Source Auto-Assigned	The source address is automatically determined  No — the source is configured or cannot be automatically determined  Yes — the source is automatically determined
Oper Destination Address	The destination address of the test packet (IPv4 or IPv6)
Destination Auto-Assigned	The destination address is automatically determined.  No — the destination is configured or cannot be automatically determined  Yes — the destination is automatically determined
Failure Condition(s)	The requirements not met causing an Oper Down state
Detectable Tx Errors	The error condition detected that may prevent the test packet from being sent
<b>Reporting</b>	

Label	Description
Reporting Enabled	The current value should be compared to a threshold and possibly reported  Yes — at least one threshold in either window is configured  No — none of the thresholds in either window is configured
Delay Measurement Last Reported	The value of the last measurement reported to the routing engine
Timestamp	The end timestamp (UTC) of the last reported delay measurement
Trigger By	The window and threshold type that was exceeded triggering the reporting. Only one will be reported if multiple are triggered in the same window.
<b>Aggregate Sample Window Delay Measurement Detail</b>	
Count	The number of sample windows included in the aggregate sample window
<b>Sample Window Delay Measurement Detail</b>	
Rcv/Snt	The number of response test packets received (Rcv) and sent (Snt)
Err	The number of errors included in the sample window. This is the total of duplicates, zero, and negative valued measurements. The negative error count is incremented if either direction is negative, regardless of the unidirectional-measurement configuration method. A negative measurement in either direction calls into question the validity of both directions. Errors are included in the receive count, but do not count toward integrity.  * — value exceeds column width; value more than 999
<b>Common Table Labels</b>	
Currently Reporting	The configured value of the delay measurement to consider (Min, Max, Avg)
End Timestamp (UTC)	The time at which the window closed
State	The state of the window  InProgress — currently executing  Completed — closed via normal execution  Terminated — preempted by some action; closed and not considered for report

Label	Description
	SwReported — new delay reported from this sample window  AswReported — new delay reported from this aggregate sample window (only applicable to Aggregate Sample Windows)
Min (us)	The minimum delay value recorded in this window, in units microseconds  N/A — not applicable or in calculable, when no responses are received, or all are in error  * — value exceeds column width; value in excess of 9999999
Max (us)	The maximum delay value recorded in this window, in units microseconds  N/A — not applicable or in calculable, when no responses are received, or all are in error  * — value exceeds column width; value in excess of 9999999
Avg (us)	The average delay value recorded in this window, in units microseconds  N/A — not applicable or in calculable, when no responses are received, or all are in error  * — value exceeds column width; value in excess of 9999999
I	The window has integrity and should be considered Y — yes, achieved integrity N — no, did not meet configured integrity percentage
Results	The metric considered for reporting in this window  N/A — not applicable or in calculable, when no responses are received, or all are in  * — value exceeds column width; value more than 9999999

## interface

### Syntax

**interface** *interface* [*interface*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] [**aux-stats**]

### Context

**[Tree]** (monitor>router>mpls interface)

## Full Context

monitor router mpls interface

## Description

This command displays statistics for MPLS interfaces at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the MPLS interface(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### **interface**

Specifies the IP address of the interface (*ip-address*) or interface name (*ip-int-name*). Up to five interfaces can be specified. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

**Values** *ip-int-name, ip-address*

### **seconds**

Configures the interval for each display, in seconds.

**Values** 11 to 60

**Default** 11 seconds

### **repeat**

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### **absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### **rate**

Displays rate-per-second for each statistic instead of the delta.

### **aux-stats**

Displays auxiliary MPLS statistics next to the default MPLS statistics.

## Platforms

All

## Output

The following output is an example of MPLS interface information.

### Output Example

```
A:ALA-12>monitor>router>mpls# interface system interval 3 repeat 3 absolute

## interface

### Syntax

**interface** *interface* [*interface*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

### Context

[\[Tree\]](#) (monitor>router>ospf3 interface)

[\[Tree\]](#) (monitor>router>ospf interface)

### Full Context

monitor router ospf3 interface

monitor router ospf interface

### Description

This command displays statistics for OSPF interfaces at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the OSPF interface(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

### Parameters

#### **interface**

Specifies the IP address of the interface (*ip-address*) or interface name (*ip-int-name*). Up to five interfaces can be specified. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

**Values** *ip-int-address, ip-address*

#### **seconds**

Configures the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

### **repeat**

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### **absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### **rate**

Displays rate-per-second for each statistic instead of the delta.

## **Platforms**

All

## **Output**

The following output is an example of OSPF interface information.

### **Output Example**

```
A:ALA-12>monitor>router>ospf# interface to-104 interval 3 repeat 3 absolute

### Context

[\[Tree\]](#) (monitor>router>rsvp interface)

## Full Context

monitor router rsvp interface

## Description

This command displays statistics for RSVP interfaces at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the RSVP interface(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *interface*

Specifies the IP address of the interface (*ip-address*) or interface name (*ip-int-name*). Up to five interfaces can be specified. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

**Values** *ip-int-name, ip-address*

### *seconds*

Configures the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

*Table 222: Output fields: LAG IP measurement interface summary*

Label	Description
LAG IP Measurement Results for Interface	
LAG Template	Displays the name of the link measurement interface on the LAG template
LAG Measurement Oper State	Displays the operational state of the test configured under the interface

Label	Description
	Up — assigned link measurement template. A test protocol is enabled, a UDP port is available, and internal resources are available.  Down — one or more requirements for the Up state are not met
LAG Name	Displays the name of the LAG
LAG Member Count	Displays the number of ports in the LAG (micro sessions)
Protocol	Displays the active protocol encapsulating the test IPv4 or IPv6 packet
Oper Source Address	Displays the source address of the test packet (IPv4 or IPv6)
Source Auto-Assigned	Displays the source address that is automatically determined  No — the source is configured or cannot be automatically determined  Yes — the source is automatically determined
Destination Address	Displays the destination address of the test packet (IPv4 or IPv6)
Destination Auto-Assigned	Displays the destination address that is automatically determined  No — the source is configured or cannot be automatically determined  Yes — the source is automatically determined
Destination UDP Port	Displays the destination UDP port that is the listening port on the Session-Reflector
Failure Condition	Displays if the requirements are not met, which causes an operationally down state
Detectable Tx Errors	Displays the detected error condition that may prevent the test packet from being sent
LAG IP Measurement Results Summary for Port Information	
Detectable Tx Error	Displays the detected error condition that may prevent the test packet from being sent for the micro session on the port
End Timestamp	Displays the time of last completed sample window
Sample Window State	Displays the state of the sample window  complt – completed sample window  discrd – operational state of the LAG IP measurement transitioned to per down during the sample window  inProg – the micro session is currently running

Label	Description
Frame Loss Ratio	Displays the round trip Frame Loss Ratio (FLR) using the count of transmitted and received packets in the sample window
Average Round Trip Delay	Displays the average round trip delay, in microseconds, for the sample window
Average Round Trip IFDV	Displays the average Inter Frame Delay Variation (IFDV) for the sample window in microseconds

**Output Example: LAG IP measurement interface port 1/1/1**

```

show test-oam lag-ip-measurement interface "to-sr7" port 1/1/1

Table 223: Output fields: LAG IP measurement port 1/1/1 summary

Label	Description
LAG IP Measurement Results for Interface	
LAG Template	Displays the name of the link measurement on the LAG template
LAG Measurement Oper State	Displays the operational state of the test configured under the interface  Up — assigned link measurement template. A test protocol is enabled, a UDP port is available, and internal resources are available.  Down — one or more requirements for the Up state are not met
LAG Name	Displays the name of the LAG
LAG Member Count	Displays the number of ports in the LAG (micro sessions)
Protocol	Displays the active protocol encapsulating the test IPv4 or IPv6 packet
Oper Source Address	Displays the source address of the test packet (IPv4 or IPv6)
Source Auto-Assigned	Displays the source address that is automatically determined  No — the source is configured or cannot be automatically determined  Yes — the source is automatically determined

Label	Description
Destination Address	Displays the destination address of the test packet (IPv4 or IPv6)
Destination Auto-Assigned	Displays the destination address that is automatically determined No — the source is configured or cannot be automatically determined Yes — the source is automatically determined
Destination UDP Port	Displays the destination UDP port that is the listening port on the Session-Reflector
Failure Condition	Displays if the requirements are not met, which causes an operationally down state
Detectable Tx Errors	Displays the detected error condition that may prevent the test packet from being sent
LAG IP Measurement Results for Port Information	
Sender Micro Session ID	Displays the micro-session ID in the packet added by the Session-Sender
Reflector Micro Session ID	Displays the micro-session ID in the packet added by the Session-Reflector
Detectable Tx Error	Displays the error condition detected that may prevent the test packet from being sent for the micro session on the port
Sender Micro Session ID Zero	Displays the number of packets arriving on the Session-Sender with all zeros in the sender micro-session ID field
Reflector Micro Session ID Zero	Displays the number of packets arriving on the Session-Sender with all zeros in the reflector micro-session ID field
Sender Micro Session ID Mismatch	Displays the number of packets arriving on the Session-Sender with a different sender micro-session ID than expected
LAG IP Measurement Sample Window for Port Information	
End Timestamp	Displays the time of the last completed sample window. "N/A" indicates the window is not completed and results are not computed.
State	Displays the state of the sample window complt – completed sample window discrd – the operational state of the LAG IP measurement transitioned to per down during the sample window inProg – the micro session is currently running
Rcv/Sent	Displays the number of test packets sent and received

Label	Description
FLR%	Displays the round trip FLR using the number transmitted and received packets in the sample window
Dir	Displays the direction relative to the result RT – round trip
Type	Displays the type of measurement FD – Frame Delay IFDV – InterFrame Delay Variation
E	Displays if zero or negative round trip delay is calculated Y – yes Blank – no
Min(us)	Displays the minimum measured value in microseconds
Max(us)	Displays the maximum measured value in microseconds
Avg(us)	Displays the maximum computed valued in microseconds

## 14 i Commands – Part II

### 14.1 interface-id-mapping

#### interface-id-mapping

##### Syntax

**interface-id-mapping**

##### Context

**[Tree]** (show>router>dhcp6>local-dhcp-server interface-id-mapping)

##### Full Context

show router dhcp6 local-dhcp-server interface-id-mapping

##### Description

This command displays information about the DHCPv6 server that uses a unique /64 prefix per interface-ID options combination.

##### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

##### Output

The following output is an example of interface ID mapping information.

##### Output Example

```
show router 600 dhcp6 local-dhcp-server "d6" interface-id-mapping
=====
Interface-ID Mappings for DHCPv6 server d6
=====
Mapped Prefix       : 2001:AAAA::/64
Relay Interface ID  : 1/1/10
LDRA Interface ID   : (Not Specified)
Active Leases       : 2001:AAAA::1 (stable)
=====
1 prefix found
=====
```

[Table 224: Output fields: interface ID mapping](#) describes interface ID mapping field descriptions.

Table 224: Output fields: interface ID mapping

Field	Description
Mapped Prefix	The mapped prefix
Relay Interface ID	The value of the Interface-ID Option assigned by the DHCPv6 Relay Agent
LDRA Interface ID	The value of the Interface-ID Option assigned by the Lightweight DHCPv6 Relay Agent
Active Leases	The number of active leases
No. of prefixes found	The total number of prefixes found.

## 14.2 interface-statistics

### interface-statistics

#### Syntax

```
interface-statistics service service-id all
interface-statistics service service-id group-interface grp-if
interface-statistics service service-id subscriber-interface sub-if
```

#### Context

[\[Tree\]](#) (clear>subscr-mgmt interface-statistics)

#### Full Context

```
clear subscriber-mgmt interface-statistics
```

#### Description

This command clears subscriber interface statistics.

#### Parameters

##### *service-id*

Specifies the service ID of the service

**Values** 1 to 214748364  
 svc-name: up to 64 characters

##### *grp-id*

Specifies the group interface name, up to 32 characters

***sub-id***

Specifies the subscriber interface, up to 32 characters

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## interface-statistics

**Syntax**

**interface-statistics service *service-id* all**

**interface-statistics service *service-id* group-interface *grp-if***

**interface-statistics service *service-id* subscriber-interface *sub-if***

**Context**

[\[Tree\]](#) (show>subscr-mgmt interface-statistics)

**Full Context**

show subscriber-mgmt interface-statistics

**Description**

This command displays subscriber interface statistics.

**Parameters**

***service-id***

Specifies the service ID of the service.

**Values** 1 to 2148278386  
svc-name: up to 64 characters

***grp-id***

Specifies the group interface name, up to 32 characters

***sub-id***

Specifies the subscriber interface, up to 32 characters

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of service interface statistics information.

**Output Example**

```
*B:Dut-C# show subscriber-mgmt interface-statistics service 10 all
=====
Subscriber statistics for svc 10, itf si-1
```

```
=====
-----
Ingress          Egress

## 14.3 interfaces

### interfaces

#### Syntax

**interfaces**

#### Context

[\[Tree\]](#) (show>test-oam>lag-meas interfaces)

#### Full Context

show test-oam lag-ip-measurement interfaces

#### Description

This command displays LAG measurement data on all LAG interfaces.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

#### Output

The following output is an example of the LAG measurement data on all LAG interfaces, and [Table 225: Output fields: LAG IP measurement summary for all interfaces](#) describes the output fields.

#### Output Example: LAG IP measurement summary for all interfaces

```
show test-oam lag-ip-measurement interfaces
-----
LAG IP Measurement Interface Operational Summary
-----
Interface
  Oper  Protocol  Detectable Tx Error  Ports
-----
to-sr7
  Up    IPv4        none                 2
```

Table 225: Output fields: LAG IP measurement summary for all interfaces

Label	Description
Interface	Displays the interface name
Oper	Displays the operational state of the LAG measurement
Protocol	Displays the IP protocol enabled for the LAG measurement
Detectable Tx Error	Displays the error preventing the LAG measurement from transmitting packets on any of the ports
Ports	Displays the number of ports (micro sessions)

## 14.4 iom

### iom

#### Syntax

`iom [slot-number]`

#### Context

[\[Tree\]](#) (tools>dump>filter>resources iom)

#### Full Context

tools dump filter resources iom

#### Description

This command shows information about filter resource utilization on all IOMs or a specified IOM. Resource utilization per filter type is available, as well as filters using most resources on a given line card.

#### Parameters

##### *slot-number*

Specifies that only the filter resource utilization associated with the IOM card in this slot will be displayed.

**Values** 1 to 10

#### Platforms

All

## Output

The following output is an example of filter resource utilization information for all IOMs.

### Output Example

```
*A:Dut-C>tools>dump>filter>resources># iom
=====
Number of ACL filter entries used / available on IOMs
=====
Slot                Used                Available
-----
1                    11                  65524
2                     5                  65530
3                     5                  65530
=====

=====
Number of ACL filters and filter entries used / available on FlexPaths
=====
Slot FlexPath  Dir  Filters  Filters  MAC/IP  MAC/IP  IPv6  IPv6

## 14.5 ip

ip

### Syntax

**ip** [**filter-type** *filter-type*]

**ip embedded** [**inactive**]

**ip** *ip-filter-id* **embedded** [**inactive**]

**ip** *ip-filter-id* [**detail**]

**ip** *ip-filter-id* **associations**

**ip** *ip-filter-id* **type** *entry-type*

**ip** *ip-filter-id* **counters** [**type** *entry-type*] [**detail**]

**ip** *ip-filter-id* **entry** *entry-id* [**counters**] [**detail**]

**ip** *ip-filter-id* [**entry** *entry-id*] **effective-action** [{**ingress** | **egress**}]

**ip** *ip-filter-id* [**entry** *entry-id*] **effective-action** **router** [{**ingress** | **egress**}]

**ip** *ip-filter-id* [**entry** *entry-id*] **effective-action** **service** *service-id* [{ **ingress** | **egress**}]

### Context

[\[Tree\]](#) (show>filter ip)

### Full Context

show filter ip

### Description

This command displays IPv4 filter information.

When **effective-action** is specified, this command displays what effectively happens to a packet that matches the criteria associated with the IPv4 filter policy.

### Parameters

#### ***filter-type***

Specifies the type of filter to display.

**Values** config, flowspec, host-common, openflow

#### **inactive**

Displays all, or optionally inactive embeddings. If *ip-filter-id* is specified, displays embeddings for the IP filter ID.

#### ***ip-filter-id***

Specifies the IPv4 filter policy for which to display information. Values can be expressed in different formats; the following shows decimal integer format.

**Values** 1 to 65535

**detail**

Displays detailed information.

**associations**

Appends, to the detailed filter policy output, information about where the specified filter policy is applied.

**entry-type**

Specifies the type of filter entry to display.

**Values** fixed, radius-insert, credit-control-insert, flow-spec, embedded, radius-shared, pcc-rule

**counters**

Displays counter information for the specified filter ID. Egress counters count the packets without Layer 2 encapsulation. Ingress counters count the packets with Layer 2 encapsulation.

**entry-id**

Specifies the filter policy entry (of the specified filter policy) for which to display information.

**Values** 1 to 2097151

**effective-action**

Displays the action that the system will effectively apply to the packet.

**ingress**

Filters the output and only displays the information for filter policies applied on ingress.

**egress**

Filters the output and only displays the information for filter policies applied on egress.

**router**

Filters the output and only displays the information for that specific service ("Base" instance).

**service-id**

Filters the output and only displays the information for the specified service. The specified value must correspond to an existing service in which the filter has been applied.

**Platforms**

All

**Output**

**Show Filter (no policy specified)** — The following is an output example of IPv4 filter information when no policy is specified. [Table 226: Output fields: IP filter ID](#) describes the command output fields.

**Output Example**

```
A:ALA-49# show filter ip
=====
Configured IP Filters                                     Total:      2
```

```

Num IP filters: 4
=====
    
```

Table 226: Output fields: IP filter ID

Label	Description
Filter Id	The IP filter ID
Scope	Template — the filter policy is of type template
	Exclusive—the filter policy is of type exclusive
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Description	The IP filter policy description

**Show Filter (no filter-id specified, embedded keyword specified)** — The following output is an example of IPv4 filter information when no filter ID is specified but the embedded keyword is specified. [Table 227: Output fields: IP \(no filter ID specified\)](#) describes the command output fields.

**Output Example**

```

*A:Dut-C>config>filter# show filter ip embedded
=====
IP Filter embedding
=====
In    From    Priority  Inserted  Status
-----
10    2        50       1/1       OK
      1        100      1/2       OK- 1 entry overwritten
20    2        100      0/5       Failed - out of resources
=====
    
```

Table 227: Output fields: IP (no filter ID specified)

Label	Description
In	Shows embedding filter index

Label	Description
From	Shows embedded filters included
Priority	Shows priority of embedded filter
Inserted	Shows embedded/total number of entries from embedded filter. Status: <b>OK</b> — embedding operation successful, if any entries are overwritten this will also be indicated <b>Failed</b> — embedding failed, the reason is displayed (out of resources)

**Show Filter (with filter-id specified)** — The following output is an example of IPv4 filter information with the filter ID specified. [Table 228: Output fields: IP filter policy](#) describes the command output fields.

**Output Example**

```
*A:Dut-B>config>filter>ip-filter# show filter ip 10
=====
IP Filter
=====
Filter Id       : 10
Scope          : Embedded
Type           : Normal
Entries        : 4
Description    : (Not Specified)
Filter Name    : 10
```

Table 228: Output fields: IP filter policy

Label	Description
Filter Id	The IPv4 filter policy ID
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Scope	Template — the filter policy is of type template
	Exclusive — the filter policy is of type exclusive
Type	Normal — the filter policy is of type normal
	src-mac — the filter policy is of type src-mac
	Packet-length — the filter policy is of type packet-length
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward
	Drop — the default action for the filter ID for packets that do not match the filter entries is to drop

Label	Description
System filter	Indicates if the filter has been chained to a system filter
Radius Ins Pt	Indicates the RADIUS insertion point, if any
CrCtl. Ins Pt	Indicates the Credit Control insertion point, if any
RadSh. Ins Pt	Indicates the RADIUS shared insertion point, if any
PccRI. Ins Pt	Indicates the PCC rule insertion point, if any
Entries	The number of entries configured in this filter ID
Description	The IPv4 filter policy entry description string
Filter Match Criteria	IP — Indicates the filter is an IPv4 filter policy
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
Description	The IPv4 filter policy entry description string
Log Id	The filter log ID
Src. IP	The source IPv4 address and prefix length match criterion; "0.0.0.0/0" indicates no criterion specified for the filter entry
Src. Port	The source TCP, UDP, or SCTP port number, port range, or port match list
Dest. IP	The destination IPv4 address and prefix length match criterion; "0.0.0.0/0" indicates no criterion specified for the filter entry
Dest. Port	The destination TCP, UDP, or SCTP port number, port range, or port match list
Protocol	The protocol for the match criteria; undefined indicates no protocol specified
Dscp	The DiffServ Code Point (DSCP) name
ICMP Type	The ICMP type match criterion; undefined indicates no ICMP type specified
ICMP Code	The ICMP code field in the ICMP header of an IPv4 packet
Fragment	False — Indicates if the filter is configured to match on all non-fragmented packets
	True — Indicates if the filter is configured to match on all fragmented packets

Label	Description
	<p>First-Only — Indicates if the filter is configured to match the first fragment of a fragmented packet</p> <p>Non-First-Only — Indicates if the filter is configured to match a fragment of a fragmented packet, but not the first fragment</p> <p>Off — fragments are not a matching criteria. All fragments and non-fragments implicitly match</p>
Src Route Opt	Indicates if the source route option has been set
Sampling	<p>Off — specifies that traffic sampling is disabled</p> <p>On—specifies that traffic matching the associated IPv4 filter entry is sampled</p>
Int. Sampling	<p>Off — interface traffic sampling is disabled</p> <p>On — interface traffic sampling is enabled</p>
IP-Option	Specifies matching packets with a specific IPv4 option or a range of IPv4 options in the IPv4 header for IPv4 filter match criteria
Multiple Option	<p>Off — the option fields are not checked</p> <p>On — packets containing one or more option fields in the IPv4 header will be used as IPv4 filter match criteria</p>
Tcp-flag	<p>Specifies the list of TCP flags selected:</p> <ul style="list-style-type: none"> <li>• match true is represented with the TCP flag value</li> <li>• match false is represented with an exclamation mark before the flag value</li> </ul> <p>TCP flags not selected as match criteria are not displayed</p> <p>Example:                      Matching "tcp-ack true" and "tcp-rst false" is represented in the show command as Tcp-flag : Ack !Rst</p>
Option-present	<p>Off — specifies not to search for packets that contain the option field or have an option field of zero</p> <p>On — matches packets that contain the option field or have an option field of zero be used as IPv4 filter match criteria</p>
Egress PBR	Indicates if the <b>egress-pbr</b> flag is set for this entry
Primary Action	Indicates the configured action, if any; indented sub-labels in the show output provide configured parameters for this action

Label	Description
Secondary Action	Indicates the configured secondary action, if any; indented sub-labels in the show output provide configured parameters for this action
PBR Target Status	The status of the target of the primary or secondary action based on simple checks
Extended Action	Indicates the configured extended action, if any
PBR Down Action	Indicates the action to take when the target is down; packets that match the entry criteria will be subject to the PBR Down Action in case the target of the main action is down
Downloaded Action	The action downloaded by CPM to IOM
Dest. Stickiness	Indicates whether stickiness is configured
Hold Remain	The stickiness timer
Ing. Matches	The number of ingress filter matches/hits for the filter entry
Egr. Matches	The number of egress filter matches/hits for the filter entry

**Show Filter Associations** — The following output is an example of IPv4 filter information when the **associations** keyword is specified. [Table 229: Output fields: IP associations](#) describes the command output fields.

**Output Example**

```
A:ALA-49# show filter ip 1 associations

```

Table 231: Output fields: filter IP effective action

Label	Description
Filter Id	The IPv4 filter policy ID
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Scope	Template — the filter policy is of type Template
	Exclusive — the filter policy is of type Exclusive
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward
	Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Entries	The number of entries configured in this filter ID
Description	The IPv4 filter policy description
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
Stickiness	No — stickiness is not configured
	Yes — stickiness is configured
PBR Dwn Act Override	Indicates whether or not the action to take when the PBR target is down has been overridden
PBR Down Action	Indicates the action to take when the target is down; packets that match the entry criteria will be subject to the PBR Down Action in case the target of the main action is down

Label	Description
Configuration	Section of the output providing information on the configured parameters
Primary Action	The configured action, if any; indented sub-labels in the show output provide configured parameters for this action
Secondary Action	The configured secondary action, if any; indented sub-labels in the show output provide configured parameters for this action
Status/Target status based on extended checks	Section of the output providing information on the operational status of certain parameters
Primary Action	The status of the target of the primary action, if any configured, based on extended checks
Secondary Action	The status of the target of the secondary action, if any configured, based on extended checks
Downloaded Action	The action downloaded by the CPM to the IOM
Stickiness Timer	The status of the stickiness timer, if any
Effective Action based on application context	Section of the output providing the effective action, in the context of services, that a packet matching the criteria will be subject to
Service Id	The service ID on which the filter policy ID is applied; the output also provides a list of service points where the filter has been applied
Type	The service type in which the service has been applied
Ingress/Egress	The direction in which the service has been applied
Effective Action	The effective action that the packet will be subject to
Extended Action	Indicates the configured extended action, if any

## ip

### Syntax

**ip** *ip-filter-id* [**entry** *entry-id*] [{**ingress** | **egress**}

### Context

**[Tree]** (clear>filter ip)

### Full Context

clear filter ip

## Description

Clears the counters associated with the entries of the specified IPv4 filter policy.

By default, the counters associated with each entry of the specified filter policy are all cleared. The scope of which counters are cleared can be narrowed using the command line parameters.

## Default

Clears all counters associated with each entry of the specified IPv4 filter policy.

## Parameters

### *ip-filter-id*

The IPv4 filter policy ID for which to clear the entry counters. Values can be expressed in different formats. The following shows decimal integer format.

**Values** 1 to 65535

### *entry-id*

Specifies that only the counters associated with the specified filter policy entry are cleared.

**Values** 1 to 2097151

### *ingress*

Specifies to only clear the ingress counters.

### *egress*

Specifies to only clear the egress counters.

## Platforms

All

## ip

## Syntax

**ip entry** *entry-id* [*interval seconds*] [*repeat repeat*] [*absolute* | *rate*]

## Context

[\[Tree\]](#) (monitor>cpm-filter ip)

## Full Context

monitor cpm-filter ip

## Description

This command displays monitor command statistics for IP filter entries.

## Parameters

### *entry-id*

Displays information on the specified filter entry ID for the specified filter ID only.

**Values** 1 to 2048

### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ip

## Syntax

**ip** *ip-filter-id* **entry** *entry-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

## Context

[\[Tree\]](#) (monitor>filter ip)

## Full Context

monitor filter ip

## Description

This command enables IP filter monitoring. The statistical information for the specified IP filter entry displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified IP filter. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *ip-filter-id*

Displays detailed information for the specified filter ID and its filter entries.

**Values** [1 to 65535] | fSpec-[0 to 2147483647] | [1 to 65535 to 8192] | [1 to 65535:P1 to 4096] | \_tmnx\_tms\_egr- *mda-id*-F | \_tmnx\_tms-ing-*mda-id*-F | \_tmx\_ofs\_ofs-name | *name*: 64 chars max

### *entry-id*

Displays information on the specified filter entry ID for the specified filter ID only.

**Values** [1 to 65535], fSpec-[0 to 2147483647]-[1 to 65353]

### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

## Platforms

All

## Output

The following output is an example of filter IP information.

### Output Example

## ip

### Syntax

**ip entry** *entry-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

### Context

[\[Tree\]](#) (monitor>management-access-filter ip)

### Full Context

monitor management-access-filter ip

### Description

This command monitors statistics for the MAF IP filter entry.

## Parameters

### *entry-id*

Specifies an existing IP MAF entry ID.

**Values** 1 to 9999

### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

## Platforms

## 14.6 ip-exception

### ip-exception

#### Syntax

**ip-exception**

**ip-exception** *ip-filter-id*

**ip-exception** *ip-filter-id* [{**associations** | **counters**}]

**ip-exception** *ip-filter-id* **entry** *entry-id* [**counters**]

#### Context

[\[Tree\]](#) (show>filter ip-exception)

#### Full Context

show filter ip-exception

#### Description

This command shows IPv4 exception information.

#### Parameters

##### *filter-id*

Specifies the IPv4 exception filter.

**Values** 1 to 65535

##### **associations**

Displays associations applicable to the specified IPv4 exception.

##### **counters**

Displays counters for the specified IPv4 exception.

##### **entry** *entry-id*

Specifies an integer that identifies the entry.

**Values** 1 to 2097151

#### Platforms

VSR

#### Output

The following output is an example of IPv4 exception filter information, and [Table 232: Output fields: IPv4 exception](#) describes the fields.

### Output Example

```
*A:Dut-C>config>filter>ip-except>entry$ show filter ip-exception 1

Table 232: Output fields: IPv4 exception

Label	Description
Filter-Id	The filter ID.
Scope	Template — The filter policy is of type Template. Exclusive — The filter policy is of type Exclusive.
Applied	No — The IPv6 exception filter has not been applied. Yes — The IPv6 exception filter is applied.
Entries	The number of entries.
Description	The description of the specified filter, if specified.
Filter Name	The filter name.
Filter Match Criteria	IP — Indicates the filter is an IPv4 filter policy.

Label	Description
Entry	The number of active or inactive entries.
Description	The IPv4 filter policy entry description string.
Src. IP	The source IP address of the logged packet.
Src. Port	The source port of the logged packet.
Dst. IP	The destination IP address of the logged packet.
Dst. Port	The destination port of the logged packet.
Protocol	The protocol for the match criteria; undefined indicates no protocol specified.
ICMP Type	The ICMP type match criterion. Undefined indicates no ICMP type specified.
Ing. Matches	The number of packets matched on ingress.
Egr. Matches	The number of packets matched on egress.

## ip-exception

### Syntax

**ip-exception** *filter-id* [**entry** *entry-id*] [{**ingress** | **egress**}]

### Context

[\[Tree\]](#) (clear>filter ip-exception)

### Full Context

clear filter ip-exception

### Description

This command clears the counters associated with the entries of the specified IP exception filter policy.

### Parameters

#### *filter-id*

Specifies the filter policy ID for which to clear the entry counters.

**Values** 1 to 65535

#### *entry-id*

Specifies that only the counters associated with the specified filter policy entry are cleared.

**Values** 1 to 2097151

**ingress**

Specifies to only clear the ingress counters.

**egress**

Specifies to only clear the egress counters.

**Platforms**

VSR

## 14.7 ip-filter

### ip-filter

**Syntax**

**ip-filter** [**entry** *entry-id*]

**Context**

[\[Tree\]](#) (show>system>security>cpm-filter ip-filter)

**Full Context**

show system security cpm-filter ip-filter

**Description**

This command displays CPM IP filters.

**Parameters**

***entry-id***

Identifies a CPM filter entry as configured on this system.

**Values** 1 to 131072

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**Output**

The following output is an example of IP filter entry information.

[Table 233: Output fields: CPM IP filter](#) describes CPM IP filter output fields.

**Output Example**

```

Table 233: Output fields: CPM IP filter

Label	Description
Entry-Id	Displays information about the specified management access filter entry
Dropped	Displays the number of dropped events.
Forwarded	Displays the number of forwarded events.
Description	Displays the CPM filter description.
Log ID	Displays the log ID where matched packets will be logged.
Src IP	Displays the source IP address(/netmask or prefix-list)
Dest. IP	Displays the destination IP address(/netmask).

Label	Description
Src Port	Displays the source port number (range).
Dest. Port	Displays the destination port number (range).
Protocol	Displays the Protocol field in the IP header.
Dscp	Displays the DSCP field in the IP header.
Fragment	Displays the 3-bit fragment flags or 13-bit fragment offset field.
ICMP Type	Displays the ICMP type field in the ICMP header.
ICMP Code	Displays the ICMP code field in the ICMP header.
TCP-syn	Displays the SYN flag in the TCP header.
TCP-ack	Displays the ACK flag in the TCP header
Match action	When the criteria matches, displays drop or forward packet.
Next Hop	In case match action is forward, indicates destination of the matched packet.
Dropped pkts	Indicates number of matched dropped packets
Forwarded pkts	Indicates number of matched forwarded packets.

## ip-filter

### Syntax

**ip-filter** [*entry entry-id*]

### Context

[\[Tree\]](#) (show>system>security>mgmt-access-filter ip-filter)

### Full Context

show system security management-access-filter ip-filter

### Description

This command displays management-access IP filters.

### Parameters

***entry-id***

Displays information for the specified entry.

**Values** 1 to 9999

## Platforms

All

## Output

The following output is an example of MAF IP filter information and [Table 234: Output fields: management access filter](#) describes the management access filter output fields.

### Output Example

```
*A:Dut-F# show system security management-access-filter ip-filter
=====
IPv4 Management Access Filter
=====
filter type:      : ip
Def. Action       : permit
Admin Status     : enabled (no shutdown)
-----

Matches          : 0
=====
*A:Dut-F#
```

Table 234: Output fields: management access filter

Label	Description
Def. action	Permit — Specifies that packets not matching the configured selection criteria in any of the filter entries are permitted.  Deny — Specifies that packets not matching the configured selection criteria in any of the filter entries are denied and that a ICMP host unreachable message will be issued.  Deny-host-unreachable — Specifies that packets not matching the configured selection criteria in the filter entries are denied.
Entry	The entry ID in a policy or filter table.
Description	A text string describing the filter.
Src IP	The source IP address or prefix list used for management access filter match criteria.
Src interface	The interface name for the next hop to which the packet should be forwarded if it hits this filter entry.
Dest port	The destination port.

Label	Description
Matches	The number of times a management packet has matched this filter entry.
Protocol	The IP protocol to match.
Action	The action to take for packets that match this filter entry.

## ip-filter

### Syntax

**ip-filter** [*entry entry-id*]

### Context

[\[Tree\]](#) (clear>cpm-filter ip-filter)

### Full Context

clear cpm-filter ip-filter

### Description

This command clears IP filter statistics.

### Parameters

*entry-id*

Specifies a particular CPM IP filter entry.

**Values** 1 to 2048

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## ip-filter

### Syntax

**ip-filter** *ip-filter-id*

### Context

[\[Tree\]](#) (tools>perform>filter ip-filter)

### Full Context

tools perform filter ip-filter

## Description

Commands in this context perform IP filter operations.

## Parameters

### *ip-filter-id*

Specifies a particular IP filter ID or filter name.

**Values** *filter-id* | *filter-name*

### *filter-id*

Specifies the IP filter ID.

**Values** 1 to 65535

### *filter-name*

Specifies name of the IP filter, up to 64 characters.

## Platforms

All

## 14.8 ip-identification-assist

### ip-identification-assist

## Syntax

**ip-identification-assist** [**isa** *mda-id/esa-vm-id*]

## Context

**[Tree]** (show>app-assure>group ip-identification-assist)

## Full Context

show application-assurance group ip-identification-assist

## Description

This command displays the status and statistics for the IP identification assist feature.

## Parameters

### **isa** *mda-id*

Specifies the slot and MDA of the ISA in the format *slot/mda*.

**Values**

<i>slot/mda</i>	
<i>slot</i>	1 to 10, depending on chassis model

*mda* 1 to 2, depending on chassis model

**isa** *esa-vm-id*

Specifies the ESA and ESA VM in the format *esa-esa-id/vm-id*.

Values	
<i>esa-esa-id/vm-id</i>	
<i>esa-id</i>	1 to 16
<i>vm-id</i>	1 to 4

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

Use the following command to display IP identification assist information for a group.

```
show application-assurance group 1 ip-identification-assist isa 1/1
```

**Output Example**

```

## ip-identification-assist

### Syntax

**ip-identification-assist**

### Context

**[Tree]** (tools>dump>app-assure>group ip-identification-assist)

### Full Context

tools dump application-assurance group ip-identification-assist

### Description

Commands in this context dump statistics for the IP identification assist feature.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 14.9 ip-prefix

### ip-prefix

#### Syntax

```
ip-prefix [hunt | detail] [rd rd] [prefix ip-prefix/ip-prefix-length] [community comm-id] [tag tag] [next-hop next-hop] [aspath-regexp reg-exp]
```

#### Context

[\[Tree\]](#) (show>router>bgp>routes>evpn ip-prefix)

#### Full Context

```
show router bgp routes evpn ip-prefix
```

#### Description

This command displays BGP-EVPN IPv4 prefix routes.

#### Parameters

##### hunt

Displays entries for the specified route.

##### detail

Displays detailed information.

##### rd

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

##### ip-prefix/ip-prefix-length

Specifies the IPv4 address and mask length.

<b>Values</b>	ip-address:	a.b.c.d
	mask:	0 to 32

##### comm-id

Specifies the community ID, up to 72 characters.

**Values** *[as-num:comm-val | ext-comm | well-known-comm]*  
where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as the following:  
*type*:{ *ip-address:comm-val1* | *as-number1:comm-val2* | *as-number2:comm-val1* }  
where:
  - *as-number1* — 0 to 65535
  - *comm-val1* — 0 to 65535
  - **type** — target, origin
  - *ip-address* — a.b.c.d
  - *comm-val2* — 0 to 4294967295
  - *as-number2* — 0 to 4294967295
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** |

### **tag**

Specifies the IPv4 prefix route tag.

**Values** 0 to 4294967295 | MAX-ET

### **next-hop**

Specifies the IPv4 or IPv6 BGP next-hop address.

**Values**

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

### **reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

## **Platforms**

All

## 14.10 ip-prefix-list

### ip-prefix-list

#### Syntax

**ip-prefix-list**

**ip-prefix-list** *prefix-list-name* [**association**]

#### Context

**[Tree]** (show>qos>match-list ip-prefix-list)

#### Full Context

show qos match-list ip-prefix-list

#### Description

Displays the list of configured IPv4 QoS prefix lists or the details of a specific IPv4 QoS prefix list together with the SAP and network QoS policies in which it is used and the entry number within that policy.

#### Parameters

##### *prefix-list-name*

Specifies an IPv4 prefix list which contains IPv4 address prefixes to be matched.

**Values** A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

##### **association**

Displays the QoS policy and entry number in which the specified prefix list is used.

#### Platforms

All

#### Output

The following output is an example of ip-prefix-list information

#### Output Example

```
*A:PE# show qos match-list ip-prefix-list
=====
QoS Match IP Prefix List
=====
Prefix List Name          Description          Num Prefixes
-----

## ip-prefix-list

### Syntax

**ip-prefix-list** [*prefix-list-name*]

**ip-prefix-list** *prefix-list-name* **references**

### Context

[\[Tree\]](#) (show>filter>match-list ip-prefix-list)

### Full Context

show filter match-list ip-prefix-list

### Description

This command displays IPv4 prefix information for match criteria in IPv4 ACL and CPM filter policies.

### Parameters

#### ***prefix-list-name***

String of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

#### **references**

The filter policies, policy entries and source/destination IPv4 match type per entry referring to this match list.

## Platforms

All

## Output

The following output is an example of IPv4 prefix information for match criteria in IPv4 ACL and CPM filter policies, and [Table 235: Output fields: filter match IP prefix lists](#) describes the output fields.

### Output example

```
show filter match-list ip-prefix-list "p11"
```

## 14.11 ip-tunnel-stats

### ip-tunnel-stats

#### Syntax

**ip-tunnel-stats**

#### Context

**[Tree]** (show>isa>stats ip-tunnel-stats)

#### Full Context

show isa statistics ip-tunnel-stats

#### Description

Commands in this context display IP tunnel statistical information. This includes statistics for non-IPsec tunnels supported on tunnel ISAs.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 14.12 ipoe

### ipoe

#### Syntax

**ipoe**

**ipoe session**

#### Context

**[Tree]** (clear>service>id ipoe)

#### Full Context

clear service id ipoe

## Description

This command clears the IPoE related data for the service.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
ipoe
```

## Syntax

```
ipoe
```

## Context

[\[Tree\]](#) (clear>call-trace ipoe)

## Full Context

```
clear call-trace ipoe
```

## Description

Commands in this context clear the IPoE job.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
ipoe
```

## Syntax

```
ipoe
```

## Context

[\[Tree\]](#) (tools>perform>subscr-mgmt>loc-user-db ipoe)

## Full Context

```
tools perform subscriber-mgmt local-user-db ipoe
```

## Description

This command contains the tools used to control IPoE entries in the local user database.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ipoe

### Syntax

ipoe

### Context

[\[Tree\]](#) (show>service>id ipoe)

### Full Context

show service id ipoe

### Description

Commands in this context display IPoE information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ipoe

### Syntax

ipoe

### Context

[\[Tree\]](#) (show>call-trace ipoe)

### Full Context

show call-trace ipoe

### Description

Commands in this context display IP over Ethernet (IPoE) call trace information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 14.13 ipoe-session

### ipoe-session

#### Syntax

**ipoe-session**

#### Context

[\[Tree\]](#) (tools>dump>router ipoe-session)

#### Full Context

tools dump router ipoe-session

#### Description

Commands in this context dump information about IPoE session-related tools in the specified routing instance.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 14.14 ipoe-session-policy

### ipoe-session-policy

#### Syntax

**ipoe-session-policy** *ipoe-session-policy-name* [**association**]

**ipoe-session-policy**

#### Context

[\[Tree\]](#) (show>subscr-mgmt ipoe-session-policy)

#### Full Context

show subscriber-mgmt ipoe-session-policy

#### Description

This command displays IPoE session policy information.

## Parameters

### *ipoe-session-policy-name*

Specifies the IPoE session policy name up to 32 characters.

### **association**

Displays the interface and captures SAPs that reference the IPoE session policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of IPoE session policy information.

### Output Example

```

show subscriber-mgmt ipoe-session-policy "ipoe-policy-1"
=====
IPoE Session Policy "ipoe-policy-1"
=====
Description           : IPoE policy

=====
    
```

**Table 236: Output fields: IPoE session policy** describes subscriber management IPoE session policy output fields.

*Table 236: Output fields: IPoE session policy*

Field	Description
Description	The user-provided description of this IPoE policy
Last Mgmt Change	The sysUpTime at the time of the last modification

Field	Description
Session Key	The session key to be used for this IPoE session to group subscriber hosts
Session Timeout	The session timeout period to be used for this IPoE session
IPoE Interface Associations	The service ID and interface name of the associated interfaces
Capture SAP Associations	The service ID and SAP ID of the associated capture SAPS

## 14.15 ipsec

ipsec

### Syntax

ipsec

### Context

[\[Tree\]](#) (clear ipsec)

### Full Context

clear ipsec

### Description

Commands in this context clear IPsec commands.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

=====
    
```

Table 237: Output fields: IPsec domain

Label	Description
Designated Role	The designated role, active or standby.
Priority	The priority.
Tunnel Group	The tunnel group ID.
Revertive	The revertive value. <b>true</b> means that revertive is configured. <b>false</b> means that revertive is not configured.
Admin State	The administrative state.
Protection Status	Displays nominal or notReady.

Label	Description
	<p><b>notReady</b> means the system is not ready for a switchover. There could be a major traffic impact if switchover happens in the case of notReady.</p> <p><b>nominal</b> means the tunnel-group is in a better situation to switchover than notReady. However, there still might be a traffic impact.</p>
Router Id	The router ID.
Current Active	The router ID of the active router.
Activity State	The activity state.
Adjacencies	
Peer	The IP address of the peer.
Router-Id	The router ID.
Oper State	The operational state of the peer.
Remote Activity State	The activity state of the peer.
Remote Designated Role	The designated role of the peer.
Domain Adjacency Entries found	The total number of domain peer entries found.
Multi-Chassis Tunnel Statistics	
Static	The number of static multi-chassis tunnels.
Dynamic	The number of dynamic multi-chassis tunnels.
Installed	The number of tunnels that have been successfully installed.
Installing	The number of tunnels that are being installed.
Awaiting Config	The number of synchronized tunnels that do not have a corresponding configuration ready.
Failed	The number of tunnels that failed to be installed.

## 14.17 ipsec-interface

### ipsec-interface

#### Syntax

**ipsec-interface**

**ipsec-interface** *ip-int-name* [**group** *grp-ipv6-address*]

**ipsec-interface** **gateway-name** *gw-name* [**remote-address** *ip-address* | *ipv6-address*] [**port** *port-id*] [**sa-id** *sa-id*]

**ipsec-interface** **static-tunnel-name** *tunnel-name* [**sa-id** *sa-id*]

#### Context

[\[Tree\]](#) (show>router>mld ipsec-interface)

#### Full Context

show router mld ipsec-interface

#### Description

This command displays information about the MLD states over IPsec tunnels.

#### Parameters

##### *ip-int-name*

Specifies the dynamic name for the MLD-enabled child\_SA.

##### *grp-ipv6-address*

Displays IPv6 multicast group address for which this entry contains information.

**Values**    *ipv6-address* - x:x:x:x:x:x:x (eight 16-bit pieces)  
              x:x:x:x:x:d.d.d.d  
              x - [0..FFFF]H  
              d - [0..255]D  
              - multicast group IPv6 address

##### *gw-name*

Specifies the IPsec gateway name, up to 32 characters.

##### *ip-address*

Displays the information associated with the specified IP address.

##### *ipv6-address*

Displays the information associated with the specified IPv6 address.

##### *port-id*

Specifies the peer's UDP port.

**Values** 0 to 4294967295

**sa-id**

Specifies the child\_SA ID.

**Values** 0 to 4294967295

**tunnel-name**

Specifies the IPsec static tunnel name up to 32 characters.

**Platforms**

All

**Output**

The following output is an example of MLD IPsec interface information. The interface name in the output is the dynamic name for an MLD-enabled child\_sa. There is a corresponding MLD interface name in the **show>ipsec>gateway name tunnel tunnel** output

**Output Example**

```
*A:DUT-A# show router 40 mld ipsec-interface "ipsec-if-1583392"
=====
mld ipsec dynamic tunnel interfaces detail
=====
name          : ipsec_gw_1040_1
remote-address: 3ffe::900:1
port          : 500

querier expiry: 0
interface name: ipsec-if-1583392
=====
```

## 14.18 ipsec-stats

### ipsec-stats

**Syntax**

**ipsec-stats**

**Context**

[\[Tree\]](#) (show>isa>stats ipsec-stats)

**Full Context**

show isa statistics ipsec-stats

## Description

Commands in this context display IPsec tunnel statistics.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 14.19 ipsec-transport-mode-profile

### ipsec-transport-mode-profile

#### Syntax

**ipsec-transport-mode-profile** [*name*]

**ipsec-transport-mode-profile** *name* **association**

#### Context

[\[Tree\]](#) (show>ipsec ipsec-transport-mode-profile)

#### Full Context

show ipsec ipsec-transport-mode-profile

#### Description

This command displays IPsec transport mode profile information. If a name is specified, the command displays details about the named **ipsec-transport-mode-profile**, otherwise, a list of configured IPsec transport mode profiles is displayed.

#### Parameters

***name***

Displays information about the specified IPsec transport mode profile, up to 32 characters.

***association***

Displays a list of IP tunnels that reference the specified **ipsec-transport-mode-profile** *name*.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of IPsec transport mode profile information. [Table 238: Output fields: IPsec transport mode profile](#) describes the fields.

#### Output Example

```
A:v70# show ipsec ipsec-transport-mode-profile "test"
=====
```

```

Table 238: Output fields: IPsec transport mode profile

Label	Description
Description	The text string to describe the transport mode profile
Keying Type	The keying type
Replay Window	The replay window size
IKE Policy ID	The ID of the IKE policy used for IKE negotiation
Auto Establish	The status of auto-establish
Transform Id1, Id2, Id3, Id4	The transform ID
Pre Shared Key	The pre-shared key used for authentication (hashed)
Local Id Type	The local ID used for IDi or IDr for IKEv2 tunnels
Cert Profile	The name of certificate profile to be used for certificate authentication
TrustAnchor Prof	The name of trust anchor profile to be used for certificate authentication.

Label	Description
Default Result	The default result when both the primary and secondary method failed to provide an answer
Primary	The primary method that is used to verify the revocation status of the peer's certificate; either CRL or OCSP.
Secondary	The secondary method that is used to verify the revocation status of the peer's certificate; either CRL, OCSP, or none.
Max Num of Keys	Phase 1 — The maximum number of IKE_SA keys, which can be saved by the system. Phase 2 — The maximum number of CHILD_SA keys, which can be saved by the system.
Transport Mode Profile	The transport mode profile name
SvcID	The service ID
Type	The service type
SAP	The SAP ID
Tunnel	The tunnel ID

## 14.20 ipv4

### ipv4

#### Syntax

**ipv4 all**

**ipv4 entry** *entry-id*

#### Context

[\[Tree\]](#) (clear>subscr-mgmt>isa-filter ipv4)

#### Full Context

clear subscriber-mgmt isa-filter ipv4

#### Description

This command resets the entry hit counts associated with the specified **isa-filter** to zero. If an *entry-id* is specified, only counters for that entry are reset, otherwise all entry counters are reset.

## Parameters

### *all*

Clears all IPv4 ISA filter entries.

### *entry-id*

Specifies the ID of the entry within the ISA filter for which to reset the counters.

**Values** 1 to 1024

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## ipv4

## Syntax

**ipv4** [**summary** | **detail**] [**egress-if** *port-id*]

**ipv4** [**summary** | **detail**] [**egress-lsp** *tunnel-id*]

**ipv4** [**summary** | **detail**] [**egress-nh** *ip-address*]

## Context

[\[Tree\]](#) (show>router>ldp>bindings>active ipv4)

## Full Context

show router ldp bindings active ipv4

## Description

This command display LDP active IPv4 bindings.

## Parameters

### **egress-if** *port-id*

Displays LDP active bindings by matching egress-if.

### **egress-lsp** *tunnel-id*

Specifies the tunnel identifier for this egress LSP.

**Values** 0 to 4294967295

### **egress-nh** *ip-address*

Displays LDP active bindings by matching egress-nh.

#### **Values**

ipv4-address - a.b.c.d

ipv6-address - x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

#### detail

Displays detailed information.

#### summary

Displays information in a summarized format.

### Platforms

All

## ipv4

### Syntax

```
ipv4 [timeout seconds] [ dhcp-client-identifier {string ascii-string | hex hex-string}] [reboot-on-success]
[save-provision-file-destination file-url] [ include-user-class]
```

### Context

[\[Tree\]](#) (tools>perform>system>auto-node-provisioning ipv4)

### Full Context

tools perform system auto-node-provisioning ipv4

### Description

This command initiates the IPv4 auto-provisioning of the node on all the ports that have an operationally up port but no IP address.

### Parameters

#### *seconds*

DHCP request timeout period, before the system tries the next interface. Within this timeout, the DHCP client tries to retransmit the DHCP request with randomized exponential backoff (RFC 2131). This randomized exponential backoff begins at 2 s and goes to 64 s (2,4,8,32,64,64,64,64). After 64 seconds, the system will retry every 64 s.

**Values** 1 to 65535 seconds

**Default** 10

#### *ascii-string*

DHCP client identifier in ASCII format, up to 127 characters long.

#### *hex-string*

DHCP client identifier in hexadecimal format, up to 254 hexadecimal nibbles long.

**Values** 0x0 to 0xFFFFFFFF

***file-url***

The file URL as a *local-url*. The local file or folder name should not exceed 99 characters).

*local-url* [cflash-id][file-path]

*cflash-id* cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:,  
cf3-A:, cf3-B:

***include-user-class***

Keyword to include user class data in network discovery requests.

**Platforms**

All

## ipv4

**Syntax**

**ipv4** [aspath-regex *reg-exp*] [community *comm-id*] [origin-val *originState*] [leaked] [leakable] [brief] [all]

**ipv4** [aspath-regex *reg-exp*] hunt [ community *comm-id*] [origin-val *originState*] [leaked] [leakable] [brief] [all]

**ipv4** [detail | longer] [aspath-regex *reg-exp*] [community *comm-id*] [origin-val *originState*] [leaked] [leakable] [all]

**Context**

[Tree] (show>router>bgp>routes ipv4)

**Full Context**

show router bgp routes ipv4

**Description**

This command displays BGP IPv4 routes.

**Parameters**

***reg-exp***

Displays routes matching the specified regular expression, up to 80 characters.

**hunt**

Displays entries for the specified route.

***comm-id***

Specifies the community ID, up to 72 characters.

**Values** [as-num:comm-val | ext-comm | well-known-comm | large-comm]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
  - {*target* | *origin*}:*ip-address*:*comm-val*
  - {*target* | *origin*}:*asnum*:*ext-comm-val*
  - {*target* | *origin*}:*ext-asnum*:*comm-val*
  - **bandwidth**:*asnum*:*val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext** \t:*value1*:*value2*
  - **flowspec-set**:*ext-asnum*:*group-id*

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

### **originState**

Filters the BGP routes displayed by the command to those routes with a particular RPKI route origin validation state.

- Values**
- valid** — Displays valid validation state information.
  - invalid** — Displays invalid validation state information.
  - notfound** — Displays state information for unfound origin values.

**leaked**

Filters BGP routes displayed by the command to those routes leaked into this router's BGP instance from another BGP instance.

**leakable**

Filters BGP routes displayed by the command to those routes eligible for leaking from this router's BGP instance to another BGP instance.

**brief**

Displays the IPv4 BGP route information in a brief format.

**all**

Displays all output for imported routes.

**Platforms**

All

## 14.21 ipv4-prefix

### ipv4-prefix

**Syntax**

**ipv4-prefix** [*ip-prefix/ip-prefix-length*]

**Context**

[\[Tree\]](#) (show>router>bgp>routes>bgp-ls ipv4-prefix)

**Full Context**

show router bgp routes bgp-ls ipv4-prefix

**Description**

This command displays BGP-LS NLRIs with an IPv4 prefix.

**Parameters**

***ip-prefix/ip-prefix-length***

Specifies information for the specified IPv4 prefix and mask length, up to 64 characters.

**Platforms**

All

## 14.22 ipv6

ipv6

### Syntax

**ipv6 all**

**ipv6 entry** *entry-id*

### Context

**[Tree]** (clear>subscr-mgmt>isa-filter ipv6)

### Full Context

clear subscriber-mgmt isa-filter ipv6

### Description

This command resets the entry hit counts associated with the specified **isa-filter** to zero. If an *entry-id* is specified, only counters for that entry are reset, otherwise all entry counters are reset.

### Parameters

***all***

Clears all IPv6 ISA filter entries.

***entry-id***

Specifies the ID of the entry within the ISA filter for which to reset the counters.

**Values** 1 to 1024

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipv6

### Syntax

**ipv6 [summary | detail] [egress-if** *port-id*]

**ipv6 [summary | detail] [egress-lsp** *tunnel-id*]

**ipv6 [summary | detail] [egress-nh** *ip-address*]

### Context

**[Tree]** (show>router>ldp>bindings>active ipv6)

## Full Context

```
show router ldp bindings active ipv6
```

## Description

This command displays LDP active IPv6 bindings.

## Parameters

### **egress-if** *port-id*

Displays LDP active bindings by matching egress-if.

### **egress-lsp** *tunnel-id*

Specifies the tunnel identifier for this egress LSP.

**Values** 0 to 4294967295

### **egress-nh** *ip-address*

Displays LDP active bindings by matching egress-nh.

**Values**

ipv4-address	- a.b.c.d
ipv6-address	- x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D

### **detail**

Displays detailed information.

### **summary**

Displays information in a summarized format.

## Platforms

All

ipv6 ipv6-filter-id [entry entry-id] effective-action router [{ingress | egress}]
ipv6 ipv6-filter-id [entry entry-id] effective-action service service-id [{ ingress | egress}]
```

## Context

[\[Tree\]](#) (show>filter ipv6)

## Full Context

```
show filter ipv6
```

## Description

This command shows IPv6 filter information.

When **effective-action** is specified, this command displays what effectively happens to a packet that matches the criteria associated with the IPv6 filter policy.

## Parameters

### *filter-type*

Specifies the type of filter to display.

**Values** config, flowspec, host-common, openflow

### *inactive*

Shows all embeddings, optionally shows inactive embedding only, if *ipv6-filter-id* is not specified shows all embedded filters.

### *ipv6-filter-id*

Specifies the IPv6 filter policy for which to display information. Values can be expressed in different formats. The following only shows decimal integer format.

**Values** 1 to 65535

### *detail*

Displays detailed information.

### *associations*

Appends, to the detailed filter policy output, information as to where the specified filter policy ID is applied.

### *entry-type*

Specifies type of filter entry to display.

**Values** fixed, radius-insert, credit-control-insert, embedded, radius-shared

### *counters*

Displays counter information. Egress counters count the packets without Layer 2 encapsulation. Ingress counters count the packets with Layer 2 encapsulation.

**entry-id**

Specifies the filter policy entry (of the specified filter policy) to display information.

**Values** 1 to 2097151

**effective-action**

Displays the action that the system will effectively apply to the packet.

**ingress**

Filters the output and only displays the information for filter policies applied on ingress.

**egress**

Filters the output and only displays the information for filter policies applied on egress.

**router**

Filters the output and only displays the information for that specific service ("Base" instance).

**service-id**

Filters the output and only displays the information for the specified service. The specified value should correspond to an existing service in which the filter has been applied.

**Platforms**

All

**Output**

**Show Filter (no filter-id specified)** — The following output is an example of IPv6 filter information when no filter ID is specified, and [Table 239: Output fields: filter IPv6 \(no filter ID specified\)](#) describes the fields.

**Output Example**

```
A:ALA-48# show filter ipv6

Table 240: Output fields: IPv6 filter policy

Label	Description
Filter Id	The IPv6 filter policy ID
Scope	Template — the filter policy is of type template
	Exclusive — the filter policy is of type exclusive
Entries	The number of entries configured in this filter ID
Description	The IPv6 filter policy description
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward
	Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Filter Match Criteria	IP — Indicates the filter is an IPv6 filter policy
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
Log Id	The filter log ID
Src. IP	The source IPv6 address and mask match criterion <ul style="list-style-type: none"> <li>• "::/0" indicates no criterion specified for the filter entry</li> </ul>
Dest. IP	The destination IPv6 address and mask match criterion <ul style="list-style-type: none"> <li>• "::/0" indicates no criterion specified for the filter entry</li> </ul>
Protocol	The protocol ID for the match criteria; undefined indicates no protocol specified

Label	Description
ICMP Type	The ICMP type match criterion; undefined indicates no ICMP type specified
Fragment	False — configures a match on all non-fragmented IPv6 packets
	True — configures a match on all fragmented IPv6 packets
	Off — fragments are not a matching criteria; all fragments and nonfragments implicitly match
Sampling	Off — specifies that traffic sampling is disabled
	On — specifies that traffic matching the associated IPv6 filter entry is sampled
IP-Option	Specifies matching packets with a specific IPv6 option or a range of IPv6 options in the IPv6 header for IPv6 filter match criteria
Match action	Default — the filter does not have an explicit forward or drop match action specified; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
	Drop — drop packets matching the filter entry
	Forward—the explicit action to perform is forwarding of the packet; if the action is Forward, then if configured, the next hop information should be displayed, including nexthop: <i>IPv6 address</i> , Indirect: <i>IPv6 address</i> or Interface: <i>IPv6 interface name</i>
Ing. Matches	The number of ingress filter matches/hits for the filter entry
Src. Port	The source TCP, UDP, or SCTP port number, port range, or port match list
Dest. Port	The destination TCP, UDP, or SCTP port number, port range, or port match list
Dscp	The DiffServ Code Point (DSCP) name
ICMP Code	The ICMP code field in the ICMP header of an IPv6 packet
Tcp-flag	<p>Specifies the list of TCP flags selected:</p> <ul style="list-style-type: none"> <li>• match true is represented with the TCP Flag value</li> <li>• match false is represented with an exclamation mark before the flag value</li> </ul> <p>TCP flags not selected as match criteria are not displayed</p> <p>Example:</p> <p>Matching "tcp-ack true" and "tcp-rst false" is represented in the show command as Tcp-flag : Ack !Rst</p>

Label	Description
Option-present	Off — specifies not to search for packets that contain the option field or have an option field of zero
	On — matches packets that contain the option field or have an option field of zero be used as IPv6 filter match criteria
Int. Sampling	Off — interface traffic sampling is disabled
	On — interface traffic sampling is enabled
Multiple Option	Off — the option fields are not checked
	On — packets containing one or more option fields in the IPv6 header will be used as IPv6 filter match criteria
Egr. Matches	The number of egress filter matches/hits for the filter entry
Ing. Rate-limiter	The number of offered, forwarded, and dropped packet matches for the filter entry

**Show Filter Associations** — The following output is an example of IPv6 filter information when the **associations** keyword is specified, and [Table 241: Output fields: IPv6 filter associations](#) describes the fields.

### Output Example

```
A:ALA-48# show filter ipv6 1 associations

```

Table 241: Output fields: IPv6 filter associations

Label	Description
Filter Id	The IPv6 filter policy ID
Scope	Template — the filter policy is of type Template
	Exclusive — the filter policy is of type Exclusive
Entries	The number of entries configured in this filter ID
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward
	Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Service Id	The service ID on which the filter policy ID is applied; the output also provides a list of service points where the filter has been applied
SAP	The Service Access Point on which the filter policy ID is applied
(Ingress)	The filter policy ID is applied as an ingress filter policy on the interface
(Egress)	The filter policy ID is applied as an egress filter policy on the interface
Type	The type of service of the service ID
Entry	The filter entry ID; if the filter entry ID indicates the entry is Inactive, the filter entry is incomplete, no action was specified
Log Id	The filter log ID
Src. IP	The source IPv6 address and mask match criterion <ul style="list-style-type: none"> <li>• "0.0.0.0/0" indicates no criterion specified for the filter entry</li> </ul>
Dest. IP	The destination IPv6 address and mask match criterion <ul style="list-style-type: none"> <li>• "0.0.0.0/0" indicates no criterion specified for the filter entry</li> </ul>
Protocol	The protocol ID for the match criteria; undefined indicates no protocol specified
ICMP Type	The ICMP type match criterion; undefined indicates no ICMP type specified

Label	Description
Fragment	False — configures a match on all non-fragmented IPv6 packets
	True — configures a match on all fragmented IPv6 packets
	Off — fragments are not a matching criteria; all fragments and nonfragments implicitly match
Sampling	Off — specifies that traffic sampling is disabled
	On — specifies that traffic matching the associated IPv6 filter entry is sampled
IP-Option	Specifies matching packets with a specific IPv6 option or a range of IPv6 options in the IPv6 header for IPv6 filter match criteria
TCP-syn	False — configures a match on packets with the SYN flag set to false
	True — configures a match on packets with the SYN flag set to true
	Off — the state of the TCP SYN flag is not considered as part of the match criteria
Match action	Default — the filter does not have an explicit forward or drop match action specified; if the filter entry ID indicates the entry is Inactive, the filter entry is incomplete, no action was specified
	Drop — drop packets matching the filter entry
	Forward — the explicit action to perform is forwarding of the packet; if the action is Forward, then if configured the nexthop information should be displayed, including Nexthop: <IPv6 address>, Indirect: <IPv6 address> or Interface: <IPv6 interface name>
Ing. Matches	The number of ingress filter matches/hits for the filter entry
Src. Port	The source TCP, UDP, or SCTP port number, port range, or port match list
Dest. Port	The destination TCP, UDP, or SCTP port number, port range, or port match list
Dscp	The DiffServ Code Point (DSCP) name
ICMP Code	The ICMP code field in the ICMP header of an IPv6 packet
Option-present	Off — specifies not to search for packets that contain the option field or have an option field of zero

Label	Description
	On — matches packets that contain the option field or have an option field of zero be used as IPv6 filter match criteria
Int. Sampling	Off — interface traffic sampling is disabled
	On — interface traffic sampling is enabled
Multiple Option	Off — the option fields are not checked
	On — packets containing one or more option fields in the IPv6 header will be used as IPv6 filter match criteria
TCP-ack	False — configures a match on packets with the ACK flag set to false
	True — configured a match on packets with the ACK flag set to true
	Off — the state of the TCP ACK flag is not considered as part of the match criteria
Egr. Matches	The number of egress filter matches/hits for the filter entry

**Show Filter Counters** — The following output is an example of IPv6 filter information when the **counters** keyword is specified, and [Table 242: Output fields: IPv6 filter counters](#) describes the output fields.

Egress count the packets without Layer 2 encapsulation. Ingress counters count the packets with Layer 2 encapsulation.

### Output Example

```
A:ALA-48# show filter ipv6 8 counters

Table 242: Output fields: IPv6 filter counters

Label	Description
IP Filter Filter Id	The IPv6 filter policy ID
Scope	Template — the filter policy is of type template
	Exclusive — the filter policy is of type exclusive
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward
	Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Filter Match Criteria	IP — Indicates the filter is an IPv6 filter policy
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
Ing. Matches	The number of ingress filter matches/hits for the filter entry
Egr. Matches	The number of egress filter matches/hits for the filter entry

Egress count the packets without Layer 2 encapsulation. Ingress counters count the packets with Layer 2 encapsulation.

**Show Filter IPv6 Output (with effective-action specified)** — The following output is an example of IPv6 filter information when the **effective-action** keyword is specified. [Table 243: Output fields: IPv6 filter effective action](#) describes the command output fields.

If the main action (either primary or secondary) cannot be performed, a reason will be given. This will be displayed on the same line as the Effective Action. The reason codes as currently defined are:

- action not supported in L2 service
- action not supported in L3 service
- action not supported on egress
- destination not reachable
- egress-pbr is off
- egress-pbr is on
- entry-default

- filter-default-action
- pbr-down-action-override
- target does not exist

**Output Example**

```

show filter ipv6 10 entry 10 effective-action

Table 243: Output fields: IPv6 filter effective action

Label	Description
Filter Id	The IPv6 filter policy ID
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied

Label	Description
Scope	Template — the filter policy is of type Template
	Exclusive — the filter policy is of type Exclusive
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward
	Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Entries	The number of entries configured in this filter ID
Description	The IPv6 filter policy description
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
Origin	The type of filter entry
Egress PBR	Indicates if the <b>egress-pbr</b> flag is set for this entry
Stickiness	No — stickiness is not configured
	Yes — stickiness is configured
PBR Dwn Act Override	Indicates whether or not the action to take when the PBR target is down has been overridden
PBR Down Action	Indicates the action to take when the target is down; packets that match the entry criteria will be subject to the PBR Down Action in case the target of the main action is down
Configuration	Section of the output providing information on the configured parameters
Primary Action	The configured action, if any; indented sub-labels in the show output provide configured parameters for this action
Secondary Action	The configured secondary action, if any; indented sub-labels in the show output provide configured parameters for this action
Status/Target status based on extended checks	Section of the output providing information on the operational status of certain parameters
Primary Action	The status of the target of the primary action, if configured, based on extended checks
Secondary Action	The status of the target of the secondary action, if configured, based on extended checks
Downloaded Action	The action downloaded by the CPM to the IOM

Label	Description
Stickiness Timer	The status of the stickiness timer, if any
Effective Action based on application context	Section of the output providing the effective action, in the context of services, that a packet matching the criteria will be subject to
Service Id	The service ID on which the filter policy ID is applied; the output also provides a list of service points where the filter has been applied
Type	The service type in which the service has been applied
Ingress/Egress	The direction in which the service has been applied
Effective Action	Indicates the effective action the packet will be subject to
Extended Action	Indicates the configured extended action, if any

## ipv6

### Syntax

```
ipv6 ipv6-filter-id [entry entry-id] [{ingress | egress}]
```

### Context

[\[Tree\]](#) (clear>filter ipv6)

### Full Context

```
clear filter ipv6
```

### Description

Clears the counters associated with the entries of the specified IPv6 filter policy.

By default, the counters associated with each entry of the specified filter policy are all cleared. The scope of which counters are cleared can be narrowed using the command line parameters.

### Default

Clears all counters associated with each entry of the specified IPv6 filter policy.

### Parameters

#### *ipv6-filter-id*

The IPv6 filter policy ID for which to clear the entry counters. Values can be expressed in different formats. The following only shows decimal integer format.

**Values** 1 to 65535

#### *entry-id*

Specifies that only the counters associated with the specified filter policy entry are cleared.

**Values** 1 to 2097151

**ingress**

Specifies to only clear the ingress counters.

**egress**

Specifies to only clear the egress counters.

**Platforms**

All

**ipv6**

**Syntax**

**ipv6** *ipv6-filter-id*

**Context**

[\[Tree\]](#) (tools>dump>filter>resources ipv6)

**Full Context**

tools dump filter resources ipv6

**Description**

This command displays information about the specified IPv6 filter including resource utilization on CPM and IOM, the IOMs on which the filter is used, and the entries using the most resources.

**Parameters**

***ipv6-filter-id***

Specifies that only the filter resource utilization associated with this IPv6 filter will be displayed.

**Values** 1 to 65535

**Platforms**

All

**Output**

The following output is an example of IPv6 filter resource utilization information.

**Output Example**

```
*A:Dut-C>tools>dump>filter>resources># ipv6 "fSpec-0"
=====
Resource utilization details for Ipv6 filter fSpec-0
=====
CPM entries used                : 0

### Full Context

tools perform system auto-node-provisioning ipv6

### Description

This command initiates the IPv6 auto-provisioning of the node on all the ports that have an operationally up port but no IP address.

### Parameters

#### *seconds*

DHCP request timeout period, before the system tries the next interface. Within this timeout, the DHCP client tries to retransmit the DHCP request with randomized exponential backoff (RFC 2131). This randomized exponential backoff begins at 2 s and goes to 64 s (2,4,8,32,64,64,64,64). After 64 seconds, the system will retry every 64 s.

**Values** 1 to 65535 seconds

**Default** 10

#### *duid-link-local*

Keyword to configure the type code of the server DUID.

#### *duid-enterprise*

Keyword to configure the type code of the server DUID.

#### *ascii-string*

DHCP client identifier in ASCII format, up to 127 characters long.

### ***hex-string***

DHCP client identifier in hexadecimal format, up to 254 hexadecimal nibbles long.

**Values** 0x0 to 0xFFFFFFFF

### ***file-url***

The file URL as a *local-url*. The local file or folder name should not exceed 99 characters).

*local-url* [cflash-id][file-path]

*cflash-id* cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:,  
cf3-A:, cf3-B:

### ***reboot-on-success***

Keyword to reboot the router when the auto-provisioning process completes successfully.

### ***include-user-class***

Keyword to include user class data in network discovery requests.

## **Platforms**

All

## **ipv6**

## **Syntax**

**ipv6 entry** *entry-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

## **Context**

[\[Tree\]](#) (monitor>cpm-filter ipv6)

## **Full Context**

monitor cpm-filter ipv6

## **Description**

This command displays monitor command statistics for IPv6 filter entries.

## **Parameters**

### ***entry-id***

Displays information on the specified filter entry ID for the specified filter ID only.

**Values** 1 to 2048

### ***seconds***

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

**repeat**

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

**absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Displays rate-per-second for each statistic instead of the delta.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## ipv6

**Syntax**

**ipv6** *entry-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**Context**

[\[Tree\]](#) (monitor>management-access-filter ipv6)

**Full Context**

monitor management-access-filter ipv6

**Description**

This command monitors statistics for the MAF IPv6 filter entry.

**Parameters**

**entry-id**

Specifies an existing IP MAF entry ID.

**Values** 1 to 9999

**interval seconds**

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10

### **repeat**

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### **absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### **rate**

Displays rate-per-second for each statistic instead of the delta.

## **Platforms**

All

## **ipv6**

## **Syntax**

**ipv6** *ipv6-filter-id* **entry** *entry-id* [ **interval** *seconds*] [**repeat** *repeat*] [ **absolute** | **rate**]

## **Context**

[\[Tree\]](#) (monitor>filter ipv6)

## **Full Context**

monitor filter ipv6

## **Description**

This command enables IPv6 filter monitoring. The statistical information for the specified IPv6 filter entry displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified IPv6 filter. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## **Parameters**

### ***ipv6-filter-id***

Displays detailed information for the specified IPv6 filter ID and its filter entries.

**Values** [1 to 65535] | fSpec-[0 to 2147483647] | [1 to 65535 to 8192] | [1 to 65535:P1 to 4096] | *\_tmnx\_tms\_egr- mda-id-F* | *\_tmnx\_tms-ing-mda-id-F* | *\_tmx\_ofs\_ofs-name* | *name*: 64 chars max

### ***entry-id***

Displays information on the specified filter entry ID for the specified filter ID only.

**Values** 1 to 65535

### ***seconds***

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

### ***repeat***

Configures how many times the command is repeated.

**Default** 10

**Values** 1 to 999

### ***absolute***

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### ***rate***

Displays rate-per-second for each statistic instead of the delta.

## **Platforms**

## ipv6

### Syntax

```
ipv6 [aspath-regex reg-exp] [community comm-id] [origin-val originState] [leaked] [leakable] [brief]
[all]
ipv6 [aspath-regex reg-exp] hunt [community comm-id] [origin-val originState] [leaked] [leakable]
[brief] [all]
ipv6 [detail | longer] [aspath-regex reg-exp] [community comm-id] [origin-val originState] [leaked]
[leakable] [all]
```

### Context

[\[Tree\]](#) (show>router>bgp>routes ipv6)

### Full Context

show router bgp routes ipv6

### Description

This command displays BGP IPv6 routes.

### Parameters

#### **reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

#### **hunt**

Displays entries for the specified route.

#### **comm-id**

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:

- *{target | origin}:ip-address:comm-val*
- *{target | origin}:asnum:ext-comm-val*
- *{target | origin}:ext-asnum:comm-val*
- **bandwidth:asnum:val-in-mbps**
- **ext:4300:ovstate**
- **ext:value1:value2**
- **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

### **originState**

Filters the BGP routes displayed by the command to those routes with a particular RPKI route origin validation state.

- Values**
- valid* — Displays valid validation state information.
  - invalid* — Displays invalid validation state information.

notfound — Displays state information for unfound origin values.

**leaked**

Filters BGP routes displayed by the command to those routes leaked into this router's BGP instance from another BGP instance.

**leakable**

Filters BGP routes displayed by the command to those routes eligible for leaking from this router's BGP instance to another BGP instance.

**brief**

Displays the IPv4 BGP route information in a brief format.

**all**

Displays all output for imported routes.

**Platforms**

All

## 14.23 ipv6-exception

### ipv6-exception

**Syntax**

`ipv6-exception exception`

`ipv6-exception exception [associations]`

`ipv6-exception exception [counters]`

`ipv6-exception exception entry entry-id [counters]`

**Context**

[\[Tree\]](#) (show>filter ipv6-exception)

**Full Context**

show filter ipv6-exception

**Description**

This command shows IPv6 exception information.

**Parameters**

***exception***

Specifies the IPv6 exception filter.

**Values** *exception-id*: 1 to 65535

*exception-name*: An existing IPv6 exception filter name up to 64 characters.

### associations

Displays associations applicable to the specified IPv6 exception.

### counters

Displays counters for the specified IPv6 exception.

### entry *entry-id*

Specifies an integer that identifies the entry.

**Values** 1 to 2097151

## Platforms

VSR

## Output

The following output is an example of IPv6 exception filter information, and [Table 244: Output fields: IPv6 exception](#) describes the fields.

### Output Example

```

Table 244: Output fields: IPv6 exception

Label	Description
Configured IPv6-Exception Filters	The number of configured IPv6 exception filters.
Filter-Id	The filter ID.
Scope	Template — The filter policy is of type Template. Exclusive — The filter policy is of type Exclusive.
Applied	No — The IPv6 exception filter has not been applied. Yes — The IPv6 exception filter is applied.
Entries	The number of entries.
Description	The description of the specified filter, if specified.
Filter Name	The filter name.
Num IPv6-Exception filters	The number of IPv6 exception filters.
Entry	The number of active or inactive entries.
Src. IP	The source IP address of the logged packet.
Src. Port	The source port of the logged packet.
Dst. IP	The destination IP address of the logged packet.

Label	Description
Dst. Port	The destination port of the logged packet.
Next Header	8-bit selector. Identifies the type of header immediately following the IPv6 header.
ICMP Type	The ICMP type match criterion. Undefined indicates no ICMP type specified.
ICMP Code	The ICMP code field in the ICMP header of an IPv6 packet.
Ing. Matches	The number of packets matched on ingress.
Egr. Matches	The number of packets matched on egress.
Filter Association	Indicates the filter is an IPv6 filter policy.
Service Id	The service ID on which the IPv6 exception ID is applied.
Filter association with IOM	The number of filters associated with an IOM.

## ipv6-exception

### Syntax

**ipv6-exception** *exception* [**entry** *entry-id*] [**ingress**]

### Context

[\[Tree\]](#) (clear>filter ipv6-exception)

### Full Context

clear filter ipv6-exception

### Description

This command clears the information about the IPv6 exception filter.

### Parameters

#### **exception**

Specifies the IPv6 exception filter by ID or name.

**Values** *exception-id* | *exception-name*

#### **exception-id**

Specifies the IPv6 exception filter ID for which to clear the entry counters.

**Values** 1 to 65535

***exception-name***

Specifies name of the IPv6 exception filter, up to 64 characters.

***entry-id***

Specifies that only the counters associated with the specified filter policy entry are cleared.

**Values** 1 to 2097151

**ingress**

Specifies to only clear the ingress counters.

**Platforms**

VSR

## 14.24 ipv6-filter

### ipv6-filter

**Syntax**

**ipv6-filter** [**entry** *entry-id*]

**Context**

[\[Tree\]](#) (show>system>security>cpm-filter ipv6-filter)

**Full Context**

show system security cpm-filter ipv6-filter

**Description**

This command displays CPM IPv6 filters and only applies to the 7750 SR and 7950 XRS.

**Parameters**

***entry-id***

Identifies a CPM IPv6 filter entry as configured on this system.

**Values** 1 to 131072

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**Output**

The following output is an example of IPv6 filter entry information.

[Table 245: Output fields: CPM IPv6](#) describes CPM IPv6 filter output fields.

**The following is an output example on the 7750 SR:**

```
A:ALA-35# show system security cpm-filter ipv6-filter

*Table 245: Output fields: CPM IPv6*

Label	Description
Entry-Id	Displays information about the specified management access filter entry
Dropped	Displays the number of dropped events.
Forwarded	Displays the number of forwarded events.
Description	Displays the CPM filter description.
Log ID	Log Id where matched packets will be logged.
Src IP	Displays Source IP address(/netmask)
Dest. IP	Displays Destination IP address(/netmask).

Label	Description
Src Port	Displays Source Port Number (range).
Dest. Port	Displays Destination Port Number (range).
next-header	Displays next-header field in the IPv6 header.
Dscp	Displays Traffic Class field in the IPv6 header.
ICMP Type	Displays ICMP type field in the icmp header.
ICMP Code	Displays ICMP code field in the icmp header.
TCP-syn	Displays the SYN flag in the TCP header.
TCP-ack	Displays the ACK flag in the TCP header.
Match action	When criteria matches, displays drop or forward packet.
Next Hop	In case match action is forward, indicates destination of the matched packet.
Dropped pkts	Indicating number of matched dropped packets.
Forwarded pkts	Indicating number of matched forwarded packets.

## ipv6-filter

### Syntax

**ipv6-filter** [**entry** *entry-id*]

### Context

**[Tree]** (show>system>security>mgmt-access-filter ipv6-filter)

### Full Context

show system security management-access-filter ipv6-filter

### Description

This command displays management-access IPv6 filters and only applies to the 7750 SR and 7950 XRS.

### Parameters

***entry-id***

Specifies the IPv6 filter entry ID to display.

**Values** 1 to 9999

## Platforms

All

## Output

The following output is an example of MAF IPv6 filter information, and the table outlined in **show>system>security>mgmt-access-filter ip-filter** describes the output fields.

### Output Example

```
*A:Dut-C# show system security management-access-filter ipv6-filter entry 1

## ipv6-filter

### Syntax

**ipv6-filter** [**entry** *entry-id*]

### Context

[\[Tree\]](#) (clear>cpm-filter ipv6-filter)

### Full Context

clear cpm-filter ipv6-filter

### Description

This command clears IPv6 filter statistics.

### Parameters

***entry-id***

Specifies a particular CPM IP filter entry.

**Values** 1 to 2048

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## ipv6-filter

### Syntax

**ipv6-filter** *ipv6-filter-id*

### Context

[\[Tree\]](#) (tools>perform>filter ipv6-filter)

### Full Context

tools perform filter ipv6-filter

### Description

Commands in this context perform IPv6 filter operations.

### Parameters

#### ***ip-v6filter-id***

Specifies a particular IPv6 filter ID or filter name.

**Values** *filter-id* | *filter-name*

#### ***filter-id***

Specifies the IPv6 filter ID.

**Values** 1 to 65535

#### ***filter-name***

Specifies name of the IPv6 filter, up to 64 characters.

### Platforms

All

## 14.25 ipv6-prefix

## ipv6-prefix

### Syntax

**ipv6-prefix** [hunt | detail] [**rd** *rd*] [**prefix** *ipv6-prefix/ipv6-prefix-length*] [**community** *comm-id*] [**tag** *tag*] [**next-hop** *next-hop*] [**aspath-regex** *reg-exp*]

## Context

## Full Context

show router bgp routes evpn ipv6-prefix

## Description

This command displays BGP-EVPN IPv6 prefix routes.

## Parameters

### hunt

Displays entries for the specified route.

### detail

Displays detailed information.

### rd

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

### ipv6-prefix/ipv6-prefix-length

Specifies the IPv6 prefix and length.

**Values**

ipv6-prefix:	x:x:x:x:x:x:x (eight 16-bit pieces)
ipv6-prefix-length:	0 to 128

### comm-id

Specifies the community ID, up to 256 characters.

### tag

Specifies the IPv6 prefix route tag.

**Values** 0 to 4294967295 | MAX-ET

### next-hop

Specifies the IPv4 or IPv6 BGP next-hop address.

**Values**

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

***reg-exp***

Displays routes matching the specified regular expression, up to 80 characters.

**Platforms**

All

## 14.26 ipv6-prefix-list

### ipv6-prefix-list

**Syntax**

**ipv6-prefix-list**

**ipv6-prefix-list** *prefix-list-name* [**association**]

**Context**

**[Tree]** (show>qos>match-list ipv6-prefix-list)

**Full Context**

show qos match-list ipv6-prefix-list

**Description**

Displays the list of configured IPv6 QoS prefix lists or the details of a specific IPv6 QoS prefix list together with the network QoS policies in which it is used and the entry number within that policy.

**Parameters**

***prefix-list-name***

Specifies an IPv6 prefix list which contains IPv6 address prefixes to be matched.

**Values** A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

**association**

Displays the QoS policy and entry number in which the specified prefix list is used.

**Platforms**

All

**Output**

The following output is an example of ipv6-prefix-list information

**Output Example**

```
*A:PE# show qos match-list ipv6-prefix-list
```

```
=====
QoS Match IPv6 Prefix List
=====
Prefix List Name          Description          Num Prefixes
-----
ipv6list1                 1
ipv6list2                 1
-----
No. of Prefix-List: 2

## ipv6-prefix-list

### Syntax

**ipv6-prefix-list** [*prefix-list-name*]

**ipv6-prefix-list** *prefix-list-name* **references**

## Context

[\[Tree\]](#) (show>filter>match-list ipv6-prefix-list)

## Full Context

```
show filter match-list ipv6-prefix-list
```

## Description

This command displays IPv6 prefixes information for match criteria in IPv6 ACL and CPM filter policies.

## Parameters

### *prefix-list-name*

A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

### references

Displays the filter policies, policy entries and source/destination IPv6 match type per entry referring to this match list.

## Platforms

All

## 14.27 isa

isa

## Syntax

```
isa
```

## Context

[\[Tree\]](#) (tools>dump>nat isa)

## Full Context

```
tools dump nat isa
```

## Description

This command enables the dump tools for NAT ISA.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

isa

### Syntax

isa

## Context

[\[Tree\]](#) (clear>wlan-gw isa)

## Full Context

clear wlan-gw isa

## Description

Commands in this context clear WLAN gateway ISA commands.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

isa

## Syntax

**isa** *video-group-id* [**esa-vm** *vapp-id* ] [**lifetime-peaks**] [**hour-peaks**]

**isa** *video-group-id* [**md** *mda-id* ] [**lifetime-peaks**] [**hour-peaks**]

## Context

[\[Tree\]](#) (clear>video>statistics isa)

## Full Context

clear video statistics isa

## Description

This command clears statistics for a particular ISA video group.

## Parameters

### *video-group-id*

statistics for a particular ISA video group a video group ID.

**Values** 1 to 4

### *vapp-id*

Specifies the video ISA Group Virtual Application ID

**Values** <esa-id>/<vm-id>

esa-id 1 to 16

vm-id 1 to 4

### *mda-id*

Specifies the card/slot identifying a provisioned ISA

**Values**

*mda-id:* slot/mda

slot: 1 to 10 (depending on the chassis model)

mda: 1 to 2

**lifetime-peaks**

Clears the lifetime peaks

**hour-peaks**

Clears the last and current hour peaks

**Platforms**

**Context**

[\[Tree\]](#) (tools>dump>wlan-gw isa)

**Full Context**

tools dump wlan-gw isa

### Description

Commands in this context dump tools for Wireless LAN Gateway ISA.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 14.28 isa-collector

### isa-collector

#### Syntax

**isa-collector**

#### Context

[\[Tree\]](#) (show>app-assure>group>cflowd>dir-exp isa-collector)

#### Full Context

show application-assurance group cflowd direct-export isa-collector

#### Description

This command displays cflowd collector assignments to ISAs.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 14.29 isa-filter

### isa-filter

#### Syntax

**isa-filter** *name* [all]

#### Context

[\[Tree\]](#) (clear>subscr-mgmt isa-filter)

#### Full Context

clear subscriber-mgmt isa-filter

## Description

This command resets the entry hit counts associated with the specified **isa-filter** to zero.

## Parameters

### ***name***

Specifies the name of the ISA filter, up to 32 characters.

### ***all***

Clears all ISA filter entries.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## isa-filter

## Syntax

**isa-filter**

**isa-filter** *name*

**isa-filter** *name* **associations**

**isa-filter** *name* **ipv4**

**isa-filter** *name* **ipv6**

## Context

[\[Tree\]](#) (show>subscr-mgmt isa-filter)

## Full Context

show subscriber-mgmt isa-filter

## Description

This command displays ISA filter information.

## Parameters

### ***name***

Specifies the ISA filter name, up to 32 characters.

### **associations**

Displays associated information about the specified ISA filter name.

### **ipv4**

Display IPv4 ISA filter information for the specified ISA filter name.

### **ipv6**

Display IPv6 ISA filter information for the specified ISA filter name.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 14.30 isa-policer

isa-policer

### Syntax

**isa-policer** *policer-name*

**isa-policer** *policer-name* **associations**

**isa-policer**

### Context

[\[Tree\]](#) (show>subscr-mgmt isa-policer)

### Full Context

show subscriber-mgmt isa-policer

### Description

This command displays ISA policer information.

### Parameters

***policer-name***

Specifies the ISA policer name, up to 32 characters.

**associations**

Displays associated information about the specified ISA policer name.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 14.31 isa-radius-policy

isa-radius-policy

### Syntax

**isa-radius-policy** *policy-name*

**isa-radius-policy** *policy-name* **associations**

## Context

[\[Tree\]](#) (show>aaa isa-radius-policy)

## Full Context

show aaa isa-radius-policy

## Description

This command displays ISA RADIUS policy information.

## Parameters

### *policy-name*

Displays information about the specified ISA RADIUS policy.

### *associations*

Displays the information associated with the ISA RADIUS server policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of AAA ISA RADIUS policy information.

### Output Example

```
*B:asd-tr0610-dr421# show aaa isa-radius-policy "ZiggoAAA_DRP_ISAPlcy"
=====
Status for ISA RADIUS server policy "ZiggoAAA_DRP_ISAPlcy"

```

[Table 246: Output fields: subscriber ISA RADIUS policy](#) describes subscriber ISA RADIUS policy output fields.

*Table 246: Output fields: subscriber ISA RADIUS policy*

Label	Description
Purposes Up	The RADIUS services that are up and running, and fully operational for this server

Label	Description
Source IP address	The IP address of the RADIUS server
Acct Tx Requests	The number of RADIUS transaction requests transmitted
Acct TX Retries	The number of RADIUS transaction request retries
Acct TX Timeouts	The number of RADIUS transaction requests that have timed out
Acct RX Replies	The number of RADIUS transaction responses received
Auth Tx Requests	The number of authentication requests transmitted
Auth Tx Retries	The number of authentication request retries
Auth Tx Timeouts	The number of RADIUS authentication requests that have timed out for the policy
CoA RX Requests	The number of Change-of-Authorization message responses received

## isa-radius-policy

### Syntax

**isa-radius-policy** *policy-name* **statistics**

### Context

[\[Tree\]](#) (clear>aaa isa-radius-policy)

### Full Context

clear aaa isa-radius-policy

### Description

This command clears ISA RADIUS policy data.

### Parameters

***policy-name***

Specifies the ISA RADIUS policy name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 14.32 isa-service-chaining

### isa-service-chaining

#### Syntax

**isa-service-chaining vas-filter** *name*

#### Context

[\[Tree\]](#) (clear>subscr-mgmt isa-service-chaining)

#### Full Context

clear subscriber-mgmt isa-service-chaining

#### Description

This command clears all L2-aware NAT flows of all hosts associated with the VAS filter and can be used if all flows need re-evaluation against a modified set of matching criteria.

#### Parameters

*name*

Specifies the filter name, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### isa-service-chaining

#### Syntax

**isa-service-chaining**

#### Context

[\[Tree\]](#) (show>subscr-mgmt isa-service-chaining)

#### Full Context

show subscriber-mgmt isa-service-chaining

#### Description

Commands in this context display ISA service chaining information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## isa-service-chaining

### Syntax

**isa-service-chaining**

### Context

**[Tree]** (show>router isa-service-chaining)

### Full Context

show router isa-service-chaining

### Description

This command displays information related to service chaining (for ESM hosts with L2-aware NAT) at the router level.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### Output

The following output is an example of ISA service chaining information.

### Output Example

```
show router isa-service-chaining
=====
ISA Service Chaining - Router "Base"
=====
VXLAN Tep range      : 1.2.3.4 - 1.2.3.8
NAT Groups           : 2
=====
```

Table 247: Output fields: ISA service chaining

Label	Description
VXLAN Tep range	The VXLAN Tep Information (VTEP) range
NAT Groups	The NAT ISA group used in a virtual router for Service Chaining.

## 14.33 isa-subnets

### isa-subnets

#### Syntax

**isa-subnets** [**detail**]

**isa-subnets** [**detail**] **interface** *interface-name*

**isa-subnets** **prefix** *ipv6-address/prefix-length*

#### Context

[\[Tree\]](#) (show>router>wlan-gw isa-subnets)

#### Full Context

show router wlan-gw isa-subnets

#### Description

This command outputs all the prefixes in use by the WLAN GW pool manager.

#### Parameters

##### **detail**

Displays detailed information for each prefix.

##### ***interface-name***

Displays only the prefixes associated with this subscriber interface.

##### ***ipv6-address/prefix-length***

Displays details of a specific IPv6 address and prefix.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of WLAN-GW ISA subnet information.

#### Output Example

```
system# show router wlan-gw isa-subnets

## isa-subnets

### Syntax

**isa-subnets all**

**isa-subnets interface** *ip-int-name*

**isa-subnets prefix** *ipv6-address/prefix-length*

### Context

[\[Tree\]](#) (clear>router>wlan-gw isa-subnets)

### Full Context

clear router wlan-gw isa-subnets

### Description

This command clears specific subnets from the pool-manager. Associated UE's is removed from the system.

When clearing the last subnet on an ISA the pool-manager will automatically allocate a new subnet with allocation-level 0%.

### Parameters

**all**

Clears all the isa-subnets.

***ip-int-name***

Clears all the isa-subnets of a specific subscriber-interface.

***ipv6-address/prefix-length***

Clears a specific IPv6 address and prefix length.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 14.34 isid-route-target

## isid-route-target

### Syntax

**isid-route-target**

### Context

[\[Tree\]](#) (show>service>id>bgp-evpn isid-route-target)

## Full Context

```
show service id bgp-evpn isid-route-target
```

## Description

This command displays a list of the auto-derived or configured ISID-based route-targets per B-VPLS service. The entries show the ISID ranges and association to either an auto-rt or an actual configured route-target.

The auto-rt display format is: <2-byte-as-number>:<4-byte-value>, where: 4-byte-value = 0x30+ISID.

## Platforms

All

## Output

### Output Example

```
*A:PE-2# show service id 10 bgp-evpn isid-route-target

## 14.35 isid-using

### isid-using

## Syntax

```
isid-using [ISID]
```

## Context

[\[Tree\]](#) (show>service isid-using)

## Full Context

```
show service isid-using
```

## Description

This command displays services using an ISID.

## Parameters

### ISID

Specifies a 24 bit (0 to 16777215) service instance identifier for this service. As part of the Provider Backbone Bridging frames, it is used at the destination PE as a demultiplexor field.

**Values** 0 to 16777215

## Platforms

All

## Output

The following output is an example of services using ISID information.

### Output Example

```
*A:SetupCLI# show service isid-using

## 14.36 isis

### isis

#### Syntax

**isis** [*isis-instance*]

## Context

**[Tree]** (clear>router isis)

## Full Context

clear router isis

## Description

Commands in this context clear and reset IS-IS protocol entities.

## Parameters

### *isis-instance*

Specifies the IS-IS instance.

**Values** 0 to 127

### *level*

Specifies the IS-IS level.

**Values** 1, 2

## Platforms

All

## Output

The following outputs are examples of IS-IS traffic engineering database information.

### Output Example

```
A:Dut-B# tools dump router te-database isis
=====

## isis

### Syntax

**isis** [*isis-instance*]

### Context

[\[Tree\]](#) (show>router isis)

### Full Context

show router isis

### Description

This command displays information for a specified IS-IS instance.

### Parameters

***isis-instance***

Specifies the instance ID for an IS-IS instance.

**Values** 0 to 127

**Default** 0

### Platforms

All

## isis

### Syntax

**isis**

### Context

[\[Tree\]](#) (tools>dump>router isis)

### Full Context

tools dump router isis

### Description

Commands in this context dump tools for IS-IS.

### Parameters

***isis-instance***

Specifies the IS-IS protocol instance within the router instance.

**Values** 0 to 127

## Platforms

All

isis

## Syntax

isis

## Context

[\[Tree\]](#) (tools>perform>router isis)

## Full Context

tools perform router isis

## Description

This command enables the tools to perform certain IS-IS tasks.

## Parameters

*isis-instance*

Specifies the IS-IS protocol instance within the router instance.

**Values** 0 to 127

## Platforms

All

isis

## Syntax

isis [*isis-instance*]

## Context

[\[Tree\]](#) (monitor>router isis)

## Full Context

monitor router isis

## Description

This command monitors commands for the IS-IS instance.

## Parameters

### *isis-instance*

Specifies the IS-IS protocol instance within the router instance.

**Values** 0 to 127

## Platforms

All

## 14.37 issu-post-process

issu-post-process

## Syntax

**issu-post-process**

## Context

[\[Tree\]](#) (tools>perform>redundancy issu-post-process)

## Full Context

tools perform redundancy issu-post-process

## Description

This command allows requests for new LSPs.

## Platforms

All

# 15 k Commands

## 15.1 keychain

### keychain

#### Syntax

**keychain** [*key-chain*] [**detail**]

#### Context

[\[Tree\]](#) (show>system>security keychain)

#### Full Context

show system security keychain

#### Description

This command displays keychain information.

#### Parameters

##### *key-chain*

Specifies the keychain name to display.

##### **detail**

Displays detailed keychain information.

#### Platforms

All

#### Output

The following output is an example of keychain information.

#### Output Example

```
*A:ALA-A# show system security keychain test

## 16 I Commands

### 16.1 I2-aware

#### I2-aware

##### Syntax

**I2-aware create subscriber** *sub-ident-string* **ip** *ip-address* **protocol** {**tcp** | **udp**} [**port** *port*] **lifetime** *lifetime* [**outside-ip** *ip-address*] [**outside-port** *port*] [**nat-policy** *policy-name*]

**I2-aware delete subscriber** *sub-ident-string* **ip** *ip-address* **protocol** {**tcp** | **udp**} **port** *port* [**nat-policy** *policy-name*]

**I2-aware modify subscriber** *sub-ident-string* **ip** *ip-address* **protocol** {**tcp** | **udp**} **port** *port* **lifetime** *lifetime* [**nat-policy** *policy-name*]

##### Context

[\[Tree\]](#) (tools>perform>nat>port-forwarding-action I2-aware)

##### Full Context

tools perform nat port-forwarding-action I2-aware

##### Description

This command enables Layer-2-Aware NAT port forwarding action.

##### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### 16.2 I2-aware-blocks

#### I2-aware-blocks

##### Syntax

**I2-aware-blocks** [**outside-ip-prefix** *ip-prefix/length*] [**outside-port** [*1..65535*]] [**pool** *pool-name*]

##### Context

[\[Tree\]](#) (show>router>nat I2-aware-blocks)

## Full Context

```
show router nat l2-aware-blocks
```

## Description

This command displays Layer 2 aware NAT blocks.

## Parameters

### *ip-prefix*

Specifies the IP prefix.

**Values** a.b.c.d (host bits must be 0)

### *length*

Specifies the IP prefix length.

**Values** 1 to 32

### *pool-name*

Specifies the pool name up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of this command.

### Output Example

```
show router nat l2-aware-blocks
=====
Layer-2-Aware NAT blocks for Base
=====
10.81.0.0 [32..33]
Pool : MyPool
Policy : outPolicy
Started : 2010/02/04 16:24:55
Subscriber ID : Sub001
10.81.0.0 [34..35]
Pool : MyPool
Policy : outPolicy
Started : 2010/02/04 16:25:24
Subscriber ID : Sub003
10.81.0.203 [32..41]
Pool : MyPool2
Policy : outPolicy2
Started: 2010/02/04 16:25:21
Subscriber ID : Sub002
-----
Number of blocks: 3
=====
```

## 16.3 I2-aware-hosts

### I2-aware-hosts

#### Syntax

**I2-aware-hosts** [**outside-router** *router-instance*] [**outside-ip** *outside-ip-address*] [**inside-ip-prefix** *ip-prefix/mask*] [**vas-filter** *vas-filter-name*]

#### Context

[\[Tree\]](#) (show>service>nat I2-aware-hosts)

#### Full Context

show service nat I2-aware-hosts

#### Description

This command displays layer-2 aware NAT hosts.

#### Parameters

##### ***nat-policy-name***

Specifies the NAT policy name, up to 32 characters.

##### ***nat-group-id***

Specifies the NAT group ID.

**Values** 1 to 4

##### ***router-instance***

Specifies the router instance.

<b>Values</b>	router-name:	Base , management
	service-id:	1 to 2147483647
	svc-name:	A string up to 64 characters in length.

##### ***outside-ip-address***

Specifies the outside IP address.

**Values** a.b.c.d

##### ***sub-ident***

Specifies the identifier, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of this command.

### Output Example

```
show service nat l2-aware-hosts
=====
Layer-2-Aware NAT hosts
=====
Inside IP Out-Router Outside IP Subscriber
-----
10.0.0.100 Base 10.81.0.0 Sub001
10.0.0.102 Base 10.81.0.0 Sub001
10.0.0.101 Base 10.81.0.203 Sub002
10.0.0.103 Base 10.81.0.0 Sub003
-----
No. of hosts: 4
=====
```

## 16.4 l2-aware-sub

### l2-aware-sub

#### Syntax

**l2-aware-sub** *sub-ident-string*

**l2-aware-sub** *sub-ident-string* **firewall-statistics**

#### Context

[\[Tree\]](#) (clear>nat l2-aware-sub)

#### Full Context

clear nat l2-aware-sub

#### Description

This command clears NAT mappings for L2-Aware subscribers.

#### Parameters

##### ***sub-ident-string***

Specifies the subscriber identification string, up to 64 characters.

##### **firewall-statistics**

Clears only the firewall counters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.5 I2-aware-subscribers

### I2-aware-subscribers

#### Syntax

**I2-aware-subscribers subscriber sub-ident**

**I2-aware-subscribers [nat-policy nat-policy-name] [nat-group nat-group-id] [member [1..255]] [outside-router router-instance] [outside-ip outside-ip-address] [firewall-policy policy-name]**

#### Context

[\[Tree\]](#) (show>service>nat I2-aware-subscribers)

#### Full Context

show service nat I2-aware-subscribers

#### Description

This command displays layer-2 aware NAT subscribers.

#### Parameters

##### **nat-policy-name**

Specifies the NAT policy name, up to 32 characters.

##### **nat-group-id**

Specifies the NAT group ID.

**Values** 1 to 4

##### **router-instance**

Specifies the router instance.

<b>Values</b>	router-name:	Base, management
	service-id:	1 to 2147483647
	svc-name:	A string up to 64 characters.

##### **outside-ip-address**

Specifies the outside IP address.

**Values** a.b.c.d

##### **sub-ident**

Specifies the identifier, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of this command.

### Output Example

```
show service nat l2-aware-subscribers

## 16.6 I2-route-table

### I2-route-table

#### Syntax

**I2-route-table** [detail] [bgp-ad] [multi-homing] [bgp-vpls] [bgp-vpws] [all-routes]

## Context

[\[Tree\]](#) (show>service l2-route-table)

## Full Context

show service l2-route-table

## Description

This command displays Layer 2 route table information.

## Parameters

### detail

Displays detailed information.

### bgp-ad

Displays BGP AD related information.

### multi-homing

Displays multihoming related information.

### bgp-vpls

Displays BGP VPLS related information.

### bgp-vpws

Displays BGP VPWS related information.

### all-routes

Displays active or inactive routes.

## Platforms

All

## Output

Use the following command to display Layer 2 route table information.

### Output Example

```

## I2-route-table

### Syntax

```
I2-route-table [detail] [bgp-ad] [multi-homing] [bgp-vpls] [bgp-vpws] [all-routes]
```

### Context

```
[Tree] (show>service>id I2-route-table)
```

### Full Context

```
show service id I2-route-table
```

### Description

This command displays Layer 2 route table information.

## Parameters

### detail

Displays detailed information.

### bgp-ad

Displays BGP-AD information.

### multi-homing

Displays multi-homing information.

### bgp-vpls

Displays BGP VPLS information.

### bgp-vpws

Displays BGP VPWS information.

### all-routes

Displays active or inactive routes.

## Platforms

All

## Output

Use the following command to display Layer 2 route table information.

### Output Example

```
show service id 1 l2-route-table detail
```

```
=====

Table 248: Output fields: service ID Layer 2 route table

Label	Description
Admin State	Displays the administrative state of the service Up — Indicates the service is administratively enabled Down — Indicates the service is administratively disabled
Vpls Id	Displays the Virtual Private LAN Service (VPLS) ID
Prefix	Displays information for the specified IP prefix and mask length
Veld	Displays the VEID for BGP-VPLS routes
PW Temp Id	Displays the Pseudowire (PW) temporary ID
RD	Displays information for the route distinguisher
Next Hop	Displays the next hop for the route
State (D-Bit)	Displays the state of the Disable-bit (D-bit). The D-bit ensures packet integrity between the terminal and host packet assembler/disassemblers
Path MTU	Displays the maximum transmission unit (MTU) of the path
Hash Label Tx	Displays the transmit hash label value
Hash Label Rx	Displays the receive hash label value

Label	Description
Control Word	Displays information about the control word. The control word is an optional 4-byte field used in the pseudowire packet
Seq Delivery	Displays information about sequence delivery
DF Bit	Displays information about the DF bit
Status	Displays the status of the service
Sdp Bind Id	Displays information about the SDP binding ID

## 16.7 I2-services

### I2-services

#### Syntax

**I2-services** [**service** *service-id*]

#### Context

[\[Tree\]](#) (show>cflowd I2-services)

#### Full Context

show cflowd I2-services

#### Description

This command displays Layer 2 and SAP/SDP services on which Layer 2 sampling is enabled.

#### Parameters

***service-id***

Specifies the service ID.

**Values** 1 to 2148278386, svc-name: up to 64 characters

#### Platforms

All

#### Output

The following output is an example of cflowd Layer 2 services information.

