter entry enabled — The subscriber ID is inserted with meta data to construct an NSH for the action in a VAS filter entry
	Meta Data — The opaque metadata used to construct an NSH (Network Service Header) for the action in a VAS filter entry

## 32.2 vas-tunnel

### vas-tunnel

#### Syntax

**vas-tunnel** [*connection-id*]

#### Context

[\[Tree\]](#) (show>router>l2tp vas-tunnel)

#### Full Context

show router l2tp vas-tunnel

#### Description

This command displays L2TP VAS tunnel operational information.

#### Parameters

***connection-id***

Specifies the identification number for an L2TP VAS tunnel connection.

**Values** 14294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of L2TP VAS tunnel information.

### Output Example

```

## 32.3 vccv-bfd

### vccv-bfd

#### Syntax

**vccv-bfd** [session]

#### Context

[\[Tree\]](#) (show>service>id vccv-bfd)

#### Full Context

show service id vccv-bfd

#### Description

This command shows whether VCCV BFD is configured for a particular service and information about the VCCV session state.

The **show>service>id>vccv-bfd session** command gives a summary of all the VCCV sessions. Using both the sdp-id and the vc-id parameters gives VCCV BFD session information about a specific spoke-SDP.

For services where auto-discovery and signaling are used (for example, BGP VPWS, VPLS, and BGP-AD VPLS), use the **show>service>id>detail** command to determine the sdp-id and vc-id parameters allocated by the system.

## Parameters

### session

Displays a summary of all VCCV sessions.

## Platforms

All

## Output

The following output is an example of VCCV BFD information.

### Output Example

```
*A:Dut-C# show service id 1000 vccv-bfd session
=====
BFD Session
=====
Interface/Lsp Name          State          Tx Intvl  Rx Intvl  Multipl

=====
```

## vccv-bfd

## Syntax

**vccv-bfd [session]**

## Context

[\[Tree\]](#) (show>service vccv-bfd)

## Full Context

show service vccv-bfd

## Description

This command displays the VCCV BFD session for the system.

## Platforms

All

## 32.4 version

### version

#### Syntax

**version**

#### Context

[\[Tree\]](#) (show>app-assure version)

#### Full Context

show application-assurance version

#### Description

This command displays the versions of the isa-aa.tim used by the CPM and the AA ISAs.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of version information.

#### Output Example

```
A:ALU>show>app-assure# version
=====
Versions of isa-aa.tim in use
=====
CPM           : TiMOS-M-7.0.R4
1/1           : TiMOS-I-7.0.R1
2/1           : TiMOS-I-7.0.R1
3/2           : TiMOS-I-7.0.R1
=====
A:ALU>show>app-assure#
```

### version

#### Syntax

**version group-interface** [ **fwd-service** *service-id*] *ip-in-name*

**version group-interface all**

**version host** *ip-address*

## version host all

**version** [**interface** *ip-int-name* | *ip-address*]

### Context

[\[Tree\]](#) (clear>router>igmp version)

### Full Context

clear router igmp version

### Description

This command clears the IGMP version on a specified interface or IP address.

### Parameters

#### **group-interface** *interface-name*

Clears the IGMP version on the specified group interface.

#### **group-interface** all

Clears the IGMP version on all group interfaces.

#### **service-id**

Specifies the service ID.

**Values** service-id: 1 to 2148278386  
svc-name: up to 64 characters.

#### **host** *ip-address*

Clears the IGMP version on the specified host.

#### **host** all

Clears the IGMP version on all hosts.

#### **interface** *ip-int-name*

Clears the IGMP version on the specified interface.

#### **interface** *ip-address*

Clears the IGMP version on the specified IP address.

### Platforms

## version

### Syntax

**version group-interface** [**fwd-service** *service-id*] *ip-int-name*

**version group-interface** all

**version host** *ipv6-address*

## version host all

**version** [*ip-int-name* | *ipv6-address*]

### Context

[\[Tree\]](#) (clear>router>mld version)

### Full Context

clear router mld version

### Description

This command clears MLD version parameters.

### Parameters

#### **group-interface** *interface-name*

Clears the MLD version on the specified group interface.

#### **group-interface** all

Clears the MLD version on all group interfaces.

#### **service-id**

Clears the MLD version information for the service ID.

**Values** service-id: 1 to 2148278386  
svc-name: up to 64 characters.

#### **host** *ipv6-address*

Clears the MLD version on the specified host.

#### **host** all

Clears the MLD version on all hosts.

#### **ip-int-name**

Clears version information for the specified MLD interface name.

#### **ipv6-address**

Clears version information for the specified MLD IPv6 address.

This command displays ISA video group information.

## Parameters

### **video-group-id**

Specifies the ISA video group ID.

### **peak-last-hour**

Displays the peak FCC/RET session and bandwidth for the current hour, the last hour, and the lifetime.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s

## Output

The following are output examples for this command.

### Output Example

```
A:SR-7/Dut-C# show isa video-group
=====

## 32.7 view

### view

#### Syntax

**view** [*view-name*] [**detail**]

#### Context

**[Tree]** (show>system>security view)

#### Full Context

show system security view

#### Description

This command lists one or all views and permissions in the MIB-OID tree.

## Parameters

### **view-name**

Specifies the name of the view to display output. If no view name is specified, the complete list of views displays.

### **detail**

Displays detailed view information.

## Platforms

All

## Output

The following output is an example of system security views.

[Table 649: Output fields: system security view](#) describes system security view output fields.

### Output Example

```
A:ALA-1# show system security view

```

Table 649: Output fields: system security view

Label	Description
View name	Displays the name of the view. Views control the accessibility of a MIB object within the configured MIB view and subtree.
OID tree	Displays the Object Identifier (OID) value. OIDs uniquely identify MIB objects in the subtree.
Mask	Displays the mask value and the mask type, along with the <i>oid-value</i> configured in the <b>view</b> command, determines the access of each sub-identifier of an object identifier (MIB subtree) in the view.
Permission	Included — Specifies to include MIB subtree objects. Excluded — Specifies to exclude MIB subtree objects.
No. of Views	Displays the total number of configured views.
Group name	Displays the access group name.

## 32.8 violators

### violators

#### Syntax

**violators** [**port**] [**interface**] [**sap**] [**video**] [**sdp**]

#### Context

**[Tree]** (show>system>security>cpu-protection violators)

#### Full Context

show system security cpu-protection violators

#### Description

This command displays all interfaces, ports or SAPs with CPU protection policy violators. It also includes objects (SAPs, interfaces) that exceed the out-profile-rate and have the log-events keyword enabled for the out-profile-rate in the cpu-protection policy associated with the object.

