Children of the parent scheduler with a lower strict priority will not receive bandwidth until all children with a higher strict priority have either reached their maximum bandwidth or are idle. Children with the same strict level are serviced relative to their weights.

Values 1 to 8

Default 1

cir-weight *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 100

Default 1

cir-level ***cir-level***

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 8 (8 is the highest priority)

Default 0

no parent

Context

[Tree] (config>qos>scheduler-policy>tier>scheduler parent)

Full Context

configure qos scheduler-policy tier scheduler parent

Description

This command defines an optional parent scheduler that is higher up the policy hierarchy. Only schedulers in tier levels 2 and 3 can have a parental association. When multiple schedulers, policers (at egress only), and/or queues share a child status with the scheduler on the parent, the weight or strict parameters define how this scheduler contends with the other children for the parent's bandwidth. The parent scheduler can be removed or changed at any time and is immediately reflected on the schedulers created by association of this scheduler policy.

When a parent scheduler is defined without specifying weight or strict parameters, the default bandwidth access method is weight with a value of 1.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and returns without an error. When a parent

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

association has been removed, the former child scheduler attempts to operate based on its configured rate parameter. Removing the parent association on the scheduler within the policy will take effect immediately on all schedulers with *scheduler-name* that have been created using the *scheduler-policy-name*.

Parameters

scheduler-name

Specifies a scheduler name. The *scheduler-name* must already exist within the context of the scheduler policy in a tier that is higher (numerically lower).

Values Any valid *scheduler-name* existing on a higher tier within the scheduler policy.

weight *weight*

Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same strict level defined by the **level** parameter. Within the level, all weight values from active children at that level are summed and the ratio of each active child's weight to the total is used to distribute the available bandwidth at that level. A weight is considered to be active when the queue or scheduler the weight pertains to has not reached its maximum rate and still has packets to transmit.

A zero (0) weight value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict level.

Values 0 to 100

Default 1

level *level*

Specifies the strict priority level of this scheduler in comparison to other child schedulers and queues vying for bandwidth on the parent scheduler-name during the above-CIR distribution phase of bandwidth allocation. During the above-CIR distribution phase, any queues or schedulers defined at a lower strict level receive no parental bandwidth until all queues and schedulers defined with a higher (numerically larger) strict level on the parent have reached their maximum bandwidth or have satisfied their offered load requirements.

When the similar **cir-level** parameter default (undefined) are retained for the child scheduler, bandwidth is only allocated to the scheduler during the above-CIR distribution phase.

Children of the parent scheduler with a lower strict priority level will not receive bandwidth until all children with a higher strict priority level have either reached their maximum bandwidth or are idle. Children with the same strict level are serviced in relation to their relative weights.

Values 1 to 8

Default 1

cir-weight *cir-weight*

Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same **cir-level** defined by the **cir-level** parameter. Within the strict **cir-level**, all **cir-weight** values from active children at that level are summed and the ratio of each active child's **cir-weight** to the total is used to distribute the available bandwidth at that

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

level. A **cir-weight** is considered to be active when the queue or scheduler that the **cir-weight** pertains to has not reached the CIR and still has packets to transmit.

A zero (0) **cir-weight** value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict cir-level.

Values 0 to 100

Default 1

cir-level ***cir-level***

Specifies the strict priority CIR level of this scheduler in comparison to other child schedulers and queues vying for bandwidth on the parent *scheduler-name* during the within-CIR distribution phase of bandwidth allocation. During the within-CIR distribution phase, any queues or schedulers defined at a lower strict CIR level receive no parental bandwidth until all queues and schedulers defined with a higher (numerically larger) strict CIR level on the parent have reached their CIR bandwidth or have satisfied their offered load requirements.

If the scheduler's **cir-level** parameter retains the default (undefined) state, bandwidth is only allocated to the scheduler during the above-CIR distribution phase.

Children with the same strict cir-level are serviced according to their cir-weight.

Values 0 to 8

Default 0

Full Context

configure service customer multi-service-site ingress scheduler-override scheduler parent

configure service customer multi-service-site egress scheduler-override scheduler parent

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command overrides the scheduler's parent weight and CIR weight information. The weights apply to the associated level or cir-level configured in the applied scheduler policy. The scheduler name must exist in the scheduler policy applied to the ingress or egress of the SAP or multi-service site.

The override weights are ignored if the scheduler does not have a **parent** command configured in the scheduler policy. This allows the parent of the scheduler to be removed from the scheduler policy without having to remove all of the SAP/MSS overrides. If the parent scheduler does not exist causing the configured scheduler to be fostered on an egress port scheduler, the override weights will be ignored and the default values used; this avoids having non-default weightings for fostered schedulers.

The **no** form of the command returns the scheduler's parent weight and CIR weight to the value configured in the applied scheduler policy.

Default

no parent

Parameters

weight

Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same strict **level** defined by the level parameter in the applied scheduler policy. Within the level, all weight values from active children at that level are summed and the ratio of each active child's weight to the total is used to distribute the available bandwidth at that level. A weight is considered to be active when the policer, queue or scheduler the weight pertains to has not reached its maximum rate and still has packets to transmit. A 0 (zero) weight value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict level.

Values 0 to 100

Default 1

cir-weight

Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same *cir-level* defined by the **cir-level** parameter in the applied scheduler policy. Within the strict **cir-level**, all **cir-weight** values from active children at that level are summed and the ratio of each active child's **cir-weight** to the total is used to distribute the available bandwidth at that level. A **cir-weight** is considered to be active when the policer, queue or scheduler that the **cir-weight** pertains to has not reached the CIR and still has packets to transmit. A 0 (zero) **cir-weight** value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict cir-level.

33.44 parent-location

parent-location

Syntax

parent-location {**default** | **sla**}

no parent-location

Context

[Tree] (config>qos>sap-egress parent-location)

Full Context

configure qos sap-egress parent-location

Description

This command determines the expected location of the parent schedulers for queues configured with a parent command within the sap-egress policy. All parent schedulers must be configured within a scheduler-policy applied at the location corresponding to the parent-location parameter.

If a parent scheduler name does not exist at the specified location, the queue will not be parented and will be orphaned.

The **no** form of this command reverts to the default.

Default

parent-location default

Parameters

default

When the sap-egress policy is applied to an sla-profile for a subscriber, the parent schedulers of the queues need to be configured in the scheduler-policy applied to the subscriber's sub-profile.

When the sap-egress policy is applied to a SAP, the parent schedulers of the queues need to be configured in the scheduler-policy applied to the SAP or the multiservice site.

sla

When the sap-egress policy is applied to an sla-profile for a subscriber, the parent schedulers of the queues need to be configured in the scheduler-policy applied to the same sla-profile.

If this parameter is configured within a sap-egress policy that is applied to any object except of the egress of an sla-profile, the configured parent schedulers will not be found and so the queues will not be parented and will be orphaned. This parameter is not supported when **policers-hqos-manageable** is configured in the SAP egress QoS policy.

© 2025 Nokia.

parent-location

Syntax

parent-location {**none** | **sub** | **vport**}

no parent-location

Context

[Tree] (config>qos>scheduler-policy>tier parent-location)

Full Context

configure qos scheduler-policy tier parent-location

Description

This command determines the expected location of the parent schedulers for the tier 1 schedulers configured with a parent command within the scheduler-policy. The parent schedulers must be configured within a scheduler-policy applied at the location corresponding to the parent-location parameter.

If a parent scheduler name does not exist at the specified location, the schedulers will not be parented and will be orphaned.

The configuration of **parent-location** and **frame-based-accounting** in a scheduler policy is mutually exclusive in order to ensure consistency between the different scheduling levels.

The **no** form of this command reverts to the default.

Default

parent-location none

Parameters

none

This parameter indicates that the tier 1 schedulers do not have a parent scheduler and the configuration of the parent under a tier 1 scheduler is blocked. Conversely, this parameter is blocked when any tier 1 scheduler has a parent configured.

sub

When the scheduler-policy is applied to an sla-profile for a subscriber, the parent schedulers of the tier 1 schedulers need to be configured in the scheduler-policy applied to the subscriber's sub-profile.

If this parameter is configured within a scheduler-policy that is applied to any object except for the egress of an sla-profile, the configured parent schedulers will not be found and so the tier 1 schedulers will not be parented and will be orphaned.

vport

When the scheduler-policy is applied to an sla-profile, a sub-profile for a subscriber, or to the egress of a pseudowire SAP, the parent schedulers of the tier 1 schedulers need to

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

be configured in the scheduler-policy applied to the Vport to which the subscriber will be assigned.

If this parameter is configured within a scheduler-policy that is applied to any object except for the egress of an sla-profile or sub-profile, or to the egress of a PW SAP, the configured parent schedulers will not be found and so the tier 1 schedulers will not be parented and will be orphaned.

Full Context

configure qos hs-port-pool-policy alt-port-class-pools class-pool parent-mid-pool

configure qos hs-port-pool-policy std-port-class-pools class-pool parent-mid-pool

Description

This command creates the buffer allocation mapping between the associated class pool and the specified mid-pool. Use care when selecting a mid-pool in an active state (properly mapped to a root-pool with a non-zero allocation percentage). If a port-class pool is parented by an inactive mid-pool, the queues using the port-class pool are forced into an operational MBS setting of 0, causing all packet to be discarded. A port-class pool can be made inactive (no available buffers) by executing **parent-mid-pool none** in the port-class pool context.

The **no** form of the command reverts to the class-pool parenting value. For the standard port-class pools, this default is 1. For alternate port-class pools the default is none.

Default

alt-port-class-pools: none

std-port-class-pools: 1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

mid-pool-id

Specifies the mid-pool identifier in the HS pool policy. Either a valid mid-pool ID or **none** must be specified when executing the **parent-mid-pool** command. The *mid-pool-id* parameter defines the parent mid-pool to which the port-class is associated. The **none** keyword deactivates the port-class pool, causing the pool to have a zero size. A queue can still map to an inactive port-class pool although all packets are discarded by the queue.

configure service vprn dhcp6 local-dhcp-server pool failover partner-down-delay

configure service vprn dhcp6 local-dhcp-server failover partner-down-delay

configure service vprn dhcp local-dhcp-server pool failover partner-down-delay

Description

This command configures the partner down delay time. Since the DHCP lease synchronization failure can be caused by the failure of the intercommunication link (and not necessary the entire node), there is a possibility the redundant DHCP servers become isolated in the network. In other words, they can serve DHCP clients but they cannot synchronize the lease. This can lead to duplicate assignment of IP addresses, since the servers have configured overlapping IP address ranges but they are not aware of each other's leases.

The purpose of the partner down delay is to prevent the IP lease duplication during the intercommunication link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and to avoid duplication of IP addresses or prefixes during the failure.

During the partner-down-delay time, the prefix designated as remote is eligible only for renewals of the existing DHCP leases that have been synchronized by the peering node. Only after the sum of the partner-down-delay and the maximum-client-lead-time will the prefix designated as remote be eligible for delegation of the new DHCP leases. When this occurs, we say that the remote IP address range has been taken over.

It is possible to expedite the takeover of a remote IP address range so that the new IP leases can start being delegated from that range shortly after the intercommunication failure is detected. This can be achieved by configuring the partner-down-delay timer to 0 seconds, along with enabling the ignore-mclt-on-takeover CLI flag. Caution must be taken before enabling this functionality. It is safe to bypass safety timers (partner-down-delay + MCLT) only in cases where the operator is certain that the intercommunication between the nodes has failed due to the entire node failure and not due to the intercommunication (MCS) link failure. Failed intercommunication due to the nodal failure would ensure that only one node is present in the network for IP address delegation (as opposed to two isolated nodes with overlapping IP address ranges where address duplication can occur). For this reason, the operator must ensure that there are redundant paths between the nodes to ensure uninterrupted synchronization of DHCP leases.

In access-driven mode of operation, partner-down-delay has no effect.

The **no** form of this command reverts to the default.

Default

password

Description

This operational command changes the local user password.

This command is automatically invoked when a user logs in after the administrator uses the **new-password-at-login** command to force a new password, or the password has expired (**aging**). At this time, the user is prompted to enter the old password, new password, and then the new password again to verify the input.

If the user fails to create a new password, CLI access is denied.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A user cannot configure a nonconforming password using the global **password** command. In this case, the CLI displays an error message and the password change fails. To configure a password value that does not conform to the minimum length or other password complexity rules, use the **config>system>security>user>password** command (for example, executed by an administrator).

Platforms

All

password

Syntax

password {**ignore** | **chap** *password* | **pap** *password*} [**hash** | **hash2** | **custom**]

no password

Context

[Tree] (config>subscr-mgmt>loc-user-db>ppp>host password)

Full Context

configure subscriber-mgmt local-user-db ppp host password

Description

This command specifies a password type or configures password string for **pap** or **chap**. The pap and chap passwords are stored in a hashed format in the config files. The **hash|hash2** optional keywords are used for config execution.

This command will only be interpreted if the local user database is connected directly to the PPPoE node under the VPRN/IES group interface. It is not used if the local user database is accessed by a local DHCP server.

The **no** form of this command reverts to the default.

Parameters

ignore

Specifies that the password be ignored, in which case authentication is always succeed, independent of the password used by the PPPoE client. The client must still perform authentication.

chap *password*

Specifies that the password, up to 64 characters, for Challenge-Handshake Authentication Protocol) (CHAP) is used. Only a password received with the CHAP protocol is accepted.

pap *password*

Specifies that the Password Authentication Protocol (PAP) is used, up to 64 characters. Only a password received with the PAP protocol is accepted, even though the CHAP protocol is proposed to the client first because it is unknown at the time of the offer which password type is allowed to the client.

Description

This command configures the password between L2TP LAC and LNS

The **no** form of this command removes the password.

Default

no password

Parameters

password

Configures the password used for challenge/response calculation and AVP hiding. The maximum length is up to 20 characters if unhashed, 32 characters if hashed, 54 characters if the hash2 keyword is specified.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

Platforms

Description

This command configures the password to be used for RADIUS authentication of data-triggered dynamic services.

The **no** form of this command removes the password from the configuration.

Parameters

password

Specifies the password that is used in RADIUS authentication of a data-triggered dynamic service. The maximum length is 20 characters if unhashed, 32 characters if hashed, and 54 characters if the **hash2** keyword is specified.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

configure subscriber-mgmt authentication-policy password

Description

This command sets a password that is sent with **user-name** in every RADIUS authentication request sent to the RADIUS server upon receipt of DHCP discover or request messages. If no password is configured, no password AVP is sent.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command reverts to the default value.

Parameters

password

Specifies a text string containing the password. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

hash

Specifies that the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies that the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

configure li x-interfaces lics lic authentication password

Description

This command configures the password for the X1 and X2 interfaces.

The **no** form of this command reverts to the default.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

hex-string

Specifies the password. Must contain exactly 32 hex nibbles.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

password

Syntax

password [*password*]

Context

[Tree] (config>system>security>user password)

Full Context

configure system security user password

Description

This command configures the user password for console and FTP access.

The password is stored in an encrypted format in the configuration file when specified. Passwords should be encased in double quotes (" ") at the time of the password creation. The double quote character (") is not accepted inside a password. It is interpreted as the start or stop delimiter of a string.

The password can be entered as plain text or a hashed value. SR OS can distinguish between hashed passwords and plain text passwords and take the appropriate action to store the password correctly.

```
config>system>security>user# password testuser1
```

The password is hashed by default.

For example:

```
config>system>security# user testuser1
config>system>security>user$ password xyzabcd1
config>system>security>user# exit
```

```
config>system>security# info
----------------------------------
...
            user "testuser1"
                password "$2y$10$pFoehOg/tCbBMPDJ/
kqpu.8af0AoVGY2xsR7WFqyn5fVTnwRzGmOK"
            exit
...
----------------------------------
config>system>security#
```

The **password** command allows you also to enter the password as a hashed value.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For example:

```
config>system>security# user testuser1
config>system>security>user$ password "$2y$10$pFoehOg/tCbBMPDJ/
kqpu.8af0AoVGY2xsR7WFqyn5fVTnwRzGmOK"
config>system>security>user# exit
config>system>security# info
----------------------------------
...
user "testuser1"
password "$2y$10$pFoehOg/tCbBMPDJ/kqpu.8af0AoVGY2xsR7WFqyn5fVTnwRzGmOK"
exit
...
----------------------------------
config>system>security#
```

Parameters

password

This is the password for the user that must be entered by this user during the login procedure. The minimum length of the password is determined by the **minimum-length** command. The maximum length can be up to 20 chars if unhashed, 32 characters if hashed. The complexity requirements for the password is determined by the **complexity-rules** command and must be followed; otherwise, the password will not be accepted.

All password special characters (#, ?, space) must be enclosed within double quotes.

For example: config>system>security>user# password "south#bay?”

The question mark character (?) cannot be directly inserted as input during a telnet connection because the character is bound to the **help** command during a normal Telnet/ console connection.

To insert a # or ? characters, they must be entered inside a notepad or clipboard program and then cut and pasted into the Telnet session in the password field that is encased in the double quotes as delimiters for the password.

If a **password** is entered without any parameters, a password length of zero is implied: (carriage return).

Full Context

bof password

Description

This command configures the password to access the BOF interactive menu at startup.

If a password is configured, the BOF interactive menu is accessible only when the correct password is entered. If the correct password is not entered in 30 s, the node reboots.

The **no** form of this command removes the configured password.

Default

no password

Parameters

password

Specifies the password.

If the **hash**, **hash2**, or **custom** parameter is not configured, the password is entered in plaintext and the password length must be between 8 and 32 characters. A plaintext password cannot contain embedded nulls or end with " hash", " hash2", or " custom".

If the **hash**, **hash2**, or **custom** parameter is configured, the password is hashed and the password length must be between 1 and 64 characters.

hash

Keyword to specify that the password is entered in an encrypted form.

hash2

Keyword to specify that the password is entered in a more complex encrypted form. The **hash2** encryption scheme is node-specific and the password cannot be transferred between nodes.

custom

Keyword to specify that the password uses custom encryption.

configure mcast-management multicast-info-policy bundle channel video analyzer alarms pat-repetition

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the analyzer to check for the program association table (PAT). It is expected that the PAT arrives periodically within a certain interval range. It is possible to configure the type of alarm that is raised when the PAT fails to arrive within the specified interval. As the delay increases between two consecutive PATs, the type of alarm raised becomes more critical, from TNC to POA.

Default

no pat-repetition

Parameters

tnc-milli-seconds

Specifies the time, in milliseconds, for which a TNC alarm is raised if the interval between two consecutive PATs is greater than or equal to this configured value.

Values 100 to 800 in multiples of 100 only

Default 100

qos-milli-seconds

Specifies the time, in milliseconds, for which a QoS alarm is raised if the interval between two consecutive PATs is greater than or equal to this configured value.

Values 200 to 900 in multiples of 100 only and higher than the *tnc-milli-seconds* value

Default 200

poa-milli-seconds

Specifies the time, in milliseconds, for which a POA alarm is raised if the interval between two consecutive PATs is greater than or equal to this configured value.

Values 300 to 1000 in multiples of 100 only and higher than the *qos-milli-seconds* value

Default 500

no path

Context

[Tree] (config>fwd-path-ext>fpe path)

Full Context

configure fwd-path-ext fpe path

Description

This command references a PXC (pair of PXC sub-ports) and consequently create an association between the PXC and the application which is referenced under the same FPE object. Each application will utilize the PXC in the form of an internal cross-connect. The exact use and internal provisioning of this cross-connect depends on the application itself.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the reference and association from the configuration.

Default

no path

Parameters

xc-a ***lag-id***

Specifies the LAG identifier associated with one side of the cross-connect. The operator has the freedom to associate **xc-a** with LAG ID containing either sub-ports.a or sub-ports.b. In other words, the system does not perform automatic check that will ensure a match between **xc-a** and the LAG ID containing sub-ports.a.

Values 1 to 800

xc-b ***lag-id***

Specifies the LAG identifier associated with one side of the cross-connect. The operator has the freedom to associate **xc-a** with LAG ID containing either sub-ports.a or sub-ports.b.

Values 1 to 800

pxc-id

Specifies the PXC identifier, the PXC construct that contains a physical port in a loopback mode that provides the cross-connect capability. The system creates two paired sub-ports on top of this physical port and each of these two sub-ports forwards traffic in one direction over the loopback. One sub-port is associated with the transit side of the loopback, while the other sub-port is associated with the termination side (see PXC Configuration Guides for further explanation).

Values 1 to 64

Full Context

configure fwd-path-ext fpe multi-path-list path

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a multipath FPE forwarding path. A single path in a multipath FPE can contain a single PXC port or LAG of PXC ports.

The PXC references a physical port in loopback mode that provides the cross-connect capability. The system creates two paired subports on top of the physical port, each of which forwards traffic in one direction over the loopback. One subport is associated with the transit side of the loopback, while the other is associated with the termination side.

The **no** form of the command removes the path.

Parameters

path-id

Specifies a path ID for the forwarding path.

Values 1 to 64

pxc-id

Specifies a dedicated PXC ID for the forwarding path.

Values 1 to 64

xc-a lag-id

Specifies the LAG ID associated with one side (transit or termination) of the cross-connect. The operator can associate **xc-a** with the LAG containing either subports.a or subports.b. The system does not enforce a match between **xc-a** and the LAG ID containing subports.a.

Values lag-[1 to 800]

xc-b lag-id

Specifies the LAG ID associated with the other side of the cross-connect (not designated for **xc-a**). The operator can associate **xc-b** with the LAG containing either subports.a or subports.b. The system does not enforce a match between **xc-b** and the LAG ID containing subports.b.

Values lag-[1 to 800]

path

Syntax

path *name*

no path

Context

[Tree] (config>service>epipe>spoke-sdp-fec path)

Full Context

configure service epipe spoke-sdp-fec path

Description

This command specifies the explicit path, containing a list of S-PE hops, that should be used for this spoke SDP. The path-name should correspond to the name of an explicit path configured in the **config>service>pw-routing** context.

If no path is configured, then each next-hop of the MS-PW used by the spoke SDP will be chosen locally at each T-PE and S-PE.

Default

no path

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

name

The name of the explicit path to be used, as configured under the **config>service>pw-routing** context.

Platforms

Context

[Tree] (config>router>mpls path)

Full Context

configure router mpls path

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates the path to be used for an LSP. A path can be used by multiple LSPs. A path can specify some or all hops from ingress to egress and they can be either **strict** or **loose**. A path can also be empty (no *path-name* specified) in which case the LSP is set up based on IGP (best effort) calculated shortest path to the egress router. Paths are created in a **shutdown** state. A path must be shutdown before making any changes (adding or deleting hops) to the path. When a path is shutdown, any LSP using the path becomes operationally down.

To create a strict path from the ingress to the egress router, the ingress and the egress routers must be included in the path statement.

The **no** form of this command deletes the path and all its associated configuration information. All the LSPs that are currently using this path will be affected. Additionally all the services that are actively using these LSPs will be affected. A path must be **shutdown** and unbound from all LSPs using the path before it can be deleted. The **no path** *path-name* command will not result in any action except a warning message on the console indicating that the path may be in use.

Parameters

path-name

Specifies a unique case-sensitive alphanumeric name label for the LSP path up to 32 characters in length.

Platforms

All

path

Syntax

path [**detail**]

no path

Full Context

configure router mpls lsp-template path-computation-method

configure router mpls lsp path-computation-method

Description

This command configures the path computation method of a RSVP-TE or SR-TE LSP.

The user can select among the **hop-to-label** translation, the local CSPF or the PCE for a configured SR-TE LSP. For SR-TE LSP templates, the PCE option is supported with the SR-TE LSP template type **on-demand-p2p-srte** and not other template types.

The user can select among the IGP-based path, the local CSPF, or the PCE for a configured RSVP-TE LSP. The PCE option is not supported with the RSVP-TE LSP template.

By default, the IGP-based path is used for an RSVP-TE LSP and the **hop-to-label** path computation method is used for an SR-TE LSP.

The **no** form of this command returns to the default path computation method for the type of LSP.

Default

no path-computation-method

Parameters

path-computation-method

Specifies the path computation method for the LSP.

Values local-cspf — Selects the local router CSPF for path computation.

pce — Selects the PCE for path computation.

Full Context

configure service template vpls-sap-template stp path-cost

configure service vpls sap stp path-cost

configure service vpls spoke-sdp stp path-cost

Description

This command configures the Spanning Tree Protocol (STP) path cost for the SAP or spoke-SDP.

The path cost is used by STP to calculate the path cost to the root bridge. The path cost in BPDUs received on the root port is incremented with the configured path cost for that SAP or spoke-SDP. When BPDUs are sent out of other egress SAPs or spoke-SDPs, the newly calculated root path cost is used. These are the values used for CIST when running MSTP.

STP suggests that the path cost is defined as a function of the link bandwidth. Since SAPs and spoke-SDPs are controlled by complex queuing dynamics, in the 7450 ESS, 7750 SR, and 7950 XRS the STP path cost is a purely static configuration.

The **no** form of this command returns the path cost to the default value.

Parameters

path-cost

The path cost for the SAP or spoke-SDP

Values 1 to 200000000 (1 is the lowest cost)

path-discovery

Syntax

path-discovery

Context

[Tree] (config>test-oam>ldp-treetrace path-discovery)

Full Context

configure test-oam ldp-treetrace path-discovery

Description

This command creates the context to configure the LDP ECMP OAM path discovery.

The ingress LER builds the ECMP tree for a given FEC (egress LER) by sending LSP Trace messages and including the LDP IPv4 Prefix FEC TLV as well as the downstream mapping TLV. It inserts an IP address range drawn from the 127/8 space. When received by the downstream LSR, it uses this range to determine which ECMP path is exercised by any IP address or a sub-range of addresses within that range based on its internal hash routine. When the MPLS Echo reply is received by the ingress LER, it records this information and proceeds with the next echo request message targeted for a node downstream of the first LSR node along one of the ECMP paths. The sub-range of IP addresses indicated in the initial reply

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

is used since the objective is to have the LSR downstream of the ingress LER pass this message to its downstream node along the first ECMP path.

The user configures the frequency of running the tree discovery using the command **config>test-oam>ldp-treetrace>path-discovery>interval**.

The ingress LER gets the list of FECs from the LDP FEC database. New FECs are added to the discovery list at the next tree discovery and not when they are learned and added into the FEC database. The maximum number of FECs to be discovered with the tree building feature is limited to 500. The user can configure FECs to include or exclude using a policy profile by applying the command **config>test-oam>ldp-treetrace>path-discovery>policy-statement**.

configure router mpls mpls-tp transit-path path-id

Description

This command configures path ID for an MPLS-TP transit path at an LSR. The path ID is equivalent to the MPLS-TP LSP ID and is used to generate the maintenance entity group intermediate point (MIP) identifier for the LSP at the LSR. A path-id must be configured for on-demand OAM to verify an LSP at the LSR.

The path-id must contain at least the following parameters: **lsp-num, src-node-id, src-global-id, src-tunnel-num, dest-node-id**.

The path-id must be unique on a node. It is recommended that his is also configured to be a globally unique value.

The **no** form of this command removes the path ID from the configuration.

Default

no path-id

Parameters

lsp-num

Specifies the LSP number.

Values 1 to 65535, or **working path**, or **protect-path**. A **working-path** is equivalent to an lsp-num of 1, and a **protect-path** is an lsp-num of 2.

src-global-id

Specifies the source global ID.

Values 0 to 4294967295

src-node-id

Specifies the source node ID.

33.67 path-mtu

path-mtu

Syntax

path-mtu [*bytes*]

no path-mtu *bytes*

Context

[Tree] (config>service>sdp path-mtu)

[Tree] (config>service>pw-template path-mtu)

Full Context

configure service sdp path-mtu

configure service pw-template path-mtu

Description

This command configures the Maximum Transmission Unit (MTU) in bytes that the SDP can transmit to the far-end device router without packet dropping or IP fragmentation overriding the SDP-type default MTU.

The SDP-type default path-mtu can be overridden on a per SDP basis. Dynamic maintenance protocols on the SDP, like RSVP, may override this setting.

If the physical MTU on an egress interface indicates the next hop on an SDP path cannot support the current path-mtu, the system modifies the operational path-mtu on that SDP to a value that can be transmitted without fragmentation.

The **no** form of this command removes any path-mtu configured on the SDP, and the SDP uses the system default for the SDP type.

Default

the default **path-mtu** defined on the system for the type of SDP

Parameters

bytes

Specifies the bytes.

Values 576 to 9800

33.68 path-mtu-discovery

path-mtu-discovery

Syntax

[**no**] **path-mtu-discovery**

Context

[Tree] (config>router>ldp>tcp-session-params>peer-transport path-mtu-discovery)

Full Context

configure router ldp tcp-session-parameters peer-transport path-mtu-discovery

Description

This command enables Path MTU discovery for the associated TCP connections. When enabled, the MTU for the associated TCP session is initially set to the egress interface MTU. The DF bit is also set so that if a router along the path of the TCP connection cannot handle a packet of a particular size without fragmenting, it sends back an ICMP message to set the path MTU for the given session to a lower value that can be forwarded without fragmenting.

If one or more transport addresses used in the Hello adjacencies to the same peer LSR are different from the LSR-ID value, the user must add each of the transport addresses to the path MTU discovery configuration as a separate peer. This means when the TCP connection is bootstrapped by a given Hello adjacency, the path MTU discovery can operate over that specific TCP connection by using its specific transport address.

Default

no path-mtu-discovery

Platforms

All

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router bgp group path-mtu-discovery

configure router bgp path-mtu-discovery

configure router bgp group neighbor path-mtu-discovery

Description

This command enables Path MTU Discovery (PMTUD) for the associated TCP connections.

When enabled, PMTUD is activated toward an IPv4 BGP neighbor. The Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, the device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value to accomodate the IP MTU constraint.

When PMTUD is disabled and there is no **tcp-mss** configuration to associate with a BGP neighbor (in either the BGP configuration or the first-hop IP interface configuration), the router advertises a TCP MSS option of only 1024 bytes, limiting received TCP segments to that size.

The **no** form of this command disables PMTUD.

33.70 path-probing

path-probing

Syntax

path-probing

Context

[Tree] (config>test-oam>ldp-treetrace path-probing)

Full Context

configure test-oam ldp-treetrace path-probing

Description

This command creates the context to configure the LDP tree trace path probing phase.

The periodic path exercising runs in the background to test the LDP ECMP paths discovered by the path discovery capability. The probe used is an LSP Ping message with an IP address drawn from the sub-range of 127/8 addresses indicated by the output of the tree discovery for this FEC.

The user configures the frequency of running the path probes using the **config>test-oam>ldp-treetrace>path-probing>interval** command. If an I/F is down on the ingress LER performing the LDP tree trace, then LSP Ping probes that normally go out this interface are not sent but the ingress LER node does not raise alarms.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The LSP Ping routine updates the content of the MPLS echo request message, specifically the IP address, as soon as the LDP ECMP path discovery phase has output the results of a new computation for the path in question.

[Tree] (config>router>mpls>lsp path-profile)

Full Context

configure router mpls lsp-template path-profile

configure router mpls lsp path-profile

Description

This command configures the PCE path profile and path group ID.

The PCE supports the computation of disjoint paths for two different LSPs originating and/or terminating on the same or different PE routers. To indicate this constraint to the PCE, the user must configure the PCE path profile ID and path group ID to which the PCE computed or PCE controlled LSP belongs to. These parameters are passed transparently by the PCC to the PCE and are thus opaque data to the router.

The association of the optional path-group ID is to allow the PCE to determine the profile ID that must be used with this path-group ID. One path-group ID is allowed per profile ID. The user can, however, enter the same path-group ID with multiple profile IDs by executing this command multiple times. A maximum of five **path-profile** [**path-group**] entries can be associated with the same LSP.

The **no** form of this command removes the path profile association with the LSP.

Parameters

profile-id

Specifies the profile ID.

Values 1 to 4294967295

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

path-group ***group-id***

Context

[Tree] (config>subscr-mgmt>up-resiliency>fsg-template path-restoration-state)

Full Context

configure subscriber-mgmt up-resiliency fate-sharing-group-template path-restoration-state

Description

This command configures how the BNG-UP manages active FSGs if the BNG-UP becomes headless (PFCP path is in restoration/headless). The BNG-UP can always move all active FSGs to standby, or it can decide whether to move them to standby based on a series of heuristic tests. If any test indicates that the BNG-UP cannot forward traffic for the FSG, or another BNG-UP becomes active, the BNG-UP moves the FSG to standby.

The **no** form of this command removes the path restoration state configuration.

Note: This only applies to active FSGs; the UP never makes a standby FSG active without CP intervention.

Default

path-restoration-state auto

Parameters

standby

Keyword that indicates any FSG becomes standby when the BNG-UP becomes headless.

auto

Keyword that indicates the BNG-UP determines whether to change the state of the FSGs to standby based on a series of heuristic tests.

33.73 path-restoration-time

path-restoration-time

Syntax

path-restoration-time *minutes*

no path-restoration-time

Context

[Tree] (config>subscr-mgmt>pfcp-association path-restoration-time)

Full Context

configure subscriber-mgmt pfcp-association path-restoration-time

Description

This command configures the time sessions are kept after a PFCP path failure is detected. When the timer expires, or if it is not configured, all sessions associated with the path are removed. If the path recovers without a restart before the timer expires, the timer is canceled, and no sessions are removed.

The **no** form of this command removes the path restoration configuration.

Default

no path-restoration-time

Parameters

minutes

Specifies the time, in minutes, that sessions are kept after a PFCP path failure. This timer should be configured to a value that is at least twice the sum of the **heartbeat interval** plus the total heartbeat timeout (heartbeat retries x heartbeat timeout = N1 x T1).

Values 5 to 1440

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

33.74 path-threshold

path-threshold

Syntax

path-threshold *num-paths*

no path-threshold

Context

[Tree] (config>eth-tunnel>lag-emulation path-threshold)

Full Context

configure eth-tunnel lag-emulation path-threshold

Description

This command configures the behavior for the eth-tunnel if the number of operational members is equal to or below a threshold level

Default

no path-threshold

Parameters

num-paths

Specifies the threshold for the Ethernet Tunnel group.

Values 0 to 15

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

33.75 path-type

path-type

Syntax

path-type {**ibgp** | **ebgp**}

no path-type

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>policy-options>policy-statement>entry>from path-type)

Full Context

configure router policy-options policy-statement entry from path-type

Description

This command matches BGP routes based on their path type (EBGP or IBGP). A route learned from an EBGP peer has path-type **ebgp**. A route learned from an IBGP or confed-EBGP peer has path-type **ibgp**.

A non-BGP route does not match a policy entry if it contains the **path-type** command.

Default

no path-type

Parameters

ibgp

Matches routes from internal BGP peers.

ebgp

Matches routes from external BGP peers.

Platforms

All

33.76 patherr

patherr

Syntax

patherr [**detail**]

no patherr

Context

[Tree] (debug>router>rsvp>packet patherr)

Full Context

configure filter ipv6-filter entry pbr-down-action-override

configure filter ip-filter entry pbr-down-action-override

configure filter mac-filter entry pbr-down-action-override

Description

This command allows overriding the default action that is applied for entries with PBR/PBF action defined, when the PBR/PBF target is down.

The **no** form of the command preserves default behavior when PBR/PBF target is down.

Default

no pbr-down-action-override

Parameters

filter-action

Specifies the packets matching the entry.

drop — Specifies that packets matching the entry will be dropped if PBR/PBF target is down.

forward — Specifies that packets matching the entry will be forwarded if PBR/PBF target is down.

filter-default-action — Specifies that packets matching the entry will be processed as per **default-action** configuration for this filter if PBR/PBF target is down.

[Tree] (config>router>mpls>lsp-template pce-control)

Full Context

configure router mpls lsp pce-control

configure router mpls lsp-template pce-control

Description

This command enables a PCE controlled LSP mode of operation. The **pce-control** option means the router delegates full control of the LSP to the PCE (PCE controlled). Enabling it means the PCE is acting in stateful-active mode for this LSP and the PCE will be able to reroute the path following a failure or re-optimize the path and update the router without a request from the router.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The user can delegate CSPF and non-CSPF LSPs, or LSPs that have the **path-computation-method pce** option enabled or disabled. The LSP maintains its latest active path computed by PCE or the router at the time it is delegated. The PCE only makes an update to the path at the next network event or reoptimization.

When configured to no, the PCE controlled mode of operation for the LSP has not effect.

Default

no pce-control

Context

[Tree] (config>router>mpls pce-report)

Full Context

configure router mpls pce-report

Description

This command separately configures the reporting modes to a PCE for RSVP-TE or SR-TE LSPs. The PCC LSP database is synchronized with the PCE LSP database using the PCEP PCRpt (PCE Report) message for PCC-controlled, PCE-computed, and PCE-controlled LSPs.

The global MPLS level **pce-report** command can be used to enable or disable PCE reporting for all SR-TE LSPs or RSVP-TE LSPs during PCE LSP database synchronization. This configuration is inherited by all LSPs of the specified type. The PCC reports both CSPF and non-CSPF LSPs. The default value is disabled for both types of LSP. This default value is meant to control the introduction of the PCE into an existing network and to let the operator decide if all LSPs of a particular type need to be reported.

The LSP-level **pce-report** command overrides the global configuration for the reporting of LSPs to the PCE. The default value is to inherit the global MPLS level value. The **enable** or **disable** value allows for the override of the inherited value. The **inherit** value explicitly resets the LSP to inherit the global configuration for that LSP type.

If PCE reporting is disabled for the LSP, either due to inheritance or due to LSP-level configuration, then enabling the **pce-control** option for the LSP has no effect.

Default

pce-report rsvp-te disable

pce-report sr-te disable

Parameters

rsvp-te

Specifies the PCE reporting mode for all TE LSPs of RSVP-TE type.

Values **enable** — enables PCE reporting for all TE LSPs of RSVP-TE type

disable — disables PCE reporting for all TE LSPs of RSVP-TE type

sr-te

Specifies the PCE reporting mode for all TE LSPs of SR-TE type.

Values **enable** — enables PCE reporting for all TE LSPs of SR-TE type

disable — disables PCE reporting for all TE LSPs of SR-TE type

Platforms

configure mcast-management multicast-info-policy bundle channel video analyzer alarms pcr-repetition

configure mcast-management multicast-info-policy bundle video analyzer alarms pcr-repetition

Description

This command configures the analyzer to check for the program clock reference (PCR). It is expected that the PCR arrives periodically within a certain interval range. It is possible to configure the type of alarm that is raised when the PCR fails to arrive within the specified interval. As the delay increases between two consecutive PCRs, the type of alarm raised becomes more critical, from TNC to POA.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no pcr-repetition

Parameters

tnc-milli-seconds

Specifies the time, in milliseconds, for which a TNC alarm is raised if the interval between two consecutive PCRs is greater than or equal to this configured value.

Values 100 to 800 in multiples of 100 only

Default 100

qos-milli-seconds

Specifies the time, in milliseconds, for which a QoS alarm is raised if the interval between two consecutive PCRs is greater than or equal to this configured value.

Values 200 to 900 in multiples of 100 only and higher than the *tnc-milli-seconds* value

Default 200

poa-milli-seconds

Specifies the time, in milliseconds, for which a POA alarm is raised if the interval between two consecutive PCRs is greater than or equal to this configured value.

Values 300 to 1000 in multiples of 100 only and higher than the *qos-milli-seconds* value

Default 500

configure service vprn subscriber-interface group-interface ipv6 dhcp6 pd-managed-route

configure service vprn subscriber-interface ipv6 dhcp6 pd-managed-route

configure service ies subscriber-interface group-interface ipv6 dhcp6 pd-managed-route

configure service ies subscriber-interface ipv6 dhcp6 pd-managed-route

Description

This command enables DHCP IA-PD (delegated prefix) to be modeled as managed (framed) route instead of as a subscriber-host. Antispoof filtering for the subscriber host associated with the IA-PD route must be set to **nh-mac**. The subscriber specific parameters (such as **sla-profile** or **sub-profile**) are ignored during the authentication phase because IA-PD is not modeled as a subscriber host. Other subscriber host-specific functions (for example, host overrides via CoA or host accounting) are not possible with a PD as the managed route.

By default, or when configured with the **next-hop ipv6** parameter, the next-hop for PD managed route is an IPv6 WAN sub-host (DHCP IA-NA or SLAAC) with the same mac address as the one in the DHCP lease state for the managed IA-PD. The DHCP IA-NA next-hop host will always override the SLAAC next-hop host if both are available. If the IPv6 next-hop is not present when the framed IA-PD is instantiated, the IA-PD is set up but the PD managed route will not be installed in the IPv6 route table and the DHCPv6 lease state for the IA-PD will have the managed route status (DHCP6 MRt Status) set to "noNextHop”.

When configured with the **next-hop ipv4** parameter the next-hop for PD managed route is a DHCPv4 sub-host that belongs to the same IPoE session or PPPoE session. For IPoE, **ipoe-session** must be enabled on the group-interface. If **ipoe-session** is disabled, an IPv4 next-hop will not be found. If the IPv4 next-hop is not found or not present at the time when the framed IA-PD is instantiated, the IA-PD is set up but the PD managed route is not installed in the IPv6 route table. In this case, the DHCPv6 lease state for the IA-PD will have the managed route status (DHCP6 MRt Status) set to noNextHop.

Note:
IPv6 filters, QoS IPv6 criteria, and IPv6 multicast are not supported for DHCPv6 IA-PD as managed route pointing to an IPv4 subscriber host as next-hop.

The DHCP IA-PD modeled as a route is displayed differently than regular subscriber hosts in **show** commands related to subscriber host state. The PD managed route is always shown directly below the host it is using as the next hop. The forwarding status of the PD managed route is also shown, where (N) indicate that the PD managed route is not forwarding. In addition, DHCP IA-PD route is displayed as a managed route for the corresponding IPv6 subscriber host (DHCP IA-NA or SLAAC) or DHCPv4 subscriber host.

DHCP IA-PD information for managed IA-PD route is still maintained in the DHCPv6 lease state.

The **no** form of this command reverts to the default.

Parameters

next-hop

Specifies the next-hop type for the DHCP IA-PD managed route

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values **ipv4** - The next-hop for PD managed route is a DHCPv4 sub-host that belongs to the same IPoE session (based on the IPoE session key which is **sap-mac** by default). IPoE session must be enabled on the group-interface.

ipv6 - The next-hop for PD managed route is an IPv6 WAN sub-host (DHCP IA-NA or SLAAC) with the same MAC address as the one in the DHCP lease state for the managed IA-PD. This is the default when no next-hop is specified.

33.100 pe-id-mac-flush-interop

pe-id-mac-flush-interop

Syntax

[**no**] **pe-id-mac-flush-interop**

Context

[Tree] (config>router>ldp>session-params>peer pe-id-mac-flush-interop)

Full Context

configure router ldp session-parameters peer pe-id-mac-flush-interop

Description

This command enables the addition of the PE-ID TLV in the LDP MAC withdrawal (mac-flush) message, under certain conditions, and modifies the mac-flush behavior for interoperability with other vendors that do not support the flush-all-from-me vendor-specific TLV. This flag can be enabled on a per LDP peer basis and allows the flush-all-from-me interoperability with other vendors. When the pe-id-mac-flush-interop flag is enabled for a given peer, the current mac-flush behavior is modified in terms of mac-flush generation, mac-flush propagation and behavior upon receiving a mac-flush.

The mac-flush generation will be changed depending on the type of event and according to the following rules:

- Any all-from-me mac-flush event will trigger a mac-flush all-but-mine message (RFC 4762 compliant format) with the addition of a PE-ID TLV. The PE-ID TLV contains the IP address of the sending PE.
- Any all-but-mine mac-flush event will trigger a mac-flush all-but-mine message WITHOUT the addition of the PE-ID TLV, as long as the source spoke SDP is not part of an end-point.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Any all-but-mine mac-flush event will trigger a mac-flush all-but-mine message WITH the addition of the PE-ID TLV, if the source spoke SDP is part of an end-point and the spoke-sdp goes from down/standby state to active state. In this case, the PE-ID TLV will contain the IP address of the PE to which the previous active spoke-sdp was connected to.

Any other case will follow the existing mac-flush procedures.

When the pe-id-mac-flush-interop flag is enabled for a given LDP peer, the mac-flush ingress processing is modified according to the following rules:

- Any received all-from-me mac-flush will follow the existing mac-flush all-from-me rules regardless of the existence of the PE-ID.
- Any received all-but-mine mac-flush will take into account the received PE-ID, that is all the mac addresses associated to the PE-ID will be flushed. If the PE-ID is not included, the mac addresses associated to the sending PE will be flushed.
- Any other case will follow the existing mac-flush procedures.

When a mac-flush message has to be propagated (for an ingress sdp-binding to an egress sdp-binding) and the pe-id-mac-flush-interop flag is enabled for the ingress and egress TLDP peers, the following behavior is observed:

- If the ingress and egress bindings are spoke SDP, the PE will propagate the mac-flush message with its own PE-ID.
- If the ingress binding is an spoke SDP and the egress binding a mesh SDP, the PE will propagate the mac-flush message without modifying the PE-ID included in the PE-ID TLV.
- If the ingress binding is a mesh SDP and the egress binding an spoke SDP, the PE will propagate the mac-flush message with its own PE-ID.
- When ingress and egress bindings are mesh-sdp, the mac-flush message is never propagated. This is the behavior regardless of the pe-id-mac-flush-interop flag configuration.

The PE-ID TLV is never added when generating a mac-flush message on a B-VPLS if the **send-bvpls-flush** command is enabled in the I-VPLS. In the same way, no PE-ID is added when propagating mac-flush from a B-VPLS to a I-VPLS when the **propagate-mac-flush-from-bvpls** command is enabled. Mac-flush messages for peers within the same I-VPLS or within the same B-VPLS domain follow the procedures described above.