#### Output Example

```
*A:Dut-B>config>cflowd# show cflowd l2-services
```

```

=====
Cflowd L2-Services

## 16.8 I2-vpn

### I2-vpn

#### Syntax

**I2-vpn** [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**rd** *rd*] [**brief**] [**I2vpn-type**] [**veid** *veid*] [**offset** *vpls-base-offset*] [**siteid** *site-id*]

**I2-vpn** [**aspath-regex** *reg-exp*] **hunt** [**community** *comm-id*] [**rd** *rd*] [**brief**] [**I2vpn-type**] [**veid** *veid*] [**offset** *vpls-base-offset*] [**siteid** *site-id*]

**I2-vpn** [**detail** | **longer**] [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**rd** *rd*] [**I2vpn-type**] [**veid** *veid*] [**offset** *vpls-base-offset*] [**siteid** *site-id*]

#### Context

[\[Tree\]](#) (show>router>bgp>routes I2-vpn)

#### Full Context

show router bgp routes I2-vpn

#### Description

This command displays BGP flow L2-VPN routes.

#### Parameters

##### **reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

##### **hunt**

Displays entries for the specified route.

##### **comm-id**

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535

- *ext-comm* — the extended community, defined as one of the following:
  - *{target | origin}:ip-address:comm-val*
  - *{target | origin}:asnum:ext-comm-val*
  - *{target | origin}:ext-asnum:comm-val*
  - **bandwidth**:*asnum:val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext**:*value1:value2*
  - **flowspec-set**:*ext-asnum:group-id*where:
  - *target* — route target
  - *origin* — route origin
  - *ip-address* — a.b.c.d
  - *ext-comm-val* — 0 to 4294967295
  - *ext-asnum* — 0 to 4294967295
  - **bandwidth** — bandwidth
  - *val-in-mbps* — 0 to 16777215
  - **ext** — extended
  - **ext:4300** — origin verification
  - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
  - *value1* — 0000 to FFFF
  - *value2* — 0 to FFFFFFFFFF
  - **flowspec-set** — flow-spec set
  - *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

### **rd**

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

### **brief**

Displays the BGP flow L2-VPN route information in a brief format.

### **l2vpn-type**

Specifies a 12-byte Virtual Switch Instance identifier (VSI-ID) type.

**Values** *bgp-ad*, *bgp-vpls*, *bgp-vpws*, and *multi-homing*

### ***veid***

Specifies a two byte identifier that represents the local bridging instance in a VPLS and is advertised through the BGP NLRI. This value must be lower than or equal to the *max-ve-id*.

**Values** 0 to 4294967295

### ***vpls-base-offset***

Specifies a two byte identifier advertised through the NLRI that is used to indicate which VE-ID should use the advertised NLRI at the receiving PE according to the following rule: if the offset  $\leq$  local VE-ID  $\leq$  offset+VBS-1 (VBS = virtual block size = 8 in our implementation) then the NLRI is processed. Otherwise it is ignored. The NLRI with this offset is generated as soon as the first VE-ID value between (offset, offset + VBS-1) is advertised in the network.

**Values** 0 to 4294967295

### ***site-id***

Specifies a two byte identifier usually employed for the BGP multi-homing solution. This value identifies the BGP multi-homing site associated with one or a set of objects (SAPs, pseudowires, or a combination). The *site-id* must be identical between the two PEs carrying the connection to the access device multi-homed to the PEs.

**Values** 0 to 4294967295

## **Platforms**

All

## **16.9 I2pt**

### I2pt

#### **Syntax**

**I2pt disabled**

**I2pt [detail]**

#### **Context**

[\[Tree\]](#) (show>service>id I2pt)

#### **Full Context**

show service id I2pt

#### **Description**

This command displays Layer 2 Protocol Tunnel (L2-PT) route information associated with this service.

## Parameters

### disabled

Displays only entries with termination disabled. This helps identify configuration errors.

### detail

Displays detailed information.

## Platforms

All

## Output

The following output is an example of service L2PT information.

### Output Example

Table 249: Output fields: L2PT describes show L2PT output fields.

Table 249: Output fields: L2PT

Label	Description
Service id	Displays the 24 bit (0 to 16777215) service instance identifier for the service.
L2pt-term enabled	Indicates if L2-PT-termination and/or Bpdu-translation is in use in this service by at least one SAP or spoke-SDP binding. If in use, at least one of L2PT-termination or Bpdu-translation is enabled.  When enabled it is not possible to enable STP on this service.
L2pt-term disabled	Indicates that L2-PT-termination is disabled.
Bpdu-trans auto	Specifies the number of L2-PT PDUs are translated before being sent out on a port or sap.
Bpdu-trans disabled	Indicates that Bpdu-translation is disabled.

Label	Description
SAPs	Displays the number of SAPs with L2PT or BPDU translation enabled or disabled.
SDPs	Displays the number of SDPs with L2PT or BPDU translation enabled or disabled.
Total	Displays the column totals of L2PT entities.
Sapld	The ID of the access point where this SAP is defined.
L2pt-termination	Indicates whether L2pt termination is enabled or disabled.
Admin Bpdu-translation	Specifies whether Bpdu translation is administratively enabled or disabled.
Oper Bpdu-translation	Specifies whether Bpdu translation is operationally enabled or disabled.
Sdpld	Specifies the SAP ID.

## label

### Syntax

#### label summary

**label** [**start** *start-label*] [**end** *end-label*] [**in-use**] [**owner** {**static** | **pce** | **sr-pol**}]

### Context

[\[Tree\]](#) (show>router>p2mp-sr-tree label)

### Full Context

show router p2mp-sr-tree label

## Description

This command displays P2MP SR label information.

## Parameters

### ***start-label***

specifies the starting label value from which to display the P2MP SR label information. If only *start-label* is specified, only labels using *start-label* are displayed.

**Values** 32 to 524287

### ***end-label***

Specifies the ending label value for which to display P2MP SR label information.

**Values** 32 to 524287

### ***in-use***

Displays labels that are in use.

### ***owner***

Displays labels owned by the specified owner.

### ***static***

Displays labels owned by the static owner.

### ***pce***

Displays labels owned by the PCE.

### ***sr-pol***

Displays labels owned by the SR policy.

## Platforms

All

## Output

The following output is an example of P2MP SR label information.

### Output Example

```
A:swsim103>show>router>p2mp-sr-tree# label
=====
P2MP-SR Label Information
=====
Label           Owner           InUse
-----
30000           static          Yes
30001           static          Yes
```

## label

## Syntax

**label** [*label*] [*detail*]

**label** [*label*] **egress-stats**

**label** [*label*] **ingress-stats**

## Context

**[Tree]** (show>router>rib-api label)

## Full Context

show router rib-api label

## Description

This command displays RIB-API label information.

## Parameters

**label**

Specifies the label of a specified RIB-API entry.

**Values** 16 to 1048575

**detail**

Displays detailed RIB-API label information.

**egress-stats**

Displays egress statistics of all instances for the specified RIB-API label.

**ingress-stats**

Displays ingress statistics of all instances for the specified RIB-API label.

## Platforms

All

## Output

The following output is an example of RIB-API label information.

### Output Example

```
show router rib-api label 400001 egress-stats

### Syntax

**label** *label* **preference** *preference* **client-tag** *client-tag* **egress-stats**

**label** *label* **ingress-stats**

### Context

[\[Tree\]](#) (clear>router>rib-api label)

### Full Context

clear router rib-api label

### Description

Clears the egress or ingress statistics of the specified RIB-API label.

### Parameters

#### ***label***

Specifies the label of the specified RIB-API entry.

**Values** 32 to 1048575

#### ***preference***

Specifies the preference of the specified RIB-API entry.

**Values** 0 to 4294967295

#### ***client-tag***

Specifies the client tag of the specified RIB-API entry.

**Values** 0 to 4294967295

#### **egress**

Specifies to only clear the egress statistics.

#### **ingress**

Specifies to only clear the ingress statistics.

## label

### Syntax

```
label label preference preference client-tag client-tag egress-stats [ interval seconds] [ repeat repeat]
    [{absolute | rate}]
```

### Context

[\[Tree\]](#) (monitor>router>rib-api label)

### Full Context

monitor router rib-api label

### Description

This command monitors the egress statistics of the specified RIB-API label.

### Parameters

#### *label*

Specifies the label of the specified RIB-API entry.

**Values** 0 to 4294967295

#### *preference*

Specifies the preference of the specified RIB-API entry.

**Values** 0 to 4294967295

#### *client-tag*

Specifies the client tag of the specified RIB-API entry.

**Values** 0 to 4294967295

#### *egress-stats*

Specifies to monitor the egress statistics of the specified RIB-API label.

#### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

**repeat**

Configures how many times the command is repeated.

**Values** 1 to 999

**absolute**

Displays the absolute statistics of the specified RIB-API label.

**rate**

Displays the rate-per-second statistics of the specified RIB-API label.

**Platforms**

All

## 16.13 label-ipv4

### label-ipv4

**Syntax**

**label-ipv4** [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**origin-val** *originState*] [**leaked**] [**leakable**]  
[**brief**] [**all**]

**label-ipv4** [**aspath-regex** *reg-exp*] **hunt** [**community** *comm-id*] [**origin-val** *originState*] [**leaked**] [**leakable**]  
[**brief**] [**all**]

**label-ipv4** [**detail** | **longer**] [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**origin-val** *originState*] [**leaked**]  
[**leakable**] [**all**]

**Context**

[\[Tree\]](#) (show>router>bgp>routes label-ipv4)

**Full Context**

show router bgp routes label-ipv4

**Description**

This command displays BGP IPv4 routes.

**Parameters**

**reg-exp**

Displays routes with an AS path matching the specified regular expression *reg-exp*, up to 80 characters.

**comm-id**

Specifies community IDs, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
  - *{target | origin}:ip-address:comm-val*
  - *{target | origin}:asnum:ext-comm-val*
  - *{target | origin}:ext-asnum:comm-val*
  - **bandwidth:asnum:val-in-mbps**
  - **ext:4300:ovstate**
  - **ext:value1:value2**
  - **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target
  - *origin* — route origin
  - *ip-address* — a.b.c.d
  - *ext-comm-val* — 0 to 4294967295
  - *ext-asnum* — 0 to 4294967295
  - **bandwidth** — bandwidth
  - *val-in-mbps* — 0 to 16777215
  - **ext** — extended
  - **ext:4300** — origin verification
  - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
  - *value1* — 0000 to FFFF
  - *value2* — 0 to FFFFFFFFFF
  - **flowspec-set** — flow-spec set
  - *group-id* — 0 to 16383
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise | blackhole**

### **originState**

Filters the BGP routes displayed by the command to those routes with a particular RPKI route origin validation state.

- Values**
- valid — Displays valid validation state information.
  - invalid — Displays invalid validation state information.
  - notfound — Displays state information for unfound origin values.

### **hunt**

Displays entries for the specified route.

**leaked**

Filters the BGP routes displayed by the command to those routes leaked into this router's BGP instance from another BGP instance.

**leakable**

Filters the BGP routes displayed by the command to those routes eligible for leaking from this router's BGP instance to another BGP instance.

**brief**

Provides a summarized display of the set of peers to which a BGP route is advertised.

**longer**

Displays the specified route and subsets of the route.

**detail**

Display the longer, more detailed version of the output.

**all**

Displays output for all label BGP IPv4 routes.

**Platforms**

All

## 16.14 label-ipv6

### label-ipv6

**Syntax**

**label-ipv6** [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**origin-val** *originState*] [**leaked**] [**leakable**] [**brief**] [**all**]

**label-ipv6** [**aspath-regex** *reg-exp*] **hunt** [**community** *comm-id*] [**origin-val** *originState*] [**leaked**] [**leakable**] [**brief**] [**all**]

**label-ipv6** [**detail** | **longer**] [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**origin-val** *originState*] [**leaked**] [**leakable**] [**all**]

**Context**

[\[Tree\]](#) (show>router>bgp>routes label-ipv6)

**Full Context**

show router bgp routes label-ipv6

**Description**

This command displays information about BGP IPv6 routes.

## Parameters

### *reg-exp*

Displays routes with an AS path matching the specified regular expression *reg-exp*, up to 80 characters.

### *comm-id*

Specifies community IDs, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm*]

where:

- *as-num* — 0 to 65535
  - *comm-val* — 0 to 65535
  - *ext-comm* — the extended community, defined as one of the following:
    - *{target | origin}:ip-address:comm-val*
    - *{target | origin}:asnum:ext-comm-val*
    - *{target | origin}:ext-asnum:comm-val*
    - **bandwidth:asnum:val-in-mbps**
    - **ext:4300:ovstate**
    - **ex \t:value1:value2**
    - **flowspec-set:ext-asnum:group-id**
- where:
- *target* — route target
  - *origin* — route origin
  - *ip-address* — a.b.c.d
  - *ext-comm-val* — 0 to 4294967295
  - *ext-asnum* — 0 to 4294967295
  - **bandwidth** — bandwidth
  - *val-in-mbps* — 0 to 16777215
  - **ext** — extended
  - **ext:4300** — origin verification
  - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
  - *value1* — 0000 to FFFF
  - *value2* — 0 to FFFFFFFFFF
  - **flowspec-set** — flow-spec set
  - *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**

### **originState**

Filters the BGP routes displayed by the command to those routes with a particular RPKI route origin validation state.

- Values**
- valid — Displays valid validation state information.
  - invalid — Displays invalid validation state information.
  - notfound — Displays state information for unfound origin values.

### **hunt**

Displays entries for the specified route.

### **leaked**

Filters the BGP routes displayed by the command to those routes leaked into this router's BGP instance from another BGP instance.

### **leakable**

Filters the BGP routes displayed by the command to those routes eligible for leaking from this router's BGP instance to another BGP instance.

### **brief**

Provides a summarized display of the set of peers to which a BGP route is advertised.

### **longer**

Displays the specified route and subsets of the route.

### **detail**

Display the longer, more detailed version of the output.

### **all**

Displays output for all label BGP IPv6 routes.

## 16.15 label-range

### label-range

#### Syntax

**label-range**

#### Context

**[Tree]** (show>router>mpls-labels label-range)

## Full Context

show router mpls-labels label-range

## Description

This command displays the MPLS label range.

## Platforms

All

## Output

The following output is an example of MPLS label range information.

[Table 251: Output fields: MPLS label range](#) describes the MPLS label range output fields.

Table 251: Output fields: MPLS label range

Label	Description
Label Type	Displays the information about <b>static-lsp</b> , <b>static-svc</b> , and <b>dynamic</b> label types.
Start Label	The label value assigned at the ingress router.
End Label	The label value assigned for the egress router.
Aging	The number of labels released from a service which are transitioning back to the label pool. Labels are aged 15 s.
Total Available	The number of label values available.

## Output Example

```

## Context

[\[Tree\]](#) (show lag)

## Full Context

show lag

## Description

This command displays Link Aggregation Group (LAG) information.

If no command line options are specified, a summary listing of all LAGs is displayed.

## Parameters

### *lag-id*

Displays only information on the specified LAG ID.

**Values** 1 to 800

**Default** Displays information for all LAG IDs.

### **detail**

Keyword that displays detailed LAG information.

**Default** Displays summary information.

### **statistics**

Keyword that displays LAG statistics information.

### **lACP-statistics**

Keyword that displays the number of LACP PDUs transmitted and received per LAG port.

### **description**

Keyword that displays the user-defined description for the LAG.

### **egress-rate-distribution**

Keyword that displays the egress traffic rate in kb/s per LAG port.

**port**

Keyword that displays port information.

**associations**

Keyword that displays a list of current router interfaces to which the LAG is assigned.

**interface**

Keyword that displays interface information.

**bfd**

Keyword that displays per-member BFD information.

**eth-cfm**

Keyword that displays a list of Ethernet tunnels to which the LAG is assigned.

**tunnel-id**

Filters ETH-CFM MEP information to one tunnel.

**Values** 1 to 4094

**flow-distribution**

Keyword that displays the flow distribution per active LAG port in a given LAG. The operator can control the flow distribution per LAG by configuring a **hash-weight** value on each ports of a LAG.

Inactive LAG ports are not displayed.

**per-link-hash**

Keyword that displays information about a SAP or interface associated with this LAG sends traffic over a single link of a LAG auto-re-balancing as links are added and removed from this LAG.

**lACP-partner**

Keyword that displays LACP partner information.

**link-map-profile**

Displays information about a specified LAG link map profile.

**Values** 1 to 64

**sap**

Keyword that displays SAP information.

**port-id**

Specifies the port ID.

**Values** *slot/mda/port*

**Platforms**

All

**Output Fields: show lag**

[Table 253: Output fields: LAG](#) describes the output fields for the **show lag** command.

*Table 253: Output fields: LAG*

Label	Description
Lag-id	The LAG or multi-link bundle ID that the port is assigned to.
Lag-name	The LAG name.
Adm	Up — The LAG is administratively up. Down — The LAG is administratively down.
Opr	Up — The LAG is operationally up.

Label	Description
	Down—The LAG is operationally down.
Threshold	The number of operational links for the LAG at or below which the configured action is invoked.
Up-Count	The number of ports that are physically present and have physical links present.
MC Act/Stdby	Member port is selected as active or standby link.

**Output Example: show lag <lag-id> detail**

```

**Output Fields: show lag <lag-id> detail**

[Table 254: Output fields: LAG detail](#) describes the output fields for the **show lag lag-id detail** command. The output is dependent on whether or not the LAG was configured as a multi-chassis (MC) LAG.

*Table 254: Output fields: LAG detail*

Label	Description
Lag-id	The LAG identification.
Lag-name	The LAG name.
Mode	The LAG mode: <ul style="list-style-type: none"> <li>• access</li> <li>• hybrid</li> <li>• network</li> </ul>
Adm	Administrative state of the LAG. Up — The LAG is administratively up. Down — The LAG is administratively down.
Opr	Operational state of the LAG. Up — The LAG is operationally up. Down — The LAG is operationally down.
Thres. Last Cleared	The last time that port or weight thresholds were cleared: <ul style="list-style-type: none"> <li>• when there is a falling or rising hit</li> <li>• when they are configured and immediately reached</li> <li>• when they are not configured when reached</li> </ul> Not cleared by the threshold cfg or deconfig command when the port or weight threshold is removed. The port or weight threshold can then be configured but not immediately reached.
Thres. Exceeded Cnt	The number of times that the weight or port threshold rising counter was reached.  The Thres. Exceed counter displays the rising counter, as the falling counter is only available via SNMP.

Label	Description
	When we configure or deconfigure the port or weight threshold, the Thresh. Exceed counter is set to 0.
Dynamic Cost	Enabled — Dynamic cost is enabled. Disabled — Dynamic cost is disabled.
Encap Type	The LAG port encapsulation type: <ul style="list-style-type: none"> <li>• dot1q</li> <li>• null</li> <li>• qinq</li> </ul>
Configured Address	The configured Ethernet MAC address.
Lag-IfIndex	A box-wide unique number assigned to this interface.
Hardware Address	The Ethernet MAC address.
Adapt Qos (access)	Displays the configured QoS mode: <ul style="list-style-type: none"> <li>• distribute</li> <li>• link</li> <li>• port-fair</li> </ul>
Hold-Time Down	The timer, in tenths of seconds, which controls the delay between detecting that a LAG is down and reporting it to the higher levels.
Port Type	The port type: <ul style="list-style-type: none"> <li>• hs</li> <li>• standard</li> </ul>
Per-Link-Hash	Enabled — Per link hash is enabled. Disabled — Per link hash is disabled.
Include-Egr-Hash-Cfg	The explicitly configured hashing that is included to the egress buffering and rate distribution.
Per FP Ing Queuing	The per FP ingress queuing status.
Per FP Egr Queuing	The per FP egress queuing status.
Per FP SAP Instance	The per FP SAP instance status.
Access Bandwidth	The LAG access bandwidth value.
Access Booking Factor	The LAG access booking factor.
Access Available BW	The access available bandwidth.
Access Booked BW	The access booked bandwidth.

Label	Description
LACP	Enabled — LACP is enabled. Down — LACP is disabled.
LACP Transmit Intvl	The LACP transmit interval mode.
LACP xmit stdby	The LACP transmit standby mode.
Selection Criteria	Configured LAG selection criteria.
Slave-to-partner	The LACP slave-to-partner enabled or disabled state.
MUX control	Configured type of multiplexing machine control used in a LAG with LACP in active/passive modes. coupled — TX and RX activate together. independent — RX activates independent of TX.
Subgrp hold time	The sub-group hold time value.
Remaining time	The sub-group remaining time value.
Subgrp selected	The number of sub-group selected in this LAG.
Subgrp candidate	The sub-group candidate.
Subgrp count	The number of sub-group configured in this LAG.
System Id	System ID used by actor in LACP messages.
System Priority	System priority used by actor in LACP messages.
Admin Key	Configured LAG key.
Oper Key	Key used by actor in LACP messages.
Prtr System Id	System ID used by partner in LACP messages.
Prtr System Priority	System priority used by partner in LACP messages.
Prtr Oper Key	Key used by partner in LACP messages.
Standby Signaling	The standby signaling mode used in this LAG.
Port hashing	Displays the LAG port hashing mechanism for flow distribution per LAG port. <ul style="list-style-type: none"> <li>• <b>port-speed</b> — the port hashing value is inherited from the port speed</li> <li>• <b>hash-weight</b> — the LAG port <b>hash-weight</b> value is used to customize flow distribution per port</li> </ul>
Port weight speed	The LAG port weight speed value for mixed-speed LAG.
Ports Up	The number of ports that are operationally up for this LAG.

Label	Description
Weights Up	Sum of weights for ports that are operationally up in this LAG.
Hash-Weights Up	Sum of hash weights for ports that are operationally up in this LAG.
Threshold Type	The type of threshold used in this LAG: <ul style="list-style-type: none"> <li>• hash-weight-threshold</li> <li>• port-threshold</li> <li>• weight-threshold</li> </ul>
Monitor oper group	The name of the operational group being monitored for this LAG.
Adaptive loadbal	The adaptive load balancing status. Enabled — The adaptive load balancing is enabled. Disabled — The adaptive load balancing is disabled.
Tolerance	The adaptive load balancing tolerance value.
Interval	The adaptive load balancing statistics pooling interval.
MC Peer Address	The multi-chassis peer IP address.
MC Peer Lag-id	The LAG ID for the multi-chassis peer.
MC System Id	The multi-chassis LAG system identifier MAC address.
MC System Priority	The multi-chassis LAG system priority.
MC Admin Key	The multi-chassis LAG administrative key.
MC Active/Standby	The multi-chassis LAG active or standby state.
MC Lacp ID in use	The multi-chassis LAG in use state.
MC extended timeout	The multi-chassis LAG extended timeout value.
MC Selection Logic	The multi-chassis LAG selection logic state.
MC Config Mismatch	The multi-chassis LAG configuration mismatch state.

**Output Example: Show LAG Statistics**

```

```

**Output Fields: Show LAG Statistics**

[Table 255: Output fields: LAG statistics](#) describes the output fields for the **show lag statistics** command.

*Table 255: Output fields: LAG statistics*

Label	Description
Lag-id	The LAG or multi-link trunk (MLT) that the port is assigned to.
Lag-name	The LAG name.
Port-id	The port ID.
Input Bytes	The number of incoming bytes for the LAG on a per-port basis.
Input Packets	The number of incoming packets for the LAG on a per-port basis.
Output Bytes	The number of outbound bytes for the LAG on a per-port basis.
Output Packets	The number of outbound packets for the LAG on a per-port basis.
Input/Output Errors	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol.  For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors.
Totals	Displays the column totals for bytes, packets, and errors.

**Output Example: show lag <lag-id> egress-rate-distribution**

```

A:7750# show lag 1 egress-rate-distribution
=====
Distribution of egress rate by adaptive load balancing

## lag

### Syntax

**lag** *lag-id* **network-aggregate-qos-stats**

### Context

[\[Tree\]](#) (show>qos lag)

### Full Context

show qos lag

### Description

This command displays the aggregate QoS statistics for the default ingress and egress queues configured on a network interface LAG.

### Parameters

#### *lag-id*

Displays only information about the specified LAG ID.

**Values** 1 to 800

#### **network-aggregate-qos-stats**

Displays the aggregate QoS statistics about network interface LAG queues.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### Output

The following output is an example of network aggregate QoS statistics information.

[Table 260: Output fields: QoS LAG](#) describes the output fields.

### Output Example

```
*A:PE# show qos lag 1 network-aggregate-qos-stats
=====
Network Aggregate QoS Statistics for LAG ID 1

Table 260: Output fields: QoS LAG

Label	Description
In Profile forwarded	Displays the number of in-profile packets or octets forwarded for ingress or egress queue
In Profile dropped	Displays the number of in-profile packets or octets dropped for ingress or egress queue
Out Profile forwarded	Displays the number of out-profile packets or octets forwarded for ingress or egress queue
Out Profile dropped	Displays the number of out-profile packets or octets dropped for ingress or egress queue

## lag

### Syntax

```

lag lag-id bfd-session family {ipv4 | ipv6} lag-port port-id
lag lag-id lacp-statistics
lag lag-id statistics [aggregate-queue]
    
```

### Context

[\[Tree\]](#) (clear lag)

### Full Context

```
clear lag
```

### Description

This command clears statistics for the specified LAG ID.

## Parameters

### *lag-id*

Clears the LAG ID.

**Values** 1 to 800

### **bfd-session**

Keyword that clears the specified BFD session.

### **family**

Keyword that clears the IP address family.

### **ipv4**

Keyword that clears IPv4.

### **ipv6**

Keyword that clears IPv6.

### *port-id*

Clears the port ID.

**Values** *slot* [/mda [/port]]

### **lACP-statistics**

Keyword that clears the LACP PDUs statistics.

### **statistics**

Keyword that clears the statistics or the BFD session for the specified LAG ID.

### **aggregate-queue**

Keyword that clears the aggregate queue statistics on a PXC-based LAG.

## Platforms

All

## lag

## Syntax

**lag lag-id lag-id**

## Context

[\[Tree\]](#) (tools>dump lag)

## Full Context

tools dump lag

## Description

This command dumps LAG information.

## Parameters

### *lag-id*

Specifies the LAG ID.

**Values** 1 to 800

## Platforms

All

lag

## Syntax

lag

## Context

[\[Tree\]](#) (tools>perform lag)

## Full Context

tools perform lag

## Description

This command provides tools for controlling LAG.

## Platforms

All

lag

## Syntax

lag *lag-id* [*lag-id*] [**bytes** | **packets** | **errors** | **utilization**] [**interval seconds**] [**repeat repeat**] [**absolute** | **rate**]

lag *lag-id* **network-aggregate-qos-stats** [**interval seconds**] [**repeat repeat**] [**absolute** | **rate**]

## Context

[\[Tree\]](#) (monitor lag)

## Full Context

monitor lag

## Description

This command monitors traffic statistics for Link Aggregation Group (LAG) ports. Statistical information for the specified LAG ID(s) displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified LAG ID. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *lag-id*

Specifies the number of the LAG, with a maximum of five LAG numbers specified in a single statement.

**Values** 1 to 200

### **bytes**

Keyword that displays the statistics in bytes only.

### **packets**

Keyword that displays the statistics in packets only.

### **errors**

Keyword that displays the statistics for errors only.

### **utilization**

Keyword that displays the statistics in percentage utilization only.

### **network-aggregate-qos-stats**

Keyword that displays the aggregate QoS statistics on network interface LAG default ingress and egress queues.

### **seconds**

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

### **repeat**

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### **absolute**

Keyword that displays the raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### **rate**

Keyword that displays the rate-per-second for each statistic instead of the delta.

## Platforms

All

## Output

The following output is an example of monitor lag command information.

### Output Example

```
A:Dut-B# monitor lag 1 interval 3 repeat 1

## 16.20 lag-ip-measurement

### lag-ip-measurement

#### Syntax

**lag-ip-measurement**

#### Context

**[Tree]** (show>test-oam lag-ip-measurement)

#### Full Context

show test-oam lag-ip-measurement

#### Description

Commands in this context display LAG measurement template information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.21 lag-ip-measurement-template

### lag-ip-measurement-template

#### Syntax

**lag-ip-measurement-template** *template-name*

#### Context

**[Tree]** (show>test-oam>lag-meas lag-ip-measurement-template)

#### Full Context

show test-oam lag-ip-measurement lag-ip-measurement-template

#### Description

This command displays LAG measurement template information.

## Parameters

### *template-name*

Specifies the template name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of the LAG IP measurement template information, and [Table 261: Output fields: LAG IP measurement template summary](#) describes the output fields.

### Output Example: LAG IP measurement template summary

```
show test-oam lag-meas# lag-ip-measurement-template "ri"
=====

Table 261: Output fields: LAG IP measurement template summary

Label	Description
LAG Template	Displays the LAG template name
Description	Displays the LAG template description
Admin State	Displays administrative state of the LAG template
Active Interfaces	Displays the number of active interfaces
Total Interfaces	Displays the total number of interfaces
Protocol	Displays the IP protocol enabled for the LAG template
Cnfg Source UDP Port	Displays the configuration source for the UDP port
Destination UDP Port	Displays the UDP port destination

Label	Description
Timestamp Format	Displays the timestamp format
DSCP	Displays the DSCP code-point name
FC	Displays the FC name
Profile	Displays the QoS profile
Allow Egress Remark	Displays if the system overwrites the IP header DSCP for each launched packet
TTL	Displays the TTL value
IPv6 UDP Checksum 0	Displays if the system processes IPv6 packets with UDP checksum zero

## 16.22 lanext

### lanext

#### Syntax

lanext

#### Context

[\[Tree\]](#) (show>subscr-mgmt>vrgw lanext)

#### Full Context

```
show subscriber-mgmt vrgw lanext
```

#### Description

This command displays Wireless LAN Gateway Home LAN Extension information.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

### lanext

#### Syntax

lanext

### Context

[\[Tree\]](#) (tools>dump>wlan-gw lanext)

### Full Context

tools dump wlan-gw lanext

### Description

Commands in this context dump tools information for WGLAN HLE parameter.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## lanext

### Syntax

lanext

### Context

[\[Tree\]](#) (tools>perform>wlan-gw lanext)

### Full Context

tools perform wlan-gw lanext

### Description

Commands in this context clear tools information for WGLAN HLE parameter.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.23 lbm-svc-act-responder

### lbm-svc-act-responder

### Syntax

**lbm-svc-act-responder** [domain {*md-index* | *md-admin-name*}] [association {*ma-index* | *ma-admin-name*}] [mep *mep-id*]

### Context

[\[Tree\]](#) (show>eth-cfm lbm-svc-act-responder)

## Full Context

```
show eth-cfm lbm-svc-act-responder
```

## Description

This command displays the MEPs created with the optional **lbm-svc-act-responder** configuration command, which allocates additional resources to facilitate high-speed LBM-to-LBR processing typically used during service activation testing. The optional filters are cumulative. These filters can be used to narrow the focus of the display to a specific area.

## Parameters

*md-index*

Specifies the MD index.

**Values** 1 to 4294967295

*md-admin-name*

Specifies the administrative name for the domain, up to 64 characters.

*ma-index*

Specifies the MA index.

**Values** 1 to 4294967295

*ma-admin-name*

Specifies the administrative name for the association, up to 64 characters.

*mep-id*

Specifies the local MEP ID.

**Values** 1 to 8191

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of ETH CFM LBM service activation responder information, and [Table 262: Output fields: LBM service activation responder](#) describes the output fields.

### Output example

```
*A:node-2# show eth-cfm lbm-svc-act-responder

## 16.25 ldp fec-egress-statistics

### ldp fec-egress-statistics

#### Syntax

**ldp fec-egress-statistics** [*ip-prefix/mask*]

#### Context

[\[Tree\]](#) (clear>router ldp fec-egress-statistics)

#### Full Context

clear router ldp fec-egress-statistics

#### Description

This command clears LDP FEC egress statistics.

#### Parameters

##### *ip-prefix*

Specify information for the specified IP prefix. Host bits must be 0.

##### *mask*

Specifies the address mask used to indicate the bits of an IP address that are being used for the subnet address.

<b>Values</b>	IPv4: 0 to 32
	IPv6: 0 to 128

#### Platforms

All

## 16.26 ldp-sync-exit

### ldp-sync-exit

#### Syntax

**ldp-sync-exit**

#### Context

[\[Tree\]](#) (tools>perform>router>isis ldp-sync-exit)

### Full Context

tools perform router isis ldp-sync-exit

### Description

This command terminates LDP synchronization and restores actual cost of an ISIS interface.

### Platforms

## ldp-treetrace

### Syntax

**ldp-treetrace** [*prefix ip-prefix/mask*] [*detail*]

### Context

[\[Tree\]](#) (show>test-oam ldp-treetrace)

### Full Context

show test-oam ldp-treetrace

## Description

This command displays OAM LDP tree trace information.

## Parameters

### *ip-prefix/mask*

Specifies the address prefix and subnet mask of the destination node.

**Values** ip-prefix: a.b.c.d (host bits must be 0)  
 mask: 0 to 32

### **detail**

Displays detailed information.

## Platforms

All

## Output

The following output example shows OAM LDP tree trace information.

### Output Example

## 16.28 learned-remote-mac

### learned-remote-mac

#### Syntax

**learned-remote-mac** [domain {*md-index* | *md-admin-name*}] [association {*ma-index* | *ma-admin-name*}]  
 [mep *mep-id*] [remote-mepid *mep-id*]

#### Context

[\[Tree\]](#) (show>eth-cfm learned-remote-mac)

#### Full Context

show eth-cfm learned-remote-mac

#### Description

This command displays the local MEP and remote MEP MAC address information relationship. The MAC address information in this table is populated and used in place of the remote *mep-id* in various ETH-CFM tests that opt to use the **remote-mepid** *mep-id* configuration instead of specifying the remote peer

MAC address. This table is maintained by the ETH-CC process. If a CCM has not been received for a remote peer, there is no entry in the **learned-remote-mac** table. However, when a CCM is received for an expected peer, an entry in the **learned-remote-mac** table is populated and maintained. This entry remains until the remote peer statement is deleted from the association, the local MEP is deleted, or if a manual **clear>eth-cfm>learned-remote-mac** command has been executed for the specified local MEP.

The optional parameters are treated as independent filters that are combined to refine the output. Omitting all optional parameters produces output that includes the entire table.

## Parameters

*md-index*

Specifies the MD index.

**Values** 1 to 4294967295

*md-admin-name*

Specifies the MD name, up to 64 characters.

*ma-index*

Specifies the MA index.

**Values** 1 to 4294967295

*ma-admin-name*

Specifies the MD name, up to 64 characters.

**mep** *mep-id*

Specifies the local *mep-id*.

**Values** 1 to 8191

**remote-mepid** *mep-id*

Specifies the remote *mep-id*.

**Values** 1 to 8191

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of learned remote MAC information, and [Table 263: Output fields: learned remote MAC](#) describes the output fields.

Table 263: Output fields: learned remote MAC

Label	Description
MdIndex	Specifies the local MEP domain index
MaIndex	Specifies the local MEP association index
L-MepId	Specifies the local MEP identifier
R-MepId	Specifies the remote MEP identifier
Learned Remote MAC	Specifies the learned MAC address of the remote peer
Stale	Results of the comparison between the CCM database and the learned-remote-mac table False — match True — mismatch
Updated	Whether the learned MAC in this table has been updated in the last CCM interval
md-admin-name	Displays the administrative MD name.
ma-admin-name	Displays the administrative MA name.

## learned-remote-mac

### Syntax

**learned-remote-mac** [**mep** *mep-id* [**remote-mepid** *mep-id*]] **domain** *md-index* **association** *ma-index*

### Context

[\[Tree\]](#) (clear>eth-cfm learned-remote-mac)

### Full Context

clear eth-cfm learned-remote-mac

### Description

This command clears the stored MAC addresses in the CFM **learned-remote-mac** address table. A valid MAC address must exist in the **learned-remote-mac** table for a successful PDU generation when that test uses the **remote-mepid** *mep-id* option in place of a *mac-address*.

The local **domain** and **association** parameters must be included as part of the clear command. The **mep** and **remote-mepid** parameters are optional. The clear command clears all matching entries based on the configured parameters. The table is populated based on the reception and processing of ETH-CC PDUs.

### Parameters

#### **mep** *mep-id*

Specifies the local MEP ID.

**Values** 1 to 8191

#### **remote-mepid** *mep-id*

Specifies the remote MEP ID.

**Values** 1 to 8191

#### **md-index**

Specifies the MD index.

**Values** 1 to 4294967295

#### **ma-index**

Specifies the MA index.

**Values** 1 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.29 lease-state

### lease-state

#### Syntax

```
lease-state [wholesaler service-id] [sap sap-id | sdp sdp-id:vc-id | interface interface-name | ip-address ip-address [/mask] | chaddr ieee-address | mac ieee-address | {[port port-id] [no-inter-dest-id | inter-dest-id inter-dest-id]}] [session { none | ipoe}] [detail]
```

#### Context

[\[Tree\]](#) (show>service>id>dhcp lease-state)

#### Full Context

```
show service id dhcp lease-state
```

#### Description

This command displays DHCP lease state related information.

#### Parameters

##### **service-id**

Specifies the service ID of the wholesaler.

**Values** 1 to 2148278316, *svc-name*: up to 64 characters

##### **sap-id**

Specifies the physical port identifier portion of the SAP definition.

##### **sdp-id**

The SDP identifier.

**Values** 1 to 17407

##### **vc-id**

The virtual circuit ID on the SDP ID for which to display information.

**Values** 1 to 4294967295

##### **interface-name**

Displays information for the specified IP interface.

##### **ip-address[/mask]**

Displays information associated with the specified IP address.

##### **ieee-address**

Specifies the source MAC address.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx (cannot be all zeros)

**port-id**

Specifies the port ID.

**no-inter-dest-id**

Displays the information about no intermediate destination ID.

**inter-dest-id**

Displays information about the specified intermediate destination ID, up to 64 characters.

**session**

Shows DHCPv4 lease states for hosts that are associated with an IPE session or for hosts that are not associated with an IPE session.

**Values** none, ipoe

**detail**

Displays detailed information.

**Platforms**

All

**Output**

The following output is an example of the DHCP **lease-state** command.

**Output Example**

```

Table 264: Output fields: DHCP lease state describes service DHCP lease-state information.

Table 264: Output fields: DHCP lease state

Field	Description
Service ID	The service ID
IP Address	The IP address
Client HW Address	The client hardware address
Subscriber-interface	The subscriber interface name
Group-interface	The group interface name
SAP	The SAP
Termination Type	The termination type

Field	Description
Up Time	The up time
Remaining Lease Time	The remaining lease time
Remaining SessionTime	The remaining session time
Persistence Key	The persistence key
Sub-Ident	The name of the subscriber identification policy
Sub-Profile-String	The subscriber profile string
SLA-Profile-String	The name of the SLA profile
App-Profile-String	The application profile string
Lease ANCP-String	The lease ANCP string
Lease Int Dest Id	The lease internal destination ID
Category-Map-Name	The category map name
Lease Info origin	The origin of the lease
Ip-Netmask	The IP netmask address
Broadcast-Ip-Addr	The broadcast IP address
Default-Router	The default router
Primary-Dns	The primary DNS address
Secondary-Dns	The secondary DNS address
Primary-Nbns	The primary NBNS
Secondary-Nbns	The secondary NBNS
ServerLeaseStart	The date and time of the start of the server lease
ServerLastRenew	The date and time of the renewal of the server lease
ServerLeaseEnd	The date and time of the end of the server lease
Session-Timeout	The session timeout value
IPoE PPP session	The type of session
Lease-Time	The lease time
DHCP Server Addr	The DHCP server IP address
Relay Agent Information	

Field	Description
Circuit Id	The circuit ID
Radius Class 1	The RADIUS Class 1 value
Radius User-Name	The RADIUS user name
Overrides: (only shown when overrides are active)	
Dir Type	The direction type
Id	The ID
PIR	The PIR value
CIR	The CIR value
CBS	The CBS value
MBS	The MBS value
WRR	The WRR value
Class-Weight	The class weight
No. of Overrides	The total number of overrides
Subscriber Host Limit Overrides and SLA Profile Instance Host Limit Overrides: (only shown when overrides are active)	
ipv4-arp	The total number of IPv4 ARP hosts limit
ipv4-dhcp	The total number of IPv4 DHCP hosts limit
ipv4-ppp	The total number of IPv4 PPP hosts limit
ipv4-overall	The total number of IPv4 hosts limit
ipv6-pd-ipoe-dhcp	The total number of IPv6 IPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-ppp-dhcp	The total number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-overall	The total number of IPv6 DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-wan-ipoe-dhcp	The total number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ipoe-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit

Field	Description
ipv6-wan-ppp-dhcp	The total number of IPv6 PPPoE DHCP WAN hosts (IANA) limit
ipv6-wan-ppp-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-overall	The total number of IPv6 WAN hosts limit
ipv6-overall	The total number of IPv6 hosts limit
lac-overall	The total number of L2TP LAC hosts limit
overall	The total number of subscriber hosts limit
Subscriber Session Limit Overrides and SLA Profile Instance Session Limit Overrides: (only shown when overrides are active)	
ipoe	The total number of IPoE sessions limit
ppoe-local	The total number of PPPoE local terminated sessions (PTA) limit
ppoe-lac	The total number of PPPoE L2TP LAC sessions limit
ppoe-overall	The total number of PPPoE sessions limit
l2tp-lns	The total number of L2TP LNS sessions limit
l2tp-lts	The total number of L2TP LTS sessions limit
l2tp-overall	The total number of L2TP sessions limit
overall	The total number of subscriber sessions limit
Number of lease states	The total number of lease states

## lease-state

### Syntax

**lease-state** [**detail**] [**wholesaler** *service-id*] [**session** {**none** | **ipoe** | **ppp**}] [**router-advertisement-policy** *policy-name*]

**lease-state** [**detail**] **interface** *interface-name* [**wholesaler** *service-id*] [**session** {**none** | **ipoe** | **ppp**}] [**router-advertisement-policy** *policy-name*]

**lease-state** [**detail**] *ipv6-address* *ipv6-prefix*[/*prefix-length*] [**wholesaler** *service-id*] [**session** {**none** | **ipoe** | **ppp**}] [**router-advertisement-policy** *policy-name*]

**lease-state** [**detail**] **mac** *ieee-address* [**wholesaler** *service-id*] [**session** {**none** | **ipoe** | **ppp**}] [**router-advertisement-policy** *policy-name*]

### Context

[\[Tree\]](#) (show>service>id>dhcp6 lease-state)

### Full Context

show service id dhcp6 lease-state

### Description

This command displays DHCPv6 lease state information.

#### Note:

The **wholesaler** *service-id* parameter is applicable only in the VPRN context.

### Parameters

#### **detail**

Displays detailed lease state information.

#### **service-id**

The service ID of the wholesaler. When specified in this context, SAP, SDP, interface, IP address and MAC parameters are ignored. This parameter only applies to the 7750 SR.

**Values** *service-id*: 1 to 2147483647

### **session**

Shows DHCPv6 lease states for clients that are associated with an IPoE session or for clients that are associated with a PPP session or for clients that are not associated with an IPoE session.

**Values** none, ipoe, ppp

### ***policy-name***

Specifies the name of the router advertisement policy.

### ***interface-name***

Specifies the interface name, up to 32 characters.

### ***ipv6-address[/mask]***

Shows information for the specified IPv6 address and mask.

### ***ieee-address***

Shows information for the specified 48-bit MAC address, expressed in the form *aa:bb:cc:dd:ee:ff* or *aa-bb-cc-dd-ee-ff*, where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers.

## **Platforms**

All

## **Output**

The following output is an example of DHCPv6 lease state information.

### **Output Example**

```
*A:eng-BNG-2# show service id 1000 dhcp6 lease-state detail

**Table 265: Output fields: DHCPv6 lease state router advertisement** describes DHCPv6 lease state router advertisement policy output fields.

*Table 265: Output fields: DHCPv6 lease state router advertisement*

Field	Description
Service ID	The service ID provided by the access node to which this subnet is bound

Field	Description
IP Address	The IP address of the service
Client HW Address	The MAC address of the client
Subscriber-Interface	The subscriber interface for the service
Group-interface	The group interface for the service
Sap/Sdp ID	The service SAP and SDP IDs
Termination Type	The PPP session type
Up Time	The value of the up time at the time of the last modification of an entry
Remaining Lease Time	The time left before the DHCPv6 lease expires. The client should renew its lease before this timer expires. (Lease Split) indicates that DHCPv6 lease split is active.
Remaining SessionTime	The time left for this session
Persistence Key	The persistence key
Sub-Ident	The subscriber identification policy name
Sub-Profile-String	The subscriber profile policy name
App-Profile-String	The application profile policy name
Lease ANCP-String	The ANCP string
Category-Map-Name	The category map name
Dhcp6 ClientID (DUID)	The DHCP client ID
Dhcp6 IAID	The DHCPv6 Identity Association Identifier (IAID) assigned by the client
Dhcp6 IAID Type	The DHCPv6 Identity Association type of this lease (non-temporary or prefix)
Dhcp6 Client Ip	The DHCPv6 IP address of the client
Primary-Dns	The primary DNS, if configured
Secondary-Dns	The secondary DNS, if configured
Pool Name	The pool name
Dhcp6 Server Addr	The DHCPv6 server address
Dhcp6 ServerID (DUID)	The DHCPv6 server ID

Field	Description
Dhcp6 Interfaceld	The DHCPv6 interface ID
Dhcp6 Remoteld	The DHCPv6 remote ID
Radius sub-if prefix	The RADIUS subscriber interface prefix
Router adv. policy	The router advertisement policy
Lease Info origin	The lease info origin
ServerLeaseStart	The date and time the lease was created
ServerLastRenew	The last renew was done for this lease
ServerLeaseEnd	The time left for this lease
Session-Timeout	The session timeout interval
IPoE PPP	IPoE or PPP
Radius User-Name	The RADIUS user name
Overrides: (only shown when overrides are active)	
Dir Type	The direction type
Id	The ID
PIR	The PIR value
CIR	The CIR value
CBS	The CBS value
MBS	The MBS value
WRR	The WRR value
Class-Weight	The class weight
No. of Overrides	The total number of overrides
Subscriber Host Limit Overrides and SLA Profile Instance Host Limit Overrides: (only shown when overrides are active)	
ipv4-arp	The total number of IPv4 ARP hosts limit
ipv4-dhcp	The total number of IPv4 DHCP hosts limit
ipv4-ppp	The total number of IPv4 PPP hosts limit
ipv4-overall	The total number of IPv4 hosts limit

Field	Description
ipv6-pd-ipoe-dhcp	The total number of IPv6 IPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-ppp-dhcp	The total number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-overall	The total number of IPv6 DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-wan-ipoe-dhcp	The total number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ipoe-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-ppp-dhcp	The total number of IPv6 PPPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ppp-slaac	The total number of IPv6 PPPoE SLAAC WAN hosts limit
ipv6-wan-overall	The total number of IPv6 WAN hosts limit
ipv6-overall	The total number of IPv6 hosts limit
lac-overall	The total number of L2TP LAC hosts limit
overall	The total number of subscriber hosts limit
Subscriber Session Limit Overrides and SLA Profile Instance Session Limit Overrides: (only shown when overrides are active)	
ipoe	The total number of IPoE sessions limit
ppoe-local	The total number of PPPoE local terminated sessions (PTA) limit
ppoe-lac	The total number of PPPoE L2TP LAC sessions limit
ppoe-overall	The total number of PPPoE sessions limit
l2tp-lns	The total number of L2TP LNS sessions limit
l2tp-lts	The total number of L2TP LTS sessions limit
l2tp-overall	The total number of L2TP sessions limit
overall	The total number of subscriber sessions limit
Number of lease states	The total number of lease states

## lease-state

### Syntax

```
lease-state all [no-dhcp-release]
lease-state [port port-id] inter-dest-id intermediate-destination-id [no-dhcp-release]
lease-state [port port-id] no-inter-dest-id [no-dhcp-release]
lease-state ip-address ip-address [/mask] [no-dhcp-release]
lease-state mac ieee-address [no-dhcp-release]
lease-state port port-id [no-dhcp-release]
lease-state sap sap-id [no-dhcp-release]
lease-state sdp sdp-id:vc-id [no-dhcp-release]
```

### Context

[\[Tree\]](#) (clear>service>id>dhcp lease-state)

### Full Context

```
clear service id dhcp lease-state
```

### Description

This command removes the DHCPv4 lease state information from the system and sends a DHCP release message on behalf of the client to the DHCP server. A DHCP release is not sent when the remaining lease-time is less than 5 minutes or when the **no-dhcp-release** parameter is specified.

### Parameters

#### **all**

Clears all lease state statistics.

#### **port-id**

Displays information about the specified port ID.

#### **intermediate-destination-id**

Displays information about the specified intermediate destination ID, up to 32 characters.

#### **no-inter-dest-id**

Displays the information about no intermediate destination ID.

#### **ip-address[/mask]**

The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that is used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

**Values** a.b.c.d.

mask: 1 to 32

### ***ieee-address***

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

### ***sap-id***

Specifies the physical port identifier portion of the SAP definition.

### ***sdp-id***

The SDP ID to be cleared.

**Values** 1 to 17407

### ***vc-id***

The virtual circuit ID on the SDP ID to be cleared.

**Values** 1 to 4294967295

### ***no-dhcp-release***

Specifies that the node clears the state without sending the DHCP release message.

## **Platforms**

All

## **lease-state**

### **Syntax**

**lease-state all** [**no-dhcp-release**]

**lease-state ipv6-address** *ipv6-prefix*[/*prefix-length*] [**no-dhcp-release**]

**lease-state mac** *ieee-address* [**no-dhcp-release**]

**lease-state sap** *sap-id* [**no-dhcp-release**]

### **Context**

[\[Tree\]](#) (clear>service>id>dhcp6 lease-state)

### **Full Context**

clear service id dhcp6 lease-state

### **Description**

This command removes the DHCPv6 lease state information from the system and sends a DHCP release message on behalf of the client to the DHCP server. A DHCP release is not sent when the remaining lease-time is less than 5 minutes or when the no-dhcp-release parameter is specified.

## Parameters

### **all**

Clears all lease-states.

### **no-dhcp-release**

Specifies that the node clears the state without sending the DHCP release message.

### **ipv6-prefix[/prefix-length]**

Clears routes only matching the specified IP address and length and only applies to the 7750 SR.

Values	ipv6	ipv6-prefix[/pref*:	x:x:x:x:x:x:x (eight 16-bit pieces)
			x:x:x:x:x:d.d.d.d
			x: [0 to FFFF]H
			d: [0 to 255]D
		prefix-length:	1 to 128

### **ieee-address**

Clears DHCP6 MAC address lease state information. The 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

### **sap-id**

Clears the specified lease state SAP information.

## Context

[\[Tree\]](#) (show>router>dhcp>local-dhcp-server leases)

## Full Context

show router dhcp local-dhcp-server leases

## Description

This command displays the DHCP leases.

## Parameters

### *ip-address*

Specifies the base IP address of the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

### *mask*

The subnet mask in dotted decimal notation.

**Values** 0 to 32

### *address-from-user-db*

Displays only leases that have IP addresses from the local-user-db.

### *dhcp-host-name*

Shows the leases that match a certain DHCP host from the local-user-db.

### *ppp-host-name*

Displays the leases that match a certain PPPoE host from the local-user-db.

### *detail*

Displays detailed information of all leases that fall into the indicated subnet.

The command with no parameters shows all leases from the local-user-db.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of lease information

### Output Example

```
*A:ALA-48>show>router>dhcp>local-dhcp-server# leases ip-address 10.0.0.4
=====
Leases for DHCP server test router Base
=====
IP Address      Lease State      Mac Address      Remaining Clnt
  PPPoE user name/Opt82 Circuit Id      LifeTime  Type
-----
No leases found
*A:ALA-48>show>router>dhcp>local-dhcp-server#
```

Table 266: Output fields: leases describes leases output fields.

Table 266: Output fields: leases

Field	Description
IP Address	The IP address for the specified lease
Lease State	The lease state of the IP address
Mac Address	The MAC address of the lease
Remaining Lifetime	The remaining lifetime of the lease
Clnt Type	The address type
PPPoE user name	The PPPoE user name
Opt82	The option number that the DHCP server uses to send the identification strings to the PPPoE client
Circuit ID	The circuit ID from Option 82

## leases

### Syntax

**leases** [*ipv6-address/prefix-length*] [*type*] [*state*] [**detail**]

### Context

[\[Tree\]](#) (show>router>dhcp6>local-dhcp-server leases)

### Full Context

```
show router dhcp6 local-dhcp-server leases
```

### Description

This command displays the DHCP6 leases.

### Parameters

#### **ipv6-address**

Specifies the base IP address of the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

#### **mask**

The subnet mask in dotted decimal notation.

**Values** 0 to 32

**type**

Displays the lease type.

**Values** pd, wan-host

**state**

Displays the state of the lease.

**Values** advertised, remove-pending, held

**detail**

Displays detailed information of all leases that fall into the indicated subnet.

The command with no parameters shows all leases from the local user database.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of lease information.

**Output Example**

```
show router 600 dhcp6 local-dhcp-server "d6" leases
=====
Leases for DHCPv6 server d6
=====
IP Address/Prefix          Lease State      Remaining      Fail
Link-local Address        LifeTime        Ctrl
-----
2001:AAAA::1/128

-----
1 leases found
=====
```

Table 267: Output fields: DHCP6 lease describes DHCP6 lease fields.

Table 267: Output fields: DHCP6 lease

Field	Description
IP Address/Prefix	The IP address and prefix of the lease
Link-local Address	The link local address of the lease
Lease State	The lease state of the lease
Remaining Lifetime	The remaining lifetime of the lease
Fail Ctrl	The type of failover control
No. leases found	The total number of leases

## leases

### Syntax

**leases** *ip-address[/mask]* [*state*]

**leases all** [*state*]

### Context

[\[Tree\]](#) (clear>router>dhcp>server leases)

### Full Context

clear router dhcp local-dhcp-server leases

### Description

This command clears DHCP leases.

### Parameters

***ip-address[/mask]***

Clears the specified IP address and mask.

***state***

Clears the state of the lease to be removed.

**Values** offered, stable, force-renew-pending, remove-pending, held, internal, internal-orphan, internal-held, sticky

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## leases

### Syntax

**leases** [*ipv6-address/prefix-length*] [*type*] [*state*]

**leases all** [*type*] [*state*]

### Context

[\[Tree\]](#) (clear>router>dhcp6>server leases)

### Full Context

clear router dhcp6 local-dhcp-server leases

### Description

This command removes the specified leases in the specified local DHCPv6 server.

## Parameters

### *ipv6-address/prefix-length*

Specifies the prefix of the leases to be removed.

### *type*

Specifies the type of the lease to be removed.

**Values** pd, slaac, wan-host

### *state*

Specifies the state of the lease to be removed.

**Values** advertised, remove-pending, held, internal, internal-orphan, internal-offered

### *all*

Removes all leases of specified type or state.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.32 lfa-info

### lfa-info

#### Syntax

**lfa-info** [**mt** *mt-id-number*] [**prefix** *ipv6-prefix*[/*prefix-length*]] [**algo** *algo-id*] [**detail**]

#### Context

**[Tree]** (show>router>isis>srv6 lfa-info)

#### Full Context

show router isis segment-routing-v6 lfa-info

#### Description

This command displays IS-IS SRv6 LFA information.

#### Parameters

##### *mt-id-number*

Displays the MT ID parameters.

**Values** 0 | 2 | 3 | 4

##### *ipv6-prefix/prefix-length*

Displays the specified IP prefix.

**Values** *ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d  
 x — 0 to FFFF (hexadecimal)  
 d — 0 to 255 (decimal)  
*prefix-length* — 0 to 128

**algo-id**

Filters information based on the specific algorithm only.

**Values** 0 | 128 to 255

**detail**

Displays detailed information.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

**Output**

The following output is an example of classic SRv6 remote locator tunnel TI-LFA backup path information, and [Table 268: Output fields: IS-IS SRv6 LFA information](#) describes the output fields.

**Output Example**

```
show router isis segment-routing-v6 lfa-info prefix 2001:1:1::/96 algo 0

## 16.38 license

### license

#### Syntax

**license available-licenses**

#### Context

[\[Tree\]](#) (show>system license)

#### Full Context

show system license

## Description

Displays information related to the active license(s) within the system. This includes the license name, target UUID, target product, target SR OS release, and the start, end, and issue date of the license.

If the **available-licenses** attribute is included, then the information for each active license shall be displayed. The usual case for more than one license in a system is during an upgrade procedures when there needs to be both the originating and destination release licenses available in the system.

## Parameters

### available-licenses

Includes information for all licenses active in the system.

## Platforms

All

## Output

The following output is an example of license information.

### Output Example

```
*A:ExitLeaf-35# show system license

## 16.40 licensing

### licensing

#### Syntax

**licensing** *port-id*

**licensing audit** [monitored]

**licensing entitlements**

## Context

**[Tree]** (show licensing)

## Full Context

show licensing

## Description

This command displays information related to the active application licenses on the system. The licenses are either monitored RTUs or entitlement ASLs, both of which cover features and scale in use in the SR OS system.

For monitored RTUs, there is a legal requirement to purchase the RTU parts to cover the administrative enabling of the related features and scale; however, the SR OS does not block the activation or scale of the feature.

For entitlement ASLs, feature activation on the SR OS system requires the installation of the ASL via the license-file mechanism before the related feature can be enabled. See the *7750 SR and 7950 XRS Pay-as-You-Grow Licensing Reference Guide* for more information.

When the **audit** keyword is used, the display shows all the monitored RTUs and entitlement ASLs of the node. Using the optional **monitored** keyword together with **audit** restricts the display to only the monitored RTUs.

When the **entitlements** keyword is used, the display shows all the entitlements in the active licenses in the system, the type of license, the quantity of POOL licenses, and the number of each that is in use or available for use.

## Parameters

### **audit**

Specifies that the state of all features covered by licenses is displayed.

### **monitored**

Specifies that only the monitored RTUs are included in the audit display.

### **entitlements**

Specifies that the number of instances allowed by the active license is displayed.

### **port-id**

Specifies the port identifier in the format *slot[/mda[/connector[/port]]]*.

<i>slot</i>	1 to 10
<i>mda</i>	1 to 2
<i>connector</i>	c1 to c36
<i>port</i>	1 to 10

2/1/c32            11   Yes       400 Gbps per MAC Chip
2/1/c33            11   Yes       400 Gbps per MAC Chip
```

### Output Fields

[Table 270: Output fields: licensing](#) describes the output fields for the **show licensing** command.

*Table 270: Output fields: licensing*

Label	Description
Connector	The identity of connector for the license limits.

Label	Description
MAC	The index of the MAC on the card or MDA to which the connector is attached.
Licensed	Whether or not the connector is licensed.  Yes — the connector is included in the licensed level of the card or MDA and may be configured for a breakout. Other rules may apply as described in the restrictions field.  No — this connector is not included in the licensed level of the card or MDA and it cannot be configured for breakout.
Restrictions	Additional license rules that may apply to the use of the connector, for example, bandwidth limits to the set of connectors on the same MAC.

**Output Example: show licensing audit**

```
# show licensing audit

**Output Fields**

Table 271: Output fields: licensing audit describes the output fields for the **show licensing audit** command.

Table 271: Output fields: licensing audit

Label	Description
License	The name of the entitlement ASL or the monitored RTU, grouped by category
Current Allocated	The number of instances of the license that are currently in use
Current Max	The maximum number of instances of the license that were recorded as in use within the current 24-hour monitoring period
Previous 24 Hr Max	The maximum number of instances of the license that were recorded in the previous full 24-hour monitoring period; shows as "n/a" if it has been less than 24 hours since startup
Last 24 Hr Interval Ended	Indicates the end time of the last 24-hour monitoring period; not displayed if it is less than 24 hours since startup

**Output Example: show licensing entitlements**

```

## 16.42 link-check

link-check

### Syntax

link-check

### Context

[\[Tree\]](#) (tools>perform>chassis link-check)

### Full Context

tools perform chassis link-check

### Description

This command checks the connection between an XCM and XMA cards on a SR-2/7/14s chassis. The function checks the connection between all XCM and XMA cards present in the system and outputs one of the following for each XMA:

- OK — the connection is good and no action is required
- NOK — the connection is suspect, re-seat the XMA to determine if this corrects the issue. If this issue persists, contact Nokia support.

### Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

## 16.43 link-group-member-status

### link-group-member-status

#### Syntax

**link-group-member-status** *name* [**level** *level*]

#### Context

[\[Tree\]](#) (show>router>isis link-group-member-status)

#### Full Context

show router isis link-group-member-status

#### Description

This command displays IS-IS link-group-member status.

#### Parameters

***name***

Up to 32 characters.

***level***

Specifies the interface level (1, 2, or 1 and 2).

#### Platforms

All

#### Output

The following output is an example of link group member status information.

## Output Example

```
A:cses-V94# show router isis link-group-member-status
- link-group-member-status <name> [level <level>]

<name>           : [32 chars max]
<level>          : 1|2

A:cses-V94# show router isis link-group-member-status "toDutB"

## 16.44 link-group-status

### link-group-status

#### Syntax

```
link-group-status name [level level]
```

#### Context

[\[Tree\]](#) (show>router>isis link-group-status)

#### Full Context

```
show router isis link-group-status
```

#### Description

This command displays IS-IS link-group status.

#### Parameters

##### *name*

Specifies the link-group name.

##### *level*

Specifies the interface level (1, 2, or 1 and 2).

## Platforms

All

## Output

The following output is an example of link group status.

### Output Example

```
A:cses-V94# show router isis link-group-status

## 16.45 link-map-profile

### link-map-profile

#### Syntax

**link-map-profile** *link-map-profile*

#### Context

[\[Tree\]](#) (show>lag link-map-profile)

#### Full Context

show lag link-map-profile

#### Description

This command displays LAG link map profile information.

#### Parameters

***link-map-profile***

Displays information about a specified LAG link map profile.

**Values** 1 to 32 (VSR)  
1 to 64 (all other platforms)

## Platforms

All

## 16.46 link-measurement

### link-measurement

#### Syntax

**link-measurement**

#### Context

[\[Tree\]](#) (show>test-oam link-measurement)

#### Full Context

show test-oam link-measurement

#### Description

Commands in this context display link measurement template information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.47 lldp

### lldp

#### Syntax

**lldp**

**lldp neighbor**

#### Context

[\[Tree\]](#) (show>system lldp)

#### Full Context

show system lldp

#### Description

This command displays local Link Layer Discovery Protocol (LLDP) information at the system level. This includes an option to display summary information for all known peers.

## Parameters

### neighbor

Displays all LLDP neighbor information.

## Platforms

All

## Output

The following output is an example of local LLDP information.

### Output Example: show system lldp

```
show system lldp

Table 273: Output fields: LLDP port information

Label	Description
Admin State	Indicates LLDP transmission or reception handling on the port
Notifications	Enabled – LLDP notifications are enabled Disabled – LLDP notifications are disabled
Tunnel Nearest Bridge	Enabled – the nearest bridge tunneling frames are enabled Disabled – the nearest bridge tunneling frames are disabled
Transmit TLVs	port-desc – this LLDP TLV is transmitted sys-name – this LLDP TLV is transmitted sys-desc – this LLDP TLV is transmitted sys-cap – this LLDP TLV is transmitted none – no LLDP TLVs are transmitted
PortID TLV Subtype	tx-if-alias – this port identifier TLV is transmitted to the peer tx-ifname – this port identifier TLV is transmitted to the peer tx-local – this port identifier TLV is transmitted to the peer
Index 0 (OOB)	Uses the IPv4 out-of-band management IP address
Index 1 (system)	Uses the IPv4 system IP address
Index 2 (IPv6 system)	Uses the IPv6 system IP address
Index 3 (IPv6 OOB)	Uses the IPv6 out-of-band management IP address
Address	The IP address associated with the index
Tx Frames	The number of LLDP frames transmitted from the port

Label	Description
Rx Frames	The number of LLDP frames received on the port
Rx Frame Errors	The number of LLDP frames received with errors on the port
Rx TLV Unknown	The number of LLDP frames received on the port with a properly formatted TLV that was not supported on the receiving port
Tx Length Err Frames	The number of LLDP frames transmitted with length errors from the port
Rx Frame Discard	The number of LLDP frames received but discarded on the port
Rx TLV Discard	The number of LLDP frames received on the port discarded because of the TLV
Rx Ageouts	The number of LLDP frames received on the port with a properly formatted TLV that was not supported on the receiving port

## 16.48 lldp-member-template

### lldp-member-template

#### Syntax

**lldp-member-template** [**dest-mac** *dest-mac-type*]

#### Context

[\[Tree\]](#) (show>lag lldp-member-template)

#### Full Context

show lag lldp-member-template

#### Description

This command displays LLDP member port information.

#### Parameters

##### **dest-mac-type**

Specifies the destination MAC address type.

- Values**
- nearest-bridge – the nearest bridge is used
  - nearest-non-tpmr – the nearest non-TPMR is used
  - nearest-customer – the nearest customer is used

## Platforms

All

## Output

The following output is an example of LLDP member port information, and [Table 274: Output fields: LLDP member port information](#) describes the output fields.

### Output example

## 16.49 Imm

### Imm

#### Syntax

**Imm** [*interval seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

#### Context

[\[Tree\]](#) (monitor>oam-pm>session Imm)

#### Full Context

monitor oam-pm session Imm

#### Description

This command monitors the Ethernet Loss Measurement Message (LMM) statistics for the specified test's raw measurement interval.

#### Parameters

##### *seconds*

Specifies the time interval, in seconds.

**Values** 3 to 60

**Default** 10

##### *repeat*

Specifies the number of times the command is repeated.

**Values** 1 to 999

**Default** 10

**absolute**

Specifies that the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Specifies that the rate-per-second is displayed.

**Default** delta

**Platforms**

All

Imm

**Syntax**

Imm

**Context**

[\[Tree\]](#) (show>oam-pm>stats>session Imm)

**Full Context**

show oam-pm statistics session Imm

**Description**

This command selects the session's Ethernet LMM test for the statistical display.

**Platforms**

All

## 16.50 Ins-group

Ins-group

**Syntax**

**Ins-group** *Ins-group-id* [associations]

**Ins-group** *Ins-group-id* **statistics** *esa-vm* *vapp-id*

**Ins-group** [*Ins-group-id*] **esa-vm**

**Ins-group** *Ins-group-id* **mda** *mda-id* **statistics**

**Ins-group** [*Ins-group-id*] **mda**

**Ins-group**

## Context

**[Tree]** (show>isa lns-group)

## Full Context

show isa lns-group

## Description

This command shows information such as the number of ESAs provisioned and in service, the LNS group operational status, and the number of L2TP sessions and ESA VM associated to the LNS group, as well as the detailed statistics of the ESA VM in relation to the LNS group.

## Parameters

### *lns-group-id*

Specifies the LNS group identifier.

**Values** 1 to 4

### *associations*

Displays information associated with the LNS group in the ISA context.

### *statistics*

Displays statistics information.

### *mda-id*

Specifies the ESA and VM identifying an LNS group.

<b>Values</b>	<i>mda-id:</i>	<i>slot/mda</i>	
		slot	1 to 10
		<i>mda</i>	1 to 2

### *vapp-id*

Specifies the ESA and VM identifying an LNS group.

<b>Values</b>	<i>vapp-id:</i>	<i>esa-id/vm-id</i>	
		<i>esa-id</i>	1 to 16
		<i>vm-id</i>	1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following outputs are examples of the number of ESAs provisioned, the LNS group information status, and the statistics of the ESA VM in relation to the LNS group.

### Output Example

```
*A:LNS# show isa lns-group esa-vm
=====

**Ins-group** *Ins-group-id* **statistics** **esa-vm** *vapp-id*

**Ins-group** *Ins-group-id* **mda** *mda-id* **statistics**

### Context

[\[Tree\]](#) (clear>isa Ins-group)

### Full Context

clear isa Ins-group

## Description

This command clears the statistics for the identified VM within the specified LNS group.

## Parameters

### *Ins-group-id*

Specifies the LNS group identifier.

**Values** 1 to 4

### **statistics**

Displays statistics information.

### *mda-id*

Specifies the ESA and VM identifying an LNS group.

<b>Values</b>	<i>mda-id:</i>	<i>slot/mda</i>	
		slot	1 to 10
		<i>mda</i>	1 to 2

### *vapp-id*

Specifies the ESA and VM identifying an LNS group.

<b>Values</b>	<i>vapp-id:</i>	<i>esa-id/vm-id</i>	
		<i>esa-id</i>	1 to 16
		<i>vm-id</i>	1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.51 load-balance

### load-balance

## Syntax

**load-balance lag-id lag-id [class {1 | 2 | 3}]**

## Context

[\[Tree\]](#) (tools>perform>lag load-balance)

## Full Context

tools perform lag load-balance

## Description

Load balance specified LAG's links when per-link-hash weighted is deployed. Load balancing can be per specified class or on all classes if no class is specified.

## Parameters

### *lag-id*

Specifies the LAG ID.

**Values** 1 to 800

### *class*

Specifies the class.

**Values** 1, 2, 3

## Platforms

All

## load-balance

## Syntax

**load-balance** [**service** *service-id*]

## Context

[\[Tree\]](#) (tools>perform>app-assure>group load-balance)

## Full Context

tools perform application-assurance group load-balance

## Description

This command rebalances AA subscribers between ISAs within a group, in case imbalance occurs such as with the addition of new cards.

## Parameters

### **service** *service-id*

Specifies the service

**Values** 1 to 2147483648

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.52 load-balancing-alg

### load-balancing-alg

#### Syntax

**load-balancing-alg [detail]**

#### Context

[\[Tree\]](#) (show>system load-balancing-alg)

#### Full Context

show system load-balancing-alg

#### Description

This command displays system load balancing settings.

#### Parameters

**detail**

Keyword to display port settings.

#### Platforms

All

#### Output

The following output is an example of load balancing information.

#### Output Example

```
*A:bkvm15# show system load-balancing-alg
=====
System-wide Load Balancing Algorithms
=====

## 16.53 local-bfd-discrim

### local-bfd-discrim

#### Syntax

**local-bfd-discrim** *bfd-discriminator*

#### Context

[\[Tree\]](#) (tools>dump>router>lsp-bfd local-bfd-discrim)

#### Full Context

tools dump router lsp-bfd local-bfd-discrim

#### Description

This command displays information for the BFD-on-LSP session with a specified local discriminator.

#### Parameters

***bfd-discriminator***

Specifies the BFD discriminator.

**Values** to 4294967295

#### Platforms

All

## 16.54 local-dhcp-db

### local-dhcp-db

#### Syntax

**local-user-db** *local-user-db-name*

#### Context

[\[Tree\]](#) (tools>perform>subscr-mgmt>local-user-db local-dhcp-db)

#### Full Context

tools perform subscriber-mgmt local-user-db local-dhcp-db

## Description

This command enables tools to control the local user database.

## Parameters

### *local-user-db-name*

Specifies the name of a local user database.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.55 local-dhcp-server

### local-dhcp-server

## Syntax

**local-dhcp-server** *server-name*

## Context

[\[Tree\]](#) (show>router>dhcp local-dhcp-server)

[\[Tree\]](#) (show>router>dhcp6 local-dhcp-server)

## Full Context

show router dhcp local-dhcp-server

show router dhcp6 local-dhcp-server

## Description

This command displays local DHCP or DHCP6 server information.

## Parameters

### *server-name*

Specifies information about the local DHCP server.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### local-dhcp-server

## Syntax

**local-dhcp-server** *server-name*

## Context

[\[Tree\]](#) (clear>router>dhcp local-dhcp-server)

[\[Tree\]](#) (clear>router>dhcp6 local-dhcp-server)

## Full Context

clear router dhcp local-dhcp-server

clear router dhcp6 local-dhcp-server

## Description

This command clears DHCP server data.

## Parameters

### *server-name*

Clears data for the specified local DHCP server.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## local-dhcp-server

## Syntax

**local-dhcp-server** *server-name*

## Context

[\[Tree\]](#) (tools>perform>router>dhcp local-dhcp-server)

[\[Tree\]](#) (tools>perform>router>dhcp6 local-dhcp-server)

## Full Context

tools perform router dhcp local-dhcp-server

tools perform router dhcp6 local-dhcp-server

## Description

This command enables tools to control the local DHCP server.

## Parameters

### *server-name*

Specifies the name of the local DHCP server.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.56 local-forward

### local-forward

#### Syntax

**local-forward** [*local-forward-id*]

#### Context

[\[Tree\]](#) (show>system>satellite local-forward)

#### Full Context

show system satellite local-forward

#### Description

This command displays satellite local forward services information.

#### Parameters

##### ***local-forward-id***

Specifies the local forward ID.

**Values** 1 to 10240

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### local-forward

#### Syntax

**local-forward**

#### Context

[\[Tree\]](#) (show>system>satellite>eth-sat local-forward)

#### Full Context

show system satellite eth-sat local-forward

#### Description

This command displays information for Ethernet satellite local forward services.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.57 local-sid

### local-sid

#### Syntax

```
local-sid [ipv6-address] [/prefix-length] [locator locator-name] [longer] [end] [end-x] [end-dt4] [end-dt6]  
[end-dt46] [end-dx2] [context context] [end-dt2u] [end-dt2m]
```

#### Context

[\[Tree\]](#) (show>router>srv6 local-sid)

#### Full Context

```
show router segment-routing-v6 local-sid
```

#### Description

This command displays SRv6 local-SID information.

#### Parameters

##### *ipv6-address*

Specifies the IPv6 address.

**Values**    x:x:x:x:x:x:x (eight 16-bit pieces)  
              x:x:x:x:x:d.d.d.d  
              x - [0 to FFFF]H  
              d - [0 to 255]D

##### *locator-name*

Specifies the locator name, up to 64 characters.

##### **longer**

Displays the specified route and subsets of the route.

##### **end**

Displays the End SID function of a locator.

##### **end-x**

Displays the End.X SID function associated with a P2P interface.

##### **end-dt4**

Displays the End.DT4 function associated with the Base routing instance.

**end-dt6**

Displays the End.DT6 function associated with the Base routing instance.

**end-dt46**

Displays the End.DT46 function associated with the Base routing instance.

**end-dx2**

Displays the End.DX2 function associated with the SRv6 instance in the service.

**context**

Specifies the router context.

**Values** *vprn-svc-name* | 'Base' | *vprn-svc-id*

**end-dt2u**

Displays the End.DT2U function associated with the SRv6 instance in the service.

**end-dt2m**

Displays the End.DT2M function associated with the SRv6 instance in the service.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

**Output**

The following output is an example of local SID information.

**Output Example**

```
*A:Dut-B# show router segment-routing-v6 local-sid

Table 275: Output fields: local SID describes local SID output fields.

Table 275: Output fields: local SID

Field	Description
SID	The segment ID
Locator	The locator name
Context	The context of the SID
Type	The type of SRv6 behavior
Function	The function value
SIDs	The total number of SIDs

## 16.58 local-tx-pdu

### local-tx-pdu

#### Syntax

**local-tx-pdu** [**domain** {*md-index* | *md-admin-name*}] [**association** {*ma-index* | *ma-admin-name*}] [**mep** *mep-id*]

#### Context

**[Tree]** (show>eth-cfm local-tx-pdu)

#### Full Context

show eth-cfm local-tx-pdu

#### Description

This command displays the transmission for ETH-CC, ETH-AIS, and ETH-CFM Grace (ETH-VSM or ETH-ED) using a character representation for each protocol per MEP. ETH-CC is expanded to include columns for RDI, Port Status TLV, and Interface Status TLV. The additional ETH-CC columns represent the actual transmitting value of the TLV, or "Absent" if not present in the ETH-CC PDU. These additional ETH-CC columns are represented with a series of dashes if the ETH-CC column under the TxPDU is a dash ("-") or "c".

The optional parameters are treated as independent and cumulative filters that are combined to refine the output. Rows in the output are populated for matches against all specified filters. Omitting all optional parameters produces output that includes all MEPs.

## Parameters

*md-index*

Specifies the MD index.

**Values** 1 to 4294967295

*md-admin-name*

Specifies the MD name, up to 64 characters.

*ma-index*

Specifies the MA index.

**Values** 1 to 4294967295

*ma-admin-name*

Specifies the MD name, up to 64 characters.

*mep-id*

Specifies the local MEP ID.

**Values** 1 to 8191

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of local PDU transmission information, and [Table 276: Output fields: ETH-CFM local PDU transmission](#) describes the output fields.

### Output example

```
show eth-cfm local-tx-pdu

Table 276: Output fields: ETH-CFM local PDU transmission

Label	Description
MdIndex	The local MEP domain index
MaIndex	The local MEP association index
MepId	The local MEP identifier
SrcMacAddress	The local MEP source MAC address
TxRdi	The RDI value
PortTLV	The Port Status TLV value
IfTLV	The Interface Status TLV value
TxPDU	The transmission, summarized in three single-character columns. The left column displays ETH-CC, the middle column displays ETH-AIS, and the right column displays ETH-CFM Grace (ETH-VSM or ETH-ED).  For ETH-AIS, "A" is displayed when a facility MEP has determined that the AIS state is active, regardless of interaction, linkages, or active transmission of associated MEPs.
md-admin-name	Displays the administrative MD name.
ma-admin-name	Displays the administrative MA name.

## 16.59 local-user-db

### local-user-db

#### Syntax

**local-user-db** *local-user-db-name* **association** [**dhcp**] [**ppp**] [**I2tp**] [**radius**] [**pppoe**] [**dhcp6**] [**capture-sap**] [**rtr-solicit**] [**wpp**] [**ipoe**] [**gtp**]

**local-user-db** *local-user-db-name* **ipoe-host** *ipoe-host-name*  
**local-user-db** *local-user-db-name* **ipoe-unmatched-hosts**  
**local-user-db** [*local-user-db-name*]  
**local-user-db** *local-user-db-name* **ppp-all-hosts**  
**local-user-db** *local-user-db-name* **ppp-host** *pppoe-host-name*  
**local-user-db** *local-user-db-name* **ppp-unmatched-hosts**

## Context

[\[Tree\]](#) (show>subscr-mgmt local-user-db)

## Full Context

show subscriber-mgmt local-user-db

## Description

This command displays local user database information.

## Parameters

### ***local-user-db-name***

Specifies the name of a local user database up, to 32 characters.

### **association**

Displays entities associated with the specified local user database.

### **dhcp**

Displays entities associated with the specified local user database for DHCP clients or server.

### **ppp**

Displays entities associated with the specified local user database for PPP sessions.

### **l2tp**

Displays entities associated with the specified local user database for L2TP sessions.

### **radius**

Displays entities associated with the specified local user database for RADIUS fallback.

### **pppoe**

Displays entities associated with the specified local user database for PPPoE sessions.

### **dhcp6**

Displays entities associated with the specified local user database for DHCPv6 clients.

### **capture-sap**

Displays capture-saps associated with the specified local user database.

### **rt-solicit**

Displays entities associated with the specified local user database for rtr-solicit session.

**wpp**

Displays entities associated with the specified local user database for WPP.

**ipoe**

Displays entities associated with the specified local user database for IPoE sessions.

**gtp**

Displays GTP APN policies associated with the specified local user database.

**ipoe-all-hosts**

Displays a summary overview of all IPoE hosts .

**ipoe-host-name**

Displays detailed information about the specified IPoE host.

**ipoe-unmatched-hosts**

Displays unmatched IPoE hosts and the reason why they cannot be matched in the specified local user database.

**ppp-all-hosts**

Displays a summary overview of all PPP hosts.

**ppp-hosts**

Displays detailed information about the specified PPP host.

**ppp-unmatched-hosts**

Displays unmatched PPP hosts and the reason why they cannot be matched in the specified local user database.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following commands display local user database information and [Table 277: Output fields: local user database](#) describes the output fields.

**Output Example**

```

Table 277: Output fields: local user database

Field	Description
Name	The local user database name
Admin State	The administrative state of the local user database
Host Count	The number of hosts associated with the local user database
Description	The user-provided description of the local user database
Number of Local User Databases	The number of local user databases configured on the node
Number of Hosts	The number of hosts configured on the node
Last Mgmt Change	The sysUpTime at the time of the last modification
DHCP Match Types	The DHCP match type
DHCP CirclD Mask Pfx	The DHCP circuit ID mask prefix
DHCP CirclD Mask Sfx	The DHCP circuit ID mask suffix
PPPoE Match Types	The PPPoE match types; circuit-id, derived-id, dual-stack-remote-id, encap-tag-range, ip, mac, option60, remote-id, sap-id, service-id, string, system-id
PPPoE CirclD Mask Pfx	The PPPoE circuit ID mask prefix
PPPoE CirclD Mask Sfx	The PPPoE circuit ID mask suffix
Circuit Id	The circuit ID to match during host identification
Mac Address	The MAC address to matching during host identification
Remote Id	The remote ID from option 82 to match against
Sap Id	The SAP ID from the Nokia vendor specific sub-option in option 82 to match against
Service Id	The service ID to match during host identification
String	The string from the Nokia vendor specific sub-option in option 82 to match against
Option 60	The Vendor-Identifying Vendor Option to match against
System Id	The system ID from the Nokia vendor specific sub-option in option 82 to match against

Field	Description
Subscriber Id	The subscriber ID which is encoded in the identification strings
SLA Profile String	The SLA profile string which is encoded in the identification strings
Sub Profile String	The subscriber profile string which is encoded in the identification strings
App Profile String	The application profile string which is encoded in the identification strings
ANCP String	The ANCP string which is encoded in the identification strings
Inter Destination Id	The intermediate destination identifier which is encoded in the identification strings
Name	The unmatched host name
Reason	Indicates why this host is not matched
Duplicate Host	The name of the host that is already matched and that has the same values, configured for the objects that correspond with the match types, as this unmatched host
Server-Name	The service name of the unmatched host
Router-Name	The router name of the unmatched host
Interface-Name	The interface name of the unmatched host
Service-Id	The service ID that matches the host identification the Nokia vendor specific sub-option in option 82, or the service where the IPoE session is established
Interface-Name	The interface name associated with the local user database
Svc-Id Svc-Id	The service ID associated with the local user database
Type	The service type
SAP	The capture SAP associated with the local user database
PPPoE	PPPoE associated with the capture SAP; Y or N
PPP	PPPoE associated with the capture SAP; Y or N
Ipoe	IPoE associated with the capture SAP; Y or N

Field	Description
DHCP	DHCP associated with the capture SAP; Y or N
DHCP6	DHCP6 associated with the capture SAP; Y or N
RS	RS associated with the capture SAP; Y or N
No. of SAP(s)	The total number of SAPs
Keepalive	
Interval	The LCP keepalive interval override value configured for this PPP host. N/A means no override is configured
Hold up multiplier	The LCP keepalive hold up multiplier override value configured for this PPP host. N/A means no override is configured

## local-user-db

### Syntax

**local-user-db** *local-user-db-name*

### Context

[\[Tree\]](#) (tools>perform>subscr-mgmt local-user-db)

### Full Context

tools perform subscriber-mgmt local-user-db

### Description

This command provides tools to control the local user database.

### Parameters

***local-user-db-name***

Specifies the name of a local user database up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.60 locator

### locator

#### Syntax

**locator** [mt {0 | 2}] [prefix *ipv6-prefix[/prefix-length]*] [adv-router *system-id | hostname*] [algo *algo-id*]

#### Context

[\[Tree\]](#) (show>router>isis>srv6 locator)

#### Full Context

show router isis segment-routing-v6 locator

#### Description

This command displays IS-IS SRv6 locators.

#### Parameters

##### *ipv6-prefix[/prefix-length]*

Displays routes only matching the specified *ip-address* and length.

**Values** *ipv6-prefix[/prefix]*: x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x: [0 to FFFF]H  
d: [0 to 255]D  
*prefix-length*: 1 to 128

##### *system-id | hostname*

Displays information for the specific IS-IS advertising router. The host name can be up to 38 characters.

##### *algo-id*

Displays information for the specified algorithm.

**Values** 0 to 255

#### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## locator

### Syntax

**locator** [*locator-name*]

### Context

[\[Tree\]](#) (show>router>srv6 locator)

### Full Context

show router segment-routing-v6 locator

### Description

This command displays the SRv6 locator status.

### Parameters

***locator-name***

Specifies the locator name, up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 16.61 lockout

## lockout

### Syntax

**lockout** *aps-id*

### Context

[\[Tree\]](#) (tools>perform>aps lockout)

### Full Context

tools perform aps lockout

### Description

This command locks out the protection circuit.

### Parameters

***aps-id***

Specifies the APS ID.

Values	<i>aps-id</i>	<i>aps-group-id</i>
	aps	keyword
	group-id	1 to 128

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## lockout

### Syntax

**lockout id** *tunnel-id*

**lockout** *lsp-name*

### Context

[\[Tree\]](#) (tools>perform>router>mpls>tp-tunnel lockout)

### Full Context

tools perform router mpls tp-tunnel lockout

### Description

This command performs a lockout of protection for an MPLS-TP LSP. This prevents a switchover to the protect path.

### Parameters

#### *tunnel-id*

Specifies the tunnel number of the MPLS-TP LSP.

**Values** 0 to 42949667295

#### *lsp-name*

Specifies the name of the MPLS-TP LSP, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## lockout

### Syntax

**lockout router** *router-id* **local-gateway-address** *local-gateway-address* **mda** *mda*

**lockout router** *router-id* **local-gateway-address** *local-gateway-address* **esa-vm** *esa-id/vm-id*

**lockout router** *router-id* **local-gateway-address** *local-gateway-address* **remote** *ip-address[:port]*  
**lockout router** *router-id* **mda** *mda*

## Context

[\[Tree\]](#) (show>ipsec lockout)

## Full Context

show ipsec lockout

## Description

This command displays the lockout status for the specified IPsec clients. If remote address information is not specified, the system displays a list of clients that have been locked out on the specified ISA, along with the IPsec gateway if *local-gateway-address* is specified.

## Parameters

### *router-id*

Specifies the ID of the router where the IPsec gateway is configured.

### *local-gateway-address*

Specifies the IP address of the local IPsec gateway.

### *mda*

Specifies the MDA ID of the ISA.

### *ip-address*

Specifies the IP address of the remote client.

### *port*

Specifies the port of the remote client.

### *esa-vm*

Displays the ID of the configured ESA and ESA VM.

### Values

esa-vm:	<i>esa-id/vm-id</i>	
	<i>esa-id</i>	1 to 16
	<i>vm-id</i>	1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of lockout information.

### Output Example

```
show ipsec lockout router 300 local-gateway-address 172.16.100.1 remote  
192.168.61.100:500  
=====
```

```
IPsec Lockout Client
=====
Lockout           : True
Router ID        : 300
Local Gateway Address : 172.16.100.1
Lockout Client Address: 192.168.61.100
Lockout Client Port  : 500
No. of Failed Attempts: 2
No. of Dropped Packets: 2
Remaining Block Time : 289 seconds
=====
```

## lockout

### Syntax

**lockout router** *router-id*

**lockout router** *router-id* **local-gateway-address** *local-gateway-address*

**lockout router** *router-id* **local-gateway-address** *local-gateway-address* **remote** *ip-address[:port]*

### Context

[\[Tree\]](#) (clear>ipsec lockout)

### Full Context

clear ipsec lockout

### Description

This command clears the lockout state for the specified clients. If remote address information is not specified, the system clears the lockout state for all clients within the specified routing instance, along with all clients within the specified IPsec gateway if *local-gateway-address* is specified.

### Parameters

#### ***router-id***

Specifies the ID of the router where the IPsec gateway is configured.

#### ***local-gateway-address***

Specifies the IP address of the local IPsec gateway.

#### ***ip-address***

Specifies the IP address of the remote client.

#### ***port***

Specifies the port of the remote client.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.62 lockout-annexb

### lockout-annexb

#### Syntax

**lockout-annexb** *aps-id*

#### Context

[\[Tree\]](#) (tools>perform>aps lockout-annexb)

#### Full Context

tools perform aps lockout-annexb

#### Description

This command locks out the Annex B APS group.

#### Parameters

***aps-id***

Specifies the APS ID.

#### Values

<i>aps-id</i>	<i>aps-group-id</i>
aps	keyword
group-id	1 to 128

#### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 16.63 log

### log

#### Syntax

**log**

#### Context

[\[Tree\]](#) (show log)

### Full Context

show log

### Description

Commands in this context display event and accounting policy log information.

### Platforms

All

log

### Syntax

## log

### Syntax

**log** *log-id*

### Context

**[Tree]** (clear>li log)

### Full Context

clear li log

### Description

This command clears LI event log information.

### Parameters

***log-id***

Specifies the log ID.

**Values** 1 to 100

### Platforms

All

## log

### Syntax

**log** [*bindings*]

**log** *log-id* [*match string*]

### Context

**[Tree]** (show>filter log)

### Full Context

show filter log

### Description

This command shows the contents of a memory-based or a file-based filter log.

If the optional keyword **match** and *string* parameter are given, the command displays the given filter log from the first occurrence of the given string.

## Parameters

### bindings

Displays the number of filter logs currently instantiated.

### log-id

Specifies the filter log ID destination expressed as a decimal integer.

**Values** 101 to 199

### string

Specifies to start displaying the filter log entries from the first occurrence of *string*.

## Platforms

All

## Output

The following output is an example of filter log entry information, and [Table 278: Output fields: filter log](#) describes the fields. If log summary is active, the filter log mini-tables contain the information described in [Table 279: Output fields: filter log summary \(mini-tables\)](#).

### Output Example

**Log Message Formatting** — Each filter log entry contains the following information in case summary log feature is not active (as appropriate).

Table 278: Output fields: filter log

Label	Description
yyyy/mm/dd hh:mm:ss	The date and timestamp for the log filter entry where <i>yyyy</i> is the year, <i>mm</i> is the month, <i>dd</i> is the day, <i>hh</i> is the hour, <i>mm</i> is the minute and <i>ss</i> is the second
Filter	The filter ID and the entry ID which generated the filter log entry in the form <i>Filter_ID:Entry_ID</i>
Desc	The description of the filter entry ID which generated the filter log entry
Interface	The IP interface on which the filter ID and entry ID was associated which generated the filter log entry
Action	The action of the filter entry on the logged packet
Src MAC	The source MAC address of the logged packet
Dst MAC	The destination MAC of the logged packet
EtherType	The Ethernet type of the logged Ethernet type II packet
Src IP	The source IP address of the logged packet; the source port is displayed after the IP address as appropriate separated with a colon

Label	Description
Dst IP	The destination IP address of the logged packet; the source port is displayed after the IP address as appropriate separated with a colon
Flags (IP flags)	M — the more fragments IP flag is set in the logged packet DF — the do not fragment IP flag is set in the logged packet
TOS	The ToS byte value in the logged packet
Protocol	The IP protocol of the logged packet (TCP, UDP, ICMP or a protocol number in hex)
Flags (TCP flags)	URG — Urgent bit set ACK — Acknowledgment bit set RST — Reset bit set SYN — Synchronize bit set FIN — Finish bit set
HEX	If an IP protocol does not have a supported decode, the first 32 bytes following the IP header are printed in a hex dump Log entries for non-IP packets include the Ethernet frame information and a hex dump of the first 40 bytes of the frame after the Ethernet header
Total Log Instances (Allowed)	Specifies the maximum allowed instances of filter logs allowed on the system
Total Log Instances (In Use)	Specifies the instances of filter logs presently existing on the system
Total Log Bindings	Specifies the count of the filter log bindings presently existing on the system
Type	The type of service of the service ID
Filter ID	Uniquely identifies an IP filter as configured on the system
Entry ID	The identifier which uniquely identifies an entry in a filter table
Log	Specifies an entry in the filter log table
Instantiated	Specifies if the filter log for this filter entry has or has not been instantiated

If the packet being logged does not have a source or destination MAC address (that is, POS) then the MAC information output line is omitted from the log entry.

If log summary is active, the filter log mini-tables contain the information described in [Table 279: Output fields: filter log summary \(mini-tables\)](#).

Table 279: Output fields: filter log summary (mini-tables)

Label	Description
Summary Log LogID	Displays the log ID
Crit1	Summary criterion that is used as index into the mini-tables of the log
TotCnt	The total count of logs
ArpCnt	Displays the total number of ARP messages logged for this log ID
Src... Dst...	The address type indication of the key in the mini-table
count	The number of messages logged with the specified source/destination address
address	The address for which count messages were received

## log

### Syntax

**log** *log-id*

### Context

[\[Tree\]](#) (clear>filter log)

### Full Context

clear filter log

### Description

Clears the contents of a memory or file based filter log.

This command has no effect on a syslog based filter log.

### Parameters

***log-id***

Specifies the filter log ID as a decimal integer.

**Values** 101 to 199

### Platforms

All

## log

### Syntax

**log** *log-id*

### Context

[\[Tree\]](#) (clear log)

### Full Context

clear log

### Description

The **clear log** *log-id* command has been deprecated and replaced by the **clear log log-id** *log-id* command. The **clear log** *log-id* command continues to be supported, but it is recommended to use the **clear log log-id** *log-id* command instead.

### Parameters

***log-id***

Specifies the event log ID to be initialized or rolled over.

**Values** 1 to 100

### Platforms

All

## log

### Syntax

**log**

### Context

[\[Tree\]](#) (tools>dump log)

  Dest Log Id: 100 Filter Id: 1001   Status: enabled  Dest Type: memory

Security      Logged   : 3          Dropped   : 0

Change        Logged   : 3896         Dropped   : 0

Debug         Logged   : 0          Dropped   : 0

=====
A:ALA-1#
    
```

Table 280: Output fields: log collector

Label	Description
<Collector Name>	<p>Main — The main event stream contains the events that are not explicitly directed to any other event stream.</p> <p>Security — The security stream contains all events that affect attempts to breach system security such as failed login attempts, attempts to access MIB tables to which the user is not granted access or attempts to enter a branch of the CLI to which access has not been granted.</p> <p>Change — The change event stream contains all events that directly affect the configuration or operation of this node.</p> <p>Debug — The debug-trace stream contains all messages in the debug stream.</p>
Dest. Log ID	Specifies the event log stream destination.
Filter ID	The value is the index to the entry which defines the filter to be applied to this log's source event stream to limit the events output to this log's destination. If the value is 0, then all events in the source log are forwarded to the destination.
Status	<p>Enabled — Logging is enabled.</p> <p>Disabled — Logging is disabled.</p>
Dest. Type	<p>Console — A log created with the console type destination displays events to the physical console device.</p> <p>Events are displayed to the console screen whether a user is logged in to the console or not.</p> <p>Session — A user logged in to the console device or connected to the CLI via a remote telnet or SSH session can also create a log with a destination type of 'session'. Events are displayed to the session device until the user logs off.</p>

Label	Description
	Syslog — Log events are sent to a syslog receiver. SNMP traps — Events defined as SNMP traps are sent to the configured SNMP trap destinations and are logged in NOTIFICATION-LOG-MIB tables. File — All selected log events are directed to a file on one of the compact flash disks. Memory — All selected log events are directed to an in-memory storage area.

## Context

[\[Tree\]](#) (show>service>id>log log-id)

## Full Context

```
show service id log log-id
```

## Description

This command displays an event log summary with settings and statistics or the contents of a specific log file, SNMP log, or memory log.

If the command is specified with no command line options, a summary of the defined system logs is displayed. The summary includes log settings and statistics.

If the log ID of a memory, SNMP, or file event log is specified, the command displays the contents of the log. Additional command line options control what and how the contents are displayed.

Contents of logs with console, session or syslog destinations cannot be displayed. The actual events can only be viewed on the receiving syslog or console device.

## Parameters

### *log-id*

Displays the contents of the specified file log or memory log ID. The log ID must have a destination of an SNMP or file log or a memory log for this parameter to be used.

**Values** 1 to 100

**Default** Displays the event log summary.

### *severity-level*

Displays only events with the specified and higher severity.

**Values** cleared, indeterminate, critical, major, minor, warning

**Default** All severity levels.

### *application*

Displays only events generated by the specified application.

**Values** anysec, application\_assurance, aps, atm, bfd, bgp, calltrace, ccag, cflowd, chassis, cpmhwfilter, cpmhwqueue, debug, dhcp, dhcps, diameter, dot1x, dynsvc, efm\_oam, elmi, ering, eth\_cfm, etun, filter, fpe, gsmp, gtungrp, igh, igmp, igmp\_snooping, ip, ipfix, ipsec, ipsec\_cpm, isis, l2tp, lag, ldap, ldp, li, lldp, logger, mcac, mcpath, mc\_redundancy, mirror, mld, mld\_snooping, mpls, mpls\_tp, mrrp, msdp, nat, ntp, oam, open\_flow, ospf, pcep, pim, pim\_snooping, port, ppp, pppoe, pppoe\_clnt, ptp, pxc, python, qos, radius, rip, rip\_ng, route\_next\_hop, route\_policy, rpki, rsvp, security, sflow, snmp, stp, subscr\_mgmt, sub\_host\_trk, svcmgr, system, tip, tls, user, user\_db, video, vrrp, vrtr, wlan\_gw, wpp

**Default** All applications.

### ***from-seq [to-seq]***

Displays the log entry numbers from a particular entry sequence number (*from-seq*) to another sequence number (*to-seq*). The *to-seq* value must be larger than the *from-seq* value.

If the *to-seq* number is not provided, the log contents to the end of the log is displayed unless the **count** parameter is present in which case the number of entries displayed is limited by the **count**.

**Values** 1 to 4294967295

**Default** All sequence numbers.

### ***count***

Limits the number of log entries displayed to the *number* specified.

**Values** 1 to 4294967295

**Default** All log entries.

### ***subject***

Displays only log entries matching the specified text *subject* string, up to 32 characters. The subject is the object affected by the event, for example the port-id would be the subject for a link-up or link-down event.

### ***regexp***

Specifies to use a regular expression as parameters with the specified **subject** string.

### ***ascending | descending***

Specifies sort direction. Logs are normally shown from the newest entry to the oldest in **descending** sequence number order on the screen. When using the **ascending** parameter, the log is shown from the oldest to the newest entry.

**Default** Descending.

### ***format***

Specifies a message string, up to 400 characters, to be used in the display criteria.

### ***msg-regexp***

Specifies to use a regular expression as parameters with the specified message string.

## **Platforms**

All

## **Output**

[Table 281: Output fields: log ID](#) describes the log ID field output.

*Table 281: Output fields: log ID*

Label	Description
Log Id	An event log destination.

Label	Description
Source	no — The event log filter is not currently in use by a log ID. yes — The event log filter is currently in use by a log ID.
Filter ID	The value is the index to the entry which defines the filter to be applied to this log's source event stream to limit the events output to this log's destination. If the value is 0, then all events in the source log are forwarded to the destination.
Admin State	Up — Indicates that the administrative state is up. Down — Indicates that the administrative state is down.
Oper State	Up — Indicates that the operational state is up. Down — Indicates that the operational state is down.
Logged	The number of events that have been sent to the log source(s) that were forwarded to the log destination.
Dropped	The number of events that have been sent to the log source(s) that were not forwarded to the log destination because they were filtered out by the log filter.
Dest. Type	Console — All selected log events are directed to the system console. If the console is not connected, then all entries are dropped. Syslog — All selected log events are sent to the syslog address. SNMP traps — Events defined as SNMP traps are sent to the configured SNMP trap destinations and are logged in NOTIFICATION-LOG-MIB tables. File — All selected log events are directed to a file on one of the CPM's compact flash disks. (7750 SR and 7450 ESS only). Memory — All selected log events are directed to an in-memory storage area.
Dest ID	The event log stream destination.
Size	The allocated memory size for the log.
Time format	The time format specifies the type of timestamp format for events sent to logs where log ID destination is either syslog or file. When the time format is UTC, timestamps are written using the Coordinated Universal Time value. When the time format is local, timestamps are written in the system's local time.

## log-id

### Syntax

```
log-id [log-id | log-name] [severity severity-level] [application application] [sequence from-seq [to-seq]] [count count] [router router-instance [expression]] [subject subject [regex]] [{ ascending | descending}] [message message [msg-regex]]
```

## Context

**[Tree]** (show>li>log log-id)

## Full Context

show li log log-id

## Description

This command displays information for specified log.

## Parameters

### ***log-id | log-name***

Specifies the log ID or name.

**Values** 1 to 100

### ***severity-level***

Specifies the severity level.

**Values** cleared, indeterminate, critical, major, minor, warning

### ***application***

Specifies the application name.

**Values** anysec, application\_assurance, aps, atm, auto\_prov, bfd, bgp, bier, bmp, calltrace, ccag, cflowd, chassis, cpmhwfilter, cpmhwqueue, debug, dhcp, dhcps, diameter, dot1x, dynsvc, efm\_oam, elmi, ering, eth\_cfm, etun, filter, fpe, gsmp, gtp, gtungrp, icl, igh, igmp, igmp\_snooping, ip, ipfix, ipsec, ipsec\_cpm, isis, l2tp, lag, ldap, ldp, li, lldp, logger, macsec, mcac, mcpath, mc\_redundancy, mgmt\_core, mirror, mld, mld\_snooping, mpls, mpls\_tp, mpls\_lmgr, mrrp, msdp, nat, nge, ntp, oam, open\_flow, ospf, pcap, pcep, pfc, pim, pim\_snooping, port, ppp, pppoe, pppoe\_clnt, profile, ptp, pxc, python, qos, radius, rib\_api, rip, rip\_ng, route\_next\_hop, route\_policy, rpki, rsvp, security, sflow, snmp, sr\_policy, stp, subscr\_mgmt, sub\_host\_trk, svcmgr, system, tip, tls, user, user\_db, video, vrrp, vrtr, wlan\_gw, wpp

### ***from-seq [to-seq]***

Specifies the sequence value.

**Values** 1 to 4294967295

### ***count***

Specifies the count.

**Values** 1 to 4294967295

### ***router-instance***

Specifies the router instance.

### ***subject***

Specifies a subject string to match.

**regexp**

Specifies to use a regular expression match.

**ascending | descending**

Specifies the sort direction.

**message**

Specifies the message, up to 400 characters.

**msg-regexp**

Specifies to use a message regular expression match.

**Platforms**

All

## log-id

**Syntax**

**log-id** [*log-id* | *log-name*] [**severity** *severity-level*] [**application** *application*] [**sequence** *from-seq* [*to-seq*]] [**count** *count*] [**router** *router-instance* [**expression**]] [**subject** *subject* [**regexp**]] [**ascending** | **descending**] [**message** *message* [**msg-regexp**]]

**Context**

[\[Tree\]](#) (show>log log-id)

**Full Context**

show log log-id

**Description**

This command displays an event log summary with settings and statistics or the contents of a specific log file, SNMP log, or memory log.

If the command is specified with no command line options, a summary of the defined system logs is displayed. The summary includes log settings and statistics.

If the log ID of a memory, SNMP, or file event log is specified, the command displays the contents of the log. Additional command line options control what and how the contents are displayed.

Contents of logs with console, session or syslog destinations cannot be displayed. The actual events can only be viewed on the receiving syslog or console device.

**Parameters**

***log-id* | *log-name***

Displays the contents of the specified file log or memory log ID. The log ID, or optional log name (up to 64 characters), must have a destination of an SNMP or file log or a memory log for this parameter to be used.

**Default** Displays the event log summary

**Values** 1 to 101

**severity-level**

Displays only events with the specified and higher severity.

**Default** All severity levels

**Values** cleared, indeterminate, critical, major, minor, warning

**application**

Displays only events generated by the specified application.

**Default** All applications

The following values are examples of applications:

**Values** bgp, cflowd, chassis, dhcp, debug, filter, igmp, ip, isis, lag, ldp, lldp, logger, mirror, mpls, oam, ospf, pim, port, ppp, rip, route\_policy, rsvp, security, snmp, stp, svcmgr, system, user, vrrp, vrtr, ospf\_ng, ntp

**expression**

Specifies to use a regular expression as match criteria for the router instance string.

**from-seq [to-seq]**

Displays the log entry numbers from a particular entry sequence number (*from-seq*) to another sequence number (*to-seq*). The *to-seq* value must be larger than the *from-seq* value.

If the *to-seq* number is not provided, the log contents to the end of the log is displayed unless the **count** parameter is present in which case the number of entries displayed is limited by the **count**.

**Default** All sequence numbers

**Values** 1 to 4294967295

**count**

Limits the number of log entries displayed to the *number* specified.

**Default** All log entries

**Values** 1 to 4294967295

**router-instance**

Specifies a router name up to 32 characters in length to be used in the display criteria.

**message**

Specifies a message string up to 400 characters in length to be used in the display criteria.

**msg-regex**

Specifies to use a regular expression as parameters with the specified *message* string.

**subject**

Displays only log entries matching the specified text *subject* string. The subject is the object affected by the event, for example the port-id would be the subject for a link-up or link-down event.

**regexp**

Specifies to use a regular expression as parameters with the specified *subject* string.

**ascending | descending**

Specifies sort direction. Logs are normally shown from the newest entry to the oldest in **descending** sequence number order on the screen. When using the **ascending** parameter, the log is shown from the oldest to the newest entry.

**Default** Descending

**Platforms**

All

**Output**

The following output is an example of log ID information.

[Table 282: Output fields: log ID](#) describes the log ID field output.

**Output Example**

```

Table 282: Output fields: log ID

Label	Description
Log Name/Id	An event log destination.
Source	no — The event log filter is not currently in use by a log ID. yes — The event log filter is currently in use by a log ID.
Filter ID	The value is the index to the entry which defines the filter to be applied to this log's source event stream to limit the events output to this log's destination. If the value is 0, then all events in the source log are forwarded to the destination.
Admin State	Up — Indicates that the administrative state is up. Down — Indicates that the administrative state is down.
Oper State	Up — Indicates that the operational state is up. Down — Indicates that the operational state is down.
Logged	The number of events that have been sent to the log source(s) that were forwarded to the log destination.
Dropped	The number of events that have been sent to the log source(s) that were not forwarded to the log destination because they were filtered out by the log filter.
Dest. Type	Console — All selected log events are directed to the system console. If the console is not connected, then all entries are dropped. Syslog — All selected log events are sent to the syslog address. SNMP traps — Events defined as SNMP traps are sent to the configured SNMP trap destinations and are logged in NOTIFICATION-LOG-MIB tables. File — All selected log events are directed to a file on one of the CPM's compact flash disks. Memory — All selected log events are directed to an in-memory storage area.

Label	Description
Dest ID	The event log stream destination.
Size	The allocated memory size for the log.
Time format	The time format specifies the type of timestamp format for events sent to logs where log ID destination is either syslog or file. When the time format is UTC, timestamps are written using the Coordinated Universal Time value. When the time format is local, timestamps are written in the system's local time.

## log-id

### Syntax

**log-id** *log-id*

### Context

[\[Tree\]](#) (clear>log log-id)

### Full Context

clear log log-id

### Description

Reinitializes or rolls over the specified memory/file event log ID. Memory logs are reinitialized and cleared of contents. File logs are manually rolled over by this command.

This command is only applicable to event logs that are directed to file destinations and memory destinations.

SNMP, syslog, console, or session logs are not affected by this command.

### Parameters

***log-id***

Specifies the event log ID to be initialized or rolled over.

**Values** 1 to 100

#### Full Context

show router mpls lsp

#### Description

This command displays LSP details.

#### Parameters

##### **lsp-name**

Specifies the name of the LSP used in the path, up to 64 characters.

##### **status up**

Keyword used to display an LSP that is operationally up.

##### **status down**

Keyword used to display an LSP that is operationally down.