#### Parameters

##### port

Displays violators associated with the port.

**interface**

Displays violators associated with the interface.

**sap**

Displays violators associated with the SAP.

**video**

Displays violators associated with the video entity.

**sdp**

Displays violators associated with the SDP.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

**Output**

The following output is an example of CPU protection violators information.

**Output Example**

```
*A:SecuritySR7>config>sys>security>cpu-protection>policy# show system security

## violators

### Syntax

**violators** [**port**] [**interface**] [**sap**]

### Context

**[Tree]** (clear>cpu-protection violators)

### Full Context

clear cpu-protection violators

### Description

This command clears the rate limit violator record.

### Parameters

#### port

Clears entries for ports.

#### interface

Clears entries for interfaces.

#### sap

Clears entries for SAPs.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## violators

### Syntax

**violators enforcement** {**sap** | **interface**} **card** *slot-number* [**fp** *fp-number*]

**violators local-monitor** {**sap** | **interface**} **card** *slot-number* [**fp** *fp-number*]

### Context

**[Tree]** (tools>dump>security>dist-cpu-protection violators)

### Full Context

tools dump security dist-cpu-protection violators

## Description

This command shows the nonconforming enforcement policers and local monitors.

## Parameters

### sap

-Indicates to display the violators associated with SAPs

### interface

- Indicates to display the violators associated with router interfaces.

### enforcement

Shows exceed and hold-down for Static and Dynamic Policers.

### local-monitor

Shows state of dynamic policer allocation for Local Monitoring Policers.

### card slot-number

The physical slot number for the card.

**Values** 1 to n (n is platform dependent)

### fp fp-number

Identifies the instance of the FP (FastPath) chipset. Some cards have a single FP and some cards can contain multiple FPs (for example, an XCM can house multiple FPs via its two XMA's).

**Values** 1 to 8

## Platforms

All

## Output

Users Output

[Table 650: Output fields: parameters](#) describes show users output fields.

## Output Example

```
*A:Dut-A# tools dump security dist-cpu-protection violators enforcement interface

test                                     ospf                                        [D] none
-----
[S]-Static [D]-Dynamic [M]-Monitor
=====
```

Table 650: Output fields: parameters

Label	Description
Interface	The name of the router interface
Policer/Protocol	The configured name of the static policer (indicated with an [S]) or the DCP protocol name for a dynamic policer (indicated with a [D]).
[S] / [D]	indicates a static vs dynamic policer
Hld Rem	The remaining time in the hold-down countdown during which a policer is treating all packets as exceeding.

## 32.9 virtual

virtual

### Syntax

virtual

### Context

[\[Tree\]](#) (show>card virtual)

### Full Context

show card virtual

### Description

Commands in this context display virtual card information.

### Platforms

VSR

virtual

### Syntax

virtual

### Context

[\[Tree\]](#) (clear>card virtual)

### Full Context

clear card virtual

### Description

Commands in this context clear virtual card statistics.

Table 651: Output fields: OSPF virtual link

Label	Description
Nbr Rtr ID	The router ID(s) of neighboring routers.
Area Id	A 32-bit integer which identifies an area.
Local Interface	The IP address of the local egress interface used to maintain the adjacency to reach this virtual neighbor.
Metric	The metric value associated with the route. This value is used when importing this static route into other protocols. When the metric is configured as zero, the metric configured in OSPF, default-import-metric, applies. This value is also used to determine the static route installed in the forwarding table.
State	The operational state of the virtual link to the neighboring router.
Authentication	Specifies whether authentication is enabled for the interface or virtual link.

Label	Description
Hello Intrval	Specifies the length of time, in seconds, between the Hello packets that the router sends on the interface.
Rtr Dead Intrvl	Specifies the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since the OSPF admin status was enabled.
Tot Rx Packets	Specifies the total number of OSPF packets received on this interface since the OSPF admin status was enabled.
Rx Hellos	Specifies the total number of OSPF Hello packets received on this interface since the OSPF admin status was enabled.
Rx DBDs	Specifies the total number of OSPF Database Description packets received on this interface since the OSPF administrative status was enabled.
Rx LSRs	Specifies the total number of Link State Requests (LSRs) received on this interface since the OSPF admin status was enabled.
Rx LSUs	Specifies the total number of Link State Updates (LSUs) received on this interface since the OSPF admin status was enabled.
Rx LS Acks	Specifies the total number of Link State Acknowledgments received on this interface since the OSPF admin status was enabled.
Tot Tx Packets	Specifies the total number of OSPF packets transmitted on this virtual interface since it was created.
Tx Hellos	Specifies the total number of OSPF Hello packets transmitted on this virtual interface since it was created.
Tx DBDs	Specifies the total number of OSPF database description packets transmitted on this virtual interface.
Tx LSRs	Specifies the total number of OSPF Link State Requests (LSRs) transmitted on this virtual interface.
Tx LSUs	Specifies the total number of OSPF Hello packets transmitted on this interface since the OSPF admin status was enabled.
Tx LS Acks	Specifies the total number of OSPF Link State Acknowledgments (LSA) transmitted on this virtual interface.
Retransmits	Specifies the total number of OSPF retransmits sent on this interface since the OSPF admin status was last enabled.

Label	Description
Discards	Specifies the total number of OSPF packets discarded on this interface since the OSPF admin status was last enabled.
Bad Networks	Specifies the total number of OSPF packets received with invalid network or mask since the OSPF admin status was last enabled.
Bad Versions	Specifies the total number of OSPF packets received with bad OSPF version numbers since the OSPF admin status was last enabled.
Bad Areas	Specifies the total number of OSPF packets received with an area mismatch since the OSPF admin status was last enabled.
Bad Dest Addr	Specifies the total number of OSPF packets received with the incorrect IP destination address since the OSPF admin status was last enabled.
Bad Auth Types	Specifies the total number of OSPF packets received with an invalid authorization type since the OSPF admin status was last enabled.
Auth Failures	Specifies the total number of OSPF packets received with an invalid authorization key since the OSPF admin status was last enabled.
Bad Neighbors	Specifies the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since the OSPF admin status was last enabled.
Bad Pkt Types	Specifies the total number of OSPF packets received with an invalid OSPF packet type since the OSPF admin status was last enabled.
Bad Lengths	Specifies the total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since the OSPF admin status was last enabled.
Bad Hello Int.	Specifies the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since the OSPF admin status was last enabled.
Bad Dead Int.	Specifies the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since the OSPF admin status was last enabled.
Bad Options	Specifies the total number of OSPF packets received with an option that does not match those configured for this interface or area since the OSPF admin status was last enabled.

Label	Description
Retrans Intrvl	Specifies the length of time, in seconds, that OSPF waits before retransmitting an unacknowledged link state advertisement (LSA) to an OSPF neighbor.
Transit Delay	Specifies the time, in seconds, it takes to transmit a link state advertisement (LSA) on the interface or virtual link.
Last Event	Specifies the date and time when an event was last associated with this OSPF interface.
Tx Failures	Transmitted OSPF packets that are dropped due to resource shortage.

## virtual-link

### Syntax

**virtual-link [detail]**

**virtual-link [detail] database**

### Context

[\[Tree\]](#) (show>router>ospf3 virtual-link)

### Full Context

show router ospf3 virtual-link

### Description

This command displays information for OSPFv3 virtual links.

### Parameters

#### database

Displays the virtual link database.

#### detail

Displays operational and statistical information about virtual links associated with this router.

### Platforms

All

### Output

The following output is an example of OSPFv3 virtual link information, and [Table 652: Output fields: OSPF3 virtual link](#) describes the output fields.

### Output Example