Default

no pe-id-mac-flush-interop

configure router dhcp6 server pool failover peer

configure router dhcp6 local-dhcp-server failover peer

configure service vprn dhcp server pool peer

configure router dhcp local-dhcp-server failover peer

Description

This command creates a sync tag. DHCP leases can be synchronized per DHCP server or DHCP pool. The pair of synchronizing servers or pools is identified by a tag. The synchronization information is carried over the Multi-Chassis Synchronization (MCS) link between the two peers. MCS link is a logical link (IP, or MPLS).

MCS runs over TCP, port 45067 and it is using either data traffic or keepalives to detect failure on the communication link between the two nodes. In the absence of any MCS data traffic for more than 0.5sec, MCS will send its own keepalive to the peer. If a reply is **not** received within three sec, MCS will declare its operation state as DOWN and the DB Sync state as out-of-sync. MCS will consequently notify its clients (DHCP Server being one of them) of this. It can take up to three seconds before the DHCP client realizes that the inter-chassis communication link has failed.

The inter-chassis communication link failure does not necessarily assume the same failed fate for the access links. The two redundant nodes can become isolated from each other in the network. This occurs when only the intercommunication (MCS) link fails. It is important that this MCS link be highly redundant.

The **no** form of this command reverts to the default.

Parameters

ip-address

Specifies the IPv4 or IPv6 address of the peer.

Values

ipv4-address:	a.b.c.d	
:	x:ipv6-addressx:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d

peer

Syntax

peer index *index* [*destination-host-string*][**create**]

no peer index *index*

Context

[Tree] (config>aaa>diam>node peer)

Full Context

configure aaa diameter node peer

Description

This command creates context for diameter peer configuration within a Diameter client node in SR OS. Up to five Diameter peers can be configured within a given Diameter client node.

This command is not applicable to legacy Diameter base.

The **no** form of this command removes the peer index information from the configuration.

Parameters

index

Specifies the index of a peer. Index is used to break a tie if a Diameter route for a given host or realm destination points to multiple diameter peers with the same preference. In such scenario, the peer with the lowest index will be selected as next-hop in traffic forwarding.

Values 1 to 5

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

destination-host-string

Identifies the peer by its name, up to 80 characters (of type DiameterIdentity). This peer name must match the one in Origin-Host AVP received in Capability Exchange Answer message. In case of a mismatch, the TCP connection will be terminated.

create

Keyword used to create the peer index. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>service>vprn>msdp>group peer)

[Tree] (config>service>vprn>msdp peer)

Full Context

configure service vprn msdp group peer

configure service vprn msdp peer

Description

This command configures peer parameters. Multicast Source Discovery Protocol (MSDP) must have at least one peer configured. A peer is defined by configuring a local-address that can be used by this node to set up a peering session and the address of a remote MSDP router, It is the address of this remote peer that is configured in this command and it identifies the remote MSDP router address.

After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. It may be required to have multiple peering sessions in which case multiple peer statements should be included in the configurations.

By default, the options applied to a peer are inherited from the global or group-level. To override these inherited options, include peer-specific options within the peer statement.

If the peer address provided is already a configured peer, then this command only provides the context to configure the parameters pertaining to this peer.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the peer address provided is not already a configured peer, then the peer instance must be created and the context to configure the parameters pertaining to this peer should be provided. In this case, the $ prompt to indicate that a new entity (peer) is being created should be used.

The peer address provided will be validated and, if valid, will be used as the remote address for an MSDP peering session.

When the **no** form of this command is entered, the existing peering address will be removed from the configuration and the existing session will be terminated. Whenever a session is terminated, all source active information pertaining to and learned from that peer will be removed. Whenever a new peering session is created or a peering session is lost, an event message should be generated.

At least one peer must be configured for MSDP to function.

Parameters

peer-address

The address configured in this statement must identify the remote MSDP router that the peering session must be established with.

Platforms

All

peer

Syntax

peer *ipv4-address*

no peer

Context

[Tree] (config>service>vprn>nat>inside>redundancy peer)

[Tree] (config>router>nat>inside>redundancy peer)

Full Context

configure service vprn nat inside redundancy peer

configure router nat inside redundancy peer

Description

This command is used in LSN44 multi-chassis redundancy in conjunction with filters. The configured peer address is an IPv4 address that is configured under an interface on the peering LSN44 node (active or standby). This IPv4 interface address is advertised via routing on the inside in order to attract traffic from the standby to the active LSN44 node.

If configured, the steering-route is advertised only from the active LSN44 node. Consequently, upstream traffic for LSN44 is attracted to the active LSN44 node. The nat action in the ipv4-filter on the active LSN44 node forwards traffic to the local MS-ISA where LSN44 function is performed. However, in that case that upstream traffic somehow arrives on the standby LSN44 node, the nat action in the IPv4-filter forwards traffic to the peer address (active LSN44 node).

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of the command removes the peer ipv4-address from the configuration.

Parameters

ipv4-address

Specifies the IP address of the NAT redundancy peer.

Values ipv4-address: a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax

peer *ip-address* [**preference** *preference*]

no peer *ip-address*

Context

[Tree] (config>router>pcep>pcc peer)

Full Context

configure router pcep pcc peer

Description

This command configures the IP address of a peer PCEP speaker. The address is used as the destination address in the PCEP session messages to a PCEP peer.

The **preference** parameter allows the PCC to select the preferred PCE when both have their PCEP sessions successfully established. A maximum of two PCEP peers is supported.

The PCE peer that is not in overload is always selected by the PCC as the active PCE. However, if neither of the PCEs are signaling the overload state, the PCE with the higher numerical preference value is selected, and in case of a tie, the PCE with the lower IP address is selected.

Note:
The system does not support two or more simultaneously active PCEs.

The **no** form of the command removes the specified peer PCEP speaker.

Parameters

ip-address

The IP address of the PCEP peer to be used as the destination address in the PCEP session.

preference

The preference value of the peer.

Values 0 to 100

Default 1

configure li x-interfaces x2 peer

Description

This command configures the LIC name for X2 interface communication, which is configured under **config**> **li**>**x-interfaces**>**lics**>**lic**.

The **no** form of this command reverts to the default.

Parameters

lic-name

Specifies the LIC name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax

[**no**] **peer** *lic-name*

Context

[Tree] (config>li>x-interfaces>x3>peers peer)

Full Context

configure li x-interfaces x3 peers peer

Description

This command configures the LIC name for X3 interface communication, which is configured under **config**> **li**>**x-interfaces**>**lics**>**lic**.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the LIC name.

Parameters

lic-name

Specifies the name for the LIC peer, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax

[**no**] **peer** {*ip-address* | *ipv6-address*}

Context

[Tree] (config>router>bfd>seamless-bfd peer)

Full Context

configure router bfd seamless-bfd peer

Description

This command specifies the context for the local mapping, used by an S-BFD initiator, between a discriminator for a far-end S-BFD reflector and its discriminator value.

The **no** form of this command removes the mapping for the peer.

Parameters

ip-address

Specifies the IPv4 address of the peer.

Values a.b.c.d

ipv6-address

Specifies the IPv6 address of the peer.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

peer

Syntax

peer [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address*} [**key-id** *key-id* | **authentication-keychain** *keychain-name*] [**version** *version*] [**prefer**]

no peer [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address*}

Context

[Tree] (config>system>time>ntp peer)

Full Context

configure system time ntp peer

Description

This command configures symmetric active mode for an NTP peer. It is recommended to configure authentication and to only configure known time servers as peers. Peers may exist within a VPRN service.

Note:
For symmetric peering to operate correctly with a peer accessible through a VPRN, local NTP server functionality must be enabled within the VPRN using the **configure service vprn ntp** command.

The **no** form of the command removes the configured peer.

Parameters

router-instance

Specifies the routing context that contains the interface.

Values *router-name* — Base | Management
service-id — 1 to 2147483647

Default Base

service name

Specifies the service name for the VPRN, up to 64 characters. CPM routing instances are not supported.

ip-address

Configures the IPv4 address of the peer that requires a peering relationship to be set up.

Values a.b.c.d

ipv6-address

Configures the IPv6 address of the peer that requires a peering relationship to be set up.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- x: [0 to FFFF] H
- d: [0 to 255] D

key-id

Specifies the key ID. Successful authentication requires that both peers must have the same authentication key-id, type, and key value.

Specify the *key-id* that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP peer. If an NTP packet is received by these nodes, the authentication key-id, type, and key value must be valid, otherwise the packet is rejected and an event or trap is generated.

Values 1 to 255

keychain-name

Identifies the keychain name, up to 32 characters.

version

Specifies the NTP version number that is generated by this node. This parameter does not need to be configured when in client mode, in which case all versions are accepted.

Values 2 to 4

Default 4

prefer

When configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, the new entry overrides the old entry.

Platforms

All

peer

Syntax

peer *ip-address* [**create**]

no peer *ip-address*

Context

[Tree] (config>service>vprn>ipsec>mc-shunt-profile peer)

[Tree] (config>router>ipsec>mc-shunt-profile peer)

peer

Syntax

peer *ip-address* [**create**]

no peer *ip-address*

Context

[Tree] (config>anysec>tnl-enc>enc-grp peer)

Full Context

configure anysec tunnel-encryption encryption-group peer

Description

This command configures the IPv4 or IPv6 address of the peer's node SID that are part of this encryption group.

This configuration identifies the peer's segment routing node SID and programs the egress label stack for matching on the FP5 for encrypting the LSP.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note: When the label stack is downloaded, the encryption SID is also included at the bottom of the stack with the S bit set.

The **no** form of this command removes the peer node SID from the ANYsec configuration. Therefore, the LSP is not encrypted and all the traffic is transmitted in clear text.

Parameters

ip-address

Specifies a peer IP address.

Values ipv4-address: a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

34.1 peer-address-change-policy

peer-address-change-policy

Syntax

peer-address-change-policy {**accept** | **ignore** | **reject**}

Context

[Tree] (config>router>l2tp peer-address-change-policy)

[Tree] (config>service>vprn>l2tp peer-address-change-policy)

Full Context

configure router l2tp peer-address-change-policy

configure service vprn l2tp peer-address-change-policy

Description

This command specifies what to do in case the system receives a L2TP response from another address than the one the request was sent to.

Default

peer-address-change-policy reject

Parameters

accept

Specifies that this system accepts any source IP address change of received L2TP control messages related to a locally originated tunnel in the state waitReply and rejects any peer address change for other tunnels; in case the new peer IP address is accepted, it is learned and used as destination address in subsequent L2TP messages.

ignore

Specifies that this system ignores any source IP address change of received L2TP control messages, does not learn any new peer IP address, and does not change the destination address in subsequent L2TP messages.

reject

Specifies that this system rejects any source IP address change of received L2TP control messages and drops those messages.

Full Context

configure ipsec client-db client client-identification peer-ip-prefix

Description

This command specifies match criteria that uses the peer's tunnel IP address as the input. Only one peer-ip-prefix criteria can be configured for a given client entry.

The **no** form of this command reverts to the default.

Default

no peer-ip-prefix

Parameters

ip-prefix/ip-prefix-length

Specifies an IPv4 or IPv6 prefix. It is considered a match if the peer's tunnel IP address is within the specified prefix.

ipv4-any

Matches any IPv4 address.

ipv6-any

Matches any IPv6 address.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

peer-ip-prefix

Syntax

[**no**] **peer-ip-prefix**

Context

[Tree] (config>ipsec>client-db>match-list peer-ip-prefix)

Full Context

configure ipsec client-db match-list peer-ip-prefix

Description

This command enables the use of the peer's tunnel IP address as the match input.

The **no** form of this command disables the peer IP prefix matching process.

Default

no peer-ip-prefix

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

34.6 peer-limit

peer-limit

Syntax

peer-limit *limit*

no peer-limit

Context

[Tree] (config>service>vprn>ptp peer-limit)

Full Context

configure service vprn ptp peer-limit

Description

This command specifies an upper limit to the number of discovered peers permitted within the routing instance. This command can ensure that a routing instance does not consume all the possible discovered peers and blocking discovered peers in other routing instances.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If it is desired to reserve a fixed number of discovered peers per router instance, then all router instances supporting PTP should have values specified with this command and the sum of all the peer-limit values must not exceed the maximum number of discovered peers supported by the system.

If the user attempts to specify a peer-limit, and there are already more discovered peers in the routing instance than the new limit being specified, the configuration is not accepted.

The **no** form of this command removes the limit from the configuration.

Default

no limit

Parameters

limit

Specifies the maximum number of discovered peers allowed in the routing instance.

Values 0 to 50

Default 0 (The maximum number of discovered peers supported by the system).

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer-limit

Syntax

peer-limit *limit*

no peer-limit

Context

[Tree] (config>system>ptp peer-limit)

Full Context

configure system ptp peer-limit

Description

This command specifies an upper limit to the number of discovered peers permitted within the routing instance. This can be used to ensure that a routing instance does not consume all the possible discovered peers and blocking discovered peers in other routing instances.

If it is desired to reserve a fixed number of discovered peers per router instance, then all router instances supporting PTP should have values specified with this command and the sum of all the peer-limit values must not exceed the maximum number of discovered peers supported by the system.

If the user attempts to specify a peer-limit, and there are already more discovered peers in the routing instance than the new limit being specified, the configuration will not be accepted.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no peer-limit

Parameters

limit

Specifies the maximum number of discovered peers allowed in the routing instance.

Values 0 to 512

Default 1 (The maximum number of discovered peers supported by the system.)

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

34.7 peer-name

peer-name

Syntax

peer-name *name*

no peer-name

Context

[Tree] (config>redundancy>multi-chassis>peer peer-name)

Full Context

configure redundancy multi-chassis peer peer-name

Description

This command specifies a peer name.

Default

no peer-name

Parameters

name

Specifies the string up to 32 characters. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

[Tree] (config>router>ldp>targeted-session peer-template-map)

Full Context

configure router ldp targeted-session peer-template-map

Description

This command enables the automatic creation of a targeted Hello adjacency and LDP session to a discovered peer. The user configures a targeted session peer parameter template and binds it to a peer prefix policy.

Each application of a targeted session template to a given prefix in the prefix list will result in the establishment of a targeted Hello adjacency to an LDP peer using the template parameters as long as the prefix corresponds to a router-id for a node in the TE database. As a result of this, the user must enable

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the traffic-engineering option in ISIS or OSPF. The targeted Hello adjacency will either trigger a new LDP session or will be associated with an existing LDP session to that peer.

Up to 5 peer prefix policies can be associated with a single peer template at all times. Also, the user can associate multiple templates with the same or different peer prefix policies. Thus multiple templates can match with a given peer prefix. In all cases, the targeted session parameters applied to a given peer prefix are taken from the first created template by the user. This provides a more deterministic behavior regardless of the order in which the templates are associated with the prefix policies.

Each time the user executes the above command, with the same or different prefix policy associations, or the user changes a prefix policy associated with a targeted peer template, the system re-evaluates the prefix policy. The outcome of the re-evaluation will tell LDP if an existing targeted Hello adjacency needs to be torn down or if an existing targeted Hello adjacency needs to have its parameters updated on the fly.

If a /32 prefix is added to (removed from) or if a prefix range is expanded (shrunk) in a prefix list associated with a targeted peer template, the same prefix policy re-evaluation described above is performed.

The template comes up in the **no shutdown** state and as such it takes effect immediately. Once a template is in use, the user can change any of the parameters on the fly without shutting down the template. In this case, all targeted Hello adjacencies are updated.

The SR OS supports multiple ways of establishing a targeted Hello adjacency to a peer LSR:

- User configuration of the peer with the targeted session parameters inherited from the **config>router>ldp>targeted-session** in the top level context or explicitly configured for this peer in the **config>router>ldp>targ-session>peer** context and which overrides the top level parameters shared by all targeted peers. Let us refer to the top level configuration context as the global context. Some parameters only exist in the global context; their value will always be inherited by all targeted peers regardless of which event triggered it.
- User configuration of an SDP of any type to a peer with the signaling tldp option enabled (default configuration). In this case the targeted session parameter values are taken from the global context.
- User configuration of a (FEC 129) PW template binding in a BGP-VPLS service. In this case the targeted session parameter values are taken from the global context.
- User configuration of a (FEC 129 type II) PW template binding in a VLL service (dynamic multi-segment PW). In this case the target session parameter values are taken from the global context
- User configuration of a mapping of a targeted session peer parameter template to a prefix policy when the peer address exists in the TE database (this feature). In this case, the targeted session parameter values are taken from the template.

Since the above triggering events can occur simultaneously or in any arbitrary order, the LDP code implements a priority handling mechanism in order to decide which event overrides the active targeted session parameters. The overriding trigger will become the owner of the targeted adjacency to a given peer. The following is the priority order:

- Priority 1: manual configuration of session parameters
- Priority 2: mapping of targeted session template to prefix policy.
- Priority 3: auto-tx parameters
- Priority 4: auto-rx parameters
- Priority 5: manual configuration of SDP, PW template binding in BGP-AD VPLS and in FEC 129 VLL.

Any parameter value change to an active targeted Hello adjacency caused by any of the above triggering events is performed on the fly by having LDP immediately send a Hello message with the new parameters to the peer without waiting for the next scheduled time for the Hello message. This allows the peer to

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

adjust its local state machine immediately and maintains both the Hello adjacency and the LDP session in UP state. The only exceptions are the following:

- The triggering event caused a change to the local-lsr-id parameter value. In this case, the Hello adjacency is brought down which will also cause the LDP session to be brought down if this is the last Hello adjacency associated with the session. A new Hello adjacency and LDP session will then get established to the peer using the new value of the local LSR ID.
- The triggering event caused the targeted peer shutdown option to be enabled. In this case, the Hello adjacency is brought down which will also cause the LDP session to be brought down if this is the last Hello adjacency associated with the session.

Finally, the value of any LDP parameter which is specific to the LDP/TCP session to a peer is inherited from the **config>router>ldp>session-params>peer** context. This includes MD5 authentication, LDP prefix per-peer policies, label distribution mode (DU or DOD), and so on.

The **no** form of this command deletes the binding of the template to the peer prefix list and brings down all Hello adjacencies to the discovered LDP peers.

34.15 peer-tracking-policy

peer-tracking-policy

Syntax

peer-tracking-policy *policy-name*

no peer-tracking-policy

Context

[Tree] (config>service>vprn>bgp peer-tracking-policy)

Full Context

configure service vprn bgp peer-tracking-policy

Description

This command specifies the name of a policy statement to use with the BGP peer-tracking function on the BGP sessions where this is enabled. The policy controls which IP routes in RTM are eligible to indicate reachability of IPv4 and IPv6 BGP neighbor addresses. If the longest matching route in RTM for a BGP neighbor address is an IP route that is rejected by the policy, or it is a BGP route accepted by the policy, or if there is no matching route, the neighbor is considered unreachable and BGP tears down the peering session and holds it in the idle state until a valid route is once again available and accepted by the policy.

The default peer-tracking policy (when the **no peer-tracking-policy** command is configured) is to use the longest matching active route in RTM that is not an LDP shortcut route or an aggregate route.

Note:
When **peer-tracking** is configured, the peer-tracking policy should only permit one of **direct-interface** or **direct** routes to be advertised to a BGP peer. Advertising both routes will cause the best route to oscillate.

Default

no peer-tracking-policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

Full Context

configure anysec tunnel-encryption encryption-group peer-tunnel-attributes

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

Commands in this context configure the peer tunnel attributes.

Tunnel attributes are used to match and identify the outgoing tunnels for encryptoin with ANYsec. A single tunnel attribute is used for multiple peers. Since an LSP is unidirectional, the outgoing tunnel can have different attributes from the incoming tunnel (for example, security termination policy).

Default

peer-tunnel-attributes

Platforms

7750 SR-1, 7750 SR-12e, 7750 SR-s

34.18 peer6

peer6

Syntax

peer6 *ipv6-address*

no peer6

Context

[Tree] (config>router>nat>inside>redundancy peer6)

[Tree] (config>service>vprn>nat>inside>redundancy peer6)

Full Context

configure router nat inside redundancy peer6

configure service vprn nat inside redundancy peer6

Description

This command is used in NAT64 multi-chassis redundancy in conjunction with filters. The configured peer6 address is an IPv6 address configured under an interface on the peering NAT64 node (active or standby). This IPv6 interface address is advertised via routing on the inside in order to attract traffic from the standby to the active NAT64 node.

Under normal circumstances, the NAT64 prefix is advertised only from the active NAT64 node. Consequently, upstream traffic for NAT64 is attracted to the active NAT64 node. The nat action in the ipv6-filter on the active NAT64 node forwards traffic to the local MS-ISA where NAT64 function is performed. However, if that upstream traffic arrives on the standby NAT64 node, the nat action in the IPv6-filter forwards traffic to the peer6 address (active NAT64 node).

The **no** form of the command removes the peer6 ip-address from the configuration.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ipv6-address

Specifies the IPv6 address of the NAT redundancy peer.

Values

ipv6-address:	ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

34.27 per-host-replication

per-host-replication

Syntax

per-host-replication [**uni-mac** | **mcast-mac**]

no per-host-replication

Context

[Tree] (config>subscr-mgmt>igmp-policy per-host-replication)

Full Context

configure subscriber-mgmt igmp-policy per-host-replication

Description

This command enables per-host-replication in IPoE model. For PPPoX, per-host-replication is the only mode of operation. In the per-host-replication mode, multicast traffic is replicated per each host within the subscriber irrespective of the fact that some hosts may be subscribed to the same multicast stream. As a result, in case that multiple hosts within the subscriber are registered for the same multicast group, the multicast streams of that group is generated. The destination MAC address of multicast streams is changed to unicast so that each host receives its own copy of the stream. Multicast traffic in the per-host-replication mode can be classified via the existing QoS CLI structure. As such the multicast traffic will flow through the subscriber queues. HQoS Adjustment is not needed in this case.

The alternative behavior for multicast replication in IPoE environment is per-SAP- replication. In this model, only a single copy of the multicast stream is sent per SAP, irrespective of the number of hosts that are subscribed to the same multicast group. This behavior applies to 1:1 connectivity model as well as on 1:N connectivity model (SAP centric behavior as opposed to subscriber centric behavior).

In the per-SAP-replication model the destination MAC address is multicast (as opposed to unicast in the per-host-replication model). Multicast traffic is flowing via the SAP queue which is outside of the subscriber context. The consequence is that multicast traffic is not accounted in the subscriber HQoS. In addition, HQoS Adaptation is not supported in the per SAP replication model.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no per-host-replication — By default there is no per host replication and replication is done per SAP. This mode utilizes the SAP queues. With per-host-replication it will allow the use of the subscriber queues. Per-host-replication uses unicast MAC and multicast IP to deliver multicast content to end hosts. This is useful for multi host per SAP cases. To interoperate with end devices that do not support unicast MAC, there is an option to use per-host-replication with a multicast MAC. The traffic is the same as replication per SAP but the difference of using the subscriber queues.

Parameters

uni-mac

Specifies that multicast traffic is sent with a unicast MAC and multicast IP.

mcast-mac

Specifies that multicast traffic is sent with a multicast MAC and IP.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

34.28 per-lag-hashing

per-lag-hashing

Syntax

[no] per-lag-hashing

Context

[Tree] (config>mirror>mirror-dest per-lag-hashing)

Full Context

configure mirror mirror-dest per-lag-hashing

Description

This command enables per-LAG hashing on the mirror destination.

When this command is enabled, the mirror destination SAP or SDP of type LAG uses all of the link members for flow hashing. Hashing to link members is based on IP flows.

The **no** form of this command disables per-LAG hashing. All mirrored packets sent to a SAP or SDP of type LAG, are sent to only one of the LAG link members. If the link member to which the mirrored packets are being sent fails, another link member takes over and provides mirrored packet forwarding. Although no hashing is performed, resiliency is still provided by this next link member.

Default

no per-lag-hashing

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

34.29 per-link-hash

per-link-hash

Syntax

per-link-hash

per-link-hash weighted [**auto-rebalance**] [**subscriber-hash-mode** *mode*]

no per-link-hash

Context

[Tree] (config>lag per-link-hash)

Full Context

configure lag per-link-hash

Description

This command configures per-link-hashing on a LAG. When enabled, SAPs/subscribers/interfaces are hashed on LAG egress to a single LAG link.

The **no** form of this command disables per-link-hashing on a LAG.

Default

no per-link-hash

Parameters

weighted

SAPs, subscribers, and interfaces are distributed amongst LAG links based on their preconfigured class and weight. As new links are added to a LAG, existing SAPs, subscribers, and interfaces are not impacted.

auto-rebalance

SAPs, subscribers, and interfaces are distributed amongst LAG links based on their preconfigured class and weight. As new links are added to a LAG, existing SAPs, subscribers, and interfaces are rebalanced automatically.

mode

Subscriber traffic can be load balanced over LAG member links in a weighted way. Traffic hashing can be performed based on SAPs or Vports.

SAP-based hashing supports weights configured at the subscriber level in a subscriber profile. SAP hashing mode supports only SAP and subscriber (1:1) deployment models.

Vport based load balancing supports SAP and subscriber (1:1) and SAP and service (N:1) deployment models.

configure service epipe load-balancing per-service-hashing

Description

This command enables on a per service basis, consistent per-service hashing for Ethernet services over LAG, over Ethernet tunnel (eth-tunnel) using load sharing protection-type or over CCAG. Specifically, it enables the new hashing procedures for Epipe, VPLS, regular or PBB services.

The following algorithm describes the hash-key used for hashing when the new option is enabled:

- If the packet is PBB encapsulated (contains an I-TAG ethertype) at the ingress side, use the ISID value from the I-TAG
- If the packet is not PBB encapsulated at the ingress side
  - For regular (non-PBB) VPLS and Epipe services, use the related service ID
  - If the packet is originated from an ingress IVPLS or PBB Epipe SAP
  - If there is an ISID configured use the related ISID value
  - If there is no ISID yet configured use the related service ID
  - For BVPLS transit traffic use the related flood list id
  - Transit traffic is the traffic going between BVPLS endpoints
  - An example of non-PBB transit traffic in BVPLS is the OAM traffic

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- The preceding rules apply regardless of traffic type
- Unicast, BUM flooded without MMRP or with MMRP, IGMP snooped

The **no** form of this command implies the use of existing hashing options.

34.33 per-source-rate

per-source-rate

Syntax

per-source-rate *packet-rate-limit*

no per-source-rate

Context

[Tree] (config>sys>security>cpu-protection>policy per-source-rate)

Full Context

configure system security cpu-protection policy per-source-rate

Description

This command configures a per-source packet arrival rate limit. Use this command to apply a packet arrival rate limit on a per source basis. A source is defined as a unique combination of SAP and MAC source address (mac-monitoring) or SAP and source IP address (ip-src-monitoring). The CPU will receive no more than the configured packet rate from each source (only certain protocols are rate limited for ip-src-monitoring as configured under **include-protocols** in the **cpu-protection** policy). The measurement is cleared each second.

This parameter is only applicable if the policy is assigned to an interface (some examples include saps, subscriber-interfaces, and spoke-sdps), and the **mac-monitor** or **ip-src-monitor** keyword is specified in the **cpu-protection** configuration of that interface.

The ip-src-monitoring is useful in subscriber management architectures that have routers between the subscriber and the BNG (router). In layer-3 aggregation scenarios, all packets from all subscribers behind the same aggregation router will arrive with the same source MAC address and as such the mac-monitoring functionality cannot differentiate traffic from different subscribers.

Default

per-source-rate max

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

packet-rate-limit

Specifies a per-source packet (per SAP/MAC source address or per SAP/IP source address) arrival rate limit in packets per second.

Values 1 to 65535, **max** (max indicates no limit)

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

34.34 per-spi-replication

per-spi-replication

Syntax

[**no**] **per-spi-replication**

Context

[Tree] (config>subscr-mgmt>igmp-policy per-spi-replication)

Full Context

configure subscriber-mgmt igmp-policy per-spi-replication

Description

This command enables per-SLA Profile Instance (SPI) replication. In this mode, a multicast stream is transmitted for the subscriber host SLA profile for each registered multicast group (channel). As a result, multiple copies of the same multicast stream are transmitted over the same SAP. The replication of the multicast packets depends on the number of SLA profile instances configured for the subscriber. For example, if the subscriber hosts use three SLA profiles, the (S,G) is replicated three times, but if the subscriber hosts use the same SLA profile, the (S,G) is only replicated once.

The **no** form of this command disables per-SPI replication.

Default

no per-spi-replication

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

34.35 per-user

per-user

Syntax

per-user user-directory *dir-url* **file-name** *file-name*

no per-user

Context

[Tree] (config>system>login-control>login-scripts per-user)

Full Context

configure system login-control login-scripts per-user

Description

This command allows users to define their own login scripts that can be executed each time they first login to a CLI session. The command executes the script " *file-url* / *username* / *file-name*" when the user *username* logs into a CLI session (authenticated by any means including local user database, TACACS+, or RADIUS).

For example:

per-user user-directory "cf1:/local/users" file-name "login-script.txt"

would search for the following script when user "admin" logs in and authenticates via RADIUS:

cf1:/local/users/admin/login-script.txt

The per user login script is executed after any global script executes and before any login-exec script configured against a local user is executed. This allows users, for example, who are authenticated via TACACS+ or RADIUS to define their own login scripts.

This CLI script executes in the context of the user who opens the CLI session. Any commands in the script that the user is not authorized to execute will fail.

The **no** form of this command disables the execution of any per user login-scripts.

Default

no per-user

Parameters

dir-url

Specifies the path or directory name.

file-name

configure port ethernet access egress queue-group queue-overrides queue percent-rate

configure port ethernet network egress queue-group queue-overrides queue percent-rate

Description

This command specifies percent rates (CIR and PIR).

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **percent-rate** is performed under the **hs-wrr-group** within the egress queue group template.

Parameters

pir-percent

Specifies the PIR as a percentage.

Values 0.01 to 100.00

cir-percent

Specifies the CIR as a percentage.

Values 0.00 to 100.00

configure service ipipe sap ingress queue-override queue percent-rate

configure service cpipe sap egress queue-override queue percent-rate

configure service cpipe sap ingress queue-override queue percent-rate

Description

The percent-rate command within the SAP ingress and egress QoS policy enables supports for a queue's PIR and CIR rate to be configured as a percentage of the egress port's line rate or of its parent scheduler's rate.

When the rates are expressed as a port-limit, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy is used on a 1-Gb and a 10-Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QOS policy to be used on SAPs on different ports without needing to use SAP based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's PIR and CIR rates will be recalculated based on the defined percentage value.

When the rates are expressed as a local-limit, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate. This enables the same QOS policy to be used on SAPs with different parent scheduler rates without needing to use SAP based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the parent scheduler rate changes after the queue is created, the queue's PIR and CIR rates will be recalculated based on the defined percentage value.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Queue rate overrides can only be specified in the form as configured in the QoS policy (a SAP override can only be specified as a percent-rate if the associated QoS policy was also defined as percent-rate). Likewise, a SAP override can only be specified as a rate (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QOS policy.

When no percent-rate is defined within a SAP ingress or egress queue-override, the queue reverts to the defined shaping and CIR rates within the SAP ingress and egress QOS policy associated with the queue.

Parameters

percent-of-line-rate

The percent-of-line-rate parameter is used to express the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

pir-percent

Specifies the queue's PIR as a percentage dependent on the use of the port-limit or local-limit.

Values 0.01 to 100.00

Default 100.00

cir-percent

Specifies the queue's CIR as a percentage dependent on the use of the port-limit or local-limit.

Values 0.00 to 100.00

Default 100.00

Full Context

configure service vpls sap egress queue-override queue percent-rate

configure service vpls sap ingress queue-override queue percent-rate

Description

The **percent-rate** command supports a queue's shaping rate and CIR rate as a percentage of the egress port's line rate. When the rates are expressed as a percentage within the template, the actual rate used per instance of the queue group queue-id will vary based on the port speed. For example, when the same template is used to create a queue group on a 1-Gb and a 10-Gb Ethernet port, the queue's rates will be 10 times greater on the 10-Gb port due to the difference in port speeds. This enables the same template to be used on multiple ports without needing to use port based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's shaping and CIR rates will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the percent-rate command and the **rate** command is executed, the percent-rate values are deleted. In a similar fashion, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

An egress port queue group queue rate override may be expressed as either a percentage or an explicit rate independent on how the queue's template rate is expressed.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case the configuration of the **percent-rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns the queue to its default shaping **rate** and **cir** rate. When **no percent-rate** is defined within a port egress queue group queue override, the queue reverts to the defined shaping and CIR rates within the egress queue group template associated with the queue.

Parameters

pir-percent

Specifies the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

Full Context

configure qos sap-egress policer percent-rate

configure qos sap-ingress policer percent-rate

Description

The percent-rate command within the SAP ingress and egress QoS policies enables supports for a policer's PIR and CIR rate to be configured as a percentage of the immediate parent root policer/arbiter rate or the FP capacity.

This enables the same QoS policy to be used on SAPs on different FPs without needing to use SAP-based policer overrides to modify a policer's rate to get the same relative performance from the policer.

If the parent arbiter rate changes after the policer is created, the policer's PIR and CIR rates will be recalculated based on the defined percentage value.

The rate and percent-rate commands override one another. If the current rate for a policer is defined using the percent-rate command and the rate command is executed, the percent-rate values are deleted. In a similar fashion, the percent-rate command causes any rate command values to be deleted. A policer's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

The **no** form of this command returns the queue to its default shaping rate and CIR rate.

Parameters

pir-percent

Specifies the policer's PIR as a percentage of the immediate parent root policer/arbiter rate or the FP capacity.

Values Percentage ranging from 0.01 to 100.00

Default 100.00

cir-percent

The **cir** keyword is optional and, when defined, the required cir-percent CIR parameter expresses the policer's CIR as a percentage of the immediate parent root policer/arbiter rate or the FP capacity.

Values Percentage ranging from 0.00 to 100.00

Default 100.00

local-limit

Keyword used to specify the local limit.

reference-port-limit

Keyword used to specify the reference port limit.

Full Context

configure qos sap-ingress queue percent-rate

Description

This command configures a queue's PIR and CIR as a percentage of the ingress port line rate or as a percentage of its parent scheduler rate. When the rates are expressed as a **port-limit**, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy is used on a 1 Gb and a 10 Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QoS policy to be used on SAPs on different ports without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port’s speed changes after the queue is created, the queue’s PIR, CIR, and FIR rates will be recalculated based on the defined percentage value.

When the rates are expressed as a **local-limit**, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate. This enables the same QoS policy to be used on SAPs with different parent scheduler rates without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue. If the parent scheduler rate changes after the queue is created, the queue's PIR, CIR, and FIR will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

Queue rate overrides can only be specified in the form configured in the QoS policy (for example, a SAP override can only be specified as a **percent-rate** if the associated QoS policy was also defined as percent-rate). Likewise, a SAP override can only be specified as a **rate** (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QoS policy.

When no **percent-rate** is defined within a SAP ingress queue-override, the queue uses the defined shaping rate, CIR, and FIR within the SAP ingress QoS policy associated with the queue.

The **no** form of this command returns the queue to its default shaping rate, CIR, and FIR.

© 2025 Nokia.

Parameters

pir-percent

Specifies the queue's PIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.01 to 100.00

Default 100.00

cir-percent

Specifies the queue's CIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.00 to 100.00

Default 100.00

fir-percent

Specifies the queue's FIR as a percentage dependent on the use of the **port-limit** or **local-limit**. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

Values 0.00 to 100.00

Default 100.00

police

Keyword used to specify that traffic feeding into the physical queue instance above the specified PIR rate is dropped. When the **police** keyword is defined, only the PIR rate may be overridden. The **police** keyword is only applicable to SAP ingress.

port-limit

Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the rate of the port (including the ingress-rate setting) to which the queue is attached. The **port-limit** is the default.

local-limit

Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the queue's parent scheduler rate. If there is no parent scheduler rate, or its rate is **max**, the **port-limit** is used.

reference-port-limit

Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the rate of the reference port (including the ingress-rate setting) to which the queue is attached.

percent-rate

Syntax

percent-rate *pir-percent* [**cir** *cir-percent*] [{**port-limit** | **local-limit** | **reference-port-limit**}]

no percent-rate

Context

[Tree] (config>qos>sap-egress>queue percent-rate)

Full Context

configure qos sap-egress queue percent-rate

Description

This command configures a queue's PIR and CIR as a percentage of the egress port line rate or as a percentage of its parent scheduler rate or **agg-rate** rate. When the rates are expressed as a **port-limit**, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy is used on a 1 Gb and a 10 Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QoS policy to be used on SAPs on different ports without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's PIR and CIR will be recalculated based on the defined percentage value.

When the rates are expressed as a **local-limit**, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate or **agg-rate** rate. This enables the same QoS policy to be used on SAPs with different parent scheduler rates without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue. If the parent scheduler rate changes after the queue is created, the queue's PIR and CIR will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

Queue rate overrides can only be specified in the form as configured in the QoS policy (a SAP override can only be specified as a **percent-rate** if the associated QoS policy was also defined as percent-rate). Likewise, a SAP override can only be specified as a rate (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QoS policy.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **percent-rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

When no **percent-rate** is defined within a SAP egress queue-override, the queue uses the defined shaping rate and CIR within the SAP egress QoS policy associated with the queue.

The **no** form of this command returns the queue to its default shaping rate and CIR.

Use subject to Terms available at: www.nokia.com/terms.

Parameters

pir-percent

Specifies the queue's PIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.01 to 100.00

Default 100.00

cir-percent

Specifies the queue's CIR as a percentage dependent on the use of the **port-limit** or **local-limit.**

Values 0.00 to 100.00

Default 100.00

port-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the port (including the **egress-rate** setting) to which this queue connects. The **port-limit** is the default.

local-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the queue's parent scheduler **rate** or **agg-rate** rate at egress. If there is no parent scheduler rate or **agg-rate** rate, or those rates are **max**, the **port-limit** is used.

reference-port-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the reference port (including the **egress-rate** setting) to which this queue connects.

configure qos queue-group-templates ingress queue-group queue percent-rate

Description

This command configures a queue's PIR and CIR as a percentage of the ingress port line rate or as a percentage of its parent scheduler rate. When the rates are expressed as a **port-limit**, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

is used on a 1 Gb and a 10 Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QoS policy to be used on SAPs on different ports without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's PIR, CIR, and FIR rates will be recalculated based on the defined percentage value.

When the rates are expressed as a **local-limit**, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate. This enables the same QoS policy to be used on SAPs with different parent scheduler rates without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue. If the parent scheduler rate changes after the queue is created, the queue's PIR, CIR, and FIR will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

Queue rate overrides can only be specified in the form configured in the QoS policy (for example, a SAP override can only be specified as a **percent-rate** if the associated QoS policy was also defined as percent-rate). Likewise, a SAP override can only be specified as a **rate** (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QoS policy.

When no **percent-rate** is defined within a SAP ingress queue-override, the queue uses the defined shaping rate, CIR, and FIR within the SAP ingress QoS policy associated with the queue.

The **no** form of this command returns the queue to its default shaping rate, CIR, and FIR.

Parameters

pir-percent

Specifies the queue's PIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.01 to 100.00

Default 100.00

cir-percent

Specifies the queue's CIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.00 to 100.00

Default 100.00

fir-percent

Specifies the queue's FIR as a percentage dependent on the use of the **port-limit** or **local-limit**. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

Values 0.00 to 100.00

Default 100.00

Context

[Tree] (config>qos>qgrps>egr>queue-group>queue percent-rate)

Full Context

configure qos queue-group-templates egress queue-group queue percent-rate

Description

The **percent-rate** command within the egress queue group template enables support for a queue's PIR and CIR rate to be configured as a percentage of the egress port's line rate. When the rates are expressed as a percentage within the template, the actual rate used per instance of the queue group *queue-id* will vary based on the port speed. For example, when the same template is used to create a queue group on a 1-Gb and a 10-Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same template to be used on multiple ports without needing to use port-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's shaping and CIR rates will be recalculated based on the defined percentage value.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case the configuration of the rate is performed under the **hs-wrr-group** within the egress queue group template.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

The **no** form of this command returns the queue to its default shaping rate and CIR rate.

Parameters

pir-percent

Expresses the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation and the egress rate setting.

Values 0.01 to 100.00 percent

Default 100.0

cir-percent

The **cir** keyword is optional and when defined, the required *pir-percent* parameter expresses the queue's committed scheduling rate as a percentage of line rate. The line rate associated with the queue's port may change dynamically due to configuration or auto-negotiation and the egress rate setting.

Values 0.01 to 100.00 percent

Default 100.0

port-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the port (including the **egress-rate** setting) to which this queue connects. The **port-limit** is the default.

local-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the queue's parent scheduler **rate** or **agg-rate** rate at egress. If there is no parent scheduler rate or **agg-rate** rate, or those rates are **max**, the **port-limit** is used.

reference-port-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the reference port (including the **egress-rate** setting) to which this queue connects.

Platforms

All

configure qos port-scheduler-policy group percent-rate

Description

The percent-rate command within the port scheduler policy group enables support for a policer's PIR and CIR rate to be configured as a percentage of the immediate parent root policer/arbiter rate or the FP capacity.

If the parent arbiter rate changes after the policer is created, the policer's PIR and CIR rates will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a policer is defined using the percent-rate command and the rate command is executed, the percent-rate values are deleted. In a similar fashion, the percent-rate command causes any rate command values to be deleted. A policer's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

The **no** form of this command returns the queue to its default shaping rate and cir rate.

Parameters

pir-percent

Specifies the policer's PIR as a percentage of the immediate parent root policer/arbiter rate or the FP capacity.

Values Percentage ranging from 0.01 to 100.00.

Default 100.00

cir *cir-percent*

The **cir** keyword is optional and, when defined, the required cir-percent CIR parameter expresses the policer's CIR as a percentage of the immediate parent root policer/arbiter rate or the FP capacity.

Values Percentage ranging from 0.00 to 100.00.

configure mcast-management bandwidth-policy t2-paths primary-path queue-parameters drop-tail low percent-reduction-from-mbs

configure mcast-management bandwidth-policy t2-paths secondary-path queue-parameters drop-tail low percent-reduction-from-mbs

Description

This command overrides the default percentage value used to determine the low drop-tail value for the queue. By default, 10 percent of the queue depth is reserved for high congestion priority traffic. When specified, the **percent-reduction-from-mbs** percentage value is applied to the queues' MBS threshold. The resulting value is subtracted from the MBS to derive the low drop-tail threshold maintained by the queue. The low drop-tail threshold defines the point at which all low-congestion priority packets destined for the queue are discarded based on queue depth. Low- and high-congestion priority is derived from the multicast records preference value compared to the record's bundle priority threshold.

The **no** form of this command restores the default value.

Default

percent-reduction-from-mbs 10

Parameters

percent

Specifies the percent of queue depth reserved for high-congestion priority traffic.

Values 0 to 100, default

0 specifies that the MBS and low drop-tail thresholds be set to the same value resulting in high- and low-congestion priority packets being treated equally.

100 specifies that the low drop-tail threshold is set to 0, resulting in all low-congestion priority packets being discarded.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values between 0 and 100 result in a corresponding differential between the MBS and the low drop-tail threshold values.

Platforms

Context

[Tree] (config>qos>sap-ingress>queue>drop-tail>low percent-reduction-from-mbs)

Full Context

configure qos sap-ingress queue drop-tail low percent-reduction-from-mbs

Description

This command configures the ingress SAP low drop tail as a percentage reduction from the MBS of the queue. For example, if a queue has an MBS of 600 kbytes and this percentage is configured to be 30% for the low drop tail, then the low drop tail will be at 420 kbytes and out-of-profile packets will not be accepted into the queue if its depth is greater than this value and will be discarded.

Default

percent-reduction-from-mbs 10

Parameters

percent

Specifies the percentage reduction from the MBS for a queue drop tail.

Values 0 to 100, default

Platforms

All

percent-reduction-from-mbs

Syntax

percent-reduction-from-mbs *percent*

no percent-reduction-from-mbs

Description

This command configures the egress SAP queue drop tails as a percentage reduction from the MBS of the queue. For example, if a queue has an MBS of 600 kbytes and this percentage is configured to be 30% for the low drop tail, then the low drop tail will be at 420 kbytes and out-of-profile packets will not be accepted into the queue if its depth is greater than this value and will be discarded.

The drop tails apply to packets with the following profile state:

- Exceed drop tail: exceed-profile
- High drop tail: in-profile
- Highplus drop tail: inplus-profile
- Low drop tail: out-of-profile

Default

Exceed drop tail: 20%

Low drop tail: 10%

High drop tail: 0%

Highplus drop tail: 0%

Parameters

percent

Specifies the percentage reduction from the MBS for a queue drop tail.

Values 0 to 100, default

Context

[Tree] (config>qos>network-queue>queue>drop-tail>low percent-reduction-from-mbs)

Full Context

configure qos network-queue queue drop-tail low percent-reduction-from-mbs

Description

This command configures the ingress and egress network queue low drop tail as a percentage reduction from the MBS of the queue. For example, if a queue has an MBS of 600 kbytes and **percent-reduction-from-mbs** is configured to be 30% for the low drop tail, then the low drop tail will be at 420 kbytes and

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

out-of-profile packets will not be accepted into the queue if its depth is greater than this value and will be discarded.

The exceed drop tail is not configurable for network queues, however, it is set to a value of 10% in addition to low drop tail and capped by the MBS.

Default

percent-reduction-from-mbs 10

Parameters

percent

Specifies the percentage reduction from the MBS for a queue drop tail.

Values 0 to 100, default

Platforms

periodic-update interval *hours* [**rate-limit** *rate*]

no periodic-update

Context

[Tree] (config>aaa>isa-radius-plcy periodic-update)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure aaa isa-radius-policy periodic-update

Description

This command enables periodic RADIUS logging of currently allocated port blocks for a NAT subscriber (NAT binding).

Default

no periodic-update (no Interim Update messages are sent)

Parameters

interval *hours*

Specifies the interval at which RADIUS logging is refreshed. The log generation might delayed past the configured interval value if the message pacing (rate-limit) is enabled or when the number of un-acknowledged (pending) messages in SR OS has reached its upper limit. An increased number of pending Interim Update messages in SR OS is due to lack of adequate responsiveness of the RADIUS server.