##### **from ip-address**

Displays the IP address of the ingress router for the LSP.

##### **to ip-address**

Displays the IP address of the egress router for the LSP.

##### **detail**

Keyword used to display detailed information.

**auto-lsp all**

Keyword used to display all the auto LSP types.

**auto-lsp mesh-p2p**

Keyword used to display the mesh-p2p auto LSP types.

**auto-lsp one-hop-p2p**

Keyword used to display the one-hop-p2p auto LSP types.

**transit**

Keyword used to display the number of static LSPs that transit through the router.

**terminate**

Keyword used to display the number of static LSPs that terminate at the router.

**count**

Keyword used to display the total number of LSPs.

**path-name**

Specifies the LSP path name.

**activepath**

Keyword used to display the present path being used to forward traffic.

**mbb**

Keyword used to display make-before-break (MBB) information.

**dns**

Keyword used to display reverse DNS resolution of actual and explicit hop information.

**Platforms**

All

**Output**

The following output is an example of MPLS LSP and detail information, and [Table 283: Output fields: MPLS LSP](#) and [Table 284: Output fields: LSP detail](#) describes the MPLS LSP output fields.

**Output Example**

```
# show router mpls lsp

Table 283: Output fields: MPLS LSP

Label	Description
LSP Name	The name of the LSP used in the path.
To	The IP address of the egress router for the LSP.
Adm State	Down — The path is administratively disabled. Up — The path is administratively enabled.
Oper State	Down — The path is operationally down. Up — The path is operationally up.
LSPs	The total number of LSPs configured.
From	The IP address of the ingress router for the LSP.
LSP Up Time	The length of time the LSP has been operational.
Transitions	The number of transitions that have occurred for the LSP.
Retry Limit	The number of attempts that the software should make to re-establish the LSP after it has failed.
Signaling	Specifies the signaling style.
Hop Limit	The maximum number of hops that an LSP can traverse, including the ingress and egress routers.
Fast Reroute/Fast Fail Config	enabled — Fast reroute is enabled. In the event of a failure, traffic is immediately rerouted on the pre-computed detour LSP, thus minimizing packet loss. disabled — There is no detour LSP from each node on the primary path.

Label	Description
PathCompMethod	pce — PCE path computation method is configured. local-cspf — Local CSPF path computation method is configured.
Adspec/ ADSPEC	enabled — The LSP includes advertising data (ADSPEC) objects in RSVP messages. disabled — The LSP does not include advertising data (ADSPEC) objects in RSVP messages.
FallbkPathComp	none — No fallback method is configured. local-cspf — Local CSPF fallback is configured.
Primary	The preferred path for the LSP.
Secondary	The alternate path that the LSP uses if the primary path is not available.
Bandwidth	The amount of bandwidth in Mb/s reserved for the LSP path.
LSP Up Time	The total time in increments that the LSP path has been operational.
LSP Tunnel ID	The value which identifies the label switched path that is signaled for this entry.
To	The IP address of the egress router for the LSP.
LSP Down Time	The total time in increments that the LSP path has not been operational.
Path Changes	The number of path changes this LSP has had. For every path change (path down, path up, path change), a corresponding syslog/trap (if enabled) is generated.
Retry Timer	The time in s, for LSP re-establishment attempts after an LSP failure.
Resv Style	se — Specifies a shared reservation environment with a limited reservation scope. This reservation style creates a single reservation over a link that is shared by an explicit list of senders. ff — Specifies a shared reservation environment with an explicit reservation scope. Specifies an explicit list of senders and a distinct reservation for each of them.
Negotiated MTU	The size of the maximum transmission unit (MTU) that is negotiated during establishment of the LSP.
FR Hop Limit	The total number of hops a detour LSP can take before merging back onto the main LSP path.
LastResignal Attempt	Displays the system up time when the last attempt to resignal this LSP was made.
MBB Type	Displays an enumerated integer that specifies the type of make-before-break (MBB). If none displays then there is no MBB in progress or no last MBB.
MBB State	Displays the state of the most recent invocation of the make-before-break functionality.
End at	Displays the system up time when the last MBB ended.

Label	Description
Old Metric	Displays the cost of the traffic engineered path for the LSP path prior to MBB.
NextRetryIn	Displays the amount of time (in s) remaining, before the next attempt is made to retry the in-progress MBB.
RetryAttempt	Displays the number attempts for the MBB is in progress.
Failure Code	Displays the reason code for in-progress MBB failure. A value of <b>none</b> indicates that no failure has occurred. See "LSP Failure Codes" in the 7450 ESS, 7750 SR, 7950 XRS, and VSR MPLS Guide for more information.
Failure Node	Displays the IP address of the node in the LSP path at which the in-progress MBB failed. When no failure has occurred, this value is <b>none</b> .
Static LSPs	Displays the number of static LSPs.
Dynamic LSPs	Displays the number of dynamic RSVP LSPs.
P2P LSPs	Displays the number of P2P RSVP LSPs.
Detour LSPs	Displays the number of detour RSVP LSPs.
P2MP S2Ls	Displays the number of P2MP RSVP S2Ls.
MPLS-TP LSPs	Displays the number of MPLS-TP LSPs.
Mesh-P2P LSPs	Displays the number of Mesh-P2P RSVP LSPs.
One Hop-P2P LSPs	Displays the number of one hop P2P RSVP LSPs.
SR-TE LSPs	Displays the number of SR-TE LSPs.
Mesh-P2P SR-TE LSPs	Displays the number of Mesh-P2P SR-TE LSPs.
One Hop-P2P SR-TE LSPs	Displays the number of one hop SR-TE LSPs.
PCE Init SR-TE LSPs	Displays the number of PCE initiated SR-TE LSPs.

Table 284: Output fields: LSP detail

Label	Description
Auto BW	Enabled — Auto-bandwidth adjustment is configured on this LSP.
AB OpState	Up – Auto-bandwidth is operationally enabled on this LSP Down – Auto-bandwidth is operationally disabled on this LSP

Label	Description
Auto BW Min	The minimum bandwidth of the LSP that auto-bandwidth can request (in Mb/s).
Auto BW Max	The maximum bandwidth of the LSP that auto-bandwidth can request (in Mb/s).
AB Up Thresh	The percent threshold for increasing LSP bandwidth.
AB Down Thresh	The percent threshold for decreasing LSP bandwidth.
AB Up BW	The absolute bandwidth threshold for increasing LSP bandwidth (in Mb/s).
AB Down BW	The absolute bandwidth threshold for decreasing LSP bandwidth (in Mb/s).
AB Coll Intv	The auto-bandwidth collection interval.
AB Adj Mul	The adjust-multiplier for this LSP (may be configured or inherited).
AB Samp Mul	The sample-multiplier for this LSP (may be configured or inherited).
AB Adj Time	The adjust-multiplier times the collection-interval (in minutes).
AB Sample Time	The sample-multiplier times the collection-interval (in minutes).
AB Adj Cnt	The adjust count (number of whole collection intervals since the start of the current adjust interval).
AB Samp Cnt	The sample count (number of whole collection intervals since the start of the current sample interval).
AB Last Adj	The system time of the last auto-bandwidth adjustment.
AB Next Adj	The approximate remaining time in the current adjust interval (adjust-multiplier – adjust count) times the collection interval (in min). This overstates the actual remaining time because the elapsed time in the current collection interval is not accounted for.
AB Adj Cause	The cause of the last auto-bandwidth adjustment: <ul style="list-style-type: none"> <li>• none – no adjustment has occurred</li> <li>• manual</li> <li>• adj-count</li> <li>• overflow</li> </ul>
AB Max AvgR*	The maximum average data rate in any sample interval of the current adjust interval.
AB Lst AvgR*	The average data rate measured in the sample interval that ended most recently.

Label	Description
AB Ovfl Lmt	The configured value of the auto-bandwidth overflow-limit.
AB Ovfl Cnt	The number of overflow samples since the last reset.
ABOvflThres	The percent threshold for declaring an overflow sample.
AB Ovfl BW	The absolute bandwidth threshold for declaring an overflow sample (in Mb/s).
AB Monitor BW	True – monitor bandwidth is enabled on the LSP. False – monitor bandwidth is not enabled on the LSP.
BFD Enable	The operational state of BFD on the LSP.
BFD failure-action	The failure action that is configured for the BFD LSP.
Lsp Self Ping	Enabled – LSP Self-ping on this RSVP LSP or RSVP LSPs (one-hop-p2p or mesh-p2p) using this LSP template is enabled. Disabled – LSP Self-ping on this RSVP LSP or RSVP LSPs (one-hop-p2p or mesh-p2p) using this LSP template is disabled. Inherited – inherits the value configured under <b>config&gt;router&gt;mpls&gt;lsp-self-ping&gt;rsvp-te</b>
OperPathComp Method	Displays the path computation method in use (pce, local, or none).
Self ping timeouts	Specifies the count of the number of LSP Self-ping timeouts.

Table 285: Output fields: MPLS LSP path

Label	Description
LSP Name	Specifies the name of the LSP used in the path
From	Specifies the IP address of the ingress router for the LSP
To	Specifies the IP address of the egress router for the LSP
Admin State	Down — The path is administratively disabled Up — The path is administratively enabled
Oper State	Down — The path is operationally down Up — The path is operationally up
Path Name	Specifies the path name
Path LSP ID	Specifies the path LSP ID
Path Type	Specifies the path type

Label	Description
Path Admin	Specifies the path administrative state
Path Oper	Specifies the operational path state
Out Interface	Specifies the port of the out interface
Out Label	Specifies the out label value
Path Up Time	Specifies the duration of path up
Path Down Time	Specifies the duration of path down
Retry Limit	Specifies the retry limit value
Retry Timer	Specifies the retry timer value
Retry Attempt	Specifies the number of retries attempted
Next Retry In	Specifies the next retry in value
BFD Configuration and State	
Template	Specifies the BFD template
Ping Interval	Specifies the ping interval value
Enable	Specifies the BFD enable status
State	Specifies the BFD state
WaitForUpTimer	Specifies the wait for up timer value
OperWaitForUpTimer	Specifies the operational wait for up timer value
WaitForUpTmLeft	Specifies the wait for up time left value
Adspec	Specifies the Adspec status
Oper Adspec	Specifies the operational Adspec status
PathCompMethod	Specifies the path computation method
OperPathCompMethod	Specifies the operational path computation method
MetricType	Specifies the metric type value
Oper MetricType	Specifies the operational metric type value
Least Fill	Specifies the least fill status
Oper LeastFill	Specifies the operational least fill status

Label	Description
FRR	Specifies the FRR status
Oper FRR	Specifies the operational FRR status
FRR NodeProtect	Specifies the FRR node protect status
Oper FRR NP	Specifies the operational FRR node protect status
FR Hop Limit	Specifies the FR hop limit value
Oper FRHopLimit	Specifies the operational FR hop limit value
FR Prop Admin Gr*	Specifies the FR prop administrative group status
Oper FRPropAdm Grp	Specifies the operational FR prop administrative group status
Propagate Adm Grp	Specifies the prop administrative group status
Oper PropAdmGrp	Specifies the operational prop administrative group status
Inter-area	Specifies the inter area status
PCE Report	Specifies the operational PCE report status
Oper PCE Report	Specifies the
PCE Control	Specifies the PCE control status
Oper PCE Control	Specifies the operational PCE control status
PCE Update ID	Specifies the PCE update ID
Neg MTU	Specifies the negotiated MTU value
Oper MTU	Specifies the operational MTU value
Bandwidth	Specifies the bandwidth type
Oper Bandwidth	Specifies the operational bandwidth
Hop Limit	Specifies the hop limit
Oper HopLimit	Specifies the operational hop limit
Record Route	Specifies the record route value
Oper Record Route	Specifies the operational record route value
Setup Priority	Specifies the setup priority value

Label	Description
Oper SetupPriority	Specifies the operational setup priority value
Hold Priority	Specifies the hold priority value
Oper HoldPriority	Specifies the operational hold priority value
Class Type	Specifies the class type
Oper CT	Specifies the operational class type
Backup CT	Specifies the backup class type
MainCT Retry Rem	Specifies the main class type rem value
MainCT Retry Limit	Specifies the main class type retry limit
Include Groups	Specifies the include groups
Oper Include Groups	Specifies the operational include groups
Exclude Groups	Specifies the exclude groups
Oper Exclude Groups	Specifies the operational exclude groups
Adaptive	Specifies the adaptive status
Oper Metric	Specifies the operational metric
Preference	Specifies the preference
Path Trans	Specifies the path trans value
CSPF Queries	Specifies the number of CSPF queries
Degraded	Specifies the degraded status
Failure Code	Specifies the failure code
Failure Node	Specifies the failure node
Explicit Hops	Specifies the explicit hops
Actual Hops	Specifies the actual hops
Record Label	Specifies the record label
Computed Hops	Specifies the computed hops
Resignal Eligible	Specifies the resignal eligibility status
Last Resignal	Specifies the last resignal

Label	Description
CSPF Metric	Specifies the CSPF metric value

## lsp

### Syntax

**lsp** *lsp-name*

### Context

[\[Tree\]](#) (clear>router>mpls lsp)

### Full Context

clear router mpls lsp

### Description

This command resets and restarts an LSP.

### Parameters

*lsp-name*

Specifies the LSP to clear, up to 64 characters in length.

### Platforms

All

## lsp

### Syntax

**lsp** [*plsp-id plsp-id*]

**lsp** *lsp-type lsp-type* [**tunnel-id** *tunnel-id*]

### Context

[\[Tree\]](#) (tools>dump>router>pcep>pcc lsp)

### Full Context

tools dump router pcep pcc lsp

### Description

This command displays LSP information.

## Parameters

### *plsp-id*

Specifies the PLSP ID.

**Values** 1 to 1048575

### *lsp-type*

Specifies the LSP type.

**Values** rsvp-p2p, rsvp-p2mp, seg-rt

### *tunnel-id*

Specifies the tunnel ID.

**Values** 1 to 1048575

## Platforms

All

## 16.73 lsp-autobandwidth

### lsp-autobandwidth

#### Syntax

**lsp-autobandwidth** [*lsp-name*]

#### Context

[\[Tree\]](#) (clear>router>mpls lsp-autobandwidth)

#### Full Context

clear router mpls lsp-autobandwidth

#### Description

This command clears the following counters/timers, as follows:

- The sample count is reset to zero, and the average data rate of the current sample interval is discarded.
- The adjust count is reset to zero.
- The maximum average data rate is zeroed.
- The overflow count is zeroed.

#### Parameters

### *lsp-name*

Specifies the LSP to clear, up to 64 characters.

## Platforms

All

## 16.74 lsp-bfd

### lsp-bfd

#### Syntax

**lsp-bfd** [*prefix-list-name* [**prefixes**]]

#### Context

[\[Tree\]](#) (show>router>ldp lsp-bfd)

#### Full Context

show router ldp lsp-bfd

#### Description

This command displays information about prefixes that have LSP BFD configured.

#### Parameters

##### **prefixes**

Shows all FECs that the system has received a label mapping message for and which are also eligible for LSP BFD.

##### **prefix-list-name**

Specifies a prefix list for which to display prefix information, and whether BFD is active for each prefix.

#### Platforms

All

#### Output

The following output is an example of LSP BFD information for prefixes.

#### Output Example

```
A:b1# show router ldp lsp-bfd "prefixListName_12345678901234567"
=====
BFD on LDP LSP Configuration Detail
=====

tools dump router ldp Isp-bfd

### Description

Commands in this context dump LSP BFD template information.

### Platforms

All

## Isp-bfd

### Syntax

**Isp-bfd**

**Isp-bfd ldp prefix** *ip-prefix/prefix-length*

**Isp-bfd local-bfd-discrim** *bfd-discriminator*

**Isp-bfd Isp-name** *Isp-name*

## Context

[Tree] (show>test-oam lsp-bfd)

## Full Context

show test-oam lsp-bfd

## Description

This command displays information about Bidirectional Forwarding Detection (BFD) sessions on LSPs.

## Parameters

### *ip-prefix/prefix-length*

Specifies an IP prefix for which to display BFD session information, and the length of the prefix.

**Values**    *ipv4-prefix* — a.b.c.d  
              *ipv4-prefix-length* — 0 to 32  
              *ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)  
                  x:x:x:x:x:d.d.d.d  
              x — 0 to FFFF (hexadecimal)  
              d — 0 to 255 (decimal)  
              *ipv6-prefix-length* — 0 to 128

### *bfd-discriminator*

Displays information about the unique local discriminator for this session.

### *lsp-name*

Specifies information about the specified LSP name up to 64 characters in length.

## Platforms

All

## Output

The following output is an example of BFD LSP information.

### Output Example

```

**lsp-db** [**lsp-type** *lsp-type*] **tunnel-id** *tunnel-id*

### Context

[\[Tree\]](#) (show>router>pcep>pcc lsp-db)

### Full Context

show router pcep pcc lsp-db

### Description

This command displays the PCEP LSP-DB information.

## Parameters

### *lsp-type*

Specifies the LSP type.

**Values** rsvp-p2p, rsvp-p2mp, seg-rt

**Note:**

The LSP type, **rsvp-p2mp**, is not supported for PCE controlled or PCE initiated LSPs.

### *ip-address*

Specifies the IP address.

**Values** a.b.c.d

### *lsp-name*

Specifies the LSP name, up to 80 characters.

### *tunnel-id*

Specifies the tunnel ID.

**Values** 1 to 65535

## Platforms

All

## Output

LSP-DB Output

[Table 286: Output fields: LSP-DB](#) describes LSP-DB output fields.

### Output Example

```

Table 286: Output fields: LSP-DB

Label	Description
PCEP-specific LSP ID	Specifies the PCEP specific LSP ID.
LSP ID	Specifies the LSP ID.
LSP Type	rsvp-p2p — Indicates the LSP type is rsvp-p2p. rsvp-p2mp — Indicates the LSP type is rsvp-p2mp. seg-rt — Indicates the LSP type is seg-rt. pce-init-seg-rt — Indicates the LSP type is pce-init-seg-rt.
Tunnel ID	Specifies the tunnel ID.
Extended Tunnel Id	Specifies the extended tunnel ID.
LSP Name	Specifies the LSP name
Source Address	Specifies the source IP address.
Destination Address	Specifies the destination IP address.
LSP Delegated	True — Specifies that LSP Delegation is true. False— Specifies that LSP Delegation is false.
Delegate PCE Address	Specifies the delegate PCE IP address.
Oper Status	active — Specifies that the operational status is active. down — Specifies that the operational status is down.

## 16.76 Isp-egress-stats

### Isp-egress-stats

#### Syntax

**Isp-egress-stats**

**Isp-egress-stats** *isp-name*

#### Context

**[Tree]** (show>router>mpls Isp-egress-stats)

## Full Context

```
show router mpls lsp-egress-stats
```

## Description

This command displays MPLS LSP egress statistics information.

## Parameters

### *lsp-name*

Specifies the LSP name, up to 64 characters.

## Platforms

All

## Output

The following output is an example of MPLS LSP egress statistics information.

### Output Example

```
*A:Dut-C>config>router>mpls>lsp$ show router mpls lsp-egress-stats lsp "1"

## lsp-egress-stats

### Syntax

**lsp-egress-stats** [**active**]

**lsp-egress-stats** **lsp** *lsp-name*

### Context

[\[Tree\]](#) (show>router>mpls>mpls-tp lsp-egress-stats)

### Full Context

show router mpls mpls-tp lsp-egress-stats

### Description

This command displays MPLS-TP LSP egress statistics information.

### Parameters

**active**

Displays statistics for all active LSPs.

***lsp-name***

Displays statistics for the specified LSP name, up to 64 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## lsp-egress-stats

**Syntax**

**lsp-egress-stats**

**lsp-egress-stats** *lsp-name*

**Context**

[\[Tree\]](#) (clear>router>mpls lsp-egress-stats)

**Full Context**

clear router mpls lsp-egress-stats

**Description**

This command clears MPLS LSP egress statistics information.

**Parameters**

***lsp-name***

Specifies the LSP to clear, up to 64 characters.

**Platforms**

All

## lsp-egress-stats

**Syntax**

**lsp-egress-stats** **lsp** *lsp-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] [**bits**]

**Context**

[\[Tree\]](#) (monitor>router>mpls lsp-egress-stats)

**Full Context**

monitor router mpls lsp-egress-stats

**Description**

This command displays egress statistics for LSP interfaces at the configured interval until the configured count is reached.

## Default

no lsp-egress-stats

## Parameters

### ***lsp-name***

Specifies the LSP name, up to 64 characters.

### ***repeat***

Specifies how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### ***seconds***

Specifies the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

### ***absolute***

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### ***rate***

Displays rate-per-second for each statistic instead of the delta.

### ***bits***

Displays the output values in bits rather than in octets.

## Platforms

All

## Output

The following output is an example of LSP egress statistics information.

### Output Example

```
B:Dut-C-cpm2# monitor router mpls lsp-egress-stats lsp sample repeat 3 interval 10
absolute

## 16.77 lsp-history

### lsp-history

#### Syntax

**lsp-history** [*lsp-name*]

#### Context

[\[Tree\]](#) (tools>dump>router>mpls lsp-history)

#### Full Context

tools dump router mpls lsp-history

#### Description

This command displays the recorded history of LSP events for all RSVP-TE and SR-TE LSPs if no LSP name is provided, or only the named LSP if an LSP name is provided.

#### Parameters

*lsp-name*

Specifies the LSP name, up to 64 characters.

#### Platforms

All

#### Output

The following example shows the LSP history output, and [Table 287: Output fields: MPLS LSP history](#) describes the output fields.

```
tools dump router mpls lsp-history "C_F_5"
```

#### Output Example

```

## lsp-ingress-stats

### Syntax

**lsp-ingress-stats** [*active*]

**lsp-ingress-stats** *lsp lsp-name*

### Context

[\[Tree\]](#) (show>router>mpls>mpls-tp lsp-ingress-stats)

### Full Context

```
show router mpls mpls-tp lsp-ingress-stats
```

### Description

This command displays MPLS-TP LSP ingress statistics information.

### Parameters

***active***

Displays statistics for all active LSPs.

***lsp-name***

Displays statistics for the specified LSP name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## lsp-ingress-stats

### Syntax

**lsp-ingress-stats**

**lsp-ingress-stats** *ip-address* **lsp** *lsp-name*

**lsp-ingress-stats** *sender-address:lsp-name*

### Context

[\[Tree\]](#) (clear>router>mpls lsp-ingress-stats)

### Full Context

clear router mpls lsp-ingress-stats

### Description

This command clears MPLS LSP ingress statistics information.

## Platforms

All

## lsp-ingress-stats

### Syntax

**lsp-ingress-stats** **lsp** *lsp-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] *ip-address* [**bits**]

### Context

[\[Tree\]](#) (monitor>router>mpls lsp-ingress-stats)

### Full Context

monitor router mpls lsp-ingress-stats

### Description

This command displays ingress statistics for LSP interfaces at the configured interval until the configured count is reached.

### Parameters

***lsp-name***

Specifies the LSP name up to 64 characters.

**repeat**

Specifies how many times the command is repeated.

**Values** 1 to 999

**Default** 10

**seconds**

Specifies the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

**absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Displays rate-per-second for each statistic instead of the delta.

**ip-address**

Specifies the IP address.

**Values** a.b.c.d

**bits**

Displays the output values in bits rather than in octets.

**Platforms**

All

**Output**

The following output is an example of LSP ingress statistics information.

**Output Example**

```

## 16.79 Isp-ldp

### Isp-ldp

#### Syntax

**Isp-ldp prefix** *ip-prefix/ip-prefix-length*

#### Context

[\[Tree\]](#) (tools>dump>router>bfd Isp-ldp)

#### Full Context

tools dump router bfd Isp-ldp

#### Description

This command displays the local and remote discriminator values for LSP BFD sessions for a given prefix, as well as the BFD session state.

#### Parameters

**prefix** *ip-prefix/ip-prefix-length*

Specifies information for the specified IP prefix and mask length.

#### Values

ipv4-address	- a.b.c.d
ipv6-address	- x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

#### Platforms

All

## 16.80 Isp-rsvp

### Isp-rsvp

#### Syntax

**Isp-rsvp** {**head** | **tail**} [**tunnel-id** *tunnel-id*]

## Context

[\[Tree\]](#) (tools>dump>router>bfd lsp-rsvp)

## Full Context

```
tools dump router bfd lsp-rsvp
```

## Description

This command displays the local and remote discriminator values for LSP RSVP sessions.

## Parameters

### head

Specifies information for the head of the LSP LDP link.

### tail

Specifies information for the tail of the LSP LDP link.

### tunnel-id *tunnel-id*

Displays information about the specified tunnel.

**Values** 0 to 4294967295

## Platforms

All

## 16.81 lsp-self-ping

### lsp-self-ping

## Syntax

```
lsp-self-ping
```

## Context

[\[Tree\]](#) (show>router>mpls lsp-self-ping)

## Full Context

```
show router mpls lsp-self-ping
```

## Description

This command displays LSP Self-ping timeout statistics.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of MPLS LSP Self-ping information.

[Table 288: Output fields: MPLS LSP self ping](#) describes the MPLS LSP Self-ping output fields.

*Table 288: Output fields: MPLS LSP self ping*

Label	Description
RSVP-TE LSP Self Ping	Specifies the status of LSP Self-ping
LSP Self Ping Timeout	Specifies the value of the LSP timeout in seconds
LSP Self Ping Interval	Specifies the LSP Self-ping interval in seconds
Number of LSP Self Ping Timeouts	Specifies the total number of LSP Self-ping timeouts

## Output Example

```
*A:Dut-C>config>router>mpls# show router mpls lsp-self-ping
=====
MPLS LSP Self Ping Timeout Statistics
=====
RSVP-TE LSP Self Ping           : Enabled
LSP Self Ping Timeout           : 60 seconds
LSP Self Ping Interval          : 1 seconds
LSP Self Ping Timeout Action    : switch
Number of LSP Self Ping Timeouts : 0
OAM Resource Failures           : 0
=====
*A:Dut-C>config>router>mpls#
```

## lsp-self-ping

### Syntax

**lsp-self-ping**

### Context

[\[Tree\]](#) (clear>router>mpls>lsp lsp-self-ping)

### Full Context

clear router mpls lsp lsp-self-ping

### Description

This command resets or clears counters and timers for MPLS LSP self ping at the LSP level.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Isp-self-ping

### Syntax

**Isp-self-ping**

### Context

[\[Tree\]](#) (clear>router>mpls Isp-self-ping)

### Full Context

clear router mpls Isp-self-ping

### Description

This command resets or clears counters and timers for MPLS LSP self ping at the LSP level.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.82 Isp-template

## Isp-template

### Syntax

**Isp-template** [*Isp-template-name*] [**detail**]

**Isp-template** [*Isp-template-name*] **bindings**

### Context

[\[Tree\]](#) (show>router>mpls Isp-template)

### Full Context

show router mpls Isp-template

### Description

This command displays MPLS LSP template information.

### Parameters

#### *Isp-template-name*

Specifies the LSP template name, up to 32 characters.

#### **detail**

Displays detailed information.

## bindings

Displays any bindings associated with the LSP template.

## Platforms

All

## Output

The following outputs are examples of LSP template information, and [Table 289: Output fields: LSP template](#) describes the output fields.

### Output Example

```

Table 289: Output fields: LSP template

Label	Description
Name	Specifies the name.
Type	Specifies the type.
Admin State	Specifies the up or down administrative state.
No of LSPs	Specifies the number of LSPs.
LSP Templates	Specifies the number of LSP templates.
LSP Template	Specifies the name of the LSP template.
From	Specifies the from IP address.
Template ID	Specifies the template ID.
Default Path	Specifies the default path value.
Bandwidth	Specifies the bandwidth value in Mbps.
Hop Limit	Specifies the maximum number of hops.
CSPF	Specifies the enabled or disabled status for CSPF.
Use TE metric	Specifies the enabled or disabled status for use TE metric.
Include Groups	Specifies the included groups or none for no included groups.

Label	Description
Exclude Groups	Specifies the excluded groups or none for no excluded groups.
Record Route	Specifies the record route value.
Record Label	Specifies the record label value.
Retry Limit	Specifies the retry limit value.
Retry Timer	Specifies the retry timer value.
LSP Count	Specifies the LSP count.
Ref Count	Specifies the reference count number.
Load Bal Wt	Specifies the load balance weight value.
ClassForwarding	Specifies the enabled or disabled status for class forwarding.
VprnAutoBind	Specifies the enabled or disabled status for VPRN autobind.
IGP Shortcut	Specifies the enabled or disabled status for IGP shortcut.
IGP LFA	Specifies the enabled or disabled status for IGP LFA.
IGP Rel Metric	Specifies the enabled or disabled status for IGP Rel metric.
Metric	Specifies the metric value.
BGP Transport Tunn	Specifies the enabled or disabled status for BGP transport tunnels.
Entropy Label	Specifies the enabled or disabled status for entropy label.
PCE Report	Specifies the enabled or disabled status for PCE reports.
Admin Tags	Specifies the administrative tag names or none.
PCE Control	Specifies the enabled or disabled status for the PCE control.
FallbkPathComp	none — No fallback method is configured. local-cspf— Local CSPF fallback is configured.

## 16.83 Ispinfo

### Ispinfo

#### Syntax

**Ispinfo** [*isp-name*] [**detail**]

## Context

[\[Tree\]](#) (tools>dump>router>mpls lspinfo)

## Full Context

tools dump router mpls lspinfo

## Description

This command dumps MPLS LSP information.

## Parameters

### *lsp-name*

Specifies the LSP name, up to 64 characters.

### *detail*

Specifies detailed LSP information.

## Platforms

All

## Output

The following output is an example of a BFD session that is up (LSPS UP).

### Output Example

```
*A:Dut-B# tools dump router mpls lspinfo
LSP "lsp1" LspIdx 1 LspType Dynamic State LSPS_UP Flags 0x2000

## 17 m Commands – Part I

### 17.1 mac

```
mac
```

#### Syntax

```
mac all | ieee-address | unknown
```

#### Context

[\[Tree\]](#) (show>subscr-mgmt>errors mac)

#### Full Context

```
show subscriber-mgmt errors mac
```

#### Description

This command sorts all the subscriber errors by MAC address.

#### Parameters

**all**

Shows all errors starting with the lowest MAC address.

***ieee-address***

Shows only the error of a specific MAC address.

**unknown**

Shows errors with unknown MAC addresses.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of subscriber management listed by MAC addresses.

#### Output Example

```
*A:eng-BNG-2# show subscriber-mgmt errors mac all
=====
Subscriber management errors
=====
-----
MAC      : 00:00:10:10:12:13
-----
```

```

Time      : 2016/06/23 17:35:46.0
Service  : 1000
SAP      : 1/1/20:841
Error    : No Offer from DHCP server after Discover from DHCP client
Extra    : DHCPv4
Time      : 2016/06/23 17:35:16.0
Service  : 1000
SAP      : 1/1/20:841
Error    : No Offer from DHCP server after Discover from DHCP client
Extra    : DHCPv4
=====
    
```

**Table 290: Output fields: subscriber management MAC error** describes subscriber management MAC error output fields.

*Table 290: Output fields: subscriber management MAC error*

Field	Description
MAC	The MAC address associated with the error
Time	The time the error was reported
Service	The service ID
SAP	The SAP on which the error occurred
Error	The error that occurred on the MAC address
Extra	Extra information about the error that occurred

## mac

### Syntax

**mac** *mac-filter-id*

**mac** *mac-filter-id* **associations**

**mac** *mac-filter-id* [**type** *entry-type*] **counters** [**detail**]

**mac** *mac-filter-id* [**entry** *entry-id*] **effective-action** [{**ingress** | **egress**}]

**mac** *mac-filter-id* [**entry** *entry-id*] **effective-action** **router** [{**ingress** | **egress**}]

**mac** *mac-filter-id* [**entry** *entry-id*] **effective-action** **service** *service-id* [{**ingress** | **egress**}]

**mac** [*mac-filter-id*] **embedded** [**inactive**]

**mac** *mac-filter-id* **entry** *entry-id* [**counters**] [**detail**]

**mac** [**filter-type** *filter-type*]

**mac** *mac-filter-id* **type** *entry-type*

### Context

**[Tree]** (show>filter mac)

## Full Context

show filter mac

## Description

This command displays MAC filter information.

When **effective-action** is specified, this command displays what effectively happens to a packet that matches the criteria associated with the MAC filter policy.

## Parameters

### ***mac-filter-id***

Displays detailed information for the specified filter ID and its filter entries.

**Values** 1 to 65535

### **associations**

Appends information as to where the filter policy ID is applied to the detailed filter policy ID output.

### ***entry-type***

Specifies the type of filter entries as "fixed" or "embedded".

### **counters**

Displays counter information for the specified filter ID.

### **detail**

Displays detailed information.

### ***entry-id***

Displays information on the specified filter entry ID for the specified filter ID only.

**Values** 1 to 2097151

### **effective-action**

Displays the action that the system will effectively apply to the packet.

### **ingress**

Filters the output and only displays the information for filter policies applied on ingress.

### **egress**

Filters the output and only displays the information for filter policies applied on egress.

### **router**

Filters the output and only displays the information for that specific service ("Base" instance).

### ***service-id***

Filters the output and only displays the information for the specified service. The specified value must correspond to an existing service in which the filter has been applied.

### ***filter-type***

Specifies the type of filter entries as "config".

## Platforms

All

## Output

**No Parameters Specified** — A brief listing of MAC filters is produced when no parameters are specified; [Table 291: Output fields: filter MAC](#) describes the output fields.

### Output Example

```
*A:Dut-C# show filter mac
=====
Configured Mac Filters                               Total:    1
=====
Filter-Id  Scope    Applied Description                                Type
-----
10         Template No                                           normal
=====
Num Mac filters: 1
=====
*A:Dut-C#
```

Table 291: Output fields: filter MAC

Label	Description
Filter Id	The MAC filter ID
Scope	Template — the filter policy is of type Template
	Exclusive — the filter policy is of type Exclusive
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Description	The MAC filter policy description

**Filter ID Specified** — The following output is an example of MAC filter information when the filter ID is specified, and [Table 292: Output fields: MAC filter ID](#) describes the fields. Detailed filter information for the filter ID and its entries is produced when the filter ID is specified.

### Output Example

```
=====
Mac Filter : 200
=====
Filter Id      : 200                Applied      : No

Match action : Default
Ing. Matches : 0
Egr. Matches : 0
=====
    
```

Table 292: Output fields: MAC filter ID

Label	Description
MAC Filter Filter Id	The MAC filter policy ID
Scope	Template — the filter policy is of type Template
	Exclusive — the filter policy is of type Exclusive
Description	The MAC filter policy description
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward
	Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Filter Match Criteria	MAC — indicates the filter is an MAC filter policy
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
Description	The filter entry description
FrameType	Ethernet — the entry ID match frame type is Ethernet IEEE 802.3
	Ethernet II — the entry ID match frame type is Ethernet Type II
Src MAC	The source MAC address and mask match criterion; when both the MAC address and mask are all zeros, no criterion specified for the filter entry

Label	Description
Dest MAC	The destination MAC address and mask match criterion; when both the MAC address and mask are all zeros, no criterion specified for the filter entry
Dot1p	The IEEE 802.1p value for the match criteria; undefined indicates no value is specified
Ethertype	The Ethertype value match criterion
DSAP	The DSAP value match criterion; undefined indicates no value specified
SSAP	SSAP value match criterion; undefined indicates no value specified
Snap-pid	The Ethernet SNAP PID value match criterion; undefined indicates no value specified
Esnap-oui-zero	Non-Zero — filter entry matches a non-zero value for the Ethernet SNAP OUI
	Zero — filter entry matches a zero value for the Ethernet SNAP OUI
	Undefined — no Ethernet SNAP OUI value specified
Match action	Default — the filter does not have an explicit forward or drop match action specified; if the filter entry ID indicates the entry is Inactive, the filter entry is incomplete, no action was specified
	Drop — packets matching the filter entry criteria will be dropped
	Forward — packets matching the filter entry criteria is forwarded
Ing. Matches	The number of ingress filter matches/hits for the filter entry
Egr. Matches	The number of egress filter matches/hits for the filter entry

**Filter Associations** — The associations for a filter ID will be displayed if the **associations** keyword is specified. The association information is appended to the filter information.

The following output is an example of MAC filter information when the associations keyword is specified, and [Table 293: Output fields: MAC associations](#) describes the fields.

**Output Example**

```
A:ALA-49# show filter mac 3 associations
=====
Mac Filter

Entries       : 1
-----
Filter Association : Mac
-----
Service Id    : 1001            Type          : VPLS
```

```
- SAP          1/1/1:1001          (Egress)
=====
```

Table 293: Output fields: MAC associations

Label	Description
Filter Association	Mac — the filter associations displayed are for a MAC filter policy ID
Service Id	The service ID on which the filter policy ID is applied; the output also provides a list of service points where the filter has been applied
SAP	The Service Access Point or spoke/mesh SDP on which the filter policy ID is applied
Type	The type of service of the Service ID
(Ingress)	The filter policy ID is applied as an ingress filter policy on the interface
(Egress)	The filter policy ID is applied as an egress filter policy on the interface

**Filter Entry Counters Output** — When the **counters** keyword is specified, the filter entry output displays the filter matches/hit information. The following table describes the command output for the command.

```
A:ALA-49# show filter mac 8 counters
=====
Mac Filter
=====
Filter Id   : 8                               Applied      : Yes
Scope      : Template                       Def. Action  : Forward
Entries    : 2
Description : Description for Mac Filter Policy id # 8
-----
Filter Match Criteria : Mac
-----
Entry       : 8                               FrameType    : Ethernet
Ing. Matches: 80 pkts (5440 bytes)
Egr. Matches: 62 pkts (3968 bytes)

Entry       : 10                              FrameType    : Ethernet
Ing. Matches: 80 pkts (5440 bytes)
Egr. Matches: 80 pkts (5120 bytes)
=====
```

Table 294: Output fields: MAC counters

Label	Description
Mac Filter Filter Id	The MAC filter policy ID

Label	Description
Scope	Template — the filter policy is of type Template Exclusive — the filter policy is of type Exclusive
Description	The MAC filter policy description
Applied	No — the filter policy ID has not been applied Yes — the filter policy ID is applied
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Filter Match Criteria	Mac — indicates the filter is an MAC filter policy
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
FrameType	Ethernet — the entry ID match frame type is Ethernet IEEE 802.3 802.2LLC — the entry ID match frame type is Ethernet IEEE 802.2 LLC 802.2SNAP — the entry ID match frame type is Ethernet IEEE 802.2 SNAP Ethernet II — the entry ID match frame type is Ethernet Type II
Ing. Matches	The number of ingress filter matches/hits for the filter entry
Egr. Matches	The number of egress filter matches/hits for the filter entry

**Show Filter MAC Output (with effective-action specified)** — The following output is an example of MAC filter information when the **effective-action** keyword is specified. [Table 295: Output fields: MAC effective action](#) describes the command output fields.

If the main action (either primary or secondary) cannot be performed, a reason will be given. This will be displayed on the same line as the Effective Action. The reason codes as currently defined are:

- entry-default
- filter-default-action
- pbr-down-action-override
- action not supported on egress
- target does not exist

**Output Example**

```
show filter mac 1 effective-action
=====
Mac Filter
```

```

Stickiness Timer : Not Running

Effective Action based on application context
Service Id      : 10                               Type        : VPLS
  Ingress
  Effective Action: Forward (target does not exist)
=====
    
```

Table 295: Output fields: MAC effective action

Label	Description
Filter Id	The MAC filter policy ID
Applied	No — the filter policy ID has not been applied Yes — the filter policy ID is applied
Scope	Template — the filter policy is of type Template Exclusive — the filter policy is of type Exclusive
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Entries	The number of entries configured in this filter ID
Type	The type of entries configures in this filter
Description	The MAC filter policy description
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified

Label	Description
Stickiness	No — stickiness is not configured Yes — stickiness is configured
PBR Dwn Act Override	Indicates whether or not the action to take when the PBR target is down has been overridden
PBR Down Action	The action to take in case the target is down
Configuration	Section of the output providing information on the configured parameters
Primary Action	The configured action, if any; indented sub-labels in the show output provide configured parameters for this action
Secondary Action	The configured secondary action, if any; indented sub-labels in the show output provide configured parameters for this action
Status/Target status based on extended checks	Section of the output providing information on the operational status of certain parameters
Primary Action	The status of the target of the primary action, if configured, based on extended checks
Secondary Action	The status of the target of the secondary action, if configured, based on extended checks
Downloaded Action	The action downloaded by the CPM to the IOM
Stickiness Timer	The status of the stickiness timer, if any
Effective Action based on application context	Section of the output providing the effective action, in the context of services, that a packet matching the criteria will be subject to
Service Id	The service ID on which the filter policy ID is applied; the output also provides a list of service points where the filter has been applied
Type	The service type in which the service has been applied
Ingress/Egress	The direction in which the service has been applied
Effective Action	Indicates the effective action the packet will be subject to

## mac

### Syntax

**mac** *mac-filter-id* [**entry** *entry-id*] [{**ingress** | **egress**}]

## Context

[\[Tree\]](#) (clear>filter mac)

## Full Context

clear filter mac

## Description

Clears the counters associated with the entries of the specified MAC filter policy.

By default, the counters associated with each entry of the specified filter policy are all cleared. The scope of which counters are cleared can be narrowed using the command line parameters.

## Default

Clears all counters associated with each entry of the specified MAC filter policy.

## Parameters

### *mac-filter-id*

The MAC filter policy ID for which to clear the entry counters. Values can either be expressed as a decimal integer or as an ASCII string of up to 64 characters. The following values only shows decimal integer.

**Values** 1 to 65535

### *entry-id*

Specifies that only the counters associated with the specified filter policy entry will be cleared. The values are expressed as a decimal integer.

**Values** 1 to 2097151

### *ingress*

Specifies to only clear the ingress counters.

### *egress*

Specifies to only clear the egress counters.

## Platforms

All

mac

## Syntax

**mac** *mac-filter-id*

## Context

[\[Tree\]](#) (tools>dump>filter>resources mac)

## Full Context

tools dump filter resources mac

## Description

This command displays information about the specified MAC filter including resource utilization on CPM and IOM, the IOMs on which the filter is used, and the entries using the most resources.

## Parameters

### *mac-filter-id*

Specifies that only the filter resource utilization associated with this IPv6 filter will be displayed.

**Values** 1 to 65535

## Platforms

All

## Output

The following output is an example of MAC filter resource utilization information.

### Output Example

```
*A:Dut-C>tools>dump>filter>resources># mac 1
=====
Resource utilization details for Mac filter 1
=====
CPM entries used           : 1
CPM subentries used       : 1
TCAM entries used (per FlexPath) : 1
Associated with IOMs      : 1

-----
Largest 5 entries
-----
Entry ID                    Active          TCAM entries
                          (per FlexPath)
-----
1                            Yes              1
No more entries defined
-----
=====
```

## mac

## Syntax

**mac** *mac-filter-id* **entry** *entry-id* [*interval seconds*] [*repeat repeat*] [*absolute* | *rate*]

## Context

[\[Tree\]](#) (monitor>filter mac)

## Full Context

monitor filter mac

## Description

This command enables MAC filter monitoring. The statistical information for the specified MAC filter entry displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified MAC filter. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *mac-filter-id*

Specifies the MAC filter policy ID.

**Values** *filter-id* | *filter-name*  
filter-id: 1 to 65535  
filter-name: 64 chars max

### *entry-id*

Displays information on the specified filter entry ID for the specified filter ID only.

**Values** 1 to 65535

### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

## Platforms

## Full Context

```
show router bgp routes evpn mac
```

## Description

This command displays BGP-EVPN MAC routes.

## Parameters

### hunt

Displays entries for the specified route.

### detail

Displays detailed information.

### rd

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

### next-hop

Specifies the IPv4 or IPv6 BGP next-hop address.

**Values**

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

### mac-address

Specifies the MAC address in xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

### comm-id

Specifies the community ID, up to 72 characters.

**Values** *[as-num:comm-val | ext-comm | well-known-comm]*

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as the following:  
*type:{ip-address:comm-val1 | as-number1:comm-val2 | as-number2:comm-val1}*

where:

- *as-number1* — 0 to 65535
- *comm-val1* — 0 to 65535
- **type** — target, origin
- *ip-address* — a.b.c.d
- *comm-val2* — 0 to 4294967295
- *as-number2* — 0 to 4294967295

- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** |

**tag**

Specifies the MAC route tag.

**Values** 0to 4294967295 | MAX-ET

**reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

**Platforms**

All

## 17.5 mac-protect

### mac-protect

#### Syntax

**mac-protect** [implicit]

#### Context

[\[Tree\]](#) (show>service>id mac-protect)

#### Full Context

show service id mac-protect

#### Description

This command displays MAC protect-related information about the service.

#### Parameters

**implicit**

Displays only the MAC addresses implicitly protected by the system.

#### Platforms

All

#### Output

The following output is an example of service MAC protect information.

#### Output Example

```
*A:ALA-48>show>service>id# mac-protect
=====
Protected MACs, Service 700
=====
ServId  MAC                Source-Identifier  Type/Age  Last Change
-----
700     ff:ff:ff:ff:ff:ff  not learned       n/a       n/a
-----
```

```
No. of MAC Entries: 1
=====
*A:ALA-48>show>service>id# mac-protect
```

## 17.6 mac-status

### mac-status

#### Syntax

**mac-status** [*mac ieee-address*] [*card slot-id*] [*pending*]

#### Context

[\[Tree\]](#) (tools>dump>service>id>fdb mac-status)

#### Full Context

tools dump service id fdb mac-status

#### Description

This command displays the status of MAC addresses within the service, displaying the line cards on which FDB entries are allocated for the MAC addresses (if a MAC address has been allocated an entry on all cards provisioned in the system, it is displayed as "All") and those for which there are pending FDB entry updates (allocate, displayed as "PendAlloc", or free, displayed as "PendFree") for each MAC address. The MAC address status is displayed per service or line card and for a single MAC address. In addition, only MAC addresses with pending updates can be displayed.

#### Parameters

##### *ieee-address*

The 48-bit MAC address for which the FDB entry will be displayed in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers.

##### *slot-id*

The slot ID of the card in the chassis. The maximum slot ID is platform-dependent. See the hardware installation guides for more information.

##### *pending*

Displays only those MAC address with pending FDB entry line card updates (allocate or free).

#### Platforms

All

#### Output

## Output Example

```
*A:PE1# tools dump service id 1 fdb mac-status
=====
VPLS FDB MAC status at 01/31/2017 08:44:39

## 17.7 mac-table

### mac-table

#### Syntax

**mac-table** [**mac** *ieee-address*] [**class** *class*] [**next-index** *index*] [**detail**]

#### Context

[\[Tree\]](#) (tools>dump>wlan-gw>lanext>bd mac-table)

#### Full Context

tools dump wlan-gw lanext bd mac-table

#### Description

This command dumps the specified MAC table entries for the specified HLE BD.

#### Parameters

##### *ieee-address*

Specifies the MAC address of the MAC table entry.

##### *class*

Specifies the source on which to filter the MAC table entries.

**Values** access, network, remote

##### *index*

Specify the **next-index** *index* parameter to display the next set of results. If there are more results than the current output, the additional results are indicated at the bottom of the current output.

**Values** 0 to 4294967295

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of MAC table information.

### Output Example

```

## 17.9 managed-hosts

### managed-hosts

#### Syntax

**managed-hosts type** {aaa | bonding | data-triggered | gtp} [ip *ip-address*] [mac *ieee-address*]

#### Context

[\[Tree\]](#) (show>service>id managed-hosts)

#### Full Context

show service id managed-hosts

#### Description

This command displays information about hosts that are not yet linked to an in-band control plane protocol, such as DHCP or DHCPv6. Examples include hosts installed by data-triggers and hosts installed by RADIUS.

## Parameters

### aaa

Displays information about managed hosts installed and removed only by RADIUS.

### bonding

Displays information about managed hosts installed in a connection bonding subscriber context.

### data-triggered

Displays information about managed hosts installed by data-triggers.

### gtp

Displays information about managed hosts installed via GTP access.

### ip-address

Displays information about a managed host with the specified IPv4 or IPv6 address.

### ieee-address

Displays information about a managed host with the specified MAC address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of managed host information.

### Output Example

```
# show service id 100 managed-hosts type data-triggered
=====
Managed data-triggered hosts
=====
IP address                               MAC address

#### Description

Commands in this context display management interface information.

## Platforms

All

## management-interface

## Syntax

**management-interface**

## Context

**[Tree]** (tools>perform>system management-interface)

## Full Context

tools perform system management-interface

## Description

This command enables tools for management interface.

## Platforms

All

## 17.13 manager

## manager

## Syntax

**manager all**

**manager** *manager-name*

## Context

**[Tree]** (clear>system>management-interface>remote-management manager)

## Full Context

clear system management-interface remote-management manager

## Description

This command clears and restarts the remote management manager connection process.

## Parameters

**all**

Clears the connection process for all managers.

***manager-name***

Specifies the configured name of the manager, up to 64 characters.

**Platforms**

All

## 17.14 manual

### manual

**Syntax**

**manual** *ring-index* **path** {**a** | **b**}

**Context**

[\[Tree\]](#) (tools>perform>eth-ring manual)

**Full Context**

tools perform eth-ring manual

**Description**

In the absence of a failure or FS, this command forces a block on the ring port where the command is issued.

**Parameters**

***ring-index***

Specifies the ring index.

**Values** 1 to 128

**path**

Displays information for a specific path.

**Values** a, b

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### manual

**Syntax**

**manual id** *tunnel-id*

**manual** *lsp-name*

### Context

[\[Tree\]](#) (tools>perform>router>mpls>tp-tunnel manual)

### Full Context

tools perform router mpls tp-tunnel manual

### Description

This command performs a manual switchover of the MPLS-TP LSP from the active path to the protect path.

### Parameters

#### *tunnel-id*

Specifies the tunnel number of the MPLS-TP LSP.

**Values** 1 to 61440

#### *lsp-name*

Specifies name of the MPLS-TP LSP, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 17.15 manual-export

**manual-export**

### Syntax

**manual-export**

### Context

[\[Tree\]](#) (tools>perform>cflowd manual-export)

### Full Context

tools perform cflowd manual-export

### Description

This command triggers the manual export operation. This command is only applicable if **export-mode** is configured as **manual**.

### Platforms

All

## 17.16 manual-switch-path

### manual-switch-path

#### Syntax

```
manual-switch-path lsp lsp-name
no manual-switch-path lsp lsp-name
manual-switch-path sr-te-lsp sr-te-lsp-name
no manual-switch-path sr-te-lsp sr-te-lsp-name
```

#### Context

[\[Tree\]](#) (tools>perform>router>mpls manual-switch-path)

#### Full Context

tools perform router mpls manual-switch-path

#### Description

This command forces a manual degraded state on the active primary path, which triggers a switchover to another best-preference non-degraded secondary path that is already up. Non-degraded standby paths are preferred over secondary paths. If non-degraded standby paths do not exist, a setup is triggered for secondary paths.

For LSPs, the **revert-timer** and **hold-timer** apply to any switchover triggered by the **manual-switch-path** command. For SR-TE LSPs, only the revert-timer applies to any switchover triggered by the **manual-switch-path sr-te-lsp** command. The revert timer is started in the case where both the primary and standby paths are initially degraded and the system is using a second secondary path, and the primary path then comes back up.

The revert timer is started only when switching from a non-degraded secondary or standby path to the primary path. If the active secondary or standby path is degraded and then the primary path comes up, the system does not start the revert timer because the intention is to move the LSP away from the degraded active path as quickly as possible.

The manually degraded state remains in effect if the path goes down or is resigned, either by make-before-break (MBB) or break-before-make (BBM). BBM applies regardless of whether the resignalling is due to a locally initiated change or through PCEP. To reset the manually degraded state, use the **no manual-switch-path** CLI command or the **delete manual-switch-path** MD-CLI command.

To revert to the primary path when the revert timer is configured prior to the expiry of the revert timer, use the following commands:

- **no manual-switch-path lsp** or **no manual-switch-path sr-te-lsp** to reset the manual degraded state on the primary path
- **tools perform router mpls revert lsp** to revert the LSP to the primary path
- **tools perform router mpls revert sr-te-lsp** to revert the SR-TE LSP to the primary path

## Parameters

### *lsp-name*

Specifies the LSP name, up to 64 characters.

### *sr-te-lsp-name*

Specifies the SR-TE LSP name, up to 64 characters.

## Platforms

All

## 17.17 map

```
map
```

### Syntax

```
map
```

```
map statistics
```

### Context

```
[Tree] (clear>nat map)
```

### Full Context

```

## Description

Commands in this context display MAP information.

## Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

## 17.18 map-domain

### map-domain

#### Syntax

**map-domain**

**map-domain** *domain-name*

**map-domain** *domain-name* **mapping-rule** *map-rule-name*

**map-domain** *domain-name* **statistics**

#### Context

[\[Tree\]](#) (show>service>nat>map map-domain)

#### Full Context

show service nat map map-domain

#### Description

This command displays the MAP domains configured in the system and displays whether the domain is instantiated (that is, shows the association with the routing context). It also provides information about the domain and the specific rules configured within the domain

#### Parameters

##### *domain-name*

Specifies the MAP domain name.

**Values** 32 chars maximum

##### *map-rule-name*

Specifies the MAP rule name.

**Values** 32 chars maximum

##### **mapping-rule**

Keyword that displays the router instances and/or subscriber profiles associated with the NAT policy.

**statistics**

Keyword that displays statistics of the specified MAP domain.

**Platforms**

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

**Output**

The following output is an example of the **map-domain** command, and [Table 297: Output fields: map domain](#) describes the fields.

**Output Example**

```
*A:Dut-D>show>service>nat>map# show service nat map map-domain

IPv4 prefix         : 192.0.2.0/24
Embedded Address bits : 9
PSID offset        : 15
Address sharing ratio : 2
No. of excluded ports : 2
No. of ports per user : 32767
Administrative state : in-service
Last management change : 07/14/2016 21:11:43
=====
```

The following output is an example of the **map-domain statistics** command, which shows the forwarding statistics for a MAP-T domain, and [Table 299: Output fields: map domain statistics](#) describes the fields.

**Output Example**

```
# show service nat map map-domain "AZ" statistics

=====
MAP domain "AZ"
=====
Upstream (IPv6->IPv4) forwarded packets      : 0
Upstream (IPv6->IPv4) forwarded octets       : 0
Upstream (IPv6->IPv4) dropped packets        : 0
Upstream (IPv6->IPv4) dropped octets         : 0
Upstream (IPv6->IPv4) dropped anti-spoof packets : 0
Upstream (IPv6->IPv4) dropped icmpv6 packets : 0
Upstream (IPv6->IPv4) dropped other packets   : 0
Upstream (IPv6->IPv4) dropped unknown protocol packets : 0
Upstream (IPv6->IPv4) fragmented packets     : 0
Upstream (IPv6->IPv4) icmpv6 node info packets : 0
Upstream (IPv6->IPv4) cpe icmpv6 error packets : 0
Upstream (IPv6->IPv4) intermediate icmpv6 error packets : 0
Downstream (IPv4->IPv6) forwarded packets    : 0
Downstream (IPv4->IPv6) forwarded octets     : 0
Downstream (IPv4->IPv6) dropped packets      : 0
Downstream (IPv4->IPv6) dropped octets       : 0
Downstream (IPv4->IPv6) dropped fragmented packets : 0
Downstream (IPv4->IPv6) dropped icmpv4 packets : 0
Downstream (IPv4->IPv6) dropped unknown protocol packets : 0
Downstream (IPv4->IPv6) fragmented packets   : 0
Downstream (IPv4->IPv6) need fragmentation packets : 0
Downstream (IPv4->IPv6) icmpv4 error packets : 0
Downstream (IPv4->IPv6) icmpv4 echo packets  : 0
=====
```

*Table 299: Output fields: map domain statistics*

Label	Description
Upstream (IPv6->IPv4) forwarded packets	Specifies the number of forwarded packets in the upstream direction within the MAP domain.

Label	Description
Upstream (IPv6->IPv4) forwarded octets	Specifies the number of forwarded octets in the upstream direction within the MAP domain.
Upstream (IPv6->IPv4) dropped packets	Specifies the number of dropped packets in the upstream direction within the MAP domain.
Upstream (IPv6->IPv4) dropped octets	Specifies the number of dropped octets in the upstream direction within the MAP domain.
Upstream (IPv6->IPv4) dropped anti-spoof packets	Specifies the number of packet drops due to antispoof failure
Upstream (IPv6->IPv4) dropped icmpv6 packets	Specifies the number of ICMPv6 drops due to truncated errors, antispoof ICMP failures, or malformed ICMPs
Upstream (IPv6->IPv4) dropped other packets	Specifies the number of packet drops due to unknown protocol (not TCP/UDP/ICMP)
Upstream (IPv6->IPv4) dropped unknown protocol packets	Specifies the number of all other drops that are not previously listed
Upstream (IPv6->IPv4) fragmented packets	Specifies the number of received fragments
Upstream (IPv6->IPv4) icmpv6 node info packets	Specifies the number of received ICMPV6 node info
Upstream (IPv6->IPv4) cpe icmpv6 error packets	Specifies the number of received ICMPV6 errors from the CPE
Upstream (IPv6->IPv4) intermediate icmpv6 error packets	Specifies the number of received ICMPV6 errors received from intermediate nodes between the BR and CPE
Downstream (IPv4->IPv6) forwarded packets	Specifies the number of forwarded packets in the downstream direction within the MAP domain.
Downstream (IPv4->IPv6) forwarded octets	Specifies the number of forwarded octets in the downstream direction within the MAP domain.
Downstream (IPv4->IPv6) dropped packets	Specifies the number of dropped packets in the downstream direction within the MAP domain.
Downstream (IPv4->IPv6) dropped octets	Specifies the number of dropped octets in the downstream direction within the MAP domain.

Label	Description
Downstream (IPv4->IPv6) dropped fragmented packets	Specifies the number of fragmentation required but the packet is dropped due to DF flag being set
Downstream (IPv4->IPv6) dropped icmpv4 packets	Specifies the total number of ICMPV4 drops
Downstream (IPv4->IPv6) dropped unknown protocol packets	Specifies the number of packet drops because of unknown protocol (not TCP/UDP/ICMP)
Downstream (IPv4->IPv6) fragmented packets	Specifies the number of received fragments
Downstream (IPv4->IPv6) need fragmentation packets	Specifies the number of frames for which IPv6 fragmentation is required (these frames can be received as packets or fragments)
Downstream (IPv4->IPv6) icmpv4 error packets	Specifies the number of ICMPV4 errors received
Downstream (IPv4->IPv6) icmpv4 echo packets	Specifies the number of ICMPV4 echoes received

## 17.19 map-t-group

### map-t-group

#### Syntax

```
map-t-group map-t-group-id [members]
map-t-group map-t-group-id member member
```

#### Context

[\[Tree\]](#) (show>isa map-t-group)

#### Full Context

```
show isa map-t-group
```

## Description

This command displays the MAP-T group information.

## Parameters

### *map-t-group-id*

Specifies the MAP-T group ID.

**Values** 1 to 4

### *member*

Specifies the member.

**Values** 1 to 255

### *member*

Keyword that displays a specific member.

### *members*

Keyword that displays all members.

## Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S,  
7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

## Output

The following output is an example of ISA MAP-T information.

### Output Example

```
# show isa map-t-group 1

=====
ISA MAP-T Group 1
=====
Description           : (Not Specified)
Admin state           : in-service
Operational state     : in-service
Fragments per packet  : 5
Last Mgmt Change     : 10/08/2024 06:51:56

## map-t-group

### Syntax

```
map-t-group
```

### Context

```
[Tree] (clear>nat>isa map-t-group)
```

### Full Context

```
clear nat isa map-t-group
```

### Description

This command clears MAP-T group information.

### Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

## 17.20 map-to-phy-port

## map-to-phy-port

### Syntax

```
map-to-phy-port {lag lag-id | eth-tunnel tunnel-index} {isid isid [end-isid isid] | service service-id | svc-name [end-service service-id | svc-name]} [summary]
```

### Context

```
[Tree] (tools>dump map-to-phy-port)
```

### Full Context

```
tools dump map-to-phy-port
```

### Description

This command provides the ability to respond to a query to provide the link in a LAG/Ethernet tunnel (load sharing protection mode)/CCAG that is currently assigned to a given service-id or ISID.

### Parameters

*lag-id*

Specifies the LAG ID.

**Values** 1 to 800

***isis***

Specifies the ISID.

**Values** 0 to 16777215

***service-id***

Specifies the service ID.

**Values** 1 to 2148278381, svc-name: 64 char max

***tunnel-index***

Specifies the tunnel index.

**Values** 1 to 1024

**summary**

Displays summary information.

**Platforms**

All

## 17.21 mapping-server

### mapping-server

**Syntax**

**mapping-server** [**prefix** *ip-address*[/*mask*]] [**index** *index*] [**level** *level*] [**flag** {*s*}]

**Context**

[\[Tree\]](#) (show>router>isis mapping-server)

**Full Context**

show router isis mapping-server

**Description**

This command displays IS-IS mapping-server information.

**Parameters**

***ip-address*[/*mask*]**

Specifies the IP address and mask of a prefix that has received a node-sid in a SID/Label binding TLV.

**Values** *ip-address*: **a.b.c.d.** (host bits must be 0)

*mask*: 0 to 32

**index**

Specifies the node-sid index value for the generated SID/Label binding TLV.

**Values** 0 to 4294967295

**Default** none

**level**

Specifies a match on the mapping server's own flooding scope for the generated SID/Label binding TLV.

**Values** 1, 2, 1/2

**flag**

Specifies a match on the flooding scope of the generated SID/Label binding TLV.

**Values** s — Specifies to match on the S flag value of 1. A SID/Label Binding TLV with the S flag set is flooded across the entire IS-IS routing domain, except across another IS-IS instance. If the S flag is not set (value of zero), the SID/Label Binding TLV is not leaked between levels.

**Platforms**

All

**Output**

The following output is an example of mapping service information.

**Output Example**

```
*A:Dut-C# show router isis mapping-server
=====
Rtr Base ISIS Instance 0 Mapping Server
=====
Index      Prefix          Range Flags Level

**mapping-server**

**Syntax**

**mapping-server** [**prefix** *ip-address*[/*mask*]] [**index** *index*] [**scope** {**as** | **area** [*area-id*]}]

## Context

[\[Tree\]](#) (show>router>ospf mapping-server)

## Full Context

show router ospf mapping-server

## Description

This command displays OSPFv2 mapping server information.

## Parameters

### *ip-address[/mask]*

Displays information associated with the specified IP address.

**Values** *ip-address*: a.b.c.d. (host bits must be 0)  
*mask*: 0 to 32

### *index*

Specifies the Node-SID index value for the generated SID or label binding TLV.

**Values** 0 to 4294967295

### *area-id*

Specifies the area ID.

**Values** *ip-address* | 0 to 4294967295

## Platforms

All

## 17.22 mappings

### mappings

## Syntax

**mappings svc service-id** [**sf-ip** *ip-address* | *ipv6-address*] [**esi** *esi*] [**state** *map-state*]

## Context

[\[Tree\]](#) (show>subscr-mgmt>isa-svc-chain mappings)

## Full Context

show subscriber-mgmt isa-service-chaining mappings

## Description

This command shows reachability details for the SF in the specified EVPN instance. This information is gathered from the EVPN routes learned from the peer.

## Parameters

### *service-id*

Displays information about the specified service ID.

**Values** 1 to 2147483647

### *ip-address*

Displays information about the specified IPv4 address up to 64 characters.

### *ipv6-address*

Displays information about the specified IPv6 address up to 64 characters.

### *esi*

Displays information about the specified the ESI value.

**Values** 10-byte Ethernet Segment Identifier  
00-11-22-33-44-55-66-77-88-99 with  
any of these separators ('-',':',' ')

### *map-state*

Displays map state status.

**Values** resolved, unresolved

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of service chaining mapping information.

### Output Example

ESI-mappings	The Ethernet Segment Identifier MAC address
No. of mappings	The total number of mappings for the EVPN ID.

## 17.23 match-criteria-overload

### match-criteria-overload

#### Syntax

**match-criteria-overload**

**match-criteria-overload card** *slot-number* **fp** *fp-number*

**match-criteria-overload card** *slot-number* **fp** *fp-number* **network** *network-policy-id* **direction** *direction*

**match-criteria-overload card** *slot-number* **fp** *fp-number* **sap-egress** *policy-id*

**match-criteria-overload card** *slot-number* **fp** *fp-number* **sap-ingress** *policy-id*

#### Context

[\[Tree\]](#) (tools>dump>qos match-criteria-overload)

#### Full Context

tools dump qos match-criteria-overload

#### Description

This command, when used without parameters, allows the operator to identify QoS match-criteria memory banks with one or more policies in overload in the system by slot number, FP number, type (IP-MAC or IPv6), SAP ingress, SAP egress, network, and direction (ingress or egress).

This command, when used with the **card** and **fp** parameters, lists the QoS policy with match criteria in overload on a specified FP when the optional parameters *slot-number* and *fp-number* are specified.

This command, when used with the **network**, **sap-egress**, or **sap-ingress** parameters, displays the match-criteria entries not programmed for a specified QoS policy due to an overload condition.

## Parameters

### ***card slot-number***

Specifies the IOM slot number for the overload command.

**Values** 1 to 10

### ***fp fp-number***

Specifies the FP number.

**Values** 1 to 8

### ***network network-policy-id***

Specifies the network policy ID.

**Values** 1 to 65538

### ***direction direction***

Specifies the memory bank ingress or egress direction.

**Values** ingress or egress

### ***sap-egress policy-id***

Specifies the SAP policy ID.

**Values** 1 to 65535

### ***sap-ingress policy-id***

Specifies the SAP policy ID.

**Values** 1 to 65535

## Platforms

All

## Output

## 17.26 mc-ecmp-rebalance

### mc-ecmp-rebalance

#### Syntax

**mc-ecmp-rebalance** [*ecmp-opt-threshold*]

#### Context

[\[Tree\]](#) (tools>perform>router>pim mc-ecmp-rebalance)

#### Full Context

tools perform router pim mc-ecmp-rebalance

#### Description

This command triggers an immediate rebalance, regardless if the hold timer has triggered or if any changes have occurred.

#### Parameters

##### ***ecmp-opt-threshold***

Forces a rebalance of all multicast streams with a priority equal or less then the specified value.

Specifying the value of 7 forces all multicast streams to be re-balanced regardless of the configured value.

**Values** 1 to 7

#### Platforms

All

## 17.27 mc-endpoint

## mc-endpoint

### Syntax

**mc-endpoint endpoint** [*mcep-id*] **statistics**

**mc-endpoint statistics**

**mc-endpoint peer** [*ip-address*] **statistics**

### Context

[\[Tree\]](#) (clear>redundancy>multi-chassis mc-endpoint)

### Full Context

clear redundancy multi-chassis mc-endpoint

### Description

This command clears multi-chassis endpoint statistics.

### Parameters

#### *mcep-id*

Clears information for the specified multi-chassis endpoint ID.

**Values** 1 to 4294967295

#### *ip-address*

Clears information for the specified peer IP address.

**Values** ipv4-address: a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x – [0 to FFFF] H
- d – [0 to 255] D

### statistics

Clears statistics for this multi-chassis endpoint.

### Platforms

All

## 17.28 mc-ipsec

### mc-ipsec

#### Syntax

```
mc-ipsec peer ip-address domain ipsec-domain-id  
mc-ipsec peer ip-address tunnel-group tunnel-group-id  
mc-ipsec peer ip-address
```

#### Context

[\[Tree\]](#) (show>redundancy>multi-chassis mc-ipsec)

#### Full Context

```
show redundancy multi-chassis mc-ipsec
```

#### Description

This command displays the 7750 SR IPsec multi-chassis states. Optionally, only the state of the specified tunnel-group is displayed.

#### Parameters

- ipsec-domain-id***  
Specifies the IPsec domain ID.
- ip-address***  
Specifies the peer address.
- tunnel-group-id***  
Specifies the tunnel-group.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

#### Output

[Table 301: Output fields: MC-IPsec peer](#) describes **show redundancy multi-chassis mc-ipsec** output fields.

Table 301: Output fields: MC-IPsec peer

Label	Description
Peer Name	The name of the peer.
Peer Addr	The IP address of the peer.
Keep Alive Intvl	The interval at which keepalive messages are exchanged.
Hold on Nbr Fail	The number of keep-alives lost before declaring the peer as failed to reach.
Discovery Intvl	The duration of the discovery interval.
Discovery Boot Intvl	The duration of the discovery boot interval.
BFD	Bi-directional forward enabled or disabled.
Last update	The date and time of the last update.
ID	The tunnel group table ID.
Peer Group	The peer group ID.
Priority	The priority for the IPsec domain.
Admin State	The administrative state of the tunnel group.
Mastership/Master State	The current mastership state.
Protection Status	Displays <b>nominal</b> or <b>notReady</b> .  <b>notReady</b> means the system is not ready for a switchover. There could be major traffic impact if switchover happens in the case of notReady.  <b>nominal</b> means the tunnel-group is in a better situation to switchover than notReady. However, there still might be traffic impact.
Installed	The number of tunnels that have been successfully installed on MS-ISA.
Installing	The number of tunnels that are being installed on MS-ISA.
Awaiting Config	The number of synchronized tunnels that do not have a corresponding configuration ready.
Failed	The number of tunnels that failed to be installed on MS-ISA.
Active Tunnel-Group	The specific active tunnel group.
Peer Ex Tnl Grp	The external tunnel group.

Label	Description
Priority	The priority of the tunnel-group
Oper State	The operational state
Installed	The number of tunnels that have been successfully installed
Installing	The number of tunnels that are being installed
Awaiting Config	The number of synchronized tunnels that do not have a corresponding configuration ready
Failed	The number of tunnels that failed to be installed

### Output Example

```

## mc-ipsec

### Syntax

**mc-ipsec peer** *ip-address* **tunnel-group** *tunnel-group-id*

**mc-ipsec peer** *ip-address*

### Context

[\[Tree\]](#) (show>redundancy>multi-chassis mc-ipsec)

### Full Context

show redundancy multi-chassis mc-ipsec

### Description

This command displays the 7750 SR IPsec multi-chassis states. Optionally, only state of specified tunnel-group will be displayed.

### Parameters

#### *ip-address*

Specifies the peer address.

#### *tunnel-group-id*

Specifies the tunnel-group.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### Output

[Table 302: Output fields: MC-IPsec peer](#) describes show **redundancy multi-chassis mc-ipsec** output fields.

*Table 302: Output fields: MC-IPsec peer*

Label	Description
Admin State	Displays the admin state of mc-ipsec.
Mastership/Master State	Displays the current MIMP state.
Protection Status	Displays <b>nominal</b> or <b>notReady</b> . <b>notReady</b> means the system is not ready for a switchover. There could be major traffic impact if switchover happens in case of not Ready.

Label	Description
	<b>nominal</b> means the tunnel-group is in a better situation to switchover than notReady. However there still might be traffic impact.
Installed	Displays the number of tunnels that has been successfully installed on MS-ISA
Installing	Displays the number of tunnels that are being installed on MS-ISA.
Awaiting Config	Displays the number of synced tunnels that do not have corresponding configuration ready
Failed	Displays the number of tunnels that failed to be installed on MS-ISA.

## mc-ipsec

### Syntax

**mc-ipsec**

### Context

[\[Tree\]](#) (tools>perform>redundancy>multi-chassis mc-ipsec)

### Full Context

tools perform redundancy multi-chassis mc-ipsec

### Description

Commands in this context provide 7750 SR mc-ipsec tools.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 17.29 mc-lag

## mc-lag

### Syntax

**mc-lag peer** *ip-address* [**lag** *lag-id*]

**mc-lag** [**peer** *ip-address* [**lag** *lag-id*]] **statistics**

### Context

[\[Tree\]](#) (show>redundancy>multi-chassis mc-lag)

### Full Context

show redundancy multi-chassis mc-lag

### Description

This command displays multi-chassis LAG information.

### Parameters

***lag-id***

Shows information for the specified LAG identifier.

**Values** 1 to 800

**ip-address**

Shows peer information about the specified IP address.

**Values** ipv4-address: a.b.c.d  
 ipv6-address:  
 • x:x:x:x:x:x:x (eight 16-bit pieces)  
 • x:x:x:x:x:d.d.d.d  
 • x – [0 to FFFF] H  
 • d – [0 to 255] D

**statistics**

Displays multi-chassis statistics.

**Platforms**

All

**Output**

See the following sections for show command output:

Table 304: Output fields: redundancy multi-chassis MC-lag peer statistics

Label	Description
Packets Rx	Indicates the number of MC-Lag packets received from the peer.
Packets Rx Keepalive	Indicates the number of MC-Lag keepalive packets received from the peer.
Packets Rx Config	Indicates the number of received MC-Lag configured packets from the peer.
Packets Rx Peer Config	Indicates the number of received MC-Lag packets configured by the peer.
Packets Rx State	Indicates the number of MC-Lag "lag" state packets received from the peer.
Packets Dropped State Disabled	Indicates the number of packets that were dropped because the peer was administratively disabled.
Packets Dropped Packets Too Short	Indicates the number of packets that were dropped because the packet was too short.
Packets Dropped Tlv Invalid Size	Indicates the number of packets that were dropped because the packet size was invalid.
Packets Dropped Tlv Invalid LagId	Indicates the number of packets that were dropped because the packet referred to an invalid or non multi-chassis lag.
Packets Dropped Out of Seq	Indicates the number of packets that were dropped because the packet size was out of sequence.
Packets Dropped Unknown Tlv	Indicates the number of packets that were dropped because the packet contained an unknown TLV.

Label	Description
Packets Dropped MD5	Indicates the number of packets that were dropped because the packet failed MD5 authentication.
Packets Tx	Indicates the number of packets transmitted from this system to the peer.
Packets Tx Keepalive	Indicates the number of keepalive packets transmitted from this system to the peer.
Packets Tx Peer Config	Indicates the number of configured packets transmitted from this system to the peer.
Packets Tx Failed	Indicates the number of packets that failed to be transmitted from this system to the peer.

## mc-lag

### Syntax

**mc-lag** [**peer** *ip-address* [**lag** *lag-id*]]

### Context

[\[Tree\]](#) (clear>redundancy>multi-chassis mc-lag)

### Full Context

clear redundancy multi-chassis mc-lag

### Description

This command clears multi-chassis Link Aggregation Group (LAG) information.

### Parameters

#### *ip-address*

Clears the specified address of the multi-chassis peer.

- Values**
- ipv4-address: a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x – [0 to FFFF] H
    - d – [0 to 255] D

#### *lag-id*

Clears the specified LAG on this system.

**Values** 1 to 200

## Platforms

All

## 17.30 mc-ring

mc-ring

### Syntax

**mc-ring**

**mc-ring peer** *ip-address* [**ring** *sync-tag*]

### Context

[\[Tree\]](#) (tools>dump>redundancy>multi-chassis mc-ring)

### Full Context

tools dump redundancy multi-chassis mc-ring

### Description

This command dumps multi-chassis ring information.

### Parameters

***ip-address***

Specifies the peer IP address.

***sync-tag***

Specifies the ring's synchronization tag created in the **config>redundancy>mc>peer>mcr> ring** context. The tag can be up to 32 characters.

## Platforms

All

mc-ring

### Syntax

**mc-ring peer** *ip-address* **statistics**

**mc-ring peer** *ip-address* [**ring** *sync-tag* [**detail** | **statistics**]]

**mc-ring peer** *ip-address* **ring** *sync-tag* **ring-node** [*ring-node-name* [**detail** | **statistics**]]

**mc-ring global-statistics**

## Context

[\[Tree\]](#) (show>redundancy>multi-chassis mc-ring)

## Full Context

show redundancy multi-chassis mc-ring

## Description

This command displays multi-chassis ring information.

## Parameters

### *ip-address*

Specifies the address of the multi-chassis peer to display.

- Values**
- ipv4-address: a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x: [0 to FFFF] H
    - d: [0 to 255] D

### *sync-tag*

Specifies a synchronization tag to be displayed that was used while synchronizing this port with the multi-chassis peer up to 32 characters.

### *ring-node-name*

Specifies a ring-node name up to 32 characters.

### *global-statistics*

Displays global statistics for the multi-chassis ring.

### *detail*

Displays detailed peer information for the multi-chassis ring.

## Platforms

All

## Output

**Output Fields:** `show redundancy multi-chassis mc-ring peer <ip-address> ring`  
[Table 305: Output fields: MC ring peer ring](#) describes the output fields for the `show redundancy multi-chassis mc-ring peer <ip-address> ring` command.

Table 305: Output fields: MC ring peer ring

Label	Description
Sync Tag	Displays the synchronization tag that was used while synchronizing this port with the multi-chassis peer.
Oper State	noPeer — The peer has no corresponding ring configured. connected — The in-band control connection with the peer is operational. broken — The in-band control connection with the peer has timed out. conflict — The in-band control connection with the peer has timed out but the physical connection is still OK; the failure of the in-band signaling connection is caused by a misconfiguration. For example, a conflict between the configuration of this system and its peer, or a misconfiguration on one of the ring access node systems. testingRing — The in-band control connection with the peer is being set up. Waiting for result. waitingForPeer — Verifying if this ring is configured on the peer. configErr — The ring is administratively up, but a configuration error prevents it from operating properly. halfBroken — The in-band control connection indicates that the ring is broken in one direction (towards the peer). localBroken — The in-band control connection with the peer is known to be broken due to local failure or local administrative action. shutdown — The ring is shutdown.
Failure Reason	Displays the failure reason.
Last Debounce	Displays the last time that the debounce mechanism (protecting the router from overload situations in case of a flapping ring) was activated.
Debounce Period	Displays the duration that the debounce mechanism was in action since the "Last Debounce".

**Output Example: show redundancy multi-chassis mc-ring peer <ip-address> statistics**

```
*A:ALA-48>show>redundancy>multi-chassis# mc-ring peer 192.168.10.104 statistics
=====
MC Ring statistics for peer 192.168.10.104
=====
Message                               Received      Transmitted
-----
MCS ID Request                         0             0
MCS ID Response                        0             0
Ring Exists Request                    0             0
Ring Exists Response                   0             0
Keepalive                              0             0
-----
Total                                  0             0
=====
*A:ALA-48>show>redundancy>multi-chassis#
```

**Output Fields:** `show redundancy multi-chassis mc-ring peer <ip-address> statistics`  
 Table 306: [Output fields: MC ring peer statistics](#) describes the output fields for the `show redundancy multi-chassis mc-ring peer <ip-address> statistics` command.

Table 306: Output fields: MC ring peer statistics

Label	Description
Message	Displays the message type.
Received	Indicates the number of valid MC-Ring signaling messages received from the peer.
Transmitted	Indicates the number of valid MC-Ring signaling messages transmitted from the peer.
MCS ID Request	Displays the number of valid MCS ID requests were received from the peer.
MCS ID Response	Displays the number of valid MCS ID responses were received from the peer.
Ring Exists Request	Displays the number of valid 'ring exists' requests were received from the peer.
Ring Exists Response	Displays the number of valid ring exists' responses were received from the peer.
Keepalive	Displays the number of valid MC-Ring control packets of type 'keepalive' were received from the peer.

**Output Example: show redundancy multi-chassis mc-ring global-statistics**

```
*A:ALA-48>show>redundancy>multi-chassis# mc-ring global-statistics
=====
Global MC Ring statistics

=====
*A:ALA-48>show>redundancy>multi-chassis#
```

**Output Fields: show redundancy multi-chassis mc-ring ring-node**

[Table 307: Output fields: MC ring node](#) describes the output fields for the mc-ring ring-node command.

*Table 307: Output fields: MC ring node*

Label	Description
Oper State	Displays the state of the connection verification (both local and remote). notProvisioned — Connection verification is not provisioned. configErr — Connection verification is provisioned but a configuration error prevents it from operating properly. notTested — Connection verification is administratively disabled or is not possible in the current situation. testing — Connection Verification is active, but no results are yet available. connected — The ring node is reachable. disconnected — Connection verification has timed out.
In Use	Displays "True" if the ring node is referenced on an e-pipe or as an inter-dest-id on a static host or dynamic lease.

**Output Fields: show redundancy multi-chassis mc-ring global-statistics**

[Table 308: Output fields: MC ring global statistics](#) describes the output fields for the **show redundancy multi-chassis mc-ring global statistics** command.

*Table 308: Output fields: MC ring global statistics*

Label	Description
Rx	Displays the number of MC-ring signaling packets were received by this system.
Rx Too Short	Displays the number of MC-ring signaling packets were received by this system that were too short.
Rx Wrong Authentication	Displays the number of MC-ring signaling packets were received by this system with invalid authentication.
Rx Invalid TLV	Displays the number of MC-ring signaling packets were received by this system with invalid TLV.
Rx Incomplete	Displays the number of MC-ring signaling packets were received by this system that were incomplete.
Rx Unknown Type	Displays the number of MC-ring signaling packets were received by this system that were of unknown type.
Rx Unknown Peer	Displays the number of MC-ring signaling packets were received by this system that were related to an unknown peer.

Label	Description
Rx Unknown Ring	Displays the number of MC-ring signaling packets were received by this system that were related to an unknown ring.
Rx Unknown Ring Node	Displays the number of MC-ring signaling packets were received by this system that were related to an unknown ring node.
Tx	Displays the number of MC-ring signaling packets were transmitted by this system.
Tx No Buffer	Displays the number of MC-ring signaling packets could not be transmitted by this system due to a lack of packet buffers.
Tx Transmission Failed	Displays the number of MC-ring signaling packets could not be transmitted by this system due to a transmission failure.
Tx Unknown Destination	Displays the number of MC-ring 'unknown destination' signaling packets were transmitted by this system.
Missed Configuration Events	Displays the number of missed configuration events on this system.
Missed BFD Events	Displays the number of missed BFD events on this system.

## mc-ring

### Syntax

**mc-ring**

### Context

[\[Tree\]](#) (clear>redundancy>multi-chassis mc-ring)

### Full Context

clear redundancy multi-chassis mc-ring

### Description

This command clears multi-chassis ring data.

### Platforms

All

## mc-ring

### Syntax

**mc-ring peer** *ip-address* **ring** *sync-tag*

### Context

[\[Tree\]](#) (show>service>sap-using mc-ring)

### Full Context

show service sap-using mc-ring

### Description

This command displays SAP information for a specific MC-RING.

### Parameters

#### *ip-address*

Specifies the IP address.

- Values**
- ipv4-address: a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x – [0 to FFFF] H
    - d – [0 to 255] D

#### *sync-tag*

Specifies the ring's synchronization tag, up to 32 characters.

### Platforms

All

## 17.31 mcac

## mcac

### Syntax

**mcac**

### Context

[\[Tree\]](#) (clear>router mcac)

### Full Context

```
clear router mcac
```

### Description

Commands in this context clear and reset Multicast Connection Admission Control (MCAC) statistics.

### Platforms

All

```
mcac
```

### Syntax

```
mcac
```

### Context

[\[Tree\]](#) (show>router mcac)

### Full Context

```
show router mcac

### Description

Commands in this context display multicast CAC related information.

### Platforms

All

## 17.32 mcast-ipv4

```
mcast-ipv4
```

### Syntax

```
mcast-ipv4 [aspath-regex reg-exp] [community comm-id] [brief] [all]
```

```
mcast-ipv4 [aspath-regex reg-exp] hunt [community comm-id] [brief] [all]
```

```
mcast-ipv4 [detail | longer] [aspath-regex reg-exp] [community comm-id] [all]
```

### Context

[\[Tree\]](#) (show>router>bgp>routes mcast-ipv4)

### Full Context

```
show router bgp routes mcast-ipv4
```

## Description

This command displays BGP multicast IPv4 routes.

## Parameters

### *reg-exp*

Displays routes matching the specified regular expression, up to 80 characters.

### *hunt*

Displays entries for the specified route.

### *comm-id*

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:

- *{target | origin}:ip-address:comm-val*
- *{target | origin}:asnum:ext-comm-val*
- *{target | origin}:ext-asnum:comm-val*
- **bandwidth:asnum:val-in-mbps**
- **ext:4300:ovstate**
- **ext:value1:value2**
- **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set

- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

#### **brief**

Displays the BGP multicast IPv4 route information in a brief format.

#### **all**

Displays all output for imported routes.

### **Platforms**

All

## 17.33 mcast-ipv6

### mcast-ipv6

#### **Syntax**

**mcast-ipv6** [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**brief**] [**all**]

**mcast-ipv6** [**aspath-regex** *reg-exp*] **hunt** [**community** *comm-id*] [**brief**] [**all**]

**mcast-ipv6** [**detail** | **longer**] [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**all**]

#### **Context**

[\[Tree\]](#) (show>router>bgp>routes mcast-ipv6)

#### **Full Context**

show router bgp routes mcast-ipv6

#### **Description**

This command displays BGP multicast IPv6 routes.

#### **Parameters**

##### ***reg-exp***

Displays routes matching the specified regular expression, up to 80 characters.

##### **hunt**

Displays entries for the specified route.

##### ***comm-id***

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
  - *{target | origin}:ip-address:comm-val*
  - *{target | origin}:asnum:ext-comm-val*
  - *{target | origin}:ext-asnum:comm-val*
  - **bandwidth**:*asnum:val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext**:*value1:value2*
  - **flowspec-set**:*ext-asnum:group-id*

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

### **brief**

Displays the BGP multicast IPv6 route information in a brief format.

### **all**

Displays all output for imported routes.

## **Platforms**

All

## 17.34 mcast-join-synch

### mcast-join-synch

#### Syntax

```
mcast-join-synch [hunt | detail] [rd rd] [community comm-id] [tag tag] [next-hop next-hop] [aspath-regex reg-exp] [originator-ip ip-address | ipv6-address]
```

#### Context

[\[Tree\]](#) (show>router>bgp>routes>evpn mcast-join-synch)

#### Full Context

```
show router bgp routes evpn mcast-join-synch
```

#### Description

This command displays BGP-EVPN multicast join sync routes.

#### Parameters

##### hunt

Displays entries for the specified route.

##### detail

Displays detailed information.

##### rd

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

##### comm-id

Specifies the community ID, up to 72 characters.

**Values** *[as-num:comm-val | ext-comm | well-known-comm]*

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as the following:  
*type:{ip-address:comm-val1 | as-number1:comm-val2 | as-number2:comm-val1}*

where:

- *as-number1* — 0 to 65535
- *comm-val1* — 0 to 65535

- **type** — target, origin
- *ip-address* — a.b.c.d
- *comm-val2* — 0 to 4294967295
- *as-number2* — 0 to 4294967295
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** |

### **tag**

Specifies the multicast join sync route tag.

**Values** 0to 4294967295 | MAX-ET

### **next-hop**

Specifies the IPv4 or IPv6 BGP next-hop address.

**Values**

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

### **reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

### **ip-address | ipv6-address**

Specifies the originator IPv4 or IPv6 address, up to 64 characters.

## **Platforms**

All

## **17.35 mcast-leave-synch**

### **mcast-leave-synch**

#### **Syntax**

**mcast-leave-synch** [hunt | detail] [rd rd] [community *comm-id*] [tag *tag*] [next-hop *next-hop*] [aspath-regex *reg-exp*] [originator-ip *ip-address* | *ipv6-address*]

#### **Context**

[\[Tree\]](#) (show>router>bgp>routes>evpn mcast-leave-synch)

## Full Context

```
show router bgp routes evpn mcast-leave-synch
```

## Description

This command displays BGP-EVPN multicast leave sync routes.

## Parameters

### hunt

Displays entries for the specified route.

### detail

Displays detailed information.

### rd

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

### comm-id

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val | ext-comm | well-known-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as the following:  
*type:{ip-address:comm-val1 | as-number1:comm-val2 | as-number2:comm-val1}*  
where:
  - *as-number1* — 0 to 65535
  - *comm-val1* — 0 to 65535
  - **type** — target, origin
  - *ip-address* — a.b.c.d
  - *comm-val2* — 0 to 4294967295
  - *as-number2* — 0 to 4294967295
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise |**

### tag

Specifies the multicast leave sync route tag.

**Values** 0to 4294967295 | MAX-ET

### next-hop

Specifies the IPv4 or IPv6 BGP next-hop address.

Values		
	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

**reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

**ip-address | ipv6-address**

Specifies the originator IPv4 or IPv6 address, up to 64 characters.

**Platforms**

All

## 17.36 mcast-management

### mcast-management

**Syntax**

**mcast-management**

**Context**

[\[Tree\]](#) (clear mcast-management)

**Full Context**

clear mcast-management

**Description**

Commands in this context clear the multicast management status.

**Platforms**

## 17.37 mcast-path-mgr

### mcast-path-mgr

## Syntax

**mcast-path-mgr cpm [unmanaged]**

## Context

[\[Tree\]](#) (tools>dump mcast-path-mgr)

## Full Context

tools dump mcast-path-mgr

## Description

This command dumps multicast path manager CPM information.

## Parameters

### unmanaged

Displays multicast path manager unmanaged and Multiple MAC Registration Protocol information.

## Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

## Output

The following output is an example of CPM information.

## Output Example

```
*A:PE-1# tools dump mcast-path-mgr cpm  
=====
```

```

### mcast-reporting-dest

#### Syntax

**mcast-reporting-dest** [*mcast-reporting-dest-name*]

#### Context

**[Tree]** (show>mcast-mgmt mcast-reporting-dest)

#### Full Context

show mcast-management mcast-reporting-dest

#### Description

This command displays multicast path management reporting destination information.

#### Parameters

***mcast-reporting-dest-name***

Specifies the multicast reporting destination name, up to 32 characters.

#### Platforms

All

## mcast-reporting-dest

### Syntax

**mcast-reporting-dest** [*mcast-reporting-dest-name*]

### Context

[\[Tree\]](#) (clear>mcast-mgmt mcast-reporting-dest)

### Full Context

clear mcast-management mcast-reporting-dest

### Description

This command clears multicast reporting destination statistics.

### Parameters

***mcast-reporting-dest-name***

Specifies the multicast reporting destination name, up to 32 characters.

### Platforms

All

## 17.39 mcast-reporting-statistics

## mcast-reporting-statistics

### Syntax

**mcast-reporting-statistics** *ip-address*

### Context

[\[Tree\]](#) (show>router>igmp mcast-reporting-statistics)

### Full Context

show router igmp mcast-reporting-statistics

### Description

This command displays IGMP multicast reporting statistics.

### Parameters

***ip-address***

Displays the information associated with the specified IP address.

## Platforms

All

## mcast-reporting-statistics

### Syntax

**mcast-reporting-statistics** [*ip-address*]

### Context

**[Tree]** (clear>router>igmp mcast-reporting-statistics)

### Full Context

clear router igmp mcast-reporting-statistics

### Description

This command clears IGMP multicast reporting statistics.

### Parameters

#### *ip-address*

Specifies the IP address.

**Values** a.b.c.d

## Platforms

All

## 17.40 mcast-umh-red

## mcast-umh-red

### Syntax

**mcast-umh-red** *pair-id*

### Context

**[Tree]** (tools>dump>router mcast-umh-red)

### Full Context

tools dump router mcast-umh-red

## Description

This command displays upstream multi-homing (UMH) information.

## Parameters

*pair-id*

Displays the information associated with the specified pair of primary and backup UMH.

**Values** 1 to 1000

## Platforms

All

## Output

The following output is an example of UMH information.

### Output Example

```
*A:DUT-B# tools dump router mcast-umh-red 100
=====
Slot 1
=====
Switch Count:      1
Last Switch:      04/23/21 15:59:40
Revert Time Left: 39 sec
Active Tunnel
  Label:           523515

Standby Tunnel
  Label:           523657
                  LDP FEC P2MP: root: 10.20.1.3, T: 1, L: 4, TunnelId: 8229
  Bandwidth:      482400 bps
```

## 17.41 mcast-vpn-ipv4

### mcast-vpn-ipv4

#### Syntax

**mcast-vpn-ipv4** [detail | longer] [rd rd] [community comm-id] [aspath-regex reg-exp] [all]

**mcast-vpn-ipv4** [brief] [rd rd] [community comm-id] [aspath-regex reg-exp] [all]

**mcast-vpn-ipv4** hunt [brief] [rd rd] [community comm-id] [aspath-regex reg-exp] [all]

#### Context

[\[Tree\]](#) (show>router>bgp>routes mcast-vpn-ipv4)

## Full Context

```
show router bgp routes mcast-vpn-ipv4
```

## Description

This command displays BGP multicast VPN IPv4 routes.

## Parameters

### detail

Displays detailed information.

### longer

Displays the specified route and subsets of the route.

### rd

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

### comm-id

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val | ext-comm | well-known-comm | large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:

- *{target | origin}:ip-address:comm-val*
- *{target | origin}:asnum:ext-comm-val*
- *{target | origin}:ext-asnum:comm-val*
- **bandwidth:asnum:val-in-mbps**
- **ext:4300:ovstate**
- **ext:value1:value2**
- **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215

- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

#### **reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

#### **all**

Displays all output for imported routes.

### **Platforms**

All

## **17.42 mcast-vpn-ipv6**

### mcast-vpn-ipv6

#### **Syntax**

**mcast-vpn-ipv6** [**detail** | **longer**] [**rd** *rd*] [**community** *comm-id*] [**aspath-regex** *reg-exp*] [**all**]

**mcast-vpn-ipv6** [**brief**] [**rd** *rd*] [**community** *comm-id*] [**aspath-regex** *reg-exp*] [**all**]

**mcast-vpn-ipv6** **hunt** [**brief**] [**rd** *rd*] [**community** *comm-id*] [**aspath-regex** *reg-exp*] [**all**]

#### **Context**

[\[Tree\]](#) (show>router>bgp>routes mcast-vpn-ipv6)

#### **Full Context**

show router bgp routes mcast-vpn-ipv6

#### **Description**

This command displays BGP multicast VPN IPv6 routes.

## Parameters

### **detail**

Displays detailed information.

### **longer**

Displays the specified route and subsets of the route.

### **rd**

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

### **comm-id**

Specifies the community ID, up to 72 characters.

**Values** *[as-num:comm-val | ext-comm | well-known-comm | large-comm]*

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:

- *{target | origin}:ip-address:comm-val*
- *{target | origin}:asnum:ext-comm-val*
- *{target | origin}:ext-asnum:comm-val*
- **bandwidth:asnum:val-in-mbps**
- **ext:4300:ovstate**
- **ext:value1:value2**
- **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF

- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

**reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

**all**

Displays all output for imported routes.

**Platforms**

All

## 17.43 md-auto-id

### md-auto-id

**Syntax**

**md-auto-id**

**Context**

[\[Tree\]](#) (show>qos md-auto-id)

**Full Context**

show qos md-auto-id

**Description**

This command displays information about QoS policy IDs that have been automatically assigned by SR OS using the **md-auto-id** functionality. See the **config>qos md-auto-id** configuration command for further details.

**Platforms**

All

**Output**

The following output is an example of QoS md-auto-id information, and [Table 309: Output fields: MD auto ID QoS](#) describes the output fields.

**Output Example**

```
*A:node-6# show qos md-auto-id
=====
```

```

MD Auto-Id Information
=====
QoS Policy-Id Range
Start                : 327675          End                : 65535
Sap Ingress Count   : 10
Sap Egress Count    : 8
Network Count       : 6
=====
    
```

Table 309: Output fields: MD auto ID QoS

Label	Description
Start	Displays the start of the range for an automatic QoS policy ID.
End	Displays the end of the range for an automatic QoS Policy ID.
Sap Ingress Count	Displays the number of SAP ingress policies with automatically-assigned IDs.
Sap Egress Count	Displays the number of SAP egress policies with automatically-assigned IDs.
Network Count	Displays the number of network policies with automatically-assigned IDs.

## md-auto-id

### Syntax

**md-auto-id**

### Context

[\[Tree\]](#) (show>filter md-auto-id)

### Full Context

show filter md-auto-id

### Description

This command displays information about filter IDs that have been automatically assigned by SR OS using the **md-auto-id** functionality. See the **config>qos md-auto-id** configuration command for further details.

### Platforms

All

## Output

The following output is an example of **md-auto-id** filter information and [Table 310: Output fields: MD auto ID filter](#) describes the output fields.

### Output Example

```
*A:node-6# show filter md-auto-id
=====
MD Auto-Id Information
=====
Filter-id Range
Start           : 1073741822           End           : 2147483647
Ip-filter Count : 30
Ipv6-filter Count : 20
Mac-filter Count : 10
=====
```

Table 310: Output fields: MD auto ID filter

Label	Description
Start	Displays the start of the range for an automatic filter policy ID
End	Displays the end of the range for an automatic filter policy ID
Ip-filter Count	Displays the number of IP filter policies with automatically-assigned IDs
Ipv6-filter Count	Displays the number of IPv6 filter policies with automatically-assigned IDs
Mac-filter Count	Displays the number of MAC filter policies with automatically-assigned IDs

## md-auto-id

### Syntax

**md-auto-id**

### Context

[\[Tree\]](#) (show>service md-auto-id)

### Full Context

show service md-auto-id

### Description

This command displays information about service, customer and PW template IDs that have been automatically assigned by SR OS using the **md-auto-id** functionality. For more information, see the **md-auto-id** configuration command.

## Platforms

All

## Output

The following output is an example of **md-auto-id** information, and [Table 311: Output fields: MD auto ID service](#) describes the output fields.

### Output Example

```
*A:node-6# show service md-auto-id
=====
MD Auto-Id Information
=====
Service-Id Range
Start           : 1073741823           End           : 2147483647
Count          : 12
Customer-Id Range
Start           : 1073741823           End           : 2147483647
Count          : 10
Pw-Template-Id Range
Start           : 1073741823           End           : 2147483647
Count          : 5
=====
```

Table 311: Output fields: MD auto ID service

Label	Description
Start	Displays the start of the range for an automatic service ID, customer ID, or PW template ID.
End	Displays the end of the range for an automatic service ID, customer ID, or PW template ID.
Count	Displays the number of service IDs, customer IDs, or PW template IDs with automatically-assigned IDs.

## 17.44 mda

mda

### Syntax

**mda slot** [*mda*] [**detail**]

### Context

[\[Tree\]](#) (show mda)

## Full Context

show mda

## Description

This command displays MDA\XMA information.

If no command line options are specified, a summary output of all MDAs is displayed in table format.

## Parameters

### *slot*

Specifies the slot number for which to display MDA information.

**Values** 1 to 10

### *mda*

Specifies the MDA number in the slot for which to display MDA information.

**Values** *slot* [*/mda*]

### *detail*

Displays detailed MDA information.

## Platforms

All

## Output

The following outputs are examples of MDA information, and [Table 312: Output fields: MDA](#) describes the output fields for the **show mda** command:

- [Output Example: show mda \(showing 7450 ESS\)](#)
- [Output Example: show mda \(showing 7950 XRS\)](#)
- [Table 312: Output fields: MDA](#)
- [Output Example: show mda <slot/mda> detail](#)
- [Output Example: show mda <slot/mda> detail \(showing Channelized MDA on a 7750 SR-7\)](#)
- [Output Example: show mda <slot/mda> detail \(showing 7950 XRS\)](#)
- [Output Fields: show mda <slot/mda> detail](#)

### Output Example: show mda (showing 7450 ESS)

```
A:node-2# show mda
=====
MDA Summary
=====
Slot  Mda    Provisioned Type                               Admin   Operational

**Output Fields: show mda <slot/mda> detail**

Table 313: Output fields: MDA detail describes the output fields for the **show mda <slot/mda> detail** command.

Table 313: Output fields: MDA detail

Label	Description
Slot	The chassis slot number.

Label	Description
Mda	The MDA slot number.
Provisioned Mda-type	The provisioned MDA type.
Equipped Mda-type	The MDA type that is physically inserted into this slot in this chassis.
Admin State	Up — The MDA is administratively up. Down — The MDA is administratively down.
Operational State	Up — The MDA is operationally up. Down — The MDA is operationally down.
Failure Reason	This hardware component has failed.
Maximum port count	The maximum number of ports that can be equipped on the MDA card.
Number of ports equipped	The number of ports that are actually equipped on the MDA.
Transmit timing selected	Indicates the source for the timing used by the MDA.
Sync interface timing status	Indicates whether the MDA has qualified one of the timing signals from the CPMs.
Network Ingress Queue Policy	Specifies the network queue policy applied to the MDA to define the queueing structure for this object.
Capabilities	Specifies the minimum size of the port that can exist on the MDA.
Egress XPL error threshold	The Egress XPL Error Threshold value used by the <b>fail-on-error</b> feature.
Egress XPL error window	The Egress XPL Error Window value used by the <b>fail-on-error</b> feature.
Max channel size	Specifies the maximum size of the channel that can exist on the channelized MDA.
Part number	The hardware part number.
CLEI code	The code used to identify the MDA.
Serial number	The MDA part number. Not user modifiable.
Manufacture date	The MDA manufacture date. Not user modifiable.
Manufacturing string	Factory-inputted manufacturing text string. Not user modifiable.
Administrative state	Up — The MDA is administratively up. Down — The MDA is administratively down.

Label	Description
Operational state	Up — The MDA is operationally up. Down — The MDA is operationally down.
Time of last boot	The date and time the most recent boot occurred.
Current alarm state	Displays the alarm conditions for the specific MDA.
Base MAC address	The base chassis Ethernet MAC address. Special purpose MAC addresses used by the system software are constructed as offsets from this base address.

## mda

### Syntax

**mda** *mda-id* [**statistics**]

### Context

[\[Tree\]](#) (clear mda)

### Full Context

clear mda

### Description

This command reinitializes the specified MDA in a particular slot.

### Parameters

#### **mda-id**

Clears the specified slot and MDA.

#### **Values**

slot/mda	slot: 1 to 10 mda: 1, 2
slot/xiom/mda	slot: 1 to 10 xiom: "x1" or "x2" mda: 1, 2

#### **statistics**

Clears statistics for the specified MDA.

### Platforms

All

## mda

### Syntax

**mda** [*mda-slot*]

### Context

[\[Tree\]](#) (tools>dump>resource-usage>card mda)

### Full Context

tools dump resource-usage card mda

### Description

This command displays resource information for MDAs.

### Parameters

***mda-slot***

Specifies an MDA slot.

**Values** 1 to 2

### Platforms

All

## 18 m Commands – Part II

### 18.1 mdt-safi

#### mdt-safi

##### Syntax

**mdt-safi** [*rd rd*] [**grp-address** *mcast-grp-address*] [**source-ip** *ip-address*] **brief** [**community** *comm-id*]

[**aspath-regex** *reg-exp*]

##### Context

[\[Tree\]](#) (show>router>bgp>routes mdt-safi)

##### Full Context

show router bgp routes mdt-safi

##### Description

This command displays BGP MDT-SAFI routes.

##### Parameters

###### *rd*

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

###### *mcast-grp-address*

Specifies the multicast group address.

**Values** a.b.c.d

###### *ip-address*

Specifies the source IP address.

**Values** a.b.c.d

### detail

Displays detailed information.

### comm-id

Specifies the community ID, up to 72 characters.

**Values** `[as-num:comm-val | ext-comm | well-known-comm | large-comm]`

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
  - `{target | origin}:ip-address:comm-val`
  - `{target | origin}:asnum:ext-comm-val`
  - `{target | origin}:ext-asnum:comm-val`
  - **bandwidth**:*asnum*:*val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext**:*value1*:*value2*
  - **flowspec-set**:*ext-asnum*:*group-id*where:
  - *target* — route target
  - *origin* — route origin
  - *ip-address* — a.b.c.d
  - *ext-comm-val* — 0 to 4294967295
  - *ext-asnum* — 0 to 4294967295
  - **bandwidth** — bandwidth
  - *val-in-mbps* — 0 to 16777215
  - **ext** — extended
  - **ext:4300** — origin verification
  - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
  - *value1* — 0000 to FFFF
  - *value2* — 0 to FFFFFFFFFF
  - **flowspec-set** — flow-spec set
  - *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

### reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

**[Tree]** (show>oam-pm>stats>session>lmm meas-interval)

**[Tree]** (show>oam-pm>stats>session>slm meas-interval)

**[Tree]** (show>oam-pm>stats>session>dm meas-interval)

#### Full Context

show oam-pm statistics session dmm meas-interval

show oam-pm statistics session lmm meas-interval

show oam-pm statistics session slm meas-interval

show oam-pm statistics session dm meas-interval

#### Description

This command selects a measurement interval for the statistical display.

#### Parameters

##### **raw**

Specifies that the interval number is not to be included because there is only one raw cumulative bin.

##### **{5-mins | 15-mins | 1-hour | 1-day}**

Identifies the measurement interval to query for the statistics.

##### ***interval-number***

Specifies the numerical reference that indicates the position from the latest sample window. The number 1 is the most recent interval with all higher numbers being that position in the past from current.

**Values** 1 to 97

**[all | bins | summary]**

Specifies a keyword to filter the output.

## Platforms

All

- show oam-pm statistics session dmm meas-interval
- show oam-pm statistics session lmm meas-interval
- show oam-pm statistics session slm meas-interval

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- show oam-pm statistics session dm meas-interval

## meas-interval

### Syntax

**meas-interval raw [loss]**

**meas-interval raw [all | bins | summary]**

**meas-interval {5-mins | 15-mins | 1-hour | 1-day} interval-number *interval-number* [loss]**

**meas-interval {5-mins | 15-mins | 1-hour | 1-day} interval-number *interval-number* delay [all | bins | summary]**

### Context

**[Tree]** (show>oam-pm>stats>session>twamp-light meas-interval)

### Full Context

show oam-pm statistics session twamp-light meas-interval

### Description

This command selects a measurement interval for the statistical display.

### Parameters

**raw**

Specifies that the interval number is not to be included because there is only one raw cumulative bin.

**{5-mins | 15-mins | 1-hour | 1-day}**

Identifies the measurement interval to query for the statistics.