```

show router ospf3 virtual-link detail

Table 652: Output fields: OSPF3 virtual link

Label	Description
Nbr Rtr ID	The router ID(s) of neighboring routers.
Area Id	A 32-bit integer which identifies an area.
Local Interface	The IP address of the local egress interface used to maintain the adjacency to reach this virtual neighbor.
Metric	The metric value associated with the route. This value is used when importing this static route into other protocols. When the metric is configured as zero, the metric configured in OSPF, default-import-metric, applies. This value is also used to determine which static route to install in the forwarding table.
State	The operational state of the virtual link to the neighboring router.
Authentication	Specifies whether authentication is enabled for the interface or virtual link.

Label	Description
Hello Intrval	Specifies the length of time, in seconds, between the Hello packets that the router sends on the interface.
Rtr Dead Intrvl	Specifies the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since the OSPF admin status was enabled.
Tot Rx Packets	Specifies the total number of OSPF packets received on this interface since the OSPF admin status was enabled.
Rx Hellos	Specifies the total number of OSPF Hello packets received on this interface since the OSPF admin status was enabled.
Rx DBDs	Specifies the total number of OSPF Database Description packets received on this interface since the OSPF administrative status was enabled.
Rx LSRs	Specifies the total number of Link State Requests (LSRs) received on this interface since the OSPF admin status was enabled.
Rx LSUs	Specifies the total number of Link State Updates (LSUs) received on this interface since the OSPF admin status was enabled.
Rx LS Acks	Specifies the total number of Link State Acknowledgments received on this interface since the OSPF admin status was enabled.
Tot Tx Packets	Specifies the total number of OSPF packets transmitted on this virtual interface since it was created.
Tx Hellos	Specifies the total number of OSPF Hello packets transmitted on this virtual interface since it was created.
Tx DBDs	Specifies the total number of OSPF database description packets transmitted on this virtual interface.
Tx LSRs	Specifies the total number of OSPF Link State Requests (LSRs) transmitted on this virtual interface.
Tx LSUs	Specifies the total number of OSPF Hello packets transmitted on this interface since the OSPF admin status was enabled.
Tx LS Acks	Specifies the total number of OSPF Link State Acknowledgments (LSA) transmitted on this virtual interface.
Retransmits	Specifies the total number of OSPF retransmits sent on this interface since the OSPF admin status was last enabled.

Label	Description
Discards	Specifies the total number of OSPF packets discarded on this interface since the OSPF admin status was last enabled.
Bad Networks	Specifies the total number of OSPF packets received with invalid network or mask since the OSPF admin status was last enabled.
Bad Versions	Specifies the total number of OSPF packets received with bad OSPF version numbers since the OSPF admin status was last enabled.
Bad Areas	Specifies the total number of OSPF packets received with an area mismatch since the OSPF admin status was last enabled.
Bad Dest Addr	Specifies the total number of OSPF packets received with the incorrect IP destination address since the OSPF admin status was last enabled.
Bad Auth Types	Specifies the total number of OSPF packets received with an invalid authorization type since the OSPF admin status was last enabled.
Auth Failures	Specifies the total number of OSPF packets received with an invalid authorization key since the OSPF admin status was last enabled.
Bad Neighbors	Specifies the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since the OSPF admin status was last enabled.
Bad Pkt Types	Specifies the total number of OSPF packets received with an invalid OSPF packet type since the OSPF admin status was last enabled.
Bad Lengths	Specifies the total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since the OSPF admin status was last enabled.
Bad Hello Int.	Specifies the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since the OSPF admin status was last enabled.
Bad Dead Int.	Specifies the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since the OSPF admin status was last enabled.
Bad Options	Specifies the total number of OSPF packets received with an option that does not match those configured for this interface or area since the OSPF admin status was last enabled.

Label	Description
Retrans Intrvl	Specifies the length of time, in seconds, that OSPF waits before retransmitting an unacknowledged link state advertisement (LSA) to an OSPF neighbor.
Transit Delay	Specifies the time, in seconds, it takes to transmit a link state advertisement (LSA) on the interface or virtual link.
Last Event	Specifies the date and time when an event was last associated with this OSPF interface.
Tx Failures	Transmitted OSPF packets that are dropped due to resource shortage.

## virtual-link

### Syntax

**virtual-link** *nbr-rtr-id* **area** *area-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

### Context

[\[Tree\]](#) (monitor>router>ospf virtual-link)

[\[Tree\]](#) (monitor>router>ospf3 virtual-link)

### Full Context

monitor router ospf virtual-link

monitor router ospf3 virtual-link

### Description

This command displays statistical OSPF virtual link information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

### Parameters

#### *nbr-rtr-id*

Specifies the IP address to uniquely identify a neighboring router in the autonomous system.

**Values** a.b.c.d

***area-id***

Specifies the OSPF area ID, expressed in dotted decimal notation or as a 32-bit decimal integer.

**Values** *ip-address*, 0 to 4294967295

***seconds***

Configures the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

***repeat***

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

***absolute***

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

***rate***

Displays rate-per-second for each statistic instead of the delta.

**Platforms**

All

## 32.11 virtual-neighbor

### virtual-neighbor

**Syntax**

**virtual-neighbor** [**remote** *ip-address*] [**detail**]

**Context**

[\[Tree\]](#) (show>router>ospf virtual-neighbor)

[\[Tree\]](#) (show>router>ospf3 virtual-neighbor)

**Full Context**

show router ospf virtual-neighbor

show router ospf3 virtual-neighbor

## Description

This command displays virtual neighbor information.