Values 1 to 72

rate-limit *rate*

Specifies the pacing of the Interim Update messages related to refreshment of the currently allocated port blocks. By default, when this command is disabled, the messages are sent at a high rate determined by the processing capability of the SR OS. Such a high message rate can exceed the processing power of the logging server which can result in the loss of logging information. To overcome this, the Interim Update messages can be generated in a staggered manner at a configured interval that is accommodating toward the processing capabilities of the logging server.

Default 1 to 100000 messages per second

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure isa nat-group log periodic-update

configure isa wlan-gw-group nat log periodic-update

Description

This command configures period updates for NAT logs about the mapping between the IP address on the inside and the IP address and port blocks on the outside. These logs can be recorded in system memory, local files, SNMP, or syslog.

This command does not affect other types of NAT logging, such as RADIUS logging or flow logging (for example, IPFIX, or syslog).

Default

no periodic-update

Parameters

interval *minutes*

Specifies the interval, in minutes, at which periodic logs are generated for each NAT subscriber.

Values 10 to 1440

rate-limit *packets-per-second*

Specifies the maximum rate at which the ESA-VM sends NAT log messages to the CPM. The specified rate is applied per ISA group, ensuring that each ESA-VM receives a proportionate share of the rate based on the total number of ESA-VMs in the group.

Default 1 to 100000

Default 10000

Default

permit-empty-passwords

Platforms

All

34.48 persist

persist

Syntax

persist {**on** | **off**}

Context

[Tree] (bof persist)

Full Context

bof persist

Description

This command specifies whether the system will preserve system indexes when a **save** command is executed in classic or mixed configuration mode. During a subsequent boot, the index file is read along with the configuration file. As a result, a number of system indexes are preserved between reboots, including the interface index, LSP IDs, path IDs, and so on. This reduces resynchronizations of the Network Management System (NMS) with the affected network element.

This command is ignored in model-driven configuration mode. In model-driven mode, system indices are always saved and they are embedded in the configuration file.

In the event that persist is **on** and the reboot with the appropriate index file fails in classic or mixed configuration mode, SNMP is operationally shut down to prevent the management system from accessing and possibly synchronizing with a partially booted or incomplete network element. To enable SNMP access, enter the **config>system>snmp>no shutdown** command.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If **persist** is enabled and the **admin save** *url* command is executed with an FTP path used as the *url* parameter, two FTP sessions simultaneously open to the FTP server. The FTP server must be configured to allow multiple sessions from the same login, otherwise, the configuration and index files will not be saved correctly.

Note:

- In classic or mixed configuration mode, persistency files (.ndx) are saved on the same disk as the configuration files and the image files.
- When an operator sets the location for the persistency file in classic or mixed configuration mode, the system will check to ensure that the disk has enough free space. If there is not enough free space, the persistency will not become active and a trap will be generated. Then, it is up to the operator to free adequate disk space. In the meantime, the system will perform a space availability check every 30 seconds. As soon as the space is available the persistency will become active on the next (30 second) check.

Default

persist off

Parameters

on

Enables the system index saves between reboots.

off

Disables the system index saves between reboots.

34.56 pfs

pfs

Syntax

pfs [**dh-group** {**1** | **2** | **5** | **14** | **15** | **19** | **20** | **21**}]

no pfs

Context

[Tree] (config>ipsec>ike-policy pfs)

Full Context

configure ipsec ike-policy pfs

Description

This command enables perfect forward secrecy on the IPsec tunnel using this policy. PFS provides for a new Diffie-Hellman key exchange each time the SA key is renegotiated. After that SA expires, the key is forgotten and another key is generated (if the SA remains up). This means that an attacker who cracks part of the exchange can only read the part that used the key before the key changed. There is no advantage in cracking the other parts if they attacker has already cracked one.

The **no** form of this command disables PFS. If this it turned off during an active SA, when the SA expires and it is time to re-key the session, the original Diffie-Hellman primes will be used to generate the new keys.

Default

no pfs

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

dh-group {1 | 2 | 5 | 14 | 15 | 19 | 20 | 21}

Specifies which Diffie-Hellman group to use for calculating session keys. More bits provide a higher level of security, but require more processing. Three groups are supported with IKE-v1:

Group 1: 768 bits

Group 2: 1024 bits

Group 5: 1536 bits

Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vprn>mvpn>pt>inclusive pim)

Full Context

configure service vprn mvpn provider-tunnel inclusive pim

Description

This command specifies the PIM mode to use, ASM or SSM, for PIM-based inclusive provider tunnels and the multicast group address to use. Also enables the context for specifying parameters for PIM peering on the inclusive provider tunnel.

Auto-discovery must be enabled in order for SSM to operate.

The **no** form of this command removes the pim context including the statements under the context.

Default

no pim

Parameters

asm

Specifies to use PIM ASM for inclusive provider tunnels.

ssm

Specifies to u PIM SSM for inclusive provider tunnels.

group-address

Specifies the multicast group address to use.

Platforms

All

pim

Syntax

[**no**] **pim**

Context

[Tree] (config>service>vprn pim)

Full Context

configure service vprn pim

Description

This command configures a Protocol Independent Multicast (PIM) instance in the VPRN service. When an PIM instance is created, the protocol is enabled. PIM is used for multicast routing within the network.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Devices in the network can receive the multicast feed requested and non-participating routers can be pruned. The router supports PIM sparse mode (PIM-SM).

The **no** form of this command deletes the PIM protocol instance removing all associated configuration parameters.

Platforms

All

pim

Syntax

[**no**] **pim**

Context

[Tree] (config>router pim)

Full Context

configure router pim

Description

This command enables a Protocol Independent Multicast (PIM) instance.

PIM is used for multicast routing within the network. Devices in the network can receive the multicast feed requested and non-participating routers can be pruned. The router OS supports PIM sparse mode (PIM-SM).

The **no** form of this command disables the PIM instance.

Default

no pim

34.65 pim-snooping

pim-snooping

Syntax

pim-snooping [**saps**] [**spoke-sdps**]

no pim-snooping

Context

[Tree] (config>redundancy>multi-chassis>peer>sync pim-snooping)

Full Context

configure redundancy multi-chassis peer sync pim-snooping

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies whether PIM snooping for IPv4 information should be synchronized with a multi-chassis peer. Entering **pim-snooping** without any parameters results in the synchronization being applied only to SAPs.

Specifying the **spoke-sdps** parameter results in the synchronization being applied to manually configured spoke SDPs. Specifying both the **saps** and **spoke-sdps** parameters results in the synchronization being applied to both SAPs and manually configured spoke SDPs.

The synchronization of PIM snooping is only supported for manually configured spoke SDPs but is not supported for spoke SDPs configured within an endpoint. See PIM Snooping for IPv4 Synchronization for service support.

Default

no pim-snooping

Parameters

saps

Specifies that SAPs are to be synchronized with the multi-chassis peer according to the synchronization tags configured on the port. This is the default when no parameters are specified.

spoke-sdps

Specifies that spoke SDPs are to be synchronized with the multi-chassis peer according to the synchronization tags configured on spoke SDPs.

Platforms

All

pim-snooping

Syntax

Context

[Tree] (ping)

Full Context

ping

Description

This command sends a ping to a destination to verify IP reachability.

Use the **ping** {*ip-address* | *dns-name*} [{**bypass-routing** | {**interface** *interface-name*} | {**next-hop** *ip-address*}}] command syntax to send a generic ping. This is the basic TCP/IP utility to verify IP reachability.

Use the **ping** *ipv4-address* **subscriber-id** *sub-ident-string* command syntax to send a ping to verify L2-Aware remote host reachability.

The L2-Aware form of this command can be initiated from the gateway IPv4 address in the inside routing context or from any IPv4 address in the outside routing context. If the gateway IPv4 address is used as the source address, it must be explicitly specified in conjunction with the L2-Aware syntax.

Any source address can be used for the ping to test the relevant NAT policy. If the source address refers to a policy that is not configured on the router, the message "MINOR: OAM #2160 router ID is not an outside router for this subscriber” is displayed. The source address does not need to belong to the system.

If the outside routing context is not specified, by default, the Base router is selected. If the specified or default Base router instance is not the outside routing context for the subscriber, the L2-Aware form of this command fails to execute, and the message "MINOR: OAM #2160 router ID is not an outside router for this subscriber” is displayed.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The NAT application shares query IDs between L2-Aware pings and ICMP or GRE traffic that has undergone NAT and is destined for a DMZ host. If there is query ID space exhaustion, ICMP or GRE flows destined for DMZ hosts are deleted, so their query IDs can be reused for the requested L2-Aware pings.

Use the **ping srv6-policy color** *color* **endpoint** *ipv6-address* command syntax to launch a ping for an SRv6 policy matching a specific color and endpoint. The ping probe may optionally be targeted at a specific segment list of the SRv6 policy. When the segment list is not specified, the ping probe is sent on the lowest available segment list.

Parameters

bypass-routing

Specifies whether to send the ping request to a host on a directly attached network, bypassing the routing table.

bytes

Specifies the request packet size in bytes, expressed as a decimal integer.

Values 0 to 16384

Default 56

candidate-path

Specifies a candidate path of the SRv6 policy to ping. The candidate path does not need to be the currently active candidate path.

centiseconds

Sets the interval in centiseconds.

Values 1 to 10000 centiseconds if **rapid** is selected.

Default 1 centisecond if **rapid** is selected.

detail

Displays detailed information.

distinguisher

Specifies the distinguisher of the SRv6 policy candidate path to send the ping probe on. This parameter must be configured if **protocol-owner** is configured to **bgp**.

Values 1 to 4294967295

do-not-fragment

Sets the DF (Do Not Fragment) bit in the ICMP ping packet (does not apply to ICMPv6).

dns-name

Specifies the DNS name of the far-end device on which to send the **svc-ping** request message, expressed as a character string.

fc-name

Specifies the forwarding class of the MPLS echo request packets.

Values be, l2, af, l1, h2, ef, h1, nc

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default nc

interface-name

Specifies the name of an IP interface. The name must already exist in the **configure router interface** context.

ip-address

Specifies the far-end IP address, in dotted decimal notation, on which to send the **svc-ping** request message.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x[-*interface*]	
	x:x:x:x:x:x:d.d.d.d[-*interface*]	
	x:	[0 to FFFF]H
	d:	[0 to 255]D
	interface:	up to 32 characters, mandatory for link local addresses

next-hop *ip-address*

Displays only static routes with the specified next hop IP address.

Values

ipv4-address:	a.b.c.d (host bits must be 0)	
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]

pattern

Specifies that the date portion in a ping packet that is filled with the pattern value specified. If not specified, position information is filled instead.

Values 0 to 65535

Default system-generated sequential pattern

preference

Specifies the preference of the SRv6 policy candidate path to send the ping probe on.

Values 0 to 4294967295

Default 100

protocol-owner

Specifies the protocol owner of the SRv6 policy candidate path to ping.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values bgp — Specifies a BGP SRv6 policy.

static — Specifies a locally configured static SRv6 policy.

rapid

Specifies that packets be generated as fast as possible instead of the default 1 per second. Changes the units for the **interval** command from seconds to centiseconds.

requests

Specifies the number of times to perform an OAM ping probe operation. Each OAM echo message request must either time out or receive a reply before the next message request is sent.

Values 1 to 100000

Default 5

router-instance

Specifies the preferred method for entering a service name. Stored as the service name. This is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

Values router-name: Base, management, *cpm-vr-name*, vpls-management

vprn-svc-name: The service name, up to 64 characters

cpm-vr-name: The CPM VR name, up to 32 characters

router-or-service

Specifies the routing instance or service, by number. The *router-instance* parameter is preferred for specifying the router or service.

Values router-name: Base, management, vpls-management

vprn-svc-id: 1 to 2147483647

Default Base

seconds

Overrides the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Default 5

Values 1 to 10

secs

Sets the interval in seconds.

Values 1 to 1000 seconds if **secs** is selected.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 1 second if **secs** is selected.

service-name

Specifies the alias function that allows the service-name to be used, converted, and stored as a service ID.

sub-ident-string

Specifies the L2-Aware NAT subscriber to which ICMP-ping is sent, up to 32 characters. The **subscriber-id** keyword serves as a differentiator between the subscribers with the same IP address in the same routing context (which is allowed in L2-Aware NAT). The **subscriber-id** keyword is mandatory for L2-Aware IPv4 ping, but optional in generic ping framework.

source *ip-address*

Specifies the IP address to be used.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

timeout

Specifies the time out, in seconds.

Values 1 to 10

Default 5

type-of-service

Specifies the service type.

Values 0 to 255

Default 0

time-to-live

Specifies the TTL value for the MPLS label, expressed as a decimal integer.

Values 1 to 128

Default 64

srv6-policy

Keyword to specify that the ping probe is applied to an SRv6 policy.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

color-id

Specifies the SRv6 policy color ID.

Values 0 to 4294967295

endpoint *ipv6-address*

Specifies an endpoint as the target of the ping.

Values

ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

segment-list

Specifies the segment list to trace.

Values 1 to 32

Full Context

configure router interface ipv6 vrrp ping-reply

configure router interface vrrp ping-reply

Description

This command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

SR OS allows this access limitation to be selectively lifted for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ping-reply** command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses. The Ping request can be received on any routed interface. Ping must not have been disabled at the management security level (either on the parental IP interface or based on the Ping source host address).

When **ping-reply** is not enabled, ICMP echo requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP echo requests regardless of the **ping-reply** setting.

The **ping-reply** command is only available in non-owner **vrrp** nodal context.

By default, ICMP echo requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command configures discarding all ICMP echo request messages destined to the non-owner virtual router instance IP addresses.

Default

no ping-reply — ICMP echo requests to the virtual router instance IP addresses are discarded.

Description

This command maps a **ping-template** name to the service IP interface. The **ping-template** *template-name* is configured in the **config>test-oam>icmp** context and assigned to the service IP interface using this command.

The **config>service>ies|vprn**>if>ping-template must be shut down to remove or change the **destination-address** value.

The **no** form of this command removes the template name from the configuration.

Parameters

template-name

Specifies the name of the ping template to be assigned to the IP interface, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure mcast-management multicast-info-policy video-policy video-interface pip

Description

Commands in this context configure within a video interface policy the properties relating to requests received by the video interface for Picture-in-Picture (PIP) channel requests.

Platforms

7450 ESS, 7750 SR, 7750 SR-s

34.73 pir

pir

Syntax

pir *pir-value*

no pir

Context

[Tree] (config>filter>policer pir)

Full Context

configure filter policer pir

Description

This command configures the peak information rate (PIR) for the policer.

The **mbs** and **pir** command options and the **pps-pir** command option are mutually exclusive. That is, the **pps-pir** option cannot be configured when the **mbs** or **pir** options are configured.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the configuration.

Parameters

pir-value

Specifies the PIR value in kilobits per second.

Value 0 to 2000000000

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

pir

Syntax

configure service ies interface ipsec ipsec-tunnel icmp6-generation pkt-too-big

configure ipsec tunnel-template icmp6-generation pkt-too-big

configure service vprn interface sap ipsec-tunnel icmp6-generation pkt-too-big

Description

This command enables the system to send ICMPv6 PTB (Packet Too Big) messages on the private side and optionally specifies the rate.

With this command configured, the system sends PTB back if it received an IPv6 packet on the private side that is bigger than 1280 bytes and also exceeds the private MTU of the tunnel.

The **ip-mtu** command (under **ipsec-tunnel** or **tunnel-template**) specifies the private MTU for the ipsec-tunnel or dynamic tunnel.

The **no** form of this command reverts **interval** and **message-count** values to their default values.

Platforms

configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms pmt-repetition

configure mcast-management multicast-info-policy bundle video analyzer alarms pmt-repetition

Description

This command configures the analyzer to check for the program map table (PMT). It is expected that the PMT arrives periodically within a certain interval range. It is possible to configure the type of alarm that is raised when the PMT fails to arrive within the specified interval. As the delay increases between two consecutive PMTs, the type of alarm raised becomes more critical, from TNC to POA.

Default

no pmt-repetition

Parameters

tnc-milli-seconds

Specifies the time, in milliseconds, for which a TNC alarm is raised if the interval between two consecutive PMTs is greater than or equal to this configured value.

Values 100 to 4800 in multiples of 100 only

Default 400

qos-milli-seconds

Specifies the time, in milliseconds, for which a QoS alarm is raised if the interval between two consecutive PMTs is greater than or equal to this configured value.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 200 to 4900 in multiples of 100 only and higher than the *tnc-milli-seconds* value

Default 800

poa-milli-seconds

Specifies the time, in milliseconds, for which a POA alarm is raised if the interval between two consecutive PMTs is greater than or equal to this configured value.

Values 300 to 5000 in multiples of 100 only and higher than the *qos-milli-seconds* value

Default 2000

configure subscriber-mgmt sla-profile ingress qos policer

configure subscriber-mgmt sla-profile egress qos policer

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is used in the sap-ingress and sap-egress QoS policies to create, modify or delete a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may have up to 32 policers (numbered 1 through 32) may be defined while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer may be defined within a QoS policy, it is not actually created on SAPs or subscribers associated with the policy until a forwarding class is mapped to the policer's ID.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

Once a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS respectively). Unlike queues which have dedicated counters, policers allow various stat-mode settings that define the counters that is associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

Once a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping will fail.

The **no** form of this command is used to delete a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscribers associated with the QoS policy once all forwarding classes have been moved away from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

Parameters

policer-id

Specifies the policer ID. The policer-id must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID is created (depending on the system's current create keyword requirements which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

Values 1 to 63

configure card fp ingress access queue-group policer-override policer

configure card fp ingress network queue-group policer-override policer

Description

This command creates, modifies or deletes a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may have up to 32 policers (numbered 1 through 32) may be defined while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer may be defined within a QoS policy, it is not actually created on SAPs or subscribers associated with the policy until a forwarding class is mapped to the policer's ID.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

Once a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS respectively). Unlike queues which have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

Once a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping fails.

The **no** form of this command deletes a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscribers associated with the QoS policy once all forwarding classes have been moved away from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

Parameters

policer-id

Specifies that the *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

configure service ipipe sap ingress policer-override policer

configure service cpipe sap ingress policer-override policer

configure service epipe sap egress policer-override policer

configure service cpipe sap egress policer-override policer

configure service ipipe sap egress policer-override policer

Description

This command, within the SAP ingress or egress contexts, is used to create a CLI node for specific overrides to a specific policer created on the SAP through a sap-ingress or sap-egress QoS policy.

The **no** form of this command is used to remove any existing overrides for the specified policer-id.

Parameters

policer-id

The *policer-id* parameter is required when executing the policer command within the policer-overrides context. The specified *policer-id* must exist within the sap-ingress or sap-egress QoS policy applied to the SAP. If the policer is not currently used by any forwarding class or forwarding type mappings, the policer will not actually exist on the SAP. This does not preclude creating an override context for the policer-id.

create

The create keyword is required when a **policer** policer-id override node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit confirmation, the create keyword is not required.

Platforms

configure application-assurance group policer

Description

This command creates application assurance policer profile of a specified type. Policers can be bandwidth or flow limiting and can have a system scope (limits traffic entering AA ISA for all or a subset of AA subscribers), subscriber scope or granularity (limits apply to each AA subscriber traffic).

The policer type and granularity can only be configured during creation. They cannot be modified. The policer profile must be removed from all AQPs in order to be removed. Changes to policer profile parameters take effect immediately for policers instantiated as result of AQP actions using this profile.

The **no** form of this command deletes the specified policer from the configuration.

Parameters

policer-name

Specifies a string of up to 32 characters that identifies the policer.

type

Specifies the policer type.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values **single-bucket-bandwidth** — Creates a profile for a single bucket (PIR) bandwidth limiting policer.

dual-bucket-bandwidth — Creates profile for a dual bucket (PIR, CIR) bandwidth limiting policer.

flow-rate-limit — Creates profile for a policer limiting rate of flow set-ups.

flow-count-limit — Creates profile for a policer limiting total flow count.

granularity

Specifies the granularity type.

Values **system** — Creates a system policer profile for a policer that limits the traffic in the scope of all or a subset of AA subscribers on a given AA ISA.

subscriber — Creates a policer profile for a policer for each AA subscriber that limits the traffic in the scope of that subscriber.

access-network-location — Creates a policer profile for a policer instance for each ANL that limits traffic bandwidth in the scope of that ANL. For ANL, only single-bucket bandwidth policers can be configured.

flow — Creates a policer profile for a policer instance for each IP flow that limits the traffic in the scope of an individual flow. Only single-bucket bandwidth policers with the permit-deny or monitor actions can be configured.

create

Keyword used to create the policer name and parameters.

Description

This command configures a TCA for the counter capturing drops or admit events due to the specified flow policer. A policer TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a policer TCA.

Parameters

policer-name

Specifies the name of the flow policer, up to 32 characters

direction

Specifies the traffic direction.

Values from-sub, to-sub

create

Keyword used to create the TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Syntax

policer *policer-id* [**fp-redirect-group**]

no policer

Context

[Tree] (config>qos>sap-ingress>fc policer)

Full Context

configure qos sap-ingress fc policer

Description

Within a sap-ingress QoS policy forwarding class context, the **policer** command is used to map packets that match the forwarding class and are considered unicast in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination. If ingress forwarding logic has resolved a unicast destination (the packet does not need to be sent to multiple destinations), it is considered to be a unicast packet and will be mapped to either an ingress queue (using the **queue** *queue-id* or **queue** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**policer** *policer-id*). The **queue** and **policer** commands within the forwarding class context are mutually exclusive. By default, the unicast forwarding type is mapped to the SAP ingress default queue (queue 1). If the **policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the unicast forwarding type within the forwarding class is overridden if the policer mapping is successful.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

When the unicast forwarding type within a forwarding class is mapped to a policer, the unicast packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unicast forwarding type within the forwarding class to the default queue. If all forwarding class forwarding types had been removed from the default queue, the queue will not exist on the SAPs or subscriber or multiservice sites associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the unicast forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters

policer-id

When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

fp-redirect-group

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

Context

[Tree] (config>qos>sap-ingress policer)

Full Context

configure qos sap-ingress policer

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is used in the sap-ingress and sap-egress QoS policies to create, modify, or delete a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may be defined to have up to 63 policers (numbered 1 through 63) while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer may be defined within a QoS policy, it is not actually created on SAPs or subscribers or multiservice sites associated with the policy until a forwarding class is mapped to the policer's ID.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

When a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS, respectively). Unlike queues that have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet, based on a defined number of bytes.

When a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping will fail.

The **no** form of this command is used to delete a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscriber or multiservice sites associated with the QoS policy when all forwarding classes have been moved away from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

Parameters

policer-id

The *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements, which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

Context

[Tree] (config>qos>sap-egress>fc policer)

Full Context

configure qos sap-egress fc policer

Description

Within a sap-egress QoS policy forwarding class context, the policer command is used to map packets that match the forwarding class to the specified policer-id. The specified policer-id must already exist within the sap-egress QoS policy. The forwarding class of the packet is first discovered at ingress, based on the ingress classification rules. When the packet arrives at egress, the sap-egress QoS policy may match a forwarding class reclassification rule that overrides the ingress derived forwarding class. The forwarding class context within the sap-egress QoS policy is then used to map the packet to an egress queue (using the queue queue-id, or port-redirect-group queue queue-id, or group queue-group-name instance instance-id queue queue-id commands) or an egress policer (policer policer-id). The queue and policer commands within the forwarding class context are mutually exclusive. By default, the forwarding class is mapped to the SAP egress default queue (queue 1). If the **policer** *policer- id* command is executed, any previous policer mapping or queue mapping for the forwarding class is overridden if the policer mapping is successful.

A policer defined within the sap-egress policy is not actually created on an egress SAP, or a subscriber using an SLA profile where the policy is applied, until at least one forwarding class is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber, or egress policing is not supported on the port associated with the SAP or subscriber, the initial forwarding class mapping will fail.

Packets that are mapped to an egress policer that are not discarded by the policer must be placed into a default queue on the packet's destination port. The system uses egress port queue groups for this purpose. An egress queue group named policer-output-queues is automatically created on each port that supports egress policers. By default, the system uses the forwarding class mappings within this queue group to decide which queue within the group will receive each packet output from the policer. This default policer output queuing behavior may be overridden for non-subscriber packets by redirection to a queue group. The name and instance of the queue group to redirect to is either specified in the QoS policy, or the fact that a forwarding class must be redirected is identified in the QoS policy and the specific queue group instance is only identified at the time the QoS policy is applied:

- If the **policer** *policer-id* command is successfully executed, the default egress queuing is performed for the forwarding class using the policer-output-queues queue group and the *queue-id* within the group based on the forwarding class map from the group template.
- If the **policer** *policer-id* **queue** *queue-id* command is successfully executed, the specified SAP *queue-id* within the egress QoS policy is used instead of the default policer output queues.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the **policer** *policer-id* **port-redirect-group-queue** keyword is successfully executed, the system will map the forwarding class to the queue within the egress queue group instance specified at the time the QoS policy is applied to the SAP, using the forwarding class map from the queue group template.
- If the **policer** *policer-id* **port-redirect-group queue** *queue-id* command is successfully executed, the system will map the forwarding class to the configured *queue-id* within the egress queue group instance that is specified at the time the QoS policy is applied to the SAP (ignoring using the forwarding class map from the queue group template).
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* command is successfully executed, the system will map the forwarding class to the queue within the specified egress queue group instance using the forwarding class map from the group template.
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* **queue** *queue-id* command is successfully executed, the system will map the forwarding class to the specified *queue-id* within the specified egress queue group instance (ignoring the forwarding class map in the group template).

If the specified **group** *group-name* is not defined as an egress queue-group-template, the **policer** command will fail. Also, if the specified group does not exist on the port for the SAPs or subscribers associated with the **sap-egress** QoS policy, the policer command will fail. While a group queue-group-name is specified in a **sap-egress** QoS policy, the groups corresponding egress template cannot be deleted. While a port egress queue group is associated with a policer instance, the port queue group cannot be deleted.

If the specified **queue** *queue-id* is not defined in the egress queue-group-template queue-group- name, the policer command will fail. While a *queue-id* within an egress queue group template is referenced by a **sap-egress** QoS policy forwarding class policer command, the queue cannot be deleted from the queue group template.

If an egress policed packet is discarded by the egress port queue group queue, the source policer discard stats are incremented. This means that the discard counters for the policer represent both the policer discard events and the destination queue drop tail events associated with the policer.

The **no** form of this command is used to restore the mapping of the forwarding class to the default queue. If all forwarding classes have been removed from the default queue, the queue will not exist on the SAPs or subscribers associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscribers will be lost.

Default

no policer

Parameters

policer-id

When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-egress** QoS policy.

Values 1 to 63

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port-redirect-group-queue

Used to override the forwarding class default egress queue destination to an egress port queue group. The specific egress queue group instance to use is specified at the time the QoS policy is applied to the SAP. Therefore, this parameter is only valid if SAP-based redirection is required.

queue *queue-id*

This parameter overrides the forwarding class default egress queue destination to a specified *queue-id*. If port-redirect-group is not configured, this will be a local SAP queue of that *queue-id*. A queue of ID *queue-id* must exist within the egress QoS policy. If **port-redirect-group-queue** is configured, the **queue** *queue-id* in the egress port queue group instance is used.

Values 1 to 8

Default Derived from forwarding class assignment in queue-group definition.

group *group-name*

The **group** *queue-group-name* is optional and is used to override the forwarding class's default egress queue destination. If the queue group-queue-id parameter is not specified, the forwarding class map within the specified group's template is used to derive which queue within the group will receive the forwarding class's packets. An egress queue group template must exist for the specified queue-group-name or the policer command will fail. The specified queue-group-name must also exist as an egress queue group on the ports where SAPs and subscribers associated with the sap-egress policy are applied or the policer command will fail.

Values Any qualifying egress queue group name

Default policer-output-queues

queue *queue-id*

The **queue** *group-queue-id* is optional when the group queue-group-name parameter is specified and is used to override the forwarding class mapping within the group's egress queue group template. The specified group-queue-id must exist within the group's egress queue group template or the policer command will fail.

Values 1 to 8

Default Derived from forwarding class assignment in queue-group definition

instance *instance-id*

This parameter is used to specify the specific instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

Values 1 to 40960

Default 1

configure qos sap-egress policer

Description

A policer defined within the sap-egress policy is not actually created on an egress SAP, or a subscriber using an SLA profile where the policy is applied, until at least one forwarding class is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber, or egress policing is not supported on the port associated with the SAP or subscriber, the initial forwarding class mapping will fail.

Packets that are mapped to an egress policer that are not discarded by the policer must be placed into a default queue on the packet's destination port. The system uses egress port queue groups for this purpose. An egress queue group named policer-output-queues is automatically created on each port that supports egress policers. By default, the system uses the forwarding class mappings within this queue group to decide which queue within the group will receive each packet output from the policer. This default policer output queuing behavior may be overridden for non-subscriber packets by redirection to a queue group. The name and instance of the queue group to redirect to is either specified in the QoS policy, or the fact that a forwarding class must be redirected is identified in the QoS policy and the specific queue group instance is only identified at the time the QoS policy is applied:

- If the **policer** *policer-id* command is successfully executed, the default egress queuing is performed for the forwarding class using the policer-output-queues queue group and the *queue-id* within the group based on the forwarding class map from the group template.
- If the **policer** *policer-id* **queue** *queue-id* command is successfully executed, the specified SAP *queue-id* within the egress QoS policy is used instead of the default policer output queues.
- If the **policer** *policer-id* **port-redirect-group-queue** keyword is successfully executed, the system will map the forwarding class to the queue within the egress queue group instance specified at the time the QoS policy is applied to the SAP, using the forwarding class map from the queue group template.
- If the **policer** *policer-id* **port-redirect-group queue** *queue-id* command is successfully executed, the system will map the forwarding class to the configured *queue-id* within the egress queue group instance that is specified at the time the QoS policy is applied to the SAP (ignoring using the forwarding class map from the queue group template).
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* command is successfully executed, the system will map the forwarding class to the queue within the specified egress queue group instance using the forwarding class map from the group template.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* **queue** *queue-id* command is successfully executed, the system will map the forwarding class to the specified *queue-id* within the specified egress queue group instance (ignoring the forwarding class map in the group template).

If the specified **group** *group-name* is not defined as an egress queue-group-template, the **policer** command will fail. Also, if the specified group does not exist on the port for the SAPs or subscribers associated with the **sap-egress** QoS policy, the policer command will fail. While a group queue-group-name is specified in a **sap-egress** QoS policy, the groups corresponding egress template cannot be deleted. While a port egress queue group is associated with a policer instance, the port queue group cannot be deleted.

If the specified **queue** *queue-id* is not defined in the egress queue-group-template queue-group- name, the policer command will fail. While a *queue-id* within an egress queue group template is referenced by a **sap-egress** QoS policy forwarding class policer command, the queue cannot be deleted from the queue group template.

If an egress policed packet is discarded by the egress port queue group queue, the source policer discard stats are incremented. This means that the discard counters for the policer represent both the policer discard events and the destination queue drop tail events associated with the policer.

The **no** form of this command is used to restore the mapping of the forwarding class to the default queue. If all forwarding classes have been removed from the default queue, the queue will not exist on the SAPs or subscribers associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscribers will be lost.

Default

no policer

Parameters

policer-id

When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-egress** QoS policy.

Context

[Tree] (config>qos>qgrps>ing>queue-group policer)

[Tree] (cfg>qos>qgrps>egr>queue-group policer)

Full Context

configure qos queue-group-templates ingress queue-group policer

configure qos queue-group-templates egress queue-group policer

Description

This command is used in ingress and egress queue-group templates to create, modify, or delete a policer.

Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. While a policer may be defined in a queue-group template, it is not actually created until the queue-group template is instantiated on the ingress context of a forwarding plane or on the egress context of a port.

When a policer is created, the policer's metering rate and profiling rates may be defined, as well as the policer's maximum and committed burst sizes (MBS and CBS, respectively). Unlike queues that have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

When a policer is created, it cannot be deleted from the queue-group template unless any forwarding classes that are redirected to the policer are first removed.

The **no** version of this command deletes the policer.

Parameters

policer-id

The *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer’s parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements, which may require the **create** keyword to actually add the new policer ID to the QoS policy) and the system enters that new policer’s context for possible parameter modification.

configure service cpipe sap egress policer-control-override

configure service epipe sap egress policer-control-override

configure service cpipe sap ingress policer-control-override

Description

This command, within the SAP ingress or egress contexts, creates a CLI node for specific overrides to the applied policer-control-policy. A policy must be applied for a policer-control-overrides node to be created. If the policer-control-policy is removed or changed, the policer-control-overrides node is automatically deleted from the SAP.

The **no** form of this command removes any existing policer-control-policy overrides and the policer-control-overrides node from the SAP.

Default

no policer-control-override

Parameters

create

The create keyword is required when the policer-control-overrides node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit confirmation, the create keyword is not required.

configure service epipe sap egress policer-control-policy

configure service cpipe sap egress policer-control-policy

configure service epipe sap ingress policer-control-policy

configure service ipipe sap ingress policer-control-policy

Description

This command, within the QoS CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied.

When applied to a sub-profile on a 7450 ESS and 7750 SR, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis.

For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As previously stated, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated in the Tier 1 and Tier 2 Arbiter subsection, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

Each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP context.

Parameters

policy-name

Each policer-control-policy must be created with a unique policy name. The name given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

create

The keyword is required when a new policy is being created and the system is configured for explicit object creation mode.

configure service template vpls-sap-template egress policer-control-policy

configure service vpls sap ingress policer-control-policy

configure service template vpls-sap-template ingress policer-control-policy

configure service vpls sap egress policer-control-policy

Description

This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

Parameters

policy-name

Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

create

The keyword is required when a new policy is being created and the system is configured for explicit object creation mode.

configure service ies interface sap egress policer-control-policy

configure service ies interface sap ingress policer-control-policy

Description

This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any

increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

Parameters

policy-name

Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

Description

This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

Parameters

policy-name

Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

configure qos policer-control-policy

Description

This command is used to create, delete, or modify policer control policies. The **policer-control-policy** controls the aggregate bandwidth available to a set of child policers. When created, the policy can be applied to ingress or egress SAPs. The policy can also be applied to the ingress or egress context of a sub-profile.

Parameters

policy-name

Each policer-control-policy must be created with a unique policy name. The *policy-name* must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system enters that policy's context for editing purposes. If policy-name does not exist, the system attempts to create a policy with the specified name. Creating a

Full Context

configure service customer multi-service-site egress policer-control-policy

configure service customer multi-service-site ingress policer-control-policy

Description

This command, within the QoS CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a 7750 SR or 7450 ESS sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and not subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

may be overridden on a per instance basis. For 7750 SR or 7450 ESS subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and thus the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

bucket will mark the appropriate amount of traffic for each child as fair based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

In order to derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of the command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP context.

Parameters

policy-name

Specifies the policy name up to 32 characters in length. Each policer-control-policy must be created with a unique policy name. The name must adhere to the system policy ASCII naming requirements. If the defined policy name already exists, the system will enter that policy's context for editing purposes. If policy name does not exist, the system will attempt to create a policy with the specified name.

policer-control-policy

Syntax

policer-control-policy *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy policer-control-policy)

Full Context

configure qos copy policer-control-policy

Description

This command copies an existing **policer-control-policy** to another **policer-control-policy**. The **copy** command is a configuration level maintenance tool used to create new entries using an existing profile ID. If **overwrite** is not specified, an error occurs if the destination policy exists.

Parameters

src-name

Specifies the existing source **policer-control-policy**, up to 32 characters, from which the **copy** command attempts to copy.

dst-name

Specifies the destination **policer-control-policy** *dst-name*, up to 32 characters, to which the copy command attempts to copy.

overwrite

Use this parameter when the **policer-control-policy** *dst-name* already exists. If it does, everything in the existing destination **policer-control-policy** *dst-name* is completely overwritten with the contents of the **policer-control-policy** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI Destination "pcp-name2" exists - use {overwrite}.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make” manner and therefore should be handled with care.

configure card fp ingress policy-accounting policers

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the number of policer resources for an policy accounting. Policy accounting can be used to collect statistics about the amount of traffic matching particular routes and, on FP4 cards and systems only, it can also be used to police traffic associated with certain routes as destinations of the traffic.

Using only statistics (policing is not performed) requires the reservation of policer statistics index resources on each FP receiving the traffic to be counted. Every **policy-accounting** interface on a card or FP uses one of these resources for every source and destination class index listed in the template referenced by the interface. The total reservation at the FP level is set using the **configure card** *slot-number* **fp** *fp-number* **policy-accounting** command.

Using FP4 policing requires the above resource, and in addition, policer index resources. Every **policy-accounting** interface on a card or FP uses one of these resources for every destination class associated with a policer in the template referenced by the interface. The total reservation of this second resource at the FP level is set using the **configure card** *slot-number* **fp** *fp-number* **ingress policy-accounting policers** command.

The total number of the above resources, per FP, must be less than or equal to 128000. In addition, the second resource pool size must be less than or equal to the size of the first resource pool.

It is possible to increase or decrease the size of either resource sub pool at any time. A decrease can cause some interfaces (randomly selected) to immediately lose their resources and stop counting or policing some traffic that was previously being counted or policed.

If the policy accounting is enabled on a spoke SDP or R-VPLS interface all FPs in the system should have a reservation for each of the above resources, otherwise the **show router interface policy-accounting** command output reports that statistics are possibly incomplete.

Default

no policers

Parameters

policy-limit

Specifies the number of policer resources for policy accounting.

Values 1 to 64000

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

34.90 policers-hqos-manageable

policers-hqos-manageable

Syntax

[**no**] **policers-hqos-manageable**

Context

[Tree] (config>qos>sap-egress policers-hqos-manageable)

Full Context

configure qos sap-egress policers-hqos-manageable

Description

This command enables Hierarchical QoS (HQoS) management of the policiers within the SAP egress policy, when the policy is applied to either the egress SAP configuration or the egress SLA profile, with multiservice sites (MSS) supported for SAPs. When enabled, the system can manage egress policers and queues together in the same HQoS hierarchy.

To be managed by HQoS, egress policers within a SAP egress QoS policy must be configured with either a **scheduler-parent** or **port-parent** command or be orphaned to an egress port scheduler applied on a Vport or port.

The **policers-hqos-manageable** command and **parent-location sla** or policers with **enable-exceed-pir** or **stat-mode no-stats** within a SAP egress QoS policy are mutually exclusive.

To prevent HQoS from measuring the traffic through both a policer managed by HQoS, then again through a post-policer access egress queue group queue, configure post-policer access egress queue groups with **no queues-hqos-manageable** so their queues are not managed by HQoS.

A post-policer local queue is not supported with HQoS managed policers, nor are those mapped by the **use-fc-mapped-queue** parameter in a criteria action statement. The **policers-hqos-manageable** command is not supported for SAP egress dynamic policers or on a 7950 XRS.

The **no** form of this command rdisables HQoS management of policers within the SAP QoS egress policy.

Default

no policers-hqos-manageable

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, VSR

Context

[Tree] (config>qos>sap-ingress policers-hqos-manageable)

Full Context

configure qos sap-ingress policers-hqos-manageable

Description

This command specifies that the policers within this SAP ingress policy are to be managed by the Hierarchical QoS (HQoS) process when the policy is applied to either the ingress part of a SAP configuration or the ingress part of an SLA profile, with multiservice sites (MSS) supported for SAPs. When enabled, ingress policers and queues can be managed together in the same HQoS hierarchy.

To be managed by HQoS, ingress policers within a SAP ingress QoS policy must be configured with either a **scheduler-parent** or **parent** command or be orphaned to an ingress port scheduler applied on a Vport or port. The **scheduler-parent** and **parent** commands are mutually exclusive.

The **policers-hqos-manageable** command and the **stat-mode no-stats** command within a SAP ingress QoS policy are mutually exclusive.

The **no** form of this command results in policers within this SAP QoS ingress policy being non-HQoS-manageable.

Default

no policers-hqos-manageable

configure service ies subscriber-interface group-interface srrp policy

configure service vprn subscriber-interface group-interface srrp policy

Description

This command associates one or more VRRP policies with the SRRP instance. A VRRP policy is a collection of connectivity and verification tests used to manipulate the in-use priorities of VRRP and SRRP instances. A VRRP policy can test the link state of ports, ping IP hosts, discover the existence of routes in the routing table or the ability to reach Layer 2 hosts. When one or more of these tests fail, the

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

VRRP policy has the option of decrementing or setting an explicit value for the in-use priority of an SRRP instance.

More than one VRRP policy may be associated with an SRRP instance. When more than one VRRP policy is associated with an SRRP instance the delta decrement of the in-use priority is cumulative unless one or more test fail that have explicit priority values. When one or more explicit tests fail, the lowest priority value event takes effect for the SRRP instance. When the highest delta-in-use-limit is used to manage the lowest delta derived in-use priority for the SRRP instance.

VRRP policy associations may be added and removed at any time. A maximum of two VRRP policies can be associated with a single SRRP instance.

The **no** form of this command removes the association with the *vrrp-policy-id* from the SRRP instance.

Parameters

vrrp-policy-id

Specifies one or more VRRP policies with the SRRP instance.

configure service ies interface ipv6 vrrp policy

Description

This command creates VRRP control policies. The VRRP policy ID must be created by the policy command prior to association with the virtual router instance.

The policy command provides the ability to associate a VRRP priority control policy to a virtual router instance. The policy may be associated with more than one virtual router instance. The priority events within the policy either override or diminish the base-priority dynamically affecting the in-use priority. As priority events clear in the policy, the in-use priority may eventually be restored to the base-priority value.

The policy command is only available in the non-owner **vrrp** *virtual-router-id* nodal context. The priority of owner virtual router instances is permanently set to 255 and cannot be changed by VRRP priority control policies. For non-owner virtual router instances, if the policy command is not executed, the base-priority will be used as the in-use priority.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes any existing VRRP priority control policy association from the virtual router instance. All such associations must be removed prior to the policy being deleted from the system.

Parameters

vrrp-policy-id

The vrrp-policy-id parameter associated the corresponding VRRP priority control policy-id with the virtual router instance. The vrrp-policy-id must already exist in the system for the policy command to be successful.

Values 1 to 9999

Context

[Tree] (config>service>vprn>bgp>next-hop-res policy)

Full Context

configure service vprn bgp next-hop-resolution policy

Description

This command specifies the name of a policy statement to use with the BGP next-hop resolution process. The policy controls which IP routes in RTM are eligible to resolve the BGP next-hop addresses of IPv4 and IPv6 routes. The policy has no effect on the resolution of BGP next-hops to MPLS tunnels. If a BGP next-hop of an IPv4 or IPv6 route R is resolved in RTM and the longest matching route for the next-hop address is an IP route N that is rejected by the policy then route R is unresolved; if the route N is accepted by the policy then it becomes the resolving route for R.

The default next-hop resolution policy (when the **no policy** command is configured) is to use the longest matching active route in RTM that is not a BGP route (unless **use-bgp-routes** is configured), an aggregate route or a subscriber management route.

Default

no policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

configure service vprn mld group-interface mcac policy

configure service vprn igmp group-interface mcac policy

Description

This command references the global channel bandwidth definition policy that is used for HMCAC and HQoS Adjust.

HQoS Adjustment is supported with redirection enabled or per-host-replication disabled. In other words, the policy from the redirected interface is used for HQoS Adjustment.

Hierarchical MCAC (HMCAC) is supported with redirection enabled or per-host-replication disabled. In HMCAC, the subscriber is checked first against its bandwidth limits followed by the check on the redirected interface against the bandwidth limits defined under the redirected interface. In the HMCAC case, the channel definition policy must be referenced under the redirected interface level.

Parameters

policy-name

Specifies the name of the global MCAC channel definition policy defined under the hierarchy **config>router>mcac>policy**. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed between double quotes.

configure router igmp interface mcac policy

configure router mcac policy

configure router mld interface policy

configure router pim interface policy

Description

This command references the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment.

Within the scope of HQoS adjustment, the channel definition policy under the group-interface is used if redirection is disabled. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode.

If redirection is enabled, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect.

Hierarchical MCAC (HMCAC) is supported on two levels simultaneously:

- subscriber level and redirected interface in case that redirection is enabled
- subscriber level and group-interface level in case that redirection is disabled

In HMCAC, the subscriber is first checked against its bandwidth limits followed by the check on the redirected interface (or group-interface) against the bandwidth limits there.

In the case that the redirection is enabled but the policy is referenced only under the group-interface, no admission control will be executed (HMCAC or MCAC).

configure router interface vrrp policy

configure router interface ipv6 vrrp policy

Description

This command adds a VRRP priority control policy association with the virtual router instance.

To further augment the virtual router instance base priority, VRRP priority control policies can be used to override or adjust the base priority value depending on events or conditions within the chassis.

The policy can be associated with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command dynamically affecting the in-use priority. As priority events clear in the policy, the in-use priority can eventually be restored to the base **priority** value.

The **policy** command is only available in the non-owner **vrrp** nodal context. The priority of **owner** virtual router instances is permanently set to 255 and cannot be changed by VRRP priority control policies. For non-owner virtual router instances, if the **policy** command is not executed, the base **priority** is used as the in-use priority.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of the command removes existing VRRP priority control policy associations from the virtual router instance. All associations must be removed prior to deleting the policy from the system.

Default

no policy — No VRRP priority control policy is associated with the virtual router instance.

Parameters

Context

[Tree] (config>vrrp policy)

Full Context

configure vrrp policy

Description

This command creates the context to configure a VRRP priority control policy which is used to control the VRRP in-use priority based on priority control events. It is a parental node for the various VRRP priority control policy commands that define the policy parameters and priority event conditions.

The virtual router instance **priority** command defines the initial or base value to be used by non-owner virtual routers. This value can be modified by assigning a VRRP priority control policy to the virtual router instance. The VRRP priority control policy can override or diminish the base priority setting to establish the actual in-use priority of the virtual router instance.

The **policy** *policy-id* command must be created first, before it can be associated with a virtual router instance.