***interval-number***

Specifies the numerical reference that indicates the position from the latest sample window. The number 1 is the most recent interval with all higher numbers being that position in the past from current.

**Values** 1 to 97

**delay**

Indicates that the statistics being queried are for delay. TWAMP-light PDUs carry both delay and loss informational elements and it is not clear from only the test type name which statistic the operator requires.

**loss**

Indicates the statistics being queried are for loss. TWAMP-light PDUs carry both delay and loss informational elements and it is not clear from only the test type name which statistic the operator requires.

**[all | bins | summary]**

Specifies a keyword to filter the output.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 18.3 measurement-template

### measurement-template

**Syntax**

**measurement-template** [*measurement-template*]

**Context**

**[Tree]** (show>test-oam>link-measurement measurement-template)

**Full Context**

show test-oam link-measurement measurement-template

**Description**

This command displays basic link measurement template information, such as the administrative state and number of interfaces referencing the template.

The base command can filter and produce output for a single measurement template. When the measurement template name is specified, delayed information about the template is displayed.

**Parameters**

***measurement-template***

Specifies the link measurement template name, up to 64 characters, for which to display a filtered list.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following outputs are examples of link measurement template information. The associated tables describe the output fields.

### Output Example

```
show test-oam link-measurement measurement-template
=====
Measurement Templates

=====
    
```

Table 315: Output fields: measurement template with template name specified

Label	Description
Template Name	Displays the name of the link measurement template
Description	Displays the configured description of the link measurement template
Admin State	Displays the administrative state of the measurement template
Unidirectional Measurement	Displays the computational method used to calculate the delay metric actual — forward delay derived — half the roundup
Delay Measurement	Displays the delay metric compared to the threshold min — minimum recorded value max — maximum recorded value avg — average recorded value
Interval	Displays the probe frequency of the test packet
Last Reported Delay Hold	Displays the configured value that determines the time a reported delay measurement should be cleared if the operational state of the test transitions to down and remains there at least the length of this timer
Protocol	Displays the type of test packet used to report delay
Destination UDP Port	Displays the configured destination UDP port for test packets
Timestamp Format	Displays the format of the timestamp encoded in the test packetntp — Network Time Protocol format 32 seconds, 32 fractional

Label	Description
	secondsptp — Truncated Precision Time Protocol format 32 seconds, 32 nanoseconds
DSCP	Displays the configured DSCP in the IP header of the test packet
FC	Displays the configured forwarding class in the local node
Profile	Displays the profile of the test packet in the local node
Allow Egress Remark	Displays whether the egress QoS policy can remark the DSCP of the test  packetNo — the egress QoS policy is bypassed unless <b>force-remark</b> is enabled Yes — the egress QoS policy is applied
TTL	Displays the IP header time to live (IPv4) or hop limit (IPv6)
IPv6 UDP Checksum 0	Displays whether processing of IPv6 packets that arrive with UDP checksum 0 is allowed or disallowed  Disallow — packets are discarded Allow — the arriving packets are processed
Sample Window	Displays the header for sample window objects
Interval Multiplier	Displays the number of probes in the sample window, multiplying this value and the interval
Aggregate Sample Window	Displays the calculated length of the window in seconds
Sample Multiplier	Displays the number of sample windows in the aggregate sample window
Duration	Displays the calculated length of the window, in seconds
Relative Threshold	Displays the configured percentage difference comparing the current and previously reported measurements
Absolute Threshold	Displays the configured microsecond difference comparing the current and previously reported measurements
Window Integrity	Displays the minimum number of measurements, expressed as a percentage, before the window is consider integral
Active Interfaces	Displays the number of interfaces actively (Oper Up) referencing the link measurement template

Label	Description
Total Interfaces	Displays the number of interfaces referencing the link measurement template, regardless of operational state

## 18.4 measurement-template-using

### measurement-template-using

#### Syntax

`measurement-template-using [measurement-template]`

#### Context

[\[Tree\]](#) (show>test-oam>link-measurement measurement-template-using)

#### Full Context

show test-oam link-measurement measurement-template-using

#### Description

This command displays the link measurement templates and the IP interfaces associated with those templates.

The base command provides a single list of all measurement templates, but the command can filter and produce output for a single measurement template.

#### Parameters

##### *measurement-template*

Specifies the link measurement template name, up to 64 characters, for which to display a filtered list.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

#### Output

The following output is an example of link measurement template information, and [Table 316: Output fields: measurement template using](#) describes the output fields.

#### Output Example

```
show test-oam link-measurement measurement-template-using
=====
Measurement Templates
=====
Template Name
Interface Name                                     Protocol
-----
```

```

standard-direct
int-PE-1-PE-2          IPv6
int-PE-1-PE-3          IPv4
int-PE-1-PE-4          IPv4
=====
    
```

Table 316: Output fields: measurement template using

Label	Description
Template Name	The name of the link measurement template
Interface Name	The name of the interface using the link measurement template
Protocol	The IP protocol enabled under the dynamic delay section of the interface: IPv4, IPv6, or None. None indicates no protocol is enabled

## 18.5 megapools

### megapools

#### Syntax

**megapools** *slot-number* **fp** *fp-number* **wred** [ **detail**] **queue-group** *queue-group-name* [**instance** *instance-id*]

**megapools** *slot-number* **fp** *fp-number*

**megapools** *slot-number* **fp** *fp-number* **wred** [**detail**] [**service-id** *service-id*]

#### Context

[\[Tree\]](#) (show megapools)

#### Full Context

show megapools

#### Description

This command displays megapool information. A megapool is a mechanism the forwarding plane uses to allow over subscription of buffer pools. Every buffer pool is created in the context of a megapool.

By default, all buffer pools are associated with a single megapool and the pools are not oversubscribed. When WRED queue support is enabled on the FP, three megapools are used.

- The original megapool services the default pools.
- The second megapool services the system internal use pools.
- The third megapool is used by the buffer pools used by the WRED queues.

The traffic manager buffers are allocated to the three megapools without oversubscription. The WRED queue pools are allowed to oversubscribe their megapool, but the megapool protects the pools associated with the other megapools from buffer starvation that could be caused by that over subscription.

## Parameters

### ***slot-number***

Displays information for the specified card slot.

**Values** 1 to 10

### ***fp-number***

Displays information for the specified FP.

**Values** 1 to 8

### **wred**

Displays WRED queue pool information.

### **detail**

Displays detailed information.

### ***queue-group-name***

Displays information for the specified port queue group name, up to 32 characters.

### ***instance-id***

Specifies the identification of a specific instance of the queue group.

**Values** 1 to 65535

### ***service-id***

Specifies the service ID.

**Values** 1 to 2148278381

### ***service-name***

Specifies a service name up to 64 characters.

## Platforms

## 18.6 memory-allocation-failure-rate

### memory-allocation-failure-rate

#### Syntax

**memory-allocation-failure-rate** *mda* [**history-stats-in-count** *count*] [**history-stats-in-min** *minutes*]  
[**current**] [**show-oid**]

**memory-allocation-failure-rate** *mda* [**history-stats-in-count** *count*] [**history-stats-in-min** *minutes*]  
[**current**] [**show-oid**] **esa-vm** *esa-id/vm-id*

## Context

[\[Tree\]](#) (show>isa>stats>tunnel-isa memory-allocation-failure-rate)

## Full Context

show isa statistics tunnel-isa memory-allocation-failure-rate

## Description

This command displays memory allocation failure rate of the specified ISA. The system collects usage information every hour for last 24 hours. The output also includes a current value.

## Parameters

### **mda**

Displays information about the specified ISA.

**Values** slot/mda

### **count**

Displays information for the number of statistics intervals to be displayed (starting with the most recent).

**Values** 1 to 24

### **minutes**

Displays information about the specified period covered by the statistics to be displayed (starting with the most recent).

**Values** 1 to 1440

### **current**

Displays information about the current statistic value. The values of count and minutes are ignored by the system after this parameter is specified.

### **show-oid**

Displays information about the Object Identifier (OID) of the current statistical value.

### **esa-vm**

Displays the ID of the configured ESA and ESA VM.

**Values**

esa-vm:	<i>esa-id/vm-id</i>	
	<i>esa-id</i>	1 to 16
	<i>vm-id</i>	1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of the **show isa stats tunnel-isa memory-allocation-failure-rate** configuration.

### Output Example

```
show>isa>stats>tunnel-isa# memory-allocation-failure-rate 1/2

#### Context

[\[Tree\]](#) (show>eth-cfm mep)

#### Full Context

show eth-cfm mep

#### Description

This command displays Maintenance Endpoint (MEP) information.

The **show eth-cfm mep** *mep-id* **domain** *md-id* **association** *ma-id* command does not display CCM ERROR, CCM XCON frames in the output.

The **show eth-cfm mep** *mep-id* **domain** *md-id* **association** *ma-id* **remote-mep** *rmep-id* command does not display some TLVs details.

#### Parameters

*mep-id*

Specifies the integer that is unique among all the MEPs in the same MA.

**Values** 1 to 8191

**domain** *md-index*

Specifies the index of the MD to which the MP is associated, or 0, if none.

**Values** 1 to 4294967295

*md-admin-name*

Specifies the MD name, up to 64 characters.

**association** *ma-index*

Specifies the index to which the MP is associated, or 0, if none.

**Values** 1 to 4294967295

*ma-admin-name*

Specifies the MA name, up to 64 characters.

**loopback**

Keyword to display loopback information for the specified MEP.

**linktrace**

Keyword to display linktrace information for the specified MEP.

**remote-mepid** *mep-id*

Keyword to display specified remote MEP ID information for specified the MEP.

**all-remote-mepids**

Keyword to display all remote MEP ID information for the specified MEP.

**eth-test-results**

Keyword to display eth-test-result information for the specified MEP.

**eth-bn-notification**

Specifies to display ETH-bandwidth information for the specified MEP.

**one-way-delay-test**

Keyword to display one-way-delay-test information for the specified MEP.

**two-way-delay-test**

Keyword to display two-way-delay-test information for the specified MEP.

**two-way-slm-test**

Keyword to display two-way-slm-test information for the specified MEP.

**remote-peer** *mac-address*

Keyword to include remote MEP ID information for the specified MEP.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following outputs are examples of ETH-CFM MEP information, and the associated tables describe the output fields.

- [Output Example \(MEPs, linktrace, and loopback\)](#), Table 318: Output fields: MEP, linktrace, and loopback
- [Output Example \(delay test\)](#), Table 319: Output fields: ETH-CFM MEP delay test

### Output Example (MEPs, linktrace, and loopback)

```

show eth-cfm mep 2 domain 10 association 11400115

Table 318: Output fields: MEP, linktrace, and loopback

Label	Description
Mep Information	
Md-index	Displays the MD index of the domain
Direction	Displays the direction of OAMPDU transmission
Ma-index	Displays the MA index of the association
Admin	Displays the administrative status of the MEP
Md-admin-name	Displays the administrative MD name.
Ma-admin-name	Displays the administrative MA name.
MepId	Displays the MEP identifier

Label	Description
CCM-Enable	Displays the status of the CCM (enabled or disabled)
IfIndex	Displays the index of the interface
PrimaryVid	Displays the identifier of the primary VLAN
FngState	Indicates the different states of the Fault Notification Generator
LowestDefectPri	Displays the lowest priority defect (a configured value) that is allowed to generate a fault alarm
HighestDefect	Identifies the highest defect that is present For example, if defRDICCM and defXconCCM are present, the highest defect is defXconCCM.
Defect Flags	Displays the number of defect flags
Mac Address	Displays the MAC address of the MEP
CcmLtmPriority	Displays the priority value transmitted in the linktrace messages (LTM)s and CCMs for this MEP The MEP must be configured on a VLAN.
CcmTx	Displays the number of Continuity Check Messages (CCM) sent The count is taken from the last polling interval (every 10 s).
CcmSequenceErr	Displays the number of CCM errors
Eth-1DM Threshold	Displays the one-way-delay threshold value
Eth-Ais	Displays the state of the ETH-AIS test (enabled or disabled)
Eth-Tst	Displays the state of the ETH-Test (enabled or disabled)
Monitor-Oper-Group	Displays the name of the operational group the MEP is monitoring. If "N/A" is displayed, no operational group is configured for the MEP.
Oper-group state	Displays the state of the operational group. If "N/A" is displayed, no operational group is configured for the MEP.
CcmLastFailure Frame	Displays the frame that caused the last CCM failure
XconCcmFailure Frame	Displays the frame that caused the XconCCMFailure
Mep Linktrace Message Information	

Label	Description
LtRxUnexplained	Displays the number of unexplained linktrace messages (LTM) that have been received
LtNextSequence	Displays the sequence number of the next linktrace message
LtStatus	Displays the status of the linktrace
LtResult	Displays the result of the linktrace
TargIsMepId	Identifies whether the target interface has a MEP-ID (true or false)
TargMepId	Displays the MEP-ID of the target interface
TargMac	Displays the MAC address of the target interface
TTL	Displays the TTL value
EgressId	Displays the egress ID of the linktrace message
SequenceNum	Displays the sequence number of the linktrace message
LtFlags	Displays the linktrace flags
<b>Mep Linktrace Replies</b>	
SequenceNum	Displays the sequence number returned by a previous transmit linktrace message, indicating which linktrace message response is returned
ReceiveOrder	Displays the order in which the linktrace initiator received the linktrace replies
Ttl	Displays the TTL field value for a returned linktrace reply
Forwarded	Indicates whether the linktrace message was forwarded by the responding MEP
LastEgressId	Displays the last egress identifier returned in the linktrace reply egress identifier TLV of the linktrace reply  The last egress identifier identifies the MEP linktrace initiator that initiated, or the linktrace responder that forwarded, the linktrace message for which this linktrace reply is the response.  This is the same value as the egress identifier TLV of that linktrace message.
TerminalMep	Indicates whether the forwarded linktrace message reached a MEP enclosing its MA

Label	Description
NextEgressId	Displays the next egress identifier returned in the linktrace reply egress identifier TLV of the linktrace reply  The next egress identifier identifies the linktrace responder that transmitted this linktrace reply and can forward the linktrace message to the next hop. This is the same value as the egress identifier TLV of the forwarded linktrace message, if any.
Relay	Displays the value returned in the Relay Action field
IngressMac	Displays the MAC address returned in the ingress MAC address field
Ingress Action	Displays the value returned in the Ingress Action field of the linktrace message
IngressPortIdSubType	Displays the format of the ingress port ID
IngressPortId	Displays the ingress port ID; the format is determined by the value of the IngressPortIdSubType
EgressMac	Displays the MAC address returned in the egress MAC address field
Egress Action	Displays the value returned in the Egress Action field of the linktrace message
EgressPortIdSubType	Displays the format of the egress port ID
EgressPortId	Displays the egress port ID; the format is determined by the value of the EgressPortIdSubType
Org Specific TLV	Displays all organization-specific TLVs returned in the linktrace reply, if any  Includes all octets including and following the TLV length field of each TLV, concatenated
<b>Mep Loopback Information</b>	
LbRxReply	Displays the number of received loopback (LB) replies
LbRxBadOrder	Displays the number of received loopback messages that are in a bad order
LbRxBadMsdu	Displays the number of loopback replies that have been received with the wrong destination MAC address (MSDU = MAC Service Data Unit)
LbTxReply	Displays the number of loopback replies transmitted out this MEP

Label	Description
LbSequence	Displays the sequence number in the loopback message
LbNextSequence	Displays the next loopback sequence
LbStatus	True — Loopback is in progress False — No loopback is in progress
LbResultOk	Displays the result of the loopback test
DestIsMepId	Identifies whether the destination interface has a MEP-ID (true or false)
DestMepId	Displays the MEP-ID of the destination interface
DestMac	Displays the MAC address of the destination interface

Table 319: Output fields: ETH-CFM MEP delay test

Label	Description
Peer Mac Addr	Displays the MAC address of the peer (remote) entity
Delay (us)	Displays the measured delay (in microseconds) for the DM test
Delay Variation (us)	Displays the measured delay variation (in microseconds) for the DV test

## mep

### Syntax

**mep** *mep-id* **domain** *md-index* **association** *ma-index* **statistics**

### Context

[\[Tree\]](#) (clear>eth-cfm mep)

## Full Context

```
clear eth-cfm mep
```

## Description

This command clears the MEP parameters.

## Parameters

### *mep-id*

Specifies the MEP ID.

**Values** 1 to 8191

### *md-index*

Specifies the MD index.

**Values** 1 to 4294967295

### *ma-index*

Specifies the MA index.

**Values** 1 to 4294967295

### *statistics*

Clears the MEP statistics.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 18.10 mesh-sdp

```
mesh-sdp
```

## Syntax

```
mesh-sdp sdp-id[:vc-id] { all | counters | stp | mrp }
```

## Context

[\[Tree\]](#) (clear>service>statistics>id mesh-sdp)

## Full Context

```
clear service statistics id mesh-sdp
```

## Description

This command clears the statistics for a particular mesh SDP bind.

## Parameters

### *sdp-id*

Specifies the SDP ID for which to display information

**Default** All SDPs.

**Values** 1 to 17407

### *vc-id*

Displays information about the virtual circuit identifier.

**Values** 1 to 4294967295

### **all**

Clears all queue statistics and STP statistics associated with the SDP

### **counters**

Clears all queue statistics associated with the SDP

### **stp**

Clears all STP statistics associated with the SDP

### **mrp**

Clears all MRP statistics associated with the SDP

## Platforms

All

## mesh-sdp

## Syntax

**mesh-sdp** *sdp-id[:vc-id]* **ingress-vc-label**

**mesh-sdp** *sdp-id[:vc-id]* **vccv-bfd** {**session** | **statistics**}

## Context

[\[Tree\]](#) (clear>service>id mesh-sdp)

## Full Context

clear service id mesh-sdp

## Description

This command clears and resets the mesh SDP binding.

## Parameters

### *sdp-id*

The spoke-SDP ID for which to clear statistics.

**Values** 1 to 17407

**vc-id**

The virtual circuit ID on the SDP ID to be reset.

**Values** 1 to 4294967295

**ingress-vc-label**

Specifies to clear the ingress VC label.

**vccv-bfd session**

Specifies to clear the session mismatch flag on the mesh-SDP binding after the flag was set to true by a detected mismatch between the configured parameters and the received parameters.

**vccv-bfd statistics**

Specifies to clear a VCCV BFD session statistics for a specified mesh-SDP.

**Platforms**

All

## 18.11 mfib

### mfib

**Syntax**

**mfib** [**ipv4** | **ipv6** | **mac**]

**mfib brief**

**mfib group** *group-address* [**statistics**]

**mfib statistics** [**ipv4** | **ipv6** | **mac**]

**Context**

[\[Tree\]](#) (show>service>id mfib)

**Full Context**

show service id mfib

**Description**

This command displays the multicast FIB on the VPLS service.

**Parameters**

**brief**

Displays a brief output

**statistics**

Displays statistics on the multicast FIB

**ipv4**

Displays IPv4 address information

**ipv6**

Displays IPv6 address information

**mac**

Displays MAC address information

**group-address**

Displays the multicast FIB for a specific multicast group address

**Platforms**

All

**Output**

The following command displays multicast FIB information and [Table 320: Output fields: multicast FIB](#) describes the output fields.

```
show service id mfib
```

**Output Example**

```

The following command shows which ISIDs are local and [Table 320: Output fields: multicast FIB](#) describes the output fields. The **mfib** command option displays ISIDs that are local and advertised. Static ISIDs are included in this display. However, ISID policy can override the ISIDs that are designated to use the default multicast tree and these do not show up in the MFIB. This is displayed on a B-VPLS control service.

```
show service id mfib
```

### Output Example

Table 320: Output fields: multicast FIB

Label	Description
Multicast FIB, Service	
Source Address	IPv4 unicast source address
Group Address	IPv4 multicast group address
SAP ID	Indicates the SAP/SDP to which the corresponding multicast stream are forwarded or blocked
Forwarding/Blocking	Indicates whether the corresponding multicast stream is blocked or forwarded
Number of Entries	Specifies the number of entries in the MFIB
Forwarded Packets	Indicates the number of multicast packets forwarded for the corresponding source/group
Forwarded Octets	Indicates the number of octets forwarded for the corresponding source/group
Svc ID	Indicates the service to which the corresponding multicast stream is forwarded or blocked. Local means that the multicast stream is forwarded or blocked to a SAP or SDP local to the service.
Multicast FIB Statistics, Service	
Matched Pkts	The number of matched packets
Matched Octets	The number of matched octets
Forwarding Rate	The forwarding rate
Isid Policy Range	
Entry	ISID policy entry number
Range	ISID policy range
AdvLocal	The AdvLocal state
UseDefMCTree	The UseDefMCTree state

## mfib

### Syntax

**mfib** [**group-mac** *ieee-address*] [**isid** *isid*]

### Context

[\[Tree\]](#) (show>service>id>spb mfib)

### Full Context

show service id spb mfib

### Description

This command displays multicast forwarding data-base (MFIB) information.

### Parameters

#### *ieee-address*

Specifies a MAC address

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

#### *isid*

Specifies an I-SID

**Values** 0 to 16777215

### Platforms

All

### Output

The following output is an example of service SPB MFIB information.

#### Output Example

```
*A:Dut-A# show service id 100001 spb mfib
=====
User service MFIB information
=====
MacAddr          ISID      Status
-----

## mfib

### Syntax

mfib

### Context

[\[Tree\]](#) (clear>service>id mfib)

### Full Context

clear service id mfib

### Description

Commands in this context clear multicast FIB info for the VPLS service.

### Platforms

All

## 18.12 mgmt-ethernet

## mgmt-ethernet

### Syntax

mgmt-ethernet

### Context

[\[Tree\]](#) (show>redundancy mgmt-ethernet)

### Full Context

show redundancy mgmt-ethernet

### Description

This command displays the management Ethernet port redundancy status. The **show router "management" interface** command can also display the CPM Ethernet port used by the management interface. If the port of the primary CPM is active, it shows "A/1" under the Port/SapId field. If the port of the secondary CPM is active, it shows "B/1 -> A/1" in the Port/SapId field.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## Output

The following output is an example of management Ethernet port redundancy information, and [Table 321: Output fields: redundancy management Ethernet](#) describes the output fields.

### Output example

```
show redundancy mgmt-ethernet
=====
Management Ethernet Redundancy
=====
Admin Status   : Enabled
Oper Status    : Management port operating on active CPM
Revert Time    : 5 seconds
=====
```

*Table 321: Output fields: redundancy management Ethernet*

Label	Description
Admin Status	Enabled — Administrative status is enabled Disabled — Administrative status is disabled
Oper Status	Up — The interface is operationally enabled Down — The interface is operationally shutdown
Revert Time	The wait duration (in seconds) before reverting to the management Ethernet port of the primary CPM

### Output example - show router "management" interface

The following output is an example of CPM's Ethernet port information, and [Table 322: Output fields: router "management" interface](#) describes the output fields. When the primary CPM Ethernet port is active, the output displays the Port/SapId information as "A1". When the port of the secondary CPM is active, the output displays the Port/SapId information as "B/1 -> A/1".

```
show router "management" interface
=====
Interface Table (Router: management)
=====
Interface-Name      Adm      Opr(v4/v6)  Mode      Port/SapId

fe80::221:5ff:fece:df49/64  PREFERRED
-----
Interfaces : 1
=====
```

*Table 322: Output fields: router "management" interface*

Label	Description
Interface-Name	The interface name

Label	Description
Adm	Up — The interface is administratively enabled Down — The interface is administratively shutdown
Opr (v4/v6)	Up — The interface is operationally enabled Down — The interface is operationally shutdown
Mode	Network — the IP interface is a network/core IP interface Service — the IP interface is a service IP interface
Port/SapId	The physical network port or the SAP identifier associated with the interface
IP-Address	The IP address of the interface
PfxState	The prefix state associated with the interface

**Output example - show port "A1"**

The following output is an example of CPM Ethernet port information when management Ethernet port redundancy is active, and [Table 323: Output fields: port "A1"](#) describes the output fields.

```
show port A/1

=====
Ethernet Interface
=====
Description      : 10/100/Gig Ethernet TX
Interface        : A/1 -> B/1          Oper Speed      : A/1 -> B/1
Link-level       : Ethernet          Config Speed    : 1 Gbps
Admin State      : up                Oper Duplex     : A/1 -> B/1
Oper State       : A/1 -> B/1
Config Duplex    : full
Physical Link    : A/1 -> B/1          MTU             : 1514
...
```

*Table 323: Output fields: port "A1"*

Label	Description
Description	A text description for the entity
Interface	Displays the physical port ID in the form <i>slot/mda/port</i> for all ports except QSFP28 and QSFP-DD ports, or <i>slot/mda/cconnector/port</i> for QSFP28 and QSFP-DD ports Displays the status of the Ethernet link behavior if management port redundancy is enabled (for example, A/1 -> B/1)
Link-level	Ethernet — The port is configured as Ethernet
Oper Duplex	full — The link is set to full duplex mode half — The link is set to half duplex mode

Label	Description
	Displays the status of the Ethernet link behavior if management port redundancy is enabled (for example, A/1 -> B/1)
Admin State	Up — The entity is administratively up Down — The entity is administratively down
Oper Speed	The operating speed of the interface Displays the status of the Ethernet link behavior if management port redundancy is enabled (for example, A/1 -> B/1)
Oper State	up — The entity is operationally up down — The entity is operationally down Additionally, the <i>lag-id</i> of the LAG it belongs to in addition to the status of the LAG member (active or standby) is specified Displays the status of the Ethernet link behavior if management port redundancy is enabled (for example, A/1 -> B/1)
Config Duplex	Full — The link is set to full duplex mode Half — The link is set to half duplex mode
Physical Link	Yes — A physical link is present No — A physical link is not present Displays the status of the Ethernet link behavior if management port redundancy is enabled (for example, A/1 -> B/1)
MTU	Displays the size of the largest packet which can be sent/received on the Ethernet physical interface, specified in octets

## mgmt-ethernet

### Syntax

**mgmt-ethernet**

### Context

[\[Tree\]](#) (tools>perform>redundancy mgmt-ethernet)

### Full Context

tools perform redundancy mgmt-ethernet

### Description

This command triggers the redundancy mode, which causes the router to act as if the management Ethernet port of the primary CPM has gone down. The router reverts if the management Ethernet port of the primary CPM has been up for the revert duration.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 18.13 mgw-address-cache

### mgw-address-cache

#### Syntax

**mgw-address-cache**

#### Context

**[Tree]** (clear>router>gtp>uplink mgw-address-cache)

#### Full Context

clear router gtp uplink mgw-address-cache

#### Description

This command clears the DNS resolution cache for all APNs known in this router. After execution, every APN to address mapping is learned again using DNS.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

### mgw-address-cache

#### Syntax

**mgw-address-cache**

#### Context

**[Tree]** (clear>router>wlan-gw mgw-address-cache)

#### Full Context

clear router wlan-gw mgw-address-cache

#### Description

This command clears the mobile gateway's DNS lookup address cache.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## mgw-address-cache

### Syntax

```
mgw-address-cache [arec] [snaptr] [srv]  
mgw-address-cache apn apn-domain-string
```

### Context

[\[Tree\]](#) (show>router>gtp>uplink mgw-address-cache)

### Full Context

```
show router gtp uplink mgw-address-cache
```

### Description

This command displays the mobile gateway's DNS lookup address cache.

### Parameters

**arec**

Displays A-records.

**snaptr**

Displays Straightforward-NAPTR information.

**srv**

Displays SRV records.

***apn-domain-string***

Specifies the Access Point Name (APN) of this DNS cache entry.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## mgw-address-cache

### Syntax

```
mgw-address-cache [arec] [snaptr] [srv]  
mgw-address-cache apn apn-domain-string
```

### Context

[\[Tree\]](#) (show>router>gtp>uplink mgw-address-cache)

### Full Context

```
show router gtp uplink mgw-address-cache
```

## Description

This command displays the mobile gateway's DNS lookup address cache.

## Parameters

### ***apn-domain-string***

Specifies the Access Point Name (APN) of this DNS cache entry, up to 108 characters.

### ***arec***

Displays A-records.

### ***snaptr***

Displays Straightforward-NAPTR information.

### ***srv***

Displays SRV records.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 18.14 micro-segment-local-sid

### micro-segment-local-sid

## Syntax

```
micro-segment-local-sid [ipv6-prefix[/prefix-length]] [longer] [micro-segment-locator ms-locator-name]  
[context contextf] [ua] [udt4] [udt6] [udt46] [udx2] [udt2u] [udt2m] [un]
```

## Context

**[Tree]** (show>router>srv6 micro-segment-local-sid)

## Full Context

```
show router segment-routing-v6 micro-segment-local-sid
```

## Description

This command displays SRv6 locally-configured micro-SID information.

## Parameters

### ***ipv6-prefix[/prefix-length]***

Displays routes only matching the specified IP address and length.

**Values** *ipv6-prefix[/prefix]*: x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x.d.d.d.d  
x: [0 to FFFF]H

d: [0 to 255]D  
*prefix-length*: 1 to 128

**longer**

Displays the specified route and subsets of the route.

***ms-locator-name***

Specifies the micro-segment locator name, up to 64 characters.

***context***

Specifies the context for which to display micro-segment local micro-SID information.

**Values** *vprn-svc-name*, *vprn-svc-id*, 'Base'

**ua**

Displays the uA SID associated with a P2P interface.

**udt4**

Displays the uDT4 function associated with the specified context.

**udt6**

Displays the uDT6 function associated with the specified context.

**udt46**

Displays the uDT46 function associated with the specified context.

**udx2**

Displays the uDX2 function associated with the SRv6 instance in the service.

**udt2u**

Displays the uDT2U function associated with the SRv6 instance in the service.

**udt2m**

Displays the uDT2M function associated with the SRv6 instance in the service.

**un**

Displays the uN SID function of a locator.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 18.15 micro-segment-locator

### micro-segment-locator

**Syntax**

**micro-segment-locator** [mt {0 | 2}] [prefix *ipv6-prefix*[/*prefix-length*]] [adv-router *system-id* | *hostname*]  
[algo *algo-id*]

## Context

[\[Tree\]](#) (show>router>isis>srv6 micro-segment-locator)

## Full Context

show router isis segment-routing-v6 micro-segment-locator

## Description

This command displays the IS-IS SRv6 micro-segment locators.

## Parameters

### **ipv6-prefix[/prefix-length]**

Displays routes only matching the specified *ip-address* and length.

**Values** *ipv6-prefix[/prefix]*: x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x: [0 to FFFF]H  
 d: [0 to 255]D  
*prefix-length*: 1 to 128

### **system-id | hostname**

Displays information for the specific IS-IS advertising router. The host name can be up to 38 characters.

### **algo-id**

Displays information for the specified algorithm.

**Values** 0 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## Output

[Table 324: Output fields: micro-segment locator](#) describes the micro-segment locator output fields.

Use the following command to display micro-segment locator information.

```
show router isis segment-routing-v6 micro-segment-locator
```

## Output Example

Tag	Displays the tag information
Flag	Displays the flag information
Algo	Displays the algorithm information
No. of Micro Segment Locators	Displays the number of micro-segment locators

## 18.16 migration

### migration

#### Syntax

**migration** [**interface** *ip-int-name*]

#### Context

**[Tree]** (tools>dump>router>ipoe-session migration)

#### Full Context

tools dump router ipoe-session migration

## Description

This command displays details on the IPoE session migration progress. It shows per group interface the number of hosts per type (DHCPv4, DHCPv6 and SLAAC) that are associated with an IPoE session or that are not associated with an IPoE session.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of IPoE session migration information.

### Output Example

```
# tools dump router ipoe-session migration interface group-int-1-1
=====
Type                Total      IPoE session  Non IPoE session
=====
Group-interface: group-int-1-1 (IPoE session enabled)
-----
DHCPv4              2          1              1
DHCPv6              3          2              1
SLAAC                0          0              0
-----
IPoE sessions       1
=====
```

## 18.17 mip

mip

## Syntax

mip

## Context

[\[Tree\]](#) (show>eth-cfm mip)

## Full Context

show eth-cfm mip

## Description

This command displays provisioned entities that allow MIP creation.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of ETH-CFM MIP information. The following table describes the output fields.

### Output Example

```

show eth-cfm mip
=====

Table 325: Output fields: ETH-CFM MIP

Label	Description
Sap	The service SAP ID
qtag1	The outer CFM VLAN tag
qtag2	The inner CFM VLAN tag
PVLAN	The configured primary VLAN
Enabled	The state of the MIP
Mac Address	The configured MAC address of the MIP
Sdp	The service SDP ID
Svclid	The service ID
Type	The SDP type
Far End	The IP address of the far-end peer for the SDP

## 18.18 mip-instantiation

### mip-instantiation

#### Syntax

**mip-instantiation** [**level** *level*] [{**sap** *sap-id* | **sdp** *sdp-id*}]

#### Context

[\[Tree\]](#) (show>eth-cfm mip-instantiation)

#### Full Context

show eth-cfm mip-instantiation

#### Description

This command displays the active MIPs created on the node, their related object values, and the SAP or SDP binding. The attributes include a column that indicates which MIP table was responsible and authoritative for the specific active attribute. Authorities can be the association (asn), default-domain (def), or the global read-only values (sys).

#### Parameters

##### *level*

The level for which all created MIPs will be displayed

**Values** 0 to 7

##### *sap-id*

The SAP for which created MIPs will be displayed

##### *sdp-id*

The SDP binding for which created MIPs will be displayed

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

#### Output

The following output is an example of ETH CFM MIP instantiation information.

[Table 326: Output fields: ETH-CFM MIP instantiation](#) describes the show MIP instantiation command output fields.

#### Output Example

```
show eth-cfm mip-instantiation
=====

```

Table 326: Output fields: ETH-CFM MIP instantiation

Label	Description
VLAN	Displays the primary <i>vlan-id</i> associated with the MIP, or "none" if <i>primary-vlan-enable</i> is not configured
L	Displays the numerical value indicating the CFM level of the MIP
LA	Displays the level authority indicating the creation routine responsible for the level
Creation	Displays the MHF creation mode that was used to create the MIP
CA	Displays the creation authority
IdPerm	Indicates whether the SenderID TLV is being included (chassis) or not (none)
IdA	Displays the IdPermission authority
Pri	Displays the numerical value that indicates the <b>mip-ltr-priority</b>
PA	Displays the <b>mip-ltr-priority</b> authority

## 18.19 mirror

### mirror

#### Syntax

**mirror mirror-dest** *service-id*

**mirror global-sampling-rate**

**mirror mirror-source** *service-id*

#### Context

[\[Tree\]](#) (show mirror)

#### Full Context

show mirror

#### Description

This command displays mirror configuration and operation information.

#### Parameters

##### *service-id*

Specify the mirror service ID.

**Values** 1 to 2148278385

##### **global-sampling-rate**

Displays the global sampling rate as well as all mirror destination services that use the global sampling rate.

#### Platforms

All

#### Output

The following output is an example of mirror destination information.

#### Output Example

```

Table 327: Output fields: mirror lists and describes the mirroring output fields:

Table 327: Output fields: mirror

Label	Description
Service Id	The service ID associated with this mirror destination.
Type	Entries in this table have an implied storage type of "volatile". The configured mirror source information is not persistent.

Label	Description
Admin State	Up — The mirror destination is administratively enabled.
	Down — The mirror destination is administratively disabled.
Oper State	Up — The mirror destination is operationally enabled.
	Down — The mirror destination is operationally disabled.
Forwarding Class	The forwarding class for all packets transmitted to the mirror destination.
Remote Sources	Yes — A remote source is configured.
	No — A remote source is not configured.
Enable Port Id	Yes — PPP Port ID Mirroring is enabled.
	No — PPP Port ID Mirroring is disabled.
Slice	The value of the slice-size, the maximum portion of the mirrored frame that will be transmitted to the mirror destination. Any frame larger than the slice-size will be truncated to this value before transmission to the mirror destination. A value of 0 indicates that mirrored packet truncation based on slice size is disabled.
Destination SAP	The ID of the access port where the Service Access Point (SAP) associated with this mirror destination service is defined.
Egr QoS Policy	This value indicates the egress QoS policy ID. A value of 0 indicates that no QoS policy is specified.

The following output is an example of global-sampling-rate information, and [Table 328: Output fields: mirror global sampling rate](#) describes the output fields.

```
show mirror global-sampling-rate
```

Table 328: Output fields: mirror global sampling rate

Label	Description
Global Sampling Rate	Specifies the configured global sampling rate
Id	Specifies the mirror destination services that use the global sampling rate by ID
Name	Specifies the mirror destination services that use the global sampling rate by name

## 18.20 mirror-dest

### mirror-dest

#### Syntax

**mirror-dest** [*service-id*]

#### Context

[\[Tree\]](#) (show>li mirror-dest)

#### Full Context

show li mirror-dest

#### Description

This command displays LI mirror destination information.

#### Parameters

***service-id***

Identifies the service in the service domain. This ID is unique to this service and cannot be used by any other service, regardless of service type. The same service ID must be configured on every router that this particular service is defined on.

#### Values

*service-id*: 1 to 2148278381

*svc-name*: 64 characters maximum

#### Platforms

All

#### Output

## Output Example

```
A:BNG-1# show li mirror-dest
=====
Mirror Services
=====
Id          Type   Adm   Opr   Destination          SDP Lbl/   Slice

-----
RADIUS LI mirror dest: indicated by [<svc-id>]
```

## mirror-dest

### Syntax

**mirror-dest** [*service-id*]

### Context

**[Tree]** (clear>li>radius mirror-dest)

### Full Context

clear li radius mirror-dest

### Description

This command deletes the mirror destination created by RADIUS.

LI configuration changes, such as updating or replacing a mirror-destination template, may prevent the RADIUS VSA "Alc-li-action" from deleting a mirror destination. To remove the mirror destination from RADIUS, the parameters for the mirror destination (a combination of the RADIUS LI VSAs and the mirror destination template) must match the parameters used during the mirror destination creation. This CLI command removes LI destinations in these cases.

### Parameters

#### *service-id*

Specifies the mirror destination service that was created through RADIUS, which can be displayed with the **show li mirror-dest** command.

**Values** 1 to 2148278385

### Platforms

All

## 18.21 mka-over-ip

### mka-over-ip

#### Syntax

**mka-over-ip**

#### Context

[\[Tree\]](#) (show>anysec mka-over-ip)

#### Full Context

show anysec mka-over-ip

#### Description

This command displays MKA-over-IP information.

#### Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

#### Output

The following output is an example of MKA over IP, and [Table 329: Output fields: MKA over IP](#) describes the output fields.

#### Output Example

```
# show anysec mka-over-ip

=====
MKA over IP

```

Table 329: Output fields: MKA over IP

Label	Descriptions
MKA over IP session UDP Port	The MKA-over-IP UDP port number
Reserved Label Block	The reserved label block
Operational Status	The operational status

## 18.22 mka-session

### mka-session

#### Syntax

**mka-session** [**port** *port-id*]

**mka-session** [**port** *port-id*] **detail**

**mka-session** [**port** *port-id*] **statistics**

#### Context

[\[Tree\]](#) (show>macsec mka-session)

#### Full Context

show macsec mka-session

#### Description

This command displays MACsec MKA session information.

#### Parameters

##### **port-id**

Specifies the port ID, up to 17 characters.

##### **detail**

Displays MACsec MKA session detailed information.

##### **statistics**

Displays MACsec MKA session statistical information.

#### Platforms

All

#### Output

**Output Fields: show macsec mka-session port**

Table 330: Output fields: MACsec MKA session port describes the output fields for the following **show macsec mka-session port** command.

Table 330: Output fields: MACsec MKA session port

Label	Description
MKA Session for port	Display the MKA session for the current port
Port	Specifies the MKA session current port.
Security Zone	Specifies Security Zone does this port belongs to.
Live Peer List	Specifies Peers (Participants) which have provided their MI and MN via KMA. The peer entry is in the Live Peer List.
Member Identifier	Specifies the MI of the peer entry.
Mesg Num	Specifies the latest Member Number of the peer entry.
Rx-SCI	Specifies the Peer Rx-SCI.
KS-priority	Specifies the Peer Key server priority.
Potential Peer List	Peers (Participants) which have Potential Peers List includes all the other peers that have transmitted an MKPDU that has been directly received by the participant or that were included in the Live Peers List of a MKPDU transmitted by a peer that has proved liveness, an MKA PDU. The peer entry is in the Potential Peer List.

**Output Example: show macsec mka-session port detail**

```
A:Dut-C# show macsec mka-session port 2/1/11 detail

**Output Fields: show macsec mka-session port detail**

Table 331: Output fields: MACsec MKA session port detail describes the output fields for the following commands:

- **show macsec mka-session port**
- **show macsec mka-session detail**
- **show macsec mka-session statistics**

Table 331: Output fields: MACsec MKA session port detail

Label	Description
MKA Oper State	Specifies the operational state of the MKA participant on this port. The operational MKA state will be up if MKA hellos are received on this port and have a valid session.
Oper Cipher Suite	Specifies the operational encryption algorithm used for data path PDUs when all parties in the CA have the (SAK). This value is specified by the key server:gcm-aes-128, gcm-aes-256, gcm-aes-xpn-128, gcm-aes-xpn-256.
Oper Encrypt Offset	Specifies the operational encryption offset used for the data path PDUs when all parties in the CA have the SAK. This value is specified by the key server: 0, 30, 50.
CAK Name	Specifies the name of the CAK in use by this MKA which is used to find the correct CAK.
MKA Member ID	Specifies indicates the Member Identifier (MI) for the MKA instance.
Transmit Interval	Specifies the time interval (in ms) at which the MKA broadcasts its liveness to its peers and is non-configurable.
Outbound SCI	Specifies the Secure Channel Identifier (SCI) information for transmitting MACsec frames and consists of the outgoing port MAC Address and a port identifier.
Message Number	Specifies the current count of MKA messages that is attached to MKA PDUs.
Key Number	Specifies the number of the currently assigned CAK. When a new CAK is generated, this number is incremented. A SAK is identified by 128-bit Key Identifier (KI) and 32-bit Key-Number (KN).
Key Server	Specifies whether this server is the highest priority server in the peer group: no, yes.
Key Server Priority	Specifies the priority of the active key server: 0-255 (default 16).

Label	Description
Latest SAK AN	Specifies the Association Number (AN) of the latest Secure Association Key (SAK). This number is concatenated with an SCI to identify a Secure Association (SA). In SR OS, only 2 SAKs are supported.
Latest SAK KI	Specifies the Key Identifier (KI) of the latest SAK. This number is derived from the MI of the key server and the key number.
Previous SAK AN	Specifies the AN of the previous SAK. This number is concatenated with an SCI to identify an SA.
Previous SAK KI	Specifies the KI of the previous SAK. This number is derived from the MI of the key server and the key number.
Peer Removed Due to Timeout	Specifies the number of peers removed from the live/potential peer list due to not receiving an MKPDU within the MKA Live Time (6.0 seconds) and is not configurable.
CKN Not Found	Specifies the number of MKPDUs received with a CKN that does not match the CA configured for the port.
New Live Peer	Specifies the number of validated peers that have been added to the live peer list.
SAK Generated by Server	Specifies the number of SAKs generated by this MKA instance.
SAK Installed for TX	Specifies the number of SAKs installed for transmitting.
SAK Installed for RX	Specifies the number of SAKs installed for receiving.
PDU Too small	Indicates that the number of MKPDUs received that are less than 32 octets.
PDU Too big	Indicates the number of MKPDUs received where the EAPOL header indicates a size larger than the received packet.
PDU Not Quad Size	Indicates the number of MKPDUs received with a size that is not a multiple of 4 octets long.
PDU Message Number Invalid	Indicates the number of MKPDUs received out of order as indicated by the Message Number.
PDU Param Set Size Invalid	Indicates the number of MKPDUs received which contain a parameter set body length that exceeds the remaining length of the MKPDU.
PDU Liveness Check Fail	Indicates the number of MKPDUs received which contain an MN that is not acceptably recent.
Param Set Not Quad Size	Indicates the number of MKPDUs received which contain a parameter set that is not a multiple of 4 octets long.

Label	Description
Unsupported Agility	Indicates the number of MKPDUs received which contain an unsupported Algorithm Agility value.
Invalid CAK Name Length	Indicates the number of MKPDUs received which contain a CAK name that exceeds the maximum CAK name length.
ICV Check Failed	Indicates the number of MKPDUs received which contain an ICV value that does not authenticate.
Peer Using Same MID	Indicates the number of MKPDUs received which contain a peer list with an MI entry which conflicts with the local MI.
SAK From Non-Live Peer	Indicates the number of SAKs received from peer that is not a member of the Live Peers List.
SAK From Non-Key Server	Indicates the number of SAKs received from an MKA participant that has not been designated as the Key Server. Only the key server should distribute SAK.
SAK Decrypt Fail	Indicates the number of AES Key Wrap SAK decryption failures that have occurred.
SAK Encrypt Fail	Indicates the number of AES Key Wrap SAK encryption failures that have occurred.
Key Number Invalid	Indicates the number of SAKs received with an invalid Key Number.
SAK Installation Failed	Indicates the number of Secy SAK installation failures that have occurred.
CAK Info Missing	Indicates the number of times internal CAK data is not available for the generation of the SAK.
Max Peers Set as Zero	Indicates the number of Secy SAK installations that have failed due to the max peer entry being set to 0.

**Output Example: show macsec mka-session detail**

```
A:Dut-C# show macsec mka-session detail

## mka-session

### Syntax

```
mka-session [port-id]
```

### Context

[\[Tree\]](#) (clear>macsec mka-session)

### Full Context

```
clear macsec mka-session
```

### Description

This command displays MACsec MKA session information.

### Parameters

*port-id*

Specifies the port ID, up to 17 characters

### Platforms

All

## 18.23 mld

mld

### Syntax

**mld** [**subscriber** *sub-ident-string*] [**detail**]

### Context

[\[Tree\]](#) (show>service>active-subscribers mld)

### Full Context

show service active-subscribers mld

### Description

This command displays active subscriber MLD information.

### Parameters

#### ***sub-ident-string***

Displays the subscriber ID of the active subscriber, up to 64 characters.

#### **detail**

Displays detailed output.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### Output

The following output is an example of MLD information for active subscribers

#### Output Example

```
*A:eng-BNG-2# show service active-subscribers mld
=====
Active Subscribers
=====
Subscriber
  MLD-Policy
  HostAddr                GrpItf                NumGroups
-----
user_1
  mld-policy-01
  2001::1                grp-int-01
-----
Number of Subscribers : 1
=====
```

Table 332: Output fields: MLD active subscribers

Label	Descriptions
Subscriber	The name of the subscriber
MLD-Policy	The name of the policy associated with the subscriber as specified by the external policy server or local user database
HostAddr	The subscriber's individual host IPv6 address or prefix.
GrpIrf	The group interface on which the subscriber is created
NumGroups	The number of multicast groups that the subscriber is currently joined with
Number of Subscribers	The total number of subscribers associated with this show command

## mld

### Syntax

mld

### Context

[\[Tree\]](#) (show>router mld)

### Full Context

show router mld

### Description

Commands in this context show MLD entities.

### Platforms

All

## mld

### Syntax

mld

### Context

[\[Tree\]](#) (clear>router mld)

### Full Context

clear router mld

### Description

Commands in this context clear and reset MLD entities.

### Platforms

All

## 18.24 mld-policy

### mld-policy

#### Syntax

**mld-policy**

**mld** *policy-name* **association**

**mld** *policy-name*

#### Context

[\[Tree\]](#) (show>subscr-mgmt mld-policy)

#### Full Context

show subscriber-mgmt mld-policy

#### Description

This command displays MLD policy information.

#### Parameters

***policy-name***

Specifies the MLD policy name, up to 32 characters.

**association**

Displays information associated with the MLD policy.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 18.25 mld-snooping

### mld-snooping

#### Syntax

**mld-snooping**

#### Context

[\[Tree\]](#) (show>service>id mld-snooping)

#### Full Context

show service id mld-snooping

#### Description

This command displays MLD snooping information.

#### Platforms

All

### mld-snooping

#### Syntax

**mld-snooping**

#### Context

[\[Tree\]](#) (clear>service>id mld-snooping)

#### Full Context

clear service id mld-snooping

#### Description

Commands in this context clear MLD snooping-related data.

#### Platforms

All

## 18.26 mlppp

```
mlppp
```

### Syntax

```
mlppp
```

### Context

[\[Tree\]](#) (show>router>l2tp mlppp)

### Full Context

```
show router l2tp mlppp
```

### Description

This command displays L2TP MLPPP operational information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## 18.27 mmrp

```
mmrp
```

### Syntax

```
mmrp mac [ieee-address]
```

### Context

[\[Tree\]](#) (show>service>id mmrp)

### Full Context

```
show service id mmrp
```

### Description

This command displays information on MACs. If a MAC address is specified, information will be displayed relevant to the specific group. No parameter will display information on all group MACs on a server.

## Parameters

### *ieee-address*

Specifies a MAC address as a hex string in the form of xx:xx:xx:xx:xx:xx: or xx-xx-xx-xx-xx-xx

## Platforms

All

## Output

The following output is an example of service MRRP MAC information.

### Output Example

```
*A:PE-A# show service id 10 mrrp mac 01:1E:83:00:00:65
-----

## 18.28 mobile-gateway

### mobile-gateway

#### Syntax

**mobile-gateway remote-address** *ip-address* [**udp-port** *port*] **statistics**

#### Context

[\[Tree\]](#) (clear>router>wlan-gw mobile-gateway)

#### Full Context

clear router wlan-gw mobile-gateway

#### Description

This command clears Mobile Gateway data.

#### Parameters

##### *ip-address*

Specifies the IP address.

- Values**
- ipv4-address: a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x: [0 to FFFF] H
    - d: [0 to 255] D

##### *port*

Specifies the port number.

- Values** 1 to 65535

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 18.29 module

### module

#### Syntax

**module** *cpm-slot* **action** {**reboot** | **disconnect**}

#### Context

[\[Tree\]](#) (tools>perform>system>bluetooth module)

#### Full Context

tools perform system bluetooth module

#### Description

This command performs reboots or disconnects on the Bluetooth module on the specified CPM.

#### Parameters

##### *cpm-slot*

Specifies the CPM slot.

**Values** {A | B | C | D}

##### **reboot**

Triggers a reboot of the Bluetooth subsystem on the module.

##### **disconnect**

Forces a disconnect of any active Bluetooth session.

#### Platforms

7750 SR-1, 7750 SR-s, 7950 XRS-20e

### module

#### Syntax

**module** [*cpm-slot*] [**detail**]

#### Context

[\[Tree\]](#) (show>system>bluetooth module)

#### Full Context

show system bluetooth module

## Description

This command displays information for Bluetooth modules.

## Parameters

### *cpm-slot*

Specifies the CPM slot.

**Values** A, B

### *detail*

Displays detailed information.

## Platforms

7750 SR-1, 7750 SR-s, 7950 XRS-20e

## Output

The following output is an example of Bluetooth module information, and [Table 333: Output fields: Bluetooth module](#) describes the output fields.

Use the following command for Bluetooth module information.

```
show system bluetooth module
```

## Output Example

```
=====
System-wide Bluetooth Configuration
=====
Passkey           : 123456           Advertising Timeout: 30
Power State       : off             Pairing Button    : Disabled
=====

Bluetooth Modules
=====
Module            : A
Device Connected  : No
Configured Identifier : (Not Configured)
Given Identifier   : 7750-SR-1-CPM-A-card-2
=====
```

Table 333: Output fields: Bluetooth module

Label	Description
Passkey	The Bluetooth passkey in use by the system
Advertising Timeout	The amount of time, in seconds, that the Bluetooth module advertises it is ready to pair.

Label	Description
Power State	The operating mode for Bluetooth
Pairing Button	Displays whether the pairing button is enabled for use
Module	Displays which CPM contains the Bluetooth module
Device Connected	Displays if there is a device actively paired to the module
Configured Identifier	The customer-defined Bluetooth identifier for the module
Given Identifier	The Bluetooth identifier in use for the module

## 18.38 ms-pw

### ms-pw

#### Syntax

```
ms-pw [rd rd] [aii-type2 aii-type2] [brief] [hunt] [aspath-regex reg-exp] [community comm-id]
```

#### Context

[\[Tree\]](#) (show>router>bgp>routes ms-pw)

#### Full Context

```
show router bgp routes ms-pw
```

#### Description

This command displays BGP Multi-Segment Pseudowire (MS-PW) routes.

#### Parameters

##### *rd*

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

##### *aii-type2*

Filters the MS-PW routes based on the All Type 2 value.

##### *reg-exp*

Displays routes matching the specified regular expression, up to 80 characters.

### **comm-id**

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
  - *comm-val* — 0 to 65535
  - *ext-comm* — the extended community, defined as one of the following:
    - *{target | origin}:ip-address:comm-val*
    - *{target | origin}:asnum:ext-comm-val*
    - *{target | origin}:ext-asnum:comm-val*
    - **bandwidth:asnum:val-in-mbps**
    - **ext:4300:ovstate**
    - **ext:value1:value2**
    - **flowspec-set:ext-asnum:group-id**
- where:
- *target* — route target
  - *origin* — route origin
  - *ip-address* — a.b.c.d
  - *ext-comm-val* — 0 to 4294967295
  - *ext-asnum* — 0 to 4294967295
  - **bandwidth** — bandwidth
  - *val-in-mbps* — 0 to 16777215
  - **ext** — extended
  - **ext:4300** — origin verification
  - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
  - *value1* — 0000 to FFFF
  - *value2* — 0 to FFFFFFFFFF
  - **flowspec-set** — flow-spec set
  - *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
  - *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

### **Platforms**

All

## 18.39 msap

```
msap
```

### Syntax

```
msap {msap-id | idle-only}
```

### Context

```
[Tree] (clear>service>id msap)
```

### Full Context

```
clear service id msap
```

### Description

This command clears Managed SAP (MSAP) information.

This command can remove an MSAP with active subscribers still associated with the MSAP. You can specify the **idle-only** parameter to clear only MSAPs in an idle state; MSAPs with active subscribers are not cleared.

### Parameters

#### *msap-id*

Specifies a Managed SAP ID.

Values	
dot1q	[port-id   lag-id]:qtag1
qinq	[port-id   lag-id]:qtag1.qtag2
qtag1	0 to 4094
qtag2	0 to 4094

#### **idle-only**

Specifies to clear only MSAPs in an idle state.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
msap
```

### Syntax

```
msap [service service-id]
```

## Context

[\[Tree\]](#) (tools>dump>service msap)

## Full Context

```
tools dump service msap
```

## Description

This command provides MSAP-related statistics for the chassis and tracks the number of sticky MSAPs. The statistics include the total number of MSAPs, sticky MSAPs, and idle MSAPs. When a subscriber disconnects from a sticky MSAP, it transitions to an idle MSAP. The idle MSAP transitions back to a sticky MSAP when the subscriber reconnects. A large number of idle MSAPs during peak network hours indicate that an idle MSAP cleanup is required. The total MSAP statistic counts both the total number of traditional MSAPs (non-sticky) and total number of sticky MSAPs. Idle MSAPs are counted towards the total number of sticky MSAPs.

## Parameters

### *service-id*

Specifies the service for which to show the MSAP-related statistics. The service is indicated in the chassis.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
msap
```

## Syntax

```
msap
```

## Context

[\[Tree\]](#) (show>service>id msap)

## Full Context

```
show service id msap
```

## Description

This command displays information for the managed SAPs associated with the service.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of managed SAP information.

### Output Example

```
[/]
A:patrick@pel# /show service id 1000 msap

Field	Description
Name	The name of the MSAP policy
Num MSAPs	The number of MSAPs
Description	The user-provided description of the MSAP policy
Number of MSAP Policies	The total number of MSAP policies
Number of MSAPs	The total number of MSAPs

## msap-policy

## Syntax

**msap-policy** *msap-policy-name* [**idle-only**]

## Context

[\[Tree\]](#) (clear>subscr-mgmt msap-policy)

## Full Context

clear subscriber-mgmt msap-policy

## Description

This command deletes Managed SAPs (MSAPs) created by the MSAP policy.

This command can remove an MSAP with active subscribers still associated with the MSAP. Use the **idle-only** parameter to remove only MSAPs in an idle state.

## Parameters

### *msap-policy-name*

Specifies an existing managed SAP policy name. A string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### **idle-only**

Specifies to remove only the MSAPs in an idle state.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### Full Context

clear redundancy multi-chassis

### Description

Commands in this context clear multi-chassis parameters.

### Platforms

All

## 18.44 multi-chassis-shunt-interface

## multi-chassis-shunt-interface

### Syntax

**multi-chassis-shunt-interface**

## Context

[\[Tree\]](#) (show>ipsec multi-chassis-shunt-interface)

## Full Context

show ipsec multi-chassis-shunt-interface

## Description

This command displays information about configured multi-chassis shunt interfaces or the multi-chassis shunt interface information in the specified routing instance or service.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of IPsec multi-chassis shunt interfaces. [Table 337: Output fields: multi-chassis shunt interface](#) describes the output fields

### Output Example

```
show>ipsec# multi-chassis-shunt-interface
=====
IPsec Multi-Chassis Shunt Interfaces
=====
Service Id  MC Shunt Interface Name      Next Hop          Resolved
-----

-----
No. of IPsec MC Shunt Interfaces: 4
```

Table 337: Output fields: multi-chassis shunt interface

Label	Description
Service Id	The service ID
MC Shunt Interface Name	The multi-chassis shunt interface name
Next Hop	The next hop
Resolved	Resolved: Yes or No
No. of IPsec MC Shunt Interfaces	The total number of MC shunt interfaces

## 18.45 multicast-info-policy

### multicast-info-policy

#### Syntax

**multicast-info-policy** [*policy-name*] [**detail**]

#### Context

[\[Tree\]](#) (show>mcast-management multicast-info-policy)

#### Full Context

show mcast-management multicast-info-policy

#### Description

This command displays multicast path management policy information.

#### Parameters

##### *policy-name*

Specifies the bandwidth policy name, up to 32 characters.

##### **detail**

Displays detailed information.

#### Platforms

All

#### Output

The following output is an example of multicast management bandwidth policy information.

#### Output Example

```
A:PE1# show mcast-management multicast-info-policy "default" detail
=====

## 18.46 mvpn

```
mvpn
```

### Syntax

```
mvpn
mvpn source-redundancy [root | leaf]
```

### Context

[\[Tree\]](#) (show>router mvpn)

### Full Context

```
show router mvpn
```

### Description

This command displays multicast VPN related information. The router instance must be specified.

### Parameters

**root**  
Displays root information.

**leaf**  
Displays leaf information.

### Platforms

All

### Output

The following outputs are examples of MVPN information.

#### Output Example

```
# show router 1 mvpn

## 18.47 mvpn-ipv4

### mvpn-ipv4

#### Syntax

**mvpn-ipv4** [*aspath-regex* *reg-exp*] [*community* *comm-id*] [*rd* *rd*] [*brief*] [*type* *mvpn-type*] [*originator-ip* *ip-address*] [*source-ip* *ipv4 address* | *ipv6 address*] [*group-ip* *ipv4 address* | *ipv6 address*] [*source-as* *as-number*]

**mvpn-ipv4** [*aspath-regex* *reg-exp*] **hunt** [*community* *comm-id*] [*rd* *rd*] [*brief*] [*type* *mvpn-type*] [*originator-ip* *ip-address*] [*source-ip* *ipv4 address* | *ipv6 address*] [*group-ip* *ipv4 address* | *ipv6 address*] [*source-as* *as-number*]

**mvpn-ipv4** [*detail* | *longer*] [*aspath-regex* *reg-exp*] [*community* *comm-id*] [*rd* *rd*] [*type* *mvpn-type*] [*originator-ip* *ip-address*] [*source-ip* *ipv4 address* | *ipv6 address*] [*group-ip* *ipv4 address* | *ipv6 address*] [*source-as* *as-number*]

#### Context

[\[Tree\]](#) (show>router>bgp>routes mvpn-ipv4)

#### Full Context

show router bgp routes mvpn-ipv4

## Description

This command displays BGP MVPN IPv4 routes.

## Parameters

### *reg-exp*

Displays routes matching the specified regular expression, up to 80 characters.

### *hunt*

Displays entries for the specified route.

### *comm-id*

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:

- *{target | origin}:ip-address:comm-val*
- *{target | origin}:asnum:ext-comm-val*
- *{target | origin}:ext-asnum:comm-val*
- **bandwidth:asnum:val-in-mbps**
- **ext:4300:ovstate**
- **ext:value1:value2**
- **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set

- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

### ***rd***

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

### ***brief***

Displays the BGP MVPN IPv4 route information in a brief format.

### ***mvpn-type***

Displays information for the specified MVPN route type.

**Values** *intra-ad* | *inter-ad* | *spsmsi-ad* | *leaf-ad* | *source-ad* | *shared-join* | *source-join*

### ***ip-address***

Specifies the originator IP address.

**Values** *a.b.c.d*

### ***ipv4 address* | *ipv6 address***

Displays the IPv4 or IPv6 address expressed in dotted decimal notation.

**Values**

<i>ipv4-address:</i>	<i>a.b.c.d</i>
<i>ipv6-address:</i>	<i>x:x:x:x:x:x:x</i> (eight 16-bit pieces)
	<i>x:x:x:x:x:d.d.d.d</i>
	<i>x: [0 to FFFF]H</i>
	<i>d: [0 to 255]D</i>

### ***as-number***

Specifies the source AS number.

**Values** 0 to 4294967295

## **Platforms**

All

## 18.48 mvpn-ipv6

### mvpn-ipv6

#### Syntax

```
mvpn-ipv6 [type mvpn-type] [rd rd] [originator-ip ip-address] [source-ip ipv4 address | ipv6 address]  
[group-ip ipv4 address | ipv6 address] [source-as as-number] [detail | longer] [aspath-regex reg-exp]  
[community comm-id]
```

```
mvpn-ipv6 [type mvpn-type] [rd rd] [originator-ip ip-address] [source-ip ipv4 address | ipv6 address]  
[group-ip ipv4 address | ipv6 address] [source-as as-number] brief [aspath-regex reg-exp]  
[community comm-id]
```

```
mvpn-ipv6 [type mvpn-type] [rd rd] [originator-ip ip-address] [source-ip ipv4 address | ipv6 address]  
[group-ip ipv4 address | ipv6 address] [source-as as-number] hunt [aspath-regex reg-exp]  
[community comm-id]
```

#### Context

[\[Tree\]](#) (show>router>bgp>routes mvpn-ipv6)

#### Full Context

```
show router bgp routes mvpn-ipv6
```

#### Description

This command displays BGP MVPN IPv6 routes.

#### Parameters

##### *mvpn-type*

Displays information for the specified MVPN route type.

**Values** intra-ad | inter-ad | spmsi-ad | leaf-ad | source-ad | shared-join | source-join

##### *rd*

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

##### *ip-address*

Specifies the originator IP address.

**Values** a.b.c.d

##### *ipv4 address* | *ipv6 address*

Displays the IPv4 or IPv6 address expressed in dotted decimal notation.

<b>Values</b>	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

**as-number**

Specifies the source AS number.

**Values** 0 to 4294967295

**detail**

Displays detailed information.

**longer**

Displays the specified route and subsets of the route.

**brief**

Displays the BGP MVPN IPv6 route information in a brief format.

**reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

**comm-id**

Specifies the community ID, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
  - *{target | origin};ip-address:comm-val*
  - *{target | origin};asnum:ext-comm-val*
  - *{target | origin};ext-asnum:comm-val*
  - **bandwidth:asnum:val-in-mbps**
  - **ext:4300:ovstate**
  - **ext:value1:value2**
  - **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d

- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

## Platforms

## 18.49 mvpn-list

### mvpn-list

#### Syntax

```
mvpn-list [type type] [auto-discovery auto-discovery] [signalling  
signalling] [group group]
```

#### Context

[\[Tree\]](#) (show>router mvpn-list)

#### Full Context

```
show router mvpn-list
```

#### Description

This command displays the list of multicast VPNs.

#### Parameters

**type**

Specifies the MVPN type.

**Values** pim, rsvp, ldp

**auto-discovery**

Specifies the auto-discovery mode.

**Values** none, default, mdt-s

**signalling**

Specifies the signalling type.

**Values** bgp, pim

**group**

Specifies the group address.

**Platforms**

All

**Output**

The following output is an example of router MVPN list information.

**Output Example**

```
*A:Dut-D# show router mvpn-list
Legend: Sig = Signal Pim-a = pim-asm Pim-s = pim-ssm A-D = Auto-Discovery

Table 338: Output fields: IGMP Snooping MVR describes the show igmp-snooping mvr output fields:

Table 338: Output fields: IGMP Snooping MVR

Label	Description
IGMP Snooping Admin State	The IGMP snooping administrative state
MVR Admin State	The MVR administrative state
MVR Policy	The MVR policy name
Svc ID	The service ID
Sap/SDP	The SAP or SDP ID
Oper State	The operational state
From VPLS	The originating VPLS name
Num Local Groups	The number of local groups

## 19 n Commands

### 19.1 nat

```
nat
```

#### Syntax

```
nat
```

#### Context

[\[Tree\]](#) (tools>dump nat)

[\[Tree\]](#) (tools>perform nat)

#### Full Context

```
tools dump nat
```

```
tools perform nat
```

#### Description

This command enables the dump or perform tools for NAT.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
nat
```

#### Syntax

```
nat
```

#### Context

[\[Tree\]](#) (clear nat)

#### Full Context

```
clear nat
```

#### Description

Commands in this context clear NAT commands.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat

## Syntax

nat

## Context

[\[Tree\]](#) (show>router nat)

## Full Context

show router nat

## Description

Commands in this context display NAT related information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat

## Syntax

nat

## Context

[\[Tree\]](#) (show>service nat)

## Full Context

show service nat

## Description

Commands in this context display NAT information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 19.2 nat-group

### nat-group

#### Syntax

**nat-group**

**nat-group** *nat-group-id* [associations]

**nat-group** *nat-group-id* [associations]

**nat-group** *nat-group-id* inter-chassis-redundancy

**nat-group** *nat-group-id* statistics inter-chassis-redundancy

**nat-group** *nat-group-id* statistics mda *mda-id* [non-zero-value-only]

**nat-group** *nat-group-id* member *member-number*

**nat-group** *nat-group-id* member *member-number* inter-chassis-redundancy

**nat-group** *nat-group-id* member *member-number* statistics inter-chassis-redundancy

**nat-group** *nat-group-id* member *member-number* reassembly-statistics [non-zero-value-only]

**nat-group** *nat-group-id* member *member-number* statistics [non-zero-value-only]

**nat-group** [*nat-group-id*] members

#### Context

[\[Tree\]](#) (show>isa nat-group)

#### Full Context

show isa nat-group

#### Description

This command lists all active member ISAs (or group members). Up to 16 group members can be displayed (16 is the supported number of LAG links). Members can share physical ISAs (MDAs) and the physical locality of the group members can be determined from the **Mda** column in the output.

The number of group members will be <=X and the actual number of displayed group members will depend on the configuration based calculation.

#### Parameters

##### *nat-group-id*

Specifies the NAT group ID.

**Values** 1 to 4

##### associations

Displays associations applicable to the specified NAT group.

**statistics**

Displays NAT group statistics.

**member**

Displays statistics information about the resources of a member of a NAT ISA group.

**member-number**

Specifies the member number.

**Values** 1 to 255

**non-zero-value-only**

Displays statistics information display whose value is bigger than zero.

**reassembly-statistics**

Displays statistics information about IP datagram reassembly on NAT-capable ISA groups.

**inter-chassis-redundancy**

Displays information about inter-chassis redundancy.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following shows output examples.

**Output Example**

```

Table 339: Output fields: CPM statistics

Field	Description
Transmitted frames	Displays the total number of transmitted frames on the CPM level.
Transmission failures	Displays the transmission failures, for example due to missing route to the peer.
Received frames	Displays the total number of received frames on the CPM level.
Received failures (wrong peer)	Displays the received failures due to wrong peer.
Keepalive timeouts	Displays the total number of keepalive timeouts.

Flows marked to delete : 0
Flows delete pending : 0
Time of last failure : N/A
Failure cause : N/A
=====
```

Table 340: Output fields: ISA statistics

Field	Description
State	Displays the state of the NAT inter-chassis redundancy member.
Peer state	Displays the state of the peer.
Local IP address	Displays the local IP address.
Remote IP address	Displays the IP address of the remote client.
Unsupported flows	Displays the flows other than TCP/UDP/ICMP in 1:1 NAT that are agnostic and by default created per subscriber by configuration on both nodes. There is no need to synchronize such flows.
Tracked flows	Displays the TCP/UDP/ICMP flows.
Tracked flows not synced	Displays the outstanding flows on the active node waiting to be synchronized (transient condition). On the standby node, all flows are in this state.
Tracked flows pending	Displays the flows waiting to be acknowledged.
Flows synced	Displays the flows that are synchronized.
Flows marked to delete	Displays the flows marked to be deleted due to a timeout, deleted pinhole or simply as a result of an invoked <b>clear</b> command.
Flows delete pending	Displays the flows waiting to be deleted due to a timeout, deleted pinhole or simply as a result of an invoked <b>clear</b> command.
Time of last failure	Displays the time of the last ISA failure.
Failure cause	Displays the cause of the ISA failure.

Table 342: Output fields: ISA member state

State	Descriptions
Active	The member is actively serving traffic.

State	Descriptions
Failed	The member is in a failed state where forwarding is not possible and L2-aware bypass redundancy mode is disabled. This event is normally associated with an MS-ISA failure.
failedBypass	The member is in failed state and the subscribers that it was serving before the failover occurred are in a bypass mode. In a bypass mode, subscribers are normally routed according to the routing table in the inside routing context (as opposed to steered to MS-ISA where NAT is performed). The operator should ensure that the routing leads those subscribers to a centralized CGN node that serve as a backup device.  This event is normally associated with an MS-ISA failure while the L2-aware bypass redundancy mode is enabled.
activeBypass	The member transitions in this state after a recovery while the L2-aware bypass mode of operation is enabled. Some subscribers that this member was serving before the failover are in bypass mode, while others that came on-line after the restoration are actively being served by this member.

## nat-group

### Syntax

**nat-group** *nat-group-id* **member** *member-number* **l2-aware-subscribers**

**nat-group** *nat-group-id* **statistics** **mda** *mda-id*

**nat-group** *nat-group-id* **statistics** **inter-chassis-redundancy**

**nat-group** *nat-group-id* **member** *member-number* **resource-peak-values**

**nat-group** *nat-group-id* **member** *member-number* **statistics**

**nat-group** *nat-group-id* **member** *member-number* **statistics** **inter-chassis-redundancy**

### Context

[\[Tree\]](#) (clear>nat>isa nat-group)

### Full Context

clear nat isa nat-group

### Description

This command clears ISA nat-group commands related statistics or removes all the subscribers that are associated with a specific NAT group member.

## Parameters

### ***nat-group-id***

Specifies the NAT group ID to clear.

**Values** 1 to 4

### ***member-number***

Specifies the member number.

**Values** 1 to 255

### ***mda-id***

Specifies the MDA for which to clear performance measurements in *slot/mda* format.

**Values** slot — 1  
mda — 1 to 4

### ***l2-aware-subscribers***

Specifies to clear the NAT group ID's l2-aware subscribers.

### ***statistics***

Specifies to clear the NAT group ID's statistics.

### ***resource-peak-values***

Specifies to reset the resource peak values to the current resource measurements.

### ***inter-chassis-redundancy***

Specifies to clear the inter-chassis redundancy data.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 19.3 nat-policy

### nat-policy

#### Syntax

**nat-policy** *nat-policy-name* **associations**

**nat-policy** *nat-policy-name*

**nat-policy** *nat-policy-name* **statistics**

**nat-policy**

#### Context

[\[Tree\]](#) (show>service>nat nat-policy)

## Full Context

```
show service nat nat-policy
```

## Description

This command displays NAT policy information.

## Parameters

### *nat-policy-name*

Specifies the NAT Policy name.

**Values** 32 chars max

### **associations**

Keyword; displays the router instances and/or subscriber profiles associated with the NAT policy.

### **statistics**

Keyword; displays statistics of the specified NAT policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of this command.

### Context

[\[Tree\]](#) (show>isa nat-system-resources)

### Full Context

show isa nat-system-resources

### Description

This command displays ISA NAT system resources.

### Parameters

#### *mda-id*

Specifies the card and slot identifying a provisioned ISA.

<b>Values</b>	<i>mda-id:</i>	<i>slot [xiom]/mda</i>
	slot	1 to 2 (7750 SR-2s) 1 to 5 (7750 SR-7) 1 to 6 (7750 SR-14s) 1 to 10 (7450 ESS, 7750 SR-12) 1 to 14 (VSR) 1 to 20 (VSR)
	xiom	x1 to x2
	mda	1 to 2 (7450 ESS, 7750 SR-1, SR-2s, SR-7, SR-12, SR-14s) 1 to 4 (VSR)

#### *nat-group-id*

Specifies the NAT group ID.

<b>Values</b>	
1 to 4 (7450 ESS, 7750 SR-1, SR-2s, SR-7, SR-12, SR-14s, VSR)	
1 to 8 (7750 SR-12)	
1 to 15 (VSR)	

#### *vapp-id*

Specifies the ID of the configured ESA and ESA VM.

<b>Values</b>	<i>vapp-id:</i>	<i>esa-id/vm-id</i>
	esa-id	1 to 16

vm-id 1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of ISA NAT ESA-VM system resources and [Table 343: Output fields: ISA NAT ESA-VM system resources](#) describes the output fields.

### Output Example

## 19.5 nat64-lsn-sub

### nat64-lsn-sub

#### Syntax

**nat64-lsn-sub** **router** *router-instance* **ipv6-address-prefix** *ipv6-prefix*

#### Context

[\[Tree\]](#) (clear>nat nat64-lsn-sub)

#### Full Context

clear nat nat64-lsn-sub

#### Description

This command clears NAT mappings for NAT64 LSN subscribers.

#### Parameters

##### ***router-instance***

Specifies the router instance, up to 32 characters.

##### ***ipv6-prefix***

Specifies the IPv6 prefix and length.

- Values**
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 19.6 neighbor

### neighbor

#### Syntax

**neighbor** *service-id*

#### Context

[\[Tree\]](#) (clear>service>id neighbor)

#### Full Context

clear service id neighbor

#### Description

This command clears commands for a specific service. It clears the discovered IPv6 address of the neighboring CE associated with an lpipe SAP. When IPv6CP comes back up following the execution of this command on an IPv6CP SAP, the node checks if an IPv6 address has been learned for the remote CE attached to the lpipe service. If one has been learned, then this is used to bring up IPv6CP.

#### Parameters

##### ***service-id***

The ID that uniquely identifies a service.

**Values** service-id: 1 to 214748364  
svc-name: A string up to 64 characters long.

##### ***service-name***

Neighboring IPv6 address.

#### Platforms

All

### neighbor

#### Syntax

**neighbor** [{**sap** *sap-id* | **sdp** *sdp-id:vc-id*} [**address** *ip-address*]] [**detail**] [*family*]

#### Context

[\[Tree\]](#) (show>service>id>pim-snooping neighbor)

## Full Context

```
show service id pim-snooping neighbor
```

## Description

This command displays PIM neighbor information.

## Parameters

### *ip-int-name*

Only displays the interface information associated with the specified IP interface name

### *sap-id*

Displays the neighbor information associated with the specified SAP

### *sdp-id:vc-id*

Displays the neighbor information associated with the specified SDP

### *ip-address*

Displays information for the neighbor with the specified IP address

### *detail*

Displays detailed neighbor information

### *family*

Displays either IPv4 or IPv6 information for the specified neighbor

**Values**    ipv4 or ipv6

## Platforms

All

## Output

The following output is an example of service PIM snooping neighbor information.

### Output Example

```
*A:PE# show service id 1 pim-snooping neighbor
=====

## neighbor

### Syntax

```
neighbor [ip-address | evpn-mpls | sap sap-id | sdp sdp-id:vc-id | vxlan vtep ip-address vni vni-id]  
[family]
```

### Context

**[Tree]** (clear>service>id>pim-snooping neighbor)

### Full Context

```
clear service id pim-snooping neighbor
```

### Description

This command clears PIM snooping neighbor information.

### Parameters

#### *ip-address*

Clears information for the neighbor with the specified IP address

#### **sap** *sap-id*

Clears PIM snooping entries associated with the specified SAP

#### **sdp** *sdp-id:vc-id*

Clears PIM entries associated with the specified SDP. For a spoke-SDP, the VC ID must be specified; for a mesh SDP, the VC ID is optional.

**Values** 1 to 17407

#### *family*

Displays either IPv4 or IPv6 information

**Values** ipv4 or ipv6

#### **evpn-mpls**

Clears PIM snooping statistics for EVPN-MPLS destinations

### Platforms

All

## neighbor

### Syntax

```
neighbor [ip-address [detail]]
```

```
neighbor [as-number [detail]]
```

```
neighbor ip-address [family [type mvpn-type] [evpn-type]] routes [brief] [community comm-id]
```

**neighbor** *ip-address* [*family*] *damping*  
**neighbor** *as-number* [*family*] *damping*  
**neighbor** *ip-address* **orf** [*paths*]  
**neighbor** *ip-address* **graceful-restart**  
**neighbor** [**dynamic**]  
**neighbor** *ip-address* **epe-statistics**

## Context

[\[Tree\]](#) (show>router>bgp neighbor)

## Full Context

show router bgp neighbor

## Description

This command displays BGP neighbor information and can be entered with or without any parameters. Issuing the command without any parameters displays information for all BGP peers. When the command is issued with a specific IP address or ASN, information is displayed only for the specified peer or peers with the same AS.

When either **received-routes** or **advertised-routes** is specified, the routes exchanged with the specified peer are listed (see the second output example, below).

When either **history** or **suppressed** is specified, the routes learned from those peers that either have a history or are suppressed (respectively) are listed.

The "State" field displays the BGP peer's protocol state. In addition to the standard protocol states, this field can also display the "Disabled" operational state, which indicates the peer is operationally disabled and must be restarted by the operator.

### Note:

The information generated by this command is not available by SNMP.

## Parameters

### **as-number**

Displays information for the specified AS number.

**Values** 1 to 4294967295

### **brief**

Displays information in a brief format. This parameter is only supported with **received-routes** and **advertised-routes**.

### **community**

Displays all routes with the specified BGP community.

### **comm-id**

Specifies community IDs, up to 72 characters.

**Values** [*as-num:comm-val* | *ext-comm* | *well-known-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
  - *{target | origin}:ip-address:comm-val*
  - *{target | origin}:asnum:ext-comm-val*
  - *{target | origin}:ext-asnum:comm-val*
  - **bandwidth**:*asnum:val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext**:*value1:value2*
  - **flowspec-set**:*ext-asnum:group-id*where:
  - *target* — route target
  - *origin* — route origin
  - *ip-address* — a.b.c.d
  - *ext-comm-val* — 0 to 4294967295
  - *ext-asnum* — 0 to 4294967295
  - **bandwidth** — bandwidth
  - *val-in-mbps* — 0 to 16777215
  - **ext** — extended
  - **ext:4300** — origin verification
  - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
  - *value1* — 0000 to FFFF
  - *value2* — 0 to FFFFFFFFFF
  - **flowspec-set** — flow-spec set
  - *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **llgr-stale** | **no-llgr** | **blackhole**

#### **detail**

Displays detailed information.

#### **dynamic**

Displays information for dynamic BGP neighbors.

#### **evpn-type**

Displays information for the specified EVPN route type.

- Values**
- auto-disc** — Displays the auto discovery routes for this peer.
  - mac** — Displays the MAC routes for this peer.

**inclusive-mcast** — Displays the inclusive multicast routes for this peer.

**eth-seg** — Displays the Ethernet segment routes for this peer.

**ip-prefix** — Displays the IPv4 routes for this peer.

**ipv6-prefix** — Displays the IPv6 routes for this peer.

**smet** — Displays the Selective Multicast Ethernet Tag routes for this peer.

**mcast-join-synch** — Displays the Multicast Join Synch routes for this peer.

**mcast-leave-synch** — Displays the Multicast Leave Synch routes for this peer.

### **family**

Specifies the type of routing information to display.

- Values**
- evpn** — Displays the BGP EVPN routes for this peer.
  - flow-ipv4** — Displays the BGP IPv4 flow-spec routes for this peer.
  - flow-ipv6** — Displays the BGP IPv6 flow-spec routes for this peer.
  - ipv4** — Displays the BGP IPv4 routes for this peer.
  - ipv6** — Displays the BGP IPv6 routes for this peer.
  - l2-vpn** — Displays the BGP L2 VPN routes for this peer.
  - label-ipv4** — Displays the BGP IPv4 labeled unicast routes for this peer.
  - label-ipv6** — Displays the BGP IPv6 labeled unicast routes for this peer.
  - mcast-ipv4** — Displays the BGP multicast IPv4 routes for this peer.
  - mcast-ipv6** — Displays the BGP multicast IPv6 routes for this peer.
  - mcast-vpn-ipv4** — Displays the BGP multicast VPN IPv4 routes for this peer.
  - mcast-vpn-ipv6** — Displays the BGP multicast VPN IPv6 routes for this peer.
  - mdt-safi** — Displays the BGP multicast VPN MDT-SAFI routes for this peer.
  - ms-pw** — Displays the BGP Multi-segment PW routes for this peer.
  - mvpn-ipv4** — Displays the BGP NG-MVPN IPv4 routes for this peer.
  - mvpn-ipv6** — Displays the BGP NG-MVPN IPv6 routes for this peer.
  - route-target** — Displays the BGP route-target constrain routes for this peer.
  - vpn-ipv4** — Displays the BGP VPN IPv4 routes for this peer.
  - vpn-ipv6** — Displays the BGP VPN IPv6 routes for this peer.

### ***received-routes***

Displays the number of routes received from this peer.

### ***advertised-routes***

Displays the number of routes advertised to this peer.

### ***damping***

Displays damping information for the specified AS number or neighbor IP address.

- Values**
- history** — Display statistics for dampened routes.
  - suppressed** — Display the number of paths from this peer that have been suppressed by damping.

### ***paths***

Displays ORF path information for the specified neighbor IP address.

- Values**
- send** — Displays the number of paths sent to this peer.
  - receive** — Displays the number of paths received from this peer.

### ***graceful-restart***

Displays neighbors configured for graceful restart.

### ***ip-address***

Displays information for the specified neighbor IP address.

- Values**
- ipv4-address:
    - a.b.c.d (host bits must be 0)
  - ipv6-address:
    - x:x:x:x:x:x [-interface]
    - x:x:x:x:x:d.d.d.d [-interface]
    - x: [0 to FFFF]H
    - d: [0 to 255]D
    - interface: up to 32 characters, mandatory for link local addresses

### ***mvpn-type***

Displays information for the specified MVPN route type.

- Values**
- intra-ad** — Displays the intra-ad routes for this peer.
  - inter-ad** — Displays the inter-ad routes for this peer.
  - spmsi-ad** — Displays the spmsi-ad routes for this peer.
  - leaf-ad** — Displays the leaf-ad routes for this peer.
  - source-ad** — Displays the source-ad routes for this peer.
  - shared-join** — Displays the shared-join routes for this peer.
  - source-join** — Displays the source-join routes for this peer.

**orf**

Displays outbound route filtering for the BGP instance. Outbound Route Filtering (ORF) is used to inform a neighbor of targets (using **target-list**) that it is willing to receive. This mechanism helps lessen the update exchanges between neighbors and saves CPU cycles to process routes that could have been received from the neighbor only to be dropped or ignored.

**epe-statistics**

Displays egress peer engineering (EPE) statistics for the specified IP address.

**Platforms**

All

**Output**

Table 345: Output fields: BGP neighbor describes the standard and detailed command output fields for a BGP neighbor.

The following outputs are examples of BGP neighbor information.

**Output Example**

```
A:node-2>show>router>bgp# neighbor

\* indicates that the corresponding row element may have been truncated.

Neighbors shown : 1

\* indicates that the corresponding row element may have been truncated.

Table 345: Output fields: BGP neighbor

Label	Description
Peer	The IP address of the configured BGP peer.
Group	The BGP peer group to which this peer is assigned.
Peer AS	The configured or inherited peer AS for the peer group.
Peer Address	The configured address for the BGP peer.

Label	Description
Peer Port	The TCP port number used on the far-end system.
Local AS	The configured or inherited local AS for the peer group.
Local Address	The configured or inherited local address for originating peering for the peer group.
Local Port	The TCP port number used on the local system.
Peer Type	External — Peer type configured as external BGP peers. Internal — Peer type configured as internal BGP peers.
Bfd	Yes — BFD is enabled. No — BFD is disabled.
Dynamic Peer	Yes — The session is dynamic (unconfigured). No — The session is statically configured.
State	Idle — The BGP peer is not accepting connections. ( <i>Shutdown</i> ) is displayed in addition, if the peer is administratively disabled. Active — BGP is listening for and accepting TCP connections from this peer. Connect — BGP is attempting to establish a TCP connections from this peer. Open Sent — BGP has sent an OPEN message to the peer and is waiting for an OPEN message from the peer. Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION. Established — BGP has successfully established a peering and is exchanging routing information.
Last State	Idle — The BGP peer is not accepting connections. Active — BGP is listening for and accepting TCP connections from this peer. Connect — BGP is attempting to establish a TCP connections from this peer. Open Sent — BGP has sent an OPEN message to the peer and is waiting for an OPEN message from the peer. Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION.
Last Event	start — BGP has initialized the BGP neighbor. stop — BGP has disabled the BGP neighbor. open — BGP transport connection opened. close — BGP transport connection closed.

Label	Description
	<p>openFail — BGP transport connection failed to open.</p> <p>error — BGP transport connection error.</p> <p>connectRetry — Connect retry timer expired.</p> <p>holdTime — Hold time timer expired.</p> <p>keepAlive — Keepalive timer expired.</p> <p>recvOpen — Receive an OPEN message.</p> <p>revKeepalive — Receive a KEEPALIVE message.</p> <p>recvUpdate — Receive an UPDATE message.</p> <p>recvNotify — Receive a NOTIFICATION message.</p> <p>None — No events have occurred.</p>
Last Error	Displays the last BGP error and subcode to occur on the BGP neighbor.
Connect Retry	The configured or inherited connect retry timer value.
Local Pref.	The configured or inherited local preference value.
Min Route Advt.	The minimum amount of time that must pass between route updates for the same IP prefix.
Min AS Originate	The minimum amount of time that must pass between updates for a route originated by the local router.
Multihop	The maximum number of router hops a BGP connection can traverse.
Damping	<p>Disabled — BGP neighbor is configured not to dampen route flaps.</p> <p>Enabled — BGP neighbor is configured to dampen route flaps.</p>
Loop Detect	<p>Ignore — The BGP neighbor is configured to ignore routes with an AS loop.</p> <p>Drop — The BGP neighbor is configured to drop the BGP peering if an AS loop is detected.</p> <p>Off — AS loop detection is disabled for the neighbor.</p>
MED Out	The configured or inherited MED value assigned to advertised routes without a MED attribute.
Authentication	<p>None — No authentication is configured.</p> <p>MD5 — MD5 authentication is configured.</p>
Next Hop Self	Disabled — BGP is not configured to send only its own IP address as the BGP nexthop in route updates to the specified neighbor.

Label	Description
	Enabled — BGP will send only its own IP address as the BGP nexthop in route updates to the neighbor.
AggregatorID Zero	Disabled — The BGP Neighbor is not configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates. Enabled — The BGP Neighbor is configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates.
Remove Private	Disabled — BGP will not remove all private AS numbers from the AS path attribute, in updates sent to the specified neighbor. Enabled — BGP will remove all private AS numbers from the AS path attribute, in updates sent to the specified neighbor.
Passive	Disabled — BGP will actively attempt to establish a BGP connection with the specified neighbor. Enabled — BGP will not actively attempt to establish a BGP connection with the specified neighbor.
Prefix Limit	No Limit — No route limit assigned to the BGP peer group. 1 to 4294967295 — The maximum number of routes BGP can learn from a peer.
Hold Time	The configured hold time setting.
Keep Alive	The configured keepalive setting.
Active Hold Time	The negotiated hold time, if the BGP neighbor is in an established state.
Active Keep Alive	The negotiated keepalive time, if the BGP neighbor is in an established state.
Cluster Id	The configured route reflector cluster ID. None — No cluster ID has been configured.
Client Reflect	Disabled — The BGP route reflector is configured not to reflect routes to this neighbor. Enabled — The BGP route reflector is configured to reflect routes to this neighbor.
Preference	The configured route preference value for the peer group.
Num of Flaps	The number of route flaps in the neighbor connection.
Recd. Prefixes	The number of routes received from the BGP neighbor.
Active Prefixes	The number of routes received from the BGP neighbor and active in the forwarding table.

Label	Description
Recd. Paths	The number of unique sets of path attributes received from the BGP neighbor.
Suppressed Paths	The number of unique sets of path attributes received from the BGP neighbor and suppressed due to route damping.
Input Queue	The number of BGP messages to be processed.
Output Queue	The number of BGP messages to be transmitted.
i/p Messages	Total number of packets received from the BGP neighbor.
o/p Messages	Total number of packets sent to the BGP neighbor.
i/p Octets	Total number of octets received from the BGP neighbor.
o/p Octets	Total number of octets sent to the BGP neighbor.
Export Policy	The configured export policies for the peer group.
Import Policy	The configured import policies for the peer group.
Egress Engineering	Enabled — EPE is enabled for the BGP neighbor. Disabled — EPE is disabled for the BGP neighbor.

**Table 346: Output fields: standard and detailed BGP neighbor** describes the command output for both the standard and detailed information for a neighbor.

The following output is an example of information about routes received from a specific BGP neighbor.

**Output Example**

```

Table 346: Output fields: standard and detailed BGP neighbor

Label	Description
BGP Router ID	The local BGP router ID.
AS	The configured autonomous system number.
Local AS	The configured local AS setting. If not configured, then it is the same value as the AS.
Flag	u — used s — suppressed h — history d — decayed * — valid i — igp e — egp ? — incomplete > — best
Network	Route IP prefix and mask length for the route.
Next Hop	BGP nexthop for the route.
LocalPref	BGP local preference path attribute for the route.
MED	BGP Multi-Exit Discriminator (MED) path attribute for the route.
AS Path	The BGP AS path for the route.
Egress Engineering	Enabled — EPE is enabled for the BGP neighbor. Disabled — EPE is disabled for the BGP neighbor.

## neighbor

### Syntax

**neighbor** [*ip-address* | *ip-int-name*] [**detail**] [**advertised-routes**]

### Context

[\[Tree\]](#) (show>router>rip neighbor)

### Full Context

show router rip neighbor

### Description

Displays RIP neighbor interface information.

### Parameters

#### *ip-address* | *ip-int-name*

Displays information for the specified IP interface.

**Values** ip-address: a.b.c.d  
ip-int-name: 32 chars max

**Default** all neighbor interfaces

#### **advertised-routes**

Displays the routes advertised to RIP neighbors. If no neighbors are specified, then all routes advertised to all neighbors are displayed. If a specific neighbor is given then only routes advertised to the given neighbor/interface are displayed.

**Default** displays RIP information

### Platforms

All

### Output

The following output is an example of standard RIP group information, and [Table 347: Output fields: RIP neighbor](#) describes the output fields.

#### Output Example

```
*A:ALA-12# show router 3 rip neighbor
=====
RIP Neighbors
=====

=====
*A:ALA-12#
    
```

Table 347: Output fields: RIP neighbor

Label	Description
Neighbor	The RIP neighbor interface name.
Adm	Down — The RIP neighbor interface is administratively down. Up — The RIP neighbor interface is administratively up.
Opr	Down — The RIP neighbor interface is operationally down. Up — The RIP neighbor interface is operationally up.
Primary IP	The primary IP address of the RIP neighbor interface.
Send Mode	Bcast — Specifies that RIPv2 formatted messages are sent to the broadcast address Mcast — Specifies that RIPv2 formatted messages are sent to the multicast address None — Specifies that no RIP messages are sent (i.e., silent listener). RIPv1 — Specifies that RIPv1 formatted messages are sent to the broadcast address.
Recv Mode	Both — Specifies that RIP updates in either version 1 or version 2 format will be accepted. None — Specifies that RIP updates will not be accepted. RIPv1 — Specifies that RIP updates in version 1 format only will be accepted. RIPv2 — Specifies that RIP updates in version 2 format only will be accepted.
Metric In	The metric added to routes received from a RIP neighbor.

### Detailed Show RIP Neighbor Output

The following output is an example of detailed RIP group information, and [Table 348: Output fields: RIP neighbor detail](#) describes the output fields.

Table 348: Output fields: RIP neighbor detail

Label	Description
Neighbor	The RIP neighbor name.
Description	The RIP neighbor description. No Description Available indicates no description is configured.
Primary IP	The RIP neighbor interface primary IP address.
Group	The RIP group name of the neighbor interface.
Admin State	Down — The RIP neighbor interface is administratively down. Up — The RIP neighbor interface is administratively up.
Oper State	Down — The RIP neighbor interface is operationally down. Up — The RIP neighbor interface is operationally up.
Send Mode	Bcast — Specifies that RIPv2 formatted messages are sent to the broadcast address. Mcast — Specifies that RIPv2 formatted messages are sent to the multicast address. None — Specifies that no RIP messages are sent (i.e., silent listener).

Label	Description
	RIPv1 — Specifies that RIPv1 formatted messages are sent to the broadcast address.
Recv Mode	Both — Specifies that RIP updates in either version 1 or version 2 format will be accepted. None — Specifies that RIP updates will not be accepted. RIPv1 — Specifies that RIP updates in version 1 format only will be accepted. RIPv2 — Specifies that RIP updates in version 2 format only will be accepted.
Metric In	The metric value added to routes received from a RIP neighbor.
Metric Out	The value added to routes exported into RIP and advertised to RIP neighbors.
Split Horizon	Disabled — Split horizon disabled for the neighbor. Enabled — Split horizon and poison reverse enabled for the neighbor.
Check Zero	Disabled — Checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications are not checked allowing receipt of RIP messages even if mandatory zero fields are non-zero for the neighbor. Enabled — Checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting noncompliant RIP messages is enabled for the neighbor.
Message Size	The maximum number of routes per RIP update message.
Preference	The preference of RIP routes from the neighbor.
Auth. Type	Specifies the authentication type.
Update Timer	The current setting of the RIP update timer value expressed in seconds.
Timeout Timer	The current RIP timeout timer value expressed in seconds.
Export Policies	The export route policy that is used to determine routes advertised to all peers.
Import Policies	The import route policy that is used to determine which routes are accepted from RIP neighbors.

### Output Example

```
*A:ALA-12# show router 3 rip neighbors interface advertised-routes

## neighbor

### Syntax

**neighbor** {*ip-address* | **as** *as-number* | **external** | **all**} [**soft** | **soft-inbound** | **hard**]

**neighbor** {*ip-address* | **as** *as-number* | **external** | **all**} **soft-route-refresh** [*family*]

**neighbor** {*ip-address* | **as** *as-number* | **external** | **all**} **statistics**

**neighbor** *ip-address* **end-of-rib**

### Context

[\[Tree\]](#) (clear>router>bgp neighbor)

### Full Context

clear router bgp neighbor

### Description

This command resets the specified BGP peer or set of peers. By default, or when the hard option is specified, the TCP connection is brought down and the state of the BGP session returns to IDLE.

If the **soft-route-refresh** option is specified without an accompanying *family* parameter, then the session remains established and one ROUTE\_REFRESH message is transmitted to the peer for each address family active on the session. If the **soft-route-refresh** option is specified with an accompanying *family* parameter, the session remains established and a single ROUTE\_REFRESH message is transmitted to the peer requesting that it resend only its routes belonging to that one address family.

SR OS routers respond to route refresh requests for any supported AFI/SAFI.

### Parameters

#### *ip-address*

Resets the BGP neighbor with the specified IP address.

**Values** ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x [-interface]
- x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters, mandatory for link local addresses

**as *as-number***

Resets all BGP neighbors with the specified peer AS.

**Values** 1 to 65535

**external**

Resets all EBGP neighbors.

**all**

Resets all BGP neighbors.

**soft**

Specifies that BGP neighbors re-evaluate all routes in the Local-RIB against the configured export policies.

**soft-inbound**

Specifies that BGP neighbors re-evaluate all routes in the RIB-In against the configured import policies.

**hard**

Initiates a hard reconfiguration.

**statistics**

Clears BGP neighbor statistics.

**end-of-rib**

Clears the routing information base (RIB). This command applies when the router is helping the BGP neighbor through a BGP graceful restart. When the **clear router bgp neighbor** command is issued without the end-of-rib option and the neighbor is in the process of restarting, stale routes from the neighbor will be retained until the stale-routes-time is reached or else the neighbor exits graceful restart. When the command is issued with the **end-of-rib** option, stale routes from the neighbor are deleted immediately and graceful restart procedures are aborted.

**soft-route-refresh**

Clears the session by sending one or more ROUTE\_REFRESH messages to the peer, but the session stays up.

**family**

Specifies the one address family that should be encoded in the ROUTE\_REFRESH request sent to the peer.

**Values** ipv4, vpn-ipv4, ipv6, mcast-ipv4, vpn-ipv6, l2-vpn, mvpn-ipv4, mdt-safi, flow-ipv4, ms-pw, route-target, mcast-vpn-ipv4, mvpn-ipv6, flow-ipv6, evpn, mcast-ipv6, label-ipv4, label-ipv6, mcast-vpn-ipv6, bgp-ls, sr-policy-ipv4, sr-policy-ipv6, flow-vpn-ipv4, flow-vpn-ipv6

## neighbor

### Syntax

**neighbor** [*ip-address* | *ip-int-name* [**address** *neighbor-ip-address*]] [**detail**] [*family*]

### Context

[\[Tree\]](#) (show>router>pim neighbor)

### Full Context

show router pim neighbor

### Description

This command displays PIM neighbor information. This can be important if an interface has more than one adjacency. For example, a LAN-interface configuration with three routers connected and all are running PIM on their LAN interfaces. These routers then have two adjacencies on their LAN interface, each with different neighbors. If the **address** *ip-address* parameter is not defined in this example, then the **show** command output would display two adjacencies.

### Parameters

#### ***ip-int-name***

Displays interface information associated with the specified IP interface name.

#### ***ip-address***

Displays interface information associated with the specified IP address.

#### ***neighbor-ip-address***

Displays information about the IP address of the neighbor, on the other side of the interface.

**detail**

Displays detailed neighbor information.

**family**

Displays family information for the specified neighbor.

**Values** ipv4, ipv6

**Platforms**

All

**Output**

The following output is an example of a PIM neighbor configuration. [Table 349: Output fields: PIM neighbor](#) provides PIM neighbor field descriptions.

**Output Example**

```
ALA-1# show router pim neighbor

Table 349: Output fields: PIM neighbor

Label	Description
Interface	The neighbor's interface name. (W) indicates wildcard tunnels.
Nbr DR Priority	The value of the neighbor's DR priority which is received in the hello message.
Nbr Address	The neighbor's address.
Up Time	The time since this PIM neighbor (last) became a neighbor of the local router
Expiry Time	The minimum time remaining before this PIM neighbor is aged out  0 — Means that this neighbor never ages out. This happens when the PIM neighbor sends a Hello message with holdtime set to `0xffff`.
Hold Time	The value of the hold time present in the hello message
DR Priority	The value of the neighbor's DR priority which is received in the hello message
Tracking Support	Indicates if the T bit in the LAN prune delay option was present in the hello message. This indicates the neighbor's capability to disable join message suppression.
LAN Delay	The value of the LAN delay field present in the hello message received from the neighbor

Label	Description
Gen Id	A randomly generated 32-bit value that is regenerated each time PIM forwarding is started or restarted on the interface, including when the router itself restarts. When a hello message with a new GenID is received from a neighbor, any old hello information about that neighbor is discarded and superseded by the information from the new hello message.
Override Intvl (ms)	The value of the override interval present in the Hello message

## neighbor

### Syntax

```
neighbor [ip-int-name | ip-address | mpls-if-name] [family]
```

### Context

```
[Tree] (clear>router>pim neighbor)
```

### Full Context

```
clear router pim neighbor
```

### Description

This command clears PIM neighbor data on a specified interface or IP address.

### Parameters

#### *ip-int-name*

Clears PIM neighbor on the specified interface.

#### *ip-address*

Clears PIM neighbor on the specified IP address.

#### *mpls-if-name*

Clears information associated with the specified MPLS interface.

**Values** mpls-if-index

#### *family*

Clears neighbor family information.

**Values** ipv4, ipv6

### Platforms

All

## neighbor

### Syntax

**neighbor** [*ip-int-name* | *ip-address*] [**detail**]

**neighbor** [*ip-int-name*] [*router-id*] [**detail**]

**neighbor overview**

**neighbor** [**remote** *ip-address*] [**detail**]

### Context

[\[Tree\]](#) (show>router>ospf neighbor)

[\[Tree\]](#) (show>router>ospf3 neighbor)

### Full Context

show router ospf neighbor

show router ospf3 neighbor

### Description

This command displays neighbor information. To reduce the amount of output, the user can select the neighbors on a given interface by address or name.

The **detail** option produces a large amount of data. It is recommended to use **detail** only when requesting a specific neighbor.

### Parameters

#### *ip-int-name*

Displays neighbor information only for neighbors of the interface identified by the interface name.

#### *ip-address*

Displays neighbor information only for neighbors of the interface identified by the IP address.

#### *router-id*

Displays neighbor information for the neighbor identified by the specified router ID in the **show> router>ospf3** context.

#### **remote**

Displays neighbor information for the neighbor identified by the specified remote IP address in the **show>router>ospf** context.

### Platforms

All

### Output

Standard OSPF Neighbor Output

**Table 351: Output fields: OSPF neighbor** describes the standard command output fields for an OSPF neighbor.

*Table 351: Output fields: OSPF neighbor*

Label	Description
Nbr IP Addr	The IP address this neighbor is using in its IP Source Address. On addressless links, this will not be 0.0.0.0, but the address of another of the neighbor's interfaces.
Nbr Rtr Id	A 32-bit integer uniquely identifying the neighboring router in the Autonomous System.
Nbr State	<p>Down — This is the initial state of a neighbor conversation. It indicates that there has been no recent information received from the neighbor.</p> <p>Attempt — This state is only valid for neighbors attached to NBMA networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort should be made to contact the neighbor.</p> <p>Init — In this state, a Hello packet has recently been seen from the neighbor. However, bidirectional communication has not yet been established with the neighbor (the router itself did not appear in the neighbor's Hello packet).</p> <p>Two Way — In this state, communication between the two routers is bidirectional.</p> <p>ExchStart — This is the first step in creating an adjacency between the two neighboring routers. The goal of this step is to decide which router is the master, and to decide upon the initial Database Descriptor sequence number.</p> <p>Exchange — In this state the router is describing its entire link state database by sending Database Description packets to the neighbor.</p> <p>Loading — In this state, Link State Request packets are sent to the neighbor asking for the more recent LSAs that have been discovered (but not yet received) in the Exchange state.</p> <p>Full — In this state, the neighboring routers are fully adjacent. These adjacencies will now appear in router-LSAs and network-LSAs.</p>
Priority	The priority of this neighbor in the designated router election algorithm. The value 0 signifies that the neighbor is not eligible to become the designated router on this particular network.
RetxQ Len	The current length of the retransmission queue.

Label	Description
Dead Time	The time until this neighbor is declared down, this timer is set to the dead router interval when a valid hello packet is received from the neighbor.
No. of Neighbors	The number of adjacent OSPF neighbors on this interface.

**Output Example**

```
A:ALA-A# show router ospf 1 neighbor

Detailed OSPF Neighbor Output

[Table 352: Output fields: OSPF neighbor detail](#) describes the detailed command output fields for an OSPF neighbor.

*Table 352: Output fields: OSPF neighbor detail*

Label	Description
Neighbor IP Addr	The IP address this neighbor is using in its IP source address. On addressless links, this will not be 0.0.0.0, but the address of another of the neighbor's interfaces.
Local IF IP Addr	The IP address of this OSPF interface.
Area Id	A 32-bit integer uniquely identifying the area to which this interface is connected. Area ID 0.0.0.0 is used for the OSPF backbone
Designated Rtr	The IP Interface address of the router identified as the Designated Router for the network in which this interface is configured. Set to 0.0.0.0 if there is no Designated router.
Neighbor Rtr Id	A 32-bit integer uniquely identifying the neighboring router in the AS.
Neighbor State	Down — This is the initial state of a neighbor conversation. It indicates that there has been no recent information received from the neighbor.  Attempt — This state is only valid for neighbors attached to NBMA networks. It indicates that no recent information has been

Label	Description
	<p>received from the neighbor, but that a more concerted effort should be made to contact the neighbor.</p> <p>Init — In this state, a Hello packet has recently been seen from the neighbor. However, bidirectional communication has not yet been established with the neighbor (the router itself did not appear in the neighbor's Hello packet).</p> <p>Two Way — In this state, communication between the two routers is bidirectional.</p> <p>Exchange start — This is the first step in creating an adjacency between the two neighboring routers. The goal of this step is to decide which router is the master, and to decide upon the initial Database Descriptor sequence number.</p> <p>Exchange — In this state the router is describing its entire link state database by sending Database Description packets to the neighbor.</p> <p>Loading — In this state, Link State Request packets are sent to the neighbor asking for the more recent LSAs that have been discovered (but not yet received) in the Exchange state.</p> <p>Full — In this state, the neighboring routers are fully adjacent. These adjacencies will now appear in router-LSAs and network-LSAs.</p>
Priority	The priority of this neighbor in the designated router election algorithm. The value 0 signifies that the neighbor is not eligible to become the designated router on this particular network.
Retrans Q Length	The current length of the retransmission queue.
Options	<p>E — External Routes Support</p> <p>MC — Multicast Support</p> <p>N/P — Type 7 LSA Support</p> <p>EA — External Attribute LSA Support</p> <p>DC — Demand Circuit Support</p> <p>O — Opaque LSA Support</p>
Backup Desig Rtr	The IP Interface address of the router identified as the Backup Designated Router for the network in which this interface is configured. Set to 0.0.0.0 if there is no backup designated router.
Events	The number of times this neighbor relationship has changed state, or an error has occurred.
Last Event Time	The time when the last event occurred that affected the adjacency to the neighbor.