## Parameters

### remote *ip-address*

Displays the specified IPv4 or IPv6 address. This reduces the amount of output displayed.

- Values**
- ipv4-address:
    - a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x: [0 to FFFF]H
    - d: [0 to 255]D

### detail

Produces detailed information on the virtual neighbor. This option produces a large amount of data. It is recommended to use **detail** only when requesting information for a specific neighbor.

## Platforms

All

## Output

OSPF Virtual Neighbor Output

[Table 653: Output fields: OSPF virtual neighbor](#) describes OSPF virtual neighbor output fields.

*Table 653: Output fields: OSPF virtual neighbor*

Label	Description
Nbr IP Addr	The IP address this neighbor is using in its IP source address. On addressless links, this will not be 0.0.0.0, but the address of another of the neighbor's interfaces.
Nbr Rtr ID	Specifies the router ID(s) of neighboring routers.
Transit Area	Specifies the transit area ID that links the backbone area with the area that has no physical connection with the backbone.
Retrans Q Length	The current length of the retransmission queue.
No. of Neighbors	Specifies the total number of OSPF neighbors adjacent on this interface, in a state of INIT or greater, since the OSPF admin status was enabled.

Label	Description
Nbr State	Specifies the operational state of the virtual link to the neighboring router.
Options	Specifies the total number of OSPF packets received with an option that does not match those configured for this virtual interface or transit area since the OSPF admin status was enabled.
Events	Specifies the total number of events that have occurred since the OSPF admin status was enabled.
Last Event Time	Specifies the date and time when an event was last associated with this OSPF interface.
Up Time	Specifies the uninterrupted time, in hundredths of seconds, the adjacency to this neighbor has been up.
Time Before Dead	Specifies the amount of time, in seconds, until the dead router interval expires.
Bad Nbr States	Specifies the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since the OSPF admin status was last enabled.
LSA Inst fails	Specifies the total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since the OSPF admin status was last enabled.
Bad Seq Nums	Specifies the total number of times when a database description packet was received with a sequence number mismatch since the OSPF admin status was last enabled.
Bad MTUs	Specifies the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since the OSPF admin status was enabled.
Bad Packets	Specifies the total number of times when an LS update was received with an illegal LS type or an option mismatch since the OSPF admin status was enabled.
LSA not in LSDB	Specifies the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since the OSPF admin status was enabled.
Option Mismatches	Specifies the total number of times when a LS update was received with an option mismatch since the OSPF admin status was enabled.

Label	Description
Nbr Duplicates	Specifies the total number of times when a duplicate database description packet was received during the Exchange state since the OSPF admin status was enabled.

## virtual-neighbor

### Syntax

**virtual-neighbor** *nbr-rtr-id* **area** *area-id* [ **interval** *seconds*] [ **repeat** *repeat*] [ **absolute** | **rate**]

## Context

[\[Tree\]](#) (monitor>router>ospf3 virtual-neighbor)

[\[Tree\]](#) (monitor>router>ospf virtual-neighbor)

## Full Context

monitor router ospf3 virtual-neighbor

monitor router ospf virtual-neighbor

## Description

This command displays statistical OSPF virtual neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified OSPF virtual neighbor router. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *nbr-rtr-id*

Specifies the IP address to uniquely identify a neighboring router in the autonomous system.

**Values** a.b.c.d

### *area-id*

Specifies the OSPF area ID, expressed in dotted decimal notation or as a 32-bit decimal integer.

**Values** *ip-address*, 0 to 4294967295

### *seconds*

Configures the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### rate

Displays rate-per-second for each statistic instead of the delta.

## 32.12 virtual-subnet

### virtual-subnet

#### Syntax

**virtual-subnet subscriber** *sub-ident*

**virtual-subnet** [**sap** *sap-id*]

#### Context

[\[Tree\]](#) (show>service>id virtual-subnet)

#### Full Context

show service id virtual-subnet

#### Description

This command displays currently recorded default gateway and subnets for all virtual subnets enabled for DHCPv4 hosts in the specified service.

#### Parameters

##### *sub-ident*

Displays information relating to the specified subscriber ID.

##### *sap-id*

Displays information relating to the specified SAP ID.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of virtual subnet information.

#### Output Example

```
show service id 500 virtual-subnet
=====
Virtual subnets in service 500
=====
Subscriber                : 00:20:fc:1e:cd:52|1/1/9:200
-----
```

```

Default router      : 192.168.100.254
Subnet             : 192.168.100.0/24
SAP                : 1/1/9:200
-----
No. of subnets: 1
=====
    
```

Table 654: Output fields: virtual subnet describes virtual subnet output fields.

Table 654: Output fields: virtual subnet

Field	Descriptions
Subscriber	The service identification that identifies the service in the service domain
Default router	The IP address of the default router received from either the DHCP or the RADIUS server
Subnet	The IP address of the subnet
SAP	The SAP associated with the service
No. of subnets	The total number of subnets for the service

## 32.13 vlan-aware-bundle

### vlan-aware-bundle

#### Syntax

```

vlan-aware-bundle [name]
vlan-aware-bundle name fdb [detail]
vlan-aware-bundle name evpn-mpls [detail]
vlan-aware-bundle name segment-routing-v6 [detail] [destinations]
vlan-aware-bundle name vxlan [detail] [destinations]
    
```

#### Context

[\[Tree\]](#) (show>service vlan-aware-bundle)

#### Full Context

```
show service vlan-aware-bundle
```

#### Description

This command displays VLAN-aware bundle information for the specified service.

## Parameters

### *name*

Displays the bundle name.

### **detail**

Keyword used to display detailed information.

### **destinations**

Keyword used to display information about EVPN-MPLS, VXLAN, and SRv6 destinations.

## Platforms

All

## Output

The following output is an example of VLAN-aware bundle information and [Table 655: Output fields: VLAN-aware bundle](#) describes VLAN-aware bundle output fields.