Because VRRP priority control policies define conditions and events that must be maintained, they can be resource intensive. The number of policies is limited to 1000.

The *policy-id* do not have to be consecutive integers. The range of available policy identifiers is from 1 to 9999.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of the command deletes the specific *policy-id* from the system. The *policy-id* must be removed first from all virtual router instances before the **no policy** command can be issued. If the *policy-id* is associated with a virtual router instance, the command will fail.

Parameters

policy-id

The VRRP priority control ID expressed as a decimal integer that uniquely identifies this policy from any other VRRP priority control policy defined on the system. Up to 1000 policies can be defined.

Values 1 to 9999

context-value

Specifies the service ID to which this policy applies. A value of zero (0) means that this policy does not apply to a service but applies to the base router instance.

Values 1 to 2147483647

Platforms

All

Syntax

policy *cpu-protection-policy-id* [**create**]

no policy *cpu-protection-policy-id*

Context

[Tree] (config>sys>security>cpu-protection policy)

Full Context

configure system security cpu-protection policy

Description

This command configures CPU protection policies.

The **no** form of this command deletes the specified policy from the configuration.

Policies 254 and 255 are reserved as the default access and network interface policies, and cannot de deleted. The parameters within these policies can be modified. An event will be logged (warning) when the default policies are modified.

Default

Policy 254 (default access interface policy):

- per-source-rate: max (no limit)
- overall-rate: 6000

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- out-profile–rate: 6000
- alarm

Policy 255 (default network interface policy):

- per-source-rate: max (no limit)
- overall-rate: max (no limit)
- out-profile-rate: 3000
- alarm

Parameters

cpu-protection-policy-id

Assigns a policy ID to the specific CPU protection policy.

Values 1 to 255

create

Keyword used to create CPU protection policy. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

no policy *policy-name*

Context

[Tree] (config>sys>security>dist-cpu-protection policy)

Full Context

configure system security dist-cpu-protection policy

Description

This command configures one of the maximum 18 Distributed CPU Protection (DCP) policies. These policies can be applied to objects such as SAPs, network interfaces or ports.

Parameters

policy-name

Specifies the name of the policy, up to 32 characters.

create

Keyword used to create a new policy.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

type

Specifies the Distributed CPU protection type for the policy.

Values access-network — Specifies this is a distributed CPU protection policy for access or network interfaces.

port — Specifies this is a distributed CPU protection policy for ports.

Default access-network

Platforms

All

policy

Syntax

policy *policy-name*

no policy

Context

[Tree] (config>router>bgp>next-hop-resolution policy)

Full Context

configure router bgp next-hop-resolution policy

Description

This command specifies the policy statement name to use with the BGP next-hop resolution process. The policy determines the eligibility of IP routes in the RTM to resolve the BGP next-hop addresses of IPv4 and IPv6 routes. The policy has no effect on the resolution of BGP next hops to MPLS tunnels.

For example, if a BGP next hop of an IPv4 or IPv6 route R is resolved in RTM and the longest matching route for the next-hop address is an IP route N that is rejected by the policy then route R is unresolved. If the route N is accepted by the policy, it becomes the resolving route for R.

The **no** form of this command reverts to the default next-hop resolution policy, which uses the longest matching active route in RTM that is not a BGP route (unless **use-bgp-routes** is configured), an aggregate route or a subscriber management route.

Default

no policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

policy

Syntax

policy *plcy-or-long-expr*

no policy

Context

[Tree] (config>router>policy-options>policy-statement>entry>from policy)

Full Context

configure router policy-options policy-statement entry from policy

Description

This command is used to call another policy by name and evaluate it as a subroutine, or to evaluate a logical expression of subroutine policies.

If the result of the subroutine evaluation is an 'accept', then the route is considered to match the entry in the parent policy that called the subroutine. If the result of the subroutine evaluation is a 'reject', then the route is considered a non-match of the entry in the parent policy that called the subroutine.

Up to 3 levels of subroutine calls are supported. If a subroutine at maximum depth has this command, it is automatically considered a non-match of all routes.

The **no** form of this command removes the policy statement as a match criterion.

Default

no policy

Parameters

plcy-or-long-expr

Specifies the name of a single **policy-statement** (up to 64 characters in length) or a policy logical expression (up to 255 characters in length) consisting of **policy-statement** names (enclosed in square brackets), logical operations ('and', 'or', 'not'), and parentheses for grouping.

no policy

Context

[Tree] (config>router>policy-options>policy-statement>entry>action policy)

Full Context

configure router policy-options policy-statement entry action policy

Description

This command configures a nested policy statement as a match criterion for the route policy entry.

Policy statements are configured at the global route policy level (**config>router>policy-options policy-statement**).

The command is used to call another policy by name and evaluate it as a subroutine. If the result of the subroutine evaluation is an 'accept', then the route is considered to match the entry in the parent policy that called the subroutine. If the result of the subroutine evaluation is a 'reject', then the route is considered a non-match of the entry in the parent policy that called the subroutine. Up to 3 levels of subroutine calls are supported. If a subroutine at maximum depth has this command, it is automatically considered a non-match of all routes.

The **no** form of this command removes the policy statement as a match criterion.

Default

no policy

Parameters

plcy-or-long-expr

Specifies the route policy name (up to 64 characters long) or a policy logical expression (up to 255 characters). Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

no policy-statement

Context

[Tree] (config>test-oam>ldp-treetrace>path-discovery policy-statement)

Full Context

configure test-oam ldp-treetrace path-discovery policy-statement

Description

This command configures the FEC policy to determine which routes are imported from the LDP FEC database to discover its paths and probing them.

If no policy is specified, the ingress LER imports the full list of FECs from the LDP FEC database. New FECs are added to the discovery list at the next path discovery and not when they are learned and added into the FEC database. The maximum number of FECs to be discovered with path discovery is limited to 500.

The user can configure FECs to **include** or **exclude**.

Policies are configured in the **config>router>policy-options** context. A maximum of five policy names can be specified.

The **no** form of this command removes the policy from the configuration.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no policy-statement

Parameters

policy-name

Specifies up to five route policy names to filter LDP imported address FECs. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. The specified policy name(s) must already be defined.

Platforms

All

policy-statement

[**no**] **policy-statement** *name*

Context

[Tree] (config>router>policy-options policy-statement)

Full Context

configure router policy-options policy-statement

Description

This command creates the context to configure a route policy statement.

Route policy statements control the flow of routing information to and from a specific protocol, set of protocols, or to a specific BGP neighbor.

The **policy-statement** is a logical grouping of match and action criteria. A single **policy-statement** can affect routing in one or more protocols and/or one or more protocols peers/neighbors. A single **policy-statement** can also affect both the import and export of routing information.

The **no** form of this command deletes the policy statement.

Default

no policy-statement

Parameters

name

Specifies the route policy statement name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

pool

Syntax

pool *nat-pool-name* **nat-group** *nat-group-id* **type** *pool-type* [**applications** *applications*] [**create**]

no pool *nat-pool-name*

Context

[Tree] (config>router>nat>outside pool)

Full Context

configure router nat outside pool

Description

This command creates a NAT pool in the outside routing context. The NAT pool defines the parameters that will be used for IP address and port translation within the pool.

Parameters

nat-pool-name

Specifies the NAT pool name, up to 32 characters.

nat-group-id

Specifies the NAT group ID.

Values 1 to 4

create

Creates the instance.

pool-type

Species the pool type.

Values large-scale, l2-aware, wlan-gw-anchor

applications

This creation-time parameter configures the NAT pool for protocol agnostic operation. The IP addresses are translated in 1:1 fashion regardless of the protocol. No ports are translated for TCP or UDP traffic. Traffic through the pool can be initiated from inside or outside. When nat-pool is configured in agnostic mode, certain parameters in the pool are pre-set and cannot be changed:

- mode one-to-one
- port-forwarding-range 0
- port-reservation blocks 1
- subscriber-limit 1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- deterministic port-reservation 65536.

This pool is used to configure static 1:1 NAT, where the operator have the control of the mapping between the inside and outside IP addresses. The static IP address mapping is using CLI constructs used in deterministic NAT (prefix and map deterministic NAT commands in the inside routing context).

ALG for TCP/UDP is supported in the protocol agnostic pool.

Values agnostic

35 p Commands – Part III

35.1 pool-manager

pool-manager

Syntax

pool-manager

Context

[Tree] (config>service>vprn>sub-if>wlan-gw pool-manager)

[Tree] (config>service>ies>sub-if>wlan-gw pool-manager)

Full Context

configure service vprn subscriber-interface wlan-gw pool-manager

configure service ies subscriber-interface wlan-gw pool-manager

Description

Commands in this context configure pool manager data for a WLAN GW subscriber interface.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

35.2 pool-name

pool-name

Syntax

[**no**] **pool-name**

Context

[Tree] (config>service>vprn>sub-if>grp-if>dhcp>option>vendor pool-name)

[Tree] (config>service>ies>if>dhcp>option>vendor pool-name)

[Tree] (config>service>ies>sub-if>grp-if>dhcp>option>vendor pool-name)

[Tree] (config>service>vprn>if>dhcp>option>vendor pool-name)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn subscriber-interface group-interface dhcp option vendor-specific-option pool-name

configure service ies interface dhcp option vendor-specific-option pool-name

configure service ies subscriber-interface group-interface dhcp option vendor-specific-option pool-name

configure service vprn interface dhcp option vendor-specific-option pool-name

Description

This command sends the pool name in the Nokia vendor specific sub-option of the DHCP relay packet.

The **no** form of this command reverts to the default.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface dhcp option vendor-specific-option pool-name
- configure service ies subscriber-interface group-interface dhcp option vendor-specific-option pool-name

All

- configure service ies interface dhcp option vendor-specific-option pool-name

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client slaac pool-name

Description

This command specifies the pool name that should be sent in the DHCPv6 messages. This is reflected in the Nokia vendor specific pool option (vendor-id 6527, option-id 0x02).

The **no** form of this command removes pool-name and the option will not be sent in DHCPv6.

Parameters

name

Specifies the pool name up with 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

pool-name

Syntax

[**no**] **pool-name**

Context

[Tree] (config>router>if>dhcp>option>vendor-specific-option pool-name)

Full Context

configure router interface dhcp option vendor-specific-option pool-name

Description

This command enables the sending of the pool name in the Nokia vendor-specific suboption of the DHCP relay packet.

The **no** form of this command disables the feature.

Default

no pool-name

Platforms

All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

35.3 pool-type

pool-type

Syntax

pool-type *pool-type*

Context

[Tree] (config>test-oam>twamp>twl>src-udp-pools>port pool-type)

Full Context

configure test-oam twamp twamp-light source-udp-port-pools port pool-type

Description

This command maps the specified source UDP port to the TWAMP Light application allowed to configure the source UDP port. The OAM-PM IP family of tests can only configure the source UDP port when the port pool UDP source port is configured with a **pool-type oam-pm**. The **test-oam link-measurement measurement-template** can only configure the **src-udp-port** when the port pool UDP source port is configured with **pool-type link-measurement**.A pool type cannot be changed if its current application (either an **oam-pm** session or **link-measurement** template) is configured to use the specified port, regardless of the administrative or operational state. The configuration reference linking to the source UDP prevents the change.

Default

pool-type oam-pm

Parameters

pool-type

Specifies the port to an application pool.

Values oam-pm, link-measurement

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

35.4 pop

pop

Syntax

[**no**] **pop**

Context

[Tree] (config>router>mpls>if>label-map pop)

Full Context

configure router mpls interface label-map pop

Description

This command specifies that the incoming label must be popped (removed). No label stacking is supported for a static LSP. The service header follows the top label. Once the label is popped, the packet is forwarded based on the service header.

The **no** form of this command removes the **pop** action for the *in-label*.

Platforms

[Tree] (config>service>vprn>if>arp-host-route populate)

Full Context

configure service vprn interface ipv6 nd-host-route populate

configure service ies interface arp-host-route populate

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service vprn interface arp-host-route populate

Description

This command enables the creation of ARP/ND host-route entries in the route-table out of a certain ARP/ND entry type.

The **no** form of this command reverts to the default.

Default

no populate

Parameters

evpn

Enables the creation of ARP-ND host routes in the route table out of EVPN ARP/ND entries (entries learned from EVPN MAC/IP routes).

dynamic

Enables the creation of ARP-ND host routes in the route table out of dynamic ARP/ND entries (learned from received ARP/ND messages from the hosts).

static

Enables the creation of ARP-ND host routes in the route table out of configured static ARP/ND entries.

route-tag [*1..255*]

Specifies the route tag that is added in the route table for ARP-ND host routes of type **evpn**, **dynamic**, or **static**. This tag can be matched on BGP VRF export and BGP peer export policies.

Platforms

All

35.6 port

port

Syntax

port *port-id* [**sync-tag** *sync-tag*] [**create**]

no port *port-id*]

Context

[Tree] (config>redundancy>multi-chassis>peer>sync port)

Full Context

configure redundancy multi-chassis peer sync port

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the port to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing this port with the multi-chassis peer.

Parameters

port-id

Specifies the port to be synchronized with the multi-chassis peer.

Values

port-id	slot/mda/port	
lag-id	lag-id	
	lag	keyword
	id	1 to 200
pw-id	pw-*id*	
	pw	keyword
	id	1 to 10239

sync-tag

Specifies a synchronization tag, up to 32 characters in length, to be used while synchronizing this port with the multi-chassis peer.

create

Creates an entry; mandatory while creating an entry.

Platforms

All

port

Syntax

[**no**] **port** {*port-id* | *aps-id* | *connector-port-id*}

Context

[Tree] (config port)

Full Context

configure port

Description

This command enables access to the context to configure ports, multilink bundles, and bundle protection groups (BPGs). Before a port can be configured, the chassis slot must be provisioned with a valid card type and the MDA parameter must be provisioned with a valid MDA type.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

No ports are configured. All ports must be explicitly configured and enabled.

Parameters

port-id

Specifies the physical port ID in the following format:

Values *slot*/*mda*/*port* [.*channel*]

for GNSS RF ports:

A/gnss or **B/gnss**

eth-sat-id

Specifies the Ethernet satellite ID to be associated with this IP interface. This parameter applies to the 7950 XRS only.

Values

eth-sat-id	esat-*id*/*slot*/*port*	
	esat	keyword
	id	1 to 20

pxc-id

Specifies the PXC ID to be associated with this IP interface. This parameter applies to the 7950 XRS only.

Values

pxc-id	pxc-*id*.*sub-port*	
	pxc	keyword
	id	1 to 64
	sub-port	a, b

aps-id

This option configures APS on unbundled SONET/SDH ports. All SONET-SDH port parameters, with certain exceptions, for the working and protection circuit ports must be configured in the **config>port>aps-id** context. The working and protection circuit ports inherit all those parameters configured. The exception parameters for the working and protect circuits can be configured in the **config>port>sonet-sdh** context. Exception list commands include:

- clock-source
- [no] loopback
- [no] report-alarm
- section-trace
- [no] threshold

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When an **configure port aps-id** is created all applicable parameters under the port CLI tree (including parameters under any submenus) assume **aps-id** defaults, or when those are not explicitly specified, default to SONET/SDH port defaults for any SONET port.

All but a few exception SONET/SDH parameters for the working channel port must be configured in the **configure port sonet-sdh** context. The protection channel inherits all the configured parameters. The exception parameters for the protection channel can be configured in the **configure port sonet-sdh** context.

Signal failure (SF) and signal degrade (SD) alarms are not enabled by default on POS interfaces. It is recommended to change the default alarm notification configuration for POS ports that belong to APS groups in order to be notified of SF/SD occurrences to be able to interpret the cause for an APS group to switch the active line.

For path alarms, modify the logical line aps-id in the **configure port aps-***id* **<sonet-sdh>path report-alarm** context. For example:

configure port **aps-1** sonet-sdh path report-alarm p-ais

For line alarms, separately, modify the 2 physical ports that are members of the logical aps-id port (the working and protect lines). APS reacts only to line alarms, not path alarms. For example:

configure port **1/2/3** sonet-sdh report-alarm lb2er-sd

configure port **4/5/6** sonet-sdh report-alarm lb2er-sd

If the SD and SF threshold rates must be modified, the changes must be performed at the line level on both the working and protect APS port member.

The **no** form of this command deletes an aps-*group-id* or bundle-aps-group-id. In order for an aps- *group-id* to be deleted,

The same rules apply for physical ports, bundles deletions apply to APS ports/bundles deletions (for example an aps-group-id must be shutdown, have no service configuration on it, and no path configuration on it). In addition working and protection circuits must be removed before an aps-group-id may be removed.

Values **port aps**-*group-id* **aps**: keyword where *group-id*: 1 to 64

Example: **port aps**-64

connector-port-id

Specifies the physical port of a connector in the following format.

Values *slot*/*mda*/*connector*/*port*

Platforms

All

port

Syntax

port *port-id*

no port

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>port-xc>pxc port)

Full Context

configure port-xc pxc port

Description

This command configures the referenced Ethernet port as a loopback or a cross-connect port (PXC). When this command is executed, the system automatically creates two PXC subports under this Ethernet port.

The physical PXC port does not require any external connectivity or optical transceivers to function properly. Consequently, all optic-related alarms are disabled on the port.

The physical PXC port is automatically configured as a hybrid port. The MTU is preset to 9212 bytes, the encapsulation type is set to dot1q, and dot1x tunneling is turned on.

A single physical port can be associated with more than one PXC. In other words, multiple PXCs are supported per physical port. Because PXC subports use a single physical port to transmit traffic in both directions, the nominal port bandwidth is asymmetrically divided between the two directions. For example, a 10 Gb/s Ethernet port in PXC mode can accommodate 9 Gb/s of traffic in one direction and 1 Gb/s in the other. Any other ratio can be achieved as long as the sum of the bandwidth of the two PXC subports does not exceed the bandwidth capacity of the physical port (10 Gb/s in this case).

Since the PXC uses a single physical port to transmit traffic in both directions, the nominal port bandwidth is asymmetrically divided between the two directions. For example, a 10 Gb/s Ethernet port in PXC mode can accommodate 9 Gb/s of traffic in one direction and 1 Gb/s in the other. Any other ratio can be achieved as long as the sum of the bandwidth of the two PXC subports does not exceed the bandwidth capacity of the physical port (10 Gb/s in this case).

The following rules apply to PXC port configurations:

- Only unused physical ports (not associated with an interface or SAP) can be referenced inside of a PXC ID configuration.
- The physical port cannot be removed from a PXC ID configuration if the corresponding PXC subports are currently in use.
- A physical port cannot be used outside the configured PXC context. For example, a regular IP interface cannot use this physical port, or a SAP on that port cannot be associated with a service.

The **no** form of this command removes the port ID from the configuration.

Parameters

port-id

Specifies the physical port in the *slot*/*mda*/*port* format.

Platforms

All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port

Syntax

port *port-id* [*port-id*] [**priority** *priority*] [**sub-group** *sub-group-id*] [**hash-weight** *weight*]

no port *port-id* [*port-id*]

Context

[Tree] (config>lag port)

Full Context

configure lag port

Description

This command adds ports to a link aggregation group (LAG).

The port configuration of the first port added to the LAG is used as a basis to compare to subsequently added ports. If a discrepancy is found with a newly added port, that port will not be added to the LAG.

Multiple (space separated) ports can be added or removed from the LAG link assuming the maximum number of ports is not exceeded.

Ports that are part of a LAG must be configured with the **autonegotiate** command either disabled or set to **limited**. By default, no ports are defined as members of a LAG.

The **no** form of this command removes ports from the LAG.

Parameters

port-id

Specifies the port ID.

The maximum number of ports in a LAG depends on the platform type, the hardware deployment, and the SR OS software release. Adding a port over the maximum allowed per specific router or switch is blocked. Some platforms support double port scale for specific port types on LAGs with a LAG ID in the range of 1 to 64 inclusive. Up to 16 ports can be specified in a single statement, up to 64 ports total.

Values

port-id | *connector-pid* | *eth-sat-id* | *pxc-id*

connector-pid	slot/mda/c*connector*/ connector-port	
port-id	slot/mda/port	
eth-sat-id	esat-*id*/*slot*/*port*	
	esat	keyword
	id	1 to 40
pxc-id	pxc-*id*.*sub-port*	

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

pxc	keyword
id	1 to 256
sub-port	a to b

priority

Specifies the port priority used by LACP. The port priority is also used to determine the primary port. The port with the lowest priority is the primary port. In the event of a tie, the smallest port ID becomes the primary port.

Values 1 to 65535

sub-group-id

Identifies a LAG subgroup. When using subgroups in a LAG, they should only be configured on one side of the LAG, not both. Only having one side perform the active/standby selection guarantees a consistent selection and fast convergence. The active or standby selection is signaled through LACP to the other side. The hold time should be configured when using subgroups to prevent the LAG going down when switching between active and standby subgroup since momentarily all ports are down in a LAG (break-before-make).

Values 1 to 8 identifies a LAG subgroup The **auto-iom** subgroup is defined based on the IOM (all ports of the same IOM are assigned to the same subgroup). The **auto-mda** subgroup is defined based on the MDA. (all ports of the same MDA are assigned to the same subgroup).

weight

Specifies the flow hashing distribution between LAG ports.

Values 1 to 100000, port-speed

Platforms

All

port

Syntax

port *port-id*

no port

Context

[Tree] (config>service>system>bgp-evpn>eth-seg port)

Full Context

configure service system bgp-evpn ethernet-segment port

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a port-id associated with the Ethernet-Segment. If the Ethernet-Segment is configured as **all-active**, then only a lag or a PW port can be associated to the Ethernet-Segment. If the Ethernet-Segment is configured as **single-active**, then a lag, port or sdp can be associated to the Ethernet-Segment. In any case, only one of the four objects can be configured in the Ethernet-Segment. A specified port can be part of only one Ethernet-Segment. Only Ethernet ports can be added to an Ethernet-Segment.

Default

no port

Parameters

port-id

Specifies the port ID associated to the Ethernet-Segment.

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*

no port

Context

[Tree] (config>service>sdp>binding port)

Full Context

configure service sdp binding port

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the port or lag identifier, to which the pseudowire ports associated with the underlying SDP are bound. If the underlying SDP is re-routed to a port or lag other than the specified one, the pseudowire ports on the SDP are operationally brought down.

The **no** form of the command removes the value from the configuration.

Default

no port

Parameters

port-id

Specifies the identifier of the port in the slot/mda/port format.

port-id	*slot*/*mda*/*port*[.*channel*]		
	pxc-id	psc-id.sub-port	
		pxc psc-id.sub-port	
		pxc: keyword	
		id: 1 to 64	
		sub-port: a, b	
	aps-id	aps-*group-id*[.*channel*]	
		aps keyword	
		group-id	1 to 64
		group-id	1 to 16
	ccag-id - ccag-<id>.<path-id>[cc-type]		
		ccag	keyword

Context

[Tree] (config>service>system>pw-port-list port)

Full Context

configure service system pw-port-list port

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is only applicable for VSR configurations. This command is used to select ports eligible for use with Flex PW port. Physical ports used by Flex PW port can be shared with any other Layer 2 or Layer 3 service. In other words, a Layer 3 interface using a regular SAP can be associated with a VPRN service, while the port is used by a Flex PW port. Another regular SAP from the same port can be associated with a VPLS or Epipe service at the same time.

The following rules should be followed when populating a pw-port-list:

- A port must be in hybrid mode before it is added to a pw-port-list.
- Before a port is removed from or added to a pw-port-list, all PW ports must be dissociated from the corresponding Epipe services (PW ports must be unconfigured). This implies that all PW SAPs must be deleted.
- Network interfaces (configured in the Base routing context) can be configured only on ports that are in the pw-port-list.
- A port mode (access, network, or hybrid) cannot be changed while the port is in the pw-port-list.

From this, the operator can consider adding all ports that are in hybrid mode to a pw-port-list at the beginning of the system configuration. This ensures that those ports can be used by a Flex PW port at any later time, independently of their current use.

The **no** form of this command removes the port ID from the configuration.

Parameters

port-id

Specifies the IP of the port.

Values slot/mda/port: 1 to 16

Platforms

VSR

port

Syntax

no port {*port-id* | **lag** *lag-id*} {[**egress**] [**ingress**]}

Context

[Tree] (config>mirror>mirror-source port)

Full Context

configure mirror mirror-source port

Description

This command enables mirroring of traffic ingressing or egressing a port (Ethernet port, SONET/SDH channel, TDM channel, or Link Aggregation Group (LAG)).

The **port** command associates a port or LAG to a mirror source. The port is identified by the *port-id*. The defined port may be Ethernet, Access or network, SONET/SDH, or TDM channel access. A network port may be a single port or a Link Aggregation Group (LAG) ID. When a LAG ID is given as the *port-id*, mirroring is enabled on all ports making up the LAG. If the port is a SONET/SDH interface, the *channel-*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

id must be specified to identify which channel is being mirrored (applies to the 7450 ESS and 7750 SR). Either a LAG port member *or* the LAG port can be mirrored.

The port is only referenced in the mirror source for mirroring purposes. The mirror source association does not need to be removed before deleting the card to which the port belongs. If the port is removed from the system, the mirroring association will be removed from the mirror source.

The same port may not be associated with multiple mirror source definitions with the **ingress** parameter defined. The same port may not be associated with multiple mirror source definitions with the **egress** parameter defined.

If a SAP is mirrored on an access port, the SAP mirroring will have precedence over the access port mirroring when a packet matches the SAP mirroring criteria. Filter and label mirroring destinations will also precedence over a port-mirroring destination.

If the port is not associated with a **mirror-source**, packets on that port will not be mirrored. Mirroring may still be defined for a SAP, label or filter entry, which will mirror based on a more specific criteria.

The encapsulation type on an access port or channel cannot be changed to Frame Relay if it is being mirrored (applies to the 7750 SR and 7450 ESS).

The **no port** command disables port mirroring for the specified port. Mirroring of packets on the port may continue due to more specific mirror criteria. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition will be removed.

Parameters

port-id

Specifies the port ID of the 7750 SR or 7950 XRS.

The following syntax applies to the 7750 SR:

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b
	bgrp-id	bpgrp-*type*-*bpgrp-num*	
		bgrp	keyword
		type	ima, ppp
		bgrp-num	1 to 2000
	ccag-id	ccag-*id*.*path-id cc-type*:*cc-id*	
		ccag	keyword

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	id	1 to 8
	path-id	a, b
	cc-type	sap-net, .net-sap
	cc-id	0 to 4094

The following syntax applies to the 7950 XRS:

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

lag-id

The LAG identifier, expressed as a decimal integer.

Note:
On the 7950 XRS, the XMA ID takes the place of the MDA.

Values 1 to 800

egress

Specifies that packets egressing the port should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

ingress

Specifies that packets ingressing the port should be mirrored. Ingress packets are mirrored to the mirror destination prior to ingress packet modification.

Context

[Tree] (config>li>li-source port)

Full Context

configure li li-source port

Description

This command specifies the port to perform lawful intercept. It is recommended when configuring **li-source>port** criteria, the li-source should only contain ports. All other criteria such as SAPs and subscribers should use a different li-source.

The **no** form of this command reverts to the default.

Parameters

port-id

Specifies the port ID to perform lawful intercept.

port-id *slot*/*mda*/*port* [.*channel*]

eth-sat-id	esat-<id>/<slot>/[u]<port>	
	esat	keyword
	id	1 to 20
	u	keyword for up-link port
pxc-id	pxc-<id>.<sub-port>	
	pxc	keyword
	id	1 to 64
	sub-port	a, b

lag-id

The LAG identifier, expressed as a decimal integer.

Note:
On the 7950 XRS, the XMA ID takes the place of the MDA.

Values 1 to 800

egress

Performs lawful intercept on egress traffic.

ingress

Performs lawful intercept on ingress traffic.

no port {*port-id* | **lag** *lag-id*} [**egress**] [**ingress**]

Context

[Tree] (debug>mirror-source port)

Full Context

debug mirror-source port

Description

This command enables mirroring of traffic ingressing or egressing a port (Ethernet port, SONET/SDH channel, TDM channel, or Link Aggregation Group (LAG)).

The **port** command associates a port or LAG to a mirror source. The port is identified by the *port-id*. The defined port may be Ethernet, Access or network, SONET/SDH, or TDM channel access. A network port may be a single port or a Link Aggregation Group (LAG) ID. When a LAG ID is given as the *port-id*, mirroring is enabled on all ports making up the LAG. If the port is a SONET/SDH interface, the *channel-id* must be specified to identify which channel is being mirrored (applies to the 7450 ESS and 7750 SR). Either a LAG port member *or* the LAG port can be mirrored.

The port is only referenced in the mirror source for mirroring purposes. The mirror source association does not need to be removed before deleting the card to which the port belongs. If the port is removed from the system, the mirroring association will be removed from the mirror source.

The same port may not be associated with multiple mirror source definitions with the **ingress** parameter defined. The same port may not be associated with multiple mirror source definitions with the **egress** parameter defined.

If a SAP is mirrored on an access port, the SAP mirroring will have precedence over the access port mirroring when a packet matches the SAP mirroring criteria. Filter and label mirroring destinations will also precedence over a port-mirroring destination.

If the port is not associated with a **mirror-source**, packets on that port will not be mirrored. Mirroring may still be defined for a SAP, label or filter entry, which will mirror based on a more specific criteria.

The encapsulation type on an access port or channel cannot be changed to Frame Relay if it is being mirrored (applies to the 7750 SR and 7450 ESS).

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no port** command disables port mirroring for the specified port. Mirroring of packets on the port may continue due to more specific mirror criteria. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition will be removed.

Parameters

port-id

Specifies the port ID of the 7750 SR or 7950 XRS.

The following syntax applies to the 7750 SR:

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b
	ccag-id	ccag-*id*.*path-id cc-type*:*cc-id*	
		ccag	keyword
		id	1 to 8
		path-id	a,b
		cc-type	sap-net, net-sap
		cc-id	0 to 4094

The following syntax applies to the 7950 XRS:

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

lag-id

Specifies the LAG identifier, expressed as a decimal integer.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note:
On the 7950 XRS, the XMA ID takes the place of the MDA.

Values 1 to 800

egress

Specifies that packets egressing the port should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

ingress

Specifies that packets ingressing the port should be mirrored. Ingress packets are mirrored to the mirror destination prior to ingress packet modification.

[Tree] (config>filter>ipv6-filter>entry>match port)

Full Context

configure filter ip-filter entry match port

configure filter ipv6-exception entry match port

configure filter ipv6-filter entry match port

Description

This command configures a TCP/UDP/SCTP source or destination port match criterion in IPv4 and IPv6 CPM (SCTP not supported) and/or ACL filter policies. A packet matches this criterion if the packet TCP/UDP/SCTP (as configured by protocol/next-header match) source OR destination port matches either the specified port value or a port in the specified port range or port-list.

Operational Note: This command is mutually exclusive with src-port and dst-port commands. Configuring "port eq 0", may match non-initial fragments where the source/destination port values are not present in a packet fragment if other match criteria are also met.

The **no** form of this command deletes the specified port match criterion.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no port

Parameters

lt | gt | eq

Specifies the operator to use relative to *port-number* for specifying the port number match criteria.

lt

Specifies that all port numbers less than *port-number* match.

gt

Specifies that all port numbers greater than *port-number* match.

eq

Specifies that the *port-number* must be an exact match.

port-number

Specifies a source or destination port to be used as a match criterion. The port number can be expressed as a decimal integer, as well as in hexadecimal or binary format. The following value shows a decimal integer only.

Values 0 to 65535

port-list *port-list-name*

Specifies an inclusive range of source or destination port values to be used as match criteria.

range *port-number port-number*

Specifies an inclusive range of source or destination port values to be used as match criteria.

Context

[Tree] (config>router>if port)

Full Context

configure router interface port

Description

This command creates an association with a logical IP interface and a physical port.

An interface can also be associated with the system (loopback address).

The command returns an error if the interface is already associated with another port or the system. In this case, the association must be deleted before the command is re-attempted. The *port-id or port-id for* Ethernet ports can be in one of the following forms:

Ethernet interfaces

If the card in the slot has MDAs/XMAs, *port-id* is in the *slot_number*/MDA or XMA */_number*/*port_number* format; for example, **1/1/3** specifies port 3 of the MDA/XMA installed in MDA/XMA slot 1 on the card installed in chassis slot 1.

SONET/SDH interfaces

When the *port-id* represents a POS interface, the *port-id* must include the *channel-id.* The POS interface must be configured as a **network** port.

The **no** form of this command deletes the association with the port. The **no** form of this command can only be performed when the interface is administratively down.

Default

no port

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

port-name

The physical port identifier to associate with the IP interface.

Values The following values apply to the 7750 SR and 7450 ESS:

Table 98: Port Names

port-name	port-id[:encap-val]	
	encap-val	0 for null
		[0 to 4094] for dot1q
		[0 to 4094].* [1 to 4094].[0to 4094] for qinq

Context

[Tree] (config>system>port-topology port)

Full Context

configure system port-topology port

Description

This command is used for satellites. It identifies to the SR OS that there is an internal connection between two ports.

Permitted pairings of the two ports are:

First port	Second port
Router port	Satellite uplink port
Satellite uplink port	Router port

For satellites, this command configures the binding between a host port ID and the satellite uplink from the satellite chassis. The port topology can be configured with the host connected to a satellite uplink or the satellite uplink port connected to the specified host port. Both configurations are supported, as shown in the following examples:

```
*A:Dut-A# configure system port-topology port esat-1/1/u4 to 1/2/2 create
*A:Dut-A# configure system port-topology no port esat-1/1/u4
*A:Dut-A# configure system port-topology port 1/2/2 to esat-1/1/u4 create
*A:Dut-A# configure system port-topology no port 1/2/2
```

The **no** form of the command removes the internal connection.

Default

no port port-id

Parameters

port-id

Specifies one port of an internal port connection. These ports can be router ports or Ethernet satellite uplink ports. Acceptable pairings are defined in the command description.

Values

(Router port)

slot/*mda*/*port*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	slot	The slot number of the card in the chassis. The maximum slot number is platform dependent. Refer to the hardware installation guides for more information.
	mda	[1 to 2]
	port	[1 to 160] (depending on the MDA type)

(Ethernet satellite uplink port)

esat-id/slot/uport

	esat	keyword
	id	[1 to 20]
	slot	[1]
	u	keyword for up-link port
	port	[1 to 4]

create

Specifies the keyword required to create the binding between the two ports.

Platforms

port

Syntax

port *port-id* [**create**]

no port *port-id*

Context

[Tree] (config>system>ptp port)

Full Context

configure system ptp port

Description

This command configures PTP over Ethernet on the physical port. The PTP process shall transmit and receive PTP messages through the port using Ethernet encapsulation (as opposed to UDP/IPv4 encapsulation).

The frames are transmitted with no VLAN tags even if the port is configured for dot1q or qinq modes for encap-type. In addition, the received frames from the external PTP clock must also be untagged.

There are two reserved multicast addresses allocated for PTP messages (see *Annex F IEEE Std 1588™-2008*). Either address can be configured for the PTP messages sent through this port.

A PTP port may not be created if the PTP profile is set g8265dot1-2010.

If the port specified in the port-id supports 1588 port based timestamping, then a side effect of enabling PTP over Ethernet on the port shall be the enabling of Synchronous Ethernet on that port.

De-provisioning of the card or MDA containing the specified port is not permitted while the port is configured within PTP.

Changing the encapsulation or the port type of the Ethernet port is not permitted when PTP Ethernet Multicast operation is configured on the port.

To allocate an ethernet satellite client port as a PTP port, the ethernet satellite must first be enabled for the transparent clock function. For more information, see the **config**>**system**>**satellite**>**eth-sat ptp-tc** command.

The SyncE/1588 ports of the CPM and CCMs can be specified as a PTP port. These use the 'A/3’ and 'B/3’ designation and they both must be specified as two PTP ports if both are to be used. The active CPM sends and receives messages on both ports if they are specified and enabled.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

port-id

Specifies a specific physical port.

Values *slot/mda/port*

create

Creates the PTP port. This keyword is required when first creating the PTP port, if the system is configured to require it (enabled in the environment create command). Once the PTP port is created, it is possible to navigate into the context without the create keyword.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure log syslog port

Description

This command configures the UDP port that will be used to send syslog messages to the syslog target host.

The port configuration is needed if the syslog target host uses a port other than the standard UDP syslog port 514.

Only one port can be configured. If multiple **port** commands are entered, the last entered port overwrites the previously entered ports.

The **no** form of this command removes the value from the configuration.

Parameters

value

Specifies the value that is the configured UDP port number used when sending syslog messages.

Values 1 **to** 65535

Platforms

All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port

Syntax

port *port*

no port

Context

[Tree] (config>system>netconf>listen port)

Full Context

configure system netconf listen port

Description

This command specifies the port on which the SR OS NETCONF server listens for new connections. Only one port can be configured for NETCONF management.

The configured port applies to both non-VPRN and VPRN management. New NETCONF connections are able to use the configured port. The SR OS NETCONF server errors if a port, different from the configured port, is used to SSH to the SR OS NETCONF server. For NETCONF connections not using VPRN management, active NETCONF connections are not disconnected if the port used to establish the connections is changed. For NETCONF connections using VPRN management, active NETCONF connections are disconnected if the port used to establish the connections is changed.

The **no** form of this command resets the port on which the SR OS NETCONF server listens to the default port of 830.

Parameters

port

Specifies the port on which NETCONF listens for new connections.

Values 22, 830

Default 830

configure system security cpm-filter ip-filter entry match port

Description

This command configures a TCP/UDP source or destination port match criterion in IPv4 and IPv6 CPM filter policies. A packet matches this criterion if packet's TCP/UDP (as configured by protocol/next-header match) source OR destination port matches either the specified port value or a port in the specified port range or port list.

This command is mutually exclusive with **src-port** and **dst-port** commands.

The **no** form of this command deletes the specified port match criterion.

Default

no port

Parameters

tcp/udp port-number

Specifies the source or destination port to be used as a match criterion specified as a decimal integer.

Values 0 to 65535

mask

Specifies the 16 bit mask to be applied when matching the port.

Values [0x0000 to 0xFFFF] | [0 to 65535] | [0b0000000000000000. to 0b1111111111111111]

range tcp/udp port-number

Specifies an inclusive range of source or destination port values to be used as match criteria. *start* of the range and *end* of the range are expressed as decimal integers.

Values start, end, port-number: 1 to 65535

port-list port-list-name

Specifies a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

35.8 port-bw-oversub-factor

port-bw-oversub-factor

Syntax

port-bw-oversub-factor *oversubscription-factor*

no port-bw-oversub-factor

Context

[Tree] (config>qos>hs-pool-policy>mid-tier>mid-pool port-bw-oversub-factor)

Full Context

configure qos hs-pool-policy mid-tier mid-pool port-bw-oversub-factor

Description

This command modifies the size of the mid-pool when calculating the port-class pool sizes based on port bandwidth ratios. The command does not actually change the size of the mid-pool, only the size reported to the port-class pool sizing function.

Port-class pools can be sized in one of two ways: dynamically (proportionate to the bandwidth of each port) or explicitly (based on a percentage of the parent mid-pool). Explicit percentages require careful determination of the amount to give each pool. The dynamic sizing function attempts to automatically size each pool based on the relative amount of bandwidth each port-class pool is supporting compared to other port's port-class pools. This is accomplished by determining a dynamic weight for each port with port-class pools mapped to a given mid-pool. As true with any weighted behavior, the mid-pool buffer allocation resource is distributed in a non-oversubscribed manner to its child port-class pools. The **port-bw-oversub-factor** *oversubscription-factor* allows this distribution mechanism to become proportionally oversubscribed based on the defined factor. An oversubscription-factor of 1.5 causes the port-class pool dynamic sizes to be 1.5 times bigger, allowing for a potentially more efficient utilization of the buffers represented by mid-pool.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **port-bw-oversub-factor** *oversubscription-factor* for a mid-pool can be modified at any time, causing the corresponding port-class pool dynamic sizes to be recalculated.

A similar behavior can be obtained by increasing the mid-pool's allocation-percent of its parent root-pool. However, the major difference in using **port-bw-oversub-factor** is that it provides larger port-class pools without allowing the mid-pool to use a higher number of buffers in the root pool.

The **no** form of the command reverts to the default.

Default

port-bw-oversub-factor 1

Parameters

oversubscription-factor

Specifies the factor by which the dynamically-sized port-class pools associated with the mid-pool may oversubscribe the mid-pool. This parameter is required when the **port-bw-oversub-factor** command is executed.

Values 1 to 10

Platforms

7750 SR-7/12/12e

35.9 port-control

port-control

Syntax

port-control [**auto** | **force-auth** | **force-unauth**]

Context

[Tree] (config>port>ethernet>dot1x port-control)

Full Context

configure port ethernet dot1x port-control

Description

This command configures the 802.1x authentication mode.

The **no** form of this command returns the value to the default.

Default

port-control force-auth

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

force-auth

Disables 802.1x authentication and causes the port to transition to the authorized state without requiring any authentication exchange. The port transmits and receives normal traffic without requiring 802.1x-based host authentication.

force-unauth

Causes the port to remain in the unauthorized state, ignoring all attempts by the hosts to authenticate. The switch cannot provide authentication services to the host through the interface.

auto

Enables 802.1x authentication. The port starts in the unauthorized state, allowing only EAPoL frames to be sent and received through the port. Both the router and the host can initiate an authentication procedure. The port will remain in unauthorized state (no traffic except EAPoL frames is allowed) until the first client is authenticated successfully. After this, traffic is allowed on the port for all connected hosts.

port-down

Syntax

[**no**] **port-down** *port-id*

Context

[Tree] (config>vrrp>policy>priority-event port-down)

Full Context

configure vrrp policy priority-event port-down

Description

This command configures a port down priority control event that monitors the operational state of a port or SONET/SDH channel. When the port or channel enters the operational down state, the event is considered set. When the port or channel enters the operational up state, the event is considered cleared.

Multiple unique **port-down** event nodes can be configured within the **priority-event** context up to the overall limit of 32 events. Up to 32 events can be defined in any combination of types.

The **port-down** command can reference an arbitrary port or channel. The port or channel does not need to be preprovisioned or populated within the system. The operational state of the **port-down** event is set as follows:

- Set – non-provisioned
- Set – not populated
- Set – down
- Cleared – up

When the port or channel is provisioned, populated, or enters the operationally up or down state, the event operational state is updated appropriately.

When the event enters the operationally down, non-provisioned, or non-populated state, the event is considered to be set. When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from cleared to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

When the event enters the operationally up state, the event is considered to be cleared. Once the events **hold-set** expires, the effects of the events **priority** value are immediately removed from the in-use priority of all associated virtual router instances.

The actual effect on the virtual router instance in-use priority value depends on the defined event priority and its delta or explicit nature.

The **no** form of the command deletes the specific port or channel monitoring event. The event may be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances will be re-evaluated. The events **hold-set** timer has no effect on the removal procedure.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no port-down — No port down priority control events are defined.

Parameters

port-id

The port ID of the port monitored by the VRRP priority control event.

The *port-id* can only be monitored by a single event in this policy. The port can be monitored by multiple VRRP priority control policies. A port and a specific channel on the port are considered to be separate entities. A port and a channel on the port can be monitored by separate events in the same policy.

Values The following values apply to the 7750 SR:

slot/*mda*/*port*[.*channel*]

eth-sat-id	esat-*id*/*slot*/*port*	
	esat	keyword
	id	1 to 20
pxc-id	pxc-*id*.*sub-port*	
	pxc	keyword
	id	1 to 64
	sub-port	a, b
aps-id	aps-*group-id*[.*channel*]	
	aps	keyword
	group-id	1 to 64
ccag-id	ccag-*id*. *path-id*[*cc-type*]	
	ccag	keyword
	id	1 to 8
	path-id	a, b
	cc-type	.sap-net, .net-sap

Values The following values apply to the 7450 ESS:

port-id	*slot*/*mda*/*port*[.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	id	1 to 20
pxc-id	pxc-*id*.*sub-port*	
	pxc	keyword
	id	1 to 64
	sub-port	a, b
ccag-id	ccag-*id*. *path-id*[*cc-type*]	
	ccag	keyword
	id	1 to 8
	path-id	a, b
	cc-type	.sap-net, .net-sap

The POS channel on the port monitored by the VRRP priority control event. The *port-id***.** *channel-id* can only be monitored by a single event in this policy. The channel can be monitored by multiple VRRP priority control policies. A port and a specific channel on the port are considered to be separate entities. A port and a channel on the port can be monitored by separate events in the same policy.

If the port is provisioned, but the *channel* does not exist or the port has not been populated, the appropriate event operational state is Set – non-populated.

If the port is not provisioned, the event operational state is Set – non-provisioned.

If the POS interface is configured as a clear-channel, the *channel-id* is 1 and the channel bandwidth is the full bandwidth of the port.

Context

[Tree] (config>service>vprn>wpp>portals>portal port-format)

[Tree] (config>router>wpp>portals>portal port-format)

Full Context

configure service vprn wpp portals portal port-format

configure router wpp portals portal port-format

Description

This command specifies the encoding format of WPP port attribute.

The standard format is as follows:

<0 to 20 character system-name><1 character separator><2-digit slot><1-digit mda><2-digit port><4-digit top><5-digit bottom>

As a general rule, if a value is not present or is too large to fit in the field, is the field set to all zeros. The following rules apply to standard formats.

- With a standard port, when the separator is a "-" character, the slot is the *slot-id*, mda is the *mda-id*, and the port is the *port-id*.
- With an ESAT port, when the separator is a ":" character, the slot is the *satellite-id*, MDA is satellite *slot-id*, and the port is satellite *port-id*.
- With a PXC port, when separator is a "#" character, the MDA is the PXC *subport-id*, and the port is the PXC *port-id*.
- With a LAG port, the port is the *lag-id*.
- With a connector port, the slot is the *slot-id*, the MDA is the *mda-id*, and the port is the *connector-id*.

The vendor-specific format is as follows:

With dot1q, append "%u" with the top *vlan-id*.