Label	Description
Up Time	This value represents the uninterrupted time, in hundredths of seconds, the adjacency to this neighbor has been up. To evaluate when the last state change occurred see last event time.
Time Before Dead	The time until this neighbor is declared down, this timer is set to the dead router interval when a valid hello packet is received from the neighbor.
Bad Nbr States	The total number of OSPF packets received when the neighbor state was not expecting to receive this packet type since this interface was last enabled.
LSA Inst fails	The total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since this interface was last enabled.
Bad Seq Nums	The total number of times when a database description packet was received with a sequence number mismatch since this interface was last enabled.
Bad MTUs	The total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since this interface was last enabled.
Bad Packets	The total number of times when an LS update was received with an illegal LS type or an option mismatch since this interface was last enabled.
LSA not in LSDB	The total number of times when an LS request was received for an LSA not installed in the LSDB of this router since this interface was last enabled.
Option Mismatches	The total number of times when a LS update was received with an option mismatch since this interface was last enabled.
Nbr Duplicates	The total number of times when a duplicate database description packet was received during the exchange state since this interface was last enabled.

### Output Example

## neighbor

### Syntax

**neighbor** [*ip-int-name* | *ip-address*]

**neighbor** [*ip-int-name*] [*router-id*]

### Context

**[Tree]** (clear>router>ospf neighbor)

**[Tree]** (clear>router>ospf3 neighbor)

### Full Context

clear router ospf neighbor

clear router ospf3 neighbor

### Description

This command marks the neighbor as dead and re-initiates the affected adjacencies.

### Parameters

#### *ip-int-name*

Clears all neighbors for the interface specified by this interface name.

#### *ip-address*

Clears all neighbors for the interface specified by this IP address.

#### *router-id*

Clears all neighbors for the interface specified by this router ID.

### Platforms

All

## neighbor

### Syntax

**neighbor** [*ip-int-name* | *ipv6-address*] [**detail**]

**neighbor** [**detail**] **advertised-routes** [*ip-int-name* | *ipv6-link-local-address*]

### Context

**[Tree]** (show>router>ripng neighbor)

### Full Context

show router ripng neighbor

## Description

This command displays RIPng neighbor interface information. If no IPv6 interface or address is specified, this command displays information for all neighbor interfaces.

## Parameters

### *ip-int-name* | *ipv6-address*

Displays information for the specified IPv6 interface and address.

### *advertised-routes*

Displays the routes advertised to RIPng neighbors. If no neighbors are specified, all routes advertised to all neighbors are displayed. If a neighbor is specified, only routes advertised to that neighbor/interface are displayed.

### *ipv6-link-local-address*

Displays information about the of the IPv6 link local address for the neighbor.

### *detail*

Displays detailed information.

## Platforms

All

## Output

The following output is an example of RIPng neighbor information.

### Output Example

```
*A:Dut-C>config>router>if# show router ripng neighbor "one"

## neighbor

### Syntax

**neighbor** *ip-addr* [*ip-addr*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

### Context

[\[Tree\]](#) (monitor>router>bgp neighbor)

### Full Context

monitor router bgp neighbor

### Description

This command displays statistical BGP neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

### Parameters

#### *ip-addr*

Displays damping information for entries received from the BGP neighbor. Up to five IP addresses can be specified.

**Values** *a.b.c.d*

#### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

#### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

**absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Displays rate-per-second for each statistic instead of the delta.

**Platforms**

All

**Output**

The following output is an example of BGP neighbor information.

**Output Example**

```
A:ALA-12>monitor>router>bgp# neighbor 192.0.2.10 interval 3 repeat 3 absolute
=====
Monitor statistics for BGP Neighbor 192.0.2.10

## neighbor

### Syntax

**neighbor** *ip-address* [*ip-address*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

### Context

[\[Tree\]](#) (monitor>router>ospf neighbor)

### Full Context

monitor router ospf neighbor

### Description

This command displays statistical OSPF neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified OSPF neighbors. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

### Parameters

#### *ip-address*

Specifies the IP address to display information for entries received from the specified OSPF neighbor. Up to five IP addresses can be specified.

**Values** a.b.c.d

#### *seconds*

Configures the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

#### *repeat*

Configures the number of times the command is repeated.

**Values** 1 to 999

**Default** 10

#### **absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Displays rate-per-second for each statistic instead of the delta.

**Platforms**

All

**Output**

The following output is an example of OSPF neighbor information.

**Output Example**

## neighbor

### Syntax

**neighbor** *router-id interface-name* [**interval seconds**] [**repeat repeat**] [**absolute | rate**] **area area-id**

### Context

[\[Tree\]](#) (monitor>router>ospf3 neighbor)

### Full Context

monitor router ospf3 neighbor

### Description

This command displays statistical OSPF3 neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified OSPF3 neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

### Parameters

#### **router-id**

Specifies the IP address.

**Values** a.b.c.d

#### **interface-name**

Specifies the interface name, up to 32 characters.

### **seconds**

Configures the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

### **repeat**

Configures the number of times the command is repeated.

**Values** 1 to 999

**Default** 10

### **absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### **rate**

Displays rate-per-second for each statistic instead of the delta.

### **area-id**

Specifies the OSPF area, up to 256 characters.

## **Platforms**

All

## **neighbor**

## **Syntax**

**neighbor** *neighbor* [*neighbor*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

## **Context**

**[Tree]** (monitor>router>rip neighbor)

**[Tree]** (monitor>router>ripng neighbor)

## **Full Context**

monitor router rip neighbor

monitor router ripng neighbor

## **Description**

This command displays statistical RIP neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified RIP neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *neighbor*

Specifies the IP interface name or the IP address of the neighbor to be monitored. Up to five can be specified in a single statement.

**Values** *ip-int-name, ip-address*

### *seconds*

Configures the interval for each display, in seconds.

**Values** 3 to 60

**Default** 10

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Displays rate-per-second for each statistic instead of the delta.

## Platforms

## neighbor

## Syntax

**neighbor** *ieee-address*

## Context

**[Tree]** (clear>system>ptp>port neighbor)

## Full Context

clear system ptp port neighbor

## Description

This command clears PTP port neighbor information.

## Parameters

### *ieee-address*

Specifies the MAC address.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xxx: [0 to FFFF]H

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 19.7 neighbor-table

### neighbor-table

## Syntax

**neighbor-table** [**ip6** *ipv6-address*] [**class** *class*] [**next-index** *index*]

## Context

[\[Tree\]](#) (tools>dump>wlan-gw>lanext>bd neighbor-table)

## Full Context

tools dump wlan-gw lanext bd neighbor-table

## Description

This command dumps neighbor table entries for the specified HLE BD.

## Parameters

### *ipv6-address*

Specifies the IPv6 address of the neighbor entry to be displayed.

### *class*

Specifies the source on which to filter the neighbor table entries.

**Values** access, network, remote

### *index*

Specify the **next-index** *index* parameter to display the next set of results If there are more results than the current output. The additional results are indicated at the bottom of the current output.

**Values** 0 to 4294967295

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 19.8 neighbors

### neighbors

#### Syntax

```
neighbors group [name] [ip-address]
```

#### Context

[\[Tree\]](#) (show>service>id>gsmp neighbors)

#### Full Context

```
show service id gsmp neighbors
```

#### Description

This command display GSMP neighbor information.

#### Parameters

##### group

A GSMP group defines a set of GSMP neighbors which have the same properties.

##### name

Specifies a GSMP group name is unique only within the scope of the service in which it is defined.

##### ip-address

Specifies the ip-address of the neighbor.

#### Platforms

All

#### Output

The following output is an example of service GSMP neighbor information.

##### Output Example

These commands show the configured neighbors per service, regardless that there exists an open TCP connection with this neighbor. The admin state is shown because for a neighbor to be admin enabled, the service, gsmp node, group node and the neighbor node in this service must all be in the **no shutdown** state. Session gives the number of session (open TCP connections) for each configured neighbor.

```

```

The following table describes show service-id gsmp neighbors group output fields:

Table 353: Output fields: GSMP neighbors group

Label	Description
Group	The GSMP group name
Neighbor	The neighbor IP address
AdminState	The administrative state of the neighbor
Sessions	The number of sessions (open TCP connections) for each configured neighbor

## 19.9 netconf

### netconf

#### Syntax

**netconf**

**netconf connection**

**netconf counters**

**netconf schema-path**

**Context**

[\[Tree\]](#) (show>system netconf)

**Full Context**

show system netconf

**Description**

This command displays NETCONF information.

**Parameters**

**connection**

Keyword to display active NETCONF sessions.

**counters**

Keyword to display NETCONF counters.

**schema-path**

Keyword to display the operational schema-path state leaf, which indicates the current path of the SR OS schema files.

**Platforms**

All

**Output**

The following output is an example of NETCONF information, and [Table 354: Output fields: NETCONF](#) describes the NETCONF output fields.

**Output Example**

```
# show system netconf
=====
NETCONF Server
=====
Administrative State      : Enabled
Operational State       : Up
=====
```

*Table 354: Output fields: NETCONF*

Label	Description
Administrative State	Enabled — Indicates that NETCONF is enabled. Disabled — Indicates that NETCONF is disabled.
Operational State	Up — Indicates that NETCONF is operational.

Label	Description
	Down — Indicates that NETCONF has no connections present.
	Transition — Indicates that NETCONF is waiting for the <b>delay-on-boot</b> timer to expire.

The following output is an example of NETCONF connection information, and [Table 355: Output fields: NETCONF connection](#) describes the NETCONF connection output fields.

### Output Example

```
# show system netconf connection
=====
NETCONF Server connections
=====
Connection      Username      Session Status      Running      Candidate
Id              Id            Id                   Locked?      Locked?
-----
135.121.197.102  admin        56      connected    no          no
-----
Number of NETCONF sessions : 1
=====
```

Table 355: Output fields: NETCONF connection

Label	Description
Connection	The IP address of the connected routers (remote client).
Username	The name of the user.
Session ID	The NETCONF session ID.
Status	Connected or not connected.
Running Locked?	Yes — Indicates the <running> datastore is locked. No — Indicates the <running> datastore is not locked.
Candidate Locked?	Yes — Indicates the <candidate> datastore is locked. No — Indicates the <candidate> datastore is not locked.
Number of NETCONF sessions	Total NETCONF sessions

The following output is an example of NETCONF counter information, and [Table 356: Output fields: NETCONF counters](#) describes the NETCONF counter output fields.

### Output Example

```
# show system netconf counters
=====
NETCONF counters:
=====
Rx Messages

RX Total	Total of all received messages
TX Messages	Types and numbers of sent messages
TX Total	Total of all sent messages
failed edit-configs	Number of failed <edit-config> requests due to a lock (including implicit ones) being taken by other netconf sessions
failed locks	Number of failed <lock> requests due to a lock (including implicit ones) being taken by other netconf sessions

The following output is an example of NETCONF schema path information, and [Table 357: Output fields: NETCONF schema path](#) describes the NETCONF schema path output fields.

**Output Example**

```

A:node-2# show system netconf schema-path
=====
NETCONF Schema Path
=====
Operational : cf3:\timos\yang.tim
=====
    
```

Table 357: Output fields: NETCONF schema path

Label	Description
Operational	Operational schema-path state leaf, indicating the current path of the SR OS schema files. This value is updated at boot time or at configuration time.

## 19.10 network

### network

#### Syntax

**network** [*policy-id*] [**detail**] [**match-criteria**]

#### Context

[\[Tree\]](#) (show>qos network)

#### Full Context

show qos network

#### Description

This command displays network policy information.

#### Parameters

##### *policy-id*

Displays information for the specific policy ID.

**Values** 1 to 65535

**Default** all network policies

##### **detail**

Includes information about ingress and egress DSCP and LSP EXP bit mappings and network policy interface associations.

##### **match-criteria**

Includes the match-criteria.

#### Platforms

All

## Output

Table 358: Output fields: QoS network

Label	Description
Policy-Id	The ID that uniquely identifies the policy.
Remark	True — Remarking is enabled for all packets that egress this router where the network policy is applied. The remarking is based on the forwarding class to DSCP and LSP EXP bit mapping defined under the egress node of the network QoS policy.  False — Remarking is disabled.
Description	A text string that helps identify the policy context in the configuration file.
Forwarding Class/ FC Name	Specifies the default ingress forwarding class (configured using the <b>network ingress default-action</b> command) assigned to packets for which there is no other configured forwarding class classification.
Profile	Specifies the default ingress packet profile (configured using the <b>network ingress default-action</b> command) assigned to packets for which there is no other configured packet profile classification.
DSCP Mapping:	
Out-of-Profile	Displays the DSCP used for out-of-profile traffic.
In-Profile	Displays the DSCP used for in-profile traffic.
LSP EXP Bit Mapping:	
Out-of-Profile	Displays the LSP EXP value used for out-of-profile traffic.

Label	Description
In-Profile	Displays the LSP EXP value used for in-profile traffic.
Interface	Displays the interface name.
IP Addr	Displays the interface IP address.
Port-Id	Specifies the physical port identifier that associates the interface.

## 19.11 network-domains

### network-domains

#### Syntax

**network-domains** [**detail**] [*network-domain-name*]

**network-domains** *network-domain-name* **interface-association**

**network-domains** [*network-domain-name*] **mcast-association** [ **state** {**consistent** | **inconsistent**}]

**network-domains** *network-domain-name* **sdp-association**

#### Context

[\[Tree\]](#) (show>router network-domains)

#### Full Context

show router network-domains

#### Description

This command displays network-domains information.

#### Parameters

##### **detail**

Displays detailed network-domains information.

##### **network-domain-name**

Displays information for a specific network domain.

##### **interface-association**

Displays information for an interface network domain association.

##### **mcast-association**

Displays information for a multicast network domain association.

##### **state**

Displays information for the state of a network domain.

**Values** consistent, inconsistent

**sdp-association**

Displays information for an SDP network domain association

**Platforms**

All

**Output**

The following output is an example of network domain information.

**Output Example**

```
*A:Dut-T>config>router# show router network-domains
=====
Network Domain Table
=====
Network Domain          Description

## 19.12 network-queue

### network-queue

#### Syntax

**network-queue** [*network-queue-policy-name*] [ **detail**]

#### Context

[\[Tree\]](#) (show>qos network-queue)

#### Full Context

show qos network-queue

#### Description

This command displays network queue policy information.

#### Parameters

##### ***network-queue-policy-name***

The name of the network queue policy.

**Values** Valid names consist of any string, up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

##### **detail**

Includes each queue's rates and adaptation-rule and cbs details. It also shows FC-to-queue mapping details.

#### Platforms

All

## Output

The following output is an example of network-queue information.

### Output Example

```
*A:PE# show qos network-queue
=====

## 19.13 next-hop

### next-hop

#### Syntax

**next-hop** [*family* [**service-id** *service-id*]] [*ip-address*[**detail**]]

#### Context

[\[Tree\]](#) (show>router>bgp next-hop)

#### Full Context

show router bgp next-hop

#### Description

This command displays BGP next-hop information.

#### Parameters

##### *family*

Specifies the type of routing information to be distributed by the BGP instance.

**Values**    ipv4, mcast-ipv4, ipv6, mcast-ipv6, label-ipv4, label-ipv6, vpn-ipv4, vpn-  
              ipv6, evpn, mcast-vpn-ipv4, mcast-vpn-ipv6

##### *ip-address*

Displays the next hop information for the specified IP address.

**Values**

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x[-interface] x:x:x:x:x:d.d.d.d[-interface]
	x - [0 to FFFF]H

d - [0 to 255]D

interface - 32 characters maximum,  
 mandatory for link local addresses

**detail**

Keyword to display the longer, more detailed version of the output.

**service-id** *service-id*

Specifies the service ID.

**Values** 1 to 2147483647

**Platforms**

All

**Output**

The following outputs are examples of BGP next-hop information:

- [Output example, Table 359: Output fields: BGP nexthop](#)
- [Output example, Table 360: Output fields: BGP detailed next hop](#)
- [Output example, Table 361: Output fields: BGP next hop](#)
- [Output example, Table 361: Output fields: BGP next hop](#)
- [Output example, Table 361: Output fields: BGP next hop](#)
- [Output example, Table 361: Output fields: BGP next hop](#)

The following output is an example of BGP next-hop information that displays the next-hop resolution enforcement of the administrative-tag policy, and [Table 359: Output fields: BGP nexthop](#) describes the output fields.

**Output example**

```
A:node-2# show router bgp next-hop vpn-ipv4
=====
BGP Router ID:10.20.1.3      AS:100      Local AS:100
=====
BGP VPN Next Hop
=====
VPN Next Hop      Owner
Autobind          FibProg Reason
Labels (User-labels) FlexAlgo Metric
Admin-tag-policy (enforcement) Last Mod.
-----
10.20.1.1      RSVP
  rsvp sr-te          Y
  -- (2)             -- 10
  rtAdmTagPoll (strict-tagged strict-untagged) 01h55m49s
-----
Next Hops : 4
=====
```

Table 359: Output fields: BGP nexthop

Label	Description
BGP Router ID	The local BGP router ID
AS	The configured autonomous system number
Local AS	The configured local AS setting. If not configured, the value is the same as the AS
VPN Next Hop	The next-hop address
Owner	The routing protocol used to derive the best next hop
Autobind	The autobind status for VPRN autobind
FibProg	The status of the FIB: <ul style="list-style-type: none"> <li>• y – FIB is programmed</li> <li>• n – FIB is not programmed</li> </ul>
Reason	The reason
Labels (User-labels)	The labels and user labels
FlexAlgo	The status of flexible algorithms: <ul style="list-style-type: none"> <li>• y – flexible algorithms are configured</li> <li>• n – flexible algorithms are not configured</li> </ul>
Admin-tag-policy (enforcement)	The administrative tag policy and the next-hop resolution enforcement of the administrative tag policy
Metric	The number of routes using the resolving prefix
Last Mod.	The time elapsed since the next hop was modified
Next Hops	The number of next hops

The following output is a detailed example of BGP next-hop information that displays the next-hop resolution enforcement of the administrative-tag policy, and [Table 360: Output fields: BGP detailed next hop](#) describes the output fields.

**Output example**

```
A:node-2# show router bgp next-hop vpn-ipv4 10.20.1.2 detail
=====
BGP Router ID:10.20.1.3      AS:100      Local AS:100

Table 360: Output fields: BGP detailed next hop

Label	Description
BGP Router ID	The local BGP router ID
AS	The configured autonomous system number
Local AS	The configured local AS setting. If not configured, the value is the same as the AS.
VPN Next Hop	The next-hop address
Autobind	The autobind service configured
Labels	The labels
User-labels	The user labels
Admin-tag-policy	The name of the administrative policy configured
Enforcement	The configured enforcement
Color	The configured color
Created	The time elapsed since the next hop was created
Last-modified	The time elapsed since the next hop was modified
Resolving prefix	The prefix of the best next hop
Preference	The BGP preference attribute for the routes
Metric	The IGP cost to reach the BGP next hop
Reference Count	The number of routes using the resolving prefix
Owner	The routing protocol used to derive the best next hop

Label	Description
Fib Programmed	The status of the FIB: <ul style="list-style-type: none"> <li>y – FIB is programmed</li> <li>n – FIB is not programmed</li> </ul>
Resolved Next Hop	The resolved next hop
Egress Label	The egress label
TunnelId	The tunnel ID
Next Hops	The number of next hops

The following output is an example of BGP next-hop information, and [Table 361: Output fields: BGP next hop](#) describes the command output fields for a BGP next hop.

```

Table 361: Output fields: BGP next hop

Label	Description
BGP ID	The local BGP router ID

Label	Description
AS	The configured autonomous system number
Local AS	The configured local AS setting. If not configured, then the value is the same as the AS
Next Hop	The next-hop address
Resolving Prefix	The prefix of the best next hop
Owner	The routing protocol used to derive the best next hop
Preference	The BGP preference attribute for the routes
Reference Count	The number of routes using the resolving prefix
Resolved Next Hop	The IP address of the next hop
Last Modified	The time elapsed since the next hop was modified
Created (only visible in detailed output)	The time elapsed since the next hop was created
Bfd-strict-mode	Y — The next hop becomes unresolved when a Strict-Mode BFD session goes down.
Reason (if the next hop is unresolvable because the BFD session is down)	BfdStrictDown — The next hop is unresolvable until a Strict-Mode BFD session to a peer with the same address comes back up after going down.

## 19.14 node

node

### Syntax

node

### Context

[\[Tree\]](#) (show>router>bgp>routes>bgp-ls node)

### Full Context

show router bgp routes bgp-ls node

### Description

This command displays BGP-LS NLRIs for node types.

## Platforms

All

## 19.15 nsp-proxy

nsp-proxy

### Syntax

nsp-proxy

### Context

[\[Tree\]](#) (tools>perform>system nsp-proxy)

### Full Context

tools perform system nsp-proxy

### Description

Commands in this context perform NSP proxy functions.

### Platforms

VSR-NRC

nsp-proxy

### Syntax

nsp-proxy [detail] module {bmp | pce | rom | topo} db {active | standby}

nsp-proxy [detail]

nsp-proxy [detail] module {bmp | pce | rom | topo}

### Context

[\[Tree\]](#) (tools>dump>system nsp-proxy)

### Full Context

tools dump system nsp-proxy

### Description

This command displays system NSP proxy information.

## Parameters

### detail

Keyword to display detailed information

### module

Keyword to specify the module.

**Values** **bmp** — Displays information about the BMP module.  
**pce** — Displays information about the PCE module.  
**rom** — Displays information about the ROM module.  
**topo** — Displays information about the topology module.

### db

Keyword to specify the database.

**Values** **active** — Displays information about the active database.  
**standby** — Displays information about the standby database.

## Platforms

VSR-NRC

## 19.16 ntp

ntp

### Syntax

```
ntp [{peers | peer [router router-instance | service-name service-name] peer-address} | {servers |  
server [router router-instance | service-name service-name] server-address} | [all]] [detail]
```

### Context

[\[Tree\]](#) (show>system ntp)

### Full Context

```
show system ntp
```

### Description

This command displays NTP protocol configuration and state.

### Parameters

#### peers

Generates a list of known peers.

### ***peer-address***

Specifies the address of a specific peer.

- Values** ipv4-address: a.b.c.d  
ipv6-address:
- x:x:x:x:x:x
  - x:x:x:x:x:d.d.d.d
  - x – [0 to FFFF] H
  - d – [0 to 255] D

### **servers**

Generates a list of known servers.

### ***server-address***

Specifies the address of a specific server.

- Values** ipv4-address: a.b.c.d  
ipv6-address:
- x:x:x:x:x:x
  - x:x:x:x:x:d.d.d.d
  - x – [0 to FFFF] H
  - d – [0 to 255] D
- ptp**: shows information about the internal PTP server.

### ***router-instance***

Specifies the routing context that contains the interface in the form of *router-name* or *service-id*.

- Values** *router-name* — Base | Management  
*service-id* — 1 to 2147483647

**Default** Base

### ***service name***

Specifies the service name for the VPRN. The name can be up to 64 characters in length. Note that CPM routing instances are not supported.

### **all**

Generates information for all clients, servers, and peers.

### **detail**

Provides detailed information.

## **Platforms**

All

## Output

The following output is an example of NTP information, and [Table 362: Output fields: NTP](#) describes the output fields.

### Output Example

```

Table 362: Output fields: NTP

Label	Description
Configured	Yes — NTP is configured No — NTP is not configured
Admin Status	up — Administrative state is enabled down — Administrative state is disabled
Server Enabled	Yes — This node is configured to serve external clients No — This node is not configured to server external clients
Stratum	Displays stratum level of this node
Oper Status	up — The operational state is enabled down — The operational state is disabled
Auth Check	Displays the authentication requirement
Auth KeyChain	Displays the authentication keychain name
Server Authenticate	Yes — Authentication is mandatory on received requests No — Authentication is not mandatory on received requests
Clock Source	Address of the chosen server

Label	Description
Auth Errors	Displays the number of authentication errors
Auth Errors Ignored	Displays the number of authentication errors ignored
Auth key Id Errors	Displays the number of key identification errors
Auth Key Type Errors	Displays the number of authentication key type errors
Current Date & Time	Current date and time as determined by the NTP process in the node
vRouter	The router instance containing the interface
Router	The router instance containing the address
Interface	The interface configured in NTP
Address	The address used for transmitted messages
Type	bcast — broadcast interface mcast — multicast interface bcInt — broadcast client svr — server actpr — active peer paspr — passive peer
Auth	yes — Authentication in use no — Authentication not in use
Poll	# — Current poll interval used on the interface
State	Reject — The peer is rejected and will not be used for synchronization. Rejection reasons could be the peer is unreachable, the peer is synchronized to this local server so synchronizing with it would create a sync loop, or the synchronization distance is too large. This is the normal startup state. Invalid — The peer is not maintaining an accurate clock. This peer will not be used for synchronization. Excess — The peer's synchronization distance is greater than ten other peers. This peer will not be used for synchronization. Outlier — The peer is discarded as an outlier. This peer will not be used for synchronization. Candidate — The peer is accepted as a possible source of synchronization.

Label	Description
	<p>Selected — The peer is an acceptable source of synchronization, but its synchronization distance is greater than six other peers.</p> <p>Chosen — The peer is chosen as the source of synchronization.</p> <p>ChosenPPS — The peer is chosen as the source of synchronization, but the actual synchronization is occurring from a pulse-per-second (PPS) signal.</p>
Remote	The IP address of the remote NTP server or peer with which this local host is exchanging NTP packets
Reference ID	<p>When stratum is between 0 and 15 this field shows the IP address of the remote NTP server or peer with which the remote is exchanging NTP packets. For reference clocks, this field shows the identification assigned to the clock, such as, ".GPS." For an NTP server or peer, if the client has not yet synchronized to a server/peer, the status cannot be determined and displays the following codes:</p> <p>Peer Codes:</p> <p>ACST — The association belongs to any cast server.</p> <p>AUTH — Server authentication failed. Wait while the association is restarted.</p> <p>AUTO — Autokey sequence failed. Wait while the association is restarted.</p> <p>BCST — The association belongs to a broadcast server.</p> <p>CRPT— Cryptographic authentication or identification failed. The details should be in the system log file or the cryptostats statistics file, if configured. No further messages will be sent to the server.</p> <p>DENY — Access denied by remote server. No further messages will be sent to the server.</p> <p>DROP — Lost peer in symmetric mode. Wait while the association is restarted.</p> <p>RSTR — Access denied due to local policy. No further messages are sent to the server.</p> <p>INIT — The association has not yet synchronized for the first time.</p> <p>MCST — The association belongs to a manycast server.</p> <p>NKEY — No key found. Either the key was never installed or is not trusted.</p> <p>RATE — Rate exceeded. The server has temporarily denied access because the client exceeded the rate threshold.</p> <p>RMOT — The association from a remote host running the ntpdc utility has had unauthorized attempted access.</p> <p>STEP — A step change in system time has occurred, but the association has not yet resynchronized.</p>

Label	Description
	System Codes: INIT — The system clock has not yet synchronized for the first time. STEP — A step change in system time has occurred, but the system clock has not yet resynchronized.
St	Stratum level of this node
A	y — Authentication is enabled n — Authentication is disabled
Poll	Polling interval
Reach	Shows the reachability for the most recent polls (up to 8) Y — The NTP peer or server did respond in the indicated poll No — The NTP peer or server did not respond in the indicated poll
Offset	The time between the local and remote UTC time, in milliseconds
Time Last Request Rx	The time at which the last request was received from the client

## 19.17 number-of-tunnels

### number-of-tunnels

#### Syntax

```
number-of-tunnels tunnel-type tunnel-type isa mda
number-of-tunnels tunnel-type tunnel-type esa-vm esa-id/vm-id
number-of-tunnels tunnel-type tunnel-type system
number-of-tunnels tunnel-type tunnel-type tunnel-group tunnel-group-id
```

#### Context

[\[Tree\]](#) (show>isa>stats>ip-tunnel-stats number-of-tunnels)

#### Full Context

```
show isa statistics ip-tunnel-stats number-of-tunnels
```

#### Description

This command displays the number of tunnels that are operationally up for the specified tunnel and scope. The following scope types are supported:

- per ISA
- per tunnel group
- per system

Note that L2TPv2 does not have a per-ISA scope.

The system collects statistics every hour for the past 24 hours per wall clock. A current value is also included in the output.

## Parameters

### *tunnel-type*

Displays information about the tunnel type.

**Values** gre, ip-in-ip, l2tpv3

### *mda*

Displays information about the ISA ID.

**Values** slot/mda

### *system*

Displays information about the system.

### *tunnel-group-id*

Displays information about the tunnel group ID.

**Values** 1 to 16

### *esa-vm*

Displays the ID of the configured ESA and ESA VM.

<b>Values</b>	esa-vm:	<i>esa-id/vm-id</i>	
		<i>esa-id</i>	1 to 16
		<i>vm-id</i>	1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## number-of-tunnels

## Context

[\[Tree\]](#) (show>isa>stats>ipsec-stats number-of-tunnels)

## Full Context

show isa statistics ipsec-stats number-of-tunnels

## Description

This command displays information for the number of IPsec tunnel statistics of the specified tunnel type and scope. The system collects statistics every hour for the last 24 hour according to the wall clock. The current value is also included in the output.

This command supports following scopes:

- per system
- per ISA
- per tunnel group
- per IPsec GW

The **start time** value in the output indicates the time when the results are collected.

## Parameters

### **tunnel-type**

Displays information about the specified the tunnel type.

**Values** all, sl2l, dl2l, ra

### **mda**

Displays information about the specified ISA ID.

**Values** slot/mda

***tunnel-group-id***

Displays information about the specified tunnel group ID.

**Values** 1 to 16

***name***

Displays information about the specified IPsec GW name up to 32 characters in length.

***count***

Displays information for the number of statistics intervals to be displayed (starting with the most recent).

**Values** 1 to 96

***minutes***

Displays information about the specified period covered by the statistics to be displayed (starting with the most recent).

**Values** 1 to 1440

***current***

Displays information about the current value. The values of count and minutes are ignored by the system once this parameter is specified.

***show-oid***

Displays information about the Object Identifier (OID) of the current statistical value.

***esa-vm***

Displays the ID of the configured ESA and ESA VM.

**Values**

esa-vm:	<i>esa-id/vm-id</i>	
	<i>esa-id</i>	1 to 16
	<i>vm-id</i>	1 to 4

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of the **show isa statistics ipsec-stats number** of tunnels command.

**Output Example**

```
show>isa>stats>ipsec-stats# number-of-tunnels tunnel-group 1

## 20 o Commands

### 20.1 oam-config-summary

#### oam-config-summary

##### Syntax

```
oam-config-summary
```

##### Context

[\[Tree\]](#) (show>test-oam oam-config-summary)

##### Full Context

```
show test-oam oam-config-summary
```

##### Description

This command displays the OAM configuration resources in use, as well as the percentage of available and per-system limits for the platform. The lines produced by the **show** command output vary by platform and may account for resource allocation in different ways. The resource accounting is tied to different resource pools across different platforms.

##### Platforms

All

##### Output

The following output is an example of OAM configuration information and [Table 363: Output fields: OAM configuration summary](#) describes the output fields.

This example is for platforms that have separate resource pools for OAM-PM (tests and packet per second). OAM-PM resources are tracked separately from the background OAM and SAA tests and transmit capacity. The limits are platform-specific.

```
show test-oam oam-config-summary
```

##### Output Example

```
-----  
OAM-Managed Test Capacity (tests)  
-----  
Resource                                     InUse %InUse  Limit  
-----  
Background ICMP Bridged Residential Gateway tests      0    0.0  50000  
Background ICMP Interface Control tests                 0    0.0   4000
```

```

Background OAM and SAA tests                0    0.0  10000
Background Static Host CPE Check tests      0    0.0   5000
Background Static Route CPE Check tests     0    0.0  10000
LSP Self Ping tests                        0    0.0   1250
OAM-PM tests                              0    0.0  24000
-----
OAM-Managed Transmit Capacity (pps)
-----
Resource                                     InUse %InUse  Limit
-----
Shared Resource Pool Maximum                0    0.0  24000
  Background Shared Pool Maximum           0    0.0  10000
    Background OAM and SAA-continuous Tx capacity 0    0.0   6000
    Background Static Route CPE Check Tx capacity 0    0.0  10000
  OAM-PM Tx capacity                       0    0.0  18000
Dedicated Resources
  LSP Self Ping Tx capacity                 0    0.0   125
-----
    
```

The following output is an example of those platforms that have a common resource pool (tests and packet per second) for background OAM, OAM-PM and SAA and [Table 363: Output fields: OAM configuration summary](#) describes the output fields.

```
show test-oam oam-config-summary
```

**Output Example**

```

-----
OAM-Managed Test Capacity (tests)
-----
Resource                                     InUse %InUse  Limit
-----
Background OAM, OAM-PM, and SAA tests        0    0.0
Background ICMP Interface Control tests      0    0.0
LSP Self Ping tests                          0    0.0
-----
OAM-Managed Transmit Capacity (pps)
-----
Resource                                     InUse %InUse  Limit
-----
Background OAM, OAM-PM, and SAA-continuous Tx capacity 0    0.2
LSP Self Ping Tx capacity                    0    0.0
-----
    
```

The following output is an example of CPE check information and [Table 363: Output fields: OAM configuration summary](#) describes the output fields.

```
show test-oam oam-config-summary
```

**Output Example**

```

-----
OAM-Managed Test Capacity (tests)
-----
Resource                                     InUse %InUse  Limit
-----
Background ICMP Bridged Residential Gateway tests 0    0.0  50000
Background ICMP Interface Control tests          0    0.0   4000
Background OAM and SAA tests                    0    0.0  10000
    
```

```

Background Static Host CPE Check tests           0   0.0  5000
Background Static Route CPE Check tests         0   0.0 10000
LSP Self Ping tests                             0   0.0  1250
OAM-PM tests                                   0   0.0 24000
-----
OAM-Managed Transmit Capacity (pps)
-----
Resource                                         InUse %InUse  Limit
-----
Shared Resource Pool Maximum                   0   0.0 24000
  Background Shared Pool Maximum                0   0.0 10000
    Background OAM and SAA-continuous Tx capacity 0   0.0  6000
    Background Static Route CPE Check Tx capacity 0   0.0 10000
  OAM-PM Tx capacity                           0   0.0 18000
Dedicated Resources
  LSP Self Ping Tx capacity                     0   0.0   125
-----
    
```

The following table describes the test OAM configuration limit fields.

Table 363: Output fields: OAM configuration summary

Label	Description
InUse	Indicates the number of resources in use
%InUse	Indicates the percentage of resources in use
Limit	Indicates the total number of available resources

## 20.2 oam-perf

### oam-perf

**Syntax**

**oam-perf [detail]**

**Context**

**[Tree]** (show>test-oam oam-perf)

**Full Context**

show test-oam oam-perf

**Description**

This command displays OAM performance information, including packet per second rates and the cumulative packets receive and transmitted. Statistics are cleared using the **clear>test-oam>oam-perf** command to properly interpret current data rate. The counts are displayed since the last clear and may be skewed because of irrelevant historical data.

## Parameters

### detail

Displays detailed information.

## Platforms

All

## Output

The following output is an example of OAM performance information.

### Output Example

```
show test-oam oam-perf
Current Time      : 12/20/2018 20:22:49
Last Clear       : 12/20/2018 20:21:08
Period Duration  : 0d 00:01:41 (101.43 seconds)
Local Tests (Tx) :      251 packets,      2.47 packets/second
Remote Tests (Rx):         0 packets,      0.00 packets/second
show test-oam oam-perf detail
Current Time      : 12/20/2018 20:22:53
Last Clear       : 12/20/2018 20:21:08
Period Duration  : 0d 00:01:45 (105.29 seconds)
=====
OAM packets Tx by locally initiated tests and Rx from remotely initiated tests
=====

```

OAM Type	--- Local Tests ----		-- Remote Tests ----	
	TxPackets	Rate(pps)	RxPackets	Rate(pps)

=====
```

## oam-perf

## Syntax

**oam-perf**

## Context

[\[Tree\]](#) (clear>test-oam oam-perf)

## Full Context

clear test-oam oam-perf

## Description

This command clears OAM performance statistics.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## oam-perf

## Syntax

```
oam-perf [interval seconds] [repeat repeat] [{absolute | rate}]
```

## Context

[\[Tree\]](#) (monitor>test-oam oam-perf)

## Full Context

```
monitor test-oam oam-perf
```

## Description

This command monitors the OAM performance statistics.

## Parameters

### *seconds*

Specifies the time interval, in seconds.

**Values** 3 to 60

### *repeat*

Specifies the number of times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Specifies that the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

### *rate*

Specifies that the rate-per-second is displayed.

**Default** delta

## Platforms

All

## 20.3 oam-pm

### oam-pm

#### Syntax

**oam-pm**

#### Context

[\[Tree\]](#) (show oam-pm)

#### Full Context

show oam-pm

#### Description

Commands in this context show Operations, Administration, and Maintenance Performance Management information.

#### Platforms

All

### oam-pm

#### Syntax

**oam-pm session *session-name* {dm | dmm | lmm | slm | twamp-light}**

#### Context

[\[Tree\]](#) (clear oam-pm)

#### Full Context

clear oam-pm

#### Description

This command clears OAM performance statistics reported by the **show>test-oam >oam-perf [ detail]**.

#### Parameters

##### ***session-name***

Identifies the session name, up to 32 characters, that the test is associated with.

##### **dm**

Specifies the MPLS delay measurement test that is affected by the command.

**dmm**

Specifies the DMM test that is affected by the command.

**lmm**

Specifies the LMM test that is affected by the command.

**slm**

Specifies the SLM test that is affected by the command.

**twamp-light**

Specifies the TWAMP-light test that is affected by the command.

**Platforms**

All

**oam-pm**

**Syntax**

**oam-pm**

**Context**

[\[Tree\]](#) (monitor oam-pm)

**Full Context**

monitor oam-pm

**Description**

Commands in this context monitor Operations, Administration, and Maintenance Performance Management information.

**Platforms**

All

## 20.4 oam-template

**oam-template**

**Syntax**

**oam-template**

**Context**

[\[Tree\]](#) (show>router>mpls>mpls-tp oam-template)

## Full Context

```
show router mpls mpls-tp oam-template
```

## Description

This command displays MPLS-TP OAM template information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of MPLS OAM template detail information.

## Output Example

```
*A:mlstp-dutA# show router mpls mpls-tp oam-template

=====
MPLS-TP OAM Templates
=====
Template Name : privatebed-oam-template Router ID      : 1
BFD Template  : privatebed-bfd-template Hold-Down Time: 0 centiseconds
                                           Hold-Up Time  : 20 deciseconds
=====
```

## 20.5 ocsp-cache

### ocsp-cache

## Syntax

```
ocsp-cache [entry-id]
```

## Context

[\[Tree\]](#) (show>certificate ocsp-cache)

## Full Context

```
show certificate ocsp-cache
```

## Description

This command displays the current cached OCSP results. The output includes the following information:

Certificate issuer

Certificate serial number

OCSP result

Cache entry expire time

## Parameters

### *entry-id*

Specifies the local cache entry identifier of the certificate that was validated by the OCSP responder.

**Values** 1 to 2000

## Platforms

All

## 20.6 of-switch

### of-switch

## Syntax

**of-switch**

**of-switch** *ofs-name* **controller** *ip-address:port* **detail**

**of-switch** *ofs-name* **status controller** [*ip-address:port*]

**of-switch** *ofs-name* **controller**

**of-switch** *ofs-name* **flowtable**

**of-switch** *ofs-name* **status**

**of-switch** *ofs-name* **port**

## Context

[\[Tree\]](#) (show>open-flow of-switch)

## Full Context

show open-flow of-switch

## Description

This command displays information related to H-OFS configuration and operations as per the parameters specified.

If no parameter is specified, this command displays a summary for H-OFS instances configured.

## Parameters

### *ofs-name*

Specifies the name of the configured H-OFS instance, up to 32 characters.

### *ip-address:port*

Displays information on the controller for the specified H-OFS instance.

**Values** ip-address: a.b.c.d  
port: 1 to 65535

**detail**

Displays detailed information.

**flowtable**

Displays information about flowtables for the specified H-OFS instance.

**status**

Displays status information for the specified H-OFS switch or its controller.

**port**

Displays information about the logical OpenFlow ports registered with the specified H-OFS instance.

**Platforms**

VSR

**Output**

**Output Example**

## of-switch

### Syntax

**of-switch** *ofs-name* [**flowtable** *of-table-id*] [**controller** *ip-address:port*] [{**grt** | **system** | **service-id** *service-id*}] [**cookie** *hex-string*] [**priority** *priority*]

**of-switch** *ofs-name* [**flowtable** *of-table-id*] [**controller** *ip-address:port*] **service-id** *service-id* **sap** *sap-id* [**cookie** *hex-string*] [**priority** *priority*]

**of-switch** *ofs-name* [**flowtable** *of-table-id*] [**controller** *ip-address:port*] **summary**

### Context

**[Tree]** (tools>dump>open-flow of-switch)

### Full Context

tools dump open-flow of-switch

### Description

This command can be used to dump information for a given OpenFlow switch or its flowtable. Priority and cookie filters are provided no focus on part of a flow table.

Usage examples:

- tools>dump>open-flow>of-switch ofs-test** — This command displays detailed flow information for a given OpenFlow switch. If the switch has **switch-defined-cookie** enabled, the flows with all cookie-types are displayed.
- tools>dump>open-flow>of-switch ofs summary** — This command displays a summary of each cookie context and the number of flows in it for the switch that has **switch-defined-cookie** enabled. If **switch-defined-cookie** is disabled, then the total number of entries is displayed (single context).
- Options like **grt**, **system**, **service-id**, **sap-id**, **cookie**, and **priority** can be used to limit display entries to the specified options.

### Parameters

#### ***ofs-name***

Specifies the name of the OFS instance, up to 32 characters.

#### ***of-table-id***

Specifies the identifier for the OpenFlow table.

**Values** 0

#### ***ip-address:port***

Specifies the IP address and TCP port for the OpenFlow channel to the controller.

**Values** ip-address: a.b.c.d  
 port: 1 to 65535

**grt**

Flowtable rules applicable to GRT instance (IES, Router).

**system**

Flowtable rules applicable to system filters.

**service-id**

Specifies the identifier for the service.

**Values** 1 to 2148007978 | *svc-name*: 64 characters max

**hex-string**

Specifies the identifier for the OpenFlow cookies.

**Values** 0x0 to 0xFFFFFFFFFFFFFFFF

**priority**

Specifies the priority for the OpenFlow switch.

**Values** 0 to 65535

**sap-id**

Specifies the identifier for the Ethernet SAP.

**Values**

null	port-id   bundle-id   bpgrp-id   lag-id   aps-id>

## 20.7 omcr

### omcr

#### Syntax

omcr

#### Context

[\[Tree\]](#) (show>redundancy>multi-chassis omcr)

#### Full Context

show redundancy multi-chassis omcr

#### Description

Commands in this context display OMCR information for subscribers.

#### Platforms

7750 SR

## 20.8 on-change-paths

### on-change-paths

#### Syntax

**on-change-paths**

**on-change-paths** {**open-config** | **nokia**}

#### Context

**[Tree]** (tools>dump>system>telemetry on-change-paths)

#### Full Context

tools dump system telemetry on-change-paths

#### Description

This command lists all state paths supporting gRPC ON\_CHANGE subscriptions. The keywords **open-config** and **nokia** specify which model should be displayed in the output.

#### Parameters

##### **open-config**

Specifies that the OpenConfig models will be displayed.

##### **nokia**

Specifies that the Nokia models will be displayed.

#### Platforms

All

#### Output

##### Output Example

```
A:node-6# tools dump system telemetry on-change-paths nokia
=====
Nokia on-change state paths

## 20.9 opaque-database

### opaque-database

#### Syntax

```
opaque-database [area area-id | as] [ adv-router router-id] [ls-id] [detail]
```

#### Context

[\[Tree\]](#) (show>router>ospf opaque-database)

#### Full Context

```
show router ospf opaque-database
```

#### Description

This command displays OSPF opaque database information.

#### Parameters

##### **area** *area-id*

Displays all opaque databases configured in this area.

**Values** ip-address — a.b.c.d  
area — 0 to 4294967295

**as**

Displays opaque databases configured in the autonomous system (AS).

**adv-router router-id [*ls-id*]**

Displays opaque database information associated with the specified advertising router. To further narrow the number of items displayed, the *ls-id* can optionally be specified.

**Platforms**

All

**Output**

OSPF Opaque Database Output

[Table 364: Output fields: OSPF opaque database](#) describes the OSPF opaque database output fields.

*Table 364: Output fields: OSPF opaque database*

Label	Description
Area Id	A 32-bit integer uniquely identifying an area. Area ID 0.0.0.0 is used for the OSPF backbone.
Type	NSSA — This area is configured as an NSSA area. Area — This area is configured as a standard area (not NSSA or stub). Stub — This area is configured as an NSSA area.
Link State Id	The link state ID is an LSA type specific field containing either a Router-Id or an IP Address; it identifies the piece of the routing domain being described by the advertisement.
Adv Rtr Id	The router identifier of the router advertising the LSA.
Age	The age of the link state advertisement in seconds.
Sequence	The signed 32-bit integer sequence number.
Cksum	The 32-bit unsigned sum of the link-state advertisements' LS checksums.

**Output Example**

```
*A:Dut-C# show router ospf opaque-database

## 20.10 open-flow

### open-flow

#### Syntax

**open-flow**

#### Context

[\[Tree\]](#) (show open-flow)

#### Full Context

show open-flow

#### Description

Displays OpenFlow switch hybrid information.

#### Platforms

VSR

### open-flow

#### Syntax

**open-flow of-switch** *ofs-name* **controller** *ip-address:port* [**channel** *channel-id*] **statistics**  
**open-flow of-switch** *ofs-name* **controller** *ip-address:port* [**vprn** *service-id* **ofc-loopback** *ip-address*]  
**statistics**

#### Context

[\[Tree\]](#) (clear open-flow)

## Full Context

clear open-flow

## Description

This command clears the OpenFlow statistics.

## Parameters

### *ofs-name*

Specifies the name of the OFS instance, up to 32 characters.

### *ip-address:port*

Specifies the IP address and TCP port for the OpenFlow channel to the controller.

Values		
ipv4-address:	a.b.c.d:port	
ipv6-address:	[x:x:x:x:x:x]:port (eight 16-bit pieces)	
	x:x:x:x:x.d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D
	port	1 to 65535

### *channel-id*

Specifies the channel ID.

**Values** 1 to 65535

### *service-id*

Specifies the service ID.

**Values** 1 to 2147483647

### *ip-address*

Specifies the IP address for the OpenFlow channel to the controller.

Values		
ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x.d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

## Platforms

VSR

## open-flow

### Syntax

**open-flow**

### Context

**[Tree]** (tools>dump open-flow)

### Full Context

tools dump open-flow

### Description

This command enables dumping of the OpenFlow information.

### Platforms

VSR

## 20.11 oper-group

## oper-group

### Syntax

**oper-group** [*group-name*]

**oper-group** [*group-name*] **detail**

**oper-group** [*group-name*] **members** [**sap**] [**sdp**] [**site**] [**egr-vtep**] [**service**] [**bgp-evpn**] [**ethernet-segment**] [**port**] [**vrrp**]

**oper-group** [*group-name*] **monitoring** [**sap**] [**sdp**] [**site**] [**srrp**] [**mvrp**] [**pw-port**] [**up-resiliency**] [**sap-mep**]

### Context

**[Tree]** (show>service oper-group)

### Full Context

show service oper-group

### Description

This command displays oper-group information, member count, monitor-client count, and status in a single line for each of the configured oper-groups.

## Parameters

### **group-name**

Displays oper-group information.

### **detail**

Displays detailed information for each of the configured oper-groups.

### **members**

Displays the members of the specified oper-group, or all oper-groups. A filter can be applied on the output to display only required member type, by specifying an optional parameter.

**Values** sap, sdp, site, egr-vtep, service, bgp-evpn, ethernet-segment, port, vrrp

### **monitoring**

Displays the clients that are monitoring the specified oper-group, or all oper-groups. A filter can be applied on the output to display only required client type, by specifying an optional parameter.

**Values** sap, sdp, site, srrp, mvrp, pw-port, up-resiliency, sap-mep

## Platforms

All

## Output

The following output is an example of server oper group information. [Table 365: Output fields: operational group detail](#) describes the output fields.

### Output Example

Table 365: Output fields: operational group detail

Label	Description
PortId	The port ID being monitored.
Adm Admin-state	Displays the administrative state.
Opr Oper-state	Displays the operational state.
Oper Group	The name of the operational group being monitored.
Creation Origin	Displays how the operational group was created.
Oper Status	Displays the operational status.
Hold Downtime	Displays the time, in seconds, that the system waits before declaring the status as "down".
Hold UpTime	Displays the time, in seconds, that the system waits before declaring the status as "up".
Members	Displays the number of members.
Monitoring	Displays the number of objects monitoring the operational group.
Sdpld	Displays the SDP ID.
Svcld	Displays the SVC ID.
Type	Displays the type of SDP binding.

Label	Description
IP address	Displays the IP address
SvcId:Instance	Displays the SVC ID and EVPN instance number.
(Type)	Displays the instance type.
Status	Displays the status of the EVPN instance.
Lag-Id	Displays the monitoring LAG ID.
Weighted	Displays whether or not the LAG is weighted.
Threshold	Displays the threshold number.
Up-Count	Displays the up-count number.
Act/Stdby	Displays whether the LAG is active or standby.
Sap	Displays the associated SAP ID
Md-index	Displays the Maintenance Domain (MD) index
Ma-index	Displays the Maintenance Association (MA) index
MepId	Displays the integer that is unique among all MEPs in the same MA
Defect	Displays the defects for the local MEP
md-admin-name	Displays the administrative MD name
ma-admin-name	Displays the administrative MA name

## 20.12 optimal-route-reflection

### optimal-route-reflection

#### Syntax

**optimal-route-reflection**

#### Context

[\[Tree\]](#) (show>router>bgp optimal-route-reflection)

#### Full Context

show router bgp optimal-route-reflection

### Description

Commands in this context display optimal route reflection (ORR) information.

### Platforms

All

## 20.13 origin-validation

### origin-validation

#### Syntax

**origin-validation**

#### Context

[\[Tree\]](#) (show>router origin-validation)

#### Full Context

show router origin-validation

#### Description

Commands in this context display origin validation information.

#### Platforms

All

### origin-validation

#### Syntax

**origin-validation rpki-session** *ip-address*

#### Context

[\[Tree\]](#) (clear>router origin-validation)

#### Full Context

clear router origin-validation

#### Description

This command creates the context to clear and reset origin validation entities.

## Parameters

### *ip-address*

Clears the origin validation entities associated with the specified IP address.

Values			
ipv4-address:	a.b.c.d		
ipv6-address:	x:x:x:x:x:x:x		[-interface]
	x:x:x:x:x:d.d.d.d		[-interface]
	x:		[0 to FFFF]H
	d:		[0 to 255]D
	interface		up to 32 characters, mandatory for link local addresses

```

## Context

[\[Tree\]](#) (monitor>router ospf)

## Full Context

```
monitor router ospf
```

## Description

Commands in this context configure monitor commands for the OSPF instance.

## Parameters

***ospf-instance***

Specifies the OSPF instance.

**Values** 0 to 31

## Platforms

All

## 20.15 ospf3

```
ospf3
```

## Syntax

```
ospf3 [instance ospf-instance] [area area-id]
```

## Context

[\[Tree\]](#) (tools>dump>router>te-database ospf3)

## Full Context

```
tools dump router te-database ospf3
```

## Description

Commands in this context dump the OSPF3 traffic engineering database.

## Parameters

### *ospf-instance*

Specifies the OSPF3 instance.

**Values** 0 to 31 (ipv6-unicast address-family), 64 to 95 (ipv6-unicast address-family)

### *area-id*

Specifies the OSPF3 area ID.

**Values** ip-address, 0 to 4294967295

## Platforms

All

## Output

The following outputs are examples of OSPF3 traffic engineering database information.

### Output Example

```
*A:Dut-C# tools dump router te-database ospf3

**overload card slot-number fp fp-number**

**overload card slot-number fp fp-number cpm-ip**

**overload card slot-number fp fp-number cpm-ipv6**

**overload card slot-number fp fp-number cpm-mac**

**overload card slot-number fp fp-number ip ip-filter-id direction direction**

**overload card slot-number fp fp-number ipv6 ipv6-filter-id direction direction**

**overload card slot-number fp fp-number mac mac-filter-id direction direction**

## Context

[\[Tree\]](#) (tools>dump>filter overload)

## Full Context

tools dump filter overload

## Description

This command, when used without parameters, allows the operator to identify filter memory banks with one or more policies in overload in the system by slot number, FP number, direction (ingress or egress), and type (IP-MAC or IPv6).

The command, when used with only the **card** and **fp** parameters, lists the filter policy ID as well as the number of entries in overload on a specified FP when the optional parameters *slot-number* and *fp-number* are specified.

This command, when used with the **ip**, **ipv6**, or **mac** parameters in conjunction with the **direction** parameter, displays the entries not programmed for a specified filter policy due to an overload condition.

This command, when used with the **cpm-ip**, **cpm-ipv6**, or **cpm-mac** parameters, displays the entries not programmed for a specified CPM filter policy. This command is available on applicable platforms only. Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide, CPM Filters and Traffic Management* section for more details.

## Parameters

### *slot-number*

Specifies the IOM slot number or CPM for the overload command.

**Values** 1 to 10

**Values** A (when used with **cpm-ip**, **cpm-ipv6**, or **cpm-mac** parameters)

### *fp-number*

Specifies the FP number.

**Values** 1 to 8

### *ip-filter-id*

Specifies the IP filter policy ID or name for which to display information.

**Values** 1 to 65535 (Specifies the policy ID)

*name* (Specifies a string of up to 64 characters uniquely identifying this filter policy name)

### *direction*

Specifies the direction.

**Values** ingress or egress

### *ipv6-filter-id*

Specifies the IPv6 filter policy ID or name for which to display information.

**Values** 1 to 65535 (Specifies the policy ID)

*name* (Specifies a string of up to 64 characters uniquely identifying this filter policy name)

**mac-filter-id**

Specifies the MAC filter ID policy for which to display information. Values can be expressed in different formats and refer to static or dynamic filters. The following values only shows decimal integer format.

**Values** 1 to 65535

*filter-name* (Specifies a string of up to 64 characters uniquely identifying this filter policy name)

**Platforms**

All

**Output**

The following output is an example of filter overload status.

**Output Example**

```
*A:Dut# tools dump filter overload
=====
Filter Overload Status
=====
Slot FP Dir Type
-----
1 1 Ing ip-mac
1 1 Egr ipv6
=====
```

The following output is an example with **card** and **fp** parameters only.

```
A:Dut# tools dump filter overload card 1 fp 1
=====
Filter Overload Status
=====
Slot FP Dir Type Filter #Entries
-----
1 1 Ing ip 5 1
1 1 Egr ipv6 40008 10
=====
```

The following output is an example with **card**, **fp**, **{cpm-ip, cpm-ipv6, or cpm-mac}** parameters only.

```
*A:Dut# tools dump filter overload card "a" fp 1 cpm-ipv6
=====
Filter Overload Status
=====
Slot FP Dir Type Filter Entry
-----
A 1 cpm-ipv6 168
=====
```

The following output is an example with **card**, **fp**, **{ip, ipv6, or mac}** and **direction** parameters only.

```
*A:Dut# tools dump filter overload card 1 fp 1 ip 9 direction ingress
=====
Filter Overload Status
=====
```

Slot	FP	Dir	Type	Filter	Entry
1	1	Ing	ip	9	100

## overload

### Syntax

**overload** {rtm | fib | prefix-limit}

### Context

[\[Tree\]](#) (clear>router>isis overload)

### Full Context

clear router isis overload

### Description

This command clears the IS-IS overload.

### Parameters

#### rtm

Clears the overload because IS-IS reached the configured maximum route limit set with **maximum-routes** or **maximum-ipv6-routes** in a VPRN.

#### fib

Clears the overload because adding routes to the hardware FIB failed.

#### prefix-limit

Clears the overload when IS-IS has reached the configured maximum prefix limit set with the **prefix-limit** command.

### Platforms

All

## overload

### Syntax

**overload** {rtm | fib | rtr-adv-lsa-limit}

### Context

[\[Tree\]](#) (clear>router>ospf overload)

[\[Tree\]](#) (clear>router>ospf3 overload)

## Full Context

```
clear router ospf overload  
clear router ospf3 overload
```

## Description

This command clears the OSPF or OSPF3 overload.

## Parameters

### **rtm**

Clears the overload because OSPF or OSPF3 reached the configured maximum route limit set with **maximum-routes** or **maximum-ipv6-routes** in a VPRN.

### **fib**

Clears the overload because adding routes to the hardware FIB failed.

### **rtr-adv-lsa-limit**

Clears the overload because OSPF or OSPF3 exceeded the configured maximum limit on LSAs advertised by another router, which was set with **rtr-adv-lsa-limit**.

**p2mp source ip-address group mcast-address [ session ip-addr [label-space]] [family] [summary | detail] [innermost-root ip-address]**  
**p2mp stitching [p2mp-id identifier root ip-address [rd rd] [ inner-root ip-address]]**  
**p2mp stitching source ip-address group mcast-address root ip-address inner-root ip-address**  
**p2mp stitching p2mp-id identifier [rd rd] innermost-root ip-address**  
**p2mp stitching source ip-address group mcast-address innermost-root ip-address**

##### Context

[\[Tree\]](#) (show>router>ldp>bindings p2mp)

##### Full Context

show router ldp bindings p2mp

##### Description

This command displays LDP P2MP FEC bindings.

## Parameters

### **detail**

Displays detailed information.

### **family**

Displays either IPv4 or IPv6 active LDP information.

### **group *mcast-address***

Displays the P2MP group multicast address bindings.

### **inner-root *ip-address***

Displays recursive FECs whose inner root address matches the specified address.

### **innermost-root *ip-address***

Displays recursive FECs whose inner root address matches the specified address and non-recursive FECs that have a root address that matches the specified address.

### **opaque-type *opaque-type***

Specifies the type of a Multi-Point Opaque Value Element.

**Values** generic, ssm, vpn-ssm, recursive-ssm, vpn-recursive, grt-recursive

### **p2mp-id *identifier***

Displays LDP active P2MP identifier bindings.

**Values** 0 to 4294967295

### **rd *rd***

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

### **root *ip-address***

Displays root IP address information.

### **session *ip-addr*[*label-space*]**

Displays information for the LDP session IP address and label space.

### **source *ip-address***

Displays LDP active P2MP source bindings.

**Values**

ipv4-address	- a.b.c.d
ipv6-address	- x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

### **stitching**

Displays stitching information for LDP P2MP FEC bindings.

**summary**

Displays information in a summarized format.

**Platforms**

All

**Output**

**Output Example**

The following show output displays recursive FECs.

```
A:Dut-C# show router ldp bindings p2mp stitching

### Context

[\[Tree\]](#) (show>router>ldp>bindings>active p2mp)

### Full Context

```
show router ldp bindings active p2mp
```

### Description

This command displays LDP active P2MP bindings.

### Parameters

**identifier**

Specifies the P2MP ID.

**Values** 0 to 4294967295

***ip-address***

Specifies the IPv4 or IPv6 address.

**Values**

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

***mcast-address***

Displays the P2MP group multicast address bindings.

**Values** ipv4-mcast-addr, ipv6-mcast-addr

***rd***

Displays information for the route distinguisher.

**Values** *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

***family***

Specifies the address family.

**Values** ipv4, ipv6

***port-id***

Specifies the port ID.

**Values**

	<i>slot[/mda[/port]]</i> or <i>slot/mda/port [.channel]</i>	
aps-id	<b>aps-group-id</b> [.channel]	
	<b>aps</b>	keyword
	<i>group-id</i>	1 to 128
eth-sat-id	<b>esat-id</b> [/slot/[u]port]	
	<b>esat</b>	keyword
	<i>id</i>	1 to 20
	<i>u</i>	keyword for up-link port
pxc-id	<b>pxc-id.sub-port</b>	
	<b>pxc</b>	keyword
	<i>id</i>	1 to 64

*sub-port*

a to b

***tunnel-id***

Specifies the tunnel ID.

**Values** 0 to 4294967295

***opaque-type***

Specifies the multi-point opaque value element type.

**Values** generic, ssm, vpn-ssm, recursive-ssm, vpn-recursive, grt-recursive

**Platforms**

All

## 21.2 p2mp-candidate-path

### p2mp-candidate-path

**Syntax**

**p2mp-candidate-path** [*path-name*] [**oper** { **up** | **down**}] [**in-use**]

**Context**

[\[Tree\]](#) (show>router>p2mp-sr-tree>p2mp-policy p2mp-candidate-path)

**Full Context**

show router p2mp-sr-tree p2mp-policy p2mp-candidate-path

**Description**

This command displays candidate path information.

**Parameters**

***path-name***

Specifies the candidate path name, up to 32 characters.

**oper up**

Displays the candidate paths with operational status up.

**oper down**

Displays the candidate paths with operational status down.

**in-use**

Displays candidate paths that are in use.

## 21.3 p2mp-info

### p2mp-info

#### Syntax

```
p2mp-info [type {originate | transit | terminate}] [s2l-endpoint ip-address]
```

#### Context

[\[Tree\]](#) (show>router>mpls p2mp-info)

#### Full Context

```
show router mpls p2mp-info
```

#### Description

This command displays P2MP cross-connect information.

#### Parameters

##### type

Specifies the P2MP type.

- Values**
- originate** — Displays the static LSPs that originate at this virtual router.
  - transit** — Displays the static LSPs that transit through this virtual router.
  - terminate** — Displays the static LSPs that terminate at this virtual router.

## Platforms

All

#### Output

The following output is an example of MPLS p2mp information.

#### Output Example

```
*A:Dut-C# show router mpls p2mp-info

## 21.4 p2mp-lsp

### p2mp-lsp

#### Syntax

**p2mp-lsp** [*lsp-name*] [**detail**]

**p2mp-lsp** [*lsp-name*] **p2mp-instance** [*p2mp-instance-name*] [ **mbb**]

**p2mp-lsp** [*lsp-name*] **p2mp-instance** [*p2mp-instance-name*] **s2l** [*s2l-name* [**to** *s2l-to-address*]] [ **status** {**up** | **down**}] [**detail**]

**p2mp-lsp** [*lsp-name*] **p2mp-instance** [*p2mp-instance-name*] **s2l** [*s2l-name* [**to** *s2l-to-address*]] [**mbb**]

**p2mp-lsp using-template** [**lsp-template** *template-name*] [**detail**]

**p2mp-lsp** [*lsp-name*] **p2mp-instance** [*p2mp-instance-name*] **s2l** [*s2l-name*] [**detail**] [**dns**]

#### Context

[\[Tree\]](#) (show>router>mpls p2mp-lsp)

#### Full Context

show router mpls p2mp-lsp

## Description

This command displays MPLS P2MP LSP information.

## Parameters

### *lsp-name*

Specifies the LSP name, up to 64 characters, used in the path.

### **detail**

Keyword used to display detailed information.

### **p2mp-instance** [*p2mp-instance-name*]

Specifies the administrative name for the P2MP instance which must be unique within a virtual router instance.

### **mbb**

Keyword used to display make-before-break (MBB) information.

### **s2l**

Keyword used to display the source-to-leaf (S2L) name.

### **to s2l-to-address**

Keyword used to display the IP address of the destination address of the S2L sub-LSP.

### **status**

Keyword used to display the status of the P2MP LSP.

- Values**
- up — Displays the total time that this S2L has been operational.
  - down — Displays the total time that this S2L has not been operational.

### **dns**

Keyword used to display reverse DNS resolution of actual and explicit hop information.

## Platforms

All

## Output

The following output is an example of MPLS P2MP LSP detailed DNS information, and [Table 366: Output fields: MPLS P2MP LSP detailed DNS](#) describes the output fields.

### Output Example

```
show router mpls p2mp-lsp p2mp-instance s2l detail dns
```

```
=====

## 21.5 p2mp-policy

### p2mp-policy

#### Syntax

**p2mp-policy** [**root-address** *ip-address*] [**tree-id** *tree-id*] [**candidate-path** *path-name*] [**detail**]

#### Context

**[Tree]** (show>router>p2mp-sr-tree>database p2mp-policy)

#### Full Context

show router p2mp-sr-tree database p2mp-policy

#### Description

This command displays the policy information present in the P2MP SR tree database.

#### Parameters

##### ***ip-address***

Specifies the root IPv4 address.

##### ***tree-id***

Specifies the P2MP SR tree ID.

**Values** 8193 to 16286

##### ***path-name***

Specifies the candidate path name, up to 64 characters.

##### **detail**

Displays detailed information.

#### Platforms

All

## Output

The following output is an example of P2MP SR tree database policy information.

### Output Example

```
A:node-2>show>router>p2mp-sr-tree>database# p2mp-policy

## p2mp-policy

### Syntax

**p2mp-policy** [*policy-name*] [**root-tree-id** *root-tree-id*] [**root-addr** *ip-address*]

### Context

**[Tree]** (show>router>p2mp-sr-tree p2mp-policy)

### Full Context

show router p2mp-sr-tree p2mp-policy

### Description

This command displays the P2MP policy information.

### Parameters

#### **policy-name**

Specifies the policy name, up to 256 characters.

#### **root-tree-id**

Specifies the root tree ID.

**Values** 8193 to 16286

### ***ip-address***

Specifies the root IPv4 address.

### **Platforms**

All

### **Output**

The following output is an example of P2MP SR tree policy information.

### **Output Example**

```

## **21.6 p2mp-sr-tree**

### **p2mp-sr-tree**

#### **Syntax**

**p2mp-sr-tree**

#### **Context**

**[Tree]** (show>router p2mp-sr-tree)

#### **Full Context**

show router p2mp-sr-tree

#### **Description**

Commands in this context display P2MP SR tree information.

## Platforms

All

## 21.7 packet

```
packet
```

### Syntax

```
packet packet-number
```

### Context

[\[Tree\]](#) (show>test-oam>build-packet packet)

### Full Context

```
show test-oam build-packet packet
```

### Description

This command displays the OAM egress port finder information for a specific packet.

### Parameters

***packet-number***

Specifies the packet number.

**Values** 1 to 65535

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 21.8 packet-size

```
packet-size
```

### Syntax

```
packet-size protocol [clear]
```

### Context

[\[Tree\]](#) (tools>dump>cflowd packet-size)

## Full Context

```
tools dump cflowd packet-size
```

## Description

This command displays packet size distribution for sampled IP traffic. Values are displays in decimal format (1.0 = 100%, .500 = 50%). Separate statistics are maintained and shown for IPv4 and IPv6 traffic.

## Platforms

All

## Output

The following output is an example of cflowd packet size information.

### Output Example

```
SR-12# tools dump cflowd packet-size ipv4
IP packet size distribution (801600 total packets):
 1-32  64  96  128  160  192  224  256  288  320  352  384  416  448  480
.000 .250 .000 .000 .010 .100 .500 .090 .000 .000 .000 .000 .000 .000 .000

 512  544  576 1024 1536 2048 2560 3072 3584 4096 4608 9000
.000 .000 .000 .050 .000 .000 .000 .000 .000 .000 .000 .000
```

## 21.9 parameters

### parameters

## Syntax

```
parameters
```

## Context

[\[Tree\]](#) (show>router>ldp parameters)

## Full Context

```
show router ldp parameters
```

## Description

This command displays configuration information about LDP parameters.

## Platforms

All

## Output

LDP Parameters Output

Table 367: Output fields: LDP parameters describes the LDP parameters output fields.

Table 367: Output fields: LDP parameters

Label	Description
Keepalive Timeout	The time interval (in s), that LDP waits before tearing down a session. If no LDP messages are exchanged during this time interval, the LDP session is torn down. Generally the value is configured to be 3 times the keepalive time (the time interval between successive LDP keepalive messages).
Timeout Factor	The value by which the keepalive timeout should be divided to give the keepalive time, for example, the time interval (in s), between LDP keepalive messages. LDP keepalive messages are sent to keep the LDP session from timing out when no other LDP traffic is being sent between the neighbors.
Hold Time	The hello time, also known as hold time. It is the time interval (in s), that LDP waits before declaring a neighbor to be down. Hello timeout is local to the system and is sent in the hello messages to a neighbor.
Hello Factor	The value by which the hello timeout should be divided to give the hello time, for example, the time interval (in s), between LDP hello messages. LDP uses hello messages to discover neighbors and to detect loss of connectivity with its neighbors.
Auth	Enabled — Authentication using MD5 message based digest protocol is enabled. Disabled — No authentication is used.
Admin Status	inService — The LDP is administratively enabled. outService — The LDP is administratively disabled.
Deaggregated FECs	False — LDP aggregates multiple prefixes into a single Forwarding Equivalence Class (FEC) and advertises a single label for the FEC. This value is only applicable to LDP interfaces and not for targeted sessions. True — LDP de-aggregates prefixes into multiple FECs.
Propagate Policy	The Propagate Policy value specifies whether the LSR should generate FECs and which FECs it should generate. system — LDP distributes label bindings only for the router's system IP address. interface — LDP distributes label bindings for all LDP interfaces. all — LDP distributes label bindings for all prefixes in the routing table. none — LDP does not distribute any label bindings.
Transport Address	interface — The interface's IP address is used to set up the LDP session between neighbors. If multiple interfaces exist between two neighbors, the 'interface' mode cannot be used because only one LDP session is actually set up between the two neighbors. system — The system's IP address is used to set up the LDP session between neighbors.

Label	Description
Label-Retention	<p>liberal — All advertised label mappings are retained whether they are from a valid next hop or not. When the label distribution value is downstream unsolicited, a router may receive label bindings for the same destination for all its neighbors. Labels for the non-next hops for the FECs are retained in the software but not used. When a network topology change occurs where a non-nexthop becomes a true next hop, the label received earlier is then used.</p> <p>conservative — Advertised label mappings are retained only if they are used to forward packets; for example, if the label came from a valid next hop. Label bindings received from non-next hops for each FEC are discarded.</p>
Control Mode	<p>ordered — Label bindings are not distributed in response to a label request until a label binding has been received from the next hop for the destination.</p> <p>independent — Label bindings are distributed immediately in response to a label request even if a label binding has not yet been received from the next hop for the destination.</p>
Route Preference	The route preference assigned to LDP routes. When multiple routes are available to a destination, the route with the lowest preference is used. This value is only applicable to LDP interfaces and not for targeted sessions.
Loop Detection	<p>none — Loop detection is not supported on this router. This is the only valid value because Path Vector based loop detection is not supported.</p> <p>other — Loop detection is supported but by a method other than hopCount, path Vector, or hopCountAndPathVector.</p> <p>hopCount — Loop detection is supported by hop count only.</p> <p>pathVector — Loop detection is supported by path vector only.</p> <p>hopCountAndPathVector — Loop detection is supported by both path vector and hop count.</p>
Keepalive Timeout	The factor used to derive the Keepalive interval.
Keepalive Factor	The time interval (in s), that LDP waits before tearing down the session.
Hold-Time	The time left before a neighbor is declared to be down.
Hello Factor	The value by which the hello timeout should be divided to give the hello time, for example, the time interval (in s), between LDP hello messages. LDP uses hello messages to discover neighbors and to detect loss of connectivity with its neighbors.
Auth	<p>Enabled — Authentication using MD5 message based digest protocol is enabled.</p> <p>Disabled — No authentication is used.</p>
Passive-Mode	<p>true — LDP responds only when it gets a connect request from a peer and does not attempt to actively connect to its neighbors.</p> <p>false — LDP actively tries to connect to its peers.</p>
Targeted-Sessions	true — Targeted sessions are enabled.

Label	Description
	false — Targeted sessions are disabled.

### Output Example

```
*A:Dut-A# show router ldp parameters
=====

## 21.10 partition

partition

### Syntax

partition summary

### Context

[\[Tree\]](#) (show>app-assure>group partition)

### Full Context

show application-assurance group partition

### Description

This command displays partition information.

### Parameters

#### summary

Displays partition summary information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 21.11 passive-dns

### passive-dns

### Syntax

passive-dns

### Context

[\[Tree\]](#) (tools>dump>app-assure>group>ipassist passive-dns)

### Full Context

tools dump application-assurance group ip-identification-assist passive-dns

### Description

Commands in this context display passive DNS monitoring statistics related to IP identification assist for top applications using IP addresses learned by passive monitoring of DNS traffic.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 21.12 password-options

### password-options

#### Syntax

**password-options**

#### Context

[\[Tree\]](#) (show>system>security password-options)

#### Full Context

show system security password-options

#### Description

This command displays configured password options.

#### Platforms

All

#### Output

The following output is an example of password options information, and [Table 368: Output fields: password options](#) describes the output fields.

#### Output Example

```
A:ALA-7# show system security password-options
=====
Password Options
=====
Password aging in days                : none
Time required between password changes : 0d 00:10:00

Number of invalid attempts permitted per login : 3
Time in minutes per login attempt           : 5
Lockout period (when threshold breached)     : 10
Authentication order                       : radius tacplus local
User password history length                : disabled
Password hashing                           : bcrypt
Accepted password length                    : 6..56 characters
Credits for each character type              : none
Required character types                    : none
Minimum number different character types     : 0
Required distance with previous password    : 5
Allow consecutively repeating a character   : always
Allow passwords containing username          : yes
Palindrome allowed                          : no
=====
A:ALA-7#
```

Table 368: Output fields: password options

Label	Description
Password aging in days	Displays the number of days a user password is valid before the user must change their password.
Time required between password changes	Displays the time interval between changed passwords.
Number of invalid attempts permitted per login	Displays the number of unsuccessful login attempts allowed for the specified <b>time</b> .
Time in minutes per login attempt	Displays the period of time, in minutes, that a specified number of unsuccessful attempts can be made before the user is locked out.
Lockout period (when threshold breached)	Displays the number of minutes that the user is locked out if the threshold of unsuccessful login attempts has been exceeded.
Authentication order	Displays the sequence in which password authentication is attempted among RADIUS, TACACS+, and local passwords.
User password history length	Displays the size of the password history file to be stored.
Password hashing	Displays the system hashing algorithm for passwords.
Accepted password length	Displays the minimum length required for local passwords.
Credits for each character type	Displays the credit for each character type. A credit is obtained for a specific character type; for example, uppercase, lowercase, numeric, or special character. Credits per character type are configurable. Credits can be used toward the minimum length of the password, so a trade-off can be made between a very long, simple password and a short, complex one.
Required character types	Displays the character types that are required in a password; for example, uppercase, lowercase, numeric, or special character.
Minimum number different character types	Displays the minimum number of each different character types in a password.
Required distance with previous password	Displays the minimum Levenshtein distance between a new password and the old password.
Allow consecutively repeating a character	Displays the number of times the same character is allowed to be repeated consecutively.

Label	Description
Allow passwords containing username	Displays whether the user name is allowed as part of the password.
Palindrome allowed	Displays whether palindromes are allowed as part of the password.

## password-options

### Syntax

**password-options**

### Context

[\[Tree\]](#) (show>system>security password-options)

### Full Context

show system security password-options

### Description

This command displays password options.

### Platforms

All

### Output

The following output is an example of password option information.

[Table 369: Output fields: password options](#) describes password-options output fields.

### Output Example

```
A:ALA-48>show>system>security# password-options
=====
Password Options
=====
Password aging in days                : 365
Number of invalid attempts permitted per login : 5
Time in minutes per login attempt      : 5
Lockout period (when threshold breached) : 20
Authentication order                  : radius tacplus local
User password hashing algorithm        : bcrypt
Configured complexity options          :
Minimum password length                 : 8
=====
A:ALA-48>show>system>security#
```

Table 369: Output fields: password options

Label	Description
Password aging in days	Displays the number of days a user password is valid before the user must change his password.
Number of invalid attempts permitted per login	Displays the maximum number of unsuccessful login attempts allowed for a user.
Time in minutes per login attempt	Displays the time in minutes that user is to be locked out.
Lockout period (when threshold breached)	Displays the number of minutes the user is locked out if the threshold of unsuccessful login attempts has exceeded.
Authentication order	Displays the most preferred method to authenticate and authorize a user.
User password hashing algorithm	Displays the algorithm with which the system hashes the user passwords.
Configured complexity options	Displays the complexity requirements of locally administered passwords, HMAC-MD5-96, HMAC-SHA-96 and DES-keys configured in the <b>authentication</b> section.
Minimum password length	Displays the minimum number of characters required in the password.

## 21.13 path

### path

#### Syntax

```
path [path-name] [isp-binding]
path path-name p2mp-isp-binding
```

#### Context

[\[Tree\]](#) (show>router>mpls path)

#### Full Context

```
show router mpls path
```

## Description

This command displays MPLS paths.

## Parameters

### *path-name*

Specifies the unique name label for the LSP path.

### *isp-binding*

Displays binding information.

### *p2mp-isp-binding*

Displays binding information.

## Platforms

All

## Output

The following output is an example of MPLS path information.

[Table 370: Output fields: MPLS path](#) describes MPLS Path output fields.

*Table 370: Output fields: MPLS path*

Label	Description
Path Name	The unique name label for the LSP path.
Adm	Down — The path is administratively disabled. Up — The path is administratively enabled.
Hop Index	The value used to order the hops in a path.
IP Address	The IP address of the hop that the LSP should traverse on the way to the egress router.
Strict/Loose	Strict — The LSP must take a direct path from the previous hop router to the next router. Loose — The route taken by the LSP from the previous hop to the next hop can traverse through other routers.
LSP Name	The name of the LSP used in the path.
Binding	Primary — The preferred path for the LSP. Secondary — The standby path for the LSP.
Paths	Total number of paths configured.

## Output Example

```
*A:SRU4>config>router>mpls# show router mpls path
=====
```

```

MPLS Path:

## 21.14 path-request

### path-request

#### Syntax

```
path-request [isp-type isp-type] [dest ip-address] [detail]
```

#### Context

[\[Tree\]](#) (show>router>pcep>pcc path-request)

#### Full Context

```
show router pcep pcc path-request
```

#### Description

This command displays the PCEP path request information.

#### Parameters

##### *isp-type*

Specifies the LSP type.

**Values** rsvp-p2p, rsvp-p2mp, seg-rt

##### **Note:**

The LSP type, **rsvp-p2mp**, is not supported for PCE controlled or PCE initiated LSPs.

##### *ip-address*

Specifies the IP address.

**Values** a.b.c.d

##### **detail**

Specifies detailed information.

#### Platforms

All

## 21.15 paths

### paths

#### Syntax

paths

#### Context

[\[Tree\]](#) (show>router>bgp paths)

#### Full Context

show router bgp paths

#### Description

This command displays a summary of BGP path attributes.

#### Platforms

All

#### Output

The following output is an example of BGP path information. [Table 371: Output fields: BGP path](#) describes the output fields.

#### Output Example

```
*A:ALA-12# show router 3 bgp paths
=====
BGP Router ID : 10.0.0.14      AS : 65206   Local AS : 65206
=====

-----
*A:ALA-12#
```

Table 371: Output fields: BGP path

Label	Description
BGP Router ID	The local BGP router ID.
AS	The configured autonomous system number.
Local AS	The configured local AS setting. If not configured, then the value is the same as the AS.
Path	The AS path attribute.
Origin	EGP — The NLRI is learned by an EGP protocol. IGP — The NLRI is interior to the originating AS. INCOMPLETE — NLRI was learned another way.
Next Hop	The advertised BGP nexthop.
MED	The Multi-Exit Discriminator value.
Local Preference	The local preference value.
Refs	The number of routes using a specified set of path attributes.
ASes	The number of autonomous system numbers in the AS path attribute.
Segments	The number of segments in the AS path attribute.
Flags	EBGP-learned — Path attributes learned by an EBGP peering. IBGP-Learned — Path attributes learned by an IBGP peering.
Aggregator	The route aggregator ID.
Community	The BGP community attribute list.
Originator ID	The originator ID path attribute value.
Cluster List	The route reflector cluster list.

## 21.16 pattern-match

### pattern-match

#### Syntax

**pattern-match [detail]**

## Context

[\[Tree\]](#) (tools>dump>filter>resources pattern-match)

## Full Context

tools dump filter resources pattern-match

## Description

This command displays pattern match records.

## Parameters

### detail

Displays detailed pattern match records.

## Platforms

All

## Output

The following output is an example of detailed pattern match records.

### Output Example

```
A:Dut-A# tools dump filter resources pattern-match
=====
Unique filter pattern match patterns
=====

## 21.17 pbb

```
pbb
```

### Syntax

```
pbb base
```

```
pbb mac-name
```

```
pbb mac-name mac-name detail
```

### Context

[\[Tree\]](#) (show>service pbb)

### Full Context

```
show service pbb
```

### Description

This command displays PBB information.

### Parameters

**base**

Displays information about a PBB base.

**mac-name**

Displays MAC name information.

**detail**

Displays detailed information.

***mac-name***

Displays information about a specific MAC name, up to 32 characters.

### Platforms

All

### Output

The following output is an example of PBB base information.

#### Output Example

```
*A:Dut-B# show service pbb base
```

```
=====
```

```
PBB MAC Information
```

```

## 21.19 pcap

```
pcap
```

### Syntax

```
pcap [session-name] [detail]
```

### Context

[\[Tree\]](#) (show pcap)

### Full Context

```
show pcap
```

### Description

This command shows the information about the packet capture session and confirms if the packet is reliable.

### Parameters

**session-name**

Specifies the session name up to 32 characters.

### Platforms

All

### Output

The following output is an example of information about the packet capture session.

### Output Example

```
=====
Pcap Session "1" Information
=====
Application Type   : mirror-dest      Session State   : ready
Capture           : stop                Last Changed    : 02/06/2018 19:52:07
Capture File Url  : ftp://*:*@192.168.40.1/pcap.pcap
Buffer Size       : 0 Bytes             File Size       : 0 Bytes
Write Failures    : 0                  Read Failures   : 0
Proc Time Bailouts : 0                 Last File Write : 02/06/2018 19:52:07
Dropped Packets   : 0 Packets
=====
```

Table 372: Output fields: PCAP

Label	Description
Buffer Size	The maximum buffer size is 20 Mb. If the number of packets in the buffer exceeds 20 Mb, packets are dropped.
File Size	The current size of the capture file.
Write Failures	The number of errors that occurred when packets were written into the buffer. A number greater than zero indicates that some packets were not captured.
Read Failures	The errors occurred when packets were read from the buffer for exporting to FTP or TFTP. A number greater than zero indicates that some packets were not captured.
Process Time Bailouts	A system process timeout. Some packets were not captured.
Dropped Packets	The number of packets dropped from the buffer due to errors.

#### Context

[\[Tree\]](#) (show>subscr-mgmt pcc-rule)

#### Full Context

show subscriber-mgmt pcc-rule

#### Description

This command displays a list of PCC rules and associated monitoring keys in the system.

#### Parameters

**key**

Displays details about a specific monitoring-key.

**id**

Displays details about a specific PCC rule.

**rule-name**

Displays information about a specific PCC rule.

**summary**

Displays summarized information for active rules in the system.

**key**

Displays information about a specific monitoring-key.

**detail**

Displays detailed information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of subscriber management PCC rule information.

### Output Example

```

Table 373: Output fields: PCC rule describes subscriber management PCC rule output fields.

Table 373: Output fields: PCC rule

Field	Description
Nbr Active PCC Rules	The number of active PCC rules
Nbr Active Combinations	The number of active IP PCC rule combinations
IPv4 Filter	The number of IPv4 filter combinations
IPv6 Filter	The number of IPv6 filter combinations
Egress QoS	The number of active egress QoS PCC rule combinations
Ingress QoS	The number of active ingress QoS PCC rule combinations
Id	The PCC ID
Dir	The flow direction on which the PCC-rule acts
ForwardAction	The filter action of the PCC-rule
QoSAction	The QoS action of the PCC-rule. The value <code>account(3)</code> is only relevant if the PCC-rule was received by the system as part of a RADIUS Subscriber Service attribute
name	The PCC rule name
monitorKey	The monitor key name that can be received in a PCC rule. An empty string (length 0) indicates that no monitor key is defined in the PCC rule
PCC rule name	The name of a PCC rule
PCC rule id	The PCC rule ID
Monitoring key	The monitoring key defined in this PCC-rule. This value is only considered if <b>monitor</b> is set in the QoS action.
Flow status	The PCC rule flow status; enabled or disabled
Nbr of Flows	The number of flow rules defined in this PCC rule
HTTP-Redirect	The URL to which all data flows that pertain to this PCC-rule must be redirected
Next-Hop Redir. IPv4	The IPv4 address to which all IPv4 data flows that pertain to this PCC-rule be redirected
Next-Hop Redir. IPv6	The IPv6 address to which all IPv6 data flows that pertain to this PCC-rule be redirected
QoS Ingr. CIP/PIR	The ingress QoS CIP and PIR values

Field	Description
QoS Egr. CIP/PIR	The egress QoS CIP and PIR values
FC change	The forwarding class (FC) that is assigned to all data flows that pertain to this PCC-rule
Src. IP	The address type of the source address
Src. Port	The port type of the source address
Dst. IP	The address type of the destination address
Protocol	The IPv4 protocol value, and for IPv6 the next header type used in the match criteria for this flow <ul style="list-style-type: none"> <li>• 6 — TCP</li> <li>• 7 — UDP</li> </ul>
DSCP	The DSCP to be matched for this flow
Subscriber	The subscriber SAP
SLA Profile Instance sap	The SLA profile instance SAP
Ingr QoS Policy Override	The ID of the overriding ingress Qos policy
Egr QoS Policy Override	The ID of the overriding egress Qos policy
IP Address	The subscriber IP address
MAC Address	The subscriber MAC address
PPPoE-SID	The PPPoE session ID of this subscriber host
Origin	The origin of this subscriber host
Preference	The preference with respect to other PCC rules
Rule ID	The PCC rule ID
Rule Name	The PCC rule name

## pcc-rule

### Syntax

**pcc rule** [**subscriber** *sub-ident-string*]

**pcc rule** [**subscriber** *sub-ident-string*] **detail**

### Context

[\[Tree\]](#) (show>service>active-subscribers pcc-rule)

### Full Context

```
show service active-subscribers pcc-rule
```

### Description

This command specifies the PCC rule.

### Parameters

#### *sub-ident-string*

Specifies the sub-ident-string, up to 32 characters.

#### **detail**

Displays detailed information for the specified PCC rule.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 21.22 pce-associations

### pce-associations

### Syntax

```
pce-associations
```

### Context

[\[Tree\]](#) (show>router>pcep>pcc pce-associations)

### Full Context

```
show router pcep pcc pce-associations
```

### Description

Commands in this context display information about PCE associations configured under the PCC.

## 21.24 pcm

## pcm

### Syntax

pcm [*pcm-slot*] [**chassis** *chassis-id*] [**detail**]

### Context

[\[Tree\]](#) (show pcm)

### Full Context

show pcm

### Description

This command displays PCM information.

### Parameters

#### *pcm-slot*

Specifies the PCM slot identifier.

**Values** 1 to 12

#### *chassis-id*

Specifies the chassis ID for the router chassis.

**Values** 1 to 2

**detail**

Displays detailed information.

**Platforms**

7950 XRS-20e

**Output**

The following output is an example of PCM information.

**Output Example: show pcm**

```
*A:Dut-A# show pcm
=====
PCM Summary
=====
Chassis/   Provisioned Type      Operational   Input   Zone
Slot       Equipped Type (if diff) State         A B2 A2 B

## pcp-server

### Syntax

**pcp-server** *server-name* **interface** *interface-name* **statistics**

### Context

[\[Tree\]](#) (clear>router pcp-server)

### Full Context

clear router pcp-server

### Description

This command clears NAT PCP server data.

### Parameters

#### **server-name**

Clears NAT PCP server data for the specified PCP server, up to 32 characters.

#### **interface-name**

Clears NAT PCP server data for the specified interface, up to 32 characters.

#### **statistics**

Clears NAT PCP server statistics.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## pcp-server

### Syntax

```
pcp-server server-name
```

### Context

[\[Tree\]](#) (tools>perform>router pcp-server)

### Full Context

```
tools perform router pcp-server
```

### Description

This command configures performance tools for a specified NAT port control policy server.

### Parameters

***server-name***

Specifies the PCP server name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 21.26 pcp-server-policy

## pcp-server-policy

### Syntax

```
pcp-server-policy
```

```
pcp-server-policy name
```

### Context

[\[Tree\]](#) (show>service>nat pcp-server-policy)

### Full Context

```
show service nat pcp-server-policy
```

### Description

This command displays PCP server policy information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 21.27 pcs

```
pcs
```

### Syntax

```
pcs[clear]
```

### Context

[\[Tree\]](#) (tools>dump>port pcs)

### Full Context

```
tools dump port pcs
```

### Description

This command dumps the Physical Coding Sublayer (PCS) information for the port.

### Platforms

All

## 21.28 peak

```
peak
```

### Syntax

```
peak  
peak application license-app
```

### Context

[\[Tree\]](#) (show>system>license-statistics peak)

### Full Context

```
show system license-statistics peak
```

### Description

This command displays peak values of application license statistics.

## Parameters

### *license-app*

Specifies the application license.

**Values**   Ins, nat, sub-mgmt, wlan-gw, aa, ipsec

## Platforms

VSR

## 21.29 peakvalue-stats

### peakvalue-stats

#### Syntax

**peakvalue-stats iom** (*slot* | **all**) [**recursive**]

**peakvalue-stats mda** (*mda* | **all**) [**recursive**]

**peakvalue-stats port** (*port-id* | **all**)

**peakvalue-stats pw-port** (*pw-port* | **all**)

**peakvalue-stats system** [**recursive**]

**peakvalue-stats service** {*svc-id* | **all**} [**recursive**]

**peakvalue-stats service** {*svc-id*} **subscriber-interface** { *sub-itf* | **all** } [**recursive**]

**peakvalue-stats service** {*svc-id*} **group-interface** { *grp-itf* | **all** }

#### Context

[\[Tree\]](#) (clear>subscriber-mgmt peakvalue-stats)

#### Full Context

clear subscriber-mgmt peakvalue-stats

#### Description

This command resets the most recent peak enhanced subscriber management counter per port, PW port, MDA, IOM, system, service, subscriber interface, or group interface.

#### Note:

Clearing one counter will not impact other counters. For example, clearing the most recent peak value for an IOM will not impact chassis peak value.

## Parameters

### *slot*

Clears IOM host peak value statistics for the specified IOM.

**mda**

Clears MDA host peak value statistics for the specified MDA.

**port-id**

Clears port host peak value statistics for the specified port ID.

**pw-port**

Clears pseudowire port host peak value statistics for the specified port.

**Values** 1 to 10239

**system**

Clears system host peak value statistics.

**all**

Clears all host peak value statistics.

**recursive**

Resets the sub-level counters. For example, clearing IOM counters with the **recursive** keyword also clears counters of all port counters on that IOM.

**service svc-id**

Clears service host peak value statistics for the specified service.

**Values** 1 to 2148278386 | *svc-name*: up to 64 characters

**subscriber-interface sub-itf**

Clears subscriber interface host peak value statistics for the specified subscriber interface, up to 32 characters.

**group-interface grp-itf**

Clears group interface host peak value statistics for the specified group interface, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 21.30 peer

peer

**Syntax**

**peer** [**peer-profile** *profile-name*] [**local-address** *ip-address*] [**control** *protocol*] [**interface-type** *interface-type*]

**peer remote-address** {*ip-address* | *ipv6-address*} [**udp-port** *port*] [**dsm-local-ip-address** {*ip-address* | *ipv6-address*}]

**peer remote-address** {*ip-address* | *ipv6-address*} [**udp-port** *port*] **statistics** [**dsm-local-ip-address** {*ip-address* | *ipv6-address*}]

## Context

[Tree] (show>router>gtp peer)

## Full Context

show router gtp peer

## Description

This command displays GTP peer information.

## Parameters

### *profile-name*

Specifies the name that identifies the profile.

### *ip-address*

Specifies the local IP address.

Values	
ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D

### *protocol*

Specifies the control plane protocol used for the connection with this Mobile Gateway.

Values	
gtpv1-c, gtpv2-c	

### *interface-type*

Specifies the interface type used in the context of this peer.

Values	
gn	— Gn interface
s2a	— S2a interface
s2b	— S2b interface
s11	— S11 interface

### *ip-address*

Specifies the remote IP address.

Values	
ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H

d - [0 to 255]D

**port**

Specifies the UDP port.

**Values** 1 to 65535

**statistics**

Displays statistics information about the Mobile Gateways connected to this system.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of peer GTP information.

**Output Example**

```
Node# show router 10 gtp peer
=====
Peers
=====
Remote address      : 192.168.100.1
UDP port           : 2123

**peer**

**Syntax**

**peer remote-address** *ip-address* [**remote-udp-port** *port*]

**peer remote-address** *ip-address* [**remote-udp-port** *port*] **statistics**

**Context**

[\[Tree\]](#) (clear>router>gtp peer)

**Full Context**

clear router gtp peer

## Description

This command clears all states for a given peer in this routing context. The system no longer sends keep-alive messages to the peer, and all active sessions are terminated.

If the optional statistics parameter is specified, only the peer statistics are cleared and all sessions remain.

## Parameters

### *ip-address*

Specifies the IP address of the peer.

#### Values

*ipv4-address*: a.b.c.d (host bits must be 0)

*ipv6-address*: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

### *port*

Specifies the UDP port used by the peer.

### *statistics*

Specifies to clear only the peer statistics with all sessions remaining active.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## peer

## Syntax

**peer** *ip-address* [**udp-port** *port*] [**ip**]

**peer** *ip-address* **statistics** [ **udp-port** *port*] [**ip**]

**peer** [**draining**] [{**blacklisted** | **selectable** | **unreachable**}]

## Context

[\[Tree\]](#) (show>router>l2tp peer)

## Full Context

show router l2tp peer

## Description

This command displays information regarding all configured L2TP peers.

If this command is executed without specifying a peer IP address, then a list of all L2TP peers are listed along with the type of transport used and statistics on the total number of tunnels and sessions, as well as the number of active tunnels and sessions.

If this command is executed with a specific peer IP address, then a detailed view for that peer is displayed.

## Parameters

### **ip-address**

Specifies the L2TP peer address.

### **port**

Specifies the UDP port for the L2TP peer. This parameter is only supported with L2TPv2 peers.

### **ip**

Displays peers using IP transport.

### **statistics**

Displays the statistics for the given IP address.

### **draining**

Displays only peers with draining tunnels.

### **blacklisted**

Displays peers that are denylisted.

### **selectable**

Displays peers that are selectable.

### **unreachable**

Displays peers that are deemed unreachable.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of L2TP peer operational information.

### Output Example

```
A:Dut-A# show router 200 l2tp peer

## peer

### Syntax

**peer** *ip-address* [**udp-port** *port*]

**peer** *ip-address* **statistics** [**udp-port** *port*]

**peer** [**draining**] [**blacklisted** | **selectable** | **unreachable**]

## Context

[\[Tree\]](#) (show>router>l2tp peer)

## Full Context

```
show router l2tp peer
```

## Description

This command displays L2TP peer operational information.

## Parameters

### *ip-address*

Specifies the IP address for the L2TP peer.

Values	
ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D
<b>draining</b>	keyword
<b>statistics</b>	keyword
<i>port</i>	[1 to 65535]

### *port*

Specifies the local UDP port of this L2TP.

**Values** 1 to 65535

### **draining**

Specifies to display information about the L2TP peer being drained.

### **blacklisted**

Specifies to display information about the peer has been deemed unreachable and has been put in the tunnel selection denylist.

### **selectable**

Specifies to display information about the peer has been deemed unreachable for the time specified in `tmnxL2tpXtTuSelBlacklistMaxTime` and can now be selected for a single session, after which the reachability of the peer is reevaluated.

### **unreachable**

Specifies to display information about the `sysUpTime` when the peer was deemed unreachable for the last time.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of L2TP peer information.

### Output Example

Label	Description
Peer	The IP address of the peer
Group Name	The name of the group associated with the peer
Local Address	The local IP address
State	The current state of the peer
Last State Change	The date and time of the last state change of the peer
Last Act Src Limit	The date and time when the active source limit was reached for messages received by the peer
SA Learnt	The number of SAs learned through a peer
Peer Admin State	The administrative state of the MSDP peer
Default Peer	The default peer configuration status
Peer connect retry	The number of connection attempts to the peer
SA accepted	The number of SA messages accepted from the peer
SA received	The total number of SA messages received from the peer
Active Source Limit	The active source message limit
Receive Msg Rate	The rate that the messages are read from the TCP session

Label	Description
Receive Msg Time	The time of MSDP messages that are read from the TCP session within the configured number of seconds
Receive Msg Thd	The configured threshold number of MSDP messages that can be processed before the MSDP message rate limiting function
Auth status	The authentication status of the peer
Auth Key	The authentication key for the peer
Export Policy	The export policy specified for the group
Import Policy	The import policy specified for the group

## peer

### Syntax

**peer** *ip-address* [**router** *router-instance* | **service-name** *service-name*] [**detail**]

### Context

[\[Tree\]](#) (show>system>ptp peer)

### Full Context

show system ptp peer

### Description

This command displays PTP information for a specific peer.

### Parameters

#### *ip-address*

Specifies the IPv4 or IPv6 address.

#### Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

#### *router-instance*

Displays the information for the specified router instance.

**Values** router-name – Base

vprn-svc-id – 1 to 2147483647

**service-name**

Specifies the service name, up to 64 characters, used to identify the router instance.

**detail**

Displays detailed information.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**Output**

The following output is an example of IPv6 peer information, and [Table 377: Output fields: PTP peer router detail](#) describes the output fields.

**Output Example**

```
show system ptp peer 1.1.1.1

=====

Table 377: Output fields: PTP peer router detail

Label	Description
IEEE 1588/PTP Peer Information	
Router	The name of the router instance
IP Address	The IP address of the PTP peer
Announce Direction	The direction from which PTP announce messages were sent or received
Admin State	The administrative state of the PTP peer
G.8275 Priority	The priority used in the BTCA for the local port when the clock profile is G.8275.1 or G.8275.2
Sync Interval	The message rate for Sync messages for this peer
Local PTP Port	The number of local PTP ports
PTP Port State	The state of the PTP port
monitorReceiver	The monitorReceiver state
Clock Id	The clockIdentity value of the local PTP clock
Remote PTP Port	The number of remote PTP ports

Label	Description
GM Clock Id	The clockIdentity value of the grandmaster clock advertised by the parent clock
GM Clock Class	The clockClass value of the grandmaster clock advertised by the parent clock
GM Clock Accuracy	The clockAccuracy value of the grandmaster clock advertised by the parent clock
GM Clock Variance	The offsetScaledLogVariance value of the grandmaster clock advertised by the parent clock
GM Clock Priority1	The priority1 value of the grandmaster clock advertised by the parent clock
GM Clock Priority2	The priority2 value of the grandmaster clock advertised by the parent clock
Steps Removed	The number of steps removed the PTP peer is from a grandmaster clock
Tx Timestamp Point	The transmit timestamp point
Rx Timestamp Point	The receive timestamp point
Last Tx Port	The <i>port-id</i> of the last port from which a synchronization packet was transmitted
Last Rx Port	The <i>port-id</i> of the last port into which a synchronization packet was received
Port Asymmetry	The configured asymmetry for the port (either Tx or Rx port)
Best Master	Indicates if this peer was selected as the best master clock by the BTCA
Parent Clock	Indicates if this is the parent clock. May differ from the Best Master if there is a local GNSS.
Backup Source	Indicates if this port is operating as a backup slave to the parent clock
Monitor Time State	Time recovery state of the monitored PTP port or peer
Last Packet Offset from Master	The offsetFromMaster calculated from the last packet exchange with the parent clock
Last Packet Mean Path Delay	The meanPathDelay calculated from the last packet exchange with the parent clock
APTS Asymmetry	The asymmetry computed by the backup source. This is used to compensate if the clock switches to this backup.

Label	Description
Offset from LclClk	The offset from master computed by the PTP source. This is the difference between the backup PTP source and the local clock set by the GNSS. This is similar to APTS Asymmetry but when using G.8275.1 profile.
Last Calc	The date and time at which the APTS Asymmetry or Offset from LclClk was last updated
Profile Name	The profile in use with this peer
Profile	The underlying standard profile used in the profile identified by profile name
Domain	The domain number used for this peer
IEEE 1588/PTP Unicast Negotiation Information	
Dir	The direction (transmitted or received) of the unicast negotiation packet
Type	The unicast negotiation packet type
Rate	The rate of packet transmission or reception
Duration	The duration of the packet transmission or reception interval, in seconds
State	The state of the negotiation
Time	The date and time that the negotiation state was changed
IEEE 1588/PTP Packet Statistics	
Input	The number of input packets within the specified category
Output	The number of output packets within the specified category

## peer

### Syntax

**peer** *ip-address* [**detail**]

### Context

[\[Tree\]](#) (show>service>id>ptp peer)

### Full Context

show service id ptp peer

## Description

This command displays PTP information for a specific peer.

## Parameters

### *ip-address*

Specifies the IP address.

**Values** a.b.c.d

### *detail*

Displays detailed information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following command displays PTP information for a single peer and [Table 378: Output fields: service PTP peer](#) describes the output fields.

```
show service id ptp peer detail
```

```

Table 378: Output fields: service PTP peer

Label	Description
IEEE 1588/PTP Peer Information	
Router	The name or ID of the router instance
IP Address	The IP address of the PTP peer
Announce Direction	The configured directions (transmit, receive, or both) for Announce messages
Admin State	The administrative state of the PTP peer
G.8265.1 Priority	Displays if the G.8265.1 profile has priority
Local PTP Port	The local PTP port number
PTP Port State	The PTP port state
Clock ID	The ID of the referenced clock
Remote PTP Port	The remote PTP port number
GM Clock Id	The clockIdentity value of the grandmaster clock advertised by the parent clock

Label	Description
GM Clock Class	The clockClass value of the grandmaster clock advertised by the parent clock
GM Clock Accuracy	The clockAccuracy value of the grandmaster clock advertised by the parent clock
GM Clock Variance	The offsetScaledLogVariance value of the grandmaster clock advertised by the parent clock
GM Clock Priority1	The priority1 value of the grandmaster clock advertised by the parent clock
GM Clock Priority2	The priority2 value of the grandmaster clock advertised by the parent clock
Steps Removed	The number of steps removed the PTP peer is from a grandmaster clock
Parent Clock	Displays whether a parent clock is referenced
IEEE 1588/PTP Unicast Negotiation Information	
IP Address	The IP address of the PTP peer
Dir	The direction (transmitted or received) of the unicast negotiation packet
Type	The unicast negotiation packet type
Rate	The rate of packet transmission or reception
Duration	The duration of the packet transmission or reception interval, in seconds
State	The state of the negotiation
Time	The date and time that the negotiation state was changed
IEEE 1588/PTP Packet Statistics	
Input	The number of input packets within the specified category
Output	The number of output packets within the specified category
PTP Packets	The total number of PTP packets across all PTP packet categories
Announce	The number of PTP Announce packets
Sync	The number of PTP Sync packets
Follow Up	The number of PTP Follow Up packets

Label	Description
Delay Request	The number of PTP Delay Request packets
Delay Response	The number of PTP Delay Response packets
Signaling	The number of PTP signaling packets
Request TLVs	The total number of Request TLV packets of all types (Announce, Sync, and Delay Response)
Grant TLVs (Granted)	The total number of granted Grant TLV packets of all types (Announce, Sync, and Delay Response)
Grant TLVs (Rejected)	The total number of rejected Grant TLV packets of all types (Announce, Sync, and Delay Response)
Cancel TLVs	The total number of Cancel TLV packets of all types (Announce, Sync, and Delay Response)
Ack Cancel TLVs	The total number of Ack Cancel TLV packets of all types (Announce, Sync, and Delay Response)
Announce	The number of Announce packets of the specified TLV category
Sync	The number of Sync packets of the specified TLV category
Delay Response	The number of Delay Response packets of the specified TLV category
Other TLVs	The total number of other TLV packets that do not match the other categories or types
Other	The number of PTP packets that do not match the other categories or types
Discards	The total number of discarded packets across all categories
Bad PTP domain	The number of packets discarded because of a bad PTP domain
Alternate Master	The number of packets discarded because of an alternate master being referenced
Out of Sequence	The number of out-of-sequence packets discarded
Peer Disabled	The number of packets discarded because of the peer being disabled
Other	The number of packets discarded for reasons not matching the other categories or types

## peer

### Syntax

**peer** *ip-address*

### Context

[\[Tree\]](#) (clear>redundancy>multi-chassis>mcr>statistics peer)

### Full Context

clear redundancy multi-chassis mc-ring statistics peer

### Description

This command clears multi-chassis ring peer statistics.

### Parameters

#### *ip-address*

Clears ring peer statistics for the specified IP address.

- Values**
- ipv4-address: a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x – [0 to FFFF] H
    - d – [0 to 255] D

### Platforms

All

## peer

### Syntax

**peer** *ip-address* [**router** *router-instance* | **service name** *service-name*] **statistics**

### Context

[\[Tree\]](#) (clear>system>ptp peer)

### Full Context

clear system ptp peer

## Description

This command clears PTP peer information.

## Parameters

### *ip-address*

Specifies the IPv4 or IPv6 address.

#### Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

### *router-instance*

Clears information that is specific to a virtual router instance, up to 32 characters.

### *service-name*

Clears information that is specific to a service name, up to 64 characters.

### *statistics*

Clears statistics information of the specified IP address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

## Syntax

**peer** [*ip-int-name*]

## Context

[\[Tree\]](#) (show>router>ripng peer)

## Full Context

show router ripng peer

## Description

This command displays RIPng peer information.

## Parameters

### *ip-int-name*

Displays peer information for peers on the specified IPv6 interface.

**Default** Display peers for all interfaces

## Platforms

All

## Output

The following output is an example of RIPng peer information.

### Output Example

```
*A:Dut-C>config>router>if# show router ripng peer
=====
RIP-NG Peers

## peer

### Syntax

```
peer [peer-address {ip-address | ipv6-address}] [router router-instance] [local-address {ip-address |
ipv6-address}]
```

### Context

**[Tree]** (show>subscr-mgmt>pfcsp peer)

### Full Context

```
show subscriber-mgmt pfcsp peer
```

## Description

This command displays connectivity details for a specific PFCP connection to a peer and the PFCP association to which the peer is linked. Multiple connections can exist per PFCP association.