Table 655: Output fields: VLAN-aware bundle

Field	Descriptions
VLAN Aware Bundle	
Bundle	The destinations bundle name
Service Id	The service ID number
Eth Tag	The Ethernet tag value
Evi	The EVI value
Number of entries	The total number of entries
Vlan-Aware-Bundle Summary	
MAC Entries	The number of MAC entries
EVPN-MPLS Destinations	The number of EVPN-MPLS destinations
EVPN-MPLS Ethernet Segment Destinations	The number of EVPN-MPLS ES destinations
VXLAN Destinations	The number of VXLAN destinations
VXLAN Ethernet Segment Destinations	The number of VXLAN ES destinations
SRv6 Destinations	The number of SRv6 destinations
SRv6 Ethernet Segment Destinations	The number of SRv6 ES destinations
Forwarding Database, Service <Id>	
ServId	The service ID
MAC	The associated MAC address
Source-Identifier	The id of the source MAC
Type/Age	The number of seconds used to age out TLS FDB entries learned on local SAPs

Field	Descriptions
	<p>Age — Specifies the number of seconds used to age out TLS FDB entries learned on an SDP. These entries correspond to MAC addresses learned on remote SAPs.</p> <p>L — Learned - Dynamic entries created by the learning process.</p> <p>OAM — Entries created by the OAM process.</p> <p>P — Indicates the MAC is protected by the MAC protection feature.</p> <p>H — Host, the entry added by the system for a static configured subscriber host.</p> <p>D or DHCP — DHCP-installed MAC. Learned addresses can be temporarily frozen by the DHCP snooping application for the duration of a DHCP lease.</p> <p>Static — Statically configured.</p> <p>T — Trusted.</p>
Last Change	The date and time of the most recent state changes
Transport:Tnl-Id	The tunnel type and tunnel ID of the FDB entry
No. of MAC Entries	The total number of MAC entries
BGP EVPN-MPLS Dest (Instance <nbr>)	
TEP Address	The TEP address
Transport:Tnl	The transport tunnel
Egr Label	The egress label
Oper State	The operational state
Mcast	The mulitcast value
Num MACs	The number of MACs
Oper Flags	The operational flags value
Sup BCast Domain	The Sup BCast domain value
Last Update	The date and time of the last update
BGP EVPN-MPLS Ethernet Segment Dest (Instance <nbr>)	
Eth SegId	The Ethernet segment ID
BGP EVPN-MPLS ES BMAC Dest	
ES BMAC Addr	The ES BMAC IP address

Field	Descriptions
VPLS VXLAN	
Vxlan Instance	VXLAN instance value
VNI	The VNI
Creation Origin	The creation origin value
Assisted-Replication	The assisted replicaion mode
RestProtSrcMacAct	The restrict protected source MAC action
VPLS VXLAN service Network Specifics	
Ing Net QoS Policy	The ingress net QoS policy
Ingress FP QGrp	The ingress FP Q group
Ing FP QGrp Inst	The ingress FP Q group instance
VTEP security	The VTEP security status
MAC Learning	The MAC learning status
MAC Aging	The MAC aging status
Discard Unknown Source	The discard unknown source value
MAC address limit	The MAC address limit
Segment Routing v6 Instance <nbr> Service <nbr>	
Locator	The SRv6 locator name
Type	The SRv6 locator type
Function	The function
SID	The segment ID
Status	The status

## 32.14 volume

### volume

#### Syntax

##### volume fields

## Context

[\[Tree\]](#) (show>app-assure>cflowd volume)

## Full Context

show application-assurance cflowd volume

## Description

This command displays the fields in the AA cflowd volume template.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of AA cflowd volume template fields, and [Table 656: Output fields: volume template](#) describes the output fields.

### Output Example

```
show application-assurance cflowd volume fields

=====
Fields for Application Assurance cflowd volume template
=====
Name                               ID      Len Mode  Dy Description
-----
aaApp                               32770  32  MRVL  *  AA Application

## 32.20 vpn-ipv4

### vpn-ipv4

#### Syntax

```
vpn-ipv4 [aspath-regex reg-exp] [community comm-id] [rd rd] [brief]
vpn-ipv4 [aspath-regex reg-exp] hunt [community comm-id] [rd rd] [brief]
vpn-ipv4 [detail | longer] [aspath-regex reg-exp] [community comm-id] [rd rd]
```

#### Context

[\[Tree\]](#) (show>router>bgp>routes vpn-ipv4)

#### Full Context

```
show router bgp routes vpn-ipv4
```

#### Description

This command displays BGP VPN IPv4 routes.

#### Parameters

*reg-exp*

Displays routes matching the specified regular expression, up to 80 characters.

## hunt

Displays entries for the specified route.

### **comm-id**

Specifies the community ID, up to 72 characters.

**Values** `[as-num:comm-val | ext-comm | well-known-comm | large-comm]`

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
  - `{target | origin}:ip-address:comm-val`
  - `{target | origin}:asnum:ext-comm-val`
  - `{target | origin}:ext-asnum:comm-val`
  - **bandwidth**:*asnum*:*val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext**:*value1*:*value2*
  - **flowspec-set**:*ext-asnum*:*group-id*where:
  - *target* — route target
  - *origin* — route origin
  - *ip-address* — a.b.c.d
  - *ext-comm-val* — 0 to 4294967295
  - *ext-asnum* — 0 to 4294967295
  - **bandwidth** — bandwidth
  - *val-in-mbps* — 0 to 16777215
  - **ext** — extended
  - **ext:4300** — origin verification
  - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
  - *value1* — 0000 to FFFF
  - *value2* — 0 to FFFFFFFFFF
  - **flowspec-set** — flow-spec set
  - *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

## rd

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

**brief**

Displays the BGP VPN IPv4 route information in a brief format.

**Platforms**

All

## 32.21 vpn-ipv6

### vpn-ipv6

**Syntax**

**vpn-ipv6** [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**rd** *rd*] [**brief**]

**vpn-ipv6** [**aspath-regex** *reg-exp*] **hunt** [**community** *comm-id*] [**rd** *rd*] [**brief**]

**vpn-ipv6** [**detail** | **longer**] [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**rd** *rd*]

**Context**

[\[Tree\]](#) (show>router>bgp>routes vpn-ipv6)

**Full Context**

show router bgp routes vpn-ipv6

**Description**

This command displays BGP VPN IPv6 routes.

**Parameters**

**reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

**hunt**

Displays entries for the specified route.

**comm-id**

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val | ext-comm | well-known-comm | large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:

- *{target | origin}:ip-address:comm-val*
- *{target | origin}:asnum:ext-comm-val*
- *{target | origin}:ext-asnum:comm-val*
- **bandwidth**:asnum:val-in-mbps
- **ext:4300**:ovstate
- **ext**:value1:value2
- **flowspec-set**:ext-asnum:group-id

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

### **rd**

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

### **brief**

Displays the BGP VPN IPv6 route information in a brief format.

## 32.22 vport

### vport

#### Syntax

**vport** *name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**vport** *name* [**interval** *seconds*] [**repeat** *repeat*] **monitor-threshold**

#### Context

[\[Tree\]](#) (monitor>port vport)

#### Full Context

monitor port vport

#### Description

This command monitors Vport statistics.

#### Parameters

##### *name*

Specifies the Vport name, up to 32 characters.

##### *seconds*

Specifies the interval for each display, in seconds.

**Values** 11 to 60

##### *repeat*

Specifies the number of times the command is repeated.

**Values** 1 to 999

##### **absolute**

When the absolute keyword is specified, the raw statistics are displayed without processing. No calculations are performed on the delta or rate statistics.

##### **rate**

When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

##### **monitor-threshold**

Displays the exceed count for the port-scheduler under Vport (if specified) or for a physical port.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## vport

### Syntax

**vport** [*name*] [**statistics** | **associations**] [ **monitor-threshold**] [**port-sched** | **hw-agg-shaper-sched**]

### Context

[\[Tree\]](#) (show>port vport)

### Full Context

show port vport

### Description

This command displays Vport information.

### Parameters

#### *name*

Specifies the Vport name, up to 32 characters.

#### **statistics**

Displays the statistics related to the Vport.

#### **associations**

Displays the associations related to the Vport.

#### **monitor-threshold**

Displays the exceed count for the port-scheduler under Vport (if specified) or for a physical port.

#### **port-sched**

Displays the port scheduler policy associated with the Vport.

#### **hw-agg-shaper-sched**

Displays the hardware aggregate shaper scheduler policy associated with the Vport.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 32.23 vrf-export-test

### vrf-export-test

## Syntax