With qinq, append "%u.%u" with the top *vlan-id* and the bottom *vlan-id*.

As a general rule, there can be no trailing zeros. The string truncates if it becomes too long. 0 to 16 characters are allowed for the system name. The following rules apply to vendor-specific formats.

- With a standard port, append "%s-%u/%u/%" with the *system-name*, *slot-id*, *mda-id*, and *port-id*.
- With an ESAT port, append "%s-S%u/%u/%u" with the *system-name*, *satellite-id*, *satellite-slot-id*, and *satellite-port-id*.
- With a PXC port, append "%s-P%u%c" with the *system-name*, PXC *port-id*, and PXC *subport-id* ? 'a' : 'b'.
- With a LAG port, append "%s-L%u" with the *system-name* and *lag-id*.
- With a connector port append "%s-%u%uc%u/%u" with the *system-name*, *slot-id*, *mda-id*, *connector-id*, and *connector-port-id*.

The **no** form of this command reverts to the default.

Full Context

configure router nat outside pool port-forwarding-dyn-block-reservation

configure service vprn nat outside pool port-forwarding-dyn-block-reservation

Description

This command will enable the reservation of the dynamic port blocks when the first port forward for the subscriber is created. The dynamic port bloc allocation is logged only if the block is being utilized (mapping are created). In other words, dynamic port block reservation due to the port forward creation but without any dynamic mapping, will not be logged.

The reserved port block will be released only when the last mapping in the block expires and there is not port forward associated with the subscriber. The de-allocation log (syslog or Radius) will be generated when the dynamic port block is completely released.

Dynamic port block reservation can be enabled only if the configured maximum number of subscriber per outside IP address is less or equal then the maximum number of configured port blocks per outside IP address.

Default

35.15 port-forwarding-range

port-forwarding-range

Syntax

port-forwarding-range [*range-start*] *range-end*

no port-forwarding-range

Context

[Tree] (config>router>nat>outside>pool port-forwarding-range)

[Tree] (config>service>vprn>nat>outside>pool port-forwarding-range)

Full Context

configure router nat outside pool port-forwarding-range

configure service vprn nat outside pool port-forwarding-range

Description

This command configures the lower and upper limit for port forwards in the ephemeral port space (wildcard port space) of all IP addresses in a NAT pool. A well-known port range (ports 1 to 1023) is always enabled for port forwards, and it cannot be disabled for pools in NAPT mode.

Pools in 1:1 mode do not support configured port forwards. These pools do not perform port translation and they automatically forward traffic initiated on the outside toward the inside.

Port 0 is always excluded from the port forwarding range.

The upper bound of the wildcard port range is reserved for port forwards. If the value for the *range-start* is not provided, the wildcard port range implicitly starts at 1024.

range-start 0 cannot be configured by an operator because it is reserved for 1:1 pools that do not support configured port forwards.

If you configure *port-forwarding-range 3000*, configures ports 1 to 3000 as port forwards. This implies that the well-known ports and wildcard ports are contiguous. If you configure *port-forwarding-range 2000 3000*, the router implicitly includes ports 1 to 1023, plus enables the wildcard port range 2000 to 3000, which is now disjoined from the well-known ports.

The *range-start* parameter has additional values that are configurable in the CLI. 0 is reserved for pools that do not support configured port forwards (those are 1:1 pools).

range-start 1 means that well-known ports and wildcard port forwards are contiguous. This is configured by omitting the *range-start* parameter and only configuring the *range-end* parameter.

The **no** form of this command disables the port forwards capability in the wildcard port range of all IP addresses in a NAT pool.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default ranges in the *range-start* and *range-end* parameters in the MIB for the NAT pools that support port forwarding ranges are set to include only well-known ports, *range-start 1* and *range-end 1023*.

Parameters

range-start

Specifies the lower boundary of the wildcard port range reserved for port forwards. When configured, the value must be less than the *range-end* value.

Values 0, 1, 1025 to 65535

Default 1

range-end

Specifies the upper boundary of the wildcard port range reserved for port forwards.

Values 0, 1023 to 65535

Default 1023

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-forwarding-range

Syntax

port-forwarding-range *range-end*

no port-forwarding-range

Context

[Tree] (config>service>nat>firewall-policy port-forwarding-range)

[Tree] (config>service>nat>nat-policy port-forwarding-range)

Full Context

configure service nat firewall-policy port-forwarding-range

configure service nat nat-policy port-forwarding-range

Description

This command configures the end of the port range available for port forwarding. The start of the range is always equal to one.

The number of ports that can be configured is half of the available block => 64512 : 2 = 32256

In combination with port-forwarding-range the formulas are:

"max port-reservation blocks" = 65535 - "port-forwarding-range"

"max port-reservation ports" = (65535 - "port-forwarding-range") / 2

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

with:

the default min value for "port-forwarding-range" = 1023

Also, the same applies for max port-forwarding-range if the port-reservation is already configured:

"max port-forwarding-range" = 65535 - "port-reservation blocks"

"max port-forwarding-range" = 65535 - ("port-reservation ports" * 2)

The **no** form of the command reverts to the default.

Default

port-forwarding-range 1023

Parameters

range-end

Specifies the end of the port range available for port forwarding.

Values 1023 to 65535

Platforms

Description

This command creates a list of port values or ranges for match criteria in QoS policies.

The **no** form of this command deletes the specified list.

Parameters

port-list-name

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

35.20 port-map

port-map

Syntax

port-map *client-port-id* **primary** *primary-uplink-port-id* [**secondary** *secondary-uplink-port-id*]

port-map *client-port-id* **system-default**

Context

[Tree] (config>system>satellite>eth-sat port-map)

Full Context

configure system satellite eth-sat port-map

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the mapping between a satellite client port and its associated uplink. This command allows both a primary and an optional secondary uplink to be configured.

If a secondary uplink is configured, it is used to forward traffic if the primary uplink is down for any reason.

Before an uplink can be used as either a primary or secondary uplink, it must be configured using the **port-topology** configuration command.

To return the uplink association to its default the **port-map** *client-port-id* **system-default** command should be used.

Parameters

client-port-id

Specifies the satellite client port associated with the port mapping, in the format **esat**-*id*/*slot*/*port*.

primary-uplink-port-id

Specifies the primary satellite uplink to be associated with the associate client port, in the format **esat**-*id*/*slot*/*uport* where *id* is 1 to 20.

secondary-uplink-port-id

Specifies the secondary satellite uplink to be associated with the associate client port, in the format **esat**-*id*/*slot*/*uport* where *id* is 1 to 20.

system-default

Specifies to set the port map to the system default.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure service vpls sap stp port-num

configure service vpls spoke-sdp stp port-num

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the virtual port number which uniquely identifies a SAP within configuration bridge protocol data units (BPDUs). The internal representation of a SAP is unique to a system and has a reference space much bigger than the 12 bits definable in a configuration BPDU. STP takes the internal representation value of a SAP and identifies it with its own virtual port number that is unique to every other SAP defined on the TLS. The virtual port number is assigned at the time that the SAP is added to the TLS. Since the order that the SAP was added to the TLS is not preserved between reboots of the system, the virtual port number may change between restarts of the STP instance.

The virtual port number cannot be administratively modified.

Full Context

configure system security cpu-protection port-overall-rate

Description

This command configures a per-port overall rate limit for CPU protection.

Default

port-overall-rate max

Parameters

packet-rate-limit

Specifies an overall per-port packet arrival rate limit in packets per second.

Values 1 to 65535, max (indicates no limit)

action-low-priority

Marks packets that exceed the rate as low-priority (for preferential discard later if there is congestion in the control plane) instead of discarding them immediately.

35.23 port-parent

port-parent

Syntax

parent [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

no parent

Context

[Tree] (config>qos>sap-egress>dynamic-queue port-parent)

Full Context

configure qos sap-egress dynamic-queue port-parent

Description

This command configures the queue treatment by the port parent that governs the available bandwidth for the queue. When multiple queues share a child status with the parent port, the **weight** and **level** options define how this queue contends with the other children for the above-CIR parent bandwidth. The **cir-weight** and **cir-level** options specify the weight the queue uses for the within-CIR port priority.

Parameters

weight

Specifies the relative weight of this queue in comparison to other child queues while vying for above-CIR priority level bandwidth on the parent scheduler. Any queues defined as weighted receive no parental bandwidth, until all strict queues and schedulers on the parent have reached their maximum bandwidth or are idle. In this manner, weighted children are considered to be the lowest priority.

Values 1 to 100

Default 1

level

Specifies the priority level of the queue (as compared to other competing schedulers and queues) used to feed to the parent, for above-CIR offered load bandwidth passes.

Values 1 to 8

Default 1

cir-weight

Specifies the weight the queue uses at the within-CIR port priority level. This applies to any charging statistics also. The weight is specified as an integer value from 0 to 100, with 100

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

being the highest weight. When the **cir-weight** option is set to 0 (the default), the queue does not receive bandwidth during the port scheduler's within-CIR passes and the **cir-level** option is ignored. If the **cir-weight** is 1 or greater, the **cir-level** option comes into play.

Values 0 to 100

Default 0

cir-level

Specifies the priority level of the queue (as compared to other competing schedulers and queues) used to fed to the port parent, for within-CIR offered load bandwidth passes.

Values 0 to 8

Default 0

Context

[Tree] (config>qos>sap-egress>policer port-parent)

Full Context

configure qos sap-egress policer port-parent

Description

This command specifies whether this SAP egress policer feeds off a port-level scheduler. When configured, the policer is parented by a port-level scheduler. This requires that **policers-hqos-manageable** be configured in the SAP egress QoS policy. This command and the SAP egress policer **scheduler-parent** and the **parent** commands are mutually exclusive.

The **port-parent** command defines a child/parent association between an egress policer and a port-based scheduler or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the policer. If the **port-parent** command is executed without any parameters, the default parameters are used.

In this context, the **port-parent** command and the **scheduler-parent** command (used to create a parent/child association between a queue and an intermediate scheduler) are mutually exclusive. Executing a **port-parent** command when a **scheduler-parent** definition exists causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **scheduler-parent** command when a **port-parent** definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler association.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Changing the parent context on a SAP egress policy policer may cause a SAP or subscriber or a multiservice site context of the policer (policy associated with a SAP or subscriber profile or a multiservice site) to enter an orphaned state. If an instance of a policer is created on a port or channel that does not have a port scheduler enabled, and the SAP egress policy creating the policer has a port parent association, the policer will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a policer is on a port or channel that has a port scheduler configured and the SAP egress policy defines the policer as having a non-existent intermediate scheduler parent, the policer will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the policer. When removed, if a port scheduler is defined on the port on which the policer instance exists, the policer will be treated as orphaned to the port scheduler.

Default

no port-parent

Parameters

weight *weight*

Specifies the weight that the policer will use at the above-CIR port priority level (defined by the **level** parameter).

All weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **weight** parameter is set to a value of 0, the policer receives bandwidth only after other children with a non-zero weight at this level.

Values 0 to 100

Default 1

level *level*

Specifies the port priority that the policer uses to receive bandwidth for its above-CIR offered load.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight *cir-weight*

Specifies the weight that the policer uses at the within-CIR port priority level (defined by the **cir-level** parameter).

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

Values 0 to 100

Default 0

cir-level ***cir-level***

Specifies the port priority that the policer will use to receive bandwidth for its within-CIR offered load. If the **cir-level** parameter is set to a value of 0 (the default value), the policer does not receive bandwidth during the port schedulers within-CIR pass and the **cir-weight** parameter is ignored. If the **cir-level** parameter is 1 or greater, the **cir- weight** parameter is used.

Values 0 to 8 (8 is the highest priority)

Default 0

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, VSR

Full Context

configure qos sap-egress queue port-parent

Description

This command specifies whether this queue feeds off a port-level scheduler. When configured, this SAP egress queue is parented by a port-level scheduler. This object is mutually exclusive with SAP egress queue parent. Only one kind of parent is allowed.

The **port-parent** command defines a child/parent association between an egress queue and a port-based scheduler or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the queue or scheduler. If the **port-parent** command is executed without any parameters, the default parameters are assumed.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

In this context, the **port-parent** command is mutually exclusive to the **parent** command (used to create a parent/child association between a queue and an intermediate scheduler). Executing a **port-parent** command when a parent definition is in place causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **parent** command when a port-parent definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler name.

Changing the parent context on a SAP egress policy queue may cause a SAP or subscriber or multiservice site context of the queue (policy associated with a SAP or subscriber profile or multiservice site) to enter an orphaned state. If an instance of a queue is created on a port or channel that does not have a port scheduler enabled and the sap-egress policy creating the queue has a port-parent association, the queue will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a queue is on a port or channel that has a port scheduler configured and the sap-egress policy defines the queue as having a non-existent intermediate scheduler parent, the queue will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the queue or scheduler. If a port scheduler is defined on the port on which the queue or scheduler instance exists, the queue or scheduler will become orphaned if an port scheduler is configured on the egress port of the queue or scheduler.

Default

no port-parent

Parameters

weight *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the level parameter).

Values 0 to 100

Default 1

level *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 100

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 0

cir-level ***cir-level***

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

no port-parent

Context

[Tree] (config>qos>network-queue>queue port-parent)

Full Context

configure qos network-queue queue port-parent

Description

This command specifies whether this queue feeds off a port-level scheduler. For the network-queue policy context, only the port-parent command is supported. When a port scheduler exists on the port, network queues without a port-parent association will be treated as an orphan queue on the port scheduler and treated according to the current orphan behavior on the port scheduler. If the port-parent command is defined for a network queue on a port without a port scheduler defined, the network queue will operate as if a parent association does not exist. When a port scheduler policy is associated with the egress port, the port-parent command will come into effect.

When a network-queue policy is associated with an FP for ingress queue definition, the port-parent association of the queues is ignored.

The **no** form of this command removes a port scheduler parent association for the queue or scheduler. If a port scheduler is defined on the port then the queue or scheduler instance exists, the queue or scheduler will become orphaned.

Default

no port-parent

[Tree] (config>qos>qgrps>egr>qgrp>queue port-parent)

Full Context

configure qos queue-group-templates egress queue-group queue port-parent

Description

This command defines the port scheduling parameters used to control the queue's behavior when a virtual egress port scheduling is enabled where the egress queue group template is applied. The **port-parent** command follows the same behavior and provisioning characteristics as the **parent** command in the SAP egress QoS policy. The **port-parent** command and the **parent** command are mutually exclusive.

The **no** form of this command removes the values from the configuration.

Parameters

weight *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the level parameter).

Values 0 to 100

Default 1

level *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the **cir-level** parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the **cir-level** parameter is ignored. If the **cir-weight** parameter is 1 or greater, the **cir-level** parameter is used.

Values 0 to 100

Default 0

cir-level *cir-level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the **cir-weight** parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the **cir-level** parameter is ignored. If the **cir-weight** parameter is 1 or greater, the **cir-level** parameter is used.

no port-parent

Context

[Tree] (config>qos>scheduler-policy>tier>scheduler port-parent)

Full Context

configure qos scheduler-policy tier scheduler port-parent

Description

The **port-parent** command defines a child/parent association between an egress scheduler and a port-based scheduler, or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the scheduler. If the **port-parent** command is executed without any parameters, the default parameters are assumed.

In this context, the **port-parent** command and the **parent** command (used to create a parent/child association to an intermediate scheduler) are mutually exclusive. Executing a **port-parent** command when a parent definition is in place causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **parent** command when a port-parent definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler name.

Changing the parent context on a SAP egress policy policer or queue may cause a SAP or subscriber context of the policer or queue (policy associated with a SAP or subscriber profile) to enter an orphaned state. If an instance of a policer or queue is created on a port or channel that does not have a port scheduler enabled and the sap-egress policy creating the policer queue has a port-parent association, the policer or queue will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a policer or queue is on a port or channel that has a port scheduler configured and the sap-egress policy defines the policer or queue as having a non-existent intermediate scheduler parent, the policer or queue will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the scheduler. If a port scheduler is defined on the port that the scheduler instance exists, the scheduler will become orphaned if an port scheduler is configured on the egress port of the queue or scheduler.

port-policy

Syntax

port-policy [*port-policy*]

no port-policy

Context

[Tree] (config>isa>wlan-gw-group port-policy)

Full Context

configure isa wlan-gw-group port-policy

Description

This command configures the port policy of this WLAN Gateway ISA group. If a port policy is associated with a WLAN Gateway ISA group, ports created for this group can take applicable configuration from that port policy. This port policy is applicable to those ports that take part in the per-tunnel QoS processing.

The **no** form of the command removes the **port-policy** name from the configuration.

Default

no port-policy

Parameters

port-policy

Specifies the port policy of this WLAN Gateway ISA group, up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-policy

Syntax

port-policy *policy-name*

no port-policy

Context

[Tree] (config>isa>lns-group port-policy)

Full Context

configure isa lns-group port-policy

Description

This command enables policies referenced in the **config>port-policy** context to be created under **ports**. These are the ports that link the carrier IOM to the ISA, and are hidden within the system (they cannot be created through the CLI). They are created automatically. Use the **show port** command to view information.

Currently only the port scheduler policy is supported. Each lns-esm port in the lns-group receives an independent port scheduler instance. The port schedulers are instantiated in the carrier IOM on the lns-esm ports that carry PPPoE traffic in the downstream direction towards the ISA before the PPPoE traffic is L2TP encapsulated.

The **no** form of the command removes the policy name from the configuration.

Default

no port-policy

Full Context

configure qos network egress fc port-redirect-group

Description

This command is used to redirect the FC of a packet of a pseudowire (PW) or network IP interface to an egress port queue group.

It defines the mapping of an FC to a queue ID or a policer ID and a queue ID and redirects the lookup of the queue or policer of the same ID in some egress port queue-group instance. However, the queue-group name and instance are explicitly provided only at the time the network QoS policy is applied to egress context of a spoke-sdp or a network IP interface.

The **no** version of this command removes the redirection of the FC.

Parameters

queue-id

This parameter must be specified when executing the **port-redirect-group** command. The specified *queue-id* must exist within the egress port queue group on each IP interface where the network QoS policy is applied.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 8

policer id

The specified policer-id must exist within the queue-group template applied to the ingress context of the forwarding plane.

[Tree] (config>router>nat>outside>pool port-reservation)

Full Context

configure service vprn nat outside pool port-reservation

configure router nat outside pool port-reservation

Description

This command configures the size of the port block that will be assigned to a host that is served by this pool. The number of ports configured are available to UDP, TCP, and ICMP (as identifiers).

Parameters

num-blocks

Specifies the number of port blocks per IP address. Setting this parameter to one (1) for large scale NAT enables 1:1 NAT for IP addresses in this pool.

Values 1 to 64512

num-ports

Specifies the number of ports per block.

Values 0 to 64512 (for deterministic pools)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

1 to 64512 (for non-deterministic pools)

port-reservation *num-ports*

no port-reservation

Context

[Tree] (config>router>nat>outside>pool>deterministic port-reservation)

[Tree] (config>service>vprn>nat>outside>pool>deterministic port-reservation)

Full Context

configure router nat outside pool deterministic port-reservation

configure service vprn nat outside pool deterministic port-reservation

Description

This command is applicable only to deterministic NAT. It configures the number of deterministic ports per subscriber (for example a subscriber is an inside IP address in LSN44 or IPv6 address or prefix in DS-Lite). Once this command is enabled, the pool will transition into deterministic mode of operation. This means that the subscribers can use dynamic port-blocks in the pool only as a mean to expand the range of originally assigned deterministic ports. A pool with such property is referred to as deterministic pool. However, deterministic NAT and non-deterministic NAT cannot use the same pool simultaneously.

All subscribers in deterministic pool are pre-mapped during the configuration phase to outside IP addresses and deterministic port-blocks. Because of this, the deterministic pool cannot be oversubscribed with subscribers (first-come, first-served).

Once the deterministic pool becomes operational (no shutdown) a log is created. The same applies if the pool is disabled (shutdown). As a result of this one-time logging, there will be no additional logging when a subscriber starts using ports from the pre-assigned deterministic port block. This drastically reduces the logging overhead. However, when a deterministic port block is expanded by a dynamic port block, a log will be created on any allocation/de-allocation of the dynamic port block. The logs are also created for static port forwards (including PCP).

The number of subscribers per outside IP address (subscriber-limit) multiplied by the number of deterministic ports per subscriber (port-reservation) will determine the port range of an outside IP address that will be dedicated to deterministic mappings. The number of subscribers per outside IP address in deterministic NAT must be power of 2 (2^n). Once the deterministic ports are allocated, the dynamic ports are carved out of the remaining port space of the same outside IP address according to the existing **port-reservation** command under the same hierarchy,

35.30 port-scheduler-policy

port-scheduler-policy

Syntax

port-scheduler-policy *port-scheduler-policy-name*

no port-scheduler-policy

Context

[Tree] (config>port>ethernet>access>egress>vport port-scheduler-policy)

Full Context

configure port ethernet access egress vport port-scheduler-policy

Description

This command specifies the destination and organization strings to be used for matching subscriber hosts with this Vport.

The parent Vport of a subscriber host queue, which has the port-parent option enabled, is determined by matching the destination string dest string associated with the subscriber and the organization string org string associated with the subscriber host with the strings defined under a Vport on the port associated with the subscriber.

If a given subscriber host policers or queue does not have the port-parent option enabled, it is foster-parented to the Vport used by this subscriber and which is based on matching the dest string and org string. If the subscriber could not be matched with a Vport on the egress port, the host policer or queue will not be bandwidth controlled and competes for bandwidth directly based on its own PIR and CIR parameters.

By default, a subscriber host policer or queue with the port-parent option enabled is scheduled within the context of the port's port scheduler policy.

The **agg-rate rate**, **port-scheduler-policy** and **scheduler-policy** commands are mutually exclusive. Changing between the use of a scheduler policy and the use of an **agg-rate** or **port-scheduler-policy** involves removing the existing command and applying the new command. Applying a scheduler policy to a Vport is only applicable to Ethernet interfaces.

The **no** form of this command removes the *port-scheduler-policy-name* from the configuration.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **agg-rate** *rate*, **port-scheduler-policy** and **scheduler-policy** commands are mutually exclusive. Changing between the use of a scheduler policy and the use of an **agg-rate**/**port-scheduler-policy** involves removing the existing command and applying the new command.

The **no** form of this command reverts to the default.

Parameters

port-scheduler-policy-name

Specifies an existing **port-scheduler-policy** configured in the **config>qos** context.

Platforms

port-scheduler-policy

Syntax

port-scheduler-policy *port-scheduler-name* [**create**]

no port-scheduler-policy *port-scheduler-name*

Context

[Tree] (config>qos port-scheduler-policy)

Full Context

configure qos port-scheduler-policy

Description

When a port scheduler has been associated with an egress port, it is possible to override the following parameters:

- The max-rate allowed for the scheduler
- The maximum rate for each priority level (1 to 8)
- The cir associated with each priority level (1 to 8)

The orphan priority level (level 0) has no configuration parameters and cannot be overridden.

The **no** form of this command removes a port scheduler policy from the system. If the port scheduler policy is associated with an egress port or channel, the command will fail.

Parameters

port-scheduler-name

Specifies an existing port scheduler name. Each port scheduler must be uniquely named within the system and can be up to 32 ASCII characters.

Platforms

All

port-scheduler-policy

Syntax

port-scheduler-policy *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy port-scheduler-policy)

Full Context

configure qos copy port-scheduler-policy

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command copies existing QoS policy entries for a QoS policy to another QoS policy.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

If **overwrite** is not specified, an error will occur if the destination policy exists.

Parameters

src-name dst-name

Indicates that the source policy and the destination policy are port scheduler policy IDs. Specify the source policy that the copy command will attempt to copy from and specify the destination policy name to which the command will copy a duplicate of the policy.

overwrite

Forces the destination policy name to be copied as specified. When forced, everything in the existing destination policy will be completely overwritten with the contents of the source policy.

35.34 port-threshold

port-threshold

Syntax

port-threshold *value* [**action** { **dynamic-cost** | **static-cost** | **down**}] [**cost** *static-cost*]

no port-threshold

Context

[Tree] (config>lag port-threshold)

Full Context

configure lag port-threshold

Description

This command configures the behavior for the Link Aggregation Group (LAG) if the number of operational links is equal to or below a threshold level.

Nokia recommends that operators use the **weight-threshold** or **hash-weight-threshold** command instead of the **port-threshold** command to control LAG operational status. For example, when 10GE and 100GE ports are mixed in a LAG, each 10GE port will have a weight of 1, while each 100GE port will have a weight of 10.

The **weight-threshold** or **hash-weight-threshold** command can also be used for LAGs with all ports of equal speed to allow a common operational model. For example, each port has a weight of 1 to mimic **port-threshold** and its related configuration.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command reverts to the default values.

Default

port-threshold 0 action down

Parameters

value

Specifies the decimal integer threshold number of operational links for the LAG at or below which the configured action is invoked. If the number of operational links exceeds the **port-threshold** value, any action taken for being below the threshold value will cease.

Values 0 to 63

action

Specifies the action to take if the number of active links in the LAG is at or below the threshold value.

dynamic-cost

Specifies that dynamic costing is activated. As a result, the LAG remains operationally up with a cost relative to the number of operational links. The link is only regarded as operationally down when all links in the LAG are down.

static-cost

Specifies that static costing is activated. As a result, the LAG remains operationally up with the configured cost, regardless of the number of operational links. The link is only regarded as operationally down when all links in the LAG are down.

down

Specifies that LAG is brought operationally down if the number of operational links is equal to or less than the configured threshold value. The LAG is only regarded as up once the number of operational links exceeds the configured threshold value.

static-cost

Specifies decimal integer static cost of the LAG.

Values 1 to 16777215

35.48 post-policer-mapping

post-policer-mapping

Syntax

post-policer-mapping *mapping-policy-name* [**create**]

no post-policer-mapping *mapping-policy-name*

Context

[Tree] (config>qos post-policer-mapping)

Full Context

configure qos post-policer-mapping

Description

This command configures a post-policer mapping policy which is used to remap a packet's forwarding class and profile state to another forwarding class and profile state for post-policer traffic.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A post-policer mapping policy is created without any forwarding class or profile remapping statements. If an empty policy is applied to a SAP-egress QoS policy, no remapping occurs.

The **no** form of this command deletes the post-policer mapping policy. A post-policer mapping policy can only be deleted if there are no references to it.

Parameters

mapping-policy-name

Specifies the name of the post-policer mapping policy, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

post-policer-mapping

Syntax

post-policer-mapping *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy post-policer-mapping)

Full Context

configure qos copy post-policer-mapping

Description

This command copies an existing post-policer mapping policy to another policy name.

The copy command is used to create new policies using existing policies and also allows bulk modifications to an existing policy with the use of the overwrite keyword.

Parameters

src-name

Specifies the source policy name that the copy command attempts to copy from.

dst-name

Specifies the destination policy name to which the command copies a duplicate of the policy.

overwrite

Specifies that the existing destination policy is to be replaced. Everything in the existing destination policy is overwritten with the contents of the source policy. If overwrite is not specified, an error occurs if the destination policy name exists.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

Description

This command applies a post-policer mapping policy in a SAP egress QoS policy. The policy contains forwarding class and profile remapping statements, which remap the forwarding class and profile state of an egress policed packet (the profile being the resulting profile after the packet has been processed by the egress policer) to another forwarding class and profile.

The remapping applies to all policers within the SAP egress QoS policy, including regular child policers and policers configured in an IP/IPv6 criteria action statement, except for dynamic policers.

Post-policer mapping is supported on FP3- and higher-based hardware, with the exception of the 7750 SR-a4/a8, which does not support egress policers resulting in the policy being ignored.

The **no** form of this command deletes the post-policer mapping policy from the SAP egress QoS policy.

Parameters

mapping-policy-name

Specifies the name of the post-policer mapping policy, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

power

Syntax

power *power-state*

Context

[Tree] (config>system>bluetooth power)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure system bluetooth power

Description

This command sets the operating mode of the Bluetooth module. This can be powered off or powered on but requires the pairing button to initiate the pairing operation, or powered on and continuously pairing.

The **pairing-button** setting also impacts how pairing operations work.

Default

power off

Parameters

power-state

Specifies the power state.

Values off — Bluetooth module powered off; all transmission and reception functionality is disabled.

enabled-manual — Bluetooth is enabled (pairing requires the use of the pairing button).

enabled-automatic — Bluetooth is enabled and continuously attempts to pair whenever it is not actively paired to a device.

Platforms

7750 SR-1, 7750 SR-s, 7950 XRS-20e

Full Context

configure card xiom mda power-priority-level

configure card mda power-priority-level

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command sets the power priority value for an XMA or MDA-s on platforms that support intelligent power management.

Default

power-priority-level 150

Parameters

priority

Specifies the power priority level. An operator must assign a priority value to each XMA or MDA-s using a range of number from 1 to 200. The lowest number has the highest priority. The priority number range from 1 to 100 should be used for modules considered essential for system operation. Lower priority values of 101 to 200 should be used for non-essential modules.

Values 1 to 200

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- configure card xiom mda power-priority-level

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

- configure card mda power-priority-level

35.51 power-safety-alert

power-safety-alert

Syntax

power-safety-alert *wattage*

Context

[Tree] (config>system>pwr-mgmt power-safety-alert)

Full Context

configure system power-management power-safety-alert

Description

This command sets a value in watts for the Power Safety Alert. The Power Safety Alert minor alarm is generated when the system power capacity drops below the Power Safety Level (in watts) plus the Power Safety Alert. This is a critical level, which when breached the system starts shutting down IO cards based on card priority.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

wattage

Specifies the number of watts for the power safety alert level.

Values 0 to 102600

Default 0

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

35.52 power-safety-level

power-safety-level

Syntax

power-safety-level *percent*

Context

[Tree] (config>system>pwr-mgmt power-safety-level)

Full Context

configure system power-management power-safety-level

Description

This command sets the Power Safety Level, which is a percentage of the calculated worst case power draw value. Once a Power Safety Level is configured by the operator, both the Basic and Advanced modes use the Power Safety Level as a reference for calculating the power redundancy using N+1 algorithm during startup and recovery from power depression.

Default

power-safety-level 100

Parameters

percent

Specifies the Power Safety Level as a percentage of the calculated worst case power draw value.

Values 0 to 100

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

35.53 power-save

power-save

Syntax

[**no**] **power-save**

Context

[Tree] (config>card power-save)

Full Context

configure card power-save

Description

This command enables power-save mode on a specific card when it is not in use. Power-save mode allows a card to be installed and configured in a platform for future use, while having minimal impact on the overall power consumption. The card placed in power-save mode is forced into an idle state to consume minimal power. This command resets the card and then disallows the download of a software image when the card comes back up. To enable power-save mode, the desired card must first be shut down, then placed into power-save mode. In this mode, the card is not counted in the intelligent power management budget. Cards set to power-save mode do not pass traffic.

The **no** form of this command removes the card from power-save mode.

Default

no power-save

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a8, 7750 SR-2e, 7750 SR-3e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

Full Context

configure system power-supply

Description

This command configures information about the type of power supply used for each power feed connection on the router chassis. The information is used to populate queries made using the **show**>**chassis detail** and **show**>**chassis power-supply** commands.

Parameters

power-supply-id

Specifies the power feed connection.

Values 1, 2

type

Specifies the type of power source that is connected to the power feed connection.

Values
- dc — Specifies that a single DC power source is connected to the power feed connector.
- ac single — Specifies that a single AC power source is connected to the power feed connector.
- ac multiple — Specifies that multiple AC power sources are connected to the power feed connector.
- default — Reverts the configured information to the default power source type for the chassis.
- none — Specifies that no power source is connected to the power feed connector.

Context

[Tree] (config>app-assure>group>statistics>tca>sctp-filter ppid-range)

Full Context

configure application-assurance group statistics threshold-crossing-alert sctp-filter ppid-range

Description

This command configures a TCA for the counter capturing hits for the specified SCTP filter PPID range command. An PPIPD range TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a TCA.

Parameters

direction

Specifies the traffic direction.

Values from-sub, to-sub

create

Keyword used to create the TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ppid-range

Syntax

ppid-range min *min-ppid* **max** *max-ppid*

no ppid-range

Context

Full Context

configure application-assurance group sctp-filter ppid-range

Description

This command specifies the range of PPID values that are allowed by AA SCTP filter firewall.

The **no** form of this command removes this PPID range.

Default

no ppid-range

Parameters

min-ppid

Specifies the minimum SCTP Payload Protocol Identifier (PPID) to be permitted by the SCTP filter. The value must be less than or equal to the **max** *max-ppid* value.

Values 0 to 4294967295

max-ppid

Specifies the minimum SCTP Payload Protocol Identifier (PPID) to be permitted by the SCTP filter. The value must be greater or equal to the **min** *min-ppid* value.

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service ies interface ipsec ipsec-tunnel dynamic-keying ppk

configure service vprn interface ipsec ipsec-tunnel dynamic-keying ppk

configure router interface ipsec ipsec-tunnel dynamic-keying ppk

Description

This command specifies the PPK to use for dynamic keying of the IPsec tunnel.

The **no** form of this command removes the PPK.

Default

no ppk

Parameters

ppk-list-name

Specifies the name of the PPK list, up to 32 characters.

ppk-id

Specifies the ID of a PPK entry in the list, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel dynamic-keying ppk
- configure ipsec ipsec-transport-mode-profile dynamic-keying ppk

VSR

Full Context

configure ipsec ppk-list ppk-id

Description

This command configures the attributes for a PPK entry within the list.

The **no** form of this command deletes the PPK entry from the list.

Parameters

ppk-id

Specifies a unique ID for the PPK, up to 64 characters.

value-string

Specifies the PPK value.

ascii

Keyword to specify that the PPK value is formatted as an ASCII string, up to 64 characters.

hex

Keyword that specifies the PPK value is formatted as a hexadecimal string, up to 128 hex nibbles.

Values 0x0 to 0xFFFFFFFF...

hash

Keyword that specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Keyword that specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Keyword that specifies the custom encryption to the management interface.

Full Context

configure subscriber-mgmt ppp-policy

Description

This command configures a PPP policy. These policies are referenced from interfaces configured for PPP. Multiple PPP policies may be configured.

The default policy cannot be modified or deleted.

Default

ppp-policy default

Parameters

ppp-policy-name

Specifies the PPP policy name, up to 32 characters.

create

Keyword used to create the entity. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

35.68 ppp-policy-parameters

ppp-policy-parameters

Syntax

ppp-policy-parameters

Context

[Tree] (config>subscr-mgmt>loc-user-db>ppp>host ppp-policy-parameters)

Full Context

configure subscriber-mgmt local-user-db ppp host ppp-policy-parameters

Description

This command enables the context to configure PPP policy parameters to override the values from the host associated with the PPP policy.

The PPP host uses the values configured in the PPP policy under the group interface. It is possible to use this command to override the values from the host associated with the PPP policy. Matching a pattern on the subscriber MAC address to limit the number of sessions per MAC address is possible.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a value is configured, the system overrides that particular PPP policy parameter. The absence of specific parameters means no overriding is performed.

no ppp-sub-id-key

Context

[Tree] (config>subscr-mgmt>auto-sub-id-key ppp-sub-id-key)

Full Context

configure subscriber-mgmt auto-sub-id-key ppp-sub-id-key

Description

This command enables certain fields to become the base for auto-generation of default sub-id name. The sub-id name is auto-generated if there is not a more specific method available. Examples of these specific methods would be a default sub-id name as a sap-id, a preconfigured static string or explicit mappings based on RADIUS/LUDB returned strings.

In case that a more specific sub-id name generation method is not available and the **auto-id** keyword is defined under the def-sub-id hierarchy, the sub-id name is generated by concatenating fields defined in this command separated by a "|" character.

The maximum length of the auto-generated sub-id name is 64 characters while the concatenation of subscriber identification fields can exceed 64 characters. Subscriber host instantiation fails if the sub-id name is based on subscriber identification fields whose concatenated length exceeds 64 characters. Failing the host creation rather than truncating the sub-id name on a 64 character boundary prevents collision of sub-ids (subscriber name duplication).

In case that a more specific sub-id name generation method is not available and the **auto-id** keyword is not defined under the def-sub-id hierarchy, the sub-id name is a random 10 character encoded string based on the fields defined under this command.

There is only one set of identification fields allowed per host type (IPoE or PPP) per chassis.

The **no** form of this command reverts to the default.

Default

ppp-sub-id-key mac sap-id session-id

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

sub-id-key

Specifies the auto-generated sub-id keys for PPP hosts.

Values **mac** — Specifies that the MAC address can be combined with other subscriber host identification fields (circuit-id, remote-id, session-id or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the mac address is used as a concatenation field in the sub-id name, then its format becomes a string xx:xx:xx:xx:xx:xx with the length 17B.

The MAC address as the subscriber host identification field is not applicable to static hosts.

circuit-id — Specifies that the circuit-id can be combined with other subscriber host identification fields (mac, remote-id, session-id or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

If the circuit-id is used as a concatenation field in the sub-id name, then its format becomes access-node-id eth slot/port:[vlan-id] or access-node-id atm slot/port:vpi.vci with a variable length.

Note:
If circuit-id contains any non-printable ASCII characters, the entire circuit-id string is formatted in hex in the sub-id name output. Otherwise all characters in circuit-id is converted to ASCII. ASCII printable characters contain bytes in range 0x20 to 0x7E.

If the circuit-id is used as the subscriber identification field is not applicable to ARP hosts or static hosts.

remote-id — Specifies that the remote-id can be combined with other subscriber host identification fields (mac, circuit-id, session-id or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

If the remote-id is used as a concatenation field in the sub-id name, then its format becomes a remote-id string with a variable length.

Note:
If the remote ID contains any non-printable ASCII characters, the entire remote-id string is formatted in hex in the sub-id name output. Otherwise all characters in remote-id is converted to ASCII. ASCII printable characters contain bytes in range 0x20 to 0x7E.

The remote ID as the subscriber identification field is not applicable to ARP hosts or static hosts.

sap-id — The SAP ID can be combined with other subscriber host identification fields (mac, circuit-id, remote-id, or session-id) to form a

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sub-id name in a user readable format or as a random 10 character encoded value.

In case that the circuit-id is used as a concatenation field in the sub-id name, then its format becomes: slot/mda:[outer-vlan].[inner-vlan] with a variable length.

The SAP ID as the subscriber identification field is applicable to all hosts types with exception of static hosts.

session-id — The session ID can be combined with other subscriber host identification fields (mac, circuit-id, remote-id, or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the circuit ID is used as a concatenation field in the sub-id name, then its format becomes a decimal number with variable length.

The session ID as the subscriber identification field is applicable only to PPPoE/PPPoEoA type hosts.

configure subscriber-mgmt authentication-policy ppp-user-name

Description

This command specifies the domain name manipulation action to perform on the PAP/CHAP user name prior to authentication.

The **no** form of this command reverts to the default.

Default

The PAP/CHAP user name is not changed.

Parameters

append *domain-name*

Appends an "@" delimiter followed by the specified *domain-name* to the PAP/CHAP user name, independent if a domain name is already present.

default-domain *domain-name*

Appends an "@" delimiter followed by the specified *domain-name* to the PAP/CHAP user name only if a domain name is not already present.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

replace *domain-name*

Replaces the string after the "@” delimiter in the PAP/CHAP user name with the specified *domain-name*.

strip

Removes the "@” delimiter and all subsequent characters from the PAP/CHAP user name.

Context

[Tree] (debug>call-trace>ppp pppoe-trace)

Full Context

debug call-trace ppp pppoe-trace

Description

This command enables tracing locally terminated or LAC PPPoE sessions specified by the configured parameters. At least one filter rule must be provisioned. This command can trace a single session or multiple sessions, and can use wildcard characters.

This command can be executed multiple times to start multiple traces. When rules overlap, such as for a wildcard SAP and a specific SAP, the rule that a specific trace is associated with cannot be guaranteed.

The **no** form of this command prevents new traces from being configured and terminates all trace jobs that were previously started using the **trace** command.

Parameters

circuit-id

Specifies a circuit ID, up to 255 characters, that is used to filter sessions to trace.

ieee-address

Specifies a MAC address that is used to identify a session to trace, in the format "ab:cd:ef:01:23:45”. A wildcard character can be used to match all remaining octets; for example, the format "ab:cd:ef:*” can be used to filter by OUI.

user-name

Specifies a username, up to 32 characters, that is used to filter sessions to trace. A wildcard character (*) can be used at the beginning and at the end of the filter.

num

Specifies the maximum number of jobs that may be started with this rule.

Values 1 to 50

Default 1

remote-id

Specifies a remote ID, up to 255 characters, that is used to filter sessions to trace.

sap-id

Specifies a SAP to trace. The following formats are accepted:

- *port*/*lag*/*pw-port*:*svlan*.*cvlan*
- *port*/*lag*/*pw-port*:*vlan*
- *port*/*lag*/*pw-port*
- *port*/*lag*/*pw-port*:*vlan*.*
- *port*/*lag*/*pw-port*:* (also matches *.*)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

trace-existing-sessions

Specifies that existing PPPoE sessions are traced. If this parameter is not included, only new PPPoE sessions are traced.

trace-name

Specifies the name, up to 32 characters, by which the trace is referenced.

trace-profile-name

Specifies the name of the trace profile to be applied, up to 32 characters. The default parameters are used if a trace profile is not specified.

[Tree] (config>service>nat>nat-policy>alg pptp)

Full Context

configure service nat up-nat-policy alg pptp

configure service nat nat-policy alg pptp

Description

This command enables PPTP ALG.

The call-id is captured in the outgoing call management messages and along with the source IP address and the source TCP, is translated by NAT. Once the PPTP call is established, the call-id in the associated GRE packet in the incoming direction (from outside to inside) is correspondingly translated so that it matches the call-id mapping established during the call establishment phase. The call IDs used in the mappings are selected randomly and they try to honor parity (odds/even).

A PPTP session can be initiated only from the inside of NAT.

GRE traffic is allowed through NAT only if the corresponding mapping exists. This mapping is created during the call negotiation phase.

There can be seven calls (GRE tunnels) per control session.

configure subscriber-mgmt local-user-db ppp host pre-auth-policy

Description
This command configures the RADIUS pre-authentication policy to use to authenticate the PPP host.

The **no** form of this command reverts to the default.

Parameters
policy-name
Specifies the pre-authentication policy of the host, up to 32 characters.

Platforms
7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

35.87 pre-login-message

pre-login-message

Syntax
pre-login-message *login-text-string* [**name**]
no pre-login-message

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>system>login-control pre-login-message)

Full Context

configure system login-control pre-login-message

Description

This command configures a message to display before logging in to the router using Telnet, SSH, or the console port.

Only one message can be configured. If a new pre-login message is configured, the new message overwrites the previous message.

Note: The pre-login message is displayed on both active and standby systems.

The **no** form of this command removes the pre-login message.

Default

no pre-login-message

Parameters

login-text-string

Specifies the pre-login message text, up to 900 characters. Any printable, 7-bit ASCII characters can be used. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Some special characters can be used to format the message text. Use the newline (\n) character to create multiline messages. A newline (\n) character in the message moves to the beginning of the next line by sending ASCII/UTF-8 characters 0xA (LF) and 0xD (CR) to the client terminal. A carriage return (\r) character in the message sends the ASCII/UTF-8 character 0xD (CR) to the client terminal.

name

Displays the configured system name before the pre-login message. To remove the system name from the pre-login message, remove the current message and configure a new message without using the **name** parameter.

no pre-shared-key *pre-shared-key-index*

Context

[Tree] (config>macsec>conn-assoc>static-cak pre-shared-key)

Full Context

configure macsec connectivity-association static-cak pre-shared-key

Description

This command specifies the pre-shared key used to enable MACsec using static connectivity association key (CAK) security mode. This command also specifies the encryption algorithm used for encrypting the SAK.

A pre-shared key includes a connectivity association key name (CKN) and a connectivity association key (CAK). The pre-shared key-the CKN and CAK-must match on both ends of a link.

A pre-shared key is configured on both devices at each end of point-to-point link to enable MACsec using static CAK security mode. The MACsec Key Agreement (MKA) protocol is enabled after the successful MKA liveliness negotiation.

The encryption-type is used for encrypting the SAK and authenticating the MKA packet. The symmetric encryption key SAK (Security Association Key) needs to be encrypted (wrapped) via the MKA protocols. The AES key is derived via pre-shared-key.

The **no** form of this command removes the index.

Parameters

pre-shared-key-index

Specifies the index of this pre-shared-key.

Values 1, 2

encryption-type

Specifies the type of encryption.

Values **aes-128-cmac**, **aes-256-cmac**

create

Mandatory to create an entry.

[Tree] (config>ipsec>client-db>client>credential pre-shared-key)

Full Context

configure ipsec client-db client credential pre-shared-key

Description

This command specifies a pre-shared key used to authenticate peers.

The **no** form of this command reverts to the default.

Default

no pre-shared-key

Parameters

key

An ASCII string to use as the pre-shared key for dynamic keying. When the **hash** or **hash2** parameters are not used, the key is a clear text key; otherwise, the key text is encrypted.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

35.90 prec

prec

Syntax

prec *ip-prec-value* [**fc** *fc-name*] [**priority** {**high** | **low**}]

no prec *ip-prec-value*

Context

[Tree] (config>qos>sap-ingress prec)

Full Context

configure qos sap-ingress prec

Description

This command explicitly sets the forwarding class or enqueuing priority when a packet is marked with an IP precedence value (*ip-prec-value)*. Adding an IP precedence rule on the policy forces packets that match the specified *ip-prec-value* to override the forwarding class and enqueuing priority based on the parameters included in the IP precedence rule.

When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy.