## Parameters

### *ip-address*

Specifies the peer or local IPv4 address.

**Values** a.b.c.d

### *ipv6-address*

Specifies the peer or local IPv6 address.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x - [0 to FFFF]H  
d - [0 to 255]D

### *router-instance*

Specifies the identifier of the router where the peer is terminated.

**Values** *router-name* – base  
*vprn-svc-id* – 1 to 2147483647

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of output of the **show subscriber-mgmt PFCP peer** command.

### Output Example

```
A:BNG-UPF# show subscriber-mgmt pfcpeer peer
=====
PFCP Peers
=====
Peer router           : 990002
Peer Address          : 17.17.17.10
Local Address         : 192.0.2.11
Association           : bng-cpf
Path Mgmt State       : up
Restoration Timer Expiry : (Not Specified)
Restart Reason        : none
=====
No. of PFCP Peers: 1
=====
```

```
peer
```

### Syntax

```
peer ip-address statistics
```

### Context

[\[Tree\]](#) (clear>service>id>ptp peer)

### Full Context

```
clear service id ptp peer
```

### Description

This command clears PTP peer information.

### Parameters

#### *ip-address*

Specifies the IP address.

**Values** a.b.c.d

#### **statistics**

Clears statistics information of the specified peer.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

```
peer
```

### Syntax

```
peer [ip-address] statistics
```

### Context

[\[Tree\]](#) (clear>router>pcep>pcc peer)

### Full Context

```
clear router pcep pcc peer
```

### Description

This command clears PCEP PCC peer statistics.

## Parameters

### *ip-address*

Specifies the IP address.

**Values** a.b.c.d

### **statistics**

Clears PCEP PCC peer statistics.

## Platforms

All

## 21.31 peer-profile

### peer-profile

## Syntax

**peer-profile** [*profile-name*]

**peer-profile** *profile-name* **associations**

## Context

[\[Tree\]](#) (show>subscr-mgmt>gtp peer-profile)

## Full Context

show subscriber-mgmt gtp peer-profile

## Description

This command displays GTP peer profile information.

## Parameters

### *profile-name*

Specifies the name that identifies the profile.

### **associations**

Specifies the associated contexts for the specified peer profile.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of GTP peer profile information.

## Output Example

```
Node# show subscriber-mgmt gtp peer-profile
=====
GTP peer profiles
=====

## 21.32 peer-profile-map

### peer-profile-map

#### Syntax

**peer-profile-map**

#### Context

[\[Tree\]](#) (show>router>gtp>s11 peer-profile-map)

#### Full Context

show router gtp s11 peer-profile-map

#### Description

This command displays the peer profile mapping that is used to connect to S11 peers.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of GTP peer profile map information.

#### Output Example

```
Node# show router 20 gtp s11 peer-profile-map
=====
Peer profile map

-----
No. of address prefixes: 2
=====
```

### peer-profile-map

#### Syntax

**peer-profile-map**

#### Context

[\[Tree\]](#) (show>router>gtp>uplink peer-profile-map)

### Full Context

show router gtp uplink peer-profile-map

### Description

This command displays the peer profile map.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 21.33 peers

```
peers
```

### Syntax

```
peers [router router-instance | service-name service-name] [detail]
```

### Context

[\[Tree\]](#) (show>system>ptp peers)

### Full Context

```
show system ptp peers
```

### Description

This command displays summary information for all the PTP peers.

### Parameters

#### ***router-instance***

Displays only the information for a specific router instance.

**Values**    router-name – Base  
              vprn-svc-id – 1 to 2147483647

#### ***service-name***

Specifies the service name, up to 64 characters, used to identify the router instance.

#### **detail**

Displays detailed information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following command displays PTP peers information and [Table 379: Output fields: PTP peers](#) describes the output fields.

```
show system ptp peers
```

Table 379: Output fields: PTP peers

Label	Description
Router	The name of the router instance
IP Address	The IP address of the PTP peer
Announce Direction Anno Flow	The direction from which PTP announce messages were sent or received
Admin State	The administrative state of the PTP peer
G.8275 Priority	The priority used in the best master clock algorithm (BMCA) for the local PTP port when the clock profile is G.8275.x
Sync Interval	The network synchronization interval, in packets per second
Local PTP Port	The number of local PTP ports
PTP Port State	The state of the PTP port
Clock Id	The clockIdentity value of the local PTP clock
Remote PTP Port	The number of remote PTP ports
GM Clock Id	The clockIdentity value of the grandmaster clock advertised by the parent clock
GM Clock Class	The clockClass value of the grandmaster clock advertised by the parent clock
GM Clock Accuracy	The clockAccuracy value of the grandmaster clock advertised by the parent clock
GM Clock Variance	The offsetScaledLogVariance value of the grandmaster clock advertised by the parent clock

Label	Description
GM Clock Priority1	The priority1 value of the grandmaster clock advertised by the parent clock
GM Clock Priority2	The priority2 value of the grandmaster clock advertised by the parent clock
Steps Removed	The number of steps removed the PTP peer is from a grandmaster clock
Last Tx Port	The <i>port-id</i> of the last port from which a synchronization packet was transmitted
Last Rx Port	The <i>port-id</i> of the last port into which a synchronization packet was received
Port Asymmetry	The asymmetry value of the PTP peer, in nanoseconds
Best Master	Whether the clock has been deemed to be the best master clock
Parent Clock	Whether there is an external parent clock
APTS Asymmetry	The APTS asymmetry value of the PTP peer, in nanoseconds
Last Calc	The date and time of the last asymmetry value calculation
Profile Name	The name of the alternate profile configuration. If an alternate profile is not configured, Primary is displayed as the profile name.
Profile	The PTP profile used for the alternate profile configuration. <ul style="list-style-type: none"> <li>• g8275dot1-2014 — The PTP profile specified in the ITU-T G.8275.1 recommendation.</li> <li>• g8275dot2-2016 — The PTP profile specified in the ITU-T G.8275.2 recommendation.</li> </ul>
Domain	The domain in which PTP 1588 runs on the system.

## 21.34 peq

peq

### Syntax

**peq** [*peq-slot*] [**chassis** *chassis-id*] [**detail**]

### Context

[\[Tree\]](#) (show peq)

### Full Context

show peq

### Description

This command displays APEQ information.

### Parameters

#### *peq-slot*

Specifies the APEQ slot identifier.

**Values** 1 to 12

#### *chassis-id*

Specifies the chassis ID for the router chassis.

**Values** 1 to 2

#### **detail**

Displays detailed information.

### Platforms

7750 SR-12e, 7750 SR-s, 7950 XRS

### Output

The following outputs are examples of PEQ information, and [Table 381: Output fields: PEQ](#) describes the output fields.

#### Output Example: show peq

```
*A:Dut-A# show peq

```

**Output Fields: show peq**

Table 381: Output fields: PEQ

Label	Description
Slot	The number of the slot in which the APEQ is installed.
Provisioned Type Equipped Type (if different)	The APEQ type provisioned.
Admin State	The administrative state.
Operational State	The operational state.
Input	Specifies the input battery feed: A, or B.
Zone	Specifies the chassis power zone.
<b>Hardware Data:</b>	
Part number	The APEQ part number.
CLEI code	The APEQ CLEI code.
Serial number	The APEQ serial number.
Manufacture date	The date the APEQ was manufactured.
Manufacturing deviations	Specifies any manufacturing deviations.

Label	Description
Manufacturing assembly number	The APEQ assembly number.
Administrative state	Specifies the administrative state of the APEQ.
Operational state	Specifies the operational state of the APEQ.
Time of last boot	Indicates the time stamp of the last system restart.
Current alarm state	Indicates the current alarm state.

## 21.35 per-link-hash

### per-link-hash

#### Syntax

`per-link-hash [class {1 | 2 | 3}]`

`per-link-hash port port-id`

#### Context

[\[Tree\]](#) (show>lag per-link-hash)

#### Full Context

show lag per-link-hash

#### Description

This command displays LAG per-link hash information.

#### Parameters

*port-id*

Displays information about a specified LAG link-map profile.

**Values** 1 to 32 (VSR)  
1 to 64 (all other platforms)

#### Platforms

All

#### Output

The following output is an example of per-link hash SAP information.

[Table 382: Output fields: per-link hash SAP](#) describes per-link hash SAP output fields.

### Output Example

```

show lag 1 associations per-link-hash sap [class]
=====

## 21.36 per-peer-queuing

### per-peer-queuing

#### Syntax

`per-peer-queuing [detail]`

#### Context

[\[Tree\]](#) (show>system>security per-peer-queuing)

#### Full Context

show system security per-peer-queuing

#### Description

This command enables or disables CPM hardware queuing per peer. TTL security only operates when per-peer-queuing is enabled.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

#### Output

The following output is an example of per peer queuing information.

[Table 385: Output fields: per-peer queuing](#) describes per-peer-queuing output fields.

#### Output Example

```
A:ALA-48# show system security per-peer-queuing
=====
CPM Hardware Queuing
=====
```

```
Per Peer Queuing      : Enabled
Total Num of Queues   : 8192
Num of Queues In Use  : 2
=====
A:ALA-48# configure
```

Table 385: Output fields: per-peer queuing

Label	Description
Per Peer Queuing	Displays the status (enabled or disabled) of CPM hardware queuing per peer.
Total Num of Queues	Displays the total number of hardware queues.
Num of Queues In Use	Displays the total number of hardware queues in use.

## per-peer-queuing

### Syntax

**per-peer-queuing**

### Context

[\[Tree\]](#) (show>system>security per-peer-queuing)

### Full Context

show system security per-peer-queuing

### Description

This command displays the number of queues in use by the Qchip, which in turn is used by PPQ, CPM filter, SAP, and so on.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### Output

The following output is an example of per peer queuing information.

[Table 386: Output fields: per-peer queuing](#) describes the per-peer-queuing output fields.

### Output Example

```
A:ALA-48>show>system>security# per-peer-queuing
=====
CPM Hardware Queuing
=====
Per Peer Queuing      : Enabled
Total Num of Queues   : 8192
Num of Queues In Use  : 0
```

```
=====
A:ALA-48>show>system>security#
```

Table 386: Output fields: per-peer queuing

Label	Description
Per Peer Queuing	Displays whether per-peer-queuing is enabled or disabled. When enabled, a peering session is established and the router will automatically allocate a separate CPM hardware queue for that peer. When disabled, no hardware queuing per peer occurs.
Total Num of Queues	Displays the total number of CPM hardware queues.
Num of Queues In Use	Displays the number of CPM hardware queues that are in use.

## 21.37 perfect-stream

```
perfect-stream
```

### Syntax

```
perfect-stream
```

### Context

[\[Tree\]](#) (show>video perfect-stream)

### Full Context

```
show video perfect-stream
```

### Description

Commands in this context display perfect stream information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s

## 21.38 perform

perform

### Syntax

perform

### Context

[\[Tree\]](#) (tools perform)

### Full Context

tools perform

### Description

Commands in this context perform troubleshooting operations.

### Platforms

All

## 21.39 performance

performance

### Syntax

**performance mda mda-id last time-span time-unit**

### Context

[\[Tree\]](#) (tools>dump>wlan-gw>isa performance)

### Full Context

tools dump wlan-gw isa performance

### Description

This command generates an overview of the processing load and data processed by the specified ISA over a period of time. The following time periods are supported:

- last minute with seconds granularity
- last hour with minutes granularity
- last day with hours granularity

- last day with days granularity

## Parameters

### *mda-id*

Specifies the MDA for getting performance measurements in *slot/mda* format.

**Values** slot — 1 to 10  
mda — 1 to 2

### *time-span*

Specifies the period for which to get measurements.

**Values** 1 to 60 (sec), 1 to 60 (min), 1 to 24 (hrs), 1 (days)

### *time-unit*

Specifies the period for which to get measurements.

**Values** sec, min, hrs, days

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s

## Output

This command displays performance information.

### Output Example

```
Node# /tools dump wlan-gw isa performance mda 2/1 last 5 min
=====
Measurements for last 5 minutes on Slot #2 MDA #1
=====
Timestamp          |      Wait      Idle      Work | Total jobs |      Total data

01/22/2018 10:11:41 |    99.47%    0.53%    0.00% |          0 |      - -
01/22/2018 10:10:41 |    99.45%    0.55%    0.00% |          0 |      - -
=====
```

## performance

## Syntax

**performance mda** *mda-id* **last** *time-span* *time-unit*

## Context

**[Tree]** (tools>dump>nat>isa performance)

## Full Context

tools dump nat isa performance

## Description

This command generates an overview of the processing load and data processed by the specified ISA over a period of time. The following time periods are supported:

- last minute with seconds granularity
- last hour with minutes granularity
- last day with hours granularity
- last 31 days with days granularity

## Parameters

### *mda-id*

Specifies the MDA for getting performance measurements in format *slot/mda*.

**Values** slot — 1 to 10  
mda — 1 to 2

### *time-span*

Specifies the period for which to get measurements.

**Values** 1 to 60 (sec) | 1 to 60 (min) | 1 to 24 (hrs) | 1 to 31 (days)

### *time-unit*

Specifies the period for which to get measurements.

**Values** sec | min | hrs | days

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## 21.40 performance-monitoring

### performance-monitoring

## Syntax

**performance-monitoring record** *record*

## Context

[\[Tree\]](#) (show>system>ptp performance-monitoring)

## Full Context

```
show system ptp performance-monitoring
```

## Description

This command displays the collected performance monitoring information for the PTP clock.

## Parameters

### *record*

Specifies the time window for the record.

Values		
0		current 15-minute interval
1-96		15-minute interval within the last 24 hours
97		current 24-hour interval
98		previous 24-hour interval
501		current minute interval
502-516		one-minute interval within the last 15 minutes

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of PTP monitoring performance statistics and [Table 387: Output fields: PTP performance monitoring](#) describes the output fields.

### Output Example

```
show system ptp performance-monitoring record 503
```

```

```

Table 387: Output fields: PTP performance monitoring

Label	Description
IEEE 1588 Performance Monitoring Statistics	
Record	
Index	The name of the router instance
Valid	The IP address of the PTP peer
Start time	The direction from which PTP announce messages were sent or received
Complete	The administrative state of the PTP peer
Duration	The priority used in the best master clock algorithm (BMCA) for the local PTP port when the clock profile is G.8265.x
offset-from-master mean-path-delay master-to-slave-delay slave-to-master-delay	Parameters from the time recovery algorithm as defined in the IEEE1588-2019 standard
average minimum maximum stddev	The average, minimum, maximum, and standard deviation of the values over the time interval of the record

## 21.41 persistence

persistence

### Syntax

**persistence**

### Context

[\[Tree\]](#) (tools>perform persistence)

### Full Context

tools perform persistence

### Description

Commands in this context configure downgrade parameters.

### Platforms

All

## 21.42 persistent

persistent

### Syntax

**persistent**

### Context

[\[Tree\]](#) (show>system>telemetry persistent)

### Full Context

show system telemetry persistent

### Description

Commands in this context display persistent telemetry information.

### Platforms

All

## 21.43 pfc

pfc

### Syntax

pfc

### Context

[\[Tree\]](#) (show>subscr-mgmt pfc)

### Full Context

show subscriber-mgmt pfc

### Description

Commands in this context display all related PFCP information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 21.44 pfc-association

pfc-association

### Syntax

pfc-association *name* statistics

### Context

[\[Tree\]](#) (clear>subscr-mgmt pfc-association)

### Full Context

clear subscriber-mgmt pfc-association

### Description

This command clears all message statistics associated with the specified PFCP association.

### Parameters

*name*

Specifies the name of a PFCP association, up to 32 characters, for which information is cleared.

**statistics**

Specifies that statistics for the specified PFCP association are cleared.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 21.45 pfc-session

### pfc-session

**Syntax**

**pfc-session session-id** *session-id*  
**pfc-session sap** *sap-id* **mac** *mac-address*

**Context**

[\[Tree\]](#) (clear>subscr-mgmt pfc-session)

**Full Context**

clear subscriber-mgmt pfc-session

**Description**

This command locally clears a PFCP session, either by providing the session ID or the associated SAP ID and MAC address.

**Note:**

This command does not delete the session on the BNG CPF and should only be used as a last attempt to delete the PFCP sessions. It is always recommended to first attempt to gracefully delete the session from the BNG CPF.

**Parameters**

**session-id**

Specifies the locally assigned PFCP session ID, up to 20 characters.

**sap-id**

Specifies the SAP ID associated with the session.

**Values**

null	<i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>aps-id</i>
dot1q	<i>port-id</i>   <i>bundle-id</i>   <i>bpgrp-id</i>   <i>lag-id</i>   <i>aps-id</i>   <i>pw-id</i>   <i>eth-sat-id</i> : [ <i>qtag1</i>   <i>cp-conn-prof-id</i> ]

## 21.50 ping-template

ping-template

## Syntax

ping-template *template-name*

ping-template

## Context

[\[Tree\]](#) (show>test-oam>icmp ping-template)

## Full Context

show test-oam icmp ping-template

## Description

This command displays a summary of configured ping templates and the total number service interfaces that reference the template. By specifying template name, the values for the specified interface and the total and active references for that specific template are displayed.

## Parameters

### *template-name*

Specifies the name of the ping template to be queried, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of ping template information.

### Output Example

```
show test-oam icmp ping-template
=====

## 21.51 ping-template-sync

```
ping-template-sync
```

### Syntax

```
ping-template-sync template-name
```

### Context

[\[Tree\]](#) (tools>perform>test-oam>icmp ping-template-sync)

### Full Context

```
tools perform test-oam icmp ping-template-sync
```

### Description

This command updates all values for service IP interfaces that reference the specified **config>test-oam>icmp>ping-template** *template-name*. Changes to the **ping-template** in this context are not automatically pushed to service IP interfaces. Values imported by the service interface are those configured when the service IP interface referenced the ping- template.

### Parameters

***template-name***

Specifies the ping template name, up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 21.52 ping-template-using

```
ping-template-using
```

### Syntax

```
ping-template-using [template-name]
```

### Context

[\[Tree\]](#) (show>test-oam>icmp ping-template-using)

### Full Context

```
show test-oam icmp ping-template-using
```

## Description

This command displays information about service IP interfaces that reference a ping template, the associated router instance, and the administrative state of the ping template under that interface.

## Parameters

### *template-name*

Displays the interfaces mapped to the **ping-template** *template-name*, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example ping template output information.

### Output Example

```
show test-oam icmp ping-template-using

### Context

[\[Tree\]](#) (show>router policy)

### Full Context

show router policy

### Description

This command displays configured policy statement information.

### Parameters

#### admin

When this keyword is specified, the entire policy option configuration is displayed, including any uncommitted configuration changes. This command is similar to the **info** command.

#### Note:

This parameter is not available in the MD-CLI.

#### as-path

When this keyword is specified, the parameter displays configured as-path regular expressions (optionally filtered by name).

#### as-path-group

When this keyword is specified, the command displays configured as-path-groups, optionally filtered by name.

### **community**

When this keyword is specified, the command displays configured community lists, optionally filtered by name.

### **damping**

When this keyword is specified, the information about the route policy damping configurations is displayed.

### **entry *entry-id***

Displays the configuration (with parameter value substitution) of the subroutine policy called by the entry with entry ID.

### **exclusive-access**

Displays the policy that edits exclusive access and lock information.

#### **Note:**

This parameter is not available in the MD-CLI.

### **expand-variables**

Displays the variables that are replaced with values in main policies or in sub-policies.

### **prefix-list *name***

Displays the prefix lists configured in the route policy.

### **policy *name***

Displays information similar to the info command for a specific policy-statement. If a *name* is provided, the matching policy-statement displays. If no *statement* name is specified, a list of all policies statements and descriptions display.

### **route-distinguisher *rd-list-name***

Keyword to display all the configured route distinguisher lists. If an *rd-list-name* is provided, the specified route distinguisher list is displayed.

### **sub-policy**

When this keyword is specified, the configuration of a subroutine policy is displayed.

### ***subpol-name***

Specifies the policy name up to 64 characters.

### ***entry-id***

Specifies the numeric entry identifier of the policy.

**Values** 1 to 4294967295

## **Platforms**

All

## **Output**

[Table 390: Output fields: route policy](#) describes route policy output fields.

Use the following command to display all configured route policies.

```
show router policy
```

### Output Example

```

=====
Route Policies
=====
Policy                Description
-----
Direct And Aggregate  Policy Statement ABC
-----
Policies :
=====
    
```

Use the following command to display the entire policy option configuration, including any uncommitted configuration changes.

```
show router policy admin
```

**Note:** This command option is similar to the **info** command, which displays information about the route policies and parameters.

### Output Example

```

prefix-list "All-Routes"
  prefix 0.0.0.0/0 longer
  prefix 2.0.0.0/8 longer
  prefix 3.0.0.0/8 longer
  prefix 4.0.0.0/8 longer
  prefix 5.0.0.0/8 longer
  prefix 6.0.0.0/8 exact
  prefix 224.0.0.0/24 longer
  exit
  ...
    
```

Use the following command to display information about a specific route policy.

```
show router policy name
```

### Output Example

```

description "Policy Statement For 'BGP To RIP'"
  entry 10
    description "Entry For Policy 'BGP To RIP'"
    from
      protocol bgp
    exit
    to
      protocol rip
    exit
    action accept
      metric set 1
      next-hop 10.0.18.200
      tag 805
    exit
  exit
  default-action reject
    
```

Use the following command to display information about the route policy damping configurations.

```
show router policy damping
```

### Output Example

```
=====
Route Damping Profiles
=====
damping "TEST-LOW"
  half-life 22
  max-suppress 720
  reuse 10000
  suppress 15000
exit
damping "TEST-HIGH"
  half-life 22
  max-suppress 720
  reuse 1000
  suppress 5000
exit
damping "TEST-MEDIUM"
  half-life 22
  max-suppress 720
  reuse 5000
  suppress 11000
exit
=====
```

Use the following command to display information about the subroutine called by an entry of the route policy.

```
show router policy "poll" sub-policy entry 10 name "pol2"
```

### Output Example

```
=====
poll entry 10 sub-policies
=====
-----
Level1 Sub-policy : pol2   Parent-policy : poll, Parent-entry 10
-----
  entry 20
    from
      community "telnet"
    exit
  exit
=====
```

Table 390: Output fields: route policy

Label	Description
Policy	Displays a list of route policy names.
Description	Displays the description of each route policy.
Policies	The total number of policies configured.

## policy

### Syntax

**policy** [*policy-id* [**event** *event-type specific-qualifier*]]

### Context

[\[Tree\]](#) (show>vrrp policy)

### Full Context

show vrrp policy

### Description

This command displays VRRP priority control policy information.

If no command line options are specified, a summary of the VRRP priority control event policies displays.

### Parameters

#### *policy-id*

Displays information on the specified priority control policy ID.

**Default** All VRRP policies IDs

**Values** 1 to 9999

#### *event-type*

Displays information on the specified VRRP priority control event within the policy ID.

**Default** All event types and qualifiers

**Values** port-down, lag-port-down, host-unreachable, route-unknown, mc-ipsec-non-forwarding

#### *specific-qualifier*

Display information about the specified qualifier.

**Values** port-id, lag-id, host-ip-addr, route-prefix/mask, tunnel-group-id

### Platforms

All

### Output

**VRRP Policy Output** — The following output is an example of VRRP policy information, and [Table 391: Output fields: VRRP policy](#) describes the fields.

Table 391: Output fields: VRRP policy

Label	Description
Policy Id	The VRRP priority control policy associated with the VRRP virtual router instance  A value of 0 indicates that no control policy is associated with the virtual router instance
Current Priority & Effects	
Current Explicit	When multiple explicitly defined events associated with the priority control policy happen simultaneously, the lowest value of all the current explicit priorities will be used as the in-use priority for the virtual router
Current Delta Sum	The sum of the priorities of all the delta events when multiple delta events associated with the priority control policy happen simultaneously; this sum is subtracted from the base priority of the virtual router to give the in-use priority
Delta Limit	The delta-in-use-limit for a VRRP policy; once the total sum of all delta events has been calculated and subtracted from the base-priority of the virtual router, the result is compared to the delta-in-use-limit value; if the result is less than this value, the delta-in-use-limit value is used as the virtual router in-use priority value; if an explicit priority control event overrides the delta priority control events, the delta-in-use-limit has no effect  If the delta-in-use-limit is 0, the sum of the delta priority control events to reduce the virtual router's in-use-priority to 0 can prevent it from becoming or staying master
Current Priority	The configured delta-in-use-limit priority for a VRRP priority control policy or the configured delta or explicit priority for a priority control event
Applied	The number of virtual router instances to which the policy has been applied; the policy cannot be deleted unless this value is 0
Description	A text string which describes the VRRP policy
Event Type & ID	A delta priority event is a conditional event defined in a priority control policy that subtracts a given amount from the base priority to give the current in-use priority for the VRRP virtual router instances to which the policy is applied  An explicit priority event is a conditional event defined in a priority control policy that explicitly defines the in-use priority for the VRRP virtual router instances to which the policy is applied

Label	Description
	Explicit events override all delta events; when multiple explicit events occur simultaneously, the event with the lowest priority value defines the in-use priority
Event Oper State	The operational state of the event
Hold Set Remaining	The amount of time that must pass before the set state for a VRRP priority control event can transition to the cleared state to dampen flapping events
Priority & Effect	Delta — the <i>priority-level</i> value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set; the sum of the priority event <i>priority-level</i> values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value  If the <b>delta</b> priority event is cleared, the <i>priority-level</i> is no longer used in the in-use priority calculation
	Explicit — the <i>priority-level</i> value is used to override the base priority of the virtual router instance if the priority event is set and no other <b>explicit</b> priority event is set with a lower <i>priority-level</i>  The set <b>explicit</b> priority value with the lowest <i>priority-level</i> determines the actual in-use protocol value for all virtual router instances associated with the policy
In Use	Specifies whether the event is currently affecting the in-use priority of some virtual router

### Output Example

```

Table 392: Output fields: VRRP policy event

Label	Description
Description	A text string which describes the VRRP policy
Policy Id	The VRRP priority control policy associated with the VRRP virtual router instance  A value of 0 indicates that no control policy is associated with the virtual router instance
Current Priority	The base router priority for the virtual router instance used in the master election process
Current Explicit	When multiple explicitly defined events associated with the priority control policy happen simultaneously, the lowest value of all the current explicit priorities will be used as the in-use priority for the virtual router

Label	Description
Applied	The number of virtual router instances to which the policy has been applied; the policy cannot be deleted unless this value is 0
Current Delta Sum	The sum of the priorities of all the delta events when multiple delta events associated with the priority control policy happen simultaneously; this sum is subtracted from the base priority of the virtual router to give the in-use priority
Delta Limit	The delta-in-use-limit for a VRRP policy; once the total sum of all delta events has been calculated and subtracted from the base-priority of the virtual router, the result is compared to the delta-in-use-limit value; if the result is less than this value, the delta-in-use-limit value is used as the virtual router in-use priority value; if an explicit priority control event overrides the delta priority control events, the delta-in-use-limit has no effect  If the delta-in-use-limit is 0, the sum of the delta priority control events to reduce the virtual router's in-use-priority to 0 can prevent it from becoming or staying master
Applied to Interface Name	The interface name where the VRRP policy is applied
VR ID	The virtual router ID for the IP interface
Opr	Up — indicates that the operational state of the VRRP instance is up
	Down — indicates that the operational state of the VRRP instance is down
Base Pri	The base priority used by the virtual router instance
InUse Priority	The current in-use priority associated with the VRRP virtual router instance
Master Priority	The priority of the virtual router instance which is the current master
Priority	The base priority used by the virtual router instance
Priority Effect	Delta — a delta priority event is a conditional event defined in a priority control policy that subtracts a given amount from the base priority to give the current in-use priority for the VRRP virtual router instances to which the policy is applied
	Explicit — a conditional event defined in a priority control policy that explicitly defines the in-use priority for the VRRP virtual router instances to which the policy is applied

Label	Description
	Explicit events override all delta events; when multiple explicit events occur simultaneously, the event with the lowest priority value defines the in-use priority
Current Priority	The configured delta-in-use-limit priority for a VRRP priority control policy or the configured delta or explicit priority for a priority control event
Event Oper State	The operational state of the event
Hold Set Remaining	The amount of time that must pass before the set state for a VRRP priority control event can transition to the cleared state to dampen flapping events
Priority	The base priority used by the virtual router instance
Priority Effect	Delta — the <i>priority-level</i> value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set; the sum of the priority event <i>priority-level</i> values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value  If the <b>delta</b> priority event is cleared, the <i>priority-level</i> is no longer used in the in-use priority calculation
	Explicit — the <i>priority-level</i> value is used to override the base priority of the virtual router instance if the priority event is set and no other <b>explicit</b> priority event is set with a lower <i>priority-level</i>  The set <b>explicit</b> priority value with the lowest <i>priority-level</i> determines the actual in-use protocol value for all virtual router instances associated with the policy
Hold Set Config	The configured number of seconds that the hold-set timer waits after an event enters a set state or enters a higher threshold set state, depending on the event type
Value In Use	Yes — the event is currently affecting the in-use priority of some virtual router
	No — the event is not affecting the in-use priority of some virtual router
# trans to Set	The number of times the event has transitioned to one of the 'set' states
Last Transition	The time and date when the operational state of the event last changed

## policy

### Syntax

**policy** [*policy-id*] **association**

### Context

[\[Tree\]](#) (show>system>security>cpu-protection policy)

[\[Tree\]](#) (show>system>security>dist-cpu-protection policy)

### Full Context

show system security cpu-protection policy

show system security dist-cpu-protection policy

### Description

This command displays CPU protection policy information.

### Parameters

#### *policy-id*

Displays CPU protection policy information for the specified policy ID.

#### **association**

This keyword displays associations for the specified policy ID.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

- show system security cpu-protection policy

All

- show system security dist-cpu-protection policy

## policy

### Syntax

**policy** *policy-assoc-name*

### Context

[\[Tree\]](#) (show>router>pcep>pcc>pce-assoc policy)

### Full Context

show router pcep pcc pce-associations policy

## Description

This command displays the policy association information.

If a policy association name is not specified, the information for all configured policy associations is displayed.

## Parameters

### *policy-assoc-name*

Specifies the name of the policy association, up to 32 characters.

## Platforms

All

## Output

The following output is an example of policy association information, and [Table 393: Output fields: policy association](#) describes the output fields.

### Output Example

```
*A:Dut-C>config>router>mpls>lsp# show router pcep pcc pce-associations policy "test_pol"
=====
PCEP PCC Policy Associations Info
=====
Association Name   : test_pol
Association ID     : 10
Association Source : 192.168.213.59
=====
```

Table 393: Output fields: policy association

Label	Description
Association Name	The policy association name
Association ID	The policy association ID
Association Source	The source IP address of the policy association. Both IPv4 and IPv6 are supported.

## 21.59 policy-edits

### policy-edits

## Syntax

**policy-edits**

## Context

[\[Tree\]](#) (show>router policy-edits)

## Full Context

show router policy-edits

## Description

This command displays edited policy information that was entered in the classic CLI.

### Note:

This command is not available in the MD-CLI.

## Platforms

All

## 21.60 policy-test

### policy-test

## Syntax

**policy-test** *plcy-or-long-expr* [ *plcy-or-expr* [*plcy-or-expr*...{up tp 14 max}] [family *family*] [rd *rd*] **prefix** *ip-prefix/ip-prefix-length* [ **longer**] [neighbor *ip-address*] [display-rejects] [{detail | brief}] [display-rejects-only] [export] [ protocol *protocol*]

## Context

[\[Tree\]](#) (show>router>bgp policy-test)

## Full Context

show router bgp policy-test

## Description

This command allows the operator to evaluate existing route policy or chain of route policies or route policy logical expression effects, as a BGP import or export policy, by identifying the routes that would be accepted or rejected after the complete evaluation.

When the policy, list of policies or logical expression is used as a BGP export policy, the **export** keyword must be included. When the policy is used as a BGP import policy, the **export** keyword should not be included.

## Parameters

### *plcy-or-long-expr*

Specifies up to 14 policy names or a long expression.

**Values** policy-name: a policy name, up to 64 characters  
long-expr: a long expression, up to 255 characters.

### ***plcy-or-expr***

Specifies the policy name or expression.

**Values** policy-name: a policy name, up to 64 characters  
expr: an expression, up to 64 characters

### ***family***

ipv4, ipv6, vpn-ipv4, vpn-ipv6, label-ipv4, label-ipv6.

**Default** ipv4

### ***rd***

Specifies the route distinguisher value in one of the following formats:

- *ip-addr.comm-val*
- *2byte-asnumber.ext-comm-val*
- *4byte-asnumber.comm-val*

### ***ip-prefix/ip-prefix-length***

Specifies an IPv4 or IPv6 prefix/mask to be evaluated. The keyword **longer** may be specified to evaluate longer prefix matches (optional).

### ***ip-address***

Specifies the IPv4 or IPv6 address of a peer from which the BGP routes to be evaluated were sent, up to 64 characters.

### ***longer***

Matches prefixes with a longer prefix-length.

### ***display-rejects***

Displays routes that were rejected by the policy. If not specified, only a count of rejected routes are shown.

### ***detail***

When the policy modifies route attributes, it displays the modifications made to the routes. This command requires an exact prefix to be specified.

### ***brief***

Provides a summarized display of the route attributes modifications. This command requires an exact prefix to be specified.

### ***display-rejects-only***

Displays only routes rejected by the policy test.

### ***export***

Indicates that the policy test is conducted in the context of a BGP export policy. The analyzed set of routes also include non-BGP routes that can be redistributed by BGP.

### ***protocol***

Displays routes by the protocol type. This keyword is only applicable when the **export** keyword is also present.

## Platforms

All

## Output

The following output is an example of policy test information, and [Table 394: Output fields: policy test field](#) describes the output fields.

### Output Example

*Table 394: Output fields: policy test field*

<b>Field</b>	<b>Description</b>
Status codes	Codes used for used, suppressed, history, decayed or valid status
Origin codes	Codes used for IGP, EGP, incomplete, best or backup origin
Flag	Indicator for network, nexthop or as-path routes

## 22 p Commands – Part II

### 22.1 pool

```
pool
```

#### Syntax

```
pool pool-name
```

#### Context

[\[Tree\]](#) (tools>perform>router>dhcp6>server pool)

[\[Tree\]](#) (tools>perform>router>dhcp>server pool)

#### Full Context

```
tools perform router dhcp6 local-dhcp-server pool
```

```
tools perform router dhcp local-dhcp-server pool
```

#### Description

This command performs local DHCP or DHCP6 server IP address pool tasks.

#### Parameters

*pool-name*

Specifies the pool name.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
pool
```

#### Syntax

```
pool pool-name
```

```
pool
```

#### Context

[\[Tree\]](#) (show>router>nat pool)

## Full Context

```
show router nat pool
```

## Description

This command displays NAT pool information.

## Parameters

### *pool-name*

Specifies the pool name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of this command.

### Output Example

```
show router nat pool

## 22.2 pool-ext-stats

### pool-ext-stats

#### Syntax

```
pool-ext-stats [pool-name]
```

#### Context

[\[Tree\]](#) (show>router>dhcp>server pool-ext-stats)

#### Full Context

```
show router dhcp local-dhcp-server pool-ext-stats
```

#### Description

This command displays extended statistics per DHCPv4 pool in local DHCPv4 server.

The following statistics are included in output:

- The number of stable leases in the pool
- The number of provisioned address in the pool
- The number of used address in the pool
- The number of free address in the pool
- The percentage of used address
- The percentage of free address

For each statistic (except for provisioned addresses), there is current value and peak value, peak value is the highest value since pool creation or last reset via the **clear router *rt-id* dhcp local-dhcp-server *svr-name* pool-ext-stats** command.

#### Parameters

***pool-name***

Specifies the name of DHCPv4 local server pool.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of pool extended statistics information.

### Output Example

```

show router 500 dhcp local-dhcp-server "d4" pool-ext-stats "pool-1"
=====
Extended pool statistics for server "d4"

[Table 395: Output fields: extended pool statistics](#) describes extended pool statistics output fields.

*Table 395: Output fields: extended pool statistics*

Field	Description
Current	The current pool statistics
Peak	The peak value since the last reset
Timestamp	The date and time of the last reset
Pool	The pool name
Stable Leases	The number of stable leases in the pool
Provisioned Addresses	The number of provisioned addresses in the pool
Used Addressed	The number of used addresses in the pool
Free Addresses	The number of free addresses in the pool
Used Pct	The percentage of subnets in use in the pool
Free Pct	The percentage of unused subnets in the pool
Last Reset Time	The date and time of the last reset in the pool
Number of entries	The total number of entries

## pool-ext-stats

### Syntax

```
pool-ext-stats [pool-name]
```

### Context

**[Tree]** (show>router>dhcp6>server pool-ext-stats)

### Full Context

```
show router dhcp6 local-dhcp-server pool-ext-stats
```

### Description

This command displays extended statistics per DHCPv6 pool in local DHCPv6 server.

The following statistics are included in output:

- The number of stable leases in the pool
- The number of provisioned /64 address block in the pool
- The number of used /64 address block in the pool
- The number of free /64 address block in the pool
- The percentage of used address (with /64 address block)
- The percentage of free address (with /64 address block)

For each statistic (except for Provisioned Addresses), there is current value and peak value, peak value is the highest value since pool creation or last reset via command "clear router <rt-id> dhcp6 local-dhcp-server <svr-name> pool-ext-stats".

### Parameters

***pool-name***

Specifies the name of DHCPv6 local server pool.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### Output

The following output is an example of subnet statistics information.

### Output Example

```
show router 500 dhcp6 local-dhcp-server "d6" pool-ext-stats "pool-v6"
=====
Extended pool statistics for server "d6"

Table 397: Output fields: failover pool statistics describes pool statistics output field descriptions.

Table 397: Output fields: failover pool statistics

Field	Description
Failover Admin State	Identifiers the failover state of the DHCP server instance inService — The failover admin state is in service outOfService — The failover admin state is out of service
Failover Oper State	The operational state of a DHCP server instance
Failover Persist Key	The maximum amount of time that one server can extend a lease for a client's binding beyond the time known by the partner server
Administrative MCLT	The administrative Maximum Client Lead Time (MCLT)
Operational MCLT	Indicates the operational MCLT

Field	Description
Startup Wait Time	The startup wait time. The startup wait time is the time that one IP address pool attempts to contact the partner IP address pool. During this time, the IP address pool is unresponsive to DHCP client requests.
Partner Down Delay	The minimum safe-time after the beginning of COMMUNICATIONS-INTERRUPTED state.  After the expiry of this time, the server enters the PARTNER-DOWN state.
Ignore McLT	The ignore McLT status. If, after the transition COMMUNICATIONS-INTERRUPTED-to-PARTNER-DOWN state, the DHCP server instance ignores the safety period with a duration of Maximum Client Lead Time; a 'true' value has the effect that the DHCP server starts offering IP addresses from the partner's scope immediately after this transition, without waiting for existing leases allocated by the partner and not known by this system to time out.  A 'true' value increases the risk that duplicate addresses are offered; if the transition to PARTNER-DOWN state is likely to be caused by a failure of the partner system rather than a communications problem, this risk is reduced.
Failover statistics for pool	The failover statistics for each pool
Dropped Invalid Packets	The number of BNDUPD packets that were dropped because the packet was malformed
Failover Shutdown	The number of BNDUPD packets that were dropped because the failover state if the DHCP server instance is shut down
Lease Already Expired	The number of BNDUPD packets that were dropped because the corresponding lease has expired
Maximum Lease Count Reached	The number of BNDUPD packets that were dropped because the maximum number of leases were reached
Subnet Not Found	The number of BNDUPD packets that were dropped because a valid subnet could not be found for the lease
Range Not Found	The number of BNDUPD packets that were dropped because a valid include range could not be found for the lease.
Host Conflict	The number of BNDUPD packets that were dropped because this DHCP server instance has already leased this address to another host

Field	Description
Address Conflict	The number of BNDUPD packets that were dropped because this DHCP server instance has already leased another address to this host
Peer Conflict	The number of BNDUPD packets that were dropped because the failover peer has leased an address within a subnet range of which the failover control is set to <b>local</b> on this local DHCP server instance
Persist Congestion	The number of BNDUPD packets that were dropped because of persistence congestion on this DHCP server instance
No Lease Hold Time Configured	The number of BNDUPD packets that were dropped because the lease hold time is zero on this DHCP server instance
Lease Not Found	The number of Binding Database Update (BNDUPD) remove packets were dropped because the corresponding lease could not be found.
Number of pools found	The total number of pools found

## 22.4 pool-threshold-stats

### pool-threshold-stats

#### Syntax

```
pool-threshold-stats [pool-name] detail [ format {exact | scientific}]
pool-threshold-stats [pool-name]
```

#### Context

[\[Tree\]](#) (show>router>dhcp6>server pool-threshold-stats)

#### Full Context

```
show router dhcp6 local-dhcp-server pool-threshold-stats
```

#### Description

This commands displays pool level threshold stats of local DHCPv6 server. A minimum-free threshold needs to be configured before system collects threshold stats for the prefix.

The stats for each threshold are calculated based on the configured minimum-free prefix length.

For example, a /59 prefix is provision in the local DHCPv6 server, and the server allocated two PD leases, one /62 and one /63. And there is a /63 minimum threshold configured. The threshold stats are calculated

based on /63 as the base unit (block). Then the value of current used block would be 3 because there is one /62 lease and one /63 lease, that equals to a total of three /63.

## Parameters

### *pool-name*

Specifies the name of the pool in local DHCPv6 server.

### *detail*

Displays detailed output.

### *format*

Specifies the format in the display to be either **exact** or **scientific**.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of pool threshold statistics information.

### Output Example

```
show router 500 dhcp6 local-dhcp-server "d6" pool-threshold-stats "1"
=====
Server "d6"
=====
Operational state      : inService
-----
Pool                   : 1
-----
Stable leases         : 2
Advertised leases     : 0
-----
Threshold  Used    Peak  Too low  Depleted  Peak timestamp
-----
/62        25%    25%   N        N         01/21/2015 21:52:12
/63        19%    19%   N        N         01/21/2015 21:52:12
```

The command shown above displays an overview of pool level thresholds in the specified pool:

- The **Peak** field indicates the peak value of used
- The **Too low** field indicate if the configured minimum-free threshold is exceeded
- The **Depleted** field indicate if there is no available prefix with the length in the provisioned prefix
- The **Peak timestamp** field indicates the time of peak used value

```

```

The above command displays detailed statistics of all pool level thresholds in the specified pool:

- **Blks** in the output means the minimum free prefix length.
- **Valid Data** output indicates whether the data you see is valid or not. The data is invalid when a background stats update is scheduled or busy.

Table 398: Output fields: pool threshold statistics describes pool threshold statistics output fields.

Table 398: Output fields: pool threshold statistics

Field	Description
Operational state	The operational state of the local DHCP server instance unknown — The operational state is unknown inService — The operational state is in service outOfService — The operational state is out of service transition — The operational state is in transition waitPersistence — The DHCP server instance is waiting for a persistence action to complete.
Pool	The pool ID
Stable Leases	The number of stable leases
Advertised leases	The number of advertised leases
Threshold	The prefix level threshold
Current Provisioned Blks	The number of provisioned blocks in this pool
Current Used Blks	The number of used blocks in this pool
Current Free Blks	The number of free blocks in this pool
Current Used Percent	The percentage of used prefixes with the minimum free threshold length in the pool compared to the number of provisioned prefixes
Current Used Peak Blks	A 64-bit word of the peak value of the number of used blocks in the pool with a prefix length
Current Used Peak Percent	The peak value of the number of used prefixes with the minimum free threshold length in the pool as a percentage of the provisioned prefixes. This depends on the current failover state of the DHCP server or pool
Current Used Peak Time	The time at which the peak value of the number of used prefixes in the pool was reached
Current Free Percent	The percentage of free prefixes with the minimum free threshold length in the pool compared to the number of provisioned prefixes. This depends on the current failover state of the DHCP server or pool
Current Free Too Low	The number of free prefixes with the minimum free threshold length available in the pool that is below the configured number of prefixes with the minimum free threshold length

Field	Description
Current Free Depleted	The number of prefixes with the minimum free threshold length available in the pool
Local Provisioned Blks	A 64-bit word of the number of provisioned prefixes with the minimum free threshold length local in the pool
Local Used Blks	A 64-bit word of the number of used prefixes with the minimum free threshold length local in the pool
Local Free Blks	A 64-bit word of the number of free prefixes with the minimum free threshold length local in the pool
Local Used Peak Blks	A 64-bit word of the peak value of the number of used prefixes with the minimum free threshold length local in the pool
Local Used Peak Percent	The peak value of the number of used prefixes with the minimum free threshold length local in the pool as a percentage of the provisioned prefixes
Local Used Peak Time	The time at which the peak value of the number of used prefixes local in the pool was reached
Remote Provisioned Blks	A 64-bit word of the number of provisioned prefixes with the minimum free threshold length remote in the pool
Remote Used Blks	A 64-bit word of the number of used prefixes with the minimum free threshold length remote in the pool
Remote Free Blks	A 64-bit word of the number of free prefixes with the minimum free threshold length remote in the pool

## pool-threshold-stats

### Syntax

**pool-threshold-stats** [*pool-name*]

### Context

[\[Tree\]](#) (clear>router>dhcp6>server pool-threshold-stats)

### Full Context

clear router dhcp6 local-dhcp-server pool-threshold-stats

### Description

This commands resets the peak stats in the pool level threshold stats in the specified pool. If the pool name is not specified, then the peak stats in all pools in the server are reset.

## Parameters

### *pool-name*

Clears information about the specified local DHCPv6 server pool.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Context

[\[Tree\]](#) (show pools)

## Full Context

show pools

## Description

This command displays pool information.

## Parameters

### *mda-id*[/*port*]

Displays the pool information of the specified MDA and port.

**Values** slot/mda[/port]

***access-app***

Specifies the pool application as either access ingress or egress.

**Values** access-ingress, access-egress

***pool-name***

Displays the pool information of the specified pool. If specified, the name must be **default**.

***service-id***

Displays the pool information for the specified service.

**Values** 1 to 2148278386, *svc-name*: 64 char max

***queue-group-name***

Displays the information for the specified queue group.

**Values** 32 chars max

***instance-id***

Specifies the identification of a specific instance of the queue group.

**Values** 1 to 65535

***network-egress***

Displays the network egress information.

***direction***

Displays the information for the ingress or egress direction.

**Values** ingress, egress

***slot-number***

Displays the information for the specified card slot.

**Values** 1 to 10

***fp-number***

Displays the information for the specified FP.

**Values** 1 to 8

***app-ingress***

Displays the network ingress or access ingress information.

**Values** network-ingress, access-ingress

***statistics***

Displays the buffer pool statistics.

**Platforms**

All

## Output

The following outputs are example of pool information, and [Table 399: Output fields: pools](#) describes the output fields.

**Note:**

The pool shared in use stat only increases when a queue is asking for a buffer outside its reserved size. If all the buffers in a pool are assigned to queues within their reserved size, then only the reserved in use size will increase. In case of resv CBS over subscription (CBS sum for all queues is bigger than pool resvCbs), it is possible that pool resv in use stat can increase above the actual pool reserved size.

### Output Example: show pools

**Output Fields: show pools**

Table 399: Output fields: pools describes the output fields for the **show pools** command.

Table 399: Output fields: pools

Label	Description
Type	Specifies the pool type.
ID-FP	Specifies the card-FP or MDA-FP or card, MDA, or port designation.
Application/Type	Specifies what the pool would be used for. The pools could be used for access or network traffic at either ingress or egress.
Pool Name	Specifies the name of the pool being used.
Resv CBS	Specifies the percentage of pool size reserved for CBS.
Utilization	Specifies the type of the slope policy.
State	The administrative status of the port.
Start-Avg	Specifies the percentage of the buffer utilized after which the drop probability starts to rise above 0.
Max-Avg	Specifies the percentage of the buffer utilized after which the drop probability is 100 percent. This implies that all packets beyond this point will be dropped.
Time Avg Factor	Specifies the time average factor the weighting between the previous shared buffer average utilization result and the new shared buffer utilization in determining the new shared buffer average utilization.
Actual ResvCBS	Specifies the actual percentage of pool size reserved for CBS.
Admin ResvCBS	Specifies the percentage of pool size reserved for CBS.
PoolSize	Specifies the size in percentage of buffer space. The value '-1' implies that the pool size should be computed as per fair weighting between all other pools.
Pool Total	Displays the total pool size.

Label	Description
Pool Shared	Displays the amount of the pool which is shared.
Pool Resv	Specifies the percentage of reserved pool size.
Pool Total In Use	Displays the total amount of the pool which is in use.
Pool Shared In Use	Displays the amount of the pool which is shared that is in use.
Queue	Specifies the number of packets/octets discarded in the queue.
Exceed-Slope	Specifies the number of packets/octets discarded because of wred-slope (exceed).
Low-Slope	Specifies the number of packets/octets discarded because of wred-slope (low).
High-Slope	Specifies the number of packets/octets discarded because of wred-slope (high).
HiPlus-Slope	Specifies the number of packets/octets discarded because of wred-slope (hiPlus).
Pool Shared	Specifies the number of packets/octets discarded by exceeding shared-buffer-pool size.
Pool Total	Specifies the number of packets/octets discarded after the total size of the bufferpool is reached.

## pools

### Syntax

**pools** *port-id* {**access-ingress** | **access-egress** | **network-egress**} **statistics**  
**pools** *slot-number fp fp-number* {**network-ingress**} **statistics**

### Context

[\[Tree\]](#) (clear pools)

### Full Context

clear pools

### Description

This command clears buffer pool statistics.

### Parameters

***port-id***

Clears information for the specified port.

**Values** 18 characters maximum

### **slot-number**

Clears information for the specified card slot.

**Values** 1 to 10

### **fp-number**

Clears information for the specified FP.

**Values** 1 to 8

### **statistics**

Clears buffer pool statistics.

**Values** **Keyword**

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## **22.6 port**

## Context

[\[Tree\]](#) (show port)

## Full Context

show port

## Description

This command displays port or channel information.

If the *port-id* parameter only specifies a portion of a port identifier, a summary of all ports that start with that portion is displayed. For example, specifying a slot number and MDA number displays a summary of all ports on that MDA. If no *port-id* is provided, a summary of all ports in the system is displayed.

If the **detail** keyword is specified without any *port-id*, the detailed output of every port is displayed. This is useful for generating a complete report or as an input into the | **match** post-filtering command to display only specific fields for all ports (customized summaries).

If the *port-id* specifies a unique port, information about that port is displayed. The specific information displayed depends on the type of port. Additional information can be displayed if the **detail** keyword is included. In addition, information subsets can be displayed by using various keywords. For example, the **otu** keyword displays only the OTU interface information for the port.

When the **associations** keyword is specified and the *port-id* is a member of a LAG, the command is interpreted as a request to display the associations of that LAG (see the **show lag lag-id associations** command).

## Parameters

### *port-id*

Specifies the physical port ID in the form *slot/mda/port*. The following table describes the port ID values.

Table 400: Output fields: port ID values

Product	Slot	MDA	Port	Values
7750 SR-12	1 to 10	1, 2	1 to 60 (depending on the MDA type)	—
7750 SR-7	1 to 5	1, 2		—
7950 XRS	1 to 20	—		—
7450 ESS-7	—	—		1 to 4
7450 ESS-12	—	—		1 to 0
7750 SR single-slot FP5	—	—		A/gnss
7750 SR-2se	—	—		A/gnss
				B/gnss
<b>Channelized MDAs</b>				
CHOC12-SFP	—			<i>slot/mda/port</i> [1 to 4]. [1 to 3]. [1 to 28]. [..24] For example, 7/2/1.1.1.28.24
CHOC3-SFP	—			<i>slot/mda/port</i> . [1 to 3]. [1 to 28]. [..24] For example, 7/2/1.1.28.24
DS3	—			<i>slot/mda/port</i> . [1 to 28] . [..24] For example, 7/1/1.1.1

**Values**

---

	WLAN-GW tunnel traffic from/toward access points, or for a reassembly traffic over a SAP-based interface
<b>nat-out-ip</b>	Information/statistics on the internal interface toward a BB ESA-VM for NAT44, DS-Lite, NAT64 and L2-aware NAT upstream/downstream traffic on the outside, or for WLAN-GW UE traffic from/toward the network
<b>nat-in-l2</b>	Information/statistics on the internal interface toward a BB ESA-VM for L2-aware NAT
<b>lns-net</b>	Information/statistics on the internal interface toward a LNS ESA-VM, L2TP encapsulated packets from the LAC undergoes L2TP header removal
<b>lns-esm</b>	Information/statistics on the internal interface toward a LNS ESA-VM, IP packets from the network which undergoes L2TP encapsulation
<b>nat-in-ds</b>	Information/statistics on the internal interface toward a BB ESA-VM for DS-lite upstream/downstream traffic on the inside
<b>lo-gre</b>	Information/statistics on the internal interface between a WLAN-GW anchor ESA VM and tunnel ESA VM, for both up and downstream traffic

#### **access**

Keyword that displays the queue group name is on an access port.

#### **active**

Keyword that displays only active events.

#### **aggregate-queue**

Keyword that displays the aggregated number of forwarded and dropped packets and bytes per direction across all queues on a PXC port (pxc-<id>.a or pxc-<id>.b).

The system aggregates statistics from all queues under the specified PXC port for presentation. The duration required to gather these statistics is typically brief, though it may vary based on the system load at the time of querying and the number of queues and member ports in a LAG.

Statistics are cached for a 30-second interval. Consequently, executing this command more frequently than every 30 seconds yields identical results and the tmnxPortLastFetchedTime MIB entry and YANG state variable does not change.

**aps**

Keyword that displays the ports on APS groups.

**associations**

Keyword that displays a list of port association.

**cleared**

Keyword that displays remote information about the bridge MAC.

**degraded**

Keyword that displays degrade severity events.

**description**

Keyword that displays port description strings.

**detail**

Keyword that displays detailed information.

**dot1x**

Keyword that displays information about 802.1x status and statistics.

**egress**

Keyword that displays whether the queue group name is an egress policy.

**egress-aggregate**

Keyword that displays aggregate egress statistics.

**ethernet**

Keyword that displays Ethernet port information.

**failure**

Keyword that displays failure severity events.

**A/gnss**

Keyword that displays interface information for the GNSS port on CPM A.

**B/gnss**

Keyword that displays interface information for the GNSS port on CPM B.

**hs-secondary-shaper**

Keyword that displays information about a specific HS secondary shaper on a port.

**ingress**

Keyword that displays whether the queue group name is an ingress policy.

**instance-id**

Specifies the identification of a specific instance of the queue group.

**Values** 1 to 65535

**macsec**

Keyword that displays the MACsec information for the port.

**monitor-threshold**

Keyword that displays the exceed-count for the port-scheduler under Vport (if specified) or for a physical port.

**optical**

Keyword that displays optical information.

**otu**

Keyword that displays optical transport unit (OTU) information.

**nearest-bridge**

Keyword that displays nearest bridge information.

**nearest-customer**

Keyword that displays nearest customer information.

**nearest-non-tpmr**

Keyword that displays nearest Two-Port MAC Relay (TPMR) information.

**network**

Keyword that displays the queue group name is on a network port.

**port-scheduler**

Keyword that displays the packet and octet counters for traffic exiting the specified port with an applied port scheduler policy, showing the total forwarded and dropped packets and octets, and the forwarded and dropped packets and octets per level.

**queue**

Keyword that displays the queue information.

**queue-depth**

Keyword that displays queue depth information for the specified queue group queue.

**queue-group**

Keyword that displays the queue group information.

**queue-group-name**

Specifies the name of an existing queue group template, up to 32 characters.

**queue-id**

Specifies the queue identification.

**Values** 1 to 16

**remote-info**

Keyword that displays remote information about the bridge MAC.

**secondary-shaper-name**

Displays information about the HS secondary name, up to 32 characters.

**statistics**

Keyword that displays port statistics.

**vport-name**

Specifies the name of the Vport up, to 32 characters in length.

**Platforms**

All

## Output

The following outputs are examples, and [Table 401: Output fields: port ID](#) provides an alphabetized list of descriptions for the output fields.

**Output Example: show port <port-id> [statistics [egress-aggregate]] [detail]**

The output displays the aggregate egress queue statistics for ports configured with monitor-agg-egress-queue-stats which have non-zero counters. This can be shown for a single port, or all ports on an MDA or card. When the detail parameter is added, the output includes those ports with counters that are all zero.

```

If the Vport name is omitted, statistics for all Vports are displayed (bulk read). The statistics are displayed only for the levels, groups, and agg-eps for which the monitor-threshold is enabled. The output information filtering per level, group, or agg-eps is not embedded in the show commands natively. Instead, the output can be filtered with the match extensions for the show command. For example, **show port 1/1/1 vport test monitor-threshold | match Lvl-1**.

**Table 401: Output fields: port ID** describes the output fields for the **show port <port-id>** command.

*Table 401: Output fields: port ID*

Label	Description
50GHz Ch Min/Max	The 50 GHz channel minimum and maximum
100GHz Ch Min/Max	The 100 GHz channel minimum and maximum
Acct Pol	The accounting policy for the egress queue-group
ACL Filter Discards	The packet was dropped by a filter (ACL) on the line card (such as IP or MAC filter). Packets dropped by CPM filters or ESM anti-spoof filters do not increment this counter.
Active Pre-Shared Key CKN	The active PSK CAK name
Active Pre-Shared Key Index	The active pre-shared key index: 1 to 2 (default 1)
Adapter Type	The type of adapter module
Addr Ctrl Invalid	The number of invalid address control received
Address	The IP address associated with the index

Label	Description
Admin CIR	The administrative Committed Information Rate (CIR) parameters for the queue. The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth.
Admin FIR	The admin queue FIR rate
Admin PIR	The administrative Peak Information Rate (PIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric out an egress interface.
Admin State	Up — The entity is administratively up Down — The entity is administratively down
Agg. Limit	The agg-rate adaptation rule setting
AIS	The number of AIS cells transmitted and received on this connection for both end to end and segment
AIS-P	The number of AIS-P packets received
Alarm Status	The bits used to indicate alarms: loc — A loss of clock which causes the operational state of the port to be downed lais — Line alarm indication signal errors lrdi — Line remote defect indication errors. LRDIs are caused by remote LOF, LOC, and LOS ss1f — Section synchronization failure as reported by the S1 byte sb1err — Section B1 errors lb2erSd — Line signal degradation BER errors lb2erSf — Line signal failure BER errors slof — Section loss of frame errors slos — Section loss of signal errors stxptr — Section synchronization error on the transmit side. Indicates if there is a positive or negative justification count per channel srxptr — Section synchronization error on the receive side. Indicates if there is a positive or negative justification count per SONET path lrei — Line error condition raised by the remote as a result of B1 errors received from this node
Alignment Errors	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets
Altitude (m MSL)	The altitude of the GNSS antenna above mean sea level, in meters

Label	Description
Amplifier Gain (dB)	The amplifier gain high and low warning alarms
Amplifier Input Power (dBm)	The amplifier input power high and low warning alarms
Amplifier Output Power (dBm)	The amplifier output power high and low warning alarms
AN	The AN for identifying the receiving SA
Ant. Cable Delay	The amount of time, in nanoseconds, compensated for signal delay because of cable length Refer to the cable manufacturer data to determine accurate signal delay statistics for the type and length of cable used
Antenna status	ok: valid antenna connection under-current: open condition. The port remains operationally up in the event that any GNSS splitters used do not provide a load. over-current: short circuit, or maximum power limits for the receiver have been exceeded no-bias voltage: antenna power disabled
Assigned ports	Specifies all ports that contain this CA
authentication method	The 802.1x session authentication method
Authenticator PAE state	The 802.1x port authenticator PAE state
Auto-negotiate	True — The link attempts to automatically negotiate the link speed and duplex parameters False — The duplex and speed values are used for the link
Average Elapsed Time	The average elapsed time
Backend state	The 802.1x port backend state
Bad Tag Packets	The number of received packets discarded with an invalid SecTAG or a zero value Packet Number (PN) or an invalid Integrity Check Value (ICV)
BFD Spoof Check Failed	The received BFD packet either failed the TTL check (single hop BFD TTL should be 255) or failed the source IP address lookup of known sessions. This counter may increment when BFD sessions are first configured since one side may start sending before the other is completely programmed and ready.
Breakout	The connector breakout configured for the port

Label	Description
Broadcast Packets Input/Output	<p>The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were addressed to a broadcast address at this sub-layer.</p> <p>The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent.</p> <p>For a MAC layer protocol, this includes both Group and Functional addresses.</p>
Broadcast Packets	<p>Input — The number of input broadcast packets</p> <p>Output — The number of output broadcast packets</p>
Broadcast Pckts	<p>The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were addressed to a broadcast address at this sub-layer.</p> <p>The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent.</p> <p>For a MAC layer protocol, this includes both Group and Functional addresses.</p>
CA name/ca-name	The CA name assigned to the port
Cast Type	The connection topology type
CBS	The CBS value defining the reserved size for the queue
Cells	<p>The number of input and output cells</p> <p>HEC discarded cells are not included in the input cell numbers</p>
Cfg Alarm	<p>The alarms that are reported when raised or cleared. Alarms that are not in this list are not reported when they are raised or cleared but appear in the Alarm Status.</p> <p>pais — Path alarm indication signal errors</p> <p>plop — Path loss of pointer (per tributary) errors</p> <p>prdi — Path remote defect indication errors</p> <p>pb3err — Path B3 errors</p> <p>pplm — Path payload mismatch. As a result, the path can be operationally downed</p> <p>prei — Path error condition raised by the remote as a result of B3 errors received from this node</p> <p>puneq — Unequipped path errors.</p> <p>plcd — Path loss of codegroup delineation error. It is applicable only when the value of tmnxPortEtherXGigMode is set to 'wan'.</p>
Cfg MTU	The configured MTU
Cfg Rx Channel	The configured DWDM ITU channel at which the coherent optical module is expected to operate
Cfg Rx LOS Thresh	The configured LOS threshold of the average input power

Label	Description
Cfg Tx Pwr Maximum	The maximum power setting supported by the transceiver (only displayed if the equipped optical module supports configurable transmit power)
Cfg Tx Pwr Minimum	The minimum power setting supported by the transceiver (only displayed if the equipped optical module supports configurable transmit power)
Cfg Tx Target power	The manually-configured average target output power
Chan-Grp IfIndex	The channel group's interface index number which reflects its initialization sequence
Cipher Suite	The cipher suite used for encrypting the SAK: gcm-aes-128, gcm-aes-256, gcm-aes-xpn-128, gcm-aes-xpn-256
CIR Rule	<p>min — The operational CIR for the queue is equal to or greater than the administrative rate specified using the rate command except where the derived operational CIR is greater than the operational PIR. If the derived operational CIR is greater than the derived operational PIR, the operational CIR will be made equal to the operational PIR.</p> <p>max — The operational CIR for the queue is equal to or less than the administrative rate specified using the rate command.</p> <p>closest — The operational CIR for the queue is the rate closest to the rate specified using the rate command without exceeding the operational CIR.</p>
CIR Weight	The weight the queue or scheduler uses at the within-CIR port priority level
Clear Tag Mode	<p>In the case of VLAN-tagged traffic, if the traffic is crossing a network, one or two VLAN tags can be transmitted in clear text so that this traffic can receive preferential treatment over the network based on 802.1 q-tag or p-bits.</p> <p>Values: single-tag, dual-tag</p>
Coherent Optical Module	Information for the coherent optical module
Coherent Optical Port Statistics	<p>Statistics for the coherent optical port</p> <p>For Coherent CFP, the Rx Power field displays per-channel power.</p>
Collect-stats Collect Stats	<p>Enabled — The collection of accounting and statistical data for the network Ethernet port is enabled. When applying accounting policies the data by default will be collected in the appropriate records and written to the designated billing file.</p> <p>Disabled — Collection is disabled. Statistics are still accumulated by the IOM cards, however, the CPU will not obtain the results and write them to the billing file.</p>
Collisions	The best estimate of the total number of collisions on this Ethernet segment
Config Duplex	<p>Full — The link is set to full duplex mode</p> <p>Half — The link is set to half duplex mode</p>
Config Revision	The configuration revision

Label	Description
Config Speed	The configured speed of the interface
Configured Address	The configured Ethernet MAC address
Configured Freq	The configured frequency for the transceiver
Configured Mode	network — The port is configured for transport network use access — The port is configured for service access
Configured Mode	network — The port is configured for transport network use access — The port is configured for service access. Channelized ports are always access ports
Configured VCs	The number of configured VCs
Connector Code	The vendor organizationally unique identifier field (OUI) contains the IEEE company identifier for the vendor
Constellation	The type of GNSS satellite navigation system used
CRC	The precision of the cyclic redundancy check. 16 — A 16-bit CRC calculation. 32 — A 32-bit CRC calculation. 32-bit CRC increases the error detection ability, but it also adds some performance overhead.
CRC Mon SD Thresh	The error rate (for CRC errors) at which to declare the Signal Degrade (SD) condition on an Ethernet interface. If the field displays Disabled, no error rate has been specified.
CRC Mon SF Thresh	The CRC error rate at which to declare the Signal Fail (SF) condition on an Ethernet interface. If the field displays Disabled, no error rate has been specified.
CRC Mon Window	The size of the sliding window, in seconds, over which the Ethernet frames are sampled to detect signal fail or signal degrade conditions.
CRC/Align Errors	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
CRC-10 Errors	The number of cells discarded on this VPL with CRC 10 errors
CRC-32 Errors	The number of valid AAL-5 SDUs and AAL-5 SDUs with CRC-32 errors received by the AAL-5 VCC
CSE	The number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular interface
CV-P	The number of Coding Violations

Label	Description
Current Freq	The current frequency
Current Penalties	The current accumulated penalties for port dampening
DAC Percent	The DAC percentage of the transceiver
Dampening State	The port dampening state: Disabled, Idle, or Active
Data Rate	The data rate at which the port is operating. When OTU is encapsulating 10-Gigabit Ethernet WAN, the data rate is 10.709 Gb/s, the G.709 standard OTU2 data rate. When OTU is encapsulating 10-Gigabit Ethernet LAN, the data rate is either 11.049 Gb/s or 11.096 Gb/s, depending on the otu2-lan-data-rate configuration parameter of the port's OTU parameters. These data rates (11.049 Gb/s and 11.096 Gb/s) are considered OTU2e data rates that are non-standard or over-clocked with respect to G.709, but have become widely used in optical networking to transport un-altered 10-Gigabit Ethernet LAN payloads.
DDM Events	Enabled — DDM events are enabled Disabled — DDM events are disabled
Decrypted Octets	The number of octets of plain text recovered from received packets that were integrity protected and encrypted
Delayed Packets	The number of received packets with the condition a PN lower than the lower bound of the replay protection on this SC
Description	A text description for the entity
Diag Capable	Indicates whether the transceiver is capable of performing diagnostics
Discards	Input — The number of discarded input packets Output — The number of discarded output packets
Discards Input/ Output	The number of inbound packets chosen to be discarded to possibly free up buffer space
Disp Control Mode	The current operational mode of the tunable dispersion compensation module
DOIE Tx Disable	Enabled — Laser is enabled if an internal MAC transmit error is encountered Disabled — Laser is disabled if an internal MAC transmit error is encountered
Dot1Q Ethertype	The Ethertype expected when the port's encapsulation type is Dot1Q
Down On Int. Error	Enabled — Down on internal error feature is enabled Disabled — Down on internal error feature is disabled
Down-when-looped	The feature is enabled or disabled
Drop Count	The number of keepalive or LQR messages that were missed before the line was brought down

Label	Description
Dropped	The number of dropped packets and octets
Drop Events	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.
Dropped CLP	The number of times the CLP1 cells have been dropped. CLP1 cells have lower priority than CLP0 cells and are expected to be discarded first in times of congestion.
Dying Gasp	Indicates whether dying gasp is enabled or disabled
Dying Gasp on Reset	EFM OAM dying gasp messages on reset: true or false
eapol-destination-address	The destination MAC address used in the EAPoL packet for MACsec Key Agreement (MKA) PDUs
EgrAmp	The egress amplifier alarm information, including: <ul style="list-style-type: none"> <li>• temperature</li> <li>• gain</li> <li>• power out</li> <li>• power in</li> </ul>
Encryption Offset	The encryption offset configured on this node: 0, 30, 50. In the case of IP traffic, the IP header can be transmitted in clear text so that the traffic is routed accordingly when crossing the network. A value of 30 is used for IPv4 and 50 for IPv6.
EFM OAM	Enabled — EFM OAM is enabled Disabled — EFM OAM is disabled
EFM OAM Link Mon	Enabled — Link monitoring functionality is enabled Disabled — Link monitoring functionality is disabled
Egr. Sched. Pol	The port scheduler policy or that the default policy default is in use
Egress CBR	The total CBR bandwidth consumed on this interface in the egress direction
Egress NRT-VBR	The total non-real-time variable bit rate (nrt-VBR) bandwidth consumed on this interface in the egress direction
Egress Octets	The egress octets on a per-port basis
Egress Octets Drop	The number of egress octets dropped
Egress Octets Fwd	The number of egress octets forwarded
Egress Packets	The egress packets on a per-port basis

Label	Description
Egress Packets Drop	The number of egress packets dropped
Egress Packets Fwd	The number of egress packets forwarded
Egress Rate	The maximum amount of egress bandwidth (in kilobits per second) that this Ethernet interface can generate
Egress RT-VBR	The total real-time variable bit rate (rt-VBR) bandwidth consumed on this interface in the egress direction
Egress UBR	The total unspecified bit rate (UBR) bandwidth consumed on this interface in the egress direction
Elev. Mask Angle	The configured elevation angle below which satellites are ignored. The default elevation mask angle is 10°.  Five or more satellites must be in view of the GNSS receiver antenna at all times when the receiver is in the process of obtaining a position fix, and these satellites must be above the configured elevation mask angle.
Encap-match	Specifies which types of traffic MACsec is enabled for
Encap Type	Null — Ingress frames will not use any tags or labels to delineate a service dot1q — Ingress frames carry 802.1Q tags where each tag signifies a different service
Encap Value	The dot1q or qinq encapsulation value on the port for this IP interface
Encrypted Octets	The number of plain text octets that are integrity protected and encrypted on the transmitting SC
Encrypted Packets	The number of packets that are integrity protected and encrypted for this transmitting SA
Encrypted SA Packets	The number of packets that are integrity protected and encrypted for this SA
Encryption Offset	Specifies the encryption offset configured on this node: 0, 30, 50.  In the case of IP traffic, the IP header can be transmitted in clear text so that the traffic is routed accordingly when crossing the network. A value of 30 will be used for IPv4 and 50 for IPv6.
Endpoint Type	The endpoint type
Errored Frame Enabled	Specifies whether errored frames are enabled
Errored Frame Event Notify	Specifies whether errored frame events notification is enabled

Label	Description
Errored Frame Period Enabled	Specifies whether an errored frame period is enabled
Errored Frame Period Event Notify	Specifies whether an errored frame period event notification is enabled
Errors Input/Output	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol.  For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors.
ESMC Tunnel	Indicates whether ESMC frames are tunneled in Epipe or VPLS service
ES-P	The number of Errored Seconds
Exceed Drop	The queue depth beyond which exceed-profile packets are not accepted into the queue and are discarded
Excess Collisns	The number of frames for which transmission on a particular interface fails due to excessive collisions
Far End	The SONET path far end
FCS Errors	The number of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check
FEC Corrected 0s	The number of bits that were received as 0s but corrected to 1s
FEC Corrected 1s	The number of bits that were received as 1s but corrected to 0s
FEC Mode	Type of FEC (Forward Error Correction) in effect: g709, enhanced or disabled. When g709 is selected, the standard FEC method is used. When enhanced is selected, a proprietary FEC algorithm is used that extends optical reach in long haul applications. When disabled the bytes that are reserved for FEC in the OTU frame are transmitted as zeros and the FEC decoder is bypassed, but OTU framing is still in effect.
FEC SES	The number of severely Errored seconds were the number of uncorrectable sub-rows was greater than 15% of the maximum
FEC Uncorrectable Sub-Rows	The number of sub-rows that were not corrected because too many errors were detected
Fifo Error	The number of FIFO errors
Fine Tuning	Indicates whether the transceiver supports fine tuning for the frequency

Label	Description
FIR Rule	The queue FIR rule
Firmware Version	Firmware version of the GNSS receiver
FR Interface Status	The status of the Frame Relay interface as determined by the performance of the DLCMI. If no DLCMI is running, the Frame Relay interface stays in the running state indefinitely.
Forwarded	The number of forwarded packets and octets
FP Number	The number of the FP that manages this port
Fragments	The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error)
Frame Based Acc	Frame-based accounting for queues parented to the scheduling policy and for the schedulers within the scheduler policy
Grace Tx Enable	Specifies whether grace Tx is enabled
Grace Vendor OUI	The EFM OAM grace vendor Organizationally Unique Identifier (OUI)
Grp-<name> Group Name	The group name
Half Life	The time, in seconds, that must pass before penalties decay to one-half the initial amount
Hardware Address	The interface's hardware or system assigned MAC address at its protocol sub-layer
HEC Errors (Dropped)	The number of cells with uncorrectable HEC errors on this interface
HEC Errors (Fixed)	The number of fixed HEC errors on this interface
HiPlus Drop Tail	The queue depth beyond which inplus-profile packets are not accepted into the queue and are discarded
Hi Drop Tail	The queue depth beyond which in-profile packets are not accepted into the queue and are discarded
Hold Time	The EFM OAM hold-time
Hold time down	The link down dampening time in seconds. The <b>down</b> timer controls the dampening timer for link down transitions
Hold Time Down Rmng	The time remaining for a hold down timer. If the <b>hold</b> timer is not active, this displays zero.

Label	Description
Hold time up	The link up dampening time in seconds. The port link dampening timer value which reduces the number of link transitions reported to upper layer protocols.
Hold Time Up Rmng	The time remaining for a hold up timer. If the <b>hold</b> timer is not active, this displays zero.
HS Turbo Queues	HS turbo queues that allow the corresponding HSQ queue group queues for higher throughput
IfIndex	The interface's index number which reflects its initialization sequence
Ignore Efm State	The suppress port operational state changes due to EFM OAM: true or false
Ignr EFM OAM State	Enabled — Any failure in the protocol state machine does not impact the state of the port Disabled — The port state is affected by any existing EFM-OAM protocol fault condition
Index 1	Management IP information, one per type maximum (system IPv4, IPv6 system, oob, oob IPv6)
IngAmp	The ingress amplifier alarm information, including: <ul style="list-style-type: none"> <li>• temperature</li> <li>• gain</li> <li>• power out</li> <li>• power in</li> </ul>
In Packets	The number of echo-reply packets received
In Pause Frames	The number of In Pause frames
Ingress CBR	The total CBR bandwidth consumed on this interface in the ingress direction
Ingress NRT-VBR	The total non-real-time variable bit rate (nrt-VBR) bandwidth consumed on this interface in the ingress direction
Ingress Octets	The ingress octets on a per-port basis
Ingress Octets Drop	The number of ingress octets dropped
Ingress Octets Fwd	The number of ingress octets forwarded
Ingress Packets	The ingress packets on a per-port basis
Ingress Packets Drop	The number of ingress packets dropped
Ingress Packets Fwd	The number of ingress packets forwarded

Label	Description
Ingress Port Forwarding Engine Drop Reason Statistics	When any of the packet counters increments, it indicates that a packet was dropped in the ingress data path or extracted to the control plane for further processing. The detailed per-reason drop statistics are available per-port for Ethernet ports (local on the 7450 ESS, 7750 SR, 7950 XRS, or satellite client ports) and for PXC sub-ports. An aggregate forwarding engine drop counter (packet and byte) is available per-SAP.
Ing. QGroup	The ingress queue group name
Ingress Rate	The maximum amount of ingress bandwidth (in mb/s) that this Ethernet port can receive with the configured sub-rate using packet-based accounting
Ingress RT-VBR	The total real-time variable bit rate (rt-VBR) bandwidth consumed on this interface in the ingress direction
Ingress UBR	The total unspecified bit rate (UBR) bandwidth consumed on this interface in the ingress direction
Host-Matches	A string optionally used by subscriber management to map subscriber's and subscriber host's queued traffic to a specific egress port virtual port
Input/Output	When the collection of accounting and statistical data is enabled, then octet, packet, error, and utilization statistics are displayed
Instance-Id	The queue-group instance ID
Int MAC Rx Errs	The number of frames for which reception on a particular interface fails due to an internal MAC sublayer receive error
Int MAC Tx Errs	The number of frames for which transmission on a particular interface fails due to an internal MAC sublayer transmit error
Interface	The port ID displayed in the <i>slot/mda/port</i> format
Interface-name port-id	The interface name of the port
ip ip-address	The IP address
IP Route Blackholed	The destination IP address of the packet matches a black hole route
IPv4 Header Error	The IPv4 packet header contains an error such as an IPv4 header checksum error, an invalid IP version number (not 4 or 6), or an incorrect Total Length field
IPv4 Invalid Address	An error in the source (SA) or destination (DA) IPv4 address was detected. For example class D or class E IPv4 DAs, loopback SA (127.0.0.0/8), 0.0.0.0/8 DA, SA is a subnet broadcast or network address and cases where the IPv4 address is a multicast address but the Ethernet destination address is not RFC1112 compliant. RFC1112 checks are also carried out on lpipe traffic.

Label	Description
IPv6 Header Error	The IPv6 packet header contains an error such as an incorrect Payload Length field or an IP version not equal to '6' when the Ethernet etype indicates it is IPv6
IPv6 Invalid Address	An error in the source (SA) or destination (DA) IPv6 address was detected. For example, an unspecified IPv6 DA, an IPv6 multicast SA and cases where the IPv6 address is a multicast address but the Ethernet destination address is not RFC2464 compliant. RFC 2464 checks are also carried out on IPIPE traffic.
Jabbers	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error)
Keep Alive	The time interval, in seconds, between keep-alive PDUs
L2 Service MTU Exceeded	The length of the packet received on a SAP bound to a layer 2 service (such as VPLS or EPIPE) exceeded the configured MTU for the service
LACP Tunnel	Indicates whether LACP packet tunneling is enabled or disabled
LAG ID	The LAG or multi-link trunk (MLT) that the port is assigned to
Laser Tunability	The laser tune-ability of the transceiver
Last Changed	The date and time when the interface connection entered its current operational state
Last Cleared Last Cleared Time	The date and time the restart count reset to zero
Last cleared time Last Cleared Time	The time of the last clear
last session id	The 802.1x last session ID
last session term cause	The 802.1x last session term cause
last session time	The 802.1x last session time
last session username	The 802.1x last session username
Last State Change	The system time moment that the entity is up
Last Unknown VPI/ VCI	The last unknown VPI/VCI that was received on this interface
Late Collisions	The number of times that a collision is detected on a particular interface later than one slot time into the transmission of a packet

Label	Description
Late Packets	The number of received packets that have been discarded due to replay window protection on this SC
Latitude	The latitude of the GNSS antenna
LCD-P	The number of LCD-P packets received
Level	The level number
Licensed	The licensed state
Limit Unused BW	The aggregate rate overrun protection on the aggregate context
Link Length support	The link length support for the transceiver
Link Monitoring	The EFM OAM link monitoring parameters: enabled or disabled
Link-level	Ethernet — The port is configured as Ethernet
LMI Type	The LMI type
Load-balance-algo	The load balancing algorithm used on the port
Local Magic Number	The local magic number to be sent to the peer. The magic number provides a method to detect loopbacks. If the value of the local magic number is the same as the value of remote magic number, then it is possible that the link might be looped back. If the two magic numbers do not match, then the link is not looped back.
Longitude	The longitude of the GNSS antenna
Loopback	The number of loopback requests and responses transmitted and received on this connection for both end to end and segment
Loop Detected	True — Loop detected False — No loop detected
LOP-P	The number of Loss Of Pointer path (LOP) occurrences
Low Drop Tail	The low drop tail percent reduction from MBS
mac mac-address	The MAC address
MAC Chip Number	The number of the MAC chip that manages this port
Macsec Encrypt	Enabled — MACsec encryption is enabled on the traffic. All fields behind source or destination MAC addresses are encrypted on each packet.  Disabled — MACsec encryption is disabled for the traffic. The packet fields are sent in clear text but data integrity is checked on each packet, and the MACsec overhead (header and ICV) is still added to each packet.
macsec-enabled	The MACsec is enabled or disabled

Label	Description
Manufacture date	The manufacturing date of the hardware component in the mmddyyyy ASCII format
Max auth requests	The 802.1x port maximum authorization requests
Max Packet Error	The number of maximum packet errors
Min Packet Error	The number of minimum packet errors
Max Penalties	The maximum penalty value for port dampening
Maximum Frequency	The supported maximum frequency for the transceiver
Max Suppress Time	Elapsed time, in seconds, after the link comes up before the worst case accumulated penalties have decayed to the reuse threshold
MBS	The MBS value defining the maximum size for the queue
Media	The media supported for the SFP
Min Frame Length	The configured minimum transmitted frame length
Minimum Frequency	The supported minimum frequency for the transceiver
MKA Key Server Priority	The MKA key server priority: 0 to 255 (default 16). A priority of 0 means more it is more likely to become the MKA server. If multiple participants have the same priority, the MAC address becomes the differentiator for electing the MKA server.
Mode	The mode of the interface. It can be set as Data Terminal Equipment (DTE) or Data Circuit-terminating Equipment (DCE)
Mode	The mode of OAM operation for an Ethernet port: active or passive
Model Number	The model number of the transceiver or adapter
Monitor Depth	Queue depth monitoring for the specified queue enabled or disabled
Monitor Oper Group	Operational group being monitored
Monitor Port Sched	Enabled — Congestion monitoring on an Egress Port Schedule (EPS) is enabled Disabled — Congestion monitoring on an EPS is disabled
MTU	The size of the largest packet which can be sent/received on the Ethernet physical interface, specified in octets
Mult Collisions	The number of frames that are involved in more than one collision and are subsequently transmitted successfully
Multicast MAC With Unicast Dest IP	The Ethernet destination (MAC) address is multicast but the IP address is unicast

Label	Description
Multicast Packets Input/Output	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both group and functional addresses. The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses.
Multicast Packets	Input — The number of input multicast packets Output — The number of output multicast packets
Multicast Pckts	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses.
Name	The entity name
Needs ICMP	The received packet requires the router to generate an ICMP message. For example, the IP packet TTL is expired or the destination host, network, or ESM subscriber is unreachable. Host unreachable can occur, among other reasons, if the destination address (for example, 10.0.1.2) of a packet resolves to a loopback interface subnet (for example, 10.0.1.1/24) but does not match the specific loopback address (for example, 10.0.1.1). Destination unreachable can also occur, for example, in response to an IPv6 packet received by a router from a point-to-point link (a non-Ethernet link) destined to an address within a subnet assigned to that same link (other than one of the receiving router's own addresses) as described in RFC 4443.
Net. Egr. Queue Pol	The network egress queue policy or that the default policy is used
No SCI Packets	The number of received packets discarded with unknown SCI information when the C bit in the SecTAG is set
No Tag Packets	The number of received packets discarded without the MAC security tag (SecTAG)
No Using SA Packets	The number of received packets that have been discarded on this SA which is not currently in use
Notifications	LLDP notifications (enabled, disabled)
Not Valid Packets	The number of not valid packets that have been discarded on this active SA
Number OCD Events	The number of times the Out of Cell Delineation (OCD) events occurred
Number of Lanes	The number of lanes of the transceiver

Label	Description
Number of Logs	The number of logs
Octets	The number of input and output octets. HEC discarded cells are not included in the input octet numbers.
Octets	The total number of octets received
OctetsIn Dropped	The number dropped egress octets that were in-profile
OctetsIn Forwarded	The number of forwarded egress octets that were in-profile
OctetsIn Total	The total number of egress octets that were forwarded and dropped
OctetsOut Dropped	The number of dropped egress octets that were out-of-profile
OctetsOut Forwarded	The number of forwarded egress octets that were in-profile
OctetsOut Total	The total number of egress octets that were forwarded and dropped
OK Packets	The number of validated packets on this SA
Oper Duplex	full — The link is set to full duplex mode half — The link is set to half duplex mode
Oper Egress Rate	The operational egress bandwidth (in kilobits per second) that the Ethernet interface can generate
Oper MTU	For channels that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the channel.
Oper Speed	The operating speed of the interface
Oper State	up — The entity is operationally up down — The entity is operationally down Additionally, the <i>lag-id</i> of the LAG it belongs to in addition to the status of the LAG member (active or standby) is specified
Oper Status	The operational status of the port
Oper Status	up: the port is operationally up (communication between the main board and the GNSS receiver is established and the port is ready to receive GNSS signals) down: the port is operationally down (none of the up conditions have been met)
Operational Channel	The operational channel for the transceiver
Operational Frequency	The operational frequency for the transceiver
Optical Compliance	The optical compliance code of the transceiver

Label	Description
Optical Compliance	The optical compliance code of the transceiver
Other	The number of OAM cells that are received but not identified
OTU Status	The status of the OTU (Optical Transport Unit): enabled or disabled. When OTU is enabled, an additional layer of framing encapsulates an MDA's natively programmed mode of operation, 10-Gigabit Ethernet LAN or WAN, adding SONET-Like Framing with FEC (Forward Error Correction). When OTU is disabled, the MDA operates in a 10-Gigabit Ethernet LAN or WAN as per Ethernet provisioning.
Out packets	The number of echo-request packets sent
Out Pause Frames	The number of Out Pause frames
Over Sized SDUs	The total number of oversized SDU discards
Overrun Packets	The number of packets discarded because the number of received packets exceeded the cryptographic performance capabilities
Oversize Pckts	The total number of packets received that were longer than can be accepted by the physical layer of that port (9900 octets excluding framing bits, but including FCS octets for GE ports) and were otherwise well formed
Packet Abort Error	The number of packets aborted due to errors received
Packets	The total number of packets received
Packets	The number of input and output packets. Packets discarded due to HEC or oversize discards are not counted. CRC errors are also in the packet counts show up on the VC level statistics but not on the port level.
PacketsIn Dropped	The number of dropped egress packets that were out-of-profile
PacketsIn Forwarded	The number of forwarded egress packets that were in-profile
PacketsIn Total	The total number of egress packets that were forwarded and dropped
PacketsOut Dropped	The number of dropped egress packets that were out-of-profile
PacketsOut Forwarded	The number of forwarded egress packets that were in-profile
PacketsOut Total	The total number of egress packets that were forwarded and dropped
Parity Error	The number of parity errors received
Part Number	The vendor part number contains ASCII characters, defining the vendor part number or product name

Label	Description
PBB Ethertype	The Ethertype used for PBB encapsulation
Per Threshold MDA Discard Statistics	See the 7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide, "Packet Classification and Scheduling" section
Phy Link	Yes — A physical link is present
Physical Link	No — A physical link is not present
Phys State Chng Cnt	<p>Increments when a fully qualified (de-bounced) transition occurs at the physical layer of an Ethernet port which includes the following transitions of the Port State as shown in the <b>show port</b> summary:</p> <ul style="list-style-type: none"> <li>- from "Down" to either "Link Up" or "Up"</li> <li>- from either "Link Up" or "Up" to "Down"</li> </ul> <p>This counter does not increment for changes purely in the link protocol states (for example, "Link Up" to "Up"). The counter is reset if the container objects for the port are deleted (for example, MDA deconfigured, or IOM type changes).</p>
PIR Rule	<p>min — The operational PIR for the queue is equal to or greater than the administrative rate specified using the rate command</p> <p>max — The operational PIR for the queue is equal to or less than the administrative rate specified using the rate command</p> <p>closest — The operational PIR for the queue is the rate closest to the rate specified using the rate command</p>
Physical Link	<p>Yes — A physical link is present</p> <p>No — A physical link is not present</p> <p>For GNSS ports:</p> <p>Yes — The port is operationally up (communication between the main board and the GNSS receiver is established and the port is ready to receive GNSS signals. For example, if the GNSS port is configured, the operational status is up, the receiver status is 3D FIX, and you disconnect the GNSS RF cable from the port, the physical link on the port still shows as up.</p> <p>No — The port is operationally down (none of the up conditions apply)</p>
PLM-P	The number of PLM-P packets received
PM BEI	The number of backward error indications received from the far end in the path monitor overhead
PM BIP8	The number of detected BIP-8 errors in the path monitor overhead
PM SES	The section monitor severely errored seconds where the number of PM-BIP8 was greater than 15% of the maximum
Polar Depend Loss (dB)	The polarization dependent loss in decibels

Label	Description
Policy-Name	The policy name
Port control	The 802.1x port control: auto, force-auth, force-unauth
Port Encap	Null — Ingress frames will not use tags or labels to delineate a service dot1q — Ingress frames carry 802.1Q tags where each tag signifies a different service
Port ID	The port ID that is configured or displayed.
Port <id> Bridge nearest-bridge	
Port <id> Bridge nearest-non-tpmr	
Port <id> Bridge nearest-customer	
Port IfIndex	The GNSS interface index number, which reflects its initialization sequence
Port Mode	Network — The port is configured for transport network use Access — The port is configured for service access Hybrid — The port is configured for both access and network use
Port State	Up — The port is physically present and has physical link present Down — The port is physically present but does not have a link. This state may also be considered as Link Down Ghost — A port that is not physically present None — The port is in its initial creation state or about to be deleted Link Up — A port that is physically present and has physical link present
Port status	The 802.1x port status
PorID TLV Subtype	The encoding of the port identifier TLVs transmitted to the peer (tx-if-alias, tx-if-name, tx-local)
Port Type	The type of port or optics installed
Present Channel	The channel that the transceiver is currently on
Protected Octets	The number of plain text octets that are integrity protected but not encrypted on the transmitting SC
Protected Packets	The number of packets that are integrity protected but not encrypted for this transmitting SA
Protected SA Packets	The number of packets that are integrity protected but not encrypted for this SA
Protocol	The applicable protocols for the specified port

Label	Description
PTP IPv4 address	IPv4 destination address of incoming PTP messages that should be timestamped. Only unicast addresses are supported.
PTP IPv6 address	IPv6 destination address of incoming PTP messages that should be timestamped. Only unicast addresses are supported.
PTP Timestamping	Filter status for ingress timestamping of PTP messages to match multiple PTP flows
Pump Temperature (C)	The pump temperature high and low warning alarms
QinQ Ethertype	The Ethertype expected when the port's encapsulation type is QinQ
Queue	The queue information
Queue Depths (percentage)	The queue depth percentages
Queue-Id	The <i>queue-id</i> that uniquely identifies the queue
Quiet period	The 802.1x port quiet period: 1 to 3600 seconds
Radius-ply	The 802.1x port RADIUS policy name
Range	The usable range to fine tune the frequency
RDI	The number of RDI cells transmitted and received on this connection for both end to end and segment
RDI-P	The number of RDI-P packets received
Reassembly Timeouts	The number of reassembly timeout occurrences
Reauth enabled	no — The 802.1x port reauth enabled is not up yes — The 802.1x port reauth enabled is up
Reauth period	The 802.1x port reauthorization period
Receiver status	Acquiring Satellites: GNSS receiver is attempting to track satellite Position Hold: GNSS receiver position is determined and GNSS receiver is no longer solving for position; TRAIM algorithm is correcting for time bias 2D Fix: GNSS receiver is attempting to obtain a two-dimensional position (latitude, longitude) solution 3D Fix: GNSS receiver is attempting to obtain a three-dimensional position (latitude, longitude, altitude) solution Unknown: default state on power-up Communication Lost: occurs after 30 s of missing Channel/Data/Status messages or TRAIM status messages from the GNSS receiver

Label	Description
	Communication Established: occurs after a successful reestablishment of communication following a Communication Lost status
Remote Error	The number of remote error received
Remote Magic Number	The magic number sent by the peer. If the value of remote magic number is the same as the value of the local magic number, then it is possible that the link might be looped back. If the two magic numbers do not match, then the link is not looped back.
Replay Protection	Enabled — Replay Protection is enabled Disabled — Replay Protection is disabled If replay protection is enabled for this CA, the out of replay-window packets will be discarded. Otherwise, the Replay Window Size value is ignored. The default value is disabled, so that when adding MACsec to an interface, it will not affect traffic immediately.
Replay Window Size	The size, in packets, of the replay window. Each packet is assigned a unique packet number. Replay protection enforces strict ordering of the packets and protects against replay attacks. In networks where out-of-order packets are expected, the window size can be set up to 4294967295.
Request Interval	The time interval in seconds at which keepalive requests are issued
Resolution	The resolution used to fine tuning the frequency
Restart Count	The number of times that this Control Protocol has reached the 'open' state
Retry	The minimum wait time, in seconds, before re-enabling the port after loop detection
Reuse Threshold	The threshold at which the port up state is no longer suppressed, after the port has been in a suppressed state and the accumulated penalties decay drops below this threshold
RS-FEC Mode	The RS-FEC mode
RxDTV Adjust	The Rx DTV adjust status
Rx Ageouts	The number of LLDP frames received on the port with a properly formatted TLV that was not supported on the receiving port
Rx Frames	The number of LLDP frames received on the port
Rx Frame Discard	The number of LLDP frames received but discarded on the port
Rx Frame Errors	The number of LLDP frames received with errors on the port
Rx Media Frame Error Count	The receive media frame error count

Label	Description
Rx TLV Discard	The number of LLDP frames received on the port discarded because of the TLV
Rx TLV Unknown	The number of LLDP frames received on the port with a properly formatted TLV that was not supported on the receiving port
Rx Total Power (dbm)	The receive total power
Rx Quality Level	Indicates which QL value has been received from the interface
Rx Signal Label	The received signal label
Rx Trace Str (Hex)	The received SONET path trace string in hexadecimal
sap	The physical port identifier portion of the SAP definition
Sat Port Queue Statistics	The satellite queue statistics with per-queue forward and drop information (packet and octet counters) for satellite uplink and client ports
Sched Policy	The name of the scheduler policy assigned to the virtual port
SCI	The Secure Channel Identifier (SCI)
SD Threshold	The configured error rate threshold at which the SD (Signal Degrade) alarm is raised
Security Zone	The security zone this port belongs
Serial Number	The vendor serial number of the hardware component
Server timeout	The 802.1x port server timeout
Service-id port-id	The service IDs affected by the encap-match configured under this sub-port. One or more services can be affected by the match (by using * or by targeting ports with traffic aggregations, for example).
SES-P	The number of Severely Errored Seconds
SF Threshold	The configured error rate threshold at which the SF (Signal Fail) alarm is raised
SF/SD Method	The selected method for declaring the SF (Signal Fail) or SD (Signal Degrade) alarm. When BIP8 is selected, the error rate of SM-BIP8 errors in the OTU frames declares SF or SD (This is very similar to SONET SF/SD which uses a rate of B2 errors). When FEC is selected, the rate of corrected bits declares SF or SD. This effectively indicates that the link would be degraded (SD) or failed (SF) if FEC was disabled and gives the user an early warning that the link is degrading or is about to fail.
Sflow	Enabled — sFlow data collection for the port is enabled Disabled — sFlow data collection is disabled

Label	Description
C/QS/S/XFP/MDI MDX	<p>Additional information related to the port. This can include optical compliance and the link length if available from the installed optics. If there is no optical compliance information programmed in the part, "Unspecified" is displayed.</p> <p>GIGE — The GigE SFP type</p> <p>FASTE — The FastE SFP type</p> <p>GIGX — The GigX SFP type</p> <p>MDI — Indicates that the Ethernet interface is of type MDI (Media Dependent Interface)</p> <p>MDX — Indicates that the Ethernet interface is of type MDX (Media Dependent Interface with crossovers)</p>
Shaped Bandwidth	The total shaped bandwidth consumed on this interface in the egress direction
Signal Label	The C2 byte value
Single Fiber Mode	<p>Yes - Single fiber option is configured</p> <p>No - Single fiber option is not configured</p>
Slot ID	The slot number of the card in the chassis
SM BEI	The number of backward error indications received from the far end in the section monitor overhead
SM BIP8	The number of detected BIP-8 errors in the section monitor overhead
SM SES	Section monitor severely errored seconds where the number of SM-BIP8 was greater than 15% of the maximum
SM-TTI Rx	This is the SM-TTI (Section Monitor Trail Trace Identifier received by this port. When the received TTI is a printable string of characters, it will be displayed as a text string. When the received TTI contains one or more non-printable characters, it will be displayed at a sequence of 64 hex bytes. When the received TTI is all zeros, the string "Not Specified" will be displayed.
SM-TTI Tx (<mode>)	This is the configured SM-TTI (Section Monitor Trail Trace Identifier) to be transmitted by this port in the OTU overhead bytes. The modes are auto, string, or bytes. In the auto and string modes, a printable character string will be displayed. In bytes mode, up to 64 hex bytes are displayed.
Sngl Collisions	The number of frames that are involved in a single collision, and are subsequently transmitted successfully
Speed	The speed of the DS0 channels used in the associated channel-group
SQE Errors	The number of times that the SQE TEST ERROR is received on a particular interface
SSM Code Type	The SSM code type in use on the port

Label	Description
State of polar ROC (krad/s)	The state of polarization rate of change
Support	The MACsec sub-port used. Multiple MACsec instances can be configured under one port, matching traffic based on the <b>encap-match</b> parameter.
subscr Subscriber	The subscriber ID
Supplicant timeout	The 802.1x port supplicant timeout
Supply Voltage (V)	The supply voltage of the DDM
Supported Grids	A list of supported grids for the transceiver
Suppress Threshold	The threshold at which the port up state is suppressed until the accumulated penalties drop below the reuse threshold again
Svc ID svc-id	The service identifier
Symbol Errors	For an interface operating at 100 Mb/s, the number of times there was an invalid data symbol when a valid carrier was present
Sym Mon SD Thresh	The error rate (for symbol errors) at which to declare the Signal Degrade (SD) condition on an Ethernet interface. If the field displays Disabled, no error rate has been specified
Sym Mon SF Thresh	The symbol error rate at which to declare the Signal Fail (SF) condition on an Ethernet interface. If the field displays Disabled, no error rate has been specified
Sym Mon Window	The size of the sliding window, in seconds, over which the errors are measured
Sync Status	locked: GNSS time is within alarm limits not locked: GNSS time is outside of the alarm limits and/or there is an insufficient number of tracked satellites
Sync. Status Msg	Whether synchronization status messages are enabled or disabled
Tagged Cells	The number of cells that have been demoted from CLP0 to CLP1
Temperature (C)	The temperature of the DDM
Threshold exceeded	The number of times that the drop count was reached
Time	GPS date and time
Time to link drop	The time remaining before the link will be declared dropped if a keepalive echo reply packet is not received

Label	Description
TimeSlots	The DS0 time slot used in the T1/E1 channel-group
Too long Frames	The number of frames received on a particular interface that exceed the maximum permitted frame size
Too Long Packets	The number of transmitted packets discarded because the packet length is greater than the Maximum Transmission Unit (MTU) of the Ethernet physical interface
Total number of access-egress queue groups	The total number of access-egress queue groups associated with the queue-group summary
Total number of network-egress queue groups	The total number of network-egress queue groups associated with the queue-group summary
Total number of access-ingress queue groups	The total number of access-ingress queue groups associated with the queue-group summary
Tot Sym Mon Errs	The total number of symbol errors
Trace String	The SONET path trace string
Traffic Statistics	See the <i>7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide</i> , "Statistics on Physical PXC Ports" section
Transceiver Code	The code for the transmission media
Transceiver Digital Diagnostic Monitoring (DDM)	Transceiver Digital Diagnostic Monitoring (DDM) information, such as temperature and supply voltage
Transceiver Lane Digital Diagnostic Monitoring (DDM)	Transceiver lane DDM information, such as lane temperature and Tx bias current
Transceiver Status	The status of the transceiver
Transceiver Type	The type of transceiver
Transmit Interval	The transmit interval of OAMPDUs
Transmit period	The 802.1x port transmit period
Transmit TLVs	The LLDP TLV to transmit (port-desc, sys-name, sys-desc, sys-cap)
Trigger Fault	The triggered EFM OAM fault
Tunneling	true — The 802.1x port tunneling is on false — The 802.1x port tunneling is not on.

Label	Description
Tunnel Nearest Bridge	The nearest bridge tunneling frames (enabled, disabled)
Tx DUS/DNU	Whether the QL value is forcibly set to QL-DUS/QL-DNU
Tx Frames	The number of LLDP frames transmitted from the port
TX Laser Frequency	The transceiver laser frequency
TX Laser Wavelength	The transceiver laser wavelength
Tx Length Err Frames	The number of LLDP frames transmitted with length error from the port
Tx Pause Frames	Setting to control transmission of PAUSE frames
Tx Quality Level	The QL value being transmitted out of the interface
Type	The connection type
UAS-P	The number of Unavailable Seconds
Unchecked Packets	The number of packets that have failed the integrity check on this SC
Unequipped	The number of unequipped packets received
Undersize Pckts	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed
Unicast MAC Destination Address Mismatch	The unicast destination MAC address is a null address or does not match any of the expected MAC addresses associated with the receiving interface. Packets with multicast or broadcast MAC addresses do not increment this counter
Unicast Packets	Input — The number of input unicast packets Output — The number of output unicast packets
Unicast Packets Input/Output	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast address at this sub-layer. The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent.
Unicast Packets Input/Output	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast address at this sub-layer
Unicast RPF Check Failed	The IP packet failed the unicast reverse path forwarding (uRPF) check
Unknown Labeled Packet	The MPLS packets dropped by the ingress port forwarding engine because of an unknown label (ILM lookup failure) or an unexpected service label

Label	Description
Unknown MAC Destination Address Discarded in VPLS	The MAC destination address lookup in the MAC FDB failed and the VPLS service is configured to discard packets with unknown destination MAC addresses
Unknown Proto Discards Input/ Output	For packet-oriented interfaces, the number of packets received through the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0.
Unknown Proto Discards	Input — The number of discarded unknown protocol packets
Untagged Packets	The number of transmitted packets without the MAC security tag (SecTAG) when the value of <code>oftmnxMacsecConnAssocReplayProtect</code> for the configured CA is set to 'false'
Use Broadcast Addr	True — Indicates that the broadcast address is to be used for the destination MAC address False — Indicates that the local port MAC address is to be used for the destination MAC address
Used Satellites	Displays the number of tracked satellites
user rx frames	The 802.1x session user Rx frames
user rx octets	The 802.1x session user Rx octets
user tx frames	The 802.1x session user Tx frames
user tx octets	The 802.1x session user Tx octets
UTC offset	Displays the difference between GPS time and UTC time <i>UTC time = GPS time – UTC offset</i>
Utilization Input/ Output	The value computed as the average of the traffic observed over the configured interval, presented as a percentage of the maximum possible traffic
Validated Octets	The number of octets of plain text recovered from received packets that were integrity protected but not encrypted
Vendor OUI	The vendor-specific Organizationally Unique Identifier (OUI) field containing the IEEE company identifier for the vendor
Violation Last Seen	The date and time of the last violation
Violation Threshold Percnt	The violation threshold percentage

Label	Description
Violation Total Count	The violation total count
Visable Satellites	The number of satellites that the GNSS receiver should see at the current time. This number can be 0 if the GNSS receiver has not yet downloaded an almanac, even if Used Satellites is more than 0.
VPI/VCI	The VPI/VCI values
Vport Name	The virtual port name
Weight	The relative weight of this scheduler in comparison to other child schedulers and queues at the same strict level
Wghtd Avg Queue Poll Interval	The weighted average queue poll interval
Wghtd Avg HiWtr Mark Poll Interval	The weighted average high water mark queue poll interval

## port

### Syntax

**port** [**detail**]

### Context

[\[Tree\]](#) (show port)

### Full Context

show port

### Description

This command displays information about all ports configured on all cards in the chassis.

### Parameters

**detail**

Displays detailed information.

### Platforms

All

### Output

The following output is an example of port information.