```
vrf-export-test policy-name [policy-name...{up tp 15 max}] prefix ip-prefix/ip-prefix-length [longer] [display-rejects] [display-rejects-only] [protocol protocol]
```

```
vrf-export-test plcy-or-long-expr [plcy-or-expr [plcy-or-expr...{up tp 14 max}] prefix ip-prefix/ip-prefix-length [longer] [display-rejects] [display-rejects-only] [protocol protocol]
```

## Context

[\[Tree\]](#) (show>router vrf-export-test)

## Full Context

```
show router vrf-export-test
```

## Description

This command tests an existing route policy, a chain of route policies, or a route policy logical expression in order to assess its effects as a VRF export policy. This is determined by identifying the routes that would be accepted or rejected after the complete evaluation.

## Parameters

### *plcy-or-long-expr*

Specifies up to 14 policy names or a long expression.

**Values**    *policy-name*: a policy name, up to 64 characters  
            *long-expr*: a long expression, up to 255 characters.

***plcy-or-expr***

Specifies the policy name or expression.

**Values** policy-name: a policy name, up to 64 characters  
expr: an expression, up to 64 characters

***policy-name***

Specifies the policy name of an existing configured and committed policy, up to 64 characters.

***longer***

Matches prefixes with a longer prefix-length.

***ip-prefix/ip-prefix-length***

Specifies an IPv4 or IPv6 prefix/mask to be evaluated. The keyword **longer** may be specified to evaluate longer prefix matches (optional).

***display-rejects***

Displays routes that were rejected by the policy. If not specified, only a count of rejected routes is displayed.

***display-rejects-only***

Displays only routes rejected by the policy test.

***protocol***

Displays routes by the protocol type.

**Platforms**

All

**Output**

**Output Example**

```

## vxlan detail

### Context

[\[Tree\]](#) (show>service>id vxlan)

### Full Context

```
show service id vxlan
```

### Description

This command displays the VXLAN instance parameters. With **destinations** added, the command shows the VXLAN bindings auto-created or configured in a specified service. The service command can be filtered by VXLAN instance, if the service has more than one instance. A VXLAN binding is composed of the remote (VTEP) and the corresponding egress (VNI) to identify the service at the egress node. The command shows the number of MACs associated to each binding as well as the operational status and if the binding is part of the multicast list. The binding will be operationally down when the VTEP address is not found in the base routing table (the VTEP address cannot be reached). A binding will be part of a multicast list if a valid BGP EVPN inclusive multicast route exists for it.

A VXLAN binding can be associated with the following types of multicast values.

- **BM** — Refers to the capability of the binding to send broadcast or multicast to the remote VTEP. This binding type is setup to AR replicator nodes from a leaf node.
- **BUM** — Refers to the capability of the binding to send broadcast or multicast to the remote VTEP. This binding type is setup to AR replicator nodes from a leaf node.
- **U** — Refers to the capability of the binding to send unknown unicast to the VTEP. This binding type is setup from leaf nodes to other leaf and RNVE nodes.
- **"-"** — Specifies that the binding can only be used for known unicast traffic.

### Parameters

#### assisted-replication replicator

Displays all the discovered candidate AR replicators for the service and the replicator that has been selected by the leaf to send the BM traffic. The list of replicators is ordered by VTEP address and VNI. This command is only supported on the nodes configured as leaf.

The "In Use" column indicates whether the replicator has been selected for the service. When selecting a replicator for the service, the candidate list is ordered by VTEP IP (lowest IP is ordinal 0) and VNI. A modulo function of the service ID and the number of candidate PEs will give the selected replicator for a specified service.

The "Pending Time" column shows the remaining seconds until the node starts sending the BM traffic to the replicator. This time is configurable by the *replicator-activation-time* parameter.

For services supporting EVPN multi-homing, the command can also show ES destinations as well as VXLAN bindings. In this case, the output can be filtered by the ESI in order to see the VXLAN destinations that the ES is comprised of.

#### esi

Specifies a 10-byte ESI by which to filter the displayed information. For example, ESI-0 | ESI-MAX or 00-11-22-33-44-55-66-77-88-99 with any of these separators ('-',':',';')

**instance**

Specifies the VXLAN instance.

**Values** 1, 2

**detail**

Keyword used to display detailed information.

**oper-flags**

Keyword used to display the operational flags.

L2 PBR	Displays the Layer 2 PBR value.

Label	Description
Sup BCast Domain	Displays the Sup BCast Domain value.

## vxlan

### Syntax

**vxlan** [*ip-address*]

### Context

**[Tree]** (show>service vxlan)

### Full Context

show service vxlan

### Description

This command displays the VXLAN bindings auto-created in a specified service. A VXLAN binding is composed of the remote VTEP (VXLAN Termination Endpoint) and the corresponding egress VNI (VXLAN Network Identifier) to identify the service at the egress node. The command shows the number of MACs associated to each binding as well as the operational status and if the binding is part of the multicast list. The binding will be operationally down when the VTEP address is not found in the base routing table (the VTEP address cannot be reached). A binding will be part of the multicast list if a valid BGP EVPN inclusive multicast route exists for it.

A VXLAN binding can be associated with the following types of Mcast values.