When the enqueuing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

The *ip-prec-value* is derived from the most significant three bits in the IP header ToS byte field (precedence bits). The three precedence bits define eight Class-of-Service (CoS) values commonly used to map packets to per-hop Quality of Service (QoS) behavior. The precedence bits are also part of the DiffServ Code Point (DSCP) method of mapping packets to QoS behavior. The DSCP uses the most significant six bits in the IP header ToS byte and so overlaps with the precedence bits. Both IP precedence and DSCP classification rules are supported. DSCP rules have a higher match priority than IP precedence rules and where a *dscp-name* DSCP value overlaps an *ip-prec-value*, the DSCP rule takes precedence.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the explicit IP precedence classification rule from the SAP ingress policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

Parameters

ip-prec-value

The *ip-prec-value* is a required parameter that specifies the unique IP header ToS byte precedence bits value that will match the IP precedence rule. If the command is executed more than once with the same *ip-prec-value*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of eight IP precedence rules are allowed on a single policy.

The precedence is evaluated from the lowest to highest value.

Values 0 to 7

fc *fc-name*

The value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a pre-existing subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (.). If *subclass-name* does not exist in the context of *fc-name*, an error will occur. If *subclass-name* is removed using the **no fc** *fc-name.subclass-name* **force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

Values

fc: *class*[.*subclass*]

class: be, l2, af, l1, h2, ef, h1, nc

subclass: 29 characters max

Default Inherit (When **fc** is not defined, the rule preserves the previous forwarding class of the packet.)

priority

The priority parameter overrides the default enqueuing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueuing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueuing priority is inherited based on previous rule matches.

Values high, low

Default Inherits the priority defined by the default-priority statement.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

high

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

Full Context

configure qos sap-egress fc prec

Description

This command defines a value to be used for remarking packets for the specified FC. If the optional in/out/exceed-profile is specified, the command will remark different IP precedence values depending on whether the packet was classified to be in, exceed, or out-of-profile. All inplus-profile traffic is marked with the same value as in-profile traffic.

Parameters

ip-prec-value

This parameter specifies the IP precedence to be used to remark all traffic.

Values 0 to 7

exceed-profile *ip-prec-value*

This optional parameter specifies the IP precedence to be used to remark traffic that is exceed-profile. If not specified, this defaults to the same value configured for the **out-profile** parameter.

no prec *ip-prec-value*

Context

[Tree] (config>qos>sap-egress prec)

Full Context

configure qos sap-egress prec

Description

This command defines a specific IP precedence value that must be matched to perform the associated reclassification actions. If an egress packet on the SAP matches the specified IP precedence value, the forwarding class, or profile behavior may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The IP precedence bits used to match against precedence reclassification rules come from the Type of Service (ToS) field within the IPv4 header. If the packet does not have an IPv4 header, precedence-based matching is not performed.

The reclassification actions from a precedence reclassification rule may be overridden by a DSCP or IP flow matching event.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping decisions. If a DSCP, ipv6-criteria, or ip-criteria match occurs after the IP precedence match, the new forwarding class may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new fc, the fc from the IP precedence match will be used.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

behavior. If a DSCP, IPv6 criteria, or IP criteria match occurs after the IP precedence match, the new profile may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new profile, the profile from the IP precedence match will be used.

The **no** form of this command removes the reclassification rule from the SAP egress QoS policy.

Parameters

fc *fc-name*

This keyword is optional. When specified, packets matching the IP precedence value will be explicitly reclassified to the forwarding class specified as *fc-name* regardless of the ingress classification decision. The explicit forwarding class reclassification may be overwritten by a higher priority DSCP, IPv6 criteria, or IP criteria reclassification match. The FC name defined must be one of the eight forwarding classes supported by the system. To remove the forwarding class reclassification action for the specified precedence value, the **prec** command must be re-executed without the **fc** parameter defined.

Values be, l1, af, l2, h1, ef, h2 or nc

profile {in | out | exceed | inplus}

This keyword is optional. When specified, packets matching the IP precedence value will be explicitly reclassified to the specified profile regardless of the ingress profiling decision. The explicit profile reclassification may be overwritten by a higher priority DSCP, IPv6 criteria, or IP criteria reclassification match. To remove the profile reclassification action for the specified precedence value, the **prec** command must be re-executed without the **profile** parameter defined.

in

Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out

Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

exceed

Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus

Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

Context

[Tree] (config>qos>network>egress prec)

Full Context

configure qos network egress prec

Description

This command defines a specific IP precedence value that must be matched in order to perform the associated reclassification actions. If an egress packet on an IES/VPRN interface spoke SDP, on a CSC network interface in a VPRN, or network interface that the network QoS policy is applied to, matches the specified IP precedence value, the forwarding class and profile may be overridden.

By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The IP precedence bits used to match against the reclassification rules come from the Type of Service (ToS) field within the IPv4 header or the Traffic Class field from the IPv6 header. If the packet does not have an IP header, IP precedence-based matching is not performed.

The configuration of egress prec classification and the configuration of an egress IP criteria or IPv6 criteria entry statement within a network QoS policy are mutually exclusive.

The IP precedence-based and DSCP-based reclassification are supported on a network interface, on a CSC network interface in a VPRN, and on a PW used in an IES or VPRN spoke interface.

This command will block the application of a network QoS policy with the egress reclassification commands to a spoke SDP part of a Layer 2 service. Conversely, this command will not allow the user to add the egress reclassification commands to a network QoS policy if it is being used by a Layer 2 spoke SDP.

The egress reclassification commands will only take effect if the redirection of the spoke SDP or CSC interface to use an egress port queue-group succeeds. For example, the following commands will succeed:

```
    -
 config>service>vprn>if>
spoke-sdp>egress>qos network-policy-id port-redirect-
group
queue-group-name instance instance-id
    - config>service>ies>if>spoke-
sdp>
egress>qos network-policy-id port-redirect-group queue-group-
name
instance instance-id
    - config>service>vprn>nw-if> qos network-policy-id port-redirect-
group
queue-group-name instance instance-id
```

When the redirection command fails in CLI, the PW will use the network QoS policy assigned to the network IP interface; however, any reclassification in the network QoS policy applied to the network interface will be ignored.

The **no** form of this command removes the egress reclassification rule.

Parameters

ip-prec-value

0 to 7

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fc fc-name

be, l2, af, l1, h2, ef, h1, nc

profile {in | out | exceed | inplus}

The profile reclassification action is mandatory. When specified, packets matching the IP precedence value will be explicitly reclassified to the profile specified regardless of the ingress profiling decision. To remove the profile reclassification action for the specified IP precedence value, the **no prec** command must be executed.

This value may be overwritten by an explicit profile action in an DSCP reclassification match.

in - Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out - Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

exceed - Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus - Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

Context

[Tree] (config>mirror>mirror-dest>spoke-sdp precedence)

Full Context

configure mirror mirror-dest spoke-sdp precedence

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command indicates that the SDP is of type secondary with a specific precedence value or of type primary.

The mirror or LI service always uses the primary type as the active pseudowire and only switches to a secondary pseudowire when the primary is down. The mirror service switches the path back to the primary pseudowire when it is back up. The user can configure a timer to delay reverting back to primary or to never revert back.

If the active pseudowire goes down, the mirror service switches the path to a secondary sdp with the lowest precedence value. That is, secondary SDPs which are operationally up are considered in the order of their precedence value, 1 being the lowest value and 4 being the highest value. If the precedence value is the same, then the SDP with the lowest SDP ID is selected.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

An SDP is created with type secondary and with the lowest precedence value of 4.

Parameters

precedence-value

Specifies the precedence of the SDP.

Values 1 to 4

primary

Specified that a special value of the precedence which assigns the SDP the lowest precedence and enables the revertive behavior.

configure service ies interface vrrp preempt

Description

The preempt command provides the ability of overriding an existing non-owner master to the virtual router instance. Enabling preempt mode is almost required for proper operation of the base-priority and vrrp-policy-id definitions on the virtual router instance. If the virtual router cannot preempt an existing non-owner master, the effect of the dynamic changing of the in-use priority is greatly diminished.

The preempt command is only available in the non-owner vrrp virtual-router-id nodal context. The owner may not be preempted due to the fact that the priority of non-owners can never be higher than the owner. The owner will always preempt all other virtual routers when it is available.

Non-owner virtual router instances will only preempt when preempt is set and the current master has an in-use message priority value less than the virtual router instances in-use priority.

A master non-owner virtual router will only allow itself to be preempted when the incoming VRRP Advertisement message Priority field value is one of the following:

- Greater than the virtual router in-use priority value
- Equal to the in-use priority value and the source IP address (primary IP address) is greater than the virtual router instance primary IP address

The **no** form of this command prevents a non-owner virtual router instance from preempting another, less desirable virtual router. Use the preempt command to restore the default mode.

Full Context

configure service vprn interface preempt

configure service vprn interface ipv6 vrrp preempt

Description

The preempt mode value controls whether a specific backup virtual router preempts a lower priority master.

When preempt is enabled, the virtual router instance overrides any non-owner master with an "in use" message priority value less than the virtual router instance in-use priority value. If preempt is disabled, the virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

The IP address owner will always become master when available. Preempt mode cannot be disabled on the owner virtual router.

The default value for preempt mode is enabled.

preemption-timer

Syntax

preemption-timer *seconds*

no preemption-timer

Context

[Tree] (config>router>rsvp preemption-timer)

Full Context

configure router rsvp preemption-timer

Description

This parameter configures the time in seconds a node holds to a reservation for which it triggered the soft preemption procedure.

The preempting node starts a separate preemption timer for each preempted LSP path. While this timer is on, the node should continue to refresh the Path and Resv for the preempted LSP paths. When the preemption timer expires, the node tears down the reservation if the head-end node has not already done so.

A value of zero means the LSP should be preempted immediately; hard preempted.

The **no** form of this command reverts to the default value.

Default

preemption-timer 300

configure system time prefer-local-time

Description

This command sets the preference to use local or UTC time in the system. This preference is applied to objects such as log file names, created and completed times reported in log files, NETCONF and gRPC date-and-time leafs, and rollback times displayed in **show** routines.

Note:

- The operator may force the timezone used for **show** outputs during a CLI session using an environment variable in the **environment**>**time-display {utc | local}** command.
- The preference for CLI output is set with the **environment time-display** command.
- The format used for the date-time strings may change when the **prefer-local-time** option is enabled. For example, when enabled, all date-time strings include a suffix of three to five characters that indicates the timezone used for the presentation. This suffix may not be present if the option in not enabled.
- The time format for timestamps on log events is controlled on a per-log basis using the **config**> **log**>**log-id**>**time-format {utc | local}** CLI command and not via **prefer-local-time**.

The **no** form of this command indicates preference for UTC time.

Full Context

configure router ldp prefer-tunnel-in-tunnel

Description

This command specifies to use tunnel-in-tunnel over a simple LDP tunnel. Specifically, the user packets for LDP FECs learned over this targeted LDP session can be sent inside an RSVP LSP which terminates on the same egress router as the destination of the targeted LDP session. The user can specify an explicit list of RSVP LSP tunnels under the Targeted LDP session or LDP will perform a lookup in the Tunnel Table Manager (TTM) for the best RSVP LSP. In the former case, only the specified LSPs will be considered to tunnel LDP user packets. In the latter case, all LSPs available to the TTM and which terminate on the same egress router as this target ed LDP session will be considered. In both cases, the metric specified under the LSP configuration is used to control this selection.

The lookup in the TTM will prefer a LDP tunnel over an LDP-over-RSVP tunnel if both are available. Also, the tunneling operates on the dataplane only. Control packets of this targeted LDP session are sent over the IGP path.

configure mcast-management multicast-info-policy bundle channel preference

configure mcast-management multicast-info-policy bundle channel source-override preference

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command sets the relative preference level for multicast channels. The preference of a channel specifies its relative importance over other multicast channels. Eight levels of preference are supported; 0 through 7. Preference value 7 indicates the highest preference level.

When the multicast ingress path manager is congested on one or more of the switch fabric multicast paths, it uses the preference values associated with each multicast record to determine which records are allowed on the path and which records be placed in a black-hole state.

The preference value is also compared to the bundles **cong-priority-threshold** setting to determine the congestion priority of the channel. The result also dictates the channels multicast CAC class level (high or low). When the channels preference value is less than the congestion priority threshold, it is considered to have a congestion priority and CAC class value equal to low. When the channels preference value is equal to or greater than the threshold, it is considered to have a congestion priority and a CAC class value equal to high.

The preference value is also compared to the bundles ecmp-opt-threshold setting to determine whether the channel is eligible for ECMP path dynamic optimization. If the preference value is equal to or less than the threshold, the channel may be optimized. If the preference value is greater than the threshold, the channel will not be dynamically optimized.

The preference command may be executed in three contexts; bundle, channel and source-override. The bundle default preference value is 0. The channel and **source-override** preference settings are considered overrides to the bundle setting and have a default value of null (undefined).

The **no** form of this command restores the default preference value (0 or null depending on the context).

Parameters

preference-level

The preference-level parameter is required and defines the preference value of the channel.

Values 1 to 7

Bundle default:	0
Channel default:	Null (undefined)
Source-override default:	Null (undefined)

Override sequence — The channel setting overrides the bundle setting. The **source-override** setting overrides the channel and bundle settings.

Full Context

configure service vprn isis level preference

Description

This command configures the preference level of either IS-IS Level 1 or IS-IS Level 2 internal routes. By default, the preferences are listed in the table below.

A route can be learned by the router by different protocols, in which case, the costs are not comparable. When this occurs, the preference is used to decide to which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in the table below. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used. If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision what route to use is determined by the configuration of the **ecmp** in the config>router context.

Default

Default preferences are listed in Table 101: Default Preferences.

Table 101: Default Preferences

Route Type	Preference	Configurable
Direct attached	0	No
Static route	5	Yes
MPLS	7	—
OSPF internal routes	10	No
IS-IS level 1 internal	15	Yes
IS-IS level 2 internal	18	Yes
OSPF external	150	Yes
IS-IS level 1 external	160	Yes[5]
IS-IS level 2 external	165	Yes[5]
BGP	170	Yes

Parameters

preference

The preference for external routes at this level expressed as a decimal integer.

Values 1 to 255

[5] External preferences are changed using the **external-preference** command in the **config>router>isis>level** *level-number* context.

configure router ospf3 preference

configure router ospf preference

Description

This command configures the preference for OSPF internal routes.

7 External preferences are changed using the external-preference command in the **config>router>isis>level** *level-number* context.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A route can be learned by the router from different protocols, in which case, the costs are not comparable. When this occurs, the preference is used to decide which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in Table 105: Route Preference Defaults by Route Type . If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the **config**>**router** context.

The **no** form of this command reverts to the default value.

Default

preference 10

Parameters

preference

Specifies the preference for internal routes expressed as a decimal integer. Defaults for different route types are listed in Table 105: Route Preference Defaults by Route Type .

Table 105: Route Preference Defaults by Route Type

Route Type	Preference	Configurable

[Tree] (config>router>isis>lfa>mhp preference)

Full Context

configure router ospf loopfree-alternates multi-homed-prefix preference

configure router isis loopfree-alternates multi-homed-prefix preference

Description

This command configures the preference for the multihomed prefix LFA backup path. This knob can be enabled at a LFA computing node to force the programming of the multihomed prefix LFA backup path which, in some topologies, can avoid transiting using the best ABR or ASBR.

The **no** form of this command reverts to the default value.

Default

preference none

Parameters

none

Specifies the preference for an LFA, TI-LFA, or RLFA backup path over the multihomed prefix LFA backup path. The multihomed prefix LFA is only programmed in cases where the prefix is not protected by LFA, RLFA, or TI-LFA.

all

Specifies the forced programming of the multihomed prefix LFA backup path regardless of the outcome of the LFA, TI-LFA, or RLFA backup path computation.

configure router ripng preference

Description

This command configures the preference for RIP routes.

A route can be learned by the router from different protocols in which case the costs are not comparable. When this occurs, the preference is used to decide which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in Table 106: Route Preference Defaults by Route Type . If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the **config>router** context.

The **no** form of the command reverts to the default value.

Default

preference 100

Parameters

preference

Specifies the preference for RIP routes expressed as a decimal integer. Defaults for different route types are listed in Table 106: Route Preference Defaults by Route Type .

preference *preference*

Context

[Tree] (conf>router>segment-routing>sr-policies>policy preference)

Full Context

configure router segment-routing sr-policies static-policy preference

Description

This command associates a preference value with a statically defined-segment routing policy. This is an optional parameter.

When there are multiple policies for the same (color, endpoint) combination that are targeted for local installation, only one is selected as the active path for the (color, endpoint). In this selection process (which considers both static local policies and BGP signaled policies), the policy with the highest preference value is preferred over all policies with a lower preference value.

The **no** form of this command reverts to the default value.

Default

preference 100

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

preference

Syntax

preference *preference*

no preference

Context

[Tree] (config>router>policy-options>policy-statement>name>default-action preference)

[Tree] (config>router>policy-options>policy-statement>entry>action preference)

Full Context

configure router policy-options policy-statement name default-action preference

configure router policy-options policy-statement entry action preference

Description

This command assigns a route preference to routes matching the route policy statement entry.

If no preference is specified, the default Route Table Manager (RTM) preference for the protocol is used.

The **no** form of this command disables setting an RTM preference in the route policy entry.

Note:
This command is supported with the following protocols: RIP import, BGP import, VPRN VRF import (**vrf-import**), and VPRN GRT lookup export (**export-grt**).

Default

no preference

Parameters

preference

Specifies the route preference expressed as a decimal integer.

Values 1 to 255 (0 represents unset - MIB only)

name — The preference parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the

preferred

Syntax

[**no**] **preferred**

Context

[Tree] (config>isa>nat-group>inter-chassis-redundancy preferred)

Full Context

configure isa nat-group inter-chassis-redundancy preferred

Description

This command sets the preference for activity of a **nat-group** in stateful inter-chassis redundancy configuration if both nodes have equal health. An example of where this can be useful is in a load balancing environment where the activity of NAT groups can be distributed between the two redundant nodes.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A **nat-group** with **preferred** command configured on a node that freshly became part of multi-chassis redundancy, takes over activity from an existing and traffic-serving node with equal health that does not have the **preferred** command configured. This causes a switchover and a brief interruption in traffic flow.

By default the preferred status is not set for the node.

The **no** form of this command reverts to the default.

configure router dhcp6 local-dhcp-server pool prefix

configure service vprn dhcp6 local-dhcp-server pool prefix

Description

This command allocates a prefix to a pool from which Prefix Delegation prefixes and or WAN addresses can be assigned for DHCP6.

The **no** form of this command removes the prefix parameters from the configuration.

Default

prefix failover local

Parameters

prefix ipv6-addr/prefix-length

Specifies the prefix.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x [0 to FFFF]H	
	d [0 to 255]D	
prefix-length	1 to 128	

failover {local | remote | access-driven}

This command designates a prefix as local, remote, or access-driven. This is used when multi-chassis synchronization is enabled.

Values **local** — An IPv6 prefix designated as local is used for new lease grants or to renew the existing lease grants. Local prefix designation should

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

be always paired with the remote designation of the same prefix on the peering node.

The IPv6 prefix configured as local on one node can only be configured as remote on the other node. No other combination is allowed between the two nodes for an IPv6 prefix that is configured as local.

The DHCPv6 relay could point to both IPv6 DHCP server addresses — the one hosting the local IPv6 prefix and the one hosting the corresponding remote IPv6 prefix. Under normal circumstances the new lease will always be allocated from the local IPv6 prefix while the leases can be renewed from either IPv6 prefix (local or remote). Under network failure, the remote IPv6 prefix can be taken over according to the intercommunication link state transitions and associated timers.

remote — A prefix designated as remote is used only to renew the existing DHCP leases. The new leases are assigned from it only after the **maximum-client-lead-time** and **partner-down-delay** *time* elapses.

To ensure faster takeover, the partner-down-delay can be set to 0 and the MCLT time can be ignored. Extra caution should be exercised when enabling this mode of operation, as described in the configuration guides.

The IPv6 prefix configured as remote on one node can only be configured as local on the other node. No other combination is allowed between the two nodes for an IP address ranges that is configured as remote.

access-driven — A prefix designated as access-driven is like local (a new prefix assignment as well as a renewal). However, as the prefix is shared between the redundant server pair, the following additional conditions should be met to avoid duplicate address allocations:

- A dual home access protection mechanism such as SRRP or MC-LAG must ensure a single active path from the

  DHCP client to the server.
- The DHCP relay should point to the local server only.

pd

Specifies that this aggregate is used by IPv6 ESM hosts for DHCPv6 prefix-delegation.

wan-host

Specifies that this aggregate is used by IPv6 ESM hosts for local addressing or by a routing gateway's WAN interface.

create

Keyword used to create the prefix configuration. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

configure service ies subscriber-interface ipv6 subscriber-prefixes prefix

configure service vprn subscriber-interface ipv6 subscriber-prefixes prefix

Description

This command allows a list of prefixes (using the prefix command multiple times) to be routed to hosts associated with this subscriber interface. Each prefix is represented in the associated FDB with a reference to the subscriber interface. Prefixes are defined as being for prefix delegation (pd) or use on a WAN interface or host (wan-host).

The **no** form of this command reverts to the default.

Parameters

ipv6-address

Specifies the 128-bit IPv6 address.

Values 128-bit hexadecimal IPv6 address in compressed form

prefix-length

Specifies the length of any associated aggregate prefix.

Values 32 to 63

pd

Specifies that this aggregate is used by IPv6 ESM hosts for DHCPv6 prefix-delegation.

wan-host

Specifies that this aggregate is used by IPv6 ESM hosts for local addressing or by a routing gateway's WAN interface.

configure service vpls bgp-ad vsi-id prefix

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the low-order 4 bytes used to compose the Virtual Switch Instance Identifier (VSI-ID) to use for NLRI in BGP auto-discovery in this VPLS service.

If no value is set, the system IP address will be used.

Default

no prefix

Parameters

low-order-vsi-id

Specifies a unique VSI ID

Values 0— 4294967295

Platforms

All

prefix

Syntax

[**no**] **prefix** *ip-prefix/prefix-length*

Context

[Tree] (config>service>vprn>bgp>group>dynamic-neighbor>match prefix)

Full Context

configure service vprn bgp group dynamic-neighbor match prefix

Description

This command configures a prefix to accept dynamic BGP sessions (sessions from source IP addresses not matching any configured neighbor addresses). A dynamic session is associated with the group having the longest match prefix entry for the source IP address of the peer. The group association determines local parameters that apply to the session, including the local AS, the local IP address, the MP-BGP families, the import and export policies, and so on.

The **no** form of this command removes a prefix entry.

Parameters

ip-prefix/prefix-length

Specifies a prefix from which to accept dynamic BGP sessions.

Values *ipv4-prefix* — a.b.c.d (host bits must be 0)

ipv4-prefix-length — 0 to 32

ipv6-prefix — x:x:x:x:x:x:x:x (eight 16-bit pieces)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

x:x:x:x:x:x:d.d.d.d

x — [0 to FFFF]H

d — [0 to 255]D

ipv6-prefix-length — 0 to 128

Platforms

prefix

Syntax

[**no**] **prefix** *ipv6-prefix*/*prefix-length*

Context

[Tree] (config>service>vprn>router-advert>if prefix)

Full Context

configure service vprn router-advertisement interface prefix

Description

This command configures an IPv6 prefix in the router advertisement messages. To support multiple IPv6 prefixes, use multiple prefix statements. No prefix is advertised until explicitly configured using prefix statements.

Parameters

ipv6-prefix

Specifies the IP prefix for prefix list entry in dotted decimal notation.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

prefix-length

Specifies a route must match the most significant bits and have a prefix length.

Values 1 to 128

All

prefix

Syntax

prefix *prefix-string*

no prefix

Context

[Tree] (config>app-assure>group>cflowd>export-override prefix)

Full Context

configure application-assurance group cflowd export-override prefix

Description

This command specifies the *prefix-string* associated with the **export-override**.

Parameters

prefix-string

Specifies a prefix string,up to eight characters. If the eight-character prefix is "ABCDEFG_" for a particular node, the cflowd export override would generate IPv4 interface names such as ABCDEFG_255.255.255.255 or IPv6 as ABCDEFG_2001:DB8:EF01:2345::/64. By default the prefix will be left blank.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

prefix

Syntax

prefix *ip-prefix/ip-prefix-length* [**name** *prefix-name*]

no prefix *ip-prefix/ip-prefix-length*

Context

[Tree] (config>service>vprn>nat>inside>nat64 prefix)

Full Context

configure router nat inside nat64 prefix

configure service vprn nat inside nat64 prefix

Description

This command configures the IPv6 prefix used to derive the IPv6 address from the IPv4 address, and is same as the prefix used by DNS64 to generate AAAA record returned for IPv4 endpoint resolution. NAT64 node announces this prefix in routing to attract traffic from IPv6 hosts. If the prefix is not configured, then a well-known prefix, 64:FF9B::/96, is used.

The **no** form of the command removes the prefix from the NAT64 configuration.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ipv6-prefix/prefix-length

Specifies the NAT64 destination prefix.

Values

ipv6-prefix:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
prefix-length	32, 40, 48, 56, 64, 96

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

prefix

Syntax

prefix *ip-prefix/length* [**nat-policy** *nat-policy-name*]

no prefix *ip-prefix/length*

Context

[Tree] (config>service>nat>nat-prefix-list prefix)

Full Context

configure service nat nat-prefix-list prefix

Description

This command creates a prefix entry in the nat-prefix-list.

This prefix can be used to identify traffic with specific destination IP that needs to be associated with corresponding nat-policy (and implicitly the NAT pool) for L2-aware subscribers. In this fashion, a single L2-aware subscriber can direct traffic to multiple NAT pools, depending on the traffic destination.

Another use for a prefix is in DNAT-only application (DNAT without SNAPT). In this case the prefix identifies the inside source IP range that will be explicitly configured to ensure proper downstream routing in dNAT-only case.

The nat-prefix-list cannot reference the default nat-policy (the one that is referenced in the subscriber-profile).

The **no** form of the command reverts to the default.

Parameters

ip-prefix/length

Specifies the IP prefix for nat prefix list entry in dotted decimal notation.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values *ip-prefix:* a.b.c.d (host bits must be 0) *ipv4-prefix-length:* 0 to 32

nat-policy *nat-policy-name*

Specifies the NAT policy name. Allowed values are any string up to 32 characters composed of printable,7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes..

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

prefix *prefix*|*prefix-length* [**create**]

no prefix *prefix*|*prefix-length*

Context

[Tree] (config>router>firewall>domain prefix)

[Tree] (config>service>vprn>firewall>domain prefix)

Full Context

configure router firewall domain prefix

configure service vprn firewall domain prefix

Description

This command specifies a prefix for which firewall functionality will apply within the domain. Prefixes cannot be shared or duplicated across multiple domains in the same routing context. A domain can contain multiple prefixes.

The **no** form of the command removes the prefix from the domain.

Parameters

create

Mandatory keyword used when creating a prefix entry.

prefix/prefix-length

Specifies the prefix.

Values *prefix* — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x — 0 to FFFF (in hexadecimal)

d — 0 to 255 (in decimal)

configure router bier template sub-domain prefix

Description

This command specifies the prefix used for BFR. The prefix should be an IPv4 /32 address. The prefix can be a loopback interface or system IP address.

The **no** form of this command removes the prefix.

Parameters

ip-address

Specifies the IP address to be used as the BFR prefix in dotted decimal format.

Platforms

All

prefix

Syntax

prefix *ip-prefix/prefix-length* [**create**]

no prefix *ip-prefix/prefix-length*

Context

[Tree] (config>test-oam>twamp>server prefix)

Full Context

configure test-oam twamp server prefix

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures an IP address prefix containing one or more TWAMP clients. For a TWAMP client to connect to the TWAMP server (and subsequently conduct tests) it must establish the control connection using an IP address that is part of a configured prefix.

Parameters

ip-prefix/prefix-length

Specifies an IPv4 or IPv6 address prefix.

Values

ipv4-prefix:	a.b.c.d (host bits must be 0)
ipv4-prefix-le:	0 to 32
ipv6-prefix:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-le:	0 to 128

prefix length

Specifies the prefix length.

Values 0 to128

create

Creates a prefix instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[**no**] **prefix** *ip-prefix/prefix-length*

Context

[Tree] (config>qos>match-list>ip-prefix-list prefix)

Full Context

configure qos match-list ip-prefix-list prefix

Description

This command adds an IPv4 address prefix to an existing IPv4 address prefix match list.

To add a set of unique prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv4 address space.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

An IPv4 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of QoS Policies that use this IPv4 address prefix list.

The **no** form of this command deletes the specified prefix from the list.

Parameters

ip-prefix

A valid IPv4 address prefix in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (host bit must be 0)

prefix-length

Length of the entered IP prefix

Values 1 to 32

Platforms

All

[Tree] (config>filter>match-list>ipv6-prefix-list prefix)

Full Context

configure filter match-list ipv6-prefix-list prefix

Description

This command adds an IPv6 address prefix to an existing IPv6 address prefix match list.

The **no** form of this command deletes the specified prefix from the list.

Operational Notes:

To add set of different prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv6 address space.

An IPv6 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of filter policies that use this IPv6 address prefix list.

Parameters

ipv6-prefix/prefix-length

Specifies an IPv6 address prefix written as hexadecimal numbers separated by colons with host bits set to 0. One string of zeros can be omitted, so 2001:db8::700:0:217A is equivalent to 2001:db8:0:0:0:700:0:217A.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>bgp>group>dynamic-neighbor>match prefix)

Full Context

configure router bgp group dynamic-neighbor match prefix

Description

This command configures a prefix to accept dynamic BGP sessions (sessions from source IP addresses not matching any configured neighbor addresses). A dynamic session is associated with the group having the longest match prefix entry for the source IP address of the peer. The group association determines local parameters that apply to the session, including the local AS, the local IP address, the MP-BGP families, the import and export policies, and so on.

The **no** form of this command removes a prefix entry.

Parameters

ip-prefix/ip-prefix-length

Specifies a prefix from which to accept dynamic BGP sessions.

Values *ipv4-prefix* — a.b.c.d (host bits must be 0)

ipv4-prefix-length — 0 to 32

ipv6-prefix — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x — [0 to FFFF]H

d — [0 to 255]D

ipv6-prefix-length — 0 to 128

Platforms

All

prefix

Syntax

[**no**] **prefix** *ip-prefix/prefix-length* [**exact** | **longer** | **through** *length* | **prefix-length-range** *length1-length2* | **to** *ip-prefix/prefix-length* | **address-mask** *mask-pattern*]

Context

[Tree] (config>router>policy-options>prefix-list prefix)

Full Context

configure router policy-options prefix-list prefix

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a prefix entry in the route policy prefix list.

The **no** form of this command deletes the prefix entry from the prefix list.

Parameters

ip-prefix/prefix-length

Specifies the IP prefix and length for the prefix list entry in dotted decimal notation.

Values ipv4-prefix:

- a.b.c.d (host bits must be 0)

ipv4-prefix-length: [0 to 32]

ipv6-prefix:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

ipv6-prefix-length: [0 to 128]

exact

Specifies the prefix list entry only matches the route with the specified *ip-prefix* and prefix *mask* (length) values.

longer

Specifies the prefix list entry matches any route that matches the specified *ip-prefix* and prefix *mask* length values equal to or greater than the specified mask.

through *length*

Specifies the prefix list entry matches any route that matches the specified ip-prefix and has a prefix length between the specified *length* values inclusive.

Values 0 to 32

prefix-length-range *length1 - length2*

Specifies a route must match the most significant bits and have a prefix length with the given range. The range is inclusive of start and end values.

Values 0 to 32, *length2* > *length1*

to *ip-prefix/prefix-length*

Specifies a second IP prefix and length used in route policy prefix lists. A route matches prefix1 to prefix2 if it matches prefix1 and prefix2 according to their respective prefix lengths and if the route's own prefix length is between the prefix lengths of prefix1 and prefix2. It could take many individual 'exact' match prefix entries to reproduce the same logic.

mask-pattern

Specifies the address mask to use for matching entries to this prefix entry. A route matches a prefix and address mask combination if the bitwise logical AND of this prefix and the

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mask equals the bitwise logical AND of the route's address and the same mask and, additionally, the prefix length of the route matches the prefix length of the prefix entry.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d

36.3 prefix-exclude

prefix-exclude

Syntax

prefix-exclude *policy-name* [*policy-name*]

no prefix-exclude

Context

[Tree] (config>router>ldp>aggregate-prefix-match prefix-exclude)

Full Context

configure router ldp aggregate-prefix-match prefix-exclude

Description

This command specifies the policy name containing the prefixes to be excluded from the aggregate prefix match procedures. In this case, LDP will perform an exact match of a specific FEC element prefix as opposed to a longest match of one or more LDP FEC element prefixes, against this prefix when it receives a FEC-label binding or when a change to this prefix occurs in the routing table.

The **no** form of this command removes all policies from the configuration.

Default

no prefix-exclude

Parameters

policy-name

Specifies the route policy name, up to five. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

The specified name(s) must already be defined.

Platforms

All

prefix-exclude

Syntax

[**no**] **prefix-exclude** *ip-prefix/prefix-length*

Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>filter>match-list>ip-pfx-list prefix-exclude)

Full Context

configure filter match-list ip-prefix-list prefix-exclude

Description

This command excludes IPv4 prefix(es) from an **ip-prefix-list.** The **prefix-exclude** command is mutually exclusive with **apply-path**.

The **no** form of this command deletes the specified excluded prefixes from the **ip-prefix-list**.

Parameters

ip-prefix

Specifies a valid IPv4 address prefix in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (host bit must be 0)

prefix-length

Specifies the length of the entered IPv4 prefix.

Values 0 to 32

Platforms

Syntax

[**no**] **prefix** *ipv6-prefix/prefix-length*

Context

[Tree] (config>filter>match-list>ipv6-pfx-list prefix-exclude)

Full Context

configure filter match-list ipv6-prefix-list prefix-exclude

Description

This command excludes IPv6 prefix(es) from an **ipv6-prefix-list**.The **prefix-exclude** command is mutually exclusive with **apply-path**.

The **no** form of this command deletes the specified excluded prefixes from the **ipv6-prefix-list**.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ipv6-prefix/prefix-length

Specifies an IPv6 address prefix written as hexadecimal numbers separated by colons with host bits set to 0. One string of zeros can be omitted, so 2001:db8::700:0:217A is equivalent to 2001:db8:0:0:0:700:0:217A.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

prefix-length

Specifies the length of the entered IPv6 prefix.

Values 1 to 128

[Tree] (config>service>vprn>bgp>group prefix-limit)

Full Context

configure service vprn bgp group neighbor prefix-limit

configure service vprn bgp group prefix-limit

Description

This command configures the maximum number of BGP routes received from a peer before administrative action is taken. The administrative action can include generating a log or taking the session down. If a session is taken down, configure the **idle-timeout** parameter to bring it back up automatically after a specific duration. Alternatively, it can be configured to stay down indefinitely, until the user performs a reset.

No prefix limits for any address family are configured by default.

This command allows the user to apply a separate limit to each address family. A set of address family limits can be applied to one neighbor or to all neighbors in a group.

The **no** form of this command removes the **prefix-limit**.

Parameters

threshold *percentage*

Specifies the threshold value (as a percentage) that triggers a warning message to be sent.

Values 1 to 100

family

Specifies the address family to which the limit applies.

Values ipv4, label-ipv4, ipv6, mcast-ipv4, flow-ipv4, flow-ipv6, mcast-ipv6

limit

Specifies the number of routes that can be learned from a peer expressed as a decimal integer.

Values 1 to 4294967295

idle-timeout *minutes*

Specifies the duration in minutes before automatically re-establishing a session.

Values 1 to 1024

idle-timeout forever

Specifies that the session is re-established only after the **clear router bgp** command is executed.

log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is reached. However, the BGP session is not taken down.

post-import

Specifies that the limit should be applied only to the number of routes that are accepted by import policies.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hold-excess *percentage*

Specifies the percentage of maximum routes that are allowed to be installed in the route table. If a peer within scope of the configuration exceeds the limit, the overflow routes are held in the BGP RIB as inactive routes and are ineligible for forwarding or advertisement to other peers. If the **post-import** parameter is configured, only routes not rejected by import policies count toward the limit. A BGP route in the overflow state is reconsidered for activation and reinstallation when an UPDATE message is received for the route. This parameter is mutually exclusive with the **idle-timeout** and **log-only** parameters.

Platforms

All

Syntax

prefix-limit *limit* [**log-only**] [**threshold** *percent*] [**overload-timeout** { *seconds* | **forever**}]

no prefix-limit

Context

[Tree] (config>service>vprn>isis prefix-limit)

Full Context

configure service vprn isis prefix-limit

Description

This command configures the maximum number of prefixes that IS-IS can learn, and use to protect the system from a router that has accidentally advertised a large number of prefixes. If the number of prefixes reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, IS-IS will go into overload.

The **overload-timeout** option controls the length of time that IS-IS is in the overload state when the prefix limit is reached. The system automatically attempts to restart IS-IS at the end of this duration. If the **overload-timeout forever** option is used, IS-IS is not restarted automatically and stays in overload until the condition is manually cleared by the administrator. This is also the default behavior when the **overload-timeout** option is not configured.

The **no** form of this command removes the **prefix-limit**.

Default

prefix-limit overload-timeout forever

Parameters

limit

Specifies the number of prefixes that can be learned, expressed as a decimal integer.

Values 1 to 4294967296

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

log-only

Enables a warning message to be sent at the specified threshold percentage and also when the limit is exceeded. However, overload is not set when this parameter is configured.

percent

Specifies the threshold value (as a percentage) that triggers a warning message to be sent.

Values 0 to 100

overload-timeout

Keyword used to control the length of time that IS-IS is in the overload state when the prefix limit is reached.

seconds

Specifies the time in minutes before IS-IS is restarted.

Values 1 to 1800

forever

Specifies that IS-IS should be restarted only after the execution of the **clear router isis overload prefix-limit** command.

Platforms

All

prefix-limit

Syntax

configure subscriber-mgmt bgp-peering-policy prefix-limits

Description

This command configures the maximum number of BGP routes per address family that can be received from an ESM dynamic BGP peer before an administrative action is taken. Administrative actions include the generation of a log event and taking down the session. If a session is taken down, it can be brought back up automatically after an idle-timeout period. With no idle timeout configured, the session stays down until the user performs a reset.

The **no** form of this command removes the prefix limits for the specified family.

Default

prefix-limits threshold 90

Parameters

family

Specifies the IP address family for prefix limits.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values ipv4, ipv6

limit

Specifies the prefix limit.

Values 1 to 4294967295

percentage

Specifies the percentage at which a warning log message is sent.

Values 1 to 100

minutes

Specifies the time, in minutes, before a BGP peer is automatically reestablished on reaching the prefix limit.

Values 1 to 1024

log-only

Keyword used to specify if the maximum limit is reached, only a log event is generated. This parameterdoes not disable the BGP session upon reaching the prefix limit.

post-import

Keyword used to specify that limits are only applied to the number of routes accepted by the import policy.

configure service vprn static-route-entry indirect prefix-list

Description

This command associates a constraint to the associated static route such that the static route is only active if **any**, **none**, or **all** of the routes in the prefix list are present and active in the route table.

If the conditional static route is configured in a VPRN and the *router-instance-name* is configured as “Base”, the activation of the static route is dependent on the existence of routes in the Base router; the prefix-list and flag are evaluated in this context.

No router instance is specified by default, and the conditional static route is dependent on the existence of routes in the same router instance as the static route itself, subject to the details of the prefix list and the flag setting.

Entries in a referenced prefix list that are not match type ‘exact’ are interpreted as though they are ‘exact’.

The **no** form of this command disables these constraints on the static route.

Default

no prefix-list

Parameters

prefix-list-name

Specifies the name of a currently configured prefix list.

all

Specifies that the static route condition is met if all prefixes in the prefix list are present in the active static route.

none

Specifies that the static route condition is met if none of the prefixes in the named prefix-list are present in the active static route.

any

Specifies that the static route condition is met if any prefixes in the prefix list are present in the active static route.

router-instance-name

Specifies the name of the router instance. Must be "Base".

Context

[Tree] (config>router>policy-options prefix-list)

Full Context

configure router policy-options prefix-list

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a context to configure a prefix list to use in route policy entries.

The **no** form of this command deletes the named prefix list.

Parameters

name

Specifies the prefix list name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or "start@variable@".

An empty prefix list can be configured for pre-provisioning. This empty prefix list will not find a match when referred to by a policy. When removing member prefixes from a prefix list, the prefix list will not be automatically removed when the last member is removed. If required, an empty prefix list must be explicitly removed using the **no** form of this command.

[Tree] (config>router>policy-options>policy-statement>entry>from prefix-list)

Full Context

configure router policy-options policy-statement entry to prefix-list

configure router policy-options policy-statement entry from prefix-list

Description

This command configures a prefix list as a match criterion for a route policy statement entry.

If no prefix list is specified, any network prefix is considered a match.

An empty prefix list will evaluate as if 'no match' was found.

The prefix lists specify the network prefix (this includes the prefix and length) a specific policy entry applies.

A maximum of 28 prefix names can be specified.

The **no** form of this command removes the prefix list match criterion.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no prefix-list

Parameters

name

Specifies the prefix list name. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or "start@variable@".

Full Context

configure router policy-options policy-statement entry from prefix-list-override

Description

This command converts a prefix list to a specific match type. The routing policy uses the converted list as a match condition.

The prefix list to be converted can be specified by its name, as an expression containing the name of a global variable that holds the name of the prefix list, or as an expression containing the name of a subroutine variable that holds the name of the prefix list.

Parameters

name

Specifies the prefix list to be converted, up to 64 characters.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

exact

Keyword to convert all entries in the specified prefix list to the exact match type.

longer

Keyword to convert all entries in the specified prefix list to the longer match type.

length1-length2

Specifies the start and end length of the prefix range.

Values 0 to 128

Note: *length2* (end length) must be equal to or greater than *length1* (start length).

length

Specifies the through length of the prefix.

Values 0 to 128

Note: Configure the through length of the prefix to a value higher than the prefix length configured in the **configure router policy-options prefix-list prefix** command.

Full Context

configure service vprn nat inside deterministic prefix-map

configure router nat inside deterministic prefix-map

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is applicable to deterministic NAT and static 1:1 NAT. It is used to configure source IP prefixes on the inside and their association with outside deterministic NAT pools via the NAT policy. Hosts within the source IP prefix are deterministically mapped to outside IP addresses and port ranges in the associated deterministic NAT pool.

Multiple source IP prefixes within an inside routing instance can be defined and they can reference different NAT policies (and therefore, outside deterministic NAT pools and routing instances). Source IP prefixes from multiple routing instances can share the same deterministic NAT pool.

With this command, multiple NAT policies based on a destination prefix or filter criteria can be used together with deterministic NAT.

Non-deterministic NAT can be used simultaneously with deterministic NAT within the same inside routing instance. However, they cannot share the same NAT pool.

Source IP prefixes can be added or removed as long as the associated deterministic NAT pool is in a **no shutdown** mode.

Removing a prefix or modifying the map statement under it requires that the source IP prefix be in a **shutdown** mode.

Parameters

ip-prefix/length

Specifies source IP prefix on the inside whose hosts is deterministically mapped to an outside IP address and port block in the corresponding deterministic NAT pool.

Values

<ip-prefix/ip-pref*>	<ipv4-prefix>/<ipv4-prefix-length>
	<ipv6-prefix>/<ipv6-prefix-length>
<ipv4-prefix>	a.b.c.d (host bits must be 0)
<ipv4-prefix-length>	0 to 32
<ipv6-prefix>	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D
<ipv6-prefix-length>	0 to 128

nat-sub-type

Specifies the subscriber type.

Values classic-lsn-sub: LSN44 subscriber

dslit-lsn-sub: DT-lite subscriber

nat-policy-name

Specifies a NAT policy, up to 32 characters, that points to an outside pool and outside routing instance.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router isis loopfree-alternates exclude prefix-policy

Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The implementation already allows the user to exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

This command specifies the name of the policy for the prefixes to exclude from the LFA SPF calculation in this IS-IS instance.

Note:
Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action, when not explicitly specified by the user in the prefix policy, is a "reject". Thus, regardless if the user did or did not explicitly add the statement "default-action reject" to the prefix policy, a prefix that did not match any entry in the policy will be accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

Default

no prefix-policy

Parameters

prefix-policy prefix-policy

Specifies the name of the prefix policy, up to 32 characters. Up to five prefix policies can be specified. The specified name must have been already defined.

Platforms

All

prefix-policy

Syntax

prefix-policy *prefix-policy* [*prefix-policy*]

no prefix-policy

[Tree] (config>router>ospf3>loopfree-alternates>exclude prefix-policy)

Full Context

configure router ospf loopfree-alternates exclude prefix-policy

configure router ospf3 loopfree-alternates exclude prefix-policy

Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The implementation already allows the user to exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

This command specifies the name of the policy for the prefixes to exclude from the LFA SPF calculation in this OSPF or OSPF3 instance.

Full Context

configure router bgp segment-routing prefix-sid-range

Description

This command configures the label block that BGP segment routing is allowed to use.

The s**tart-label** and **max-index** parameters specify that BGP should be restricted to a subrange of the SRGB, with the subrange starting at **start-label** and ending at **max-index**.

It is not possible to enable segment routing (perform a **no shutdown**) unless the **prefix-sid-range** is configured using the **global** keyword or using the **start-label** and **max-index** parameters.

The **no** form of the command allocates no labels for BGP segment-routing.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no prefix-sid-range

Parameters

global

Specifies that BGP is allowed to allocate labels from the entire space of the SRGB, as defined under **config**>**router**>**mpls-labels**>**sr-labels**.

start-label

Specifies the first label value that is available to BGP in a contiguous range of labels.

Values 0 to 524287

max-index

Specifies the last label value that is available to BGP in a contiguous range of labels.

Values 1 to 524287

[Tree] (config>router>isis>segment-routing prefix-sid-range)

Full Context

configure router isis segment-routing prefix-sid-range

Description

This command configures the prefix SID index range and offset label value for a given IGP instance.