### Output Example

```
*A:cses-V22# show port

## Context

[\[Tree\]](#) (clear port)

## Full Context

clear port

## Description

This command clears port statistics for the specified ports.

## Parameters

### *port-id*

Specifies the physical port identifier.

**Values** *slot* [/*mda*/]*port*] or *slot/mda/port* [*channel*]

### *aps-id*

Specifies the APS group identifier.

*aps-group-id* [*channel*]

*aps* keyword

*group-id* 1 to 64

### *esa-vm-id*

Specifies the ESA VM identifier.

<b>Values</b>	<i>esa-esa-id/vm-id/vm-port</i>	
	<i>esa</i>	keyword
	<i>esa-id</i>	1 to 16
	<i>vm-id</i>	1 to 4

vm-port

vm-type specific [fm-sub|to-  
sub|..]

### **statistics**

Keyword that clears the statistics for the specified port.

### **cp**

Clears Connection Profile statistics.

**Values** 1 to 8000

### **interface-connection**

Keyword that clears the interface-connection statistics.

### **ilmi**

Keyword that clears the ILMI information. This parameter is only applicable for ports/bundles that support ILMI.

### **pvc**

Keyword that clears the PVC statistics.

### **pvp**

Keyword that clears the PVP statistics.

### **pvt**

Keyword that clears the PVT statistics.

### **slot**

Specifies the slot number.

**Values** 1 to 10

### **mda**

The MDA number.

**Values** 1, 2

**Default** All MDAs

### **port-connection**

Keyword that clears the port-connection statistics.

### **phys-state-change-count**

Keyword that clears the counter that tracks physical port state transitions for ethernet ports ("Phys State Chng Cnt" in "show port" output, or tmnxPortPhysStateChangeCount in the TIMETRA-PORT-MIB).

### **port-scheduler**

Keyword that clears the packet and octet counters for the port scheduler that is applied to the specified port.

### **queue-group-name**

Clears the specified port queue group name. It uniquely identifies a port ingress queue group in the managed system, up to 32 characters.

***instance-id***

Specifies the specific instance of a queue group.

**Values** 1 to 65535

**ingress**

Keyword that clears the ingress queue group information.

**egress**

Keyword that clears the egress queue group information.

**access**

Keyword that clears the access mode statistics for the queue group.

**network**

Keyword that clears the network mode statistics for the queue group.

**ethernet**

Keyword that clears the Ethernet port statistics.

**dampening**

Keyword that clears the current accumulated penalties of the exponential port dampening feature for the port. The accumulated penalties can be cleared only with this command keyword.

**efm-oam**

Keyword that clears the efm-oam statistics on the port.

**events**

Keyword that clears the efm-oam events.

**local**

Keyword that clears only local EFM OAM events.

**remote**

Keyword that clears only remote (received from peer) events. Local and remote is not specified.

**Default** Without specifying an option, both local and remote are cleared.

***shaper-name***

Clears information about the specified shaper name, up to 32 characters.

***name***

Clears information about the specified Vport name up to 32 characters.

**standard *value***

Keyword that clears the high water marks within specific standard port class pools using the standard parameters.

**Values** 1 to 6

**alternate *value***

Keyword that clears the high water marks within specific alternative port class pools using the alternative parameters.

**Values** 1 to 6

### aggregate-queue

Keyword that clears the aggregated forwarded and dropped packets in all queued statistics for the specified port.

### Platforms

All

## Context

[Tree] (show>service>id>pim-snooping port)

## Full Context

show service id pim-snooping port

## Description

This command displays PIM port information.

## Parameters

### *sap-id*

Displays the port information associated with the specified SAP

### *sdp-id:vc-id*

Displays the port information associated with the specified SDP

### *grp-ip-address*

Specifies the IP multicast group address for which this entry contains information

### *detail*

Displays detailed port information

### *family*

Displays either IPv4 or IPv6 information for the specified port

**Values**    ipv4 or ipv6

## Platforms

All

## Output

The following output is an example of service PIM snooping information.

### Output Example

```
*A:PE# show service id 1 pim-snooping port
=====
PIM Snooping Ports ipv4
=====
Sap/Sdp Id                               Opr

SAP:1/1/2                                 Up
=====
*A:PE#
```

## port

### Syntax

```
port port-id [{ingress | egress}] [{access | network}] queue-group queue-group-name [instance  
instance-id] [{ detail | root-detail | thresholds | priority-info | depth] [arbiter {name | root}]
```

### Context

[\[Tree\]](#) (show>qos>policer-hierarchy port)

### Full Context

```
show qos policer-hierarchy port
```

### Description

This command displays information about the policer hierarchy per port.

### Parameters

#### *port-id*

Displays information about the specified port.

**Values** *slot/mda/port[.channel]*

#### **ingress**

Displays ingress port information.

#### **egress**

Displays egress port information.

#### **access**

Displays policer-hierarchy statistics applied on the specified access port.

#### **network**

Displays policer hierarchy statistics applied on the specified network port.

#### **queue-group-name**

Displays information about the specified queue group name, up to 32 characters.

#### **instance-id**

Displays information about the instance of the named queue group.

**Values** 1 to 65535

#### **detail**

Displays detailed information.

#### **root-detail**

Displays detailed information about the arbiter root.

#### **thresholds**

Displays the threshold, parenting, rate, and traffic information related to a policer.

### **priority-info**

Displays the threshold information related to the root arbiter.

### **depth**

Displays the bucket depth, parenting, rate, and traffic information related to a policer.

### **name**

Displays information about the name of the QoS arbiter of this forwarding plane.

### **root**

Displays information about the arbiter root.

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## **port**

### **Syntax**

**port** *port-id* **queue-group** *queue-group-name* [**scheduler** *scheduler-name*] [{ **ingress** | **egress**}] [{**access** | **network**}] [**instance** *instance-id*] [**detail**]

### **Context**

[\[Tree\]](#) (show>qos>scheduler-hierarchy port)

### **Full Context**

show qos scheduler-hierarchy port

### **Description**

This command displays scheduler hierarchy information per port.

### **Parameters**

#### ***port-id***

Specifies the port ID.

*port-id*      *slot/mda/port* [*.channel*]

eth-sat-id      *esat-id/slot/port*

esat      keyword

*id*      1 to 20

pxc-id      *pxc-id.sub-port*

pxc      keyword

<i>id</i>	1 to 64
<i>sub-port</i>	a, b

**detail**

Displays detailed information.

**queue-group-name**

Displays information about the specified queue group on the port.

**scheduler-name**

Displays information about the specified scheduler policy on the port.

**ingress**

Specifies to display ingress queue group information.

**egress**

Specifies to display egress queue group information.

**access**

Displays scheduler-hierarchy statistics applied on an access port.

**network**

Displays scheduler-hierarchy statistics applied on a network port.

**instance-id**

Specifies the identification of a specific instance of the queue group.

**vport name**

Displays statistics for the named VPORT.

**Platforms**

All

**Output**

The following output is an example of port scheduler hierarchy information, and [Table 402: Output fields: QoS schedule hierarchy port](#) describes port scheduler hierarchy fields.

**Output Example**

```
*A:Dut-R# show qos scheduler-hierarchy port 1/2/1 detail

Table 402: Output fields: QoS schedule hierarchy port

Label	Description
S	Displays the scheduler name.
Q	Displays the queue ID and information.
Admin CIR/PIR:	Specifies the configured value of CIR/PIR.
Assigned CIR/PIR:	Specifies the on-the-wire PIR/CIR rate given to a member by that parent level.
Offered CIR/PIR:	Specifies the on-the-wire offered load on that member.
Consumed CIR/PIR:	Specifies the amount of scheduler bandwidth used by this member.

## port

### Syntax

**port** *port-id* **queue-group** *queue-group-name* [**egress**] [{**access** | **network**}] [**instance** *instance-id*] [**detail**]

**port** *port-id* **vport** *name* [**detail**]

## Context

[\[Tree\]](#) (show>qos>agg-rate port)

## Full Context

show qos agg-rate port

## Description

This command displays the H-QoS aggregate rate limit per port or Vport.

## Parameters

### *port-id*

Specifies the port ID.

<i>port-id</i>	<i>slot/mda/port [.channel]</i>		
	eth-sat-id	<i>esat-id/slot/port</i>	
		esat	keyword
		<i>id</i>	1 to 20
	pxc-id	<i>pxc-id.sub-port</i>	
		pxc	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b

### **queue-group** *queue-group-name*

Displays information about the specified queue group on the port.

### **egress**

Displays egress queue group information.

### **access**

Displays H-QoS aggregate rate limit information on an access port.

### **network**

Displays H-QoS aggregate rate limit information on a network port.

### **instance** *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

### **vport** *name*

Displays H-QoS aggregate rate limit information for the specified Vport.

### **detail**

Displays detailed information.

## Platforms

All

## Output

The following output is an example of QoS port aggregation rate output, and [Table 403: Output fields: QoS aggregation rate](#) describes the QoS port aggregation rate fields.

### Output Example

```
*A:PE# show qos agg-rate port 1/1/1 queue-group "qg1" instance 1 access egress
=====

Table 403: Output fields: QoS aggregation rate

Label	Description
Egress Scheduler Policy	Indicates the name of the egress scheduler policy.
Egress Queue-Group	Indicates the queue group name.
Instance-Id	Indicates the identifier of a specific instance of the queue group.
AdminRate	Displays the configured aggregate rate in the subscriber profile.
OperRate	Displays the actual downstream rate.
Limit Unused Bandwidth	Indicates whether the <b>limit-unused-bandwidth</b> command is enabled to protect against exceeding the aggregated bandwidth
OnTheWireRates	Indicates whether the displayed rates are on-the-wire rates.
LastMileOnTheWireRates	Indicates whether the displayed rates are on-the-wire rates for the last mile only.

## port

### Syntax

**port** *port-id* [**detail**]

### Context

[\[Tree\]](#) (show>system>ptp port)

### Full Context

show system ptp port

### Description

This command displays PTP port information.

### Parameters

#### *port-id*

Specifies the port ID.

**Values** slot/mda/port

#### **detail**

Displays detailed information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### Output

The following output is an example of PTP port information, and [Table 404: Output fields: PTP port](#) describes the output fields.

#### Output Example

```
show system ptp port
```

```

Table 405: Output fields: PTP port detail

Label	Description
IEEE 1588/PTP Ethernet Port Information	
Port	The port ID
PTP Admin State	The PTP administrative state
PTP Oper State	The PTP operational state
Local MAC Addr	The local MAC address op
Multicast MAC Addr	The multicast MAC address
Cfg Sync Rate	The configured synchronization rate
Cfg Delay Req Rate	The configured delay request rate
Master-Only	The master-only value
G.8275 Priority	The G.8275 priority
monitorReceiver	The monitorReceiver state
monitorSender	The monitorSender state
PTP Port Number	The PTP port number
PTP Port State	The PTP port state
Neighbors	The neighbors
Timestamp Point	The timestamp point

Label	Description
Port Asymmetry	The port asymmetry time
Profile Name	The profile name
Profile	The profile
Domain	The domain
IEEE 1588/PTP Ethernet Port Neighbor Clocks	
Port	The port ID
MAC Address	The MAC address
Clock Id	The clock ID
PTP Port #	The port number assigned to this PTP clock
Rx Packet Rate	The receive rate
PTSF-unusable	Indicates if there is a Packet Timing Signal Fail (PTSF)-unusable condition associated with a neighbor port
Best Master	Indicates if this peer is selected as the best master clock by the BTCA
Parent Clock	Indicates if this is the parent clock. May differ from the best master if there is a local GNSS.
Backup Source	Indicates if this port is operating as a backup slave to the parent clock
Monitor Time State	Time recovery state of the monitored PTP port or peer
Last Packet Offset from Master	The offsetFromMaster calculated from the last packet exchange with the parent clock
Last Packet Mean Path Delay	The meanPathDelay calculated from the last packet exchange with the parent clock
APTS Asymmetry	The asymmetry computed by the backup source. This is used to compensate if the clock switches to this backup.
IEEE 1588/PTP Packet Statistics	
Input	The number of input packets within the specified category
Output	The number of output packets within the specified category

## port

### Syntax

**port** *port-id* **neighbor** *ieee-address* **ptsf-unusable** **statistics**

### Context

[\[Tree\]](#) (clear>system>ptp port)

### Full Context

clear system ptp port

### Description

This command clears PTP port information.

### Parameters

#### *port-id*

Clears the specified port ID.

**Values** *slot/mda/port*

#### *ieee-address*

Specifies the MAC address.

**Values** *xx:xx:xx:xx:xx:xx* or *xx-xx-xx-xx-xx-xx*

#### **ptsf-unusable**

Keyword used to clear the PTSF-unusable condition associated with a neighbor port.

#### **statistics**

Keyword used to clear statistics information of the specified port ID.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## port

### Syntax

**port** *port-id* [*port-id*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] [**multiclass**] [**aggregate-queue**]  
**port** **all-ethernet-rates** [**interval** *seconds*] [**repeat** *repeat*]

### Context

[\[Tree\]](#) (monitor port)

## Full Context

monitor port

## Description

This command enables port traffic monitoring. The specified port(s) statistical information displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified port(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the **rate** is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *port-id*

Specify up to 5 port IDs. Port-IDs are only MLPPP bundles or bundle protection groups when the multiclass is specified.

<i>port-id</i>	<i>slot/mda/port [.channel]</i>		
	eth-sat-id	<i>esat-id/slot/port</i>	
		esat	keyword
		<i>id</i>	1 to 20
	pxc-id	<i>pxc-id.sub-port</i>	
		pxc	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b
	aps-id	<i>aps-group-id[.channel]</i>	
		aps	keyword
		<i>group-id</i>	1 to 64

### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

**absolute**

Keyword that displays the raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Keyword that displays the rate-per-second for each statistic; instead of the delta.

**all-ethernet-rates**

Keyword that displays port traffic monitoring and utilization output for all data Ethernet ports enabled in the system, in a table output format.

**aggregate-queue**

Keyword that periodically displays the aggregated number of forwarded and dropped packets and bytes per direction across all queues on a PXC port (pxc-<id>.a or pxc-<id>.b).

The system periodically aggregates statistics from all queues under the specified PXC port for presentation. The duration required to gather these statistics is typically brief, though it may vary based on the system load at the time of querying and the number of queues and member ports in a LAG.

Statistics are cached for a 30-second interval, which is also the minimum interval at which this command can output results.

**Platforms**

All

**Output**

The following outputs are examples of port information.

## port

### Syntax

**port** *port-id* [*port-id*] **atm** [**aal-5** | **cp** *cp-id* | **ilmi** | **interface-connection** | **pvc** *vpi/vci* [**aal-5** | **oam**] | **pvp** *vpi* [**aal-5** | **oam** | **pvt** *vpi1.vpi2*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**port** *port-id* [*port-id*] **hw-aggr-shaper-sched** [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**port** *port-id* [*port-id*] **hw-aggr-shaper-sched** [**interval** *seconds*] [**repeat** *repeat*] **monitor-threshold**

**port** *port-id* [*port-id*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] [**multiclass**]

**port** *port-id* [*port-id*] **port-scheduler** [ **interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

## Context

[Tree] (monitor port)

## Full Context

monitor port

## Description

This command enables port traffic monitoring. Various keywords can be used to monitor specific attributes of the ATM port. The specified port(s) statistical information displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified port(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the **rate** is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

## Parameters

### *port-id*

Specifies up to five port IDs. Port-IDs are only be MLPPP bundles or bundle protection groups when the multiclass is specified.

<i>port-id</i>	<i>slot/mda/port</i> [ <i>.channel</i> ]		
	<i>aps-id</i>	<i>aps-group-id</i> [ <i>.channel</i> ]	
		<i>aps</i>	keyword
		<i>group-id</i>	1 to 64

### *seconds*

Configures the interval for each display in seconds.

**Values** 3 to 60

**Default** 10 seconds

### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### *absolute*

Displays raw statistics without processing. No calculations are performed on the delta or rate statistics.

**rate**

Displays the rate-per-second for each statistic, instead of the delta.

**monitor-threshold**

Displays the exceed count for the port-scheduler under Vport (if specified) or for a physical port.

**multiclass**

Monitors multiclass statistics.

**port-scheduler**

Monitors the packet and octet counters for traffic exiting the specified port for the applicable applied port scheduler policy.

**atm**

Monitors ATM statistics.

**aal-5**

Monitors the AAL-5 statistics for the port.

**cp-id**

Monitors ATM connection profile statistics.

**Values** 1 to 8000

**ilmi**

Monitors ATM ILMI statistics.

**interface-connection**

Monitors ATM interface connection statistics.

**pvc vpi/vci**

Monitors ATM PVC statistics.

**Values** vpi -[0 to 4095] (NNI)  
[0 to 255] (UNI)  
vci - [1| 2| 5 to 65535]

**pvp vpi**

Monitors ATM PVP statistics

**Values** vpi [0 to 4095] (NNI) [0 to 255] (UNI)

**pvt vpi1.vpi2**

Monitors ATM PVT statistics.

**Values** [0 to 4095].[0 to 4095] (NNI)[0 to 255].[0 to 255] (UNI)

**oam**

Monitors ATM PVC/PVP OAM statistics.

**Platforms**

All

## Output

The following output is an example of port ATM information.

### Output Example

```

## port

### Syntax

```
port port-id egress network queue-group queue-group-name instance instance-id [ interval seconds ]  
[repeat repeat] [absolute | rate] [arbiter [root | name]]
```

### Context

[\[Tree\]](#) (monitor>qos>arbiter-stats port)

### Full Context

monitor qos arbiter-stats port

### Description

This command monitors arbiter statistics in an egress port queue group.

### Parameters

**port** *port-id*

<i>port-id</i>	<i>slot/mda/port</i> [.channel]		
	eth-sat-id	esat- <i>id</i> /slot/ <i>port</i>	
		esat	keyword
		<i>id</i>	1 to 20
	pxc-id	pxc- <i>id.sub-port</i>	
		pxc	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b

**Values** slot/mda/port

**egress network**

Specifies statistics are for an egress network queue group.

**queue-group queue-group-name**

Specifies the name of the queue group up to 32 characters.

**instance instance-id**

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

**interval seconds**

Configures the interval for each display in seconds.

**Default** 11 seconds

**Values** 11 to 60

**repeat repeat**

Configures how many times the command is repeated.

**Default** 10

**Values** 1 to 999

**absolute**

When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

**rate**

When the **rate** keyword is specified, the rate-per-second for each statistic is displayed.

**arbiter name**

Specify the name of the policer control policy arbiter.

**Values** An existing arbiter-name in the form of a string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

**root**

Specify the root arbiter.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

**port**

**Syntax**

**port** *port-id* **queue-group** *queue-group-name* [ **ingress** | **egress** ] [ **interval** *seconds* ] [ **repeat** *repeat* ] [ **absolute** | **rate** ] [ **access** | **network** ] [ **instance** *instance-id* ]

**port** *port-id* **vport** *name* [ **interval** *seconds* ] [ **repeat** *repeat* ] [ **absolute** | **rate** ]

**Context**

**[Tree]** (monitor>qos>scheduler-stats port)

**Full Context**

monitor qos scheduler-stats port

**Description**

This command enables port traffic monitoring.

## Parameters

### **port** *port-id*

Specifies the port ID.

#### **Values**

*slot/mda/port* [.channel]

eth-sat-id    *esat-id/slot/port*

*esat*                                keyword

*id*                                 1 to 20

pxc-id        *pxc-id.sub-port*

*pxc*                                keyword

*id*                                 1 to 64

*sub-port*                        a, b

### **queue-group** *queue-group-name*

Specifies the name of the queue group up to 32 characters.

### **instance** *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values**    1 to 65535

### **ingress**

Specifies statistics are for an ingress queue group.

### **egress**

Specifies statistics are for an egress queue group.

### **interval** *seconds*

Configures the interval for each display in seconds.

**Default**    11 seconds

**Values**    11 to 60

### **repeat** *repeat*

Configures how many times the command is repeated.

**Default**    10

**Values**    1 to 999

### **absolute**

When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

### **rate**

When the **rate** keyword is specified, the rate-per-second for each statistic is displayed.

### **access**

Displays scheduler statistics applied on an access port.

### **network**

Displays scheduler statistics applied on a network port.

## **Platforms**

All

## **port**

## **Syntax**

**port** *port-id* **exp-secondary-shaper** *shaper-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**port** *port-id* **vport** *name* [**interval** *seconds*] [**repeat** *repeat*]

## **Context**

[\[Tree\]](#) (monitor>qos port)

## **Full Context**

monitor qos port

## **Description**

This command monitors expanded secondary shaper statistics.

## **Parameters**

### ***port-id***

Specifies the port ID.

**Values** *slot/mda/port*  
*esat-id/slot/port*  
*pxc-id.sub-port*

### ***shaper-name***

Displays statistics for the named exp secondary shaper.

### ***seconds***

Configures the interval for each display in seconds.

**Values** 11 to 60

**Default** 11 seconds

### ***repeat***

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

**absolute**

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

**rate**

Displays rate-per-second for each statistic.

**vport name**

Displays statistics for the named Vport.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

port

**Syntax**

**port** *port-id* **queue-group** *queue-group-name* [**egress**] [**network**] [**instance** *instance-id*] [**arbiter** {*name* | *root*}]

**Context**

[\[Tree\]](#) (clear>qos>arbiter-stats port)

**Full Context**

clear qos arbiter-stats port

**Description**

This command clears the arbiter statistics per port.

**Parameters**

***port-id***

Specifies the port ID.

**Values**

*slot/mda/port* [*.channel*]

*pxc-id* *pxc-id.sub-port*

*pxc*

keyword

*id*

1 to 64

*sub-port*

a, b

***queue-group-name***

Specifies the queue group name, up to 32 characters.

### **network**

Clears the egress network queue group statistics.

### **instance-id**

Specifies the ID of a specific instance for the queue group.

**Values** 1 to 65535

### **name**

Specifies the arbiter name, up to 32 characters.

### **root**

Specifies the arbiter root, up to 32 characters.

## **port**

### **Syntax**

**port** *port-id* **queue-group** *queue-group-name* [**ingress** | **egress**] [**access** | **network**] [**instance** *instance-id*] [**scheduler** *scheduler-name*]

**port** *port-id* **vport** *name* [**scheduler** *scheduler-name*]

### **Context**

[\[Tree\]](#) (clear>qos>scheduler-stats port)

### **Full Context**

clear qos scheduler-stats port

### **Description**

This command clears the scheduler statistics per port.

### **Parameters**

#### ***port-id***

Specifies the ID of a specific instance for the queue group.

**Values** *slot/mda/port* [*.channel*]

#### ***queue-group-name***

Specifies the queue group name, up to 32 characters.

#### **ingress**

Clears statistics for the ingress queue group.

#### **egress**

Clears statistics for the egress queue group.

**access**

Clears scheduler statistics applied on an access port.

**network**

Clears scheduler statistics applied on a network port.

**instance-id**

Specifies the ID of a specific instance for the queue group.

**Values** 1 to 65535

**name**

Specifies the Vport name, up to 32 characters.

**scheduler-name**

Specifies the scheduler name, up to 32 characters.

**Platforms**

All

port

**Syntax**

```
port port-id egress [network] [queue-group queue-group-name] [instance instance-id] [arbiter name |  
root]
```

**Context**

[\[Tree\]](#) (show>qos>arbiter-stats port)

**Full Context**

```
show qos arbiter-stats port
```

**Description**

This command displays the arbiter statistics per port.

**Parameters**

**port-id**

Displays information about the specified port.

**Values** *slot/mda/port* [*.channel*]

**network**

Displays arbiter statistics applied on a network port.

**queue-group-name**

Specifies the queue group name, up to 32 characters.

***name***

Specifies the arbiter name, up to 32 characters.

***root***

Specifies the arbiter root, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

port

**Syntax**

**port** *port-id* **network egress queue-group** *group-name* **instance** *instance-id* [ **detail**]

**Context**

[\[Tree\]](#) (show>qos>policer port)

**Full Context**

show qos policer port

**Description**

This command displays the policer statistics per port.

**Parameters**

***port-id***

Displays information about the specified port.

**Values** *slot/mda/port*

***group-name***

Specifies the queue group name, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

port

**Syntax**

**port** *port-id* **vport** *name* [**scheduler** *scheduler-name*]

**Context**

[\[Tree\]](#) (show>qos>scheduler-stats port)

## Full Context

show qos scheduler-stats port

## Description

This command displays the Vport scheduler stats.

## Parameters

### *port-id*

Displays information for the specified port.

### *name*

Displays information for the specified Vport.

### *scheduler-name*

Displays information for the specified scheduler-name.

## Platforms

All

## Output

The following output is an example of Vport scheduler information.

### Output Example

```
*A:BNG# show qos scheduler-stats port 1/1/1 vport "dslam1" scheduler "dslam-sched"
=====
Scheduler Stats
=====
Scheduler                               Forwarded Packets      Forwarded Octets
-----
Egress Schedulers
dslam-sched                             0                      0
=====
*A:BNG#
```

Table 406: Output fields: Vport scheduler statistics describes Vport scheduler statistics output fields.

Table 406: Output fields: Vport scheduler statistics

Field	Description
Scheduler	The scheduler name
Forwarded Packets	The number of forwarded packets, as determined by the subscriber ingress scheduler policy
Forwarded Octets	The number of forwarded octets, as determined by the subscriber ingress scheduler policy

## 23 p Commands – Part III

### 23.1 port-db

#### port-db

##### Syntax

**port-db sap** *sap-id*

**port-db sap** *sap-id* **detail**

**port-db sap** *sap-id* **group** *grp-ipv6-address*

**port-db sdp** *sdp-id:vc-id* [**detail**]

**port-db sdp** *sdp-id:vc-id* **group** *grp-ipv6-address*

##### Context

[\[Tree\]](#) (show>service>id>mld-snooping port-db)

##### Full Context

show service id mld-snooping port-db

##### Description

This command displays MLD snooping information related to a specific SAP.

##### Platforms

All

##### Output

The following output is an example of MLD snooping information for a specific SAP.

##### Output Example

```

## port-db

### Syntax

```

port-db sap sap-id [detail]
port-db sap sap-id group grp-address
port-db sdp sdp-id:vc-id [detail]
port-db sdp sdp-id:vc-id group grp-ip-address
vxlan vtep ip-address vni vni-id
    
```

### Context

**[Tree]** (show>service>id>igmp-snooping port-db)

## Full Context

```
show service id igmp-snooping port-db
```

## Description

This command displays information on the IGMP snooping port database for the VPLS service.

## Parameters

### *grp-ip-address*

Displays the IGMP snooping port database for a specific multicast group address

### *sap-id*

Displays the IGMP snooping port database for a specific SAP

### *sdp-id*

Displays only IGMP snooping entries associated with the specified mesh SDP or spoke-SDP. For a spoke-SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

**Values** 1 to 17407

### *vc-id*

The virtual circuit ID on the SDP ID for which to display information

**Default** For mesh SDPs only, all VC IDs

**Values** 1 to 4294967295

### *grp-address*

Displays IGMP snooping statistics matching the specified group address.

### *ip-address*

Displays IGMP snooping statistics matching one particular source within the multicast group.

### *vxlan vtep ip-address vni <1..16777215>*

Displays the IGMP snooping entries associated with a specific VXLAN binding, given by the VXLAN Termination Endpoint (VTEP) and VXLAN Network Identifier (VNI).

### *vni*

The VXLAN Network Identifier (VNI) for which to display information.

**Values** 1 to 16777215

Table 407: Output fields: IGMP snooping port database describes the show output fields.

Table 407: Output fields: IGMP snooping port database

Label	Description
Group Address	The IP multicast group address for which this entry contains information.
Mode	Specifies the type of membership reports received on the interface for the group.  In the include mode, reception of packets sent to the specified multicast address is requested only from those IP source addresses listed in the source-list parameter of the IGMP membership report.  In the exclude mode, reception of packets sent to the specified multicast address is requested from all IP source addresses except those listed in the <b>source-list</b> parameter.
Type	Indicates how this group entry was learned.  If this group entry was learned by IGMP, the value is set to dynamic.

Label	Description
	For statically configured groups, the value is set to static.
Compatibility mode	Specifies the IGMP mode. This is used for routers to be compatible with older-version routers. IGMPv3 hosts must operate in Version 1 and Version 2 compatibility modes. IGMPv3 hosts must keep state per local interface regarding the compatibility mode of each attached network. A host's compatibility mode is determined from the host compatibility mode variable which can be in one of three states: IGMPv1, IGMPv2 or IGMPv3. This variable is kept per interface and is dependent on the version of general queries heard on that interface as well as the older-version querier present timers for the interface.
V1 host expires	The time remaining until the local router will assume that there are no longer any IGMP Version 1 members on the IP subnet attached to this interface. Upon hearing any IGMPv1 membership report, this value is reset to the group membership timer. While this time remaining is non-zero, the local router ignores any IGMPv2 leave messages for this group that it receives on this interface.
V2 host expires	The time remaining until the local router will assume that there are no longer any IGMP Version 2 members on the IP subnet attached to this interface. Upon hearing any IGMPv2 membership report, this value is reset to the group membership timer. While this time remaining is non-zero, the local router ignores any IGMPv3 leave messages for this group that it receives on this interface.
Source address	The source address for which this entry contains information.
Up Time	The time since the source group entry was created.
Expires	The amount of time remaining before this entry will be aged out.
Number of sources	Indicates the number of IGMP group and source specific queries received on this SAP.
Forwarding/Blocking	Indicates whether this entry is on the forward list or block list.
Number of groups	Indicates the number of groups configured for this SAP.

## port-db

### Syntax

**port-db sap** *sap-id* [**group** *grp-ip-address*]

**port-db sap** *sap-id* **group** *grp-ip-address* **source** *src-ip-address*

```
port-db sdp sdp-id:vc-id [group grp-ip-address]  
port-db sdp sdp-id:vc-id group grp-ip-address source src-ip-address  
port-db [group grp-ip-address] vxlan vtep ip-address vni vni-id  
port-db group grp-ip-address source src-ip-address vxlan vtep ip-address vni vni-id
```

## Context

[\[Tree\]](#) (clear>service>id>igmp-snooping port-db)

## Full Context

```
clear service id igmp-snooping port-db
```

## Description

This command clears the information on the IGMP snooping port database for the VPLS service.

## Parameters

### *sap-id*

Clears IGMP snooping statistics matching the specified SAP ID and optional encapsulation value

### *sdp-id*

Clears only IGMP snooping entries associated with the specified mesh SDP or spoke-SDP. For a spoke-SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

**Values** 1 to 17407

### *vc-id*

Clears information for the specified virtual circuit ID on the SDP ID

**Default** For mesh SDPs only, all VC IDs

**Values** 1 to 4294967295

### *grp-ip-address*

Clears IGMP snooping statistics matching the specified group address

### *src-ip-address*

Clears IGMP snooping statistics matching the specified particular source

### **vxlan vtep** *ip-address* **vni** <1..16777215>

Clears the IGMP snooping statistics associated with a specific VXLAN destination given by the VXLAN Termination Endpoint (VTEP) and VXLAN Network Identifier (VNI).

### *vni-id*

Displays information for the specified VXLAN Network Identifier (VNI)

**Values** 1 to 16777215

## Platforms

All

## port-db

### Syntax

```
port-db sap sap-id [group grp-ip-address]  
port-db sap sap-id group grp-ip-address source src-ip-address  
port-db sdp sdp-id:vc-id [group grp-ip-address]  
port-db sdp sdp-id:vc-id group grp-ip-address source src-ip-address  
port-db [group grp-ip-address] vxlan vtep ip-address vni vni-id  
port-db group grp-ip-address source src-ip-address vxlan vtep ip-address vni vni-id
```

### Context

[\[Tree\]](#) (clear>service>id>mld-snooping port-db)

### Full Context

```
clear service id mld-snooping port-db
```

### Description

This command clears MLD snooping port-db group data.

### Parameters

#### *sap-id*

Clears IGMP snooping statistics matching the specified SAP ID and optional encapsulation value

#### *sdp-id*

Clears only IGMP snooping entries associated with the specified mesh SDP or spoke-SDP. For a spoke-SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

**Values** 1 to 17407

#### *vc-id*

Clears information for the specified virtual circuit ID on the SDP ID

**Default** For mesh SDPs only, all VC IDs

**Values** 1 to 4294967295

#### *grp-ip-address*

Clears IGMP snooping statistics matching the specified group address

#### *src-ip-address*

Clears IGMP snooping statistics matching the specified particular source

#### **vxlan vtep** *ip-address* **vni** <1..16777215>

Clears the IGMP snooping statistics associated with a specific VXLAN destination given by the VXLAN Termination Endpoint (VTEP) and VXLAN Network Identifier (VNI).

### ***vni-id***

Displays information for the specified VXLAN Network Identifier (VNI)

**Values** 1 to 16777215

### **Platforms**

## 23.4 port-list

### port-list

#### Syntax

**port-list** [*port-list-name*]

**port-list** *port-list-name* **references**

#### Context

[\[Tree\]](#) (show>filter>match-list port-list)

#### Full Context

show filter match-list port-list

## Description

This command displays TCP/UDP/SCTP port values or ranges for match criteria in IPv4 and IPv6 ACL and CPM filter policies.

## Parameters

### *port-list-name*

A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

### references

Displays the filter policies, policy entries and source/destination/port match type per entry referring to this match list.

## Platforms

All

port-list

## Syntax

**port-list**

**port-list** *port-list-name* [**association**]

## Context

[\[Tree\]](#) (show>qos>match-list port-list)

## Full Context

show qos match-list port-list

## Description

This command displays the list of configured QoS port lists or the details of a specific QoS port list together with the network QoS policies in which it is used and the entry number within that policy.

## Parameters

### *port-list-name*

Displays a port list, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

### association

Displays the network QoS policy and entry number in which the specified port list is used.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of QoS port list information. [Table 408: Output fields: port list](#) describes the output fields.

### Output Example

```
*A:PE# show qos match-list port-list
=====

=====
```

Table 408: Output fields: port list

Label	Description
Port List Name	Displays the port list name.

Label	Description
Description	Displays the port list description.
Num Ports/Range	Displays the number of ports or range of ports.
No. of Port-List	Displays the number of port lists.
QoS Policy ID	Displays the QoS policy ID.

## 23.5 port-map

### port-map

#### Syntax

**port-map** [*client-map-id*]

#### Context

[\[Tree\]](#) (show>system>satellite>eth-sat port-map)

#### Full Context

show system satellite eth-sat port-map

#### Description

This command displays information about configured satellites port maps.

#### Parameters

##### *client-map-id*

Specifies the client map to display. If a client port is associated with a resilient secondary uplink, a second line shows the current secondary uplink association.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

#### Output

The following output is an example of satellite port map information.

#### Output Example

```
A:admin@Dut-A# show system satellite eth-sat 1 port-map
=====
Satellite Port Mapping Information
=====
Client Port      Adm  Oper  Uplink Port      Adm  Oper  Host Port Adm  Oper  Act

			esat-1/1/u2	Up	Up	1/1/2	Up	Up	N

## 23.6 port-policy

### port-policy

#### Syntax

**port-policy**

**port-policy** *policy-name*

**port-policy** *policy-name* **associations**

#### Context

[\[Tree\]](#) (show port-policy)

#### Full Context

show port-policy

#### Description

This command displays port policy information.

#### Parameters

***policy-name***

Specifies the port policy name, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.7 port-queues

### port-queues

#### Syntax

**port-queues** *queue-depth* [*queue queue-id*]

## Context

[\[Tree\]](#) (clear>port port-queues)

## Full Context

clear port port-queues

## Description

This command clears the port queues and queue depth.

## Parameters

### **queue-depth**

Clears the queue depth.

### **queue-id**

Specifies the queue ID.

**Values** 1 to 16

## Platforms

All

port-queues

## Syntax

port-queues queue *queue-id*

port-queues queue-depth [**queue** *queue-id*]

## Context

[\[Tree\]](#) (show>port port-queues)

## Full Context

show port port-queues

## Description

This command displays port queues, queue override, and queue depth information.

## Parameters

### **queue-depth**

Displays queue depth information for the specified queue group queue.

### **queue-id**

Specifies the queue ID.

**Values** 1 to 16

## Platforms

All

## 23.8 port-recorder

### port-recorder

#### Syntax

**port-recorder detail** [**flow-count** *flows*] [**byte-count** *kbytes*] [**isa** *mda-id /esa-vm-id*] **url** *file-url*

**port-recorder status** [**isa** *mda-id/esa-vm-id*]

**port-recorder top** *granularity* [**max-count** *max-count*] [**isa** *mda-id*]

#### Context

[\[Tree\]](#) (tools>dump>app-assure>group port-recorder)

#### Full Context

tools dump application-assurance group port-recorder

#### Description

This command saves the port recorded by the tool into a file. The port-recorder is configured using debug commands.

#### Parameters

##### **flow-count** *flows*

Match ports with flow count greater than the specified value.

**Values** slot 1 to 4294967295

##### **bytes-count** *kbytes*

Match ports with bytes count greater than the specified value.

**Values** slot 1 to 4294967295

##### **status**

Displays the current status of the port-recorder with current-time, start-time, stop-time, sample-rates as well as number of bytes and flows for UDP and TCP traffic on the specified AA ISA card. The port-recorder is configured using debug commands.

##### **top**

Displays by bytes or flows the top ports recorded by the tool on a particular AA ISA.

##### **mda-id/esa-vm-id**

Specifies the AA ISA.

**Values** slot 1 to 10, mda 1 to 2

**file-url**

Specifies the URL for the file to direct the port-recorder output to.

**Values**

<b>local-url:</b>	<cflash-id>/[<file-path>]
	200 chars max, including cflash-id
	directory length 99 chars max each
<b>remote-url:</b>	[[ftp://  tftp://]<login>:<pswd>@<remote-locn>/][<file-path>]
	255 chars max
	directory length 99 chars max each
<b>remote-locn:</b>	<hostname>   <ipv4-address>   <ipv6-address> ]
ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:d.d.d.d[-interface]
	x - [0..FFFF]H
	d - [0..255]D
interface	32 chars max, for link local addresses
cflash-id	flash slot ID

**granularity**

Specifies if the output is sorted by bytes or flows.

**Values** bytes, flows

**max-count**

Specifies the maximum number of values to display.

**Values** 1 to 25

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.9 port-scheduler

### port-scheduler

#### Syntax

**port-scheduler** [*interval seconds*] [*repeat repeat*] [*absolute| rate*]

#### Context

[\[Tree\]](#) (monitor>port port-scheduler)

#### Full Context

monitor port port-scheduler

#### Description

This command monitors port scheduler statistics.

#### Parameters

##### *seconds*

Configures the interval for each display in seconds.

**Values** 11 to 60

##### *repeat*

Configures how many times the command is repeated.

**Values** 1 to 999

##### *absolute*

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

##### *rate*

Displays rate-per-second for each statistic instead of the delta.

#### Platforms

All

### port-scheduler

#### Syntax

**port-scheduler statistics**

## Context

[\[Tree\]](#) (clear>port port-scheduler)

## Full Context

clear port port-scheduler

## Description

This command clears port scheduler statistics.

## Parameters

### statistics

Clears port scheduler statistics.

## Platforms

All

port-scheduler

## Syntax

**port-scheduler statistics**

## Context

[\[Tree\]](#) (show>lag port-scheduler)

## Full Context

show lag port-scheduler

## Description

This command displays port scheduler policy information applied to the LAG.

## Parameters

### statistics

Displays statistics for the port scheduler policy applied to the LAG.

## Platforms

All

port-scheduler

## Syntax

**port-scheduler statistics**

## Context

[\[Tree\]](#) (show>port port-scheduler)

## Full Context

show port port-scheduler

## Description

This command displays port schedule policy information applied to the port.

## Parameters

### statistics

Displays port schedule policy statistics.

## Platforms

All

## 23.10 port-scheduler-policy

### port-scheduler-policy

## Syntax

**port-scheduler-policy** [*port-scheduler-policy-name*] [ **association**]

**port-scheduler-policy** *port-scheduler-policy-name* **network-policy** *network-queue-policy-name*

**port-scheduler-policy** *port-scheduler-policy-name* **sap-egress** *policy-id*

**port-scheduler-policy** *port-scheduler-policy-name* **scheduler-policy** *scheduler-policy-name*

**port-scheduler-policy** *port-scheduler-policy-name* **scheduler-policy** *scheduler-policy-name* **sap-egress**  
*policy-id*

## Context

[\[Tree\]](#) (show>qos port-scheduler-policy)

## Full Context

show qos port-scheduler-policy

## Description

This command displays port-scheduler policy information

## Parameters

### *port-scheduler-policy-name*

Displays information for the specified existing port scheduler policy.

**association**

Displays associations related to the specified port scheduler policy.

**network-policy *network-queue-policy-name***

Displays information for the specified existing network queue policy.

**sap-egress *policy-id***

Displays information for the specified existing SAP egress policy.

**scheduler-policy *scheduler-policy-name***

Displays information for the specified existing scheduler policy.

**Platforms**

All

**Output**

The following output is an example of QoS port scheduler policy information, and [Table 409: Output fields: QoS port scheduler](#) describes the QoS port scheduler policy fields.

**Output Example**

```
*A:Dut-R# show qos port-scheduler-policy p1

Table 409: Output fields: QoS port scheduler

Label	Description
Policy Name	Displays the port scheduler policy name.
HQOS Algorithm	Displays the port scheduler H-QoS algorithm used to calculate the operational rates for the children connected to the port scheduler.
Max Rate	Displays the explicit maximum frame-based bandwidth limit of this port scheduler.
Lvlx PIR	Displays the total bandwidth limit, PIR, for the specified priority level.
Lvlx CIR	Displays the within-CIR bandwidth limit for the specified priority level.
Orphan Lvl	Displays above-CIR port priority of orphaned queues and scheduler.
Orphan Weight	Displays the weight of orphaned queues and schedulers that are above-CIR.

Label	Description
Orphan CIR-Lvl	Displays the port priority of orphaned queues and schedulers that are within-CIR.
Orphan CIR-Weight	Displays the weight of orphaned queues and schedulers that are within-CIR.
Associations	Displays associations related to the specified port scheduler policy.
Mode	Displays the port scheduler policy mode (STRICT, RR, WRR, WDRR).
Accounting	Displays whether the accounting mode is frame-based or packet-based
Last Changed	Displays the last time the configuration changed.
Queue #	Displays the weight of the queue if configured.

## 23.11 port-topology

### port-topology

#### Syntax

**port-topology** [uni-dir]

#### Context

[\[Tree\]](#) (show>system port-topology)

#### Full Context

show system port-topology

#### Description

This command generates a listing of the internal connections within the router. These include connections to satellite ports. Use of the **uni-dir** keyword will list each connection twice; once for each direction.

#### Parameters

**uni-dir**

Specifies to list each direction as a separate row.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of port topology information.

### Output Example

```
*A:Dut-A# show system port-topology
=====
Port Topology
=====
Port Far-end
Id Port Id
-----
esat-1/1/u1 1/1/1

```

## 23.12 port-xc

### port-xc

#### Syntax

```
port-xc [pxc pxc-id]
```

#### Context

[\[Tree\]](#) (show>port-xc port-xc)

#### Full Context

```
show port-xc
```

#### Description

This command displays information about Port Cross-Connect (PXC) information.

#### Parameters

*pxc-id*

Specifies the PXC ID.

**Values** 1 to 64

#### Platforms

All

## Output

The following output is an example of PXC information, and [Table 410: Output fields: port cross connect](#) describes the output fields.

### Output Example

```
*A:cses-B04# show port-xc
=====
Port Cross-Connect Information

=====
```

Table 410: Output fields: port cross connect

Label	Description
PXC Id	The port cross-connect identifier
Admin State	The administrative state of the port
Oper State	The operational state of the port
Port Id	The port ID
Description	The PXC ID description
Interface	The port ID
MAC Chip Number	The MAC chip number for this port

Label	Description
Licensed	Yes — The port is licensed and can be used in a service configuration. No — The port is unlicensed and may not be used
IFIndex	Displays the interface's index number which reflects its initialization sequence.
Last State Change	Displays the last time the operational status of the port changed state.
Ing. Pool % Rate	The increment or decrement of the active bandwidth associated with the ingress port. This active bandwidth affects the amount of ingress buffer space managed by the port.
Egr. Pool % Rate	The increment or decrement of the active bandwidth associated with the egress port. This active bandwidth affects the amount of egress buffer space managed by the port.

## 23.13 positive-app-id

### positive-app-id

#### Syntax

**positive-app-id**

#### Context

**[Tree]** (tools>dump>app-assure>group>ipassist positive-app-id)

#### Full Context

tools dump application-assurance group ip-identification-assist positive-app-id

#### Description

This command dumps the statistics related to IP identification assist for top applications using IP addresses learned from successfully classified traffic using the AA application database.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

Use this command to dump the statistics.

```
tools dump application-assurance group "1" ip-identification-assist positive-app-id isa "1/1"
```

### Output Example

```

## 23.14 post-policer-mapping

### post-policer-mapping

#### Syntax

**post-policer-mapping** [*post-policer-name*] [**association** | **detail**]

#### Context

[\[Tree\]](#) (show>qos post-policer-mapping)

#### Full Context

show qos post-policer-mapping

#### Description

This command displays information about post-policer mapping policies. Omitting the policy name will list all policies.

#### Parameters

##### *post-policer-name*

Specifies the name of the post-policer mapping policy, up to 32 characters.

##### **association**

Displays the entities associated with the post-policer mapping policy.

##### **detail**

Displays the detailed information for the post-policer mapping policy.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

#### Output

This section shows output example for post-policer mapping.

#### Output Example

```

Table 411: Output fields: chassis power management

Label	Description
Power Management Mode	Specifies the configured power management mode: None, Basic, or Advanced.
Power Safety Level	Specifies the configured Power Safety Level, which is a percentage of the worst case power consumption level.
Power Safety Alert	Specifies the configured power level in watts, which causes the system to raise an alarm if the available power level drops below a set level.

Label	Description
Power-Zone	Specifies the chassis power zone.
Number of PEQs	Specifies the total number of APEQs installed.
PEQ number:	Specifies the APEQ to which the information is associated
PEQ Equipped Type	Specifies the APEQ type installed.
PEQ Provisioned Type	Specifies the APEQ type provisioned.
Status	Specifies the APEQ status.
Input Feed Status	Specifies the feed status. This field indicates that power is detected on all inputs or lists the inputs where no power is detected.
PCM Equipped Type	<p>Indicates the type of PCM installed in the specified PIM or PCM slot:</p> <ul style="list-style-type: none"> <li>• (empty slot)</li> <li>• indeterminate</li> <li>• quad-pcm</li> </ul> <p>Some PCMs can only be verified for presence based on power available at the associated APEQ. These are indicated as indeterminate.</p> <p>When the equipped type is quad-pcm, the additional fields of Power-Zone, Status, and Input Feed Status and Hardware Data are displayed.</p>
PCM Provisioned Type	<p>One of the following types:</p> <ul style="list-style-type: none"> <li>• (not specified)</li> <li>• dual-pcm</li> <li>• quad-pcm</li> </ul> <p>For a given PCM number, if the equipped type is not detected and the provisioned type is not specified, the PCM is not displayed.</p>
<b>Hardware Data:</b>	
Part number	The APEQ part number.
CLEI code	The APEQ CLEI code.
Serial number	The APEQ serial number.
Manufacture date	The date the APEQ was manufactured.
Manufacturing deviations	Specifies any manufacturing deviations.
Manufacturing assembly number	The APEQ assembly number.
Administrative state	Specifies the administrative state of the APEQ.
Operational state	Specifies the operational state of the APEQ.

Label	Description
Time of last boot	Indicates the time stamp of the last system restart.
Current alarm state	Indicates the current alarm state.

## 23.16 power-module

### power-module

#### Syntax

**power-module** [*power-module-id*] [**detail**]

#### Context

[\[Tree\]](#) (show>chassis>power-shelf power-module)

#### Full Context

show chassis power-shelf power-module

#### Description

This command displays the power-module.

#### Parameters

##### ***power-module-id***

Specifies the power module ID.

**Values** 1 to 10

##### ***detail***

Displays detailed power module information.

#### Platforms

7750 SR-s

#### Output

The following output is an example of a power module

#### Output Example: show chassis power-shelf power-module

```
A:DUT-A# show chassis power-shelf 1 power-module

## power-module

### Syntax

**power-module** *power-module-id*

### Context

[\[Tree\]](#) (clear>chassis>power-shelf power-module)

### Full Context

clear chassis power-shelf power-module

### Description

This command toggles the output power of the power module, turning it off for two seconds then on. This procedure can be used to clear an ovSD (output voltage shutdown) fault. The only alternative method to clear the ovSD fault is to physically remove the power module from the power shelf and re-insert. Running this command does not clear the latched faults.

### Parameters

***power-module-id***

Specifies the power-module ID.

**Values** 1 to 10

## Platforms

7750 SR-s

## power-module

### Syntax

**power-module** *power-module-id* **telemetry**

### Context

[\[Tree\]](#) (tools>dump>power-shelf power-module)

### Full Context

tools dump power-shelf power-module

### Description

This command displays the specified power module information, telemetry, and fault data. When a fault is no longer active it remains marked as a latched fault for tracking purposes until manually cleared.

### Parameters

#### *power-module-id*

Displays information about the specified power-module ID.

**Values** 1 to 10

#### **telemetry**

Displays telemetry and fault data for the specified power module.

## Platforms

7750 SR-s

## power-module

### Syntax

**power-module** *power-module-id* **clear-faults**

### Context

[\[Tree\]](#) (tools>perform>power-shelf power-module)

### Full Context

tools perform power-shelf power-module

### Description

This command clears all the latched faults for inactive faults.

## Parameters

### *power-module-id*

Specifies power-module ID.

**Values** 1 to 10

### *clear-faults*

Clears fault conditions against the specified power module.

## Platforms

7750 SR-s

## 23.17 power-shelf

### power-shelf

## Syntax

**power-shelf** [*power-shelf-id*] [ **detail**] [**chassis** *chassis-name*]

## Context

[\[Tree\]](#) (show>chassis power-shelf)

## Full Context

show chassis power-shelf

## Description

This command displays the power shelf.

## Parameters

### *power-shelf-id*

Specifies the power shelf ID.

**Values** 1 to 2

### *detail*

Displays detailed power shelf information.

### *chassis-name*

Specifies the chassis name, up to 256 characters maximum.

## Platforms

7750 SR-s

## Output

The following output is an example of power shelves

### Output Example: show chassis power-shelf

```
A:DUT-A# show chassis power-shelf
=====
Power Shelf Summary
=====
Slot      Provisioned Type      Admin Operational   Zone  Input Output
         Equipped Type (if diff) State State              Mode
-----
1         ps-a10-shelf-dc      up   up                1     80A   on
2         ps-b10-shelf-ac/hv   up   up                1     N/A   on
=====
```

## power-shelf

### Syntax

**power-shelf** *power-shelf-id*

### Context

[\[Tree\]](#) (clear>chassis power-shelf)

### Full Context

clear chassis power-shelf

### Description

Commands in this context clear power-shelf components.

### Parameters

***power-shelf-id***

Specifies power-shelf ID.

**Values** 1 to 2

### Platforms

7750 SR-s

## power-shelf

### Syntax

**power-shelf** *power-shelf-id*

### Context

[\[Tree\]](#) (tools>dump power-shelf)

## Full Context

tools dump power-shelf

## Description

Commands in this context display power-shelf information.

## Parameters

### *power-shelf-id*

Displays information about the specified power-shelf.

**Values** 1, 2

## Platforms

7750 SR-s

power-shelf

## Syntax

**power-shelf** *power-shelf-id*

## Context

[\[Tree\]](#) (tools>perform power-shelf)

## Full Context

tools perform power-shelf

## Description

Commands in this context configure power-shelf parameters.

## Parameters

### *power-shelf-id*

Specifies the power-shelf ID.

**Values** 1, 2

## Platforms

7750 SR-s

## 23.18 ppp

```
ppp
```

### Syntax

```
ppp
```

### Context

[\[Tree\]](#) (show>service>id ppp)

### Full Context

```
show service id ppp
```

### Description

Commands in this context display service PPP information for the specified service.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
ppp
```

### Syntax

```
ppp
```

### Context

[\[Tree\]](#) (tools>perform>subscr-mgmt>loc-user-db ppp)

### Full Context

```
tools perform subscriber-mgmt local-user-db ppp
```

### Description

This command provides the tools to control PPPoE entries in the local user database.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ppp

### Syntax

ppp

### Context

[\[Tree\]](#) (show>call-trace ppp)

### Full Context

show call-trace ppp

### Description

Commands in this context display Point-to-Point Protocols (PPP) call trace information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.19 ppp-policy

## ppp-policy

### Syntax

ppp-policy [*ppp-policy-name* **[association]**]

### Context

[\[Tree\]](#) (show>subscr-mgmt ppp-policy)

### Full Context

show subscriber-mgmt ppp-policy

### Description

This command displays PPP policy information.

### Parameters

***ppp-policy-name***

Specifies an existing PPP policy.

**association**

Displays the object the PPP policy is associated.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of PPP policy information and [Table 412: Output fields: subscriber management PPP policy](#) describes the field descriptions.

*Table 412: Output fields: subscriber management PPP policy*

Label	Description
Description	Specifies the description.
Last Mgmt Change	Specifies the date and time of the last management change.
PPP-mtu	Specifies the configured maximum PPP MTU size.
Force PPP-mtu >1492	Specifies if PPPoE MRU negotiations greater than 1492 bytes are enabled without receiving a "PPP-Max-Payload" tag in the PADI/PADR client message (Yes, No).
Keepalive Interval	Specifies the keepalive interval, in seconds.
Keepalive Multiplier	Specifies the keepalive multiplier value.
Disable AC-Cookies	Specifies to disable AC cookies (Yes, No).
PADO Delay	Specifies the PADO delay value, in milliseconds.
Max Sessions-Per-Mac	Specifies the maximum number of sessions with the same client MAC address and active on the same SAP or MSAP.
Reply-On-PADT	Specifies to reply on PADT (Yes, No).
Allow Same CID	Specifies to allow the same Circuit ID for multiple PPPoE sessions with the same client MAC address and active on the same SAP when using the internal DHCPv4 client for IPv4 address allocation (Yes, No).
Re-establish Session	Specifies if a PPPoE session can be re-established upon receiving a PADR from a PPPoE client that previously disconnected without sending a PADT and for which a session is still active in the BNG (PADR, Disabled).
PPP-Authentication	Specifies the PPP Authentication method (PAP, CHAP, pref-PAP or pref-CHAP).
PPP-CHAP Challenge	Specifies the minimum and maximum length of a PPP CHAP Challenge (in bytes).
PPP-Init-Delay (ms)	Specifies the delay in milliseconds for sending an LCP configure request after the discovery phase.

Label	Description
IPCP negotiate subnet	Specifies if IPCP subnet negotiation is enabled (Yes, No).
Unique SIDs-Per-SAP	Specifies the unique SIDs per-SAP (disabled, per-capture-sap, per-msap).
Reject-Disabled-Ncp	Specifies if an LCP protocol reject is sent for an unconfigured NCP (Yes, No).
Ignore-Magic-Num	Specifies if the LCP peer magic number should be ignored (Yes, No).
Session Timeout	Specifies the session timeout value in seconds (default = unlimited).
SID Allocation	Specifies the PPPoE Session ID allocation method (sequential, random).
PADO AC-Name	Specifies the AC name used in PADO messages.
Default username	Specifies the default username for PAP or CHAP authentication.
Default password	Specifies the default PAP password (Specified, Not specified).
Accept MRRU	Specifies to accept MRRU (true, false).
Request short sequence nr.	Specifies to request short sequence numbers (true, false).
Endpoint class	Specifies the endpoint class (null, ipv4-address or mac-address).
Endpoint address	Specifies the endpoint IPv4 or mac address.

## 23.20 pppoe

### pppoe

#### Syntax

pppoe

#### Context

[\[Tree\]](#) (show>service>id pppoe)

#### Full Context

show service id pppoe

#### Description

Commands in this context display PPPoE information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### pppoe

#### Syntax

pppoe

#### Context

[\[Tree\]](#) (clear>call-trace pppoe)

#### Full Context

clear call-trace pppoe

#### Description

Commands in this context clear the PPPoE job.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## pppoe

### Syntax

pppoe

### Context

[\[Tree\]](#) (clear>service>id pppoe)

### Full Context

clear service id pppoe

### Description

Commands in this context clear PPPoE-related data for the specified service.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.21 pppoe-client

## pppoe-client

### Syntax

pppoe-client [**brg-id** *brg-ident*]  
pppoe-client [**brg-id** *brg-ident*] [**detail**]  
pppoe-client [**brg-id** *brg-ident*] [**statistics**]

### Context

[\[Tree\]](#) (show>subscr-mgmt>vrgw>brg pppoe-client)

### Full Context

show subscriber-mgmt vrgw brg pppoe-client

### Description

This command displays information of PPPoE clients started by the vRGW.

### Parameters

***brg-ident***

Specifies the string identifying the BRG, up to 32 characters maximum.

**detail**

Displays detailed PPPoE client information.

**statistics**

Displays PPPoE client statistics.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of PPPoE client information.

**Output Example**

```

## pppoe-client

### Syntax

**pppoe-client**

### Context

[\[Tree\]](#) (tools>perform>subscr-mgmt>brg pppoe-client)

### Full Context

tools perform subscriber-mgmt vrgw brg pppoe-client

### Description

This command enables tools for controlling PPPoE clients in a BRG.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.22 pppoe-client-policy

```
pppoe-client-policy
```

### Syntax

```
pppoe-client-policy [name]  
pppoe-client name associations
```

### Context

```
[Tree] (show>subscr-mgmt pppoe-client-policy)
```

### Full Context

```
show subscriber-mgmt pppoe-client-policy
```

### Description

This command displays PPPoE client policy information.

### Parameters

#### *name*

Specifies the PPPoE client policy name, up to 32 characters.

#### associations

Displays information associated with the policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.23 prefix-ext-stats

```
prefix-ext-stats
```

### Syntax

```
prefix-ext-stats ipv6-address/prefix-length  
prefix-ext-stats pool pool-name
```

### Context

```
[Tree] (show>router>dhcp6>server prefix-ext-stats)
```

## Full Context

```
show router dhcp6 local-dhcp-server prefix-ext-stats
```

## Description

This command displays extended statistics per DHCPv6 prefix in local DHCPv6 server.

The following statistics are included in output:

- The number of stable leases in the prefix
- The number of provisioned /64 address block in the prefix
- The number of used /64 address block in the prefix
- The number of free /64 address block in the prefix
- The percentage of used address (with /64 address block)
- The percentage of free address (with /64 address block)

For each statistic (except for Provisioned Addresses), there is current value and peak value, peak value is the highest value since prefix creation or last reset via command **clear>router *rt-id*>dhcp6>local-dhcp-server *svr-name*>prefix-ext-stats**.

When the **pool** parameter is used, the statistics of each prefix in the pool are displayed.

## Parameters

### *ipv6-address/prefix-length*

Specifies the IPv6 prefix.

### *pool-name*

The name of DHCPv6 local server pool.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of prefix extended stats information.

### Output Example

```
show router 500 dhcp6 local-dhcp-server "d6" prefix-ext-stats 2001:ABCD::/62
=====
Extended statistics for prefix 2001:ABCD::/62
=====
-----
                Current      Peak      TimeStamp
-----
Local:
Failover Oper State   Active
Stable Leases         0          0      01/07/2013 19:54:52
Provisioned Blks      4
Used Blks              0          0      01/07/2013 19:54:52
Free Blks              4          4      01/07/2013 19:54:52
Used Pct               0          0      01/07/2013 19:54:52
Free Pct              100       100     01/07/2013 19:54:52
Last Reset Time      01/07/2013 19:54:52
-----
Number of entries      1
```

Table 414: Output fields: [prefix extended statistics](#) describes extended prefix statistics output fields.

Table 414: Output fields: *prefix extended statistics*

Field	Description
Current	The current extended prefix statistics
Peak	The peak value since the last reset
TimeStamp	The date and time of the last reset
Failover Oper State	The operational state of the DHCP specified prefix
Stable Leases	The number of stable leases
Provisioned Blks	The number of provisioned blocks
Used Blks	The number of used blocks
Free Blks	The number of free blocks
Used Pct	The percentage of extended prefixes in use
Free Pct	The percentage of free prefixes in use
Last Reset Time	The date and time of the last reset
Number of entries	The total number of entries

## prefix-ext-stats

clear router dhcp6 local-dhcp-server prefix-ext-stats

### Description

This command reset the begin time of peak values in output of the **show router *rt-id* dhcp6 local-dhcp-server *svr-name* prefix-ext-stats** command/

## Parameters

### *ipv6-address/prefix-length*

Clears information about the specified IPv6 prefix.

### *pool-name*

Clears information about the specified local DHCPv6 server pool name.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.24 prefix-label

```
prefix-label
```

### Syntax

```
prefix-label
```

### Context

[\[Tree\]](#) (show>router>bgp prefix-label)

### Full Context

```
show router bgp prefix-label
```

### Description

This command displays BGP Prefix label information.

### Platforms

All

## 23.25 prefix-sids

```
prefix-sids
```

### Syntax

```
prefix-sids [ipv4-unicast | ipv6-unicast | ipv4-multicast | ipv6-multicast | mt mt-id-number] [ ip-  
prefix[/prefix-length]] [sid sid] [ adv-router system-id | hostname] [srms | no-srms] [algo algo-id]
```

### Context

[\[Tree\]](#) (show>router>isis prefix-sids)

## Full Context

show router isis prefix-sids

## Description

This command displays IS-IS prefix SIDs.

## Parameters

### **ipv4-unicast**

Displays IPv4 unicast parameters.

### **ipv6-unicast**

Displays IPv6 unicast parameters.

### **ipv4-multicast**

Displays IPv4 multicast parameters.

### **ipv6-multicast**

Displays IPv6 multicast parameters.

### **mt-id-number**

Displays multi-topology parameters.

**Values** 0, 2, 3, 4

### **ip-prefix[/prefix-length]**

Displays information about the specified IP prefix and length.

**Values** ipv4-prefix:

- a.b.c.d (host bits must be 0)

ipv4-prefix-length: [0 to 32]

ipv6-prefix-length:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D
- ipv6-prefix-length: [0 to 128]

### **sid**

Displays information for the specific segment identifier.

**Values** 0 to 524287

### **system-id | hostname**

Displays information for the specific IS-IS advertising router. Host name up to 38 characters.

### **srms**

Displays parameters filtered for segment routing mapping server.

**no-srms**

Displays parameters filtered for no segment routing mapping server.

**algo-id**

Displays information for the specified algorithm.

**Values** 0 to 255

**Platforms**

All

**Output**

The following outputs are examples of prefix SID information, and [Table 415: Output fields: IS-IS prefix SIDs](#) describes the output fields.

**Output Example**

```
*A:Dut-B# show router isis 0 prefix-sids

```

Table 415: Output fields: IS-IS prefix SIDs

Label	Description
Prefix	Displays the IP prefix for the SID
SID	Displays the SID value
Adv-Rtr	Displays the IP address of the advertised router
SRMS	Displays whether the prefix SID is advertised by the SR mapping server (Y or N) or selected to be programmed (S)
Flags	Displays the SID flags
No. of Prefix/SIDs	Displays the number of Prefix/SIDs

## prefix-sids

### Syntax

**prefix-sids** [*ip-prefix[/prefix-length]*] [**sid** *sid*] [**adv-router** *router-id*] [**algo** *algo-id*]

### Context

[\[Tree\]](#) (show>router>ospf prefix-sids)

### Full Context

show router ospf prefix-sids

### Description

This command displays OSPF prefix SIDs.

## Parameters

### *ip-prefix[/prefix-length]*

Displays information about the specified IP prefix and length, up to 64 characters.

### *sid*

Displays information for the specific segment identifier.

**Values** 0 to 524287

### *router-id*

Displays information for the specific advertising router identified by its router identifier.

### *algo-id*

Displays the algorithm identifier.

**Values** 0 to 255

## Platforms

All

## Output

The following outputs are examples of OSPF prefix SIDs information, and [Table 416: Output fields: OSPF prefix SIDs](#) describes the output fields.

### Output Example

```
*A:Dut-F# show router ospf prefix-sids
=====
Rtr Base OSPFv2 Instance 0 Prefix-Sids

Table 416: Output fields: OSPF prefix SIDs

Label	Description
Prefix	Displays the IP prefix for the SID
Area	Displays the OSPF area
RtType	Displays the route type (INTRA-AREA or INTER-AREA)
SID	Displays the SID value
Adv-Rtr	Displays the IP address of the advertised router
SRMS	Displays whether the prefix SID is advertised by the SR mapping server (Y or N) or selected to be programmed (S)
Flags	Displays the SID flags
No. of Prefix/SIDs	Displays the number of Prefix/SIDs

## prefix-sids

### Syntax

**prefix-sids** [*ip-prefix[/prefix-length]*] [**sid** *sid*] [**adv-router** *router-id*]

### Context

**[Tree]** (show>router>ospf3 prefix-sids)

### Full Context

show router ospf3 prefix-sids

### Description

This command displays OSPF prefix SIDs.

### Parameters

#### *ip-prefix[/prefix-length]*

Displays information about the specified IP prefix and length, up to 64 characters.

#### *sid*

Displays information for the specific segment identifier.

**Values** 0 to 524287

#### *router-id*

Displays information for the specific advertising router identified by its router ID.

### Platforms

All

### Output

The following outputs are examples of OSPFv3 prefix SIDs information, and [Table 417: Output fields: OSPFv3 prefix SIDs](#) describes the output fields.

### Output Example

```
*A:Dut-F# show router ospf prefix-sids

## prefix-sids

### Syntax

**prefix-sids** [**interface** *ip-int-name*] [**ipv4** | **ipv6**]

### Context

[\[Tree\]](#) (show>router>seg-rt>sr-mpls prefix-sids)

### Full Context

show router segment-routing sr-mpls prefix-sids

### Description

This command displays information about the prefix SIDs and their state on the router.

### Parameters

#### *ip-int-name*

Displays information about the specified interface, up to 32 characters.

#### **ipv4**

Displays the prefix SIDs that are IPv4 capable.

#### **ipv6**

Displays the prefix SIDs that are IPv6 capable.

### Platforms

All

## Output

The following output is an example of prefix SIDs information, and [Table 418: Output fields: SR-MPLS prefix SIDs](#) describes the output fields.

### Output Example

```
*A:Dut-A# show router segment-routing sr-mpls prefix-sids

Table 418: Output fields: SR-MPLS prefix SIDs

Label	Description
Interface Name	The name of the loopback or system interface
AF	The address family associated with the prefix SID
SID	The SID index
Label	The SID label
State	The operational state of the prefix SID <ul style="list-style-type: none"> <li>enabled — Operational state up</li> <li>adminDown — Administrative state down (for example, no SID configured)</li> <li>failed — Operational state down due to failure (for example, resource allocation failure)</li> <li>ifDown — The interface is down</li> <li>ifFailed — Interface configuration failure (for example, the interface is not a loopback)</li> </ul>

## 23.26 prefix-stats

### prefix-stats

#### Syntax

**prefix-stats** *ipv6-address/prefix-length*

**prefix-stats pool** *pool-name*

#### Context

**[Tree]** (show>router>dhcp6>local-dhcp-server prefix-stats)

#### Full Context

show router dhcp6 local-dhcp-server prefix-stats

#### Description

This command displays prefix statistics.

#### Parameters

##### *ipv6-address*

Specifies the base IP address of the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

##### *pool-name*

Specifies the name of DHCPv6 local server pool.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.27 prefix-threshold-stats

### prefix-threshold-stats

#### Syntax

**prefix-threshold-stats pool** *pool-name detail* [ **format** {**exact** | **scientific**}]

**prefix-threshold-stats pool** *pool-name*

**prefix-threshold-stats** *ipv6-address/prefix-length detail* [**format** {**exact** | **scientific**}]

**prefix-threshold-stats** *ipv6-address/prefix-length*

## Context

[\[Tree\]](#) (show>router>dhcp6>server prefix-threshold-stats)

## Full Context

```
show router dhcp6 local-dhcp-server prefix-threshold-stats
```

## Description

This command displays prefix level threshold stats of local DHCPv6 server prefix. A minimum-free threshold needs to be configured before system collects threshold stats for the prefix.

The stats for each threshold are calculated based on the configured minimum-free prefix length.

For example, a /59 prefix is provisioned in the local DHCPv6 server, and the server allocated two PD leases, one /62 and one /63. And there is a /63 minimum threshold configured. The threshold stats are calculated based on /63 as the base unit (block). Then the value of the current used block would be 3 because there is one /62 lease and one /63 lease, that equals to a total three /63.

## Parameters

### **pool** *pool-name*

Specifies the name of the pool in local DHCPv6 server, up to 32 characters.

### **detail**

Displays detailed output statistics.

### **format**

Specifies that the number format in the display is either **exact** or **scientific**.

### **ipv6-address/prefix-length**

Specifies the IPv6 prefix with prefix length.

#### **Values**

ipv6-address x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x [0 to FFFF]H

d [0 to 255]D

prefix-length [1 to 128]

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of prefix threshold information.

### Output Example

```
show router 500 dhcp6 local-dhcp-server "d6" leases
=====
Leases for DHCPv6 server d6
=====
```

```

=====
    
```

The command shown above displays an overview of prefix level thresholds in the specified pool:

- The **Peak** field indicates the peak value of used.
- The **Too low** field indicate if the configured minimum-free threshold is exceeded.
- The **Depleted** field indicate if there is no available prefix with the length in the provisioned prefix.
- The **Peak** timestamp field indicates the time of peak used value.

The command displayed above displays detailed statistics of prefix level thresholds in the specified provision prefix.

[Table 419: Output fields: prefix threshold statistics](#) describes prefix threshold statistics output fields.

*Table 419: Output fields: prefix threshold statistics*

Field	Description
Operational state	The operational state of the local DHCP server instance unknown — The operational state is unknown inService — The operational state is in service outOfService — The operational state is out of service transition — The operational state is in transition waitPersistence — The DHCP server instance is waiting for a persistence action to complete.
Pool	The number of pools in the specified prefix
Stable leases	The number of stable leases associated with the prefix
Advertised leases	The advertised leases associated with the prefix
Prefix	The specified prefix
Draining	The draining state

Field	Description
	Y — enabled N — disabled
Threshold	The prefix level threshold
Current Provisioned Blks	The number of provisioned blocks for this prefix
Current Used Blks	The number of used blocks for this prefix
Current Free Blks	The number of free blocks for this prefix
Current Used Percent	The percentage of used prefixes with the minimum free threshold length for this prefix
Current Used Peak Blks	A 64-bit word of the peak value of the number of used blocks for this prefix
Current Used Peak Percentage	The peak value of the number of used prefixes with the minimum free threshold length in the pool as a percentage of the provisioned prefixes.
Current Used Peak Time	The time at which the peak value of the number of used prefixes in the pool was reached
Current Free Percent	The percentage of free prefixes with the minimum free threshold length in the pool compared to the number of provisioned prefixes.
Current Free Too Low	The number of free prefixes with the minimum free threshold length available in the pool that is below the configured number of prefixes with the minimum free threshold length
Current Free Depleted	The number of prefixes with the minimum free threshold length available
Local Provisioned Blks	A 64-bit word of the number of provisioned prefixes with the minimum free threshold length local
Local Used Blks	The higher 64-bits word of the number of used prefixes with the minimum free threshold length
Local Free Blks	A 64-bit word of the number of free prefixes with the minimum free threshold length
Local Used Peak Blks	A 64-bit word of the peak value of the number of used prefixes with the minimum free threshold length
Local Used Peak Percent	The peak value of the number of used prefixes with the minimum free threshold length local in the pool as a percentage of the provisioned prefixes

Field	Description
Local Used Peak Time	The time at which the peak value of the number of used prefixes local in the pool was reached
Remote Provisioned Blks	A 64-bit word of the number of provisioned prefixes with the minimum free threshold length
Remote Used Blks	A 64-bit word of the number of used prefixes with the minimum free threshold length remote in the pool
Remote Free Blks	A 64-bit word of the number of free prefixes with the minimum free threshold length remote in the pool
Remote Used Peak Blks	The higher 64-bit word of the number of used prefixes with the minimum free threshold length
Remote Used Peak Percent	The peak value of the number of used prefixes with the minimum free threshold length remote in the pool as a percentage of the provisioned prefixes
Remote Used Peak Time	The time at which the peak value of the number of used prefixes remote in the pool was reached.
Peak Reset Time	The time at which the peak values have been reset
Valid Dada	The actual status of the threshold statistics data of the pool. Y — the data is up to date and may be used. N — the data is being recalculated in the background and is not stable for further use

## prefix-threshold-stats

### Syntax

**prefix-threshold-stats** *ipv6-address/prefix-length*

**prefix-threshold-stats pool** *pool-name*

### Context

**[Tree]** (clear>router>dhcp6>server prefix-threshold-stats)

### Full Context

#### Context

[\[Tree\]](#) (show>router>ldp>bindings prefixes)

#### Full Context

show router ldp bindings prefixes

#### Description

This command displays LDP Prefix fec bindings.

#### Parameters

### **prefix** *ip-prefix/ip-prefix-length*

Specify information for the specified IP prefix and mask length.

#### Values

ipv4-prefix

- a.b.c.d

ipv4-prefix-length	[0 to 32]
ipv6-address	- x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D
ipv6-prefix-length	[0 to 128]

**session *ip-addr*[*label-space*]**

Specify information for the specified IP address and label space.

<b>Values</b>	ipv4-address	- a.b.c.d: <i>label-space</i>
	ipv6-address	- x:x:x:x:x:x:x[ <i>label-space</i> ]
	label-space	0 to 65535

**detail**

Displays detailed information.

**summary**

Displays information in a summarized format.

**family**

Displays either IPv4 or IPv6 active LDP information.

**Values** ipv4 or ipv6

**egress-lsp *tunnel-id***

Specifies the tunnel identifier for this egress LSP.

**Values** 0 to 4294967295

**egress-nh *ip-address***

Displays LDP active bindings by matching egress-nh.

<b>Values</b>	ipv4-address	- a.b.c.d
	ipv6-address	- x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D

**egress-if *port-id***

Displays LDP active bindings by matching egress-if.

**community**

The string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

**Values** up to 32 characters | no-community (selects FEC with no community string)

### Context

[\[Tree\]](#) (show>router>ldp>bindings>active prefixes)

### Full Context

show router ldp bindings active prefixes

### Description

This command displays LDP active prefix bindings.

### Parameters

#### ***ip-prefix/ip-prefix-length***

Specifies information for the IP prefix and mask length.

<b>Values</b>		
	ipv4-prefix:	a.b.c.d
	ipv4-prefix-length:	0 to 32
	ipv6-prefix:	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D
	ipv6-prefix-length:	1 to 128

***ip-address***

Specifies the IPv4 or IPv6 address.

<b>Values</b>		
	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D

***family***

Specifies the address family.

<b>Values</b>	
	ipv4, ipv6

***port-id***

Specifies the port ID.

<b>Values</b>		
	<i>slot[/mda[/port]] or slot/mda/port [.channel]</i>	
aps-id	<b>aps-group-id</b> [.channel]	
	<b>aps</b>	keyword
	<i>group-id</i>	1 to 128
eth-sat-id	<b>esat-id</b> [/slot/[u]port]	
	<b>esat</b>	keyword
	<i>id</i>	1 to 20
	<i>u</i>	keyword for up-link port
pxc-id	<b>pxc-id.sub-port</b>	
	<b>pxc</b>	keyword

<i>id</i>	1 to 64
<i>sub-port</i>	a to b

### ***tunnel-id***

Specifies the tunnel ID.

**Values** 0 to 4294967295

### ***community***

The string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

**Values** up to 32 characters | no-community (selects FEC with no communitystring

## **23.29 profile**

### **profile**

#### **Syntax**

**profile** [*user-profile-name*]

#### **Context**

[\[Tree\]](#) (show>system>security profile)

#### **Full Context**

show system security profile

#### **Description**

This command displays user profile information.

If the *profile-name* is not specified, then information for all profiles are displayed.

#### **Parameters**

***user-profile-name***

Displays information for the specified user profile.

## Platforms

All

## Output

The following output is an example of user profile output information.

[Table 420: Output fields: user profile](#) describes user profile output fields.

### Output Example

```
A:ALA-7# show system security profile administrative
=====
User Profile
=====
User Profile : administrative
Def. Action  : permit-all
-----
Entry       : 10
Description :
Match Command: configure system security
Action      : permit
-----
Entry       : 20
Description :
Match Command: show system security
Action      : permit
-----
No. of profiles:
=====
A:ALA-7#
```

*Table 420: Output fields: user profile*

Label	Description
User Profile	Displays the profile name used to deny or permit user console access to a hierarchical branch or to specific commands.
Def. action	Permit all — Permits access to all commands. Deny — Denies access to all commands. None — No action is taken.
Entry	The entry ID in a policy or filter table.
Description	Displays the text string describing the entry.
Match Command	Displays the command or subtree commands in subordinate command levels.
Action	Permit all — Commands matching the entry command match criteria are permitted. Deny — Commands not matching the entry command match criteria are not permitted.
No. of profiles	The total number of profiles listed.

## profile

### Syntax

**profile** [*profile-name*]

### Context

**[Tree]** (show>system>security profile)

### Full Context

show system security profile

### Description

This command displays user profiles for CLI command tree permissions.

### Parameters

#### *profile-name*

Specify the profile name to display information about a single user profile. If no profile name is displayed, the entire list of profile names are listed.

### Platforms

All

### Output

The following output is an example of profile information.

[Table 421: Output fields: profile](#) describes the profile output fields.

### Output Example

```
A:ALA-48>config>system>snmp# show system security profile
=====
User Profile
=====
User Profile : test
Def. Action  : none
-----
Entry       : 1
Description  :
Match Command:
Action      : unknown
=====
User Profile : default
Def. Action  : none
-----
Entry       : 10
Description  :
Match Command: exec
Action      : permit
-----
Entry       : 20
Description  :
```

```

Match Command: exit
Action       : permit
-----
Entry       : 30
Description :
Match Command: help
Action       : permit
-----
...
-----
Entry       : 80
Description :
Match Command: enable-admin
Action       : permit
=====

User Profile : administrative
Def. Action  : permit-all
-----
Entry       : 10
Description :
Match Command: configure system security
Action       : permit
-----
Entry       : 20
Description :
Match Command: show system security
Action       : permit
=====

No. of profiles: 3
=====
A:ALA-48>config>system>snmp#
    
```

Table 421: Output fields: profile

Label	Description
User Profile	default — Displays the action to be given to the user profile if none of the entries match the command.  administrative — Specifies the administrative state for this profile.
Def. Action	none — No action is given to the user profile when none of the entries match the command.  permit-all — The action to be taken when an entry matches the command.
Entry	10 - 80 — Displays an entry which represents the configuration for a system user.
Description	A text string describing the entry.
Match Command	administrative — Enables the user to execute all commands.  configure system security — Enables the user to execute the <b>config system security</b> command.

Label	Description
	enable-admin — Enables the user to enter a special administrative mode by entering the <b>enable-admin</b> command. exec — Enables the user to execute (exec) the contents of a text file as if they were CLI commands entered at the console. exit — Enables the user to execute the <b>exit</b> command. help — Enables the user to execute the <b>help</b> command. logout — Enables the user to execute the <b>logout</b> command. password — Enables the user to execute the <b>password</b> command. show config — Enables the user to execute the <b>show config</b> command. show — Enables the user to execute the <b>show</b> command. show system security — Enables the user to execute the show system security command.
Action	permit — Enables the user access to all commands. deny-all — Denies the user access to all commands.

## 23.30 protection-template

### protection-template

#### Syntax

**protection-template**

#### Context

[\[Tree\]](#) (show>router>mpls>mpls-tp protection-template)

#### Full Context

show router mpls mpls-tp protection-template

#### Description

This command displays MPLS-TP protection template information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of MPLS protection template fields.

### Output Example

```
*A:mlstp-dutA# show router mpls mpls-tp protection-template
=====
MPLS-TP Protection Templates
=====
Template Name : privatebed-protection-template Router ID      : 1
Protection Mode: one2one                        Direction       : bidirectional
Revertive      : revertive                      Wait-to-Restore: 300sec
Rapid-PSC-Timer: 10ms                          Slow-PSC-Timer  : 5sec
=====
```

## 23.31 protocol

protocol

### Syntax

**protocol**

### Context

[\[Tree\]](#) (clear>router>bgp protocol)

### Full Context

clear router bgp protocol

### Description

This command resets the entire BGP protocol. If the AS number was previously changed, the BGP AS number does not inherit the new value.

### Platforms

All

protocol

### Syntax

**protocol** [*protocol-name*] count [**detail**]

**protocol count** [**detail**]

**protocol count top** *granularity* [**max-count** *max-count*]

## Context

**[Tree]** (show>app-assure>group protocol)

**[Tree]** (show>app-assure>group>aa-sub protocol)

## Full Context

show application-assurance group protocol

show application-assurance group aa-sub protocol

## Description

This command displays per-protocol statistics. The system-wide statistics displayed account for all flows completed and the last internal snapshot of the active flows.

Subscriber statistics are available for special study subscribers and account for all completed and active flows at the moment of this statistics request.

## Parameters

### *protocol-name*

Displays information about the specified protocol name.

### **count**

Displays protocol counters.

### **detail**

Displays detailed information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of the **protocol** command.

### Output Example

```
A:ALU>show>app-assure>group# protocol count
=====
Protocol Statistics
=====
Protocol                Disc Octets          Packets          Flows

Table 422: Output fields: provider tunnel

Label	Description
Service Provider Tunnel Information	
Type	The provider tunnel type (inclusive or selective)
Root and Leaf	The root and leaf status
Admin State	The administrative state
Data Delay Intvl	The data delay interval in seconds
PMSI Type	The PMSI type
LSP Template	The LSP template name
Remain Delay Intvl	The remaining delay interval in seconds

Label	Description
LSP Name used	The LSP name
PMSI Owner	The PMSI owner
Oper State	The operational state
Root Bind Id	The root binding ID
wildcard-spmsi/ Wildcard SPMSI	The wildcard SPMSI status
Maximum-p2mp- spmsi/Max P2MP SPMSI	The maximum P2MP SPMSI value
Group-range/Group range	The group range
s-pmsi-threshold/ S- PMSI Threshold	The SPMSI threshold so that the root node attempts to setup an S-PMSI tree, in Kbps
Pe-threshold-add/ PE Threshold add	The PE threshold add value
Pe-threshold-delete/ PE Threshold del	The PE threshold delete value
LDP Spmsi tunnels	
LSP ID	The LSP ID
Root Addr/Root Address	The root address
Spmsi IfIndex/S-PMSI If Index	The SPMSI If Index value
Num. Leaf PEs	The number of leaf PEs
Number of SGs	The number of SGs
Uptime	The cumulative up time
Group Address	The group address
Source Address	The source address
Origin IP Address	The origin IP address
State	The state value
S-pmsi Threshold	The SPMSI threshold value

Label	Description
Remain Delay Intvl	The remaining delay interval in seconds
Group Receiver PE	The group receiver PE IP address
Leaf Address	The Leaf IP addresses
Pe-threshold-add	The PE threshold add value
Pe-threshold-delete	The PE threshold delete value
Current Receiver PE Count	The current receive PE count value
LDP Spmsi Tunnels	The total number of SPMSI tunnels

## 23.35 provider-tunnel-using

### provider-tunnel-using

#### Syntax

**provider-tunnel-using leaf-only** [bgp-ad | bgp-vpls | bgp-evpn-mpls]

**provider-tunnel-using root-and-leaf** [bgp-ad | bgp-vpls | bgp-evpn-mpls]

#### Context

[\[Tree\]](#) (show>service provider-tunnel-using)

#### Full Context

show service provider-tunnel-using

#### Description

This command displays the list of provider tunnels existing in the router for all services. The output can be filtered based on the provider tunnel owner.

#### Parameters

##### leaf-only

Displays the leaf-only provider tunnels for all services.

##### root-and-leaf

Displays the root and leaf provider tunnels for all services.

##### bgp-ad

Filters the provider tunnels owned by BGP AD services.

### bgp-vpls

Filters the provider tunnels owned by BGP VPLS services.

### bgp-evpn-mpls

Filters the provider tunnels owned by BGP EVPN-MPLS services.

## Platforms

All

## Output

The following output is an example of provider tunnel using information.

### Output Example

```
A:PE-76# show service provider-tunnel-using root-and-leaf

#### Full Context

tools dump service id provider-tunnels

## Description

This command dumps the inclusive or selective provider tunnels based on type.

## Platforms

All

## Output

Use the following command to display terminating provider tunnels.

```
tools dump service id provider-tunnels type terminating
```

### Output Example

```
=====
VPLS 1001 Inclusive Provider Tunnels Terminating
=====
ipmsi (RSVP)                P2MP-ID  Tunl-ID  Ext-Tunl-ID
-----
                        1001     61440    10.20.1.1
                        1001     64944    10.20.1.2
-----
```

Use the following command to display originating provider tunnels.

```
tools dump service id provider-tunnels type originating
```

### Output Example

```
=====
VPLS 1001 Inclusive Provider Tunnels Originating
=====
ipmsi (RSVP)                P2MP-ID  Tunl-ID  Ext-Tunl-ID
-----
ipmsi-1001-73728           1001     61440    10.20.1.3
-----
```

Use the following command to display both originating and terminating provider tunnels.

```
tools dump service id provider-tunnels
```

### Output Example

```
=====
VPLS 1001 Inclusive Provider Tunnels Originating
=====
ipmsi (RSVP)                P2MP-ID  Tunl-ID  Ext-Tunl-ID

**23.37 proxy-arp**

```
proxy-arp
```

**Syntax**

- proxy-arp** [*ip-address*] [*detail*]
- proxy-arp** [*ip-address*] **dynamic**

## Context

**[Tree]** (show>service>id proxy-arp)

## Full Context

show service id proxy-arp

## Description

This command displays, in a table, the existing proxy-ARP entries for a particular service. The table is populated by EVPN MAC routes that contain a MAC and an IP address, as well as static entries or dynamic entries from snooped ARP messages on access SAP or SDP-bindings.

A 7750 SR, 7450 ESS, or 7950 XRS that receives an ARP request from a SAP or SDP-binding performs a lookup in the proxy-ARP table for the service. If a match is found, the router replies to the ARP and does not allow ARP flooding in the VPLS service. If a match is not found, the ARP is flooded within the service if the configuration allows it.

The command allows for specific IP addresses to be displayed. Dynamic IP entries associated to a MAC list are displayed with the corresponding MAC list and resolve timers information.

## Parameters

### *ip-address*

Specifies an IP address.

**Values** a.b.c.d

### *detail*

Displays detailed information.

### *dynamic*

Displays detailed information about dynamic entries.

## Platforms

All

## Output

The following output is an example of proxy ARP information.

### Output Example

```
*A:PE-3# show service id 5 proxy-arp

Table 423: Output fields: proxy-ARP detail

Label	Description
Proxy ARP	
Admin State	The administrative state of proxy-arp

Label	Description
Dyn Populate	The addition of dynamic entries to the table
Age Time	The aging timer for proxy entries, where entries are flushed upon timer expiry
Send Refresh	The time at which to send a refresh message in seconds
Table Size	The maximum number of learned and static entries allowed in the proxy table of the service
Total	The total number of entries in the service
Static Count	The current number of static entries in the service
EVPN Count	The current number of EVPN entries in the service
Dynamic Count	The current number of dynamic entries in the service
Duplicate Count	The current number of duplicate entries in the service
Process Probes	The process probe status
Restrict Non Configured IPs	The restrict non-configured IPs status
Sponge MAC	The sponge MAC address
Dup Detect	
Detect Window	The window size in minutes
Num Moves	The number of moves required to declare a duplicate entry
Hold down	The hold-down time for a duplicate entry
Anti Spoof MAC	The MAC address to replace the proxy-arp offending entry's MAC
VPLS Flood Control	
Rcvd Garp Flood	The received VPLS Garp flood status
Rcvd Req Flood	The received VPLS request flood status
EVPN	
Garp Flood	The EVPN received Garp flood status
Req Flood	The received EVPN request flood status
Static Black Hole	The static black hole status
EVPN Route Tag	The route tag of the entry
VPLS Proxy Arp Entries	
IP Address	The IP address of proxy-arp

Label	Description
Mac Address	The optional anti-spoof-mac to use
Type	The type of entry
Status	The status of entry
Flags	The flag type
Last Update	The date and time of the last update
Number of entries	The number of VPLS proxy ARP entries

The following output is an example of proxy ARP dynamic information.

```

## proxy-arp

### Syntax

**proxy-arp** [**ip-address** *ip-address*] [**detail**]

### Context

[\[Tree\]](#) (show>service>id proxy-arp)

### Full Context

show service id proxy-arp

## Description

This command displays the proxy-ARP entries existing for a particular service. A 7750 SR, 7450 ESS or 7950 XRS router receiving an ARP request from a SAP or SDP-binding will perform a lookup in the proxy-arp table for the service. If the router finds a match, it will reply to the ARP and will not let the ARP be flooded in the VPLS service. If the router does not find a match, the ARP will be flooded within the service. The command allows for specific IP addresses to be shown.

The **detail** parameter allows the user to display all the entries. An individual IP address entry can also be shown.

## Platforms

All

## Output

The following output is an example of service proxy ARP information.

### Output Example

```

Table 424: Output fields: IGMP snooping proxy describes the show output fields.

Table 424: Output fields: IGMP snooping proxy

Label	Description
Group Address	The IP multicast group address for which this entry contains information.
Mode	Specifies the type of membership report(s) received on the interface for the group. In the include mode, reception of packets sent to the specified multicast address is requested only from those IP source addresses listed in the source-list parameter of the IGMP membership report.  In the "exclude" mode, reception of packets sent to the specified multicast address is requested from all IP source addresses except those listed in the source-list parameter.
Up Time	The total operational time in seconds.
Num Sources	Indicates the number of IGMP group and source specific queries received on this interface.
Number of groups	Number of IGMP groups.

Label	Description
Source Address	The source address for which this entry contains information.

## 23.40 proxy-nd

### proxy-nd

#### Syntax

**proxy-nd** [*ipv6-address*] [*detail*]

**proxy-nd** [*ipv6-address*] **dynamic**

#### Context

[\[Tree\]](#) (show>service>id proxy-nd)

#### Full Context

show service id proxy-nd

#### Description

This command displays, in a table, the existing proxy-ND entries for a particular service. The table is populated by the EVPN MAC routes containing a MAC and an IPv6 address, as well as static entries or dynamic entries from snooped NA messages on access SAP or SDP-bindings.

A 7750 SR, 7450 ESS, or 7950 XRS that receives a Neighbor Solicitation (NS) from a SAP or SDP-binding performs a lookup in the proxy-ND table for the service. If a match is found, the router replies to the NS and does not allow NS flooding in the VPLS service. If a match is not found, the NS is flooded in the service if the configuration allows it.

The command allows for specific IPv6 addresses to be shown. Dynamic IPv6 entries associated to a MAC list are shown with the corresponding MAC list and resolve timers information.

#### Parameters

##### *ipv6-address*

Specifies an IPv6 address.

**Values**    *ipv6-address*:  
              x:x:x:x:x:x:x (eight 16-bit pieces)  
              x:x:x:x:x:d.d.d.d  
              where:  
              x - [0 to FFFF]H  
              d - [0 to 255]D

### detail

Displays detailed information.

### dynamic

Displays detailed information about dynamic entries.

Table 425: Output fields: proxy-ND detail

Label	Description
Proxy ND	
Admin State	The administrative state of proxy-nd
Dyn Populate	The addition of dynamic entries to the table
Age Time	The aging timer for proxy entries, where entries are flushed upon timer expiry
Send Refresh	The time at which to send a refresh message in seconds
Table Size	The maximum number of learned and static entries allowed in the proxy table of the service
Total	The total number of entries in the service
Static Count	The current number of static entries in the service
EVPN Count	The current number of EVPN entries in the service
Dynamic Count	The current number of dynamic entries in the service
Duplicate Count	The current number of duplicate entries in the service
Process DAD NS	The response to DAD neighbor solicitations

Label	Description
Restrict Non Configured IPs	The restrict non-configured IPs status
Sponge MAC	The sponge MAC address
Dup Detect	
Detect Window	The window size in minutes
Num Moves	The number of moves required to declare a duplicate entry
Hold down	The hold-down time for a duplicate entry
Anti Spoof MAC	The MAC address to replace the proxy-nd offending entry's MAC
VPLS Flood Control	
Rcvd Unknown NS Flood	The received unknown neighbor solicitations flood status
Rcvd Rtr Unsol NA Flood	The received router unsolicited neighbor association flood status
Rcvd Host Unsol NA Fld	The received host unsolicited neighbor association flood status
EVPN	
Unknown NS Flood	Displays if unknown Neighbor Solicitation messages floods into the EVPN network
ND Advertise	The advertisement of static or dynamic entries that are learned as host or routers
Rtr Unsol NA Flood	Displays if system floods router unsolicited Neighbor Advertisements to EVPN
Host Unsol NA Fld	Displays if the system floods host unsolicited Neighbor Advertisements to the EVPN
EVPN Route Tag	The route tag of the entry
VPLS Proxy ND Entries	
IP Address	The IP address of proxy-nd
Mac Address	The optional anti-spoof-mac to use
Type	The type of entry
Status	The status of entry
Flags	The flag type
Last Update	The date and time of the last update
Number of entries	The number of VPLS proxy ARP entries

The following output is an example of proxy ND dynamic information and [Table 426: Output fields: proxy-ND dynamic](#) describes the output fields.

**Output Example**

```

## proxy-nd

### Syntax

**proxy-nd**

### Context

[\[Tree\]](#) (tools>perform>service>id proxy-nd)

### Full Context

tools perform service id proxy-nd

### Description

Commands in this context provide proxy-nd tools.

### Platforms

All

## proxy-nd

### Syntax

**proxy-nd**

**proxy-nd duplicate** [*ipv6-address*]

**proxy-nd dynamic** [*ipv6-address*]

### Context

[\[Tree\]](#) (clear>service>id proxy-nd)

### Full Context

clear service id proxy-nd

### Description

This command allows all the duplicate or dynamic proxy-ND entries to be cleared from the table. Individual IPv6 entries can also be specified.

### Platforms

All

## proxy-nd

### Syntax

**proxy-nd usage**

### Context

[\[Tree\]](#) (tools>dump>service proxy-nd)

### Full Context

tools dump service proxy-nd

### Description

This command provides information about the usage and limit of the system-wide proxy-nd table for all the services. The command also shows if the limit has been exceeded and a trap raised.

### Platforms

All

### Output

#### Output Example

```
*A:Dut# tools dump service proxy-nd usage
Proxy nd Usage
Current Usage      :          0
System Limit      :    511999
High Usage Trap Raised:      No
High Usage Threshold:    95 percent
High Usage Clear Threshold:  90 percent
```

## 23.41 psb

## psb

### Syntax

**psb** [*endpoint endpoint-address*] [*sender sender-address*] [*tunnelid tunnel-id*] [*lspid lsp-id*] [*detail*]  
[*status {up | down}*]

### Context

[\[Tree\]](#) (tools>dump>router>rsvp psb)

### Full Context

tools dump router rsvp psb

## Description

This command displays path state block (PSB) information for RSVP.

When a PATH message arrives at an LSR, the LSR stores the label request in the local PSB for the LSP. If a label range is specified, the label allocation process assigns a label from that range.

The PSB contains the IP address of the previous hop, and the session, sender, and TSPEC. This information is used to route the corresponding RESV message back to LSR 1.

## Parameters

### **endpoint** *endpoint-address*

Specifies the IP address of the last hop.

### **sender** *sender-address*

Specifies the IP address of the sender.

### **tunnelid** *tunnel-id*

Specifies the SDP ID.

**Values** 0 to 4294967295

### **lspid** *lsp-id*

Specifies the label switched path that is signaled for this entry.

**Values** 1 to 65535

### **detail**

Displays detailed RSVP PSB information.

### **status** {*up* | *down*}

Specifies the LSP status.

## Platforms

All

## Output

The following output is an example of MPLS RSVP PSB information.

### Output Example

```

Label	Description
Admin State	The administrative state of PTP
Oper State	The operational state of PTP

Label	Description
Peer Limit	The maximum number of PTP peers that the system may create automatically

## ptp

### Syntax

ptp

### Context

[\[Tree\]](#) (show>system ptp)

### Full Context

show system ptp

### Description

This command displays Precision Time Protocol (PTP) configuration and state information. This information can be displayed for the entire node or on a per router instance basis.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### Output

The following output is an example of PTP information, and [Table 428: Output fields: system PTP](#) describes the output fields.

### Output Example

```
show system ptp
```

```

Label	Description
Local Clock	
Clock Type	The type of clock of the network element. <ul style="list-style-type: none"> <li>ordinarySlave — The system is always a TimeReceiver clock in the PTP hierarchy. The system derives its timing from one or more TimeTransmitter clocks in the network.</li> </ul>

Label	Description
	<ul style="list-style-type: none"> <li>ordinaryMaster — The system is a grandmaster clock in the PTP hierarchy. The system provides timing to multiple TimeReceiver clocks in the network.</li> <li>boundary — The system is a boundary clock, which may be anywhere in the PTP clock hierarchy. It can obtain timing from a TimeTransmitter clock, and provide timing to multiple Time Receiver clocks.</li> </ul>
PTP Profile	The Precision Time Protocol (PTP) profile specifies the standard to which PTP conforms <ul style="list-style-type: none"> <li>g8265dot1-2010 — The PTP profile specified in the ITU-T G.8265.1 recommendation</li> <li>ieee1588-2008 — The default PTP profile specified in the IEEE 1588-2008 standard</li> <li>g8275dot1-2014 — The PTP profile specified in the ITU-T G.8275.1 recommendation</li> </ul>
Domain	The domain in which PTP 1588 runs on the system
Network Type	The SR OS is configured to use PTP clock classes corresponding to either SONET or SDH quality levels
Admin State	The administrative state of PTP
Oper State	The operational state of PTP
Announce Interval	The packet rate requested in REQUEST_UNICAST_TRANSMISSION signaling messages for announce packets
Announce Rx Timeout	The number of announce intervals that have to occur without receiving a PTP announce message before the PTP event ANNOUNCE_RECEIPT_TIMEOUT_EXPIRES occurs
Peer Limit	The maximum number of PTP peers that may be automatically created by the system on this router instance
G.8275.1 Priority	The priority used in the best TimeTransmitter clock algorithm for the local (internal) PTP port when Clock Profile is g8275dot1-2014
PTSF-unusable	The PTSF unusable administrative state
Clock ID	The clock Identity value of the local PTP clock (defaultDS)
Clock Class	The clockClass value of the local PTP clock (defaultDS)
Clock Accuracy	The clockAccuracy value accuracy of the local PTP clock (defaultDS)
Clock Variance	The offsetScaledLogVariance value of the local PTP clock (defaultDS)
Clock Priority1	The priority1 value of the local PTP clock (defaultDS)

Label	Description
Clock Priority2	The priority2 value of the local PTP clock (defaultDS)
Steps Removed	The steps removed value used in Announce messages sent from this PTP clock
Sync Uncertain	For the local clock: the value of the synchronization uncertainty that is used in Announce messages transmitted by this node.  For the parent clock: the value received in the Announce messages from that clock.
Reason Uncertain	Provides an explanation for a Sync Uncertain true indication. <ul style="list-style-type: none"> <li>• parent uncertain — Parent clock has syncUncertain true in its Announce messages</li> <li>• parent clock class — Parent clock quality is not clockClass 6</li> <li>• local clock class — Local clock is the parent clock and the local clock quality is not clockClass 6</li> <li>• sets not locked — Central frequency clock is not locked to a reference</li> <li>• sets quality — Central frequency clock is locked to a reference that is not PRC or PRS</li> <li>• time not locked — PTP time algorithm is not locked</li> <li>• freq not locked — PTP frequency algorithm is not locked</li> </ul>
TxWhileSync Uncertain	The value of the <b>tx-while-sync-uncertain</b> configuration item
PTP Port State	The PTP port state. Only shown for ordinary clocks which contain only one PTP port
Last Changed	The date and time of the last change of the PTP port state
Parent Clock	
Port	The port that is being used as a backup to a local GNSS time source
Remote MAC Address	The MAC address of the parent clock port sending PTP message to the local PTP clock
Parent Clock ID	The clock Identity of the parent clock
Remote PTP Port	The port number of the PTP port on the parent clock that is used to communicate with the local PTP clock
Local Clock is Parent Clock	Displayed if there is no external parent clock
GM Clock Id	The clockIdentity value of the grandmaster clock advertised by the parent clock

Label	Description
GM Clock Class	The clockClass value of the grandmaster clock advertised by the parent clock
GM Clock Accuracy	The clockAccuracy value of the grandmaster clock advertised by the parent clock
GM Clock Variance	The offsetScaledLogVariance value of the grandmaster clock advertised by the parent clock
GM Clock Priority1	The priority1 value of the grandmaster clock advertised by the parent clock
GM Clock Priority2	The priority2 value of the grandmaster clock advertised by the parent clock
Time Properties	
Timescale	The time scale of the time distributed by PTP
Frequency Traceable	Indicates if the time distributed by PTP is traceable a primary reference
Time Traceable	Indicates if the time distributed by PTP is traceable to a primary reference
Time Source	The source of time used by the grandmaster clock
UTC Offset	The current offset between the International Atomic Time (TAI) and Universal Coordinated Time (UTC) timescales
Leap Second	Indicates if there is a leap second pending
Central Frequency Clock	
Status	The state of the central frequency clock
Quality	The quality level of the source into the central frequency clock
Reference Selected	The reference currently in use as the source into the central frequency clock
PTP Frequency Recovery	
Frequency Recovery State	The state of the frequency recovery algorithm. <ul style="list-style-type: none"> <li>• notApplicable — The system is not attempting to recover a clock.</li> <li>• initial — The system is configured to recover a clock, but not enough information has yet been received to adjust the local clock to match a TimeTransmitter clock.</li> <li>• acquiring — The system has enough information to attempt clock recovery, and has started the process of adjusting its local clock frequency to match the TimeTransmitter clock.</li> </ul>

Label	Description
	<ul style="list-style-type: none"> <li>• <b>phaseTracking</b> — The system has adjusted its local clock to the approximate frequency of the TimeTransmitter clock, and is adjusting the local clock to minimize the phase difference between the two clocks.</li> <li>• <b>holdover</b> — The system has stopped receiving useful information from the chosen TimeTransmitter clock, and is maintaining the last estimated frequency for its local clock.</li> <li>• <b>locked</b> — The system is locked to the chosen TimeTransmitter clock and the phase error between the TimeTransmitter clock and the local clock is relatively small.</li> </ul>
Last Changed	The date and time of the last change of the PTP Recovery State
Frequency Offset	The offset computed by the frequency recovery algorithm required to align the local oscillator to the frequency of the parent clock. The value is provided in parts per billion. Positive values indicate that the recovered clock is faster than nominal, and negative values indicate that the recovered clock is slower than nominal.
PTP Time Recovery	
Role	The role of the PTP time recovery clock <ul style="list-style-type: none"> <li>• <b>backup</b> — The PTP time recovery clock is in a backup clock scenario</li> <li>• <b>time source</b> — The PTP time recovery clock is in a time source clock scenario</li> </ul>
Clock Source	The IP address of the clock source
Router	The router used for PTP time recovery
Current Time	The date and time. If the timescale is PTP, then the time is converted to UTC time based on the current offset between UTC and PTP time.
Time Recovery State	The state of the time recovery algorithm. <ul style="list-style-type: none"> <li>• <b>acquiring</b> — The time recovery is active but it is not in locked or holdover state</li> <li>• <b>locked</b> — The time recovery algorithm is generating time adjustments within the locked performance range</li> <li>• <b>holdover</b> — No adjustment has been made out of the time recovery algorithm for a period of time</li> </ul>
Last Packet Offset From Master	The offsetFromMaster calculated from the last packet exchange with the parent clock
Last Calc	The time at which the previous field was calculated

Label	Description
Last Packet Mean Path Delay	The meanPathDelay calculated from the last packet exchange with the parent clock
Last Adjustment	The nanosecond change to the local time scale that last came out of the time recovery algorithm

## ptp

### Syntax

**ptp**

### Context

[\[Tree\]](#) (clear>system ptp)

[\[Tree\]](#) (clear>service>id ptp)

### Full Context

clear system ptp

clear service id ptp

### Description

Commands in this context clear Precision Timing Protocol (PTP) information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.43 ptsf-unusable

## ptsf-unusable

### Syntax

**ptsf-unusable**

### Context

[\[Tree\]](#) (clear>system>ptp>port>neighbor ptsf-unusable)

### Full Context

clear system ptp port neighbor ptsf-unusable

### Description

This command clears the PTSF-unusable condition from the neighbor PTP clock.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.44 public-static-devices

### public-static-devices

#### Syntax

**public-static-devices** [*mac ieee-address*]

#### Context

[\[Tree\]](#) (show>subscr-mgmt>vrgw>brg>gateway public-static-devices)

#### Full Context

show subscriber-mgmt vrgw brg gateway public-static-devices

#### Description

This command displays public static device mappings.

#### Parameters

*ieee-address*

Specifies the MAC address, up to 30 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.45 pw

### pw

#### Syntax

**pw**

#### Context

[\[Tree\]](#) (tools>perform>service>id>admin-lock pw)

[\[Tree\]](#) (tools>perform>service>id>loopback pw)

### Full Context

```
tools perform service id admin-lock pw
```

```
tools perform service id loopback pw
```

### Description

In the admin-lock context, this command administratively locks the specified spoke SDP by locking the host service. The command must be executed at both ends of the PW or MS-PW represented by the spoke SDP. Test traffic can then be injected using a test SAP.

In the loopback context, this command enters the MPLS-TP PW context for starting or stopping a loopback on a specified spoke SDP. An administrative lock should first be applied to both ends of the PW or MS-PW represented by the spoke SDP prior to configuring the loopback.

Loopback functions for MPLS-TP pseudowire can be specified for either a T-PE or S-PE.

### Platforms

All

## 23.46 pw-port

pw-port

### Syntax

```
pw-port [pw-port-id] [detail]
```

```
pw-port sdp sdp-id
```

```
pw-port sdp none
```

```
pw-port [pw-port-id] statistics
```

### Context

[\[Tree\]](#) (show pw-port)

### Full Context

```
show pw-port
```

### Description

Displays pseudo-wire port information.

If no optional parameters are specified, the command displays a summary of all defined PW ports. The optional parameters restrict output to only ports matching the specified properties.

## Parameters

### *pw-port-id*

Specifies the pseudo-wire port identifier.

**Values** 1 to 10239

### **detail**

Displays detailed port information that includes all the **pw-port** output fields.

### *sdp-id*

The SDP ID for which to display matching PW port information.

**Values** 1 to 17407

### **statistics**

Displays port statistics information.

## Platforms

All

## Output

The following outputs are example of PW port information.

### Output Example

```
#show pw-port

The following table describes the **show pw-port** output fields.