- **BM** — Refers to the capability of the binding to send Broadcast or Multicast to the remote VTEP. This binding type is setup to AR Replicator nodes from a Leaf node.
- **BUM** — Refers to the capability of the binding to send Broadcast or Multicast to the remote VTEP. This binding type is setup to AR Replicator nodes from a Leaf node.
- **U** — Refers to the capability of the binding to send Unknown Unicast to the VTEP. This binding type is setup from Leaf nodes to other Leaf and RNVE nodes.
- **"-"** — Specifies that the binding can only be used for known unicast traffic.

### Parameters

#### *ip-address*

Specifies the remote VTEP address for the VXLAN binding.

**Values**    ipv4-address: a.b.c.d  
               ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
               x:x:x:x:x:d.d.d.d

show system license-statistics week

### Description

This command displays application license statistics for the last week.

### Parameters

***license-app***

Specifies the application license.

**Values**    Ins, nat, sub-mgmt, wlan-gw, aa, ipsec

### Platforms

VSR

## 33.4 wholesalers

wholesalers

### Syntax

**wholesalers**

### Context

[\[Tree\]](#) (show>service>id wholesalers)

## Full Context

```
show service id wholesalers
```

## Description

This command displays service wholesaler information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of service wholesaler information.

### Output Example

```
*A:ALA-48>config# show service id 102 wholesalers
=====
Wholesalers for service 102
=====
Wholesaler Svc ID          Num Static Hosts      Num Dynamic Hosts
-----
101                        3                     1
-----
Number of wholesalers : 1
=====
*A:ALA-48>config#
```

Wholesaler information can also be displayed in the lease-state context.

```
*A:ALA-48>config# show service id 105 dhcp lease-state wholesaler 101
=====
DHCP lease state table, service 105
=====
IP Address      Mac Address          Sap/Sdp Id          Remaining Lease      MC
                LifeTime            Origin              Stdby
-----
Wholesaler 101 Leases
-----
10.3.2.62      00:00:1f:bd:00:c6  lag-1:105          00h00m39s  RADIUS
-----
Number of lease states : 1
=====
*A:ALA-48>config#
```

## 33.5 wlan-gw

### wlan-gw

#### Syntax

```
wlan-gw
```

## Context

[\[Tree\]](#) (clear wlan-gw)

## Full Context

clear wlan-gw

## Description

Commands in this context clear WLAN gateway commands.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw

## Syntax

wlan-gw

## Context

[\[Tree\]](#) (clear>router wlan-gw)

## Full Context

clear router wlan-gw

## Description

Commands in this context clear WLAN gateway data.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw

## Syntax

wlan-gw gtp-statistics

wlan-gw statistics

## Context

[\[Tree\]](#) (clear>subscr-mgmt wlan-gw)

## Full Context

clear subscriber-mgmt wlan-gw

## Description

This command clears WLAN-GW data.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

wlan-gw

## Syntax

wlan-gw

## Context

[\[Tree\]](#) (show>call-trace wlan-gw)

## Full Context

show call-trace wlan-gw

## Description

Commands in this context display information related to the wlan-gw call-trace functionality.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

wlan-gw

## Syntax

wlan-gw

## Context

[\[Tree\]](#) (show>router wlan-gw)

## Full Context

show router wlan-gw

## Description

This command displays Wireless LAN Gateway information.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw

### Syntax

wlan-gw

### Context

[\[Tree\]](#) (show>subscr-mgmt wlan-gw)

### Full Context

show subscriber-mgmt wlan-gw

### Description

Commands in this context display Wireless LAN Gateway information.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw

### Syntax

wlan-gw

### Context

[\[Tree\]](#) (tools>dump wlan-gw)

### Full Context

tools dump wlan-gw

### Description

Commands in this context dump tools for Wireless LAN Gateway.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw

### Syntax

wlan-gw

## Context

[\[Tree\]](#) (tools>perform wlan-gw)

## Full Context

tools perform wlan-gw

## Description

Commands in this context provide tools for Wireless LAN Gateway.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 33.6 wlan-gw-group

### wlan-gw-group

## Syntax

**wlan-gw-group** *wlan-gw-group-id*

**wlan-gw-group** *wlan-gw-group-id* **associations**

**wlan-gw-group** *wlan-gw-group-id* **member** *member-id*

**wlan-gw-group** *wlan-gw-group-id* **member** *member-id* **resource-statistics**

**wlan-gw-group** *wlan-gw-group-id* **member** *member-id* **statistics** [**type** *type*] [**non-zero-value-only**]

**wlan-gw-group**

## Context

[\[Tree\]](#) (show>isa wlan-gw-group)

## Full Context

show isa wlan-gw-group

## Description

This command displays WLAN-GW group information, including WLAN-GW tunnels.

## Parameters

### **wlan-gw-group-id**

Displays information about the specified WLAN-GW group ID.

**Values** 1 to 4

### **associations**

Displays information about associations for the specified WLAN-GW group ID.

**member member-id**

Displays information about the WLAN-GW-specific status and basic statistics information about the specified member.

**Values** 1 to 255

**type type**

Displays a reduced output to only show statistics of the specified type.

**Values** packet-errors, host-errors, bd-errors, forwarding, reassembly, aa, radius, arp, dhcp, dhcp6, icmp, icmp6

**non-zero-value-only**

Displays a reduced output to only show statistics whose value is bigger than zero.

**resource-statistics**

Displays the resource usage on the specified group member.

**statistics**

Displays statistics information about the members of the specified WLAN-GW group.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of ISA WLAN-GW group information.

**Output Example**

```
*A:Dut-B>config>isa>wlan-gw-group$ show isa wlan-gw-group 4

## wlan-gw-group

### Syntax

**wlan-gw-group** *group-id* **member** *member-id* **resource-peak-values**

**wlan-gw-group** *group-id* **member** *member-id* **statistics**

### Context

[\[Tree\]](#) (clear>wlan-gw>isa wlan-gw-group)

### Full Context

clear wlan-gw isa wlan-gw-group

### Description

This command resets wlan-gw statistics per group member.

### Parameters

#### *group-id*

Specifies the WLAN-GW group ID.

**Values** 1 to 4

#### *member member-id*

Specifies the member ID.

**Values** 1 to 255

#### **statistics**

Resets the statistics measurements to zero.

#### **resource-peak-values**

Resets the resource peak values to the current resource measurements.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 33.7 wpp

```
wpp
```

### Syntax

```
wpp
```

### Context

[\[Tree\]](#) (clear>router wpp)

### Full Context

```
clear router wpp
```

### Description

Commands in this context clear WPP data.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
wpp
```

### Syntax

```
wpp portal-group name
```

```
wpp [portal-group name] [host ip-address] hosts
```

### Context

[\[Tree\]](#) (show>aaa wpp)

### Full Context

```
show aaa wpp
```

### Description

This command displays information about the specified WPP portal group or the WPP hosts controlled by the WPP portal group.