The key parameter is the configuration of the prefix SID index range and the offset label value which this IGP instance will use. Since each prefix SID represents a network global IP address, the SID index for a prefix must be network-wide unique. Thus, all routers in the network are expected to configure and advertise the same prefix SID index range for a given IGP instance. However, the label value used by each router to represent this prefix; that is, the label programmed in the ILM can be local to that router by the use of an offset label, referred to as a start label:

Local Label (Prefix SID) = start-label + {SID index}

The label operation in the network becomes thus very similar to LDP when operating in the independent label distribution mode (RFC 5036, *LDP Specification*) with the difference that the label value used to

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

forward a packet to each downstream router is computed by the upstream router based on advertised prefix SID index using the above formula.

There are two mutually exclusive modes of operation for the prefix SID range on the router. In the **global** mode of operation, the user configures the global value and this IGP instance will assume the start label value is the lowest label value in the SRGB and the prefix SID index range size equal to the range size of the SRGB. Once one IGP instance selected the global option for the prefix SID range, all IGP instances on the system will be restricted to do the same. The user must shutdown the segment routing context and delete the **prefix-sid-range** command in all IGP instances in order to change the SRGB. Once the SRGB is changed, the user must re-enter the **prefix-sid-range** command again. The SRGB range change will be failed if an already allocated SID index/label goes out of range.

In the per-instance mode of operation, the user partitions the SRGB into non-overlapping sub-ranges among the IGP instances. The user thus configures a subset of the SRGB by specifying the start label value and the prefix SID index range size. All resulting net label values (start-label + index} must be within the SRGB or the configuration will be failed. Furthermore, the code checks for overlaps of the resulting net label value range across IGP instances and will strictly enforce that these ranges do not overlap. The user must shutdown the segment routing context of an IGP instance in order to change the SID index/label range of that IGP instance using the **prefix-sid-range** command. In addition, any range change will be failed if an already allocated SID index/label goes out of range. The user can however change the SRGB on the fly as long as it does not reduce the current per IGP instance SID index/label range defined with the **prefix-sid-range**. Otherwise, the user must shutdown the segment routing context of the IGP instance and delete and re-configure the **prefix-sid-range** command.

Default

no prefix-sid-range

Parameters

label-value

Specifies the label offset for the SR label range of this IGP instance.

Values 0 to 524287

index-value

Specifies the maximum value of the prefix SID index range for this IGP instance.

Values 1 to 524287

Full Context

configure router ospf3 segment-routing prefix-sid-range

configure router ospf segment-routing prefix-sid-range

Description

This command configures the prefix SID index range and offset label value for an IGP instance.

The key parameter is the configuration of the prefix SID index range and the offset label value that this IGP instance will use. Because each prefix SID represents a network global IP address, the SID index for a prefix must be unique network-wide. Therefore, all routers in the network are expected to configure and advertise the same prefix SID index range for an IGP instance. However, the label value used by each router to represent this prefix, that is, the label programmed in the ILM, can be local to that router by the use of an offset label, referred to as a start label:

Local Label (Prefix SID) = start-label + {SID index}

The label operation in the network is very similar to LDP when operating in independent label distribution mode (RFC 5036, *LDP Specification*), with the difference being that the label value used to forward a packet to each downstream router is computed by the upstream router based on the advertised prefix SID index using the above formula.

There are two mutually exclusive modes of operation for the prefix SID range on the router. In the **global** mode of operation, the user configures the global value and this IGP instance will assume the start label value is the lowest label value in the SRGB and the prefix SID index range size equal to the range size of the SRGB. After one IGP instance selected the global option for the prefix SID range, all IGP instances on the system will be restricted to do the same. The user must shutdown the segment routing context and delete the **prefix-sid-range** command in all IGP instances in order to change the SRGB. After the SRGB is changed, the user must re-enter the **prefix-sid-range** command again. The SRGB range change will be failed if an already allocated SID index/label goes out of range.

In per-instance mode, the user partitions the SRGB into non-overlapping sub-ranges among the IGP instances. The user configures a subset of the SRGB by specifying the start label value and the prefix SID index range size. All resulting net label values (start-label + index) must be within the SRGB or the configuration will fail. The 7750 SR checks for overlaps of the resulting net label value range across IGP instances and will strictly enforce no overlapping of these ranges. The user must shut down the segment routing context of an IGP instance in order to change the SID index/label range of that IGP instance using the **prefix-sid-range** command. A range change will fail if an already allocated SID index/label goes out of range. The user can change the SRGB without shutting down the segment routing context as long as it does not reduce the current per-IGP instance SID index/label range defined with the **prefix-sid-range** command. Otherwise, shut down the segment routing context of the IGP instance, and disable and re-enable the **prefix-sid-range** command.

Context

[Tree] (config>router>mpls>lsp primary)

Full Context

configure router mpls lsp primary

Description

This command specifies a preferred path for the LSP. This command is optional only if the **secondary** *path-name* is included in the LSP definition. Only one primary path can be defined for an LSP.

Some of the attributes of the LSP such as the bandwidth, and hop-limit can be optionally specified as the attributes of the primary path. The attributes specified in the **primary path** *path-name* command, override the LSP attributes.

The **no** form of this command deletes the association of this *path-name* from the LSP *lsp-name*. All configurations specific to this primary path, such as record, bandwidth, and hop limit, are deleted. The primary path must be shutdown first in order to delete it. The **no primary** command will not result in any action except a warning message on the console indicating that the primary path is administratively up.

Parameters

path-name

Specifies the case-sensitive alphanumeric name label for the LSP path up to 64 characters in length.

Platforms

All

primary

Syntax

Full Context

configure isa application-assurance-group primary

Description

This command assigns an AA ISA or ESA-VM configured in the specified location to this application assurance group. Primary and backup ISAs have equal operational status and when both ISAs are coming up, the one that becomes operational first becomes the active ISA.

On an activity switch from the primary ISA, all configurations are already on the backup ISA but flow state information must be re-learned. Any statistics not yet spooled are lost. Auto-switching from the backup to primary, after the primary becomes available again, is not supported.

The user is notified through SNMP events when:

- When AA service goes down (all ISAs in the group are down) or comes back up (an ISA in the group becomes active)
- When AA redundancy fails (one of the ISAs in the group is down) or recovers (the failed MDA comes back up)
- When an AA activity switch occurred.

The **no** form of this command removes the specified ISA from the application assurance group.

Parameters

mda-id

Specifies the slot/mda or esa/vm, identifying a provisioned AA ISA.

Values

slot/*mda*	
slot	1 to 10, depending on chassis model
mda	1 to 2

esa-vm-id

Specifies the ESA and VM, identifying a provisioned ESA-VM. The value of the esa-vm-id for application assurance is used as the esa-id plus 128. For example, an ESA 1 with VM2 would be referred to as esa-129/2.

Values

esa-id+128/vm-id	
esa-id	1 to 16
vm-id	1 to 4

primary

Syntax

primary *mda-id*

no primary

Context

[Tree] (config>isa>tunnel-grp primary)

Full Context

configure isa tunnel-group primary

Description

This command assigns an ISA IPsec module configured in the specified slot to this IPsec group. The backup ISA IPsec provides the IPsec group with warm redundancy when the primary ISA IPsec in the group is configured. Primary and backup ISA IPsec have equal operational status and when both MDAs are coming up, the one that becomes operational first becomes the active ISA IPsec.

All configuration information is pushed down to the backup MDA from the CPM once the CPM gets notice that the primary module has gone down. This allows multiple IPsec groups to use the same backup module. Any statistics not yet spooled will be lost. Auto-switching from the backup to primary, once the primary becomes available again, is supported.

The operator is notified through SNMP events when:

- When the ISA IPsec service goes down (all modules in the group are down) or comes back up (a module in the group becomes active).
- When ISA IPsec redundancy fails (one of the modules in the group is down) or recovers (the failed module comes back up).
- When an ISA IPsec activity switch took place.

The **no** form of this command removes the specified primary ID from the group's configuration.

Default

no primary

Parameters

mda-id

Specifies the card/slot identifying a provisioned IPsec ISA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Description

This command specifies the primary IPv6 address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable find a node in its topology database that matches a primary address of the location, then it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address.

The IP addresses specified for a location should be topologically "close” to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the primary IPv6 address information.

Use subject to Terms available at: www.nokia.com/terms.

Default

no primary-ipv6-address

Parameters

ipv6-address

Specifies the primary IPv6 address of a location expressed in dotted decimal notation.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

primary-p2mp-instance

Syntax

[**no**] **primary-p2mp-instance** *instance-name*

Context

[Tree] (config>router>mpls>lsp primary-p2mp-instance)

Full Context

configure router mpls lsp primary-p2mp-instance

Description

This command creates the primary instance of a P2MP LSP. The primary instance of a P2MP LSP is modeled as a set of root-to-leaf (S2L) sub-LSPs. The root, for example a head-end node triggers signaling using one path message per S2L path. The leaf sub-LSP paths are merged at branching points.

This command is not supported on the 7450 ESS.

Parameters

instance-name

Specifies a name that identifies the P2MP LSP instance. The instance name can be up to 32 characters long and must be unique.

Full Context

configure mcast-management multicast-info-policy bundle primary-tunnel-interface

configure mcast-management multicast-info-policy bundle channel primary-tunnel-interface

configure mcast-management multicast-info-policy bundle channel source-override primary-tunnel-interface

Description

This command allows the user to define a bundle in the multicast-info-policy and specify channels in the bundle that must be received from the primary tunnel interface associated with an RSVP P2MP LSP. The multicast info policy is applied to the base router instance.

The egress LER can accept multicast packets via two different methods. The regular RPF check on unlabeled IP multicast packets, which is based on routing table lookup. The static assignment which specifies the receiving of a multicast group <*,G> or a specific <S,G> from a primary tunnel-interface associated with an RSVP P2MP LSP.

One or more primary tunnel interfaces in the base router instance can be configured. That is, the user can specify to receive different multicast groups, <*,G> or specific <S,G>, from different P2MP LSPs. This assumes that there are static joins configured for the same multicast groups at the ingress LER to forward over a tunnel interface associated with the same P2MP LSP.

At any given time, packets of the same multicast group can be accepted from either the primary tunnel interface associated with a P2MP LSP or from a PIM interface. These are mutually exclusive options. As soon as a multicast group is configured against a primary tunnel interface in the multicast info policy, it is blocked from other PIM interfaces.

A multicast packet received on a tunnel interface associated with a P2MP LSP can be forwarded over a PIM or IGMP interface which can be an IES interface, a spoke SDP terminated IES interface, or a network interface.

The **no** form of this command removes the static RPF check.

Parameters

lsp-name

Species a string of up to 32 characters identifying the LSP name as configured at the ingress LER.

ip-address

Specifies a string of 15 characters representing the IP address of the ingress LER for the LSP.

p2mp-id

Identifier used for signaling mLDP P2MP LSP (applies only to the 7750 SR).

[Tree] (config>service>vprn>sub-if>grp-if>srrp priority)

[Tree] (config>service>ies>sub-if>grp-if>srrp priority)

Full Context

configure service vprn subscriber-interface group-interface srrp priority

configure service ies subscriber-interface group-interface srrp priority

Description

This command overrides the default base priority for the SRRP instance. The SRRP instance priority is advertised by the SRRP instance to its neighbor router and is compared to the priority received from the neighbor router. The router with the best (highest) priority enters the master state while the other router enters the backup state. If the priority of each router is the same, the router with the lowest source IP address in the SRRP advertisement message assumes the master state.

The base priority of an SRRP instance can be managed by VRRP policies. A VRRP policy defines a set of connectivity or verification tests which, when they fail, may lower an SRRP instances base priority (creating an in-use priority for the instance). Every time an SRRP instances in-use priority changes when in master state, it sends an SRRP advertisement message with the new priority. If the dynamic priority drops to zero or receives an SRRP Advertisement message with a better priority, the SRRP instance transitions to the *becoming backup* state.

When the priority command is not specified, or the no priority command is executed, the system uses a default base priority of 100. The priority command may be executed at any time.

The **no** form of this command restores the default base priority to the SRRP instance. If a VRRP policy is associated with the SRRP instance, it will use the default base priority as the basis for any modifications to the SRRP instances in-use priority.

Default

priority 100

Parameters

priority

Specifies a base priority for the SRRP instance to override the default.

Values 1 to 254

Platforms

Description

The bridge-priority command is used to populate the priority portion of the bridge ID field within outbound BPDUs (the most significant 4 bits of the bridge ID). It is also used as part of the decision process when determining the best BPDU between messages received and sent. All values are truncated to multiples of 4096, conforming with IEEE 802.1t and 802.1D-2004.

The **no** form of this command returns the bridge priority to the default value.

Default

priority 4096

Parameters

bridge-priority

Specifies the bridge priority for the STP instance

Values Allowed values are integers in the range of 4096 to 65535 with 4096 being the highest priority. The actual bridge priority value stored/used is the number entered with the lowest 12 bits masked off which means the actual range of values is 4096 to 61440 in increments of 4096.

Full Context

configure service vpls spoke-sdp stp priority

configure service vpls sap stp priority

configure service vpls spoke-sdp priority

Description

This command configures the Nokia Spanning Tree Protocol (STP) priority for the SAP or spoke SDP.

STP priority is a configurable parameter associated with a SAP or spoke SDP. When configuration BPDUs are received, the priority is used in some circumstances as a tie breaking mechanism to determine whether the SAP or spoke SDP be designated or blocked.

In traditional STP implementations (802.1D-1998), this field is called the port priority and has a value of 0 to 255. This field is coupled with the port number (0 to 255 also) to create a 16 bit value. In the latest STP standard (802.1D-2004) only the upper 4 bits of the port priority field are used to encode the SAP or spoke SDP priority. The remaining 4 bits are used to extend the port ID field into a 12 bit virtual port number field. The virtual port number uniquely references a SAP or spoke SDP within the STP instance.

STP computes the actual priority by taking the input value and masking out the lower four bits. The result is the value that is stored in the SDP priority parameter. For instance, if a value of 0 is entered, masking out the lower 4 bits results in a parameter value of 0. If a value of 255 is entered, the result is 240.

The **no** form of this command returns the STP priority to the default value.

Default

priority 128

Parameters

stp-priority

Specifies the STP priority value for the SAP or spoke SDP. 0 is the highest priority. The actual value used for STP priority (and stored in the configuration) is the result of masking out the lower 4 bits, therefore the actual value range is 0 to 240 in increments of 16.

configure service ies interface ipv6 vrrp priority

Description

This command provides the ability to configure a specific priority value to the virtual router instance. In conjunction with an optional policy command, the base-priority is used to derive the in-use priority of the virtual router instance.

This command is only available in the non-owner vrrp virtual-router-id nodal context. The priority of owner virtual router instances is permanently set to 255 and cannot be changed. For non-owner virtual router instances, if the priority command is not executed, the base-priority will be set to 100.

The **no** form of this command restores the default value of 100 to base-priority.

Default

priority 100

Parameters

base-priority

The base-priority parameter configures the base priority used by the virtual router instance. If a VRRP Priority Control policy is not also defined, the base-priority will be the in-use priority for the virtual router instance.

configure service vprn ospf3 area interface priority

configure service vprn ospf area interface priority

Description

This command configures the priority of the OSPF interface that is used to elect the designated router (DR) on the subnet.

This parameter is only used if the interface is of type **broadcast**. The router with the highest priority interface becomes the DR. A router with priority 0 is not eligible to be the designated router or backup designated router.

The **no** form of this command resets the interface priority to the default value.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

priority 1

Parameters

number

The interface priority expressed as a decimal integer. A value of 0 indicates the router is not eligible to be the Designated Router of Backup Designated Router on the interface subnet.

Values 0 to 255

Platforms

All

priority

Syntax

priority *dr-priority*

no priority

Context

[Tree] (config>service>vprn>pim>if priority)

configure router mpls lsp secondary priority

configure router mpls lsp primary priority

configure router mpls lsp-template priority

Description

This command enables the soft preemption procedures for this LSP path. The operator enables the soft preemption mechanism on a specific LSP name by explicitly configuring the setup and holding priorities for the primary path at the head-end node. The operator can similarly configure priority values for a secondary path for this LSP name. Different values could be used for the primary and for any of the secondary paths. In the absence of explicit user configuration, the setup priority is internally set to the default value of 7 and the holding priority is set to the default value of 0.

Note:
Valid user-entered values for these two parameters require that the holding priority be numerically lower than or equal to the setup priority, otherwise preemption loops can occur.

Preemption is effected when a router preempting node processes a new RSVP session reservation and there is not enough available bandwidth on the RSVP interface, or the Class Type (CT) when Diff-Serv is enabled, to satisfy the bandwidth in the FlowSpec object while there exist other session reservations for LSP paths with a strictly lower holding priority (numerically higher holding priority value) than the setup priority of the new LSP reservation. If enough available bandwidth is freed on the link or CT to accommodate the new reservation by preempting one or more lower priority LSP paths, the preempting node allows temporary overbooking of the RSVP interface and honors the new reservation.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The preempting node will immediately set the 'Preemption pending' flag (0x10) in the IPv4 Sub-Object in the RRO object in the Resv refresh for each of the preempted LSP paths. The IPv4 Sub-Object corresponds to the outgoing interface being used by the preempting and preempted LSP paths; however, the bandwidth value in the FlowSpec object is not changed. The Resv flag must also be set if the preempting node is a merge point for the primary LSP path and the backup bypass LSP or detour LSP and the backup LSP is activated.

When evaluating if enough available bandwidth will be freed, the preempting node considers the reservations in order from the lowest holding priority (numerically higher holding priority value) to the holding priority just below the setup priority of the new reservation. A new reservation cannot preempt a reservation which has a value of the holding priority equal to the new reservation setup priority.

When Diff-Serv is enabled on the preempting node and the MAM bandwidth allocation model is used, a new reservation can only preempt a reservation in the same Class Type (CT).

LSP paths which were not flagged at the head-end for soft preemption will be hard preempted. LSP paths with the default holding priority of 0 cannot be preempted. LSP paths with zero bandwidth do not preempt other LSP paths regardless of the values of the path setup priority and the path holding priority. They can also not be preempted.

When evaluating if enough available bandwidth will be freed, the preempting node considers the reservations in order from the lowest holding priority (numerically higher holding priority) to the holding priority just below the setup priority of the new reservation. There is no specific order in which the reservations in the same holding priority are considered.

The preempting node starts a preemption timer for each of the preempted LSP paths. While this timer is on, the node should continue to refresh the Path and Resv for the preempted LSP paths. When the preemption timer expires, the node tears down the reservation if the head-end node has not already done so.

A head-end node upon receipt of the Resv refresh message with the 'Preemption pending' flag must immediately perform a make-before-break on the affected adaptive CSPF LSP. Both IGP metric and TE metric based CSPF LSPs are included. If an alternative path that excludes the flagged interface is not found, then the LSP is put on a retry in a similar way to the Global Revertive procedure at a head-end node. However, the number of retries and the retry timer are governed by the values of the **retry-limit** and **retry-timer** parameters: **config>router>mpls>lsp>retry-limit**; **config>router>mpls>lsp>retry-timer**.

MPLS will keep the address list of flagged interfaces for a maximum of 60 s (not user-configurable) from the time the first Resv message with the 'Preemption pending' flag is received. This actually means that MPLS will request CSPF to find a path that excludes the flagged interfaces in the first few retries until success or until 60 s have elapsed. Subsequent retries after the 60 s will not exclude the flagged interfaces as it is assumed IGP has converged by then and the Unreserved Bandwidth sub-TLV for that priority, or TE Class, in the TE database will show the updated value taking into account the preempting LSP path reservation or a value of zero if overbooked.

If the LSP has a configured secondary standby which is operationally UP, the router will switch the path of the LSP to it and then start the MBB. If no standby path is available and a secondary non-standby is configured, the router will start the MBB and signal the path of the secondary. The LSP path will be switched to either the secondary or the new primary, whichever comes up first.

The **no** form of this command reverts the LSP path priority to the default values and results in setting the setup priority to 7, in setting the hold priority to 0, and in clearing the 'soft preemption desired' flag in the RRO in the Resv refresh message.

Default

no priority

Description

This optional command associates an enqueuing priority with the static route. The options are either high or low, with low being the default. This parameter has the ability to affect the likelihood that a packet will be enqueued at SAP ingress in the face of ingress congestion.

Once a packet is enqueued into an ingress buffer, the significance of this parameter is lost.

Default

priority low

Parameters

low

Setting the enqueuing parameter for a packet to **low** decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. Once the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

high

Setting the enqueuing parameter for a packet to **high** increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. Once the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

Full Context

configure router flexible-algorithm-definitions flex-algo priority

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the priority of the FAD. This priority is used as a tie-breaker when the router has received multiple FADs for the same flexible algorithm.

Every router that is configured to participate in a particular flexible algorithm uses the same tie-breaker logic to select the winning FAD. This allows for consistent FAD definition selection in cases where routers advertise different definitions for a specific flexible algorithm. The following rules apply to the breaker mechanism.

- From the advertisements of the FAD in the area (including both locally generated advertisements and received advertisements), select the one with the highest priority value.
- If there are multiple advertisements of the FAD with the same highest priority, select the one that is originated from the router with either the highest system ID or router ID.

The **no** form of this command sets the priority to the default value.

Default

priority 100

Parameters

priority

Configures the priority of this FAD.

Values 0 to 255

Default 100

Description

This command configures the base router priority for the virtual router instance used in the master election process.

The priority is the most important parameter set on a non-owner virtual router instance. The priority defines a virtual router's selection order in the master election process. Together, the priority value and the **preempt** mode allow the virtual router with the best priority to become the master virtual router.

The *base-priority* is used to derive the in-use priority of the virtual router instance as modified by any optional VRRP priority control policy. VRRP priority control policies can be used to either override or adjust the base priority value depending on events or conditions within the chassis.

The **priority** command is only available in the non-owner **vrrp** nodal context. The priority of **owner** virtual router instances is permanently set to 255 and cannot be changed.

For non-owner virtual router instances, the default base priority value is 100.

The **no** form of the command reverts to the default value.

Default

priority 100

Parameters

priority

The base priority used by the virtual router instance expressed as a decimal integer. If no VRRP priority control policy is defined, the *base-priority* is the in-use priority for the virtual router instance.

Values 1 to 254

Platforms

All

priority

Syntax

priority *priority-level* [{**delta** | **explicit**}]

no priority

configure vrrp policy priority-event port-down priority

configure vrrp policy priority-event route-unknown priority

configure vrrp policy priority-event lag-port-down weight-down priority

configure vrrp policy priority-event host-unreachable priority

Description

This command controls the effect the set event has on the virtual router instance in-use priority.

When the event is set, the *priority-level* is either subtracted from the base priority of each virtual router instance or it defines the explicit in-use priority value of the virtual router instance depending on whether the **delta** or **explicit** keywords are specified.

Multiple set events in the same policy have interaction constraints:

- If any set events have an explicit **priority** value, all the delta **priority** values are ignored.
- The set event with the lowest explicit **priority** value defines the in-use priority that are used by all virtual router instances associated with the policy.
- If no set events have an explicit **priority** value, all the set events delta **priority** values are added and subtracted from the base priority value defined on each virtual router instance associated with the policy.
- If the delta priorities sum exceeds the **delta-in-use-limit** parameter, then the **delta-in-use-limit** parameter is used as the value subtracted from the base priority value defined on each virtual router instance associated with the policy.

If the **priority** command is not configured on the priority event, the *priority-value* defaults to 0 and the qualifier keyword defaults to **delta**, therefore, there is no impact on the in-use priority.

The **no** form of the command configures the set event to subtract 0 from the base priority (no effect).

Default

no priority

Parameters

priority-level

The priority level adjustment value expressed as a decimal integer.

Values 0 to 254

delta

Configures what effect the *priority-level* will have on the base priority value. The default base priority value is **delta**.

When **delta** is specified, the *priority-level* value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set. The sum of the priority event *priority-level* values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value. If the **delta** priority event is cleared, the *priority-level* is no longer used in the in-use priority calculation.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

explicit

Configures what effect the *priority-level* will have on the base priority value.

When **explicit** is specified, the *priority-level* value is used to override the base priority of the virtual router instance if the priority event is set and no other **explicit** priority event is set with a lower *priority-level*. The set **explicit** priority value with the lowest *priority-level* determines the actual in-use protocol value for all virtual router instances associated with the policy.

Platforms

priority

Syntax

priority *bridge-priority*

no priority

Context

[Tree] (config>service>pw-template>stp priority)

Full Context

configure service pw-template stp priority

Description

The **bridge-priority** command is used to populate the priority portion of the bridge ID field within outbound BPDUs (the most significant 4 bits of the bridge ID). It is also used as part of the decision process when determining the best BPDU between messages received and sent. All values will be truncated to multiples of 4096, conforming with IEEE 802.1t and 802.1D-2004.

The **no** form of this command returns the bridge priority to the default value.

Default

priority 4096

Parameters

bridge-priority

Specifies the bridge priority for the STP instance.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values Allowed values are integers in the range of 4096 to 65535 with 4096 being the highest priority. The actual bridge priority value stored/used is the number entered with the lowest 12 bits masked off which means the actual range of values is 4096 to 61440 in increments of 4096.

36.44 private-retail-subnets

private-retail-subnets

Syntax

[**no**] **private-retail-subnets**

Context

[Tree] (config>service>vprn>sub-if private-retail-subnets)

Full Context

configure service vprn subscriber-interface private-retail-subnets

Description

This command controls the export of retail subnets and prefixes to the wholesale forwarding service. When this attribute is configured, subnets and prefixes configured on the retail subscriber interface are no longer exported to the associated wholesale VPRN and remain private to the retail VPRN. This is useful in a IPoE or PPPoE business service context, as it allows retail services to use overlapping IP address spaces even if those services are associated with the same wholesale service. IPoE and PPPoE sessions are actually terminated in the retail service although their traffic transits on a SAP belonging to the wholesale service.

Configuring private retail subnets is not supported for IPv4 static hosts and ARP hosts. If PPPoE sessions need to coexist with IPv4 static hosts or ARP hosts, then this attribute should not be configured on the retail subscriber interface.

This command fails if the subscriber interface is not associated with a wholesale service.

If the retail VPRN is of the type **hub**, this attribute is mandatory. In this case, private retail subnets are enabled by default and cannot be unconfigured.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command disables overlapping IP addresses between different retailers referring to this interface.

configure ipsec client-db client private-service

Description

This command specifies the private service ID that is used for tunnel setup.

The **no** form of this command reverts to the default.

Default

no private-service

Parameters

service-id

Specifies the service ID of the tunnel delivery service.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **private-service name** *service-name* variant can be used in all configuration modes.

Values {*id* | *svc-name*}

id: 1 to 2147483647

svc-name: up to 64 characters (*svc-name* is an alias for input only. The *svc-name* gets replaced with an id automatically by SR OS in the configuration).

36.50 probe-history

probe-history

Syntax

probe-history {**keep** | **drop** | **auto**}

Context

[Tree] (config>saa>test probe-history)

Full Context

configure saa test probe-history

Description

Specifies history probe behavior. Defaults are associated with various configured parameters within the SAA test. Auto (keep) is used for test with probe counts of 100 or less, and intervals of 1 second and above. Auto (drop) only maintains summary information for tests marked as continuous with file functions, probe counts more than 100 and intervals of less than 1 second. SAA tests that are not continuous with a write to file defaults to Auto (keep). The operator is free to change the default behaviors for each type. Each test that maintains per probe history consumes more system memory. When per probe entries are required, the probe history is available at the completion of the test.

Default

probe-history auto

Parameters

auto

An auto selector that determines the storage of the history information.

drop

Stores summarized min/max/avg data not per probe information for test runs. This may be configured for all tests to conserve memory.

keep

Stores per probe information for tests. This consumes significantly more memory than summary information and should only be used if necessary.

Full Context

configure service vpls sap process-cpm-traffic-on-sap-down

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is applicable to simple SAPs configured on LAGs that are not part of any "endpoint" configurations or complicated resiliency schemes like MC-LAG with inter-chassis-backup (ICB) configurations. When configured, a simple LAG SAP is not removed from the forwarding plane and flooded traffic (unknown unicast, broadcast and multicast) is dropped on egress. This allows applicable control traffic that is extracted at the egress interface to be processed by the CPM. This command will not prevent a VPLS service from entering an operationally down state if it is the last active connection to enter a nonoperational state. By default, without this command, when a SAP on a LAG enters a nonoperational state, it is removed from the forwarding plane and no forwarding occurs to the egress.

The **no** form of this command removes a SAP over a LAG that is not operational from the forwarding process.

Default

no process-cpm-traffic-on-sap-down

profile

Syntax

profile {**in** | **out**}

no profile

Context

[Tree] (config>qos>sap-ingress>fc profile)

Full Context

configure qos sap-ingress fc profile

Description

This command places a forwarding class or subclass into a color aware profile mode. Normally, packets associated with a class are considered in-profile or out-of-profile solely based on the dynamic rate of the ingress queue relative to its CIR. Explicitly defining a class as in-profile or out-of-profile overrides this function by handling each packet with the defined profile state.

The profile command may only be executed when the forwarding class or the parent forwarding class (for a subclass) is mapped to a queue that has been enabled to support color aware profile packets. The queue may only be configured for profile-mode at the time the queue is created in the SAP ingress QoS policy.

A queue operating in profile-mode may support in-profile, out-of-profile, and non-profiled packets simultaneously. However, the high- and low-priority classification actions are ignored when the queue is in profile-mode.

The **no** form of this command removes an explicit in-profile or out-of-profile configuration on a forwarding class or subclass.

Default

no profile — The default profile state of a forwarding class or subclass is not to treat ingress packets as color aware. An explicit definition for in-profile or out-of-profile must be specified on the forwarding class or subclass.

Parameters

in

The **in** keyword is mutually exclusive to the **out** keyword. When the profile in command is executed, all packets associated with the class will be handled as in-profile. Packets explicitly handled as in-profile or out-of-profile still flow through the ingress service queue

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

associated with the class to preserve order within flows. In-profile packets will count against the CIR of the queue, diminishing the amount of CIR available to other classes using the queue that are not configured with an explicit profile.

out

The **out** keyword is mutually exclusive to the **in** keyword. When the profile out command is executed, all packets associated with the class will be handled as out-of-profile. Packets explicitly handled as in-profile or out-of-profile still flow through the ingress service queue associated with the class to preserve order within flows. Out-of-profile packets will not count against the CIR of the queue, allowing other classes using the queue that are not configured with an explicit profile to be measured against the full CIR.

Platforms

All

profile

Syntax

profile {**g8265dot1-2010** | **ieee1588-2008** | **g8275dot1-2014** | **g8275dot2-2016**}

Context

[Tree] (config>system>ptp profile)

Full Context

configure system ptp profile

Description

This command configures the profile for the internal PTP clock, which defines the Best timeTransmitter Clock Algorithm (BTCA) behavior.

The profile setting for the clock cannot be changed unless PTP is shutdown.

The **clock-type** is restricted based on the PTP profile setting.

- If the profile is **ieee1588-2008**, the **clock-type** is not restricted.
- If the profile is **g8265dot1-2010**, the **clock type** may only be **ordinary slave** or **ordinary master**; boundary clock is not allowed.
- If the profile is **g8275dot1-2014** or **g8275dot2-2016**, the **clock-type** may only be boundary clock or **ordinary slave**; **ordinary master** is not allowed.

When the profile is changed, the domain changes to the default value for the new profile. Any command parameters that are set to default for the original profile are changed to the default for the new profile. This applies to the following:

- **log-anno-interval** set for the clock
- **log-sync-interval** set for a peer or a port
- **log-delay-interval** set for a port

Non-default parameter values for the original profile remain unchanged.

configure qos queue-group-templates ingress queue-group profile-capped

configure qos sap-ingress policer profile-capped

configure qos sap-egress policer profile-capped

configure qos queue-group-templates egress queue-group profile-capped

Description

Profile-capped mode enforces an overall in-profile burst limit to the CIR bucket for ingress undefined, ingress explicit in-profile, egress soft-in-profile, and egress explicit in-profile packets. The default behavior when profile-capped mode is not enabled is to ignore the CIR output state when an explicit in-profile packet is handled by an ingress or egress policer.

The profile-capped mode makes two changes:

- At egress, soft-in-profile packets (packets received from ingress as in-profile) are treated the same as explicit in-profile (unless explicitly reclassified as out-of-profile) and have an initial policer state of in-profile.
- At both ingress and egress, any packet output from the policer with a non-conforming CIR state are treated as out-of-profile (out-of-profile state is ignored for initial in-profile packets when profile-capped mode is not enabled).

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt single-sub-parameters profiled-traffic-only

configure service vpls sap sub-sla-mgmt single-sub-parameters profiled-traffic-only

Description

This command specifies whether only profiled traffic is applicable for this SAP. The profiled traffic refers to single subscriber traffic on a dedicated SAP (in the VLAN-per-subscriber model). When enabled, subscriber queues are instantiated through the QOS policy defined in the sla-profile and the associated SAP queues are deleted. This can increase subscriber scaling by reducing the number of queues instantiated per subscriber (in the VLAN-per-subscriber model). In order for this to be achieved, any configured multi-sub-sap limit must be removed (leaving the default of 1).

The **no** form of this command disables the command.

36.63 propagate-admin-group

propagate-admin-group

Syntax

[**no**] **propagate-admin-group**

Context

[Tree] (config>router>mpls>lsp>fast-reroute propagate-admin-group)

[Tree] (config>router>mpls>lsp-template>fast-reroute propagate-admin-group)

Full Context

configure router mpls lsp fast-reroute propagate-admin-group

configure router mpls lsp-template fast-reroute propagate-admin-group

Description

The command enables the signaling of the primary LSP path admin-group constraints in the FRR object at the ingress.

When this command is executed, the admin-group constraints configured in the context of the P2P LSP primary path, or the ones configured in the context of the LSP and inherited by the primary path, are copied into the FAST_REROUTE object. The admin-group constraints are copied into the 'include-any' or 'exclude-any' fields.

The ingress LER thus propagates these constraints to the downstream nodes during the signaling of the LSP to allow them to include the admin-group constraints in the selection of the FRR backup LSP for protecting the LSP primary path.

The ingress LER inserts the FAST_REROUTE object by default in a primary LSP path message. If the user disables the object using the following command, the admin-group constraints will not be propagated: **config>router>mpls>no frr-object**.

Note that the same admin-group constraints can be copied into the Session Attribute object. They are intended for the use of an LSR, typically an ABR, to expand the ERO of an inter-area LSP path. They are also used by any LSR node in the path of a CSPF or non-CSPF LSP to check the admin-group constraints against the ERO regardless if the hop is strict or loose. These are governed strictly by the command:

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

config>router>mpls>lsp>propagate-admin-group

In other words, the user may decide to copy the primary path admin-group constraints into the FAST_REROUTE object only, or into the Session Attribute object only, or into both. Note, however, that the PLR rules for processing the admin-group constraints can make use of either of the two object admin-group constraints.

This feature is supported with the following LSP types and in both intra-area and inter-area TE where applicable:

- Primary path of a RSVP P2P LSP.
- S2L path of an RSVP P2MP LSP instance
- LSP template for an S2L path of an RSVP P2MP LSP instance.

The **no** form of this command disables the signaling of administrative group constraints in the FRR object.

Default

no propagate-admin-group

Platforms

All

propagate-admin-group

Syntax

[**no**] **propagate-admin-group**

Context

[Tree] (config>router>mpls>lsp-template propagate-admin-group)

[Tree] (config>router>mpls>lsp propagate-admin-group)

Full Context

configure router mpls lsp-template propagate-admin-group

configure router mpls lsp propagate-admin-group

Description

This command enables propagation of session attribute object with resource affinity (C-type 1) in PATH message. If an LSR receives a session attribute with resource affinity, then it will check the compatibility of admin-groups received in PATH message against configured admin-groups on the egress interface of LSP.

To support admin-group for inter-area LSP, the ingress node must configure propagating admin-groups within the session attribute object. If a PATH message is received by an LSR node that has the **cspf-on-loose-hop** option enabled and the message includes admin-groups, then the ERO expansion by CSPF to calculate the path to the next loose hop includes the admin-group constraints received from ingress node.

If this option is disabled, then the session attribute object without resource affinity (C-Type 7) is propagated in PATH message and CSPF at the LSR node does not include admin-group constraints.

This admin group propagation is supported with a P2P LSP, a P2MP LSP instance, and an LSP template.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The user can change the value of the **propagate-admin-group** option on the fly. A RSVP P2P LSP performs a Make-Before-Break (MBB) on changing the configuration. A S2L path of an RSVP P2MP LSP performs a Break-Before-Make on changing the configuration.

The **no** form of this command reverts to the default value.

Default

no propagate-admin-group

Platforms

All

36.64 propagate-hold-time

propagate-hold-time

Syntax

propagate-hold-time *seconds*

no propagate-hold-time

Context

[Tree] (config>eth-cfm>redundancy>mc-lag propagate-hold-time)

protection

Syntax

protection none

protection hmac-sha256 key *key* [**hash** | **hash2** | **custom**]

no protection

Context

[Tree] (config>python>py-script protection)

Full Context

configure python python-script protection

Description

This command specifies the format of the Python script file(s) in this python-script. Unintentional changing of Python script file could be prevented by using protected format.

The **no** form of this command equals to **protection none**.

Parameters

none

Indicates the Python script is stored in plain text, without any mechanism in place to ensure the integrity nor the confidentiality of the content of the Python script.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hmac-sha256

Indicates the first line of the Python script must consist of the hash value obtained by hashing the rest of the Python script using the **hmac-sha256** hashing algorithm.

key

The specified key along with original Python script file content are used to compute the hash. The computed hash will be compared to the hash in the Python script file. If there is no match, then system will fail to load the script.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the key entered is a customized hashing scheme.

36.74 protection-template

protection-template

Syntax

protection-template *name*

no protection-template

Context

[Tree] (config>router>mpls>mpls-tp protection-template)

Full Context

configure router mpls mpls-tp protection-template

Description

Protection templates are used to define generally applicable protection parameters for MPLS-TP tunnels. Only linear protection is supported, and so the application of a named template to an MPLS-TP LSP implies that linear protection is used. A protection template is applied under the MEP context of the protect-path of an MPLS-TP LSP.

The protection-template command creates or edits a named protection template.

Default

no protection-template

Parameters

name

Specifies the protection template name as a text string of up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

protection-template

Syntax

protection-template *name*

no protection-template

Context

[Tree] (config>router>mpls>lsp>protect-tp-path>mep protection-template)

Full Context

configure router mpls lsp protect-tp-path mep protection-template

Description

This command applies a protection template name to an MPLS-TP LSP that the protect path is configured under. If the template is applied, then MPLS-TP 1:1 linear protection is enabled on the LSP, using the parameters specified in the named template.

A named protection template can only be applied to the protect path context of an MPLS-TP LSP.

The no form of this command removes the template and thus disables mpls-tp linear protection on the LSP.

Default

no protection-template

Parameters

name

Specifies at text string for the template up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure eth-tunnel protection-type

Description

This command configures the model used for determining which members are actively receiving and transmitting data.

When the value is set to "g8031-1to1 (1)", as per the G.8031 specification, only two members are allowed, and only one of them can be active at one point in time.

When the value is set to "loadsharing (2)", multiple members can be active at one point in time.

Default

protection-type g8031-1to1

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

protection-type

Syntax

protection-type {**link** | **node**}

no protection-type

Context

[Tree] (config>router>route-next-hop-policy>template protection-type)

Full Context

configure router route-next-hop-policy template protection-type

Description

This command configures the protection type constraint into the route next-hop policy template.

The user can select if link protection or node protection is preferred in the selection of an LFA next-hop for all IP prefixes and LDP FEC prefixes to which a route next-hop policy template is applied. The default in SR OS implementation is node protection. The implementation will fall back to the other type if no LFA next-hop of the preferred type is found.

When the route next-hop policy template is applied to an IP interface, all prefixes using this interface as a primary next-hop will follow the protection type preference specified in the template.

The **no** form deletes the protection type constraint from the route next-hop policy template.

Default

protection-type node

Parameters

{link | node}

Specifies the two possible values for the protection type.

Default node

Platforms

All

36.76 proto-version

proto-version

Syntax

proto-version {v070 | latest}

Context

[Tree] (config>system>grpc>gnmi proto-version)

Full Context

configure system grpc gnmi proto-version

Description

This command sets the gnmi.proto version that the GRPC server should use for all gNMI RPCs.

Default

proto-version latest

Parameters

v070

Specifies to use v0.7.0 for gNMI RPCs. Only use this option for backward compatibility with legacy collectors.

latest

Specifies to use the latest gnmi.proto version for gNMI RPCs. The latest version is v0.8.0.

Platforms

Full Context

configure subscriber-mgmt isa-service-chaining vas-filter entry match protocol

Description

This command configures the protocol ID to be matched in this entry of the VAS filter.

The **no** form of this command removes the protocol ID from the match criterium in the entry.

Parameters

protocol-id

Specifies the protocol to match.

Values protocol-id: *protocol-number* | *protocol-name*
protocol-number: 1, 6, 17]D
[0x1,0x6,0x11]H [0b1,0b110,0b10001]B
protocol-name: none, icmp, tcp, udp
* udp/tcp wildcard

Platforms

protocol

Syntax

protocol {**eq** | **neq**} *protocol-name*

no protocol

Context

[Tree] (config>app-assure>group>policy>app-filter>entry protocol)

Full Context

configure application-assurance group policy app-filter entry protocol

Description

This command configures protocol signature in the application definition.

The **no** form of this command restores the default (removes protocol from match application defined by this app-filter entry).

Default

no protocol

Parameters

eq

Specifies that the value configured and the value in the flow are equal.

neq

Specifies that the value configured differs from the value in the flow.

protocol-name

A string of up to 32 characters identifying a predefined protocol.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

protocol

Syntax

protocol *protocol-name* **export-using** *export-method*

Full Context

configure application-assurance group statistics aa-sub protocol

Description

This command configures aa-sub accounting statistics for export of protocols of a given AA ISA group/partition.

The no form of this command removes the protocol name.

Parameters

protocol-name

Specifies an existing protocol name up to 32 characters in length.

export-using *export-method*

Specifies that the method of stats export to be used. Accounting-policy is the only option for protocol statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

protocol

Syntax

protocol

Context

[Tree] (config>app-assure>group>statistics protocol)

Full Context

configure application-assurance group statistics protocol

Description

Commands in this context configure accounting and statistics collection parameters per-system for protocols of application assurance for a given AA ISA group/partition.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

protocol

[Tree] (config>ipsec>ts-list>remote>entry protocol)

Full Context

configure ipsec ts-list local entry protocol

configure ipsec ts-list remote entry protocol

Description

This command specifies the protocol and port range in the IKEv2 traffic selector.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The SR OS supports OPAQUE ports and port ranges for the following protocols:

- TCP
- UDP
- SCTP
- ICMP
- ICMPv6
- MIPv6

For ICMP and ICMPv6, the *port* value takes the form *icmp-type*/*icmp-code*. For MIPv6, the *port* value is the mobility header type. For other protocols, only the **port any** configuration can be used.

Default

no protocol

Parameters

protocol-id

Specifies the protocol ID. The value can be a number, a protocol name, or **any**.

begin-port-id

Specifies the beginning of the port range.

Values For TCP, UDP, and SCTP, the value is the port number.

For ICMP and ICMPv6, the value takes the form *icmp-type*/*icmp-code*; for example, 0/0.

For MIPv6, the value is the mobility header type.

end-port-id

Specifies the end of the port range

Values For TCP, UDP, and SCTP, the value is the port number.

For ICMP and ICMPv6, the value takes the form *icmp-type*/*icmp-code*; for example, 0/0.

For MIPv6, the value is the mobility header type.

opaque

Specifies OPAQUE ports.

any

Specifies any port.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

protocol

Syntax

[**no**] **protocol** {*number* | **any**}

Context

[Tree] (config>service>nat>firewall-policy>unknown-protocols protocol)

Full Context

configure service nat firewall-policy unknown-protocols protocol

Description

This command configures the protocol numbers that are allowed to create unknown flows.

Protocol or IPv6 extension header values that are explicitly supported by SR OS can be configured but will not be treated as unknown protocols.

The **no** form of the command removes the allowance for the specified protocol to create unknown flows.

Parameters

any

Specifies that unknown flows can be created by any protocol.

number

Specifies the IANA number of a protocol that needs to be allowed to create unknown flows.

Values 0 to 255

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

protocol

Syntax

[**no**] **protocol** *protocol-id*

Context

[Tree] (config>filter>match-list>protocol-list protocol)

Full Context

configure filter match-list protocol-list protocol

Description

This command adds a protocol to the match protocol list.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the protocol from the **protocol-list**.

Parameters

protocol-id

protocol-number, *protocol-name*

protocol-number

Specifies the protocol number value to be added or removed from the protocol list. The value can be expressed as a decimal integer, or in hexadecimal or binary format.

Values [0 to 255]D

[0x0 to 0xFF]H

[0b0 to 0b11111111]B

protocol-name

Specifies the protocol name to be added or removed from the protocol list.

Values icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp.

protocol

Syntax

protocol *protocol*

no protocol [*protocol*]

Context

[Tree] (config>vrrp>policy>priority-event>route-unknown protocol)

Full Context

configure vrrp policy priority-event route-unknown protocol

Description

This command adds one or more route sources to match the route unknown IP route prefix for a route unknown priority control event.

If the route source does not match one of the defined protocols, the match is considered unsuccessful and the **route-unknown** event transitions to the set state.

The **protocol** command is optional. If the **protocol** command is not executed, the comparison between the RTM prefix return and the **route-unknown** IP route prefix will not include the source of the prefix. The **protocol** command cannot be executed without at least one associated route source parameter.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

All parameters are reset each time the **protocol** command is executed and only the explicitly defined protocols are allowed to match.

The **no** form of the command removes protocol route source as a match criteria for returned RTM route prefixes.

To remove specific existing route source match criteria, execute the **protocol** command and include only the specific route source criteria. Any unspecified route source criteria is removed.

Default

no protocol — No route source for the route unknown priority event is defined.