Table 431: Output fields: PW port statistics

Label	Description
PW Port	The PW port identifier
Encap	The encapsulation type of the PW port
SDP:VD-Id	This field is not applicable to the Flex PW port
lflIndex	The interface index used for the PW port
Epipe	The ID of the Epipe service in which this PW port is configured. The tunnel type that is terminated on this PW port can be determined from the Epipe.
Description	The description string for the PW port
Service Id	The ID of the Epipe service in which this PW port is configured
Admin Status	The Admin status of the SDP
Oper Status	The operational status of the SDP
I. Fwd. Pkts.	The number of forwarded packets ingress in this PW port
I. Fwd. Octs.	The number of forwarded octets ingressing this PW port
E. Fwd. Pkts.	The number of forwarded packets egressing this PW port
I. Dro. Pkts.	The number of dropped packets on ingress
I. Dro. Octs.	The number of dropped octets on ingress
E. Fwd. Octets.	The number of forwarded octets egressing this PW port
Grp Enc Stats	Not applicable to Flex PW port

## pw-port

### Syntax

**pw-port** [*pw-port-id*] [**detail**]  
**pw-port sdp** *sdp-id*  
**pw-port sdp none**  
**pw-port** *pw-port-id* **statistics**

### Context

[\[Tree\]](#) (show pw-port)

### Full Context

show pw-port

### Description

This command displays FPE-based PW-port configuration information, state information and forwarding statistics.

### Parameters

#### *pw-port-id*

Specifies the PW-port ID.

**Values** 1 to 10239

#### *sdp-id*

Displays PW port information based on the known internal SDP ID

#### **sdp none**

Displays information about FPE-based PW-ports that are not associated with any internal SDPs

#### **statistics**

Displays forwarding statistics, such as the number of forwarded or dropped frames (Ethernet, VLANs, payload)

### Platforms

All

### Output

The following output is an example of PW port information.

[Table 432: Output fields: PW port](#) describes the **show pw-port** command output fields.

### Output Example

```
*A:vSIM# show pw-port 1  
=====
```

Table 432: Output fields: PW port

Label	Description
PW-Port	Displays the PW port ID.
Encap	Displays the PW port encapsulation (dot1q or qinq).
SDP	Displays the Internal SDP to which this PW port is bound.
lflIndex	Displays the Internal interface index.
VC-Id	Displays the VC-id of the internal spoke SDP that interconnects external PW to this PW port.
Description	Displays the description of this PW port.
SDP Binding Port	Displays the PXC sub-port to which this PW port is bound. This is termination side of PXC, always denoted as .b side.
VC Type	Displays the VC type of the PW port.
Admin Status	Displays the admin status of the internal SDP.
Oper Status	Displays the operational status of the internal SDP.
Admin Ingress Label	Displays the ingress VC-label associated with this PW port.
Admin Egress Label	Displays the egress VC-label associated with this PW port.
Oper Flags	Displays the operational flags on the internal SDP.
Monitor Oper-Group	Displays the operational group that is being monitored by this PW port.
I. Fwd. Pkts.	Displays the number of forwarded packets ingressing this PW port.
I. Fwd. Octs.	Displays the number of forwarded octets ingressing this PW port.
E. Fwd. Pkts.	Displays the number of forwarded packets egressing this PW port.
I. Dro. Pkts.	Displays the number of dropped packets on ingress.
I. Dro. Octs.	Displays the number of dropped octets on ingress.
E. Fwd. Octets.	Displays the number of forwarded octets egressing this PW port.

## pw-port

## 23.50 pxc

pxc

### Syntax

**pxc** [*pxc-id*]

### Context

[\[Tree\]](#) (show>port pxc)

### Full Context

show port pxc

### Description

This command displays PXC port information.

### Parameters

***pxc-id***

Specifies the PXC ID.

**Values** 1 to 64

### Platforms

All

## 23.51 python

python

### Syntax

python

### Context

[\[Tree\]](#) (clear python)

### Full Context

clear python

### Description

Commands in this context clear Python commands.

### Platforms

All

python

### Syntax

python

### Context

[\[Tree\]](#) (show python)

### Full Context

show python

### Description

Commands in this context display Python information.

### Platforms

All

## python

### Syntax

`python`

### Context

[\[Tree\]](#) (tools>dump python)

### Full Context

tools dump python

### Description

Commands in this context dump Python information.

### Platforms

All

## 23.52 python-policy

## python-policy

### Syntax

`python-policy name cache`

`python-policy name cache hex-key hex-string`

`python-policy name cache string-key string-key`

### Context

[\[Tree\]](#) (tools>dump>python python-policy)

### Full Context

tools dump python python-policy

### Description

This command dumps all cached entries or a specified entry of a specified Python policy.

The DDP key in the output is the python cache persistency record key.

#### Note:

The DDP Key in the output could be used for the `tools>dump>persistence>python` command.

## Parameters

### *name*

Specifies the name of the Python policy, up to 32 characters.

### *string-key*

Specifies the key of the entry to be updated in ASCII strong format, up to 512 characters maximum.

### *hex-key*

Specifies the key of the entry to be updated in hex string format.

**Values** 0x0..0xFFFFFFFF...(988 hex nibbles maximum)

## Platforms

All

## python-policy

## Syntax

**python-policy** *name* **cache** **hex-key** *hex-string* **set-lifetime** [*lifetime*]

**python-policy** *name* **cache** *string-key* [512 chars max] **set-lifetime** [*lifetime*]

## Context

[\[Tree\]](#) (tools>perform python-policy)

## Full Context

tools perform python-policy

## Description

This command set the lifetime of a specified python cache entry.

## Parameters

### *name*

Specifies the name of the Python policy, up to 32 characters.

### *string-key*

Specifies the key of the entry to be updated in ASCII strong format.

### *hex-string*

Specifies the key of the entry to be updated in hex string format.

### **set-lifetime**

Specifies the new lifetime of the entry.

**Values** 1 to 2147483647

## Platforms

All

## python-policy

## Syntax

**python-policy**

**python-policy** *policy-name* [**association**]

## Context

[\[Tree\]](#) (show>python python-policy)

## Full Context

show python python-policy

## Description

This command displays information about the currently configured Python policy.

The system will display a list of currently configured Python policy names if no parameter is specified.

## Parameters

### *policy-name*

Specifies the Python policy name, up to 32 characters, to display.

### **association**

Displays the associations of the specified Python policy.

## Platforms

All

## Output

The following output is an example of DHCP Python policy information

### Output Example

```
show python python-policy "dhcp"
=====
Python policy "dhcp"
=====
Description   : (Not Specified)
-----
Messages
-----
Type           Dir      Script
-----
dhcpDiscover   egress  dhcpv4
dhcpRequest    egress  dhcpv4
dhcpAck        ingress dtc
-----
No. of Messages: 3
```

```
=====
-----
show python python-policy "dhcp" association
=====
Python Policy Association
=====
Location
-----
Service: 500, GrpIf g1, dhcp
-----
No. of Python policy association: 1
=====
```

## python-policy

### Syntax

```
python-policy name cache all
python-policy name cache hex-key hex-string
python-policy name cache string-key string-key
```

### Context

[\[Tree\]](#) (clear>python python-policy)

### Full Context

```
clear python python-policy
```

### Description

This command clears Python policy data.

### Parameters

#### *name*

Specifies the name of the Python policy, up to 32 characters.

#### *string-key*

Specifies the key of the entry to be updated in ASCII strong format, up to 512 characters maximum.

#### *hex-string*

Specifies the key of the entry to be updated in hex string format.

**Values** 0x0..0xFFFFFFFF...(988 hex nibbles maximum)

### Platforms

All

## 23.53 python-script

### python-script

#### Syntax

**python-script**

**python-script** *script-name* [**association** | **source-in-use**]

#### Context

[\[Tree\]](#) (show>python python-script)

#### Full Context

show python python-script

#### Description

This command displays information about the currently configured Python script.

The system will display a list of currently configured Python script names if no parameter is specified.

#### Parameters

##### **script-name**

Specifies the Python script name, up to 32 characters, to display information.

##### **association**

Displays the associations of the specified Python script.

##### **source-in-use**

Displays the Python source code in use.

#### Platforms

All

#### Output

The following output is an example of Python script information.

#### Output Example

```
show python python-script "dhcpv4"
=====
Python script "dhcpv4"
=====
Description   : (Not Specified)
Admin state   : inService
Oper state    : inService
Action on fail: drop
Protection    : none

=====
Python Script Association
=====
Policy                Type                Dir
-----
dhcp                  dhcpDiscover       egress
dhcp                  dhcpRequest        egress
-----
No. of Python script association: 2
=====
```

## python-script

### Syntax

**python-script**

### Context

[\[Tree\]](#) (tools>perform python-script)

### Full Context

tools perform python-script

### Description

Commands in this context perform Python script operations.

### Platforms

All

## python-script

### Syntax

**python-script** *script-name* **nat-group** *nat-group-id* **statistics**

**python-script** *script-name* **wlan-gw-group** *wlan-gw-group-id* **statistics**

### Context

[\[Tree\]](#) (clear>python python-script)

### Full Context

clear python python-script

## Description

This command clears Python script statistics.

## Parameters

### *script-name*

Specifies the Python script name, up to 32 characters, to display information.

### *wlan-gw-group-id*

Specifies the WLAN-GW group ID.

**Values** 1 to 4

### *nat-group-id*

Specifies the NAT group ID.

**Values** 1 to 8 (7750 SR-12)  
1 to 4 (all other platforms)

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## 23.54 python-script protect

### python-script protect

## Syntax

```
python-script protect input file-url hmac-sha256 key secret-key output file-url
```

## Context

[\[Tree\]](#) (tools>perform python-script protect)

## Full Context

```
tools perform python-script protect
```

## Description

This command converts a normal (unprotected) Python script file into an SRPY format with specified key.

## Parameters

### input *file-url*

Specifies the URL of the input script file, up to 180 characters.

### key *secret-key*

Specifies the key used to compute the hash, up to 128 characters.

**output *file-url***

Specifies the URL of the output script file, up to 180 characters.

**Platforms**

All

## 23.55 python-script reload

### python-script reload

**Syntax**

**python-script reload** *name*

**Context**

[\[Tree\]](#) (tools>perform python-script reload)

**Full Context**

tools perform python-script reload

**Description**

This command reloads and recompiles the primary, secondary, and tertiary scripts in the specified Python script, in that order. The system uses the first script that comes up.

**Note:**

Executing this command may update the last modified time for the system configuration.

**Parameters**

***name***

Specifies the name of the Python script to be reloaded, up to 32 characters.

**Platforms**

All

## 24 q Commands

### 24.1 qos

```
qos
```

#### Syntax

```
qos
```

#### Context

[\[Tree\]](#) (clear qos)

#### Full Context

```
clear qos
```

#### Description

Commands in this context clear QoS statistics.

#### Platforms

All

```
qos
```

#### Syntax

```
qos
```

#### Context

[\[Tree\]](#) (show qos)

#### Full Context

```
show qos
```

#### Description

Commands in this context display QoS information.

#### Platforms

All

## qos

### Syntax

qos

### Context

[\[Tree\]](#) (tools>dump qos)

### Full Context

tools dump qos

### Description

Commands in this context dump QoS information.

### Platforms

All

## qos

### Syntax

qos

### Context

[\[Tree\]](#) (monitor qos)

### Full Context

monitor qos

### Description

Commands in this context configure criteria to monitor QoS scheduler statistics for specific customers and SAPs.

### Platforms

All

## 24.2 querier

### querier

#### Syntax

querier

#### Context

[\[Tree\]](#) (show>service>id>mld-snooping querier)

#### Full Context

show service id mld-snooping querier

#### Description

This command displays information about the current querier.

#### Platforms

All

#### Output

The following output is an example of service MLD snooping querier information.

#### Output Example

```
*A:rbae_C# show service id 1 mld-snooping querier
=====
MLD Snooping Querier info for service 1
=====
Sap Id           : 2/1/5
IP Address       : FE80:db8:12
Expires         : 11s
Up Time          : 0d 00:13:35
Version          : 2

General Query Interval : 10s
Query Response Interval : 1.0s
Robust Count           : 2
=====
*A:rbae_C#
```

### querier

#### Syntax

querier

## Context

[\[Tree\]](#) (show>service>id>igmp-snooping querier)

## Full Context

show service id igmp-snooping querier

## Description

This command displays information on the IGMP snooping queriers for the VPLS service.

## Platforms

All

## Output

### Output Example

```
*A:ALA-1>show>service>id>snooping# querier
=====
IGMP Snooping Querier info for service 10
=====
Sap Id           : 1/1/1
IP Address       : 10.10.10.1
Expires         : 6s
Up Time         : 0d 00:56:50
Version         : 3

General Query Interval : 5s
Query Response Interval : 2.0s
Robust Count          : 2
=====
*A:ALA-1>show>service>id>snooping#
```

[Table 433: Output fields: IGMP snooping queriers](#) describes the show output fields.

*Table 433: Output fields: IGMP snooping queriers*

Label	Description
SAP Id	Specifies the SAP ID of the service.
IP address	Specifies the IP address of the querier.
Expires	The time left, in seconds, that the query will expire.
Up time	The length of time the query has been enabled.
Version	The configured version of IGMP.
General Query Interval	The frequency at which host-query packets are transmitted.
Query Response Interval	The time to wait to receive a response to the host-query message from the host.

Label	Description
Robust Count	Specifies the value used to calculate several IGMP message intervals.

## querier

### Syntax

querier

### Context

[\[Tree\]](#) (clear>service>id>igmp-snooping querier)

### Full Context

## 24.4 queue

### queue

#### Syntax

**queue queue-group** *queue-group-name* *port-id* { **ingress** | **egress** } [**id** *queue-id*] [**instance** *instance-id*]

**queue sap** *sap-id* {**ingress** | **egress**} [**id** *queue-id*]

**queue subscriber** *sub-ident-string* [**sla-profile** *sla-profile-name*] {**ingress** | **egress**} [**id** *queue-id*]

#### Context

[\[Tree\]](#) (show>qos queue)

#### Full Context

show qos queue

#### Description

The **show qos queue** command outputs the Burst Control Group (BCG) name and slowest accurate visitation time for the specified queues.

For each queue specified, the system may find multiple hardware queues. This may be true for ingress queues on multipoint services (VPLS, IES, VPRN) or for queues created on an Ethernet Link Aggregation Group (LAG). When this is true, the show command displays the BCG name for each individual hardware queue.

The BCG name associated with a queue may be specified in the **show bcg** command to display the historical and current visitation time for the BCG managing the burst tolerance of the queue. If the output visitation time is greater (longer time) than the queue returned slowest accurate visitation time, the queue's shaping rate may be negatively impacted.

#### Parameters

##### **queue-group-name** *port-id*

Specifies that the system should find and display the BCG and calculate the slowest accurate visitation time for the queues within the specified *queue-group-name* on the specified *port-id*. If the specified *port-id* is not provisioned on the system or the specified *queue-group-name* is not found on the port's specified direction, the show command will fail.

**Values** port-id: up to 17 characters

queue-group-name: up to 32 characters

**{ingress | egress}**

Specifies the direction to display and are mutually exclusive.

**queue-id**

Limits the return queues to a single *queue-id*.

**Values** 1 to 16

**instance-id**

Specifies which instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

**Values** 1 to 65535

**sap-id**

Specifies that the system should find and display the BCG and calculate the slowest accurate visitation time for the queues within the specified *sap-id*. If the specified *sap-id* is not found, the show command will fail.

**Values** up to 64 characters

**sub-ident-string**

Specifies that the system should find and display the BCG and calculate the slowest accurate visitation time for the queues associated with the specified *sub-ident-string*. If the specified *sub-ident-string* does not exist, the show command will fail.

**Values** up to 32 characters

**sla-profile-name**

Specifies that the system should find and display the BCG and calculate the slowest accurate visitation time for the queues associated with the specified subscriber and sla-profile *sla-profile-name*. If the specified *sla-profile-name* does not exist, the show command will fail.

**Platforms**

All

## 24.5 queue-depth

### queue-depth

**Syntax**

**queue-depth** [*queue queue-id*] [**ingress** | **egress**]

## Context

[\[Tree\]](#) (clear>service>id>sap queue-depth)

## Full Context

clear service id sap queue-depth

## Description

This command clears queue depth information for the specified SAP.

## Parameters

### *queue-id*

Specifies the queue ID.

**Values** 1 to 32

### **ingress**

Clears information for the ingress policy.

### **egress**

Clears information for the egress policy.

## Platforms

All

## 24.6 queue-depth-violations

### queue-depth-violations

## Syntax

**queue-depth-violations** *mda-id*[/*port*] [**non-zero-counts-only**]

**queue-depth-violations** *mda-id*[/*port*] **access-egress** [**non-zero-counts-only**]

**queue-depth-violations** *mda-id*[/*port*] **access-egress** **service** *service-id* [**non-zero-counts-only**]

**queue-depth-violations** *mda-id*[/*port*] **access-egress** **queue-group** *queue-group-name* [**instance** *instance-id*] [**non-zero-counts-only**]

**queue-depth-violations** *mda-id*[/*port*] **network-egress** [**non-zero-counts-only**]

**queue-depth-violations** *mda-id*[/*port*] **network-egress** **queue-group** *queue-group-name* [**instance** *instance-id*] [**non-zero-counts-only**]

## Context

[\[Tree\]](#) (show>qos queue-depth-violations)

## Full Context

show qos queue-depth-violations

## Description

This command displays queue depth violation information, with the option of requesting only the information with a non-zero violation count.

## Parameters

### *mda-id[/port]*

Displays the pool information associated with the specified XMA or MDA and port.

**Values** slot/mda[/port]

### *non-zero-counts-only*

Displays only non-zero counts.

### *access-egress*

Displays access egress information.

### *service-id*

Specifies that the system should find and display queue depth violation information for the queues associated with the specified *service-id*.

**Values** 1 to 2147483648, *svc-name*: up to 64 characters

### *queue-group-name*

Specifies that the system should find and display information for the queues within the specified *queue-group-name*, up to 32 characters, on the specified *mda-id*.

### *instance-id*

Specifies which instance of a queue group with template *queue-group-name* to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

**Values** 1 to 65535

### *network-egress*

Displays network egress information.

## Platforms

All

## Output

The following output is an example of queue depth violation information, and [Table 434: Output fields: QoS queue depth violation](#) describes the output fields.

## 24.7 queue-group

### queue-group

#### Syntax

```
queue-group [queue-group-name] {ingress | egress} [{association | detail}]  
queue-group summary
```

#### Context

[\[Tree\]](#) (show>qos queue-group)

#### Full Context

```
show qos queue-group
```

#### Description

This command displays queue-group information.

#### Parameters

##### **queue-group-name**

Specifies the name of an existing queue group template up to 32 characters.

##### **ingress**

Specifies whether the queue group name is an ingress policy.

##### **egress**

Specifies whether the queue group name is an egress policy.

##### **association**

Displays the entities associated with the specified queue group name.

##### **detail**

Displays detailed queue group information for the specified queue group name.

##### **summary**

Displays the total number of queue-group instances per card (IOM or XCM).

#### Platforms

All

#### Output

The following outputs are examples of queue group information.

#### Output Example

```
*A:PE# show qos queue-group egress

## queue-group

### Syntax

**queue-group** *queue-group-name* **egress access** [**instance** *instance-id*] [**egress-queue** *egress-queue-id*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**queue-group** *queue-group-name* **ingress access** **ingress-queue** *ingress-queue-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**queue-group** *queue-group-name* **egress network** **instance** *instance-id* [**policer** *policer-id*] [**egress-queue** *egress-queue-id*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

### Context

**[Tree]** (monitor>port queue-group)

### Full Context

monitor port queue-group

### Description

This command enables queue-group monitoring for the specified parameters.

## Parameters

### ***queue-group-name***

Specifies the name of the queue-group up to 32 characters.

### ***access***

Specifies the access type.

**Values** access

### ***network***

Specifies the network type.

**Values** network

### ***instance-id***

Specifies the identification of a specific instance of the queue group.

**Values** 1 to 65535

### ***policer-id***

The specified policer ID must exist within the queue-group template applied to the ingress context of the forwarding plane.

**Values** 1 to 8

### ***egress-queue-id***

Monitors statistics for this queue.

**Values** 1 to 8

### ***ingress-queue-id***

Monitors statistics for this queue.

**Values** 1 to 32

### ***seconds***

Configures the interval for each display, in seconds.

**Values** 11 to 60

**Default** 11

### ***repeat***

Configures how many times the command is repeated.

**Values** 1 to 999

**Default** 10

### ***absolute***

When the absolute keyword is specified, the raw statistics are displayed without processing. No calculations are performed on the delta or rate statistics.

### rate

When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

### Platforms

All

## queue-group

### Syntax

**queue-group** [ingress | egress] [*queue-group-name*] [access | network [instance *instance-id*]

**queue-group** [ingress | egress] [*queue-group-name*] [access | network] associations [instance *instance-id*]

**queue-group** [ingress | egress] *queue-group-name* [access | network] [instance *instance-id*] **queue-depth** [queue *queue-id*]

**queue-group** [ingress | egress] [*queue-group-name*] [access | network] **statistics** [instance *instance-id*]

**queue-group summary**

### Context

[\[Tree\]](#) (show>port queue-group)

### Full Context

show port queue-group

### Description

This command displays queue group information.

### Parameters

#### ***queue-group-name***

Specifies the queue group name, up to 32 characters.

#### **statistics**

Displays queue group port statistics.

#### **associations**

Displays queue group port associations.

#### **summary**

Displays summary information.

#### ***instance-id***

Specifies the identification of a specific instance of the queue group.

**Values** 1 to 65535

### **queue-depth**

Displays queue depth information for the specified queue group queue.

### **queue-id**

Specifies the queue ID.

**Values** 1 to 32

### **Platforms**

All

## 24.8 queue-group-redirect-list

### queue-group-redirect-list

#### **Syntax**

**queue-group-redirect-list** [*policy-name*] [ **association** | **detail**]

#### **Context**

[\[Tree\]](#) (show>qos queue-group-redirect-list)

#### **Full Context**

show qos queue-group-redirect-list

#### **Description**

This command displays queue group redirect list information.

#### **Parameters**

##### ***policy-name***

Specifies the name of a queue group redirect list, up to 32 characters.

##### **association**

Displays the entities associated with the specified queue group redirect list.

##### **detail**

Displays detailed information, including queue group redirect list associations.

#### **Platforms**

All

#### **Output**

The following output is an example of queue group redirect list information.

### Output Example

## 25 r Commands

### 25.1 radius

radius

#### Syntax

**radius** *server-index*

#### Context

[\[Tree\]](#) (clear radius)

#### Full Context

clear radius

#### Description

This command applies to RADIUS servers configured for user access (**configure system security radius server**). This command clears the RADIUS server state.

#### Parameters

***server-index***

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 5

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius

#### Syntax

**radius**

#### Context

[\[Tree\]](#) (clear>li radius)

## Full Context

clear li radius

## Description

This command clears RADIUS associated entities.

## Platforms

All

## radius

## Syntax

**radius** [**user** *user-name*] [**policy** *policy-name*] [**server-index** *index*] **statistics**

## Context

[\[Tree\]](#) (show radius)

## Full Context

show radius

## Description

This command displays RADIUS server related information.

## Parameters

### *user-name*

Specifies the RADIUS username, up to 32 characters.

### *policy-name*

Specifies the policy name, up to 32 characters.

### *index*

Specifies the server index.

**Values** 1 to 16

## Platforms

All

## 25.2 radius-accounting

### radius-accounting

#### Syntax

**radius-accounting** [*policy-name*]

#### Context

[\[Tree\]](#) (clear>subscriber-mgmt radius-accounting)

#### Full Context

clear subscriber-mgmt radius-accounting

#### Description

This command clears RADIUS accounting data for the specified policy.

#### Parameters

***policy-name***

The name of the policy. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

#### Platforms

## 25.3 radius-accounting-policy

### radius-accounting-policy

#### Syntax

**radius-accounting-policy** *name* **association**

**radius-accounting-policy** [*name*]

**radius-accounting-policy** *name* **statistics**

#### Context

[\[Tree\]](#) (show>subscr-mgmt radius-accounting-policy)

#### Full Context

show subscriber-mgmt radius-accounting-policy

## Description

This command displays RADIUS accounting policy information.

## Parameters

### *name*

Specifies the RADIUS accounting policy name.

### *association*

Displays parameters associated with this RADIUS accounting policy.

### *statistics*

Displays statistics associated with this RADIUS accounting policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of subscriber management RADIUS accounting policy information.

### Output Example

```
*B:asd-tr0610-dr421# show subscriber-mgmt radius-accounting-policy "ZiggoAcct1813"
statistics

[Table 435: Output fields: RADIUS accounting policy](#) describes subscriber management RADIUS accounting policy output fields.

*Table 435: Output fields: RADIUS accounting policy*

Label	Description
Tx Requests/TX Reqs	Displays the number of accounting requests transmitted for this policy.
Rx Responses/Rx Resps	Displays the number of accounting responses received for this policy.

Label	Description
Request Timeouts/ Req Timeouts	Displays the number of accounting requests which have timed out for this policy.
Send Retries	Displays the number of retries to a different server for a single accounting request for this policy.
Send Failed Req Send Failed	Displays how many accounting requests failed because the packet could not be sent out for this policy.
Radius Servers	<p>Displays a table in which the statistics associated with this RADIUS accounting policy are broken down by individual RADIUS server.</p> <p>The table columns are:</p> <p>Index—displays the index number assigned to the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.</p> <p>IP Address—the address of the RADIUS server.</p> <p>TX Reqs—see TX Requests in this table.</p> <p>Rx Resps—see RX Responses in this table.</p> <p>Req Timeouts—see Request Timeouts in this table.</p> <p>Req Send Failed—see Send Failed in this table.</p>

## radius-accounting-policy

### Syntax

**radius-accounting-policy** [*rad-acct-plcy-name*]

**radius-accounting-policy** *rad-acct-plcy-name* **associations**

**radius-accounting-policy** *rad-acct-plcy-name* **statistics**

### Context

[\[Tree\]](#) (show>app-assure radius-accounting-policy)

### Full Context

show application-assurance radius-accounting-policy

### Description

This command displays RADIUS accounting policy information.

## Parameters

### *rad-acct-plcy-name*

Specifies the RADIUS accounting policy.

### **associations**

Specifies to show what contexts are associated with this policy.

### **statistics**

Specifies to show statistics related to this policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

## Syntax

**radius-accounting-policy** *rad-acct-plcy-name* [**server** *server-index*] **statistics**

## Context

[\[Tree\]](#) (clear>app-assure radius-accounting-policy)

## Full Context

clear application-assurance radius-accounting-policy

## Description

This command clears application assurance RADIUS accounting statistics for the specified policy.

## Parameters

### *policy-name*

The name of the policy. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

### *server-index*

The index for the RADIUS server.

**Values** 1 to 5 (a maximum of 5 accounting servers)

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

## Syntax

**radius-accounting-policy** [*name*]

## Context

[Tree] (show>ipsec radius-accounting-policy)

## Full Context

show ipsec radius-accounting-policy

## Description

This command displays RADIUS accounting-policy related information.

## Parameters

*name*

Specifies an existing RADIUS accounting policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of the **show ipsec radius-accounting-policy** command.

### Output Example

```
show ipsec radius-accounting-policy
=====
Radius Accounting Policy

```

## 25.4 radius-acct

### radius-acct

#### Syntax

radius-acct

#### Context

[\[Tree\]](#) (show>service>active-subscribers>hierarchy radius-acct)

#### Full Context

show service active-subscribers hierarchy radius-acct

#### Description

This command provides information about subscriber RADIUS accounting sessions including: the accounting policy name, the accounting mode, the interim intervals, the accounting session ID, and the multi-session ID. If there are no RADIUS accounting sessions enabled for subscribers, this command still shows the session ID that can be used by CoA.

PD hosts modeled as routes are not considered hosts, and therefore, are not shown in the output of this command.

This command only shows a numeric RADIUS session ID even if the RADIUS accounting policy is configured using the descriptive format.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of subscriber RADIUS accounting session information.

#### Output Example

```
# show service active-subscribers hierarchy radius-acct

## 25.5 radius-acct-terminate-cause

### radius-acct-terminate-cause

#### Syntax

**radius-acct-terminate-cause**

#### Context

**[Tree]** (tools>dump>aaa radius-acct-terminate-cause)

#### Full Context

tools dump aaa radius-acct-terminate-cause

#### Description

This command shows all available termination causes and their respective number values. The TermCause is equivalent to VSA 226 Alc-Error-Code numeric values. The description is equivalent to VSA 227Alc-Error-Message string.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.6 radius-attr-username

### radius-attr-username

#### Syntax

**radius-attr-username** [*user-name*] [**summary**]

#### Context

[\[Tree\]](#) (tools>dump>subscr-mgmt radius-attr-username)

#### Full Context

tools dump subscriber-mgmt radius-attr-username

#### Description

This command displays a list of subscriber IDs associated to each username and statistics associated to the username.

#### Parameters

##### *user-name*

Specifies the username that matches the RADIUS attribute VSA [1] username. A single username can also be specified to query the list of associated subscriber IDs.

##### **summary**

Displays summary RADIUS attribute username information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.7 radius-authentication-policy

### radius-authentication-policy

#### Syntax

**radius-authentication-policy** [*name*]

#### Context

[\[Tree\]](#) (show>ipsec radius-authentication-policy)

#### Full Context

show ipsec radius-authentication-policy

## Description

This command displays IPsec RADIUS authentication policy information.

## Parameters

*name*

Specifies an existing RADIUS authentication policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.8 radius-configuration

### radius-configuration

## Syntax

**radius-configuration**

## Context

[\[Tree\]](#) (show>aaa radius-configuration)

## Full Context

show aaa radius-configuration

## Description

This command displays RADIUS configuration information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of AAA RADIUS configuration information.

## Output Example

```
# show aaa radius-configuration
=====
RADIUS configuration
=====
CoA Port                : 3799
=====
```

[Table 436: Output fields: RADIUS configuration](#) provides a description of the counters in the output of the **show aaa isa-radius-policy** command.

Table 436: Output fields: RADIUS configuration

Label	Description
CoA Port	The RADIUS Change of Authorization (CoA) port

## 25.9 radius-proxy-server

### radius-proxy-server

#### Syntax

```
radius-proxy-server server-name  
radius-proxy-server server-name cache  
radius-proxy-server server-name cache hex-key hex-string  
radius-proxy-server server-name cache string-key string  
radius-proxy-server server-name cache summary  
radius-proxy-server server-name statistics  
radius-proxy-server
```

#### Context

[\[Tree\]](#) (show>router radius-proxy-server)

#### Full Context

```
show router radius-proxy-server
```

#### Description

This command displays RADIUS proxy server information.

#### Parameters

##### ***server-name***

Specifies the default RADIUS proxy server name created in the **config>router>radius-proxy** context.

##### **cache**

Displays cached information.

##### ***hex-string***

Displays the hex key string.

**Values** [0x0 to 0xFFFFFFFF (max 64 hex nibbles)]

**string**

Displays the packet type of the RADIUS messages to use to generate the key for the cache of this RADIUS proxy server.

**summary**

Displays summarized information.

**statistics**

Displays statistics for the specified RADIUS proxy server.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of subscriber RADIUS proxy server.

**Output Example**

```

Table 437: Output fields: proxy server describes subscriber RADIUS proxy server output fields.

Table 437: Output fields: proxy server

Label	Description
Invalid response Authenticator Rx packet	The number of packets received by this RADIUS proxy server
Rx Access-Request	The number of Access-Request packets received by this RADIUS proxy server
Rx Accounting-Request	The number of Accounting-Request packets received by this RADIUS proxy server
Rx dropped	The number of packets received by this RADIUS proxy server but dropped

Label	Description
Retransmit	The number of packets received by this RADIUS proxy server that were rejected because they are retransmitted
Wrong purpose	The number of packets received by this RADIUS proxy server that were rejected because the value of tmnxRadProxSrv Purpose is set to a value not matching the type of packet
No UE MAC to cache	The number of packets received by this RADIUS proxy server that were rejected because the UE MAC address was not present in the packet
Client context limit reached	The number of packets received by this RADIUS proxy server that were rejected because the limit of client contexts was reached. For each RADIUS transaction a client context is created, and are deleted once the transaction is finished.
No ISA RADIUS policy configured	The number of packets received by this RADIUS proxy server that were rejected because it has no ISA RADIUS server policy configured for that type of packet
Server admin down	The number of packets received by this RADIUS proxy server that were rejected because it is administratively shut down
No RADIUS policy configured	The number of packets received by this RADIUS proxy server that were rejected because it has no RADIUS server policy configured for that type of packet
No load-balance-key configured	The number of packets received by this RADIUS proxy server that were rejected because the selected RADIUS server policy's algorithm is set to hashBased and no load balance key is configured
Invalid length	The number of packets received by this RADIUS proxy server that were rejected because their length was invalid
Invalid Code field	The number of packets received by this RADIUS proxy server that were rejected because they had an invalid Code field
Invalid attribute encoding	The number of packets received by this RADIUS proxy server that were rejected because one of the attributes was incorrectly encoded
Invalid User-Name	The number of packets received by this RADIUS proxy server that were rejected because they contained an invalid User-Name attribute
Invalid password	The number of packets received by this RADIUS proxy server that were rejected because the User-Password attribute could not be decoded

Label	Description
Invalid accounting Authenticator	The number of accounting packets received by this RADIUS proxy server that were rejected because they contained an invalid Authenticator field
Invalid Message-Authenticator	The number of packets received by this RADIUS proxy server that were rejected because they contained an invalid Message-Authenticator attribute
Management core overload	The number of packets that were rejected by this RADIUS server because the ISA management core is not able to process any new RADIUS requests because of overload
No memory	The number of packets that were rejected by this RADIUS server because there was not enough memory to store them
Accounting-Request with invalid Acct-Status-Type	The number of accounting packets received by this RADIUS proxy server that were rejected because they contained an invalid Acct-Status-Type attribute
Accounting-Request with no Acct-Status-Type	The number of accounting packets received by this RADIUS proxy server that were rejected because they contained no Acct-Status-Type attribute
Registered user overload	The number of packets that were rejected by this RADIUS server because the registered user indicated to be in overload
Dropped by Python	The number of packets received by this RADIUS proxy server but dropped by Python
Tx Access-Accept	The number of Access-Accept packets transmitted by this RADIUS proxy server
Tx Access-Reject	The number of Access-Reject packets transmitted by this RADIUS proxy server
Tx Access-Challenge	The number of Access-Challenge packets transmitted by this RADIUS proxy server
Tx Accounting-Response	The number of Accounting-Response packets transmitted by this RADIUS proxy server
Tx dropped	The number of packets dropped by this RADIUS proxy server before transmission
No key to cache	The number of packets that could not be cached by this RADIUS proxy server because the key information was not present in the packet
Cache key too long	The number of packets that could not be cached by this RADIUS proxy server because the key information present in the packet was too long

Label	Description
Cache attributes too long	The number of packets that could not be cached by this RADIUS proxy server because the total length of the attributes is too long
Reached maximum number of cache entries	The number of packets that could not be cached by this RADIUS proxy server because the limit has been reached
No memory	The number of packets that could not be transmitted by this RADIUS proxy server because there was not enough memory
Server timeout	The number of packets that were dropped because the RADIUS servers have timed out
Server authentication failure	The number of packets that were dropped because the RADIUS server replied with a packet which failed authentication (invalid response Authenticator or Message Authenticator attribute)
Server invalid Code	The number of packets that were dropped because the RADIUS server replied with a packet with an invalid Code field
Invalid attribute encoding	The number of packets that were dropped because the RADIUS server replied with a packet with an invalid attribute
Registered user overload	The number of packets that were dropped because the registered user indicated to be in overload
No RADIUS server configured	The number of packets that were dropped by this RADIUS server because the RADIUS server policy has no servers configured
RADIUS server send failure	The number of packets that were dropped by this RADIUS server because the packet could not get transmitted to one of the servers in the RADIUS server policy
Dropped by Python	The number of packets that were dropped by this RADIUS server because the packet was dropped by the Python script
Invalid response Authenticator	The number of packets that were dropped because the RADIUS server replied with a packet which failed authentication

## radius-proxy-server

### Syntax

**radius-proxy-server** *server-name* **statistics**

### Context

[\[Tree\]](#) (clear>router radius-proxy-server)

### Full Context

```
clear router radius-proxy-server
```

### Description

This command clears RADIUS proxy server data.

### Parameters

***server-name***

Specifies the proxy server name.

***statistics***

Clears statistics for the specified server.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.10 radius-script-policy

### radius-script-policy

#### Syntax

```
radius-script-policy [policy-name]
```

```
radius-script-policy policy-name association
```

```
radius-script-policy policy-name script {primary | secondary}
```

#### Context

[\[Tree\]](#) (show>aaa radius-script-policy)

#### Full Context

```
show aaa radius-script-policy
```

#### Description

This command displays RADIUS script policy information.

#### Parameters

***policy-name***

Specifies the RADIUS script policy name, up to 32 characters.

***association***

Displays the associations related to the RADIUS script policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.11 radius-server

### radius-server

#### Syntax

```
radius-server server-name  
radius-server server-name associations  
radius-server
```

#### Context

[\[Tree\]](#) (show>router radius-server)

#### Full Context

```
show router radius-server
```

#### Description

This command displays RADIUS server configuration information.

#### Parameters

##### **server-name**

Specifies the RADIUS server name, up to 32 characters.

##### **associations**

Displays the RADIUS server policy associations for the specified server.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Output

The following outputs are examples of RADIUS server information.

### Output Example

```
[/]  
A:patrick@pel# /show router radius-server "radius-1"  
=====
```

RADIUS server "radius-1"	
=====	
Description	: (Not Specified)
Address	: 172.16.6.2
Port Auth/Acct	: 1812/1813
CoA script policy	: (Not Specified)
Python policy	: (Not Specified)

```
Pending request limit      : 4096
Accept CoA                 : true
Last management change     : 07/05/2022 14:30:02
=====

=====
```

## 25.12 radius-server-policy

### radius-server-policy

#### Syntax

```
radius-server-policy policy-name [acct-on-off]
radius-server-policy policy-name associations
radius-server-policy policy-name msg-buffer-stats
radius-server-policy policy-name statistics
radius-server-policy [acct-on-off]
```

#### Context

[\[Tree\]](#) (show>aaa radius-server-policy)

#### Full Context

```
show aaa radius-server-policy
```

#### Description

This command displays RADIUS server policy configuration information.

#### Parameters

##### *policy-name*

Displays information for the specified RADIUS server policy.

##### **association**

Displays the information configured with the RADIUS server policy.

##### **msg-buffer-stats**

Displays statistics related to the RADIUS messages that are buffered for each specified RADIUS server policy.

**statistics**

Displays statistics for the specified RADIUS server policy.

**act-on-off**

Displays the admin state of the acct-on-off feature.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of AAA RADIUS server policy information.

**Output Example**

```
*B:asd-tr0610-dr421# show aaa radius-server-policy "ZiggoAAA_anycast" statistics
=====
RADIUS server policy "ZiggoAAA_anycast" statistics
=====
Tx transaction requests           : 24818681
Rx transaction responses          : 24817329
Transaction requests timed out   : 1351
Transaction requests send failed : 0
Packet retries                   : 12410
Transaction requests send rejected : 0
Authentication requests failed   : 303530
Accounting requests failed       : 0
Ratio of access-reject over auth responses : 13%
Transaction success ratio        : 99%
Transaction failure ratio        : 1%
Statistics last reset at         : 05/21/2015 01:11:39
```

**Table 438: Output fields: RADIUS server policy statistics** describes RADIUS server policy statistics output fields.

*Table 438: Output fields: RADIUS server policy statistics*

Label	Description
Tx transaction requests	The number of RADIUS transaction requests transmitted
Rx transaction responses	The number of RADIUS transaction responses received
Transaction requests timed out	The number of RADIUS transaction requests that have timed out
Transaction requests send failed	The number of RADIUS transaction requests that could not be transmitted
Packet retries	The number of times a RADIUS request packet was retransmitted to a server
Transaction requests send rejected	The number of RADIUS transaction requests that were not transmitted due to unacceptable configuration

Label	Description
Authentication requests failed	The number of authentication failures for this policy
Accounting requests failed	The number of accounting failures for this policy
Ratio of access-reject over auth responses	The ratio of access-rejects in the auth responses for this policy
Transaction success ratio	The transaction success ratio for this policy
Transaction failure ratio	The transaction failure ratio for this policy
Statistics last reset at	Indicated the date and time at which the statistics for this policy were last reset

## radius-server-policy

### Syntax

**radius-server-policy** *policy-name* **msg-buffer** [**session-id** *acct-session-id*]

### Context

[\[Tree\]](#) (tools>dump>aaa radius-server-policy)

### Full Context

tools dump aaa radius-server-policy

### Description

This command dumps the RADIUS message buffer content for the specified radius-server-policy:

- message-type (acct-interim or acct-stop)
- Acct-Session-Id
- Remaining lifetime

When specifying the session-id, the message details are displayed.

### Parameters

#### ***policy-name***

Specifies the **radius-server-policy** for which the message buffer content should be displayed.

#### ***acct-session-id***

Displays the RADIUS message details for the message with specified session-id that is stored in the RADIUS message buffer.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *policy-name* **msg-buffer** [**acct-session-id** *acct-session-id*]

**radius-server-policy** *policy-name* **statistics** [**msg-buffer-only**]

**radius-server-policy** *policy-name* **server** *server-index* **statistics**

### Context

[\[Tree\]](#) (clear>aaa radius-server-policy)

### Full Context

clear aaa radius-server-policy

### Description

This command dumps the RADIUS message buffer content for the specified radius-server-policy:

- message-type (acct-interim or acct-stop)
- Acct-Session-Id
- Remaining lifetime

When specifying the session-id, the message details are displayed.

### Parameters

#### ***policy-name***

Specifies the radius-server-policy for which the information should be cleared.

#### ***acct-session-id***

Deletes all RADIUS messages or the RADIUS message with specified session-id from the RADIUS message buffer.

#### ***msg-buffer-only***

Clears all statistics for the specified radius-server-policy: radius-server-policy statistics, RADIUS server statistics and RADIUS message buffer statistics. With the optional keyword **msg-buffer-only**, only the RADIUS message buffer statistics are cleared.

#### ***server-index***

Clears the RADIUS server statistics for the specified server-index in the specified radius-server-policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.13 range

range

### Syntax

range [area-id]

### Context

[\[Tree\]](#) (show>router>ospf3 range)

[\[Tree\]](#) (show>router>ospf range)

### Full Context

show router ospf3 range

show router ospf range

### Description

This command displays ranges of addresses on an Area Border Router (ABR) for the purpose of route summarization or suppression.

### Parameters

**area-id**

Displays the configured ranges for the specified area.

**Values** ip-address — a.b.c.d  
area — 0 to 4294967295

### Platforms

All

### Output

OSPF Range Output

[Table 439: Output fields: OSPF range](#) describes the OSPF range output fields.

*Table 439: Output fields: OSPF range*

Label	Description
Area Id	A 32-bit integer uniquely identifying an area. Area ID 0.0.0.0 is used for the OSPF backbone.
Address/Mask	The mask for the range expressed as a decimal integer mask length or in dotted decimal notation.

Label	Description
Advertise	False — The specified address/mask is not advertised outside the area.  True — The specified address/mask is advertised outside the area.
LSDB Type	NSSA — This range was specified in the NSSA context, and specifies that the range applies to external routes (via type-7 LSAs) learned within the NSSA when the routes are advertised to other areas as type-5 LSAs.  Summary — This range was not specified in the NSSA context, the range applies to summary LSAs even if the area is an NSSA.

### Output Example

```
A:ALA-A# show router ospf 1 range
=====
Rtr Base OSPFv2 Instance 1 Ranges
=====
Area Id          Address/Mask      Advertise  LSDB Type
-----
No. of Ranges: 0
=====
A:ALA-A#

A:ALA-A# show router ospf range 180.0.7.9
=====
Rtr Base OSPFv2 Instance 0 Ranges for Area-Id 180.0.7.9
=====
Area Id          Address/Mask      Advertise  LSDB Type
-----
No. of Ranges: 0
=====
A:ALA-A#
```

## 25.14 reassembly-statistics

### reassembly-statistics

#### Syntax

```
reassembly-statistics group nat-group-id member [member]
```

#### Context

[\[Tree\]](#) (clear reassembly-statistics)

#### Full Context

```
clear reassembly-statistics
```

## Description

This command clears IP reassembly statistics.

## Parameters

### *nat-group-id*

Specifies the NAT group ID.

**Values** 1 to 8 (7750 SR-12)  
1 to 15 (VSR)  
1 to 4 (all other platforms)

### *member*

Specifies the member ID.

**Values** 1 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.15 reboot-required

### reboot-required

## Syntax

```
reboot-required
```

## Context

[\[Tree\]](#) (clear>system reboot-required)

## Full Context

```
clear system reboot-required
```

## Description

This command clears the reboot required information. Use this command after a configuration triggers the reboot required state, but the configuration is removed.

## Platforms

All

## 25.16 recover-l2aw-bypass

```
recover-l2aw-bypass
```

### Syntax

```
recover-l2aw-bypass mda
```

### Context

[\[Tree\]](#) (tools>perform>nat recover-l2aw-bypass)

### Full Context

```
tools perform nat recover-l2aw-bypass
```

### Description

This command restores NAT resources to the recovered MS-ISA and resumes forwarding subscriber traffic.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.17 redirect

```
redirect
```

### Syntax

```
redirect statistics
```

### Context

[\[Tree\]](#) (tools>dump>system>cpm-http-redirect redirect)

### Full Context

```
tools dump system cpm-http-redirect redirect
```

### Description

This command displays system level statistics for all redirected TCP sessions in **optimized- mode**. These include the following:

- Close requests to TCP: TCP layer requested to send a FIN
- Abort requests to TCP: error in the received packet and the TCP layer needs to send a RST

- Data requests to TCP: number of redirects sent to the TCP layer
- Connections deleted: number of connections closed without a successful redirect performed
- HTTP GET parse errors: formatting error in the HTTP request
- HTTP GET process errors: HTTP GET is formatted properly but the redirect still fails. Example: system unable to find a corresponding host
- HTTP Response dropped: communication error; the redirect failed to be sent to the TCP layer

## Parameters

### statistics

Specifies system level statistics for all redirected TCP sessions.

## Platforms

All

## Output

The following output is an example of the **statistics** command information.

### Output Example

```
A# tools dump system cpm-http-redirect redirect statistics
=====
CPM HTTP Redirect statistics
=====
Close requests to TCP                : 2
Abort requests to TCP                : 0
Data requests to TCP                 : 2
Requests rejected - out of memory    : 0
Connections deleted                  : 0
HTTP GET parse errors                 : 0
HTTP GET process errors               : 0
HTTP Response dropped                : 0
```

## 25.18 redirect-policy

### redirect-policy

#### Syntax

```
redirect-policy [redirect-policy-name {dest ip-address | associations}]
```

#### Context

[\[Tree\]](#) (show>filter redirect-policy)

#### Full Context

```
show filter redirect-policy
```

## Description

This command shows redirect filter information.

## Parameters

### *redirect-policy-name*

Displays information for the specified redirect policy, up to 32 characters.

### *dest ip-address*

Directs the router to use a specified IP address for communication.

#### Values

ipv4-address:	a.b.c.d.
ipv6-address:	x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x.d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

### *associations*

Appends association information.

## Platforms

All

## Output

**Redirect Policy Output** — The following output is an example of redirect policy information, and [Table 440: Output fields: redirect policy](#) describes the fields.

### Output Example

```
A:ALA-A>config>filter# show filter redirect-policy
=====
Redirect Policies
=====
Redirect Policy          Applied Description
-----
wccp                    Yes
redirect1               Yes    New redirect info
redirect2               Yes    Test test test test
=====
ALA-A>config>filter#

ALA-A>config>filter# show filter redirect-policy redirect1
=====
Redirect Policy
=====
Redirect Policy: redirect1          Applied      : Yes
Description      : New redirect info
Active Dest      : 10.10.10.105
-----
Destination      : 10.10.10.105
```

```

-----
Description      : another test
Admin Priority   : 95
Admin State     : Up
Oper Priority    : 105

Timeout        : 30
Hold Remain    : 0
Action Taken   : Disable
=====
A:ALA-A>config>filter#
    
```

Table 440: Output fields: redirect policy

Label	Description
Redirect Policy	Specifies a specific redirect policy
Applied	Specifies whether the redirect policy is applied to a filter policy entry
Description	Displays the user-provided description for this redirect policy
Active Destination	IP address — specifies the IP address of the active destination
	none — indicates that there is currently no active destination
Destination	Specifies the destination IP address
Oper Priority	Specifies the operational value of the priority for this destination; the highest operational priority across multiple destinations is used as the preferred destination
Admin Priority	Specifies the configured base priority for the destination
Admin State	Specifies the configured state of the destination
	Out of Service — tests for this destination will not be conducted
Oper State	Specifies the operational state of the destination
Ping Test	Specifies the name of the ping test
Source Address	Specifies the source address of the ping test (if any)
Timeout	Specifies the amount of time in seconds that is allowed for receiving a response from the far-end host; if a reply is not received within this time the far-end host is considered unresponsive
Interval	Specifies the amount of time in seconds between consecutive requests sent to the far end host

Label	Description
Drop Count	Specifies the number of consecutive requests that must fail for the destination to be declared unreachable
Hold Down	Specifies the amount of time in seconds that the system should be held down if any of the test has marked it unreachable
Hold Remain	Specifies the amount of time in seconds that the system will remain in a hold down state before being used again
Last Action at	Displays a time stamp of when this test received a response for a probe that was sent out

## redirect-policy

### Syntax

**redirect-policy** *redirect-policy-name*

### Context

[\[Tree\]](#) (tools>perform>filter redirect-policy)

### Full Context

tools perform filter redirect-policy

### Description

Commands in this context perform redirect policy operations.

### Parameters

***redirect-policy-name***

Specifies a particular redirect policy name, up to 32 characters.

### Platforms

All

## 25.19 redirect-policy-binding

## redirect-policy-binding

### Syntax

**redirect-policy-binding** [*name*]

## Context

[\[Tree\]](#) (show>filter redirect-policy-binding)

## Full Context

show filter redirect-policy-binding

## Description

This command shows configured redirect-policy bindings information.

## Parameters

**name**

Displays information for the specified redirect policy binding, up to 32 characters.

## Platforms

All

## Output

**Redirect Policy Output** — The following output is an example of redirect policy binding information, and [Table 441: Output fields: redirect policy bindings](#) describes the fields.

### Output Example

```
A:ALA-A>config>filter# show filter redirect-policy-binding
=====
Redirect Policy Bindings
=====
Name                               Binding Operator Oper State
-----
TestBinding                         And                       Up
=====
ALA-A#
```

Table 441: Output fields: redirect policy bindings

Label	Description
Test Binding	Specifies a specific test binding field

## 25.21 reflectors

## reflectors

## Syntax

**reflectors**

## Context

[\[Tree\]](#) (show>test-oam>twamp>twamp-light reflectors)

## Full Context

show test-oam twamp twamp-light reflectors

## Description

This command displays TWAMP-Light reflector information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Output

The following output is an example of TWAMP Light reflector information, and [Table 442: Output fields: TWAMP Light reflectors](#) describes the output fields.

### Output Example

```
show test-oam twamp twamp-light reflectors
=====
TWAMP-Light Reflectors
=====
Router/VRPN  Admin  Type  uS  UDP Port Prefix  Frames Rx  Frames Tx IPv6Udp0
-----
Base        Up  STAMP  Y   862    1    2425283  2425283  No
500        Up  STAMP  Y   862    2     6340    6340    No
-----
No. of TWAMP-Light Reflectors: 2
uS = Y: LAG micro-session delay and loss measurement enabled
=====
```

Table 442: Output fields: TWAMP Light reflectors

Label	Description
Router/VRPN	Displays the routing instance
Admin	Displays the administrative state of the reflector
Type	Displays the configured packet processing of the reflector STAMP – supports STAMP formatted packets and optional STAMP TLVs, as well as processing TWAMP Light formatted packets TWL – supports TWAMP Light formatted packets, but not the decoding of STAMP options. STAMP packets are processed using TWAMP Light logic and additional STAMP-specific fields are treated as padding.
uS	Displays if LAG micro session delay and loss measurement is enabled Y – Yes Blank – No
UDP Port	Displays the listening UDP port on the Session-Reflector
Prefix	Displays the IP source-allowed prefixes configured
Frames Rx	Displays the number of packets received on the Session-Reflector
Frames Tx	Displays the number of packets transmitted by the Session-Reflector
IPv6Udp0	Allow for the processing of IPv6 packets that arrive with a UDP port of zero

## 25.22 refresh-lsas

### refresh-lsas

#### Syntax

**refresh-lsas** [*lsa-type*] [*area-id*]

#### Context

[\[Tree\]](#) (tools>perform>router>ospf3 refresh-lsas)

[\[Tree\]](#) (tools>perform>router>ospf refresh-lsas)

#### Full Context

tools perform router ospf3 refresh-lsas

tools perform router ospf refresh-lsas

#### Description

This command refreshes LSAs for OSPF.

#### Platforms

All

## 25.23 release-hold-down

### release-hold-down

#### Syntax

**release-hold-down interface** *interface-name* [ **protocol** *protocol*] [**static-policer** *name*]

**release-hold-down sap** *sap-id* [**protocol** *protocol*] [**static-policer** *name*]

#### Context

[\[Tree\]](#) (tools>perform>security>dist-cpu-protection release-hold-down)

#### Full Context

tools perform security dist-cpu-protection release-hold-down

#### Description

This command releases a Distributed CPU Protection (DCP) policer from a hold-down countdown (or indefinite hold-down if configured as such).

## Parameters

**interface** *interface-name*

Specifies Router interface name.

**sap** *sap-id*

Specifies sap identifier.

**protocol** *protocol*

Specifies DCP protocol name (for example, arp, dhcp).

**static-policer** *name*

Specifies DCP static policer name as defined in the DCP policy.

## Platforms

All

## 25.24 remap-lease-state

### remap-lease-state

#### Syntax

**remap-lease-state** **old-mac** *ieee-address* **mac** *ieee-address*

**remap-lease-state** **sap** *sap-id* [**mac** *ieee-address*]

#### Context

[\[Tree\]](#) (tools>perform>subscr-mgmt remap-lease-state)

#### Full Context

tools perform subscriber-mgmt remap-lease-state

#### Description

This command allows the remapping of all existing hosts if network card on CMTS/WAC side is changed is required.

When this command is executed, the following restrictions apply:

- When **sap** is taken, all leases associated with the SAP are re-written.
  - For a SAP with a configured MAC in **lease-populate** command, this MAC is taken.
  - For a SAP without a configured MAC the MAC from tools command is taken.
  - For a SAP without a configured MAC and no MAC in tools command no action is performed.
- When using the **old-mac** option, providing a new MAC *ieee-address* is mandatory.

This command is applicable only when dealing with DHCP lease states which were instantiated using I2header mode of DHCP operation.

## Parameters

### **old-mac** *ieee-address*

Specifies the old MAC address to remap.

### **mac** *ieee-address*

Specifies that the provisioned MAC address is used in the anti-spoofing entries for this SAP when I2-header is enabled. The parameter may be changed mid-session. Existing sessions will not be re-programmed unless a **tools perform** command is issued for the lease.

### **sap-id**

Specifies the physical port identifier portion of the SAP definition.

When configured, the SAP parameter remaps all MAC addresses of DHCP lease states on the specified SAP. When no optional MAC parameter is specified, the **sap sap-id** command remaps all MAC addresses of lease states towards the MAC address specified in the I2-header configuration.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.25 remote-bfd-discrim

### remote-bfd-discrim

#### Syntax

**remote-bfd-discrim** *bfd-discriminator*

#### Context

[\[Tree\]](#) (tools>dump>router>lsp-bfd remote-bfd-discrim)

#### Full Context

tools dump router lsp-bfd remote-bfd-discrim

#### Description

This command displays information the BFD-on-LSP sessions with a specified remote discriminator.

#### Parameters

##### **bfd-discriminator**

Specifies the BFD discriminator.

**Values** to 4294967295

## Platforms

All

## 25.26 remote-management

### remote-management

#### Syntax

**remote-management**

#### Context

[\[Tree\]](#) (clear>system>management-interface remote-management)

#### Full Context

clear system management-interface remote-management

#### Description

This command clears the remote management service.

#### Platforms

All

### remote-management

#### Syntax

**remote-management [detail]**  
**remote-management manager** [*manager-name*]

#### Context

[\[Tree\]](#) (show>system>management-interface remote-management)

#### Full Context

show system management-interface remote-management

#### Description

This command displays a summarized status of the Remote Management service.

#### Parameters

**detail**

Displays detailed remote management service information.

***manager-name***

Displays remote management service information for the specified manager.

**Platforms**

All

**Output**

The following outputs are examples of the **show system management-interface remote- management** command and parameters, and the tables describe the fields.

- [Output Example: remote-management](#); output fields [Table 443: Output fields: remote management](#)
- [Output Example: remote-management detail](#); output fields [Table 444: Output fields: remote management detail](#) and [Table 443: Output fields: remote management](#) for fields that are common to all the remote management output commands
- [Output Example: remote-management manager](#); output fields [Table 445: Output fields: remote management manager](#) and [Table 443: Output fields: remote management](#) for fields that are common to all the remote management output commands

**Output Example: remote-management**

Device name	Displays the device name that is configured for this manager
Device label	Displays the device label that is configured for this manager
TLS secured	Displays the configured TLS status
TLS profile	Displays TLS profile, if configured
Source address	Displays the configured source address
Source TCP port	Displays the TCP source port
Manager TCP port	Displays the manager TCP port
Last registration status	Displays the status of the last registration attempt for this manager
Last registration time	Displays the time of the last registration for this manager
Last hello time	Displays the time of the last hello for this manager

Label	Description
Time until next hello	Displays the time until the next hello for this manager
Sent registration messages	Displays the number of registration messages sent for this manager
Failed registration messages	Displays the number of failed registration messages for this manager
Cancelled registrations	Displays the number of canceled registration messages for this manager

## 25.27 replication-segment

### replication-segment

#### Syntax

**replication-segment** [**root-address** *ip-address*] [**tree-id** *tree-id*] [**inst-id** *instance-id*] [**origin** {**Static** | **PCEP** | **SR-Policy**}] [**detail**] [**downstream-nodes** *id*]

#### Context

**[Tree]** (show>router>p2mp-sr-tree>database replication-segment)

#### Full Context

show router p2mp-sr-tree database replication-segment

#### Description

This command displays information for the replication segments in the P2MP SR tree database.

#### Parameters

##### ***ip-address***

Displays replication segment information for the root with the specified IPv4 address.

##### ***tree-id***

Displays replication segment information for the P2MP SR tree with the specified ID.

**Values** 8193 to 16286

##### ***instance-id***

Displays replication segment information for the instance ID of a candidate path.

**Values** 0 to 4294967295

##### **origin**

Displays information for policies created using the specified method.

**Static**

Displays static policies.

**PCEP**

Displays PCEP policies.

**SR-Policy**

Displays SR policies.

**detail**

Displays detailed information.

**downstream-nodes**

Displays next hop information.

**id**

Displays information for the next hop with the specified ID.

**Platforms**

All

**Output**

The following output is an example of P2MP SR tree database replication segment information.

**Output example**

```
A:node-2>show>router>p2mp-sr-tree# database replication-segment
=====
Replication Segments

## replication-segment

### Syntax

```
replication-segment [segment-name] [inst-id instance-id] [incoming-sid static-label] [origin { Static | PCEP | SR-Policy}] [oper { up | down}] [tree-id root-tree-id] [root-addr ip-address] [sr-mpls | srv6]
```

### Context

**[Tree]** (show>router>p2mp-sr-tree replication-segment)

### Full Context

```
show router p2mp-sr-tree replication-segment
```

### Description

This command displays information for the specified replication segment of the P2MP SR tree.

### Parameters

#### ***segment-name***

Specifies the name of the replication segment, up to 32 characters.

#### ***instance-id***

Specifies the instance ID.

**Values** 0 to 4294967295

#### ***static-label***

Specifies the static label ID.

**Values** 0 to 4294967295

#### **origin**

Displays policies created using the specified method.

#### **Static**

Displays static policies.

#### **PCEP**

Displays PCEP policies.

#### **SR-Policy**

Displays SR policies.

#### **oper up**

Displays replication segments with operational status up.

#### **oper down**

Displays replication segments with operational status down.

#### ***root-tree-id***

Specifies the P2MP SR tree ID.

**Values** 8193 to 16286

**ip-address**

Specifies the root IPv4 address.

**sr-mpls**

Displays SR MPLS replication segments.

**srv6**

Displays SRv6 replication segments.

**Platforms**

All

**Output**

The following outputs show examples of P2MP SR tree replication-segment information and [Table 446: Output fields: P2MP SR tree replication segment](#) describes the output fields.

- [Output example: Replication segment](#)
- [Output example: SR MPLS replication segments](#)
- [Output example: SRv6 replication segments](#)

**Output example: Replication segment**

```
show router p2mp-sr-tree replication-segment

Table 446: Output fields: P2MP SR tree replication segment

Label	Description
Action	Displays the SR MPLS replication segment action (pop, push, swap)
Adm/Opr	Displays the administrative or operational state of the segment (up, down)
Function	Displays the incoming SID locator function (end-replicate) for the SRv6 segment
InSID	Displays the SR MPLS incoming replication SID IP address used to find the replication state
Incoming SID	Displays the SRv6 incoming replication SID used to find the replication state
InstId	Displays the Instance ID represented by the replication SID. Each candidate path has two instances IDs. The instance ID is unique within a P2MP policy.
Locator	Displays the SRv6 incoming SID locator
Name	Displays the name of the segment
NumNhIds	Displays the number of the next hop IDs
Origin	Displays policies created using the configured method (static, PCEP)
Role	Displays the role the SRv6 replication segment performs in handling the packets (leaf, root, transit)
RootAddr	Displays the root IP address of the segment
Treeld	Displays the tree ID of the segment

## 25.28 request

request

### Syntax

**request** *aps-id* {**protect** | **working**}

### Context

[\[Tree\]](#) (tools>perform>aps request)

### Full Context

tools perform aps request

### Description

This command requests a manual switch to protection or working circuit.

### Parameters

**aps-id**

Specifies the APS ID.

#### Values

<i>aps-id</i>	<i>aps-group-id</i>
aps	keyword
group-id	1 to 128

**protect**

This command requests a manual switch to a port that is acting as the protection circuit for the APS group.

**working**

This command requests a manual switch to a port that is acting as the working circuit for this APS group.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 25.29 requirements

### requirements

#### Syntax

**requirements** [detail]

#### Context

[\[Tree\]](#) (show>chassis>power-management requirements)

#### Full Context

show chassis power-management requirements

#### Description

This command displays maximum power requirements for the installed devices.

#### Parameters

##### detail

Displays detailed information.

#### Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

#### Output

The following output is an example of power management requirements information, and [Table 447: Output fields: chassis power management requirements](#) describes the output fields.

#### Output Example: show chassis power-management requirements

```
*A:Dut-A# show chassis power-management requirements

=====
    
```

Table 447: Output fields: chassis power management requirements

Label	Description
SUPPLY	
Power Capacity	Specifies the total amount of power available to the chassis.

Label	Description
Safety Level	Specifies the configured Power Safety Level, which is a percentage of the worst case power consumption level.
Alert Level	Specifies the configured power level in Watts, which causes the system to raise an alarm if the available power level drops below a set level.
Mode	Specifies the configured mode: none, basic, advanced.
Reserved Power	Signifies the amount of power in reserve. For basic and advanced modes, the system keeps an additional margin of reserve power capacity. This margin is the provisioned capacity of the highest-rated power module. In advanced mode, the system will shed load to always keep this amount of power in reserve. In basic mode, it won't shed load to maintain the reserve, but it only allows cards or MDAs to load as long as the reserve power margin can be maintained.
Reqd. + Reserve	Specifies the Safety Level (Watts) + Reserved Power.
Remaining Power	Specifies the excess capacity. It is equal to ("Power Capacity" - "Reqd + Reserve").
REQUIREMENTS	
Fan	Specifies the amount of power required for each fan tray.
IO Module	Specifies the amount of power required for each IO Module.
CPM Module	Specifies the amount of power required for each CPM.
Fabric Module	Specifies the amount of power required for each SFM.
MDA Module	Specifies the amount of power required for each line card.
Total Required	Specifies the total amount of power required for all system elements.
Safety Level	Specifies the percentage configured with <b>configure system power-management power-safety-level percent</b> . This is a percentage of the total system requirement (Total Required). The corresponding value in Watts is also shown for information.
Safety Alert	Specifies the output of <b>configure system power-management power-safety-alert wattage</b> . A non-zero value indicates that the user wants to receive a warning when the system power capacity drops to within this number of Watts of the system level. If the power safety is 0, "N/A" is displayed in the output since no alert will be produced.

Label	Description
Alert Level	Specifies the value when the safety alert will be issued (= safety-level + safety alert). If the power safety alert is 0, "N/A" is displayed in the output since no alert will be produced.

## 25.30 resignal

### resignal

#### Syntax

**resignal** {*lsp lsp-name path path-name* | **delay** *minutes*}

**resignal** {*p2mp-lsp p2mp-lsp-name p2mp-instance p2mp-instance-name* | **p2mp-delay** *p2mp-minutes*}

**resignal** {*sr-te-lsp sr-te-lsp-name path path-name* | **sr-te-delay** *sr-te-minutes*}

#### Context

[\[Tree\]](#) (tools>perform>router>mpls resignal)

#### Full Context

tools perform router mpls resignal

#### Description

This command resignals a specific path of a RSVP-TE P2P LSP, a RSVP P2MP LSP tree, or a SR-TE LSP. When an **lsp-name** and **path-name** are provided, a manual resignal is performed for the named path of the named LSP only. In this case, the new path is always programmed in data path regardless of the metric comparison between the new path and the current path.

The **delay**, **p2mp-delay**, or the **sr-te-delay** parameters override the global resignal timer value of all LSPs of the corresponding type for resignal. At the expiry of this override timer, the procedures of the timer based resignal are applied to all LSPs of the corresponding type. The resignal timer is then reset to its configured value in MPLS configuration. In this case, the new path is programmed in data path only if the metric of the new path is different from one of the current path.

#### Parameters

##### ***lsp lsp-name***

Specifies an existing LSP name, up to 64 characters in length, to resignal.

##### ***path path-name***

Specifies an existing path name to resignal.

##### ***delay minutes***

Configures an override of the global resignal timer or all RSVP-TE P2P LSPs.

**Values** 0 to 30

**p2mp-lsp *p2mp-lsp-name***

Specifies an existing point-to-multipoint RSVP-TE LSP name, up to 64 characters, to resignal.

**p2mp-instance *p2mp-instance-name***

Specifies a name, up to 32 characters, that identifies the P2MP LSP instance.

**p2mp-delay *p2mp-minutes***

Configures an override of the global resignal timer or all RSVP-TE P2MP LSPs.

**Values** 0 to 60

**sr-te-delay *sr-te-minutes***

Configures an override of the global resignal timer or all SR-TE LSPs.

**Values** 0 to 30

**sr-te-lsp *sr-te-lsp-name***

Specifies the name of a SR-TE LSP to resignal. The name must be 64 characters maximum.

**Platforms**

All

## 25.31 resignal-bypass

### resignal-bypass

**Syntax**

**resignal-bypass** {lsp *bypass-lsp-name* [**force**] | **delay** *minutes*}

**Context**

**[Tree]** (tools>perform>router>mpls resignal-bypass)

**Full Context**

tools perform router mpls resignal-bypass

**Description**

This command performs a manual re-optimization of a specific dynamic or manual bypass LSP, or of all dynamic bypass LSPs.

The name of a manual bypass LSP is the one provided by the user at configuration time. The name of a dynamic bypass LSP is shown in the output of **show>router>mpls>bypass-tunnel dynamic detail**.

The **delay** option triggers the global re-optimization of all dynamic bypass LSPs at the expiry of the specified delay. Effectively, this option forces the global bypass resignal timer to expire after an amount of time equal to the value of the **delay** parameter. This option has no effect on a manual bypass LSP.

However, when *bypass-lsp-name* is specified, the named dynamic or manual bypass LSP is signaled and the associations are moved only if the new bypass LSP path has a lower cost than the current one. This behavior is different from that of the similar command for the primary or secondary active path of an LSP, which signals and switches to the new path regardless of the cost comparison. This handling is required because a bypass LSP may have a large number of PSB associations and the processing churn is much higher.

In the specific case where the name corresponds to a manual bypass LSP, the LSP is torn down and resignaled using the new path provided by CSPF if no PSB associations exist. If one or more PSB associations exist but no PLR is active, the command fails and the user is required to explicitly enter the **force** option. In this case, the manual bypass LSP is torn down and resignaled, leaving temporarily the associated LSP primary paths unprotected. If one or more PLRs associated with the manual bypass LSP is active, the command fails.

Finally, and as with the timer based resignal, the PSB associations are checked for the SRLG and admin group constraints using the updated information provided by CSPF for the current path and new path of the bypass LSP.

## Parameters

### *lsp bypass-lsp-name [force]*

Specifies the name of the dynamic or manual bypass LSP. The force option is required when the name corresponds to a manual bypass LSP and the LSP has PSB associations.

### *delay minutes*

Specifies the time, in minutes, MPLS waits before attempting to re-signal dynamic bypass LSP paths originated on the system.

**Values** 0 to 30

tools dump nat isa resources

## Description

This command dumps ISA resources for an MDA, ESA VM, NAT group, or redundancy utilization.

## Parameters

### *mda-id*

Specifies the card and slot identifying a provisioned ISA.

### Values

<i>mda-id:</i>	<i>slot [xiom/]mda</i>
	slot
	1 to 2 (7750 SR-2s)
	1 to 5 (7750 SR-7)
	1 to 6 (7750 SR-14s)
	1 to 10 (7450 ESS, 7750 SR-12)
	1 to 14 (VSR)
	1 to 20 (VSR)
	xiom
	x1 to x2
	mda
	1 to 2 (7450 ESS, 7750 SR-1, SR-2s, SR-7, SR-12, SR-14s)
	1 to 4 (VSR)

**nat-group-id**

Specifies the NAT group ID.

**Values** 1 to 4 (7450 ESS, 7750 SR-1, SR-2s, SR-7, SR-12, SR-14s, VSR)  
 1 to 8 (7750 SR-12)  
 1 to 15 (VSR)

**vapp-id**

Specifies the ID of the configured ESA and ESA VM.

**Values** *vapp-id:* *esa-id/vm-id*  
                   esa-id           1 to 16  
                   vm-id           1 to 4

**member-id**

Specifies the member ID.

**Values** 1 to 255

**redundancy-utilization**

Keyword that specifies redundancy utilization.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following output is an example of ISA NAT ESA-VM system resources.

## resources

### Syntax

**resources esa-vm** *vapp-id*

**resources mda** *mda-id*

### Context

[\[Tree\]](#) (tools>dump>wlan-gw>isa resources)

## Full Context

tools dump wlan-gw isa resources

## Description

This command dumps ISA resources for an MDA or ESA VM.

## Parameters

### *mda-id*

Specifies the card and slot identifying a provisioned ISA.

Values	<i>mda-id:</i>	<i>slot [xiom]/mda</i>
	slot	1 to 2 (7750 SR-2s) 1 to 5 (7750 SR-7) 1 to 6 (7750 SR-14s) 1 to 10 (7450 ESS, 7750 SR-12) 1 to 14 (VSR) 1 to 20 (VSR)
	xiom	x1 to x2
	mda	1 to 2 (7450 ESS, 7750 SR-1, SR-2s, SR-7, SR-12, SR-14s) 1 to 4 (VSR)

### *vapp-id*

Specifies the ID of the configured ESA and ESA VM.

Values	<i>vapp-id:</i>	<i>esa-id/vm-id</i>
	esa-id	1 to 16
	vm-id	1 to 4

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of ISA WLAN gateway system resources.

### Output Example

```
# tools dump wlan-gw isa resources mda 3/1
=====
ISA WLAN Gateway Group 1 Member 1
```

```

#### Syntax

**retailers**

#### Context

[\[Tree\]](#) (show>service>id retailers)

#### Full Context

show service id retailers

#### Description

This command displays service retailer information.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of service retailer information.

#### Output Example

```
*A:ALA-48>config# show service id 101 retailers
=====
Retailers for service 101
=====
Retailer Svc ID           Num Static Hosts      Num Dynamic Hosts
-----
102                       3                     1
105                       0                     1
-----
Number of retailers : 2
=====
*A:ALA-48>config#
```

## 25.37 revert

### revert

#### Syntax

**revert** [*isp isp-name*]

## Context

[\[Tree\]](#) (tools>perform>router>mpls revert)

## Full Context

tools perform router mpls revert

## Description

Use this command to cause a named LSP, which is currently using a secondary path and for which the revert-timer has been configured, to switch back to using the primary path. Any outstanding revert-timer is canceled.

The primary path must be up for this command to be successful.

## Parameters

### *lsp-name*

Specifies an existing LSP name, up to 64 characters in length.

## Platforms

All

## 25.38 rib-api

rib-api

## Syntax

rib-api

## Context

[\[Tree\]](#) (show>router rib-api)

## Full Context

show router rib-api

## Description

This command displays RIB-API protocol entities information.

## Platforms

All

## rib-api

### Syntax

**rib-api**

### Context

[\[Tree\]](#) (clear>router rib-api)

### Full Context

clear router rib-api

### Description

This command clears RIB-API protocol entities information.

### Platforms

## 25.39 ring

ring

## Syntax

**ring peer** *ip-address* **ring** *sync-tag*

## Context

[\[Tree\]](#) (clear>redundancy>multi-chassis>mcr>statistics ring)

## Full Context

clear redundancy multi-chassis mc-ring statistics ring

## Description

This command clears multi-chassis ring statistics.

## Parameters

### *ip-address*

Clears ring statistics for the specified IP address.

- Values**
- ipv4-address: a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x – [0 to FFFF] H
    - d – [0 to 255] D

### *sync-tag*

Clears ring statistics for the specified sync tag. 32 characters maximum.

## Platforms

All

## 25.40 ring-node

### ring-node

#### Syntax

**ring-node peer** *ip-address* **ring sync-tag node** *ring-node-name*

#### Context

[\[Tree\]](#) (clear>redundancy>multi-chassis>mcr>statistics ring-node)

#### Full Context

clear redundancy multi-chassis mc-ring statistics ring-node

#### Description

This command clears multi-chassis ring statistics.

#### Parameters

##### *ip-address*

Clears ring-node peer statistics for the specified IP address.

- Values**
- ipv4-address: a.b.c.d
  - ipv6-address:
    - x:x:x:x:x:x:x (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d
    - x – [0 to FFFF] H
    - d – [0 to 255] D

##### *sync-tag*

Clears ring-node peer statistics for the specified synchronization tag. The tag can be up to 32 characters.

##### *ring-node-name*

Clears ring-node peer statistics for the specified ring node name. The ring node name can be up to 32 characters.

## Platforms

All

## 25.41 ring-nodes

### ring-nodes

#### Syntax

## 25.46 root-objects

### root-objects

#### Syntax

**root-objects**

#### Context

[\[Tree\]](#) (show>service>dynsvc root-objects)

#### Full Context

show service dynamic-services root-objects

#### Description

This command displays the root objects created by dynamic data services.

**Note:**

This command is not available in the MD-CLI.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

#### Output

The following output is an example of dynamic services root object information.

### Output Example

```
# show service dynamic-services root-objects
=====
Dynamic Service Root Objects
=====
OID prefix           : svcRowStatus
OID index            : .100000
Snippet name         : vprn
Snippet instance     : VRF-1
Orphan time          : N/A
-----
No. of Root Objects: 1
=====
```

Table 448: Output fields: root objects describes the Root Objects fields.

Table 448: Output fields: root objects

Output field	Description
OID prefix	The corresponding SNMP OID prefix for this root object.
OID index	The corresponding SNMP OID index for this root object.
Snippet name	The name of the python function that created this root object. The name is set to N/A when the root-object is orphaned.
Snippet instance	The instance for which the python function with "Snippet name" created this root object. If the snippet is a result from a dynamic reference, then the snippet instance is the reference-id string passed in the dyn.reference(). If the snippet is not the result from a dynamic reference, then the snippet instance is the dynamic data service SAP-ID. The instance is set to N/A when the root object is orphaned.
Orphan time	The timestamp when the root-object became orphaned (root-object not deleted when corresponding teardown function is called) or N/A if the root-object is not orphaned.

## 25.47 route

### route

#### Syntax

**route** [family] [ip-prefix/prefix-length] [detail]

**route next-hop** {ip-address | ipv6-address} [detail]

## Context

[\[Tree\]](#) (show>router>rib-api route)

## Full Context

show router rib-api route

## Description

This command displays RIB-API route information.

## Parameters

### family

Specifies the IPv4 or IPv6 address route family.

**Values**    ipv4, ipv6

### ip-prefix/prefix-length

Displays RIB-API route entries only matching the specified IP prefix and length.

#### Values

ipv4-prefix:        a.b.c.d (host bits must be 0)

ipv4-prefix-length 0 to 32

ipv6-prefix:        x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x:                    [0 to FFFF]H

d:                    [0 to 255]D

ipv6-prefix-length: 0 to 128

### detail

Displays detailed RIB-API route information.

### ip-address

Specifies the next-hop IPv4 address of the RIB-API route.

#### Values

ipv4-address: a.b.c.d

### ipv6-address

Specifies the next-hop IPv6 address of the RIB-API route.

#### Values

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x:                    [0 to FFFF]H

d:

[0 to 255]D

Table 449: Output fields: RIB-API route

Label	Description
Family	The route family: <ul style="list-style-type: none"> <li>• ipv4</li> <li>• ipv6</li> </ul>
Prefix	The IP prefix for the route RTM entry
Rib-API Pref	The RIB-API preference opposing to the routes from different clients with the same prefix
Client IP	The IP address of the gRPC client that configured the RIB-API route entry
Act	The boolean (YES or NO) that indicates whether the status of the RIB-API route in RTM is active or not
Next Hop	The next-hop IP address of the RIB-API route entry
No. of Rib-API Routes	The total number of the displayed RIB-API routes
Client Tag	The client tag unique identifier assigned to each gRPC connection by the gRPC server
Stale client	The stale client (Y or N) that indicates if the route is from a disconnected gRPC client
Metric	The metric of the route
RTM Preference	The RTM preference opposing to the routes having the same prefix from different protocols (BGP, OSPF)
Last Updated	The time stamp of when the route was added or modified from a gRPC client
Nexthop	The next-hop IP address of the RIB-API route entry
Active In RTM	The boolean (Y or N) that indicates whether the status of the RIB-API route is active or not in RTM
Inactive Reason	The inactive reason or the route not active in RTM

## 25.48 route-downloader

### route-downloader

#### Syntax

```
route-downloader route-downloader-name [router router-instance | service-name service-name] [family family]
```

#### Context

[\[Tree\]](#) (clear>aaa route-downloader)

#### Full Context

```
clear aaa route-downloader
```

#### Description

This command clears all the radius-downloaded routes from the internal downloader cache (or protocol RIB/db) (and thus eventually from the RTM itself). The parameters **vprn** and/or **family** allow to restrict the deletion of those routes learned in a particular address family (IPv4 or IPv6) and/or a particular VPRN.

By default, all VPRNs and both IPv4 and IPv6 families are affected.

#### Note:

Clearing the internal protocol DB means the corresponding prefixes that were deleted should be removed from the RTM (and from any other exports) as well.

#### Parameters

##### ***route-downloader-name***

Specifies the route downloader name, up to 32 characters.

##### ***router-instance***

Specifies the router instance name (Base) or service ID.

##### ***service-name***

Specifies the configured service name for the routing instance, up to 64 characters

##### ***family***

Specifies to limit the removal of prefixes only belonging to the address family IPv4 or IPv6. Only these two values are accepted.

**Values**    ipv4, ipv6

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## route-downloader

## 25.50 route-table

### route-table

#### Syntax

**route-table** [*family*] [*ip-prefix[/prefix-length]*] [**longer** | **exact** | **protocol** *protocol-name*] [**instance** *instance-id*] [**all**] [**next-hop-type** *type*] [**qos**] [**alternative**] [**accounting-class**]

**route-table** [*family*] [**summary**]

**route-table** *tunnel-endpoints* [*ip-prefix* *[/prefix-length]*] [**longer** | **exact**] [**detail**]

**route-table** [*family*] [*ip-prefix[/prefix-length]*] [**longer** | **exact** | **protocol** *protocol-name*] [**instance** *instance-id*] [**extensive** [**all**]]

#### Context

[\[Tree\]](#) (show>router route-table)

#### Full Context

show router route-table

## Description

This command displays the active routes in the routing table.

If no command line arguments are specified, all routes are displayed, sorted by prefix.

## Parameters

### *family*

Displays the specified family.

**Values** ipv4, ipv6, mcast-ipv4, mcast-ipv6

### *ip-prefix[/prefix-length]*

Displays routes only matching the specified *ip-prefix* and optional *mask*.

**Values** ipv4-prefix: a.b.c.d (host bits must be 0)

ipv4-prefix-le: 0 to 32

ipv6-prefix:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

ipv6-prefix-le: 0 to 128

### *longer*

Displays routes matching the *ip-prefix/mask* and routes with longer masks.

### *exact*

Displays the exact route matching the *ip-prefix/mask*.

### *protocol-name*

Displays routes learned from the specified protocol.

**Values** aggregate, arp-nd, bgp, bgp-label, bgp-vpn, dhcpv6-na, dhcpv6-pd, dhcpv6-pd-exc, dhcpv6-ta, evpn-iff, evpn-ift, host, ipsec, isis, ldp, local, managed, nat, nd-ra, ospf, ospf3, periodic, rib-api, rip, ripng, srv6, srv6-policy, static, sub-mgmt, video, vpn-leak

#### **Note:**

It is possible that a specific platform only supports a subset of the above protocol values.

### *instance-id*

Specifies the IGP instance of the route table.

**Values** For isis — 0 to 127

For ospf — 0 to 31

For ospfv3 —

- 0 to 31 (when ospfv3 is used for IPv6)

- 64 to 95 (when ospfv3 is used for IPv4)

**Note:**

It is possible that a specific platform only supports a subset of the above values.

**all**

Displays all routes, including inactive routes.

**type**

Displays only the tunneled next-hops. For each route entry, the tunnel owner and tunnel ID is shown.

**Values**    tunneled

**qos**

Displays QoS active routes in the routing table.

**alternative**

Displays LFS and backup route details.

**accounting-class**

Displays accounting class information.

**Note:**

Not all platforms support this parameter.

**summary**

Displays route table summary information.

**tunnel-endpoints**

Displays tunnel endpoint information.

**extensive**

Displays detailed information.

**Platforms**

All

**Output**

The following output are examples of route table information, and [Table 450: Output fields: route table](#) describes the output fields.

**Output Example Standard Route Table Information**

The following output shows standard route table information.

Table 450: Output fields: route table

Label	Description
Dest Address	The route destination address and mask

Label	Description
Next Hop [Interface Name]	The next hop interface name
Next Hop	The next hop IP address for the route destination
Type	Local — The route is a local route Remote — The route is a remote route
Protocol	The protocol through which the route was learned
Age	The route age in seconds for the route
Metric	The route metric value for the route
Pref	The route preference value for the route
No. of Routes	The number of routes displayed in the list

### Output Example NAT

The following output is an example showing that NAT routes are visible in the routing table.

```
*A:Dut-C# /show router 101 route-table

## 25.51 route-target

### route-target

#### Syntax

```
route-target [source-as as-number] [brief] [ aspath-regex reg-exp] [community comm-id]  
route-target [rtc-prefix rtc-prefix] [hunt] [ brief] [aspath-regex reg-exp] [ community comm-id]  
route-target rtc-prefix rtc-prefix [aspath-regex reg-exp] [community comm-id]  
route-target [rtc-prefix rtc-prefix] [detail | longer] [aspath-regex reg-exp] [community comm-id]
```

#### Context

[\[Tree\]](#) (show>router>bgp>routes route-target)

#### Full Context

```
show router bgp routes route-target
```

#### Description

This command displays BGP route target routes.

#### Parameters

##### *as-number*

Specifies the source AS number.

**Values** 0 to 4294967295

##### *rtc-prefix*

Filters the route-target constraint routes to include only those routes matching a specific NLRI string.

**Values** *source-as*: {*ip-addr.comm-val* | *2byte-asnumber.ext-comm-val* | *4byte-asnumber.comm-val*}/*prefix-length*

*ip-addr*: a.b.c.d

*comm-val*: 0 to 65535

*2byte-asnumber*: 0 to 65535

*ext-comm-val*: 0 to 4294967295

*4byte-asnumber*: 0 to 4294967295

*prefix-length*: 0 to 96

**detail**

Displays detailed information.

**longer**

Displays the specified route and subsets of the route.

**reg-exp**

Displays routes matching the specified regular expression, up to 80 characters.

**comm-id**

Specifies the community ID, up to 72 characters.

**Values** `[as-num:comm-val | ext-comm | well-known-comm | large-comm]`

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:

- *{target | origin}:ip-address:comm-val*
- *{target | origin}:asnum:ext-comm-val*
- *{target | origin}:ext-asnum:comm-val*
- **bandwidth:asnum:val-in-mbps**
- **ext:4300:ovstate**
- **ext:value1:value2**
- **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383

- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

router

### Syntax

**router** [*router-instance*]

**router service-name** *service-name*

### Context

[\[Tree\]](#) (show router)

### Full Context

show router

### Description

Commands in this context display various types of information for the specified router instance.

### Parameters

#### ***router-instance***

specifies the router name, CPM router instance, or VPRN service ID.

#### **Values**

*router-instance* : *router name* | *vprn-svc-id*

*router-name*      Base | management | *cpm-vr-name* |  
vpls-management

*cpm-vr-name*      [32 characters maximum]

*vprn-svc-id*      [1..2147483647]

**Default**      Base

#### ***service-name***

specifies the service name, up to 64 characters.

## Platforms

## router

### Syntax

```
router [router-instance]
router service-name service-name
```

### Context

[\[Tree\]](#) (tools>dump router)

### Full Context

tools dump router

### Description

This command dumps tools for the router instance.

### Parameters

#### ***router-instance***

Specifies the router name or service ID used to identify the router instance.

#### **Values**

router-name   vprn-svc-id	
router-name	Base   Management   <i>cpm-vr-name</i>   vpls-management Default: Base
vprn-svc-id	1 to 2147483647
cpm-vr-name	32 chars max

#### ***service-name***

Specifies the service name used to identify the router instance. 64 characters maximum.

### Platforms

All

## router

### Syntax

```
router [router-instance]
```

**router service-name** *service-name*

### Context

[\[Tree\]](#) (clear router)

### Full Context

clear router

### Description

Clear router commands affect the router instance in which they are entered.

### Parameters

#### ***router-instance***

Specifies the router name or service ID used to identify the router instance.

#### **Values**

router-name | vprn-svc-id

router-name                      Base | Management | *cpm-vr-name* | vpls-management

Default: Base

vprn-svc-id                        1 to 2147483647

cpm-vr-name                        32 chars max

#### ***service-name***

Specifies the service name used to identify the router instance. 64 characters maximum.

### Platforms

### Description

Commands in this context clear router advertisement information.

### Platforms

7450 ESS-7, 7750 SR-1, 7750 SR-7, 7750 SR-1e, 7750 SR-2e, 7750 SR-s

## router-advertisement

### Syntax

```
router-advertisement all
router-advertisement interface interface-name
```

### Context

[\[Tree\]](#) (clear>router router-advertisement)

### Full Context

```
clear router router-advertisement
```

### Description

This command clears all router advertisement counters.

### Parameters

**all**

Clears all router advertisement counters for all interfaces.

***interface-name***

Clears router advertisement counters for the specified interface.

### Platforms

All

## router-advertisement

### Syntax

```
router-advertisement
router-advertisement routes
```

### Context

[\[Tree\]](#) (show>router>autoconfigure router-advertisement)

### Full Context

```
show router autoconfigure router-advertisement
```

### Description

This command displays router advertisement information.

## Parameters

### routes

Displays routes received from router advertisements.

## Platforms

7450 ESS-7, 7750 SR-1, 7750 SR-7, 7750 SR-1e, 7750 SR-2e, 7750 SR-s

## 25.54 router-advertisement-policy

### router-advertisement-policy

## Syntax

**router-advertisement-policy** [*name*]

## Context

[\[Tree\]](#) (show>subscr-mgmt router-advertisement-policy)

## Full Context

show subscriber-mgmt router-advertisement-policy

## Description

This command displays IPv6 router advertisement policy information.

## Parameters

### *name*

Specifies the router advertisement policy name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.55 routes

### routes

## Syntax

**routes**

## Context

[\[Tree\]](#) (show>service>id>spb routes)

## Full Context

show service id spb routes

## Description

This command displays SPB route information.

## Platforms

All

## Output

The following output is an example of service SPB route information.

### Output Example

```
*A:Dut-A# show service id 100001 spb routes

## Context

[\[Tree\]](#) (show>router>bgp routes)

## Full Context

```
show router bgp routes
```

## Description

This command displays routes in the BGP Routing Information Base (RIB). When this command is issued without any command options, the output displays all learned BGP routes belonging to the IPv4 address family. When this command is issued with other parameters, the output can display a narrower or wider set of routes, including routes belonging to other address families.

## Parameters

### **bgp-ls**

Displays BGP-LS routes.

### **bgp-ls ipv4-prefix**

Displays BGP-LS IPv4-prefix NLRI routes.

### **bgp-ls link**

Displays BGP-LS link NLRI routes.

### **bgp-ls node**

Displays BGP-LS node NLRI routes.

### **evpn auto-disc**

Displays EVPN autodiscovery routes.

### **evpn eth-seg**

Displays EVPN Ethernet Segment (ES) routes.

### **evpn incl-mcast**

Displays EVPN IMET routes.

### **evpn ip-prefix**

Displays EVPN IP prefix routes (type 5).

### **evpn ipv6-prefix**

Displays EVPN IPv6 prefix routes (type 5).

### **evpn mac**

Displays EVPN MAC routes (type 2).

### **evpn mcast-join-synch**

Displays EVPN multicast join sync routes.

### **evpn mcast-join-leave**

Displays EVPN multicast join leave routes.

### **evpn smet**

Displays EVPN SMET routes.

### **flow-ipv4**

Displays IPv4 flow-spec routes.

### **flow-ipv6**

Displays IPv6 flow-spec routes.

**ipv4**

Displays unlabeled unicast IPv4 routes.

**ipv6**

Displays unlabeled unicast IPv6 routes.

**I2-vpn**

Displays BGP-VPLS, BGP-VPWS, BGP multihoming and BGP-AD routes (or some subset).

**label-ipv4**

Displays labeled unicast IPv4 routes (AFI1, SAFI4).

**label-ipv6**

Displays labeled unicast IPv6 routes (AFI2, SAFI4).

**mcast-ipv4**

Displays multicast IPv4 routes (AFI1, SAFI2).

**mcast-ipv6**

Displays multicast IPv6 routes (AFI2, SAFI2).

**mcast-vpn-ipv4**

Displays multicast VPN IPv4 routes.

**mcast-vpn-ipv6**

Displays multicast VPN IPv6 routes.

**mdt-safi**

Displays MVPN MDT SAFI routes.

**ms-pw**

Displays multisegment pseudowire routes.

**mvpn-ipv4**

Displays MVPN IPv4 routes.

**mvpn-ipv6**

Displays MVPN IPv6 routes.

**route-target**

Displays RT constraint routes.

**sr-policy-ipv4**

Displays BGP segment routing policy routes (IPv4 endpoint).

**sr-policy-ipv6**

Displays BGP segment routing policy routes (IPv6 endpoint).

**vpn-ipv4**

Displays unicast IPv4 VPN routes (AFI1, SAFI128).

**vpn-ipv6**

Displays unicast IPv6 VPN routes (AFI2, SAFI128).

**brief**

Displays summary information about the BGP routes.

**detail**

Displays detailed information about the BGP routes, including information about the original path attribute values.

**hunt**

Displays detailed information about the BGP routes, including information about the advertised routes (RIB-OUT).

**longer**

When used within a command that also provides a specific IP prefix value, this filters the output to include all routes that match the prefix with the same or a longer prefix length.

**as-path-regex**

Filters the BGP routes to include only those routes with an AS path matching the specified regular expression.

**community**

Filters the BGP routes to include only those routes with a community value matching the specified value.

**all**

Includes active routes of other (non-BGP) protocols that BGP has imported into its RIB.

**leakable**

Filters the BGP routes to include only those routes that have been marked as leakable to other BGP instances (by means of a BGP import policy).

**leaked**

Filters the BGP routes to include only those routes that have been leaked from other BGP instances (by means of a leak-import policy).

**original-val**

Filters the BGP routes to include only those routes that have a specific RPKI route origin validation state (Not-Found, Valid, Invalid).

**esi**

Filters the BGP EVPN routes to include only those routes with a specific Ethernet Segment identifier value.

**next-hop**

Filters the BGP EVPN routes to include only those routes with a specific BGP next-hop address.

**rd**

Filters the BGP routes to include only those routes with a specific route distinguisher value.

**tag**

Filters the BGP EVPN routes to include only those routes with a specific administrative tag value.

**originator-ip**

Filters the BGP EVPN or MVPN routes to include only those routes with a specific originator IP address (in the NLRI).

**prefix**

Filters the BGP type 5 EVPN routes to include only those routes with a specific IPv4 or IPv6 prefix.

**mac-address**

Filters the BGP type 2 EVPN routes to include only those routes that have a specific MAC address.

**grp-address**

Filters the MDT-SAFI routes to include only those routes matching a specific multicast group address.

**source-as**

Filters the MVPN or RT-constraint routes to include only those routes matching a specific source AS number (in the NLRI).

**source-ip**

Filters the multicast routes to include only those routes matching a specific source address.

**group-ip**

Filters the MVPN routes to include only those routes matching a specific group address.

**type**

Filters the MVPN routes based on type (intra-ad, inter-ad, spmsi-ad, leaf-ad, source-ad, shared-join, source-join).

**aii-type2**

Filters the MS-PW routes based on All type 2 value.

**offset**

Filters BGP-VPLS routes based on offset value.

**siteid**

Filters BGP multihoming routes based on the site ID value.

**veid**

Filters BGP-VPLS routes based on VEID value.

**rtc-prefix**

Filters the RT-constraint routes to include only those routes matching a specific NLRI string (formatted as *source-as:route-target/prefix-length*).

**color**

Filters the SR policy routes to include only those routes matching a specific color value.

**endpoint**

Filters the SR policy routes to include only those routes matching a specific endpoint address.

**mvpn-type**

Specifies the MVPN type.

**Values** intra-ad, inter-ad, spmsi-ad, leaf-ad, source-ad, shared-join, and source-join.

### ***ip-prefix***

Specifies an IP prefix to match. For some address families this parameter has no meaning and should be omitted.

**Values** ip-address: a.b.c.d  
ipv4-prefix: a.b.c.d  
ipv4-prefix-length: [0 to 32]  
ipv6-prefix [/pref\* ipv6-prefix]:

- x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

prefix-length: [0 to 128]

### ***reg-exp***

An AS path regular expression to match routes based on their AS path attribute *reg-exp*, up to 80 characters.

### ***comm-id***

Specifies a community value, up to 72 characters.

**Values** [as-num:comm-val | ext-comm | well-known-comm]

where

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:

- {*target* | *origin*}:ip-address:comm-val
- {*target* | *origin*}:asnum:ext-comm-val
- {*target* | *origin*}:ext-asnum:comm-val
- **bandwidth**:asnum:val-in-mbps
- **ext:4300**:ovstate
- **ext** \t:value1:value2
- **flowspec-set**:ext-asnum:group-id

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth

- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**

### ***rd***

Specifies a route distinguisher value.

**Values** ip-addr:comm-va  
2byte-asnumber:ext-comm-val  
4byte-asnumber:comm-val}

### ***veid***

Specifies a two-byte identifier that represents the local bridging instance in a VPLS and is advertised through the BGP NLRI. This value must be lower than or equal to the max-ve-id.

**Values** 0 to 4294967295

### ***vpls-base-offset***

Specifies a two-byte identifier advertised through the NLRI that is used to indicate which VE-ID should use the advertised NLRI at the receiving PE according to the following rule: if the offset <= local VE-ID <= offset + VBS - 1 (VBS = virtual block size = 8 in our implementation), then the NLRI is processed. Otherwise, it is ignored. The NLRI with this offset is generated as soon as the first VE-ID value between (offset, offset + VBS - 1) is advertised in the network.

**Values** 0 to 4294967295

### ***site-id***

Specifies a two-byte identifier usually employed for the BGP multihoming solution. It identifies the BGP multihoming site associated with one or a set of objects (SAPs, pseudowires or combination). The site-id must be identical between the two PEs carrying the connection to the access device multihomed to the PEs.

**Values** 0 to 4294967295

### ***l2vpn-type***

Specifies a 12-byte Virtual Switch Instance identifier (VSI-ID) type.

**Values** bgp-ad, bgp-vpls, bgp-vpws, and multi-homing

### ***rtc-prefix***

*source-as:{ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val}/prefix-length*

**Values** *ip-addr:* a.b.c.d  
*comm-val:* 0 to 65535  
*2byte-asnumber:* 0 to 65535  
*ext-comm-val:* 0 to 4294967295  
*4byte-asnumber:* 0 to 4294967295  
*prefix-length:* 0 to 96

### ***origin-val***

Filters the BGP routes displayed by the command to those routes with a particular RPKI route origin validation state.

**Values** *valid* — Displays valid validation state information.  
*invalid* — Displays invalid validation state information.  
*notfound* — Displays state information for not found origin values.

## **Platforms**

All

## **Output**

The following outputs are examples of BGP route information, and [Table 451: Output fields: BGP routes](#) describes the output fields:

Table 451: Output fields: BGP routes

Label	Description
Add Paths Send	The local BGP router ID
Aggregator	The aggregator attribute value none — Aggregator attributes are not present
Aggregator AS	The aggregator AS value

Label	Description
	none — Aggregator AS attributes are not present
AIGP Metric	The Accumulated IGP metric
All-Type2/Preflen	The FEC 129 All Type 2/preference length
AS	The configured Autonomous System (AS) number
AS-Path	The BGP AS path attribute
Atomic Aggr.	Atomic — The atomic aggregator flag is set Not Atomic — The atomic aggregator flag is not set
AttrSet	The attribute set
AttrSet OriginAS	The attribute set origin AS
BGP Router ID	The local BGP router ID
BSID/Pref/TunnType	The binding SID (BSID), preference, and tunnel type
Cluster	The route reflector cluster list
Community	The BGP community attribute list
Connector	The connector attribute value
DB Orig Val	The database RPKI route origin validation state
Dest Class	The destination class
D-Path	The D-Path
ESI	The Ethernet Segment Identifier
EVPN type	The Ethernet VPN route type
Extended Tunne* (Extended Tunnel ID)	The extended tunnel ID
Final Orig Val	The final RPKI route origin validation state
Flag	The flag is set to one of the following: <ul style="list-style-type: none"> <li>• u — used</li> <li>• s — suppressed</li> <li>• h — history</li> <li>• d — decayed</li> <li>• * — valid</li> <li>• i — igp</li> <li>• e — egp</li> </ul>

Label	Description
	<ul style="list-style-type: none"> <li>• ? — incomplete</li> <li>• &gt; — best</li> <li>• S — sticky</li> </ul>
From	The IP address of the advertising BGP neighbor
Fwd Class	The forwarding class
Gateway Address	The gateway address
GroupIP/Group IP	The group IP address
Identifier	The service access (SAP) points
IGP Cost	The Interior Gateway Protocol (IGP) cost for the route
Interface Name	The name of the interface
Last Modified	The time elapsed since the next hop was modified
Local AS	The configured local AS setting If not configured, the value is the same as the AS
Local Pref.	The local preference value This value is used if the BGP route arrives from a BGP peer without the Local Pref attribute set. It is overridden by any value set via a route policy
MED	The MED metric value none — MED metrics are present
MPLS Label	The MPLS label
Neighbor-AS	The neighbor AS
Network	The IP prefix and mask length
Nexthop	The BGP next hop
Originator Id	The originator ID path attribute value none — The originator ID attribute is not present
OriginatorIP/Originator IP	The originator IP
OSPFLevel	The Open Shortest Path First (OSPF) level
P2MP-ID	The Internal identifier of point-to-multipoint LSP
Path Id	The path ID

Label	Description
Peer Router Id	The router ID of the advertising router
PMSI Tunnel Attribute	The P-Multicast Service Interface (PMSI) tunnel attribute
Prefix	The number of interfaces on the nodes on which BGP is enabled
Priority	The priority of the BGP route
Protocol	The protocol
RD	The Route Distinguisher (RD)
RD/Color/End Point RD/Color/End Pt	The RD, color, and end point
Res. Nexthop	The resolved next hop
RIB Priority	The Routing Information Base (RIB) priority
Route Dist.	The route distinguisher identifier attached to routes that distinguishes the VPN to which it belongs
Route Source	The route source
Route Tag	The route tag of the entry
Route Type	The route type
Source Class	The source class
SourceAS/Source AS	The source AS
SourceIP/Source IP	The source IP
Tag	The tag information
TieBreakReason	<p>The step in the BGP decision process where a BGP route lost the tiebreak with the next better BGP route for the same prefix</p> <p>LocalPref — This route is not the best because the next better route has a higher LOCAL_PREF</p> <p>AIGP — This route is not the best because the next better route has a lower derived AIGP metric value</p> <p>ASPathLen — This route is not the best because the next better route has a shorter AS PATH length</p> <p>Origin — This route is not the best because the next better route has a lower origin value</p> <p>MED — This route is not the best because the next better route has a lower MED, and MED comparison of the routes was allowed</p>

Label	Description
	IBGP — This IBGP route is not the best because the next better route is an EBGP route NHCost — This route is not the best because the next better route has a lower metric value to reach the BGP NEXT HOP BGPID — This route is not the best because the next better route has a lower Originator ID or BGP Identifier ClusterLen — This route is not the best because the next better route has a shorter cluster list length PeerIP — This route is not the best because the next better route has a lower neighbor IP address
Tunnel-ID	The tunnel ID
Tunnel-type	The tunnel type
Type	The type
VPN Label	The label generated by the PEs label manager
VPRN Imported	The VPRNs where a particular BGP-VPN received route has been imported and installed
Attributes	
Flags	The flags of the BGP-LS route
IGP Metric	The IGP metric
Admin-Grp	The admin group
Maximum Link BW (kbps)	The maximum link bandwidth (BW)
Maximum Reservable BW (kbps)	The maximum reservable bandwidth (BW)
TE Default Metric	The Traffic Engineering (TE) default metric
Unreserved BW (kbps)	The unreserved bandwidth (BW)
Descriptor	
IPv4 Address	The IPv4 address of the descriptor
Link descriptor	
IPV4 Interface Addr	The IPv4 interface address
IPV4 Neighbor Addr	The IPv4 neighbor address
Link State Attribute TLVs	

Label	Description
Administrative group (color)	The administrative group color
Maximum link bandwidth	The maximum link bandwidth
Max. reservable link bandwidth	The maximum reservable link bandwidth
Unreserved bandwidth0	The unreserved bandwidth0
Unreserved bandwidth1	The unreserved bandwidth1
Unreserved bandwidth2	The unreserved bandwidth2
Unreserved bandwidth3	The unreserved bandwidth3
Unreserved bandwidth4	The unreserved bandwidth4
Unreserved bandwidth5	The unreserved bandwidth5
Unreserved bandwidth6	The unreserved bandwidth6
Unreserved bandwidth7	The unreserved bandwidth7
TE Default Metric	The traffic engineering (TE) default
IGP Metric	The IGP metric
Adjacency Segment Identifier (Adj-SID)	The Adjacency Segment Identifier (Adj-SID)
Local Node	
Name	The name of the local node
Autonomous System	The Autonomous System
Area ID	The area ID
Rtr ID	The router ID
Flags	The flags in the detailed output display additional information about BGP routes

Label	Description
Local Node descriptor	
Autonomous System	The Autonomous System
Link State Id	The link-state ID
IGP Router Id	The IGP router
Prefix descriptor	
IPv4 Address	The IPv4 address
Prefix-len	The prefix length
MT_ID	The multitopology ID
Route Type	The route type
Remote Node	
Name	The remote node name
Autonomous System	The Autonomous System
Area ID	The area ID
Rtr ID	The router ID
Remote Node descriptor	
Autonomous System	The Autonomous System
Link State Id	The link-state ID
IGP Router Id	The Interior Gateway Protocol (IGP) ID

## routes

### Syntax

**routes** [**ipv4-unicast** | **ipv6-unicast** | **ipv4-multicast** | **ipv6-multicast** | **mt** *mt-id-number*] [*ip-prefix*[/*prefix-length*]] [**alternative**] [**exclude-shortcut**] [**flex-algo** {*flex-algo-id* | **all**}] [**status** {**reachable** | **unreachable**}] [**detail**]

### Context

[\[Tree\]](#) (show>router>isis routes)

### Full Context

show router isis routes

## Description

This command displays the routes in the IS-IS route table.

## Parameters

### **ipv4-unicast**

Displays IPv4 unicast parameters.

### **ipv6-unicast**