## Parameters

### *name*

Specifies the name of the WPP portal group up to 32 characters.

### *ip-address*

Specifies the IP address of the WPP host.

### *hosts*

Shows the status of triggered hosts.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of WPP portal group or WPP host information.

### Output Example

```
show aaa wpp portal-group "test"
=====
wpp portal group "test"
=====
administrative state      : in-service
controlled router        : 500
number of enabled interfaces : 1
triggered hosts          : disabled
last management change   : 01/02/2017 19:02:11
=====
```

[Table 659: Output fields: WPP portal group](#) describes WPP portal group output fields.

*Table 659: Output fields: WPP portal group*

Field	Description
administrative state	The administrative state of the WPP portal group
controlled router	The identifier of the virtual router instance being controlled by this portal
number of enabled interfaces	The number of interfaces associated with this portal that are administratively enabled
triggered hosts	Triggered hosts are enabled or disabled on this portal

## wpp

## Syntax

### wpp

**wpp** [**portal** *wpp-portal-name*] [**host** *ip-address*] **hosts**

**wpp portal** *wpp-portal-name*  
**wpp statistics**

## Context

[Tree] (show>router wpp)

## Full Context

show router wpp

## Description

This command displays WPP port-related information in the specified routing instance.

## Parameters

### **wpp-portal-name**

Specifies the name of this WPP portal.

### **ip-address**

Specifies the host IP address.

### **hosts**

Displays the hosts enabled on the portal.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of router WPP information.

### Output Example

```
show router wpp
=====
WPP portals
=====

=====
```

Table 660: Output fields: router WPP describes router WPP output fields.

Table 660: Output fields: router WPP

Label	Description
Portal	The web portal server name that the system communicates to for the hosts on the group interface
Address	The portal IP address
Controlled-Rtr	The identifier of the virtual router instance being controlled by this portal
Num-Itf	The number of interfaces associated with this portal
Number of enabled interfaces	The number of interfaces associated with this portal that are administratively enabled
Triggered hosts	Triggered hosts are enabled or disabled on this portal
Last management change	The time of the most recent management-initiated change to this WPP portal

## wpp

### Syntax

**wpp peer** [*ip-address*] **statistics**

### Context

[\[Tree\]](#) (show>redundancy>multi-chassis wpp)

### Full Context

show redundancy multi-chassis wpp

### Description

This command displays multi-chassis WPP information.

### Parameters

#### *ip-address*

Specifies the IP address.

- Values**
- ipv4-address: a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x: [0 to FFFF] H

- d: [0 to 255] D

### statistics

Displays statistics.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## wpp

### Syntax

**wpp peer** [*ip-address*] **statistics**

### Context

[\[Tree\]](#) (clear>redundancy>multi-chassis wpp)

### Full Context

clear redundancy multi-chassis wpp

### Description

This command clears multi-chassis WPP information.

### Parameters

#### *ip-address*

Specifies the WPP IP address.

- |               |                                       |
|---------------|---------------------------------------|
| <b>Values</b> | ipv4-address: a.b.c.d                 |
|               | ipv6-address:                         |
|               | • x:x:x:x:x:x:x (eight 16-bit pieces) |
|               | • x:x:x:x:x:d.d.d.d                   |
|               | • x: [0 to FFFF] H                    |
|               | • d: [0 to 255] D                     |

### statistics

Clears the multi-chassis WPP statistics.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 34 x Commands

### 34.1 x-interfaces

#### x-interfaces

##### Syntax

x-interfaces

##### Context

[\[Tree\]](#) (show>li x-interfaces)

##### Full Context

show li x-interfaces

##### Description

Commands in this context display information about the LI X1, X2, and X3 interfaces.

##### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### 34.2 x1

#### x1

##### Syntax

x1 lic *lic-name*

##### Context

[\[Tree\]](#) (show>li>x-interfaces>statistics x1)

##### Full Context

show li x-interfaces statistics x1

##### Description

This command displays X1 statistics.

## Parameters

### *lic-name*

Specifies the LIC name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 34.3 x2

### x2

## Syntax

**x2 lic** *lic-name*

## Context

[\[Tree\]](#) (show>li>x-interfaces>statistics x2)

## Full Context

show li x-interfaces statistics x2

## Description

This command displays X2 statistics.

## Parameters

### *lic-name*

Specifies the LIC name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 34.4 x3

### x3

## Syntax

**x3 lic** *lic-name*

## Context

[\[Tree\]](#) (show>li>x-interfaces>statistics x3)

### Full Context

show li x-interfaces statistics x3

### Description

This command displays X3 statistics.

### Parameters

*lic-name*

Specifies the LIC name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 34.5 xiom

xiom

### Syntax

xiom [*xiom*] [ **detail**]

### Context

[\[Tree\]](#) (show xiom)

### Full Context

show xiom

### Description

This command lists the XIOM modules in the chassis along with their administrative and operational states.

### Parameters

*xiom*

Specifies the slot and XIOM module identifier.

#### Values

slot[/*xiom*]

slot: 1 to 7

xiom: "x1" or "x2"

**detail**

Displays detailed information.

### Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

## Output

The following output shows XIOM information and [Table 661: Output fields: XIOM](#) describes the output fields.

### Output Example: show xiom

```
A:Dut-0# show xiom
=====
Xiom Information
=====
Slot  Xiom    Provisioned Type           Admin   Operational
      Xiom    Equipped Type (if different) State   State
-----
1     x2      iom-s-3.0t:he3000g+      up      up
2     x1      iom-s-3.0t:he3000g+      up      up
=====
```

Table 661: Output fields: XIOM

Label	Description
Slot	The chassis slot number.
Xiom	The XIOM module number.
Provisioned Type	The XIOM type provisioned.
Equipped Type	The XIOM type actually installed.
Admin State	up - Administratively up. down - Administratively down (for example, shutdown).
Operational State	up - Operationally up. down - Operationally down.

## xiom

### Syntax

**xiom** *xiom*

### Context

[\[Tree\]](#) (clear xiom)

### Full Context

clear xiom

### Description

This command re-initializes the specified XIOM in a particular slot.

## Parameters

### *xiom*

Clears the specified XIOM.

#### Values

slot/xiom

slot: 1 to 6

xiom: x1 or x2

## Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s