Parameters

protocol

Explicitly defined protocols

Values **bgp** - This parameter defines BGP as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **bgp** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **bgp** parameter, a returned route prefix with a source of BGP will not be considered a match and will cause the event to enter the set state. This parameter only applies to the 7750 SR and 7950 XRS.

bgp-vpn - This parameter defines **bgp-vpn** as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **bgp-vpn** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **bgp-vpn** parameter, a returned route prefix with a source of **bgp-vpn** will not be considered a match and will cause the event to enter the set state. This parameter only applies to the 7750 SR and 7950 XRS.

ospf - This parameter defines OSPF as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **ospf** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **ospf** parameter, a returned route prefix with a source of OSPF will not be considered a match and will cause the event to enter the set state.

is-is - This parameter defines IS-IS as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **is-is** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **is-is** parameter, a returned route prefix with a source of IS-IS will not be considered a match and will cause the event to enter the set state.

rip - This parameter defines RIP as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **rip** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the **rip** parameter, a returned route prefix with a source of RIP will not be considered a match and will cause the event to enter the set state.

static - This parameter defines a static route as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **static** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **static** parameter, a returned route prefix with a source of static route will not be considered a match and will cause the event to enter the set state.

Platforms

All

protocol

Syntax

protocol *protocol-id*

no protocol

Context

[Tree] (config>system>security>mgmt-access-filter>ip-filter>entry protocol)

Full Context

configure system security management-access-filter ip-filter entry protocol

Description

This command configures an IP protocol type to be used as a management access filter match criterion.

The protocol type, such as TCP, UDP, and OSPF, is identified by its respective protocol number. Well-known protocol numbers include ICMP (1), TCP (6), and UDP (17).

The **no** form the command removes the protocol from the match criteria.

Parameters

protocol

Specifies the protocol number for the match criterion.

Values 1 to 255 (decimal)

Platforms

All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

protocol

Syntax

[**no**] **protocol** *name* [**create**]

Context

[Tree] (config>sys>security>dist-cpu-protection>policy protocol)

Full Context

configure system security dist-cpu-protection policy protocol

Description

This command creates the control protocol for the policy.

The **no** form of this command means packets of the specified protocol are not monitored or enforced (although they count in the FP protocol queue) on the objects to which this DCP policy is assigned. The packets are treated as part of the **all-unspecified** protocol if the protocol is created in the policy.

Parameters

names

Signifies the protocol name.

The following explanatory notes for specific protocols apply:

- bfd-cpm - includes all BFD handled on the CPM, including the cpm-np type, single hop and multi hop, and MPLS-TP CC and CV BFD
- dhcp - includes DHCP for IPv4 and IPv6
- eth-cfm - 802.1ag and includes Y.1731. ETH-CFM packets on port and LAG-based facility MEPs are not included (but packets on tunnel MEPs are)
- icmp - includes IPv4 and IPv6 ICMP (including RS/RA/Redirect), except NS/NA Neighbor Discovery packets that are classified as a separate NDIS protocol
- icmp-ping-check - includes packets associated with ping-template functions
- isis - includes IS-IS used for SPBM
- ldp - includes LDP and T-LDP
- mpls-ttl - includes MPLS packets that are extracted because of an expired MPLS-TTL field
- ndis - includes IPv6 NS/NA Neighbor Discovery (not including RS/RA/Redirect which are classified as part of the ICMP protocol)
- ospf - includes all OSPFv2 and OSPFv3 packets
- pppoe-pppoa - includes PADx, LCP, PAP/CHAP, and NCPs
- ssh - includes TCP port 22 or a user-configured SSH server port
- vrrp - includes VRRP and SRRP packets
- multi-chassis - includes SR OS Multi-Chassis UDP port 1025 packets

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- multi-chassis-sync - includes SR OS Multi-Chassis Sync TCP port 45067 packets
- all-unspecified - a special aggregate entry for protocols that are not explicitly specified. When configured, this option treats all extracted control packets that are not explicitly configured in the DCP policy as a single aggregate flow (or virtual protocol). It lumps together remaining control traffic to allow it to be rate limited as one flow. It includes all control traffic of all protocols that are extracted and sent to the CPM (including protocols that cannot be explicitly configured with the distributed CPU protection feature). Control packets that are both forwarded and copied for extraction are not included. If a user later explicitly configures a protocol, that protocol is suddenly no longer part of the **all-unspecified** flow. This protocol must be explicitly configured to operate.

  Values all-unspecified, arp, bfd-cpm, bgp, dhcp, eth-cfm, http-redirect, icmp, icmp-ping-check, igmp, isis, ldp, mld, mpls-ttl, multi-chassis, multi-chassis-sync, ndis, ospf, pim, pppoe-pppoa, radius, rsvp, ssh, vrrp

create

Mandatory keyword to create the protocol.

Platforms

All

protocol

Syntax

protocol *protocol* [**all** | { **instance** *instance*}]

protocol *protocol2* [*protocol2* (up to 5 max)]

no protocol

Context

[Tree] (config>router>policy-options>policy-statement>entry>from protocol)

Full Context

configure router policy-options policy-statement entry from protocol

Description

This command configures a routing protocol as a match criterion for a route policy statement entry. This command is used for both import and export policies depending how it is used.

The **protocol direct-interface** route type matches the specific direct interface host IPv4 /32 and IPv6 /128 routes. The **protocol direct** route type matches direct routes and does not match the specific /32 or /128 interface route itself.

Note:
The **instance** command cannot be used if multiple protocol names are specified for the *protocol2* parameter.

The **no** form of this command removes the protocol match criterion.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no protocol

Parameters

protocol

Specifies the protocol name for the match criterion.

Values direct, static, bgp, isis, ospf, rip, aggregate, bgp-vpn, igmp, pim, ospf3, ldp, sub-mgmt, mld, managed, vpn-leak, nat, periodic, ipsec, dhcpv6-pd, dhcpv6-na, dhcpv6-ta, dhcpv6-pd-excl, ripng, bgp-label, direct-interface, arp-nd, rib-api, evpn-ifl, evpn-iff, srv6

instance

Specifies the OSPF, OSPFv3, or IS-IS protocol instance.

Values isis-inst — 0 to 127

ospf-inst — 0 to 31

ospf3-inst — 0 to 31, 64 to 95

protocol2

Specifies up to five protocol names to match on.

Values direct, static, isis, aggregate, bgp, bgp-label, direct-interface

all

Keyword that specifies to match on any OSPF, OSPFv3, or IS-IS protocol instance.

Platforms

All

protocol-protection

Syntax

protocol-protection [**allow-sham-links**] [**block-pim-tunneled**]

no protocol-protection

Context

[Tree] (config>sys>security>cpu-protection protocol-protection)

Full Context

configure system security cpu-protection protocol-protection

Description

This command causes the network processor on the CPM to discard all packets received for protocols that are not configured on the particular interface. This helps mitigate DoS attacks by filtering invalid control traffic before it hits the CPU. For example, if an interface does not have IS-IS configured, then protocol protection will discard any IS-IS packets received on that interface.

Default

no protocol-protection

Parameters

allow-sham-links

Allows sham links. As OSPF sham links form an adjacency over the MPLS-VPRN backbone network, when protocol-protection is enabled, the tunneled OSPF packets to be received over the backbone network must be explicitly allowed.

block-pim-tunneled

Blocks extraction and processing of PIM packets arriving at the SR OS node inside a tunnel (for example, MPLS or GRE) on a network interface. With protocol-protection enabled and tunneled pim blocked, PIM in an mVPN on the egress DR will not switch traffic from the (*,G) to the (S,G) tree.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies an existing policy-statement to analyze match and action criteria that controls the flow of routing information to and from a given protocol, set of protocols, or a neighbor.

The **no** form of this command disables the proxy ARP capability.

Parameters

policy-name

Specifies the export route policy name. Allowed values are any string, up to 32 characters, composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

The specified name must already be defined.

Platforms

All

- configure service ies interface proxy-arp-policy
- configure service vprn interface proxy-arp-policy

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface proxy-arp-policy
- configure service ies subscriber-interface group-interface proxy-arp-policy

proxy-arp-policy

Syntax

proxy-arp-policy *policy-name* [*policy-name*]

no proxy-arp-policy

Context

[Tree] (config>subscr-mgmt>git>ipv4 proxy-arp-policy)

Full Context

configure subscriber-mgmt group-interface-template ipv4 proxy-arp-policy

Description

This command configures a proxy ARP policy for the interface.

The **no** form of this command disables the proxy ARP capability.

Default

no proxy-arp-policy

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

policy-name

Specifies the export route policy name. Allowed values are any string, up to 32 characters, composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. A maximum of five policy names can be specified.

Note:
The specified policy name must already be defined.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

proxy-arp-policy

Syntax

proxy-arp-policy *policy-name* [*policy-name*]

no proxy-arp-policy

Context

[Tree] (config>router>if proxy-arp-policy)

Full Context

configure router interface proxy-arp-policy

Description

This command enables and configure proxy ARP on the interface and specifies an existing policy-statement to analyze match and action criteria that controls the flow of routing information to and from a given protocol, set of protocols, or a specific neighbor. The policy-name is configured in the **config>router>policy-options** context.

Use proxy ARP so the router responds to ARP requests on behalf of another device. Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address.

Default

no proxy-arp-policy

Parameters

policy-name

Specifies the export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. A maximum of five policy names can be specified in a single statement. The specified policy names must already be defined.

36.94 psid-offset

psid-offset

Syntax

psid-offset *psid-offset-length*

no psid-offset

Context

[Tree] (config>service>nat>map-domain>mapping-rule psid-offset)

Full Context

configure service nat map-domain mapping-rule psid-offset

Description

This command configures the length of the high order bits in the protocol port field whose aggregate value should always be greater than 0. This automatically excludes certain ports (such as well-known ports) from the translation.

It is a function of the CE to make sure that the psid-offset bits are always greater than 0. The VSR does not check whether those bits are 0.

Default

psid-offset 6

Parameters

psid-offset-length

Specifies the length of the psid-offset bits in the protocol port field.

Values 0 to 16

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

36.97 ptp-asymmetry

ptp-asymmetry

Syntax

ptp-asymmetry *nanoseconds*

no ptp-asymmetry

Context

[Tree] (config>port>ethernet ptp-asymmetry)

Full Context

configure port ethernet ptp-asymmetry

Description

This command configures the PTP asymmetry delay on an Ethernet port. The command is used to correct for known asymmetry as part of time of day or phase recovery using PTP packets on both local and downstream PTP clocks.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no ptp-asymmetry

Parameters

nanoseconds

Specifies the value, in nanoseconds, that the forward path delay varies from the mean path delay; the value can be a negative number.

Values -2147483648 to 2147483647

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

36.98 ptp-hw-assist

ptp-hw-assist

Syntax

[**no**] **ptp-hw-assist**

Context

[Tree] (config>service>ies>if ptp-hw-assist)

Full Context

configure service ies interface ptp-hw-assist

Description

This command configures the 1588 port based timestamping assist feature for the interface. This feature is supported on a specific set of hardware. The command may be blocked if not all hardware has the required level of support.

Only one interface per physical port can have ptp-hw-assist enabled.

The **no** form of this command disables the feature for the interface.

Default

no ptp-hw-assist

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ptp-hw-assist

Syntax

[**no**] **ptp-hw-assist**

Context

[Tree] (config>service>vprn>if ptp-hw-assist)

Full Context

configure service vprn interface ptp-hw-assist

Description

This command configures the 1588 port based timestamping assist feature for the interface. This feature is supported on a specific set of hardware. The command may be blocked if not all hardware has the required level of support.

If the SAP configuration of the interface is removed, the ptp-hw-assist configuration will be removed.

If the IPv4 address configuration of the interface is removed, the ptp-hw-assist configuration will be removed.

Only one interface per physical port can have **ptp-hw-assist** enabled.

The **no** form of this command disables the feature for the interface.

Default

no ptp-hw-assist

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ptp-hw-assist

Syntax

[**no**] **ptp-hw-assist**

Context

[Tree] (config>router>if ptp-hw-assist)

Full Context

configure router interface ptp-hw-assist

Description

This command configures the 1588 port based timestamping assist feature for the interface. Various checks are performed to ensure that this feature can be enabled. If a check fails:

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- The command is blocked/rejected with an appropriate error message.
- If the SAP configuration of the interface is removed, the ptp-hw-assist configuration will be removed.
- If the IPv4 address configuration of the interface is removed, the ptp-hw-assist configuration will be removed.

The port validates the destination IP address on received 1588 messages. If the 1588 messages are sent to a loopback address within the node rather than the address of the interface, the loopback address must be configured in the **configure system security source-address application ptp** context.

The **no** form of this command disables the feature for the interface.

Default

no ptp-hw-assist

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ptp-ip

Syntax

[**no**] **ptp-ip**

Context

[Tree] (config>system>sat>eth-sat ptp-ip)

Full Context

configure system satellite eth-sat ptp-ip

Description

Commands in this context configure the Precision Time Protocol over IP (PTP over IP) transparent clock functionality.

Enable the **configure system satellite eth-sat feature ptp-tc** command to allow PTP over IP to function.

The **no** form of this command disables the PTP over IP transparent clock functionality.

Default

no ptp-ip

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

36.100 ptp-tc

ptp-tc

Syntax

[**no**] **ptp-tc**

Context

[Tree] (config>system>satellite>eth-sat ptp-tc)

Full Context

configure system satellite eth-sat ptp-tc

Description

This command enables the ethernet satellite IEEE1588 transparent clock function. This function works with the SR OS host router configured as a PTP ordinary clock or boundary clock. This provides increased accuracy on the PTP event messages transiting the satellite. When a IEEE1588 event message transits the ethernet satellite, the correction field of the message is updated with the residence time of that message. This is used in PTP time calculations. All ports of the satellite are enabled for this capability with the one setting. This feature must be enabled to allow the assignment of one of the satellite's client ports as a PTP port under **config>system>ptp>port**. This feature is only valid when using PTP over Ethernet encapsulation; it is not valid for PTP over IP encapsulation.

To enable this command, the satellite must have first been configured to support the feature using the **config>system>satellite>eth-sat>feature transparent-clock-eth** and must have been enabled for synchronous ethernet with **config>system>satellite>eth-sat>sync-e**.

All host ports connecting to this satellite must support 1588 port-based timestamping.

The **no** version of this command disables the specific satellite functionality.

Default

no ptp-tc

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

36.108 public-tcp-mss-adjust

public-tcp-mss-adjust

Syntax

public-tcp-mss-adjust *octets*

public-tcp-mss-adjust default

no public-tcp-mss-adjust

Context

[Tree] (config>service>vprn>l2tp>l2tpv3 public-tcp-mss-adjust)

[Tree] (config>router>l2tp>group>l2tpv3 public-tcp-mss-adjust)

[Tree] (config>service>vprn>l2tp>group>tunnel>l2tpv3 public-tcp-mss-adjust)

[Tree] (config>service>vprn>l2tp>group>l2tpv3 public-tcp-mss-adjust)

Full Context

configure service vprn l2tp l2tpv3 public-tcp-mss-adjust

configure router l2tp group l2tpv3 public-tcp-mss-adjust

configure service vprn l2tp group tunnel l2tpv3 public-tcp-mss-adjust

configure service vprn l2tp group l2tpv3 public-tcp-mss-adjust

Description

This command enables TCP MSS adjust for L2TPv3 tunnels on the public side on the group or tunnel level. When the command is configured, the system updates the TCP MSS option value of the received TCP SYN packet on the public side that is encapsulated in the L2TPv3 tunnel.

Note that this command can be overridden by the corresponding configuration on the group or tunnel level.

With the **default** parameter, the system uses the upper level configuration. With the non-default parameter, the system uses this configuration instead of the upper level configuration.

The **no** form of this command disables TCP MSS adjust on the public side.

Default

no public-tcp-mss-adjust

Parameters

octets

Specifies the new TCP MSS value in octets

Values 512 to 9000

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

default

Specifies to use the upper-level configuration

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service ies interface ipsec ipsec-tunnel public-tcp-mss-adjust

configure ipsec tunnel-template public-tcp-mss-adjust

configure router interface ipsec ipsec-tunnel public-tcp-mss-adjust

Description

This command enables the Maximum Segment Size (MSS) for the TCP traffic in an IPsec tunnel which is sent from the public network to the private network. The system may use this value to adjust or insert the MSS option in TCP SYN packet.

If the **auto** parameter is specified, the system derives the new MSS value based on the public MTU and IPsec overhead.

The **no** form of this command disables TCP MSS adjust on the public side.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no public-tcp-mss-adjust

Parameters

auto

Derive the new MSS value based on the public MTU and IPsec overhead.

bytes

Specifies the new TCP MSS value in bytes.

Values 512 to 9000

octets

Specifies the new TCP MSS value in octets

Values 512 to 9000

36.109 purge-timeout

purge-timeout

Syntax

purge-timeout *seconds*

no purge-timeout

Context

[Tree] (config>system>grpc>rib-api purge-timeout)

Full Context

configure system grpc rib-api purge-timeout

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the purge timeout associated with the RibApi gRPC service.

If a gRPC client used the RibApi gRPC service to program RIB entries into the router, and then the TCP connection drops for any reason, the associated RIB entries are immediately marked as stale and a timer with the **purge-timeout** value is started. Upon timer expiration, all of the stale entries are removed. While the timer is running, the stale entries remain valid and usable for forwarding but are less preferred than any non-stale entry. The **purge-timeout** gives an opportunity for the disconnected client, or some other client, to re-program the necessary RIB entries so that forwarding can continue uninterrupted.

The **no** form of this command resets to the default value of 0. Entries are immediately deleted when the TCP connection drops.

Default

no purge-timeout

Parameters

seconds

Specifies the number of seconds until the stale entries are purged.

Values 1 to 100 000

Default 0

Platforms

All

36.110 purge-timer

purge-timer

Syntax

purge-timer *minutes*

no purge-timer

Context

[Tree] (config>router>bgp purge-timer)

Full Context

configure router bgp purge-timer

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

When the system sends a VPN-IP Route-Refresh to a peer it sets all the VPN-IP routes received from that peer (in the RIB-IN) to stale and starts the purge-timer. If the routes are not updated (refreshed) before the purge-timer has expired then the routes are removed.

The BGP purge timer configures the time before stale routes are purged.

The **no** form of this command reverts to the default.

Default

purge-timer 10

Parameters

minutes

Specifies the maximum time before stale routes are purged.

Values 1 to 60

Platforms

All

36.111 push

push

Syntax

push {*label* | **implicit-null-label**} **nexthop** *ip-address*

no push {*out-label* | **implicit-null-label**}

Context

[Tree] (config>router>mpls>static-lsp push)

Full Context

configure router mpls static-lsp push

Description

This command specifies the label to be pushed on the label stack and the next hop IP address for the static LSP.

The **no** form of this command removes the association of the label to push for the static LSP.

Parameters

implicit-null-label

Specifies the use of the implicit label value for the push operation.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

label

The label to push on the label stack. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment
- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services
- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services
- label values 131,072 through 1,048,575 are reserved for future use

Values 16 to 1048575

nexthop *ip-address*

Specifies the IP address of the next hop towards the LSP egress router. If an ARP entry for the next hop exists, then the static LSP is marked operational. If ARP entry does not exist, software sets the operational status of the static LSP to down and continues to ARP for the configured nexthop. Software continuously tries to ARP for the configured nexthop at a fixed interval.

36.115 pw-port

pw-port

Syntax

pw-port *pw-port-id* [**pw-headend**]

no pw-port

Context

[Tree] (config>service>system>bgp-evpn>eth-seg pw-port)

Full Context

configure service system bgp-evpn ethernet-segment pw-port

Description

This command configures a PW port associated to the Ethernet Segment. When the Ethernet Segment is configured as **all-active**, only a LAG or a PW port can be associated to the Ethernet Segment. When the Ethernet Segment is configured as **single-active**, then a LAG, port or SDP can be associated to the Ethernet Segment, but not a PW port unless the **pw-headend** parameter is configured. In either case, only one of the four objects can be configured in the Ethernet Segment. A specified PW port can be part of only one Ethernet Segment.

The **no** version of this command removes the PW port from the Ethernet Segment.

Default

no pw-port

Parameters

pw-port-id

Specifies the PW port identifier.

Values 1 to 32767

pw-headend

Keyword used to specify multihoming procedures are run in the PW port stitching Epipe and the routes advertised in the context of the stitching Epipe contain the ESI of the Ethernet Segment.

Platforms

All

no pw-port

Context

[Tree] (config>service>epipe pw-port)

Full Context

configure service epipe pw-port

Description

This command configures the association of the PW-port with the PXC ports or PXC based LAGs referenced in the FPE. That is, the PW-port becomes anchored by the PXC. This enables an external PW that is mapped to the anchored PW-port to be seamlessly rerouted between the I/O ports without interruption of service on the PW-port. This mapping between the external PW (spoke SDP) and the PXC based PXC-port is performed via an Epipe operating in vc-switching mode (creation time parameter).

Default

no pw-port

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

pw-port-id

Specifies the PW-port associated with this service.

Values 1 to 10239

fpe *fpe-id*

Specifies the FPE object which contains the PXC-based ports or PXC-based LAGs.

Values 1 to 64

configure service epipe spoke-sdp pw-status-signaling

Description

This command enables pseudowire status signaling for this spoke SDP binding.

The **no** form of this command disables the status signaling.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

pw-status-signaling

Platforms

All

pw-status-signaling

Syntax

[**no**] **pw-status-signaling**

Context

[Tree] (config>service>vpls>spoke-sdp pw-status-signaling)

Full Context

configure service vpls spoke-sdp pw-status-signaling

Description

This command specifies the type of signaling used by this multi-segment pseudowire provider-edge for this service.

When no pw-status-signaling is enabled, a 7450 ESS, 7750 SR, and 7950 XRS will not include the pseudowire status TLV in the initial label mapping message of the pseudowire used for a spoke-SDP. This will force both 7450 ESS, 7750 SR, and 7950 XRS PEs to use the pseudowire label withdrawal method for signaling pseudowire status.

If pw-status-signaling is configured, the node will include the use of the pseudowire status TLV in the initial label mapping message for the pseudowire.

36.121 pw-template

pw-template

Syntax

pw-template *policy-id* [**use-provisioned-sdp** | [**prefer-provisioned-sdp**] [**auto-gre-sdp**]][**create**] [**name** *name*]

no **pw-template** *policy-id*

Context

[Tree] (config>service pw-template)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service pw-template

Description

This command configures an SDP template.

Parameters

policy-id

Specifies a number that uniquely identifies a template for the creation of an SDP.

Values *policy-id*: 1 to 2147483647

use-provisioned-sdp

Specifies whether to use an already provisioned SDP. When specified, the tunnel manager is consulted for an existing active SDP (with a matching far-end address), and the SDP with the lowest metric is chosen. If there are multiple SDPs with the same metric, then the highest SDP identifier that is oper-up is chosen. The choice of SDP can be configured by applying **sdp-include/exclude** in the PW template together with an sdp-group in the provisioned SDPs. This option, and the **auto-gre-sdp** option, are mutually exclusive.

prefer-provisioned-sdp

Specifies that if an existing matching SDP that conforms to any restrictions defined in the **pw-template** is found (for example, **sdp-include**/**exclude** *group*), then it will be used, following the same logic as for the **use-provisioned-sdp** parameter. Otherwise, the command will automatically create an SDP in the same manner as if the user did not specify any option. This option and the **use-provisioned-sdp** option are mutually exclusive.

auto-gre-sdp

Specifies that an SDP should automatically be created using a GRE tunnel. This option and the **use-provisioned-sdp** option are mutually exclusive. The PW template parameters **hash-label**, **entropy-label** and **sdp-include/exclude** are ignored when an GRE SDP is auto-created.

auto-mpls-sdp

Specifies that an SDP should automatically be created using an MPLS tunnel. This is the default.

create

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

name name

A name of the operator’s choice, up to 64 characters. The name is saved as part of the configuration.

If a name is not specified at creation time, then SR OS assigns a string version of the policy-id as the name.

Values *name*: 64 characters maximum

Context

[Tree] (config>service>epipe>bgp pw-template-binding)

Full Context

configure service epipe bgp pw-template-binding

Description

This command binds the advertisements received with the route targets (RT) that match the configured list (either the generic or the specified import) to a specific pw-template. If the RT list is not present, or if multiple matches are found, the numerically lowest pw-template is used.

The pw-template-binding applies to BGP-VPWS when enabled in the Epipe.

For BGP VPWS, the following additional rules govern the use of pseudowire-template:

- On transmission, the settings for the L2-Info extended community in the BGP updates are derived from the pseudowire template attributes. If multiple pseudowire template bindings (with or without import-rt) are specified for the same VPWS instance the first pw-template entry will be used for the information in the BGP update sent.
- On reception, the values of the parameters in the L2-Info extended community of the BGP updates are compared with the settings from the corresponding pseudowire template bindings. The following steps are used to determine the local pw-template:
  - The RT values are matched to determine the pw-template. The route targets configured for each pw-template-binding are compared to the route targets within the BGP update. The PW template corresponding to **pw-template-binding** with the first matching route target is used to for the SDP. The matching is performed from the lowest PW template binding identifier to the highest.
  - If no pw-template-binding matches are found from the previous step, the first (numerically lowest) configured pw-template entry without any route-target configured will be used.

If the value used for Layer 2 MTU (unless the value zero is received), or control word does not match, the pseudowire is created but with the operationally down state.

If the value used for the S (sequenced delivery) flags is not zero the pseudowire is not created.

The **tools perform** commands can be used to control the application of changes in pw-template for BGP-VPWS.

The **no** form of this command removes the values from the configuration.

Parameters

policy-id

Specifies an existing policy ID.

Values 1 to 2147483647

import-rt ext-comm

Specifies the communities, up to five, allowed to be accepted from remote PE neighbors. An extended BGP community in the type:x:y format. The value x can be an integer or IP address. The type can be the target or origin.

Values target:{*ip-addr*:*comm-val* | *2byte-asnumber*:*ext-comm-val*| *4byte-snumber*:*comm-val*}

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ip-addr	a.b.c.d
comm-val	0 to 65535
2byte-asnumber	0 to 65535
ext-comm-val	0 to 4294967295
4byte-asnumber	0 to 4294967295

endpoint-name

Specifies the name of the endpoint the BGP PW template is associated with, up to 32 characters. When the configured endpoint is associated to the **pw-template-binding** of a BGP VPWS service, EVPN MPLS can also be configured and associated to the same endpoint in the same Epipe service. Modifying this element causes the parent element to be recreated automatically in order for the new value to take effect.

Platforms

pw-template-binding

Syntax

pw-template-binding *policy-id* [**split-horizon-group** *group-name*] [**import-rt** {*ext-community*}]

no pw-template-bind *policy-id*

Context

[Tree] (config>service>vpls>bgp pw-template-binding)

[Tree] (config>service>vpls>bgp-ad pw-template-binding)

Full Context

configure service vpls bgp pw-template-binding

configure service vpls bgp-ad pw-template-binding

Description

This command binds the advertisements received with the route target (RT) that matches the configured list (either the generic or the specified import) to a specific PW template. If the RT list is not present the pw-template is used for all of them.

The **pw-template-binding** applies to both BGP-AD and BGP-VPLS if these features are enabled in the VPLS.

For BGP VPLS the following additional rules govern the use of pseudowire-template.

- On transmission, the settings for the L2-Info extended community in the BGP update are derived from the pseudowire template attributes. If multiple pseudowire template bindings (with or without import-rt) are specified, the first pw-template entry will be used for the information in the BGP update sent.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- On reception, the values of the parameters in the L2-Info extended community of the BGP update are compared with the settings from the corresponding pw-template. The following steps are used to determine the local pw-template.
  - The RT values are matched to determine the pw-template. The route targets configured for each pw-template-binding are compared to the route targets within the BGP update. The PW template corresponding to pw-template-binding with the first matching route target is used to for the SDP. The matching is performed from the lowest PW template binding identifier to the highest
  - If no pw-templates matches are found from the previous step, the first (numerically lowest) configured pw-template entry without any route-target configured will be used.

If the values used for Layer 2 MTU (unless the value zero is received) or control word flag do not match, the pseudowire is created but with the operationally down state.

If the value used for the S (sequenced delivery) flags is not zero, the pseudowire is not created.

The tools perform commands can be used to control the application of changes in pw-template for both BGP-AD and BGP-VPLS.

The **no** form of this command removes the values from the configuration.

Parameters

policy-id

Specifies an existing policy ID

Values 1 to 2147483647

group-name

The specified group-name overrides the split horizon group template settings

import-rt ext-comm

Specifies communities allowed to be accepted from remote PE neighbors. An extended BGP community in the **type**:**x**:**y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers. A maximum of five *import-rt ext-com* can be specified.

Values target:{*ip-addr:comm-val*| *2byte-asnumber:ext-comm-val*| *4byte-asnumber:comm-val*}

ip-addr: a.b.c.d

comm-val: [0 to 65535]

2byte-as-number: [0 to 65535]

ext-comm-val: [0 to 4294967295]

4byte-asnumber: [0 to 4294967295]

36.124 pw-template-id-range

pw-template-id-range

Syntax

pw-template-id-range start *pw-template-id* **end** *pw-template-id*

no pw-template-id-range

Context

[Tree] (config>service>md-auto-id pw-template-id-range)

Full Context

configure service md-auto-id pw-template-id-range

Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to PW templates that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A PW template created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD-CLI interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

Default

no pw-template-id-range

Parameters

start *pw-template-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

Values 1 to 2147483647

end *pw-template-id*

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

Values 1 to 2147483647

36.125 pw-type

pw-type

Syntax

pw-type ethernet-vlan *vlan-id*

pw-type ethernet

no pw-type

Context

[Tree] (config>service>vpls>sap>l2tpv3-session pw-type)

[Tree] (config>service>epipe>sap>l2tpv3-session pw-type)

Full Context

configure service vpls sap l2tpv3-session pw-type

configure service epipe sap l2tpv3-session pw-type

Description

This command specifies the PW-type for the associated L2TPv3 session.

The support types are either Ethernet or Ethernet-VLAN. If Ethernet-VLAN is configured, a VLAN value must be specified as well.

The **no** form of this command deletes the PW-type configuration.

Parameters

vlan-id

Specifies the VLAN-ID.

Platforms

All

36.126 pwc

pwc

Syntax

pwc [**previous**]

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (pwc)

Full Context

pwc

Description

This command displays the present or previous working context of the CLI session. The **pwc** command provides a user who is in the process of dynamically configuring a chassis a way to display the current or previous working context of the CLI session. The **pwc** command displays a list of the CLI nodes that hierarchically define the current context of the CLI instance of the user.

The following example is from a 7750 SR:

```
A:ALA-1>config>router>bgp>group# pwc
------------------------------------------------
Present Working Context :
------------------------------------------------
<root>
  configure
  router Base
  bgp
  group test
  ospf
  area 1
------------------------------------------------
A:ALA-1>config>router>bgp>group#
```

When the **previous** keyword is specified, the previous context displays. This is the context entered by the CLI parser upon execution of the **exit** command. The current context of the CLI is not affected by the **pwc** command.

The following example is from a 7450 ESS:

```
*A:ALA-1>config>router>ospf>area>if# pwc previous
------------------------------------------------------------
Previous Working Context :
------------------------------------------------------------
 <root>
  configure
  router "Base"
  ospf
  area "0.0.0.0"
------------------------------------------------------------
*A:ALA-1config>router>ospf>area>if#
```

Parameters

previous

Displays the previous present working context.

36.127 pxc

pxc

Syntax

pxc *pxc-id* [**create**]

no pxc *pxc-id*

Context

[Tree] (config>port-xc pxc)

Full Context

configure port-xc pxc

Description

This command creates a port cross-connect (PXC) object. Referencing an Ethernet port within the PXC object will automatically configure this Ethernet port as a loopback port. The node will automatically create two PXC sub-ports under this Ethernet port. The configuration of PXC sub-ports can be accessed through the CLI.

Parameters

pxc-id

Specifies the port cross-connect identifier.

Values 1 to 64

Platforms

All

36.128 pxc-pxc-id.sub-port-id

pxc-pxc-id.sub-port-id

Syntax

pxc-*pxc-id.sub-port-id*

Context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure port pxc-pxc-id.sub-port-id

Description

This command enables access to PXC sub-port level parameters. The PXC sub-ports are automatically created once the external Ethernet port is configured inside of an PXC object. The PXC sub-ports are by default administratively disabled (shutdown). In order for PXC sub-ports to became operational, both, the underlying external Ethernet port and the PXC object must be operationally up.

Parameters

pxc-id

Specifies the unique identifier of this PXC.

Values 1 to 64

sub-port-id

When this the *pxc-id* is configured, two logical sub-ports are automatically created. These logical sub-ports are used to create two paths within the loop; one upstream path, and one downstream path. These sub-ports are destroyed when either this PXC row is destroyed, this object is de-provisioned.

37 q Commands

37.1 q-tag-range

q-tag-range

Syntax

q-tag-range *qtag1* [**to** *qtag1*]

no q-tag-range *qtag1*

Context

[Tree] (config>service>system>bgp-evpn>eth-seg>dot1q q-tag-range)

Full Context

configure service system bgp-evpn ethernet-segment dot1q q-tag-range

Description

This command determines the VIDs associated with the virtual Ethernet Segment on a specific dot1q port or LAG based on the following considerations:

- Values *, 0 to 4094 are allowed.
- Any SAP for which the service-delimiting qtag matches the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:0 will not match port 1/1/1, qtag-range 100.
- Maximum 8 ranges are allowed in the dot1q context.
- A range can be comprised of a single qtag.
- Shutting down the ES is not required prior to changing the q-tag-range.

The **no** form of the command removes the configured range. Only the first qtag1 value is required to remove the range.

Parameters

qtag1

Specifies the VID. When configuring a range of qtags (and not a single value), the second qtag1 value must be greater than the first qtag1.

Values *, 0 to 4094

The **no** form of this command reverts the qinq-etype value to the default.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no qinq-etype

Parameters

qinq-etype-value

Specifies the qinq-etype to expect in the form of 0x600 to 0xfff.

Values 1536 to 65535 in decimal or hex formats

Platforms

All

qinq-etype

Syntax

qinq-etype *qinq-etype*

no qinq-etype

Context

[Tree] (config>pw-port qinq-etype)

Full Context

configure pw-port qinq-etype

Description

This command configures the QinQ Ethertype on the PW port. The PW port is used to extract a customer's Ethernet traffic that is transported in a tunnel over an IP/MPLS network. The **qinq-etype** represents the first two bytes (TPID) in the outer 801.1Q header of the double-tagged Ethernet frame inside the tunnel.

The **no** form of this command removes the configuration.

Parameters

qinq-etype

The value for the **qinq-etype** field, in hexadecimal format.

Values 0x0600..0xFFFF

Default 0x8100

Platforms

All

© 2025 Nokia.

configure subscriber-mgmt msap-policy vpls-only-sap-parameters egress qos

configure subscriber-mgmt msap-policy ies-vprn-only-sap-parameters egress qos

Description

This command specifies the ingress or egress Quality of Service (QoS) policy that is associated with a Managed SAP (MSAP). Only QoS policies with scope template can be associated with MSAPs.

The **no** form of this command resets the default value. The system default QoS policy is used in that case.

Default

qos 1 — For egress parameters.

qos 1 multipoint-shared — For ingress vpls-only-sap-parameters.

qos 1 shared-queuing — For ingress ies-vprn-only-sap-parameters.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

policy-id

Specifies the QoS policy ID or name to associate with the MSAPs. The policy ID or name must already exist.

Values id: 1 to 65535

name: policy name up to 64 characters.

multipoint-shared

Ingress unicast MSAP queues are mapped one-for-one with hardware queues. Multipoint MSAP queues are not instantiated. Unicast and BUM packets traverse the ingress forwarding plane twice: in the first pass, both unicast and BUM traffic use the unicast MSAP queues, while in the second pass shared unicast and multipoint queues are used towards the egress line card. Multipoint-shared queuing greatly reduces ingress queue consumption. This keyword can only be specified for ingress **vpls-only-sap-parameters**.

shared-queuing

Ingress unicast MSAP queues are mapped one-for-one with hardware queues. Unicast packets traverse the ingress forwarding plane twice: in the first pass the MSAP queues are used, while in the second pass shared queues are used towards the egress line card. Shared-queuing greatly reduces ingress queue consumption. This keyword can only be specified for ingress **ies-vprn-only-sap-parameters**.

service-queuing

Ingress MSAP queues are mapped to multiple hardware queues, per egress line card destination. For scaled environments such as in subscriber management, this could lead to a high number of queue resources being used. Therefore, service-queuing for MSAPs should only be enabled for specific use cases. This keyword can only be specified for ingress parameters.

configure subscriber-mgmt sla-profile egress qos

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the egress QoS policy applicable to this SLA profile. The policy must already be defined in the **config>qos>sap-egress** context.

The **no** form of this command reverts to the default.

Default

qos 1 port-scheduler

Parameters

policy-id

Specifies the egress policy to be applied to the egress SLA profile.

Values 1 to 65535

vport-scheduler | port-scheduler

Specifies if a host queue with the port-parent option enabled should be scheduled within the context of a Vport port scheduler policy or at the port's port scheduler policy.

force

Forces a policy change

Platforms

configure subscriber-mgmt sla-profile ingress qos

Description

This command specifies the ingress QoS policy applicable to this SLA profile. The policy must already be defined in the **config>qos>sap-ingress** context.

The **no** form of this command reverts to the default.

Default

qos 1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

policy-id

Specifies the policy to be applied to the ingress SLA profile.

Values 1 to 65535

shared-queuing

Specifies the policy used by this SAP. When the value of this object is null it means that the SAP will use individual ingress QoS queues, instead of the shared ones.

multipoint-shared

This keyword is mutually exclusive with the **shared-queuing** and **service-queuing** keywords. When multipoint-shared is specified, the ingress forwarding plane will conserve hardware queues by performing two tier queuing on ingress unicast and multipoint packets through the SAP. Unicast service queues defined in the SAP ingress QoS policy are created for the SAP on the ingress forwarding plane without regard for the switch fabric destinations to which the SAP may need to forward (other destinations in the VPLS context). The multipoint queues defined in the SAP ingress QoS policy are not created for the SAP. Instead, all multipoint traffic is mapped to the unicast queues based on forwarding class in the first pass. In the second pass the unicast packets is mapped to the unicast shared queues while the multipoint traffic is mapped to the multipoint shared queues.

service-queuing

This keyword is mutually exclusive with the **multipoint-shared** and **shared-queuing** keywords to state that service queuing is needed.

force

Forces a policy change.

configure service vprn subscriber-interface group-interface sap ingress qos

Description

Associates a Quality of Service (QoS) policy with an egress Service Access Point (SAP) or IP interface.

QoS egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the *policy-id* does not exist, an error are returned.

The **qos** command is used to associate egress QoS policies. The **qos** command only allows egress policies on SAP or IP interface egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP or IP interface for egress, so the default QoS policy is used.

The normal behavior is for queues to be created per destination.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

Parameters

policy-id

The egress policy ID to associate with SAP or IP interface on egress. The policy ID must already exist.

Values 1 to 65535

configure service ies interface sap egress qos

configure service vprn interface sap egress qos

Description

This command associates a Quality of Service (QoS) policy with an egress Service Access Point (SAP) or IP interface.

QoS egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the policy ID does not exist, an error is returned.

The **qos** command associates both ingress and egress QoS policies. The **qos** command only allows ingress policies to be associated on SAP or IP interface ingress and egress policies on SAP or IP interface egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP or IP interface for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

Parameters

policy-id

The ingress/egress policy ID to associate with SAP or IP interface on ingress/egress. The policy ID must already exist.

Values 1 to 65535

port-redirect-group

This keyword associates a SAP egress with an instance of a named queue group template on the egress port of a given IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command.

queue-group-name

Specifies the name of the egress port queue group of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid egress queue group, created under config>port>ethernet>access>egress.

instance *instance-id*

Specifies the instance of the named egress port queue group on the IOM/IMM/XMA.

configure service ies interface sap ingress qos

configure service vprn interface sap ingress qos

Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the policy ID does not exist, an error is returned.

The **qos** command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The no form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

Parameters

policy-id

The ingress/egress policy ID to associate with SAP or IP interface on ingress/egress. The policy ID must already exist.

1 to 65535

shared-queuing

Specifies the ingress shared queue policy used by this SAP. When the value of this object is null it means that the SAP uses individual ingress QoS queues instead of the shared ones.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

multipoint-shared

Specifies that this queue-id is for multipoint forwarded traffic only. This queue-id can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. Attempting to map forwarding class unicast traffic to a multipoint queue generates an error; no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The multipoint designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the multipoint keyword, an error is generated and the command is not executed.

The multipoint keyword can be entered in the command line on a preexisting multipoint queue to edit queue ID parameters.

Default Present (the queue is created as non-multipoint).

Values **Multipoint** or not present.

fp-redirect-group

Creates an instance of a named queue group template on the ingress forwarding plane of a given IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command. The named queue group template can contain only policers. If it contains queues, then the command fails.

queue-group-name

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM/XMA, up to 32 characters. The queue-group-name must correspond to a valid ingress queue group template name, configured in the **config>qos>queue-group-templates** context.

instance-id

Specifies the instance of the named queue group to be created on the IOM/IMM/XMA ingress forwarding plane.

configure service cpipe sap egress qos

configure service epipe sap egress qos

configure service ipipe sap egress qos

Description

This command associates a Quality of Service (QoS) policy with an egress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the *policy-id* does not exist, an error will be returned.

The **qos** command, when used under the egress context, is used to associate egress QoS policies.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **qos** command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

Parameters

policy-id

The egress policy ID to associate with SAP on egress. The policy ID must already exist.

Values 1 to 65535

queue-group-name

Specifies the name of the egress port queue group of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid egress queue group, created under *config>port>ethernet>access>egress*.

instance-id

Specifies the instance of the named egress port queue group on the IOM/IMM/XMA.

Values 1 to 40960

Default 1

Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the policy-id does not exist, an error will be returned.

The **qos** command, when used under the ingress context, is used to associate ingress QoS policies. The **qos** command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

Parameters

policy-id

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

Values 1 to 65535

shared-queuing

This keyword can only be specified on SAP ingress. The shared-queuing keyword specifies the shared queue policy will be used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

fp-redirect-group

This keyword can only be used on SAP ingress and associates a SAP ingress with an instance of a named queue group template on the ingress forwarding plane of a specified IOM/IMM/XMA. The queue-group-name and **instance** *instance-id* are mandatory parameters when executing the command.

queue-group-name

Specifies the name of the queue group to be instance on the forwarding plane of the IOM/IMM/XMA, up to 32 characters in length. The *queue-group-name* must correspond to a valid ingress forwarding plane queue group, created under **config**>**card**>**fp**>**ingress**>**access**.

instance-id

Specifies the instance of the named queue group on the IOM/IMM/XMA ingress forwarding plane.

Description

This command is used to redirect pseudowire (PW) packets to an egress port queue-group for the purpose of shaping.

The egress PW shaping provisioning model allows the mapping of one or more PWs to the same instance of queues, or policers and queues, that are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only, or policers and queues for each FC that needs to be redirected.
2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface that the PW packets can be forwarded on. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue-group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different PWs to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-sdp inside a service, or to the egress context of a PW template and specify the redirect queue-group name.

One or more spoke-sdps can have their FCs redirected to use queues only, or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model:

1. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-sdp to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on. This queue can be a queue-group queue or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a PW packet.
2. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-sdp to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on.
3. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports that have network IP interfaces. The handling of this is dealt with in the data path as follows:
   - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
   - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the PW packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.
4. If a network QoS policy is applied to the egress context of a PW, any PW FC that is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the PW is redirected to exists and the redirection succeeds, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP is performed according to the relevant mappings of the {FC, profile} in the egress context of the network QoS policy applied to the PW. This is true regardless of whether an instance of the queue-group exists or not on the egress port the PW packet is forwarded to. If the packet's profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet's DEI/dot1p and the tunnel's DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the PW is redirected does not exist, the redirection command is failed. In this case, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface to which the PW packet is forwarded.

The **no** version of this command removes the redirection of the PW to the queue-group.

Description

This command is used to redirect pseudowire packets to an egress port queue-group for the purpose of shaping.

The egress pseudowire shaping provisioning model allows the mapping of one or more pseudowires to the same instance of queues, or policers and queues, which are defined in the queue-group template.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only or policers and queues for each FC that needs to be redirected.
2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface on which the pseudowire packets can be forwarded. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue-group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-SDP inside a service or to the egress context of a pseudowire template and specify the redirect queue-group name.

One or more spoke-SDPs can have their FCs redirected to use queues only or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model:

1. When a pseudowire FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface on which the pseudowire packet is forwarded. This queue can be a queue-group queue, or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a pseudowire packet.
2. When a pseudowire FC is redirected to use a queue or a policer, and a queue in a queue-group and the queue-group name exists, but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the pseudowire packet is forwarded on.
3. When a pseudowire FC is redirected to use a queue, or a policer and a queue in a queue-group, and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports which have network IP interfaces. The handling of this is dealt with in the data path as follows:
   a. When a pseudowire packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
   b. When a pseudowire packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the pseudowire packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.
4. If a network QoS policy is applied to the egress context of a pseudowire, any pseudowire FC, which is not explicitly redirected in the network QoS policy, will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the pseudowire is redirected to exists and the redirection succeeds, the marking of the packet DEI/dot1p/DSCP and the tunnel DEI/dot1p/DSCP/EXP is performed; according to the relevant mappings of the (FC, profile) in the egress context of the network QoS policy applied to the pseudowire. This is true regardless, whether an instance of the queue-group exists or not on the egress port to which the pseudowire packet is forwarded. If the packet profile value changed due to egress child

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policer CIR profiling, the new profile value is used to mark the packet DEI/dot1p and the tunnel DEI/dot1p/EXP, and the DSCP/prec will be remarked if e**nable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the marking of the packet DEI/dot1p/DSCP and the tunnel DEI/dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface to which the pseudowire packet is forwarded.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

Values 1 to 65535

port-redirect-group *queue-group-name*

This optional parameter specifies that the *queue-group-name* will be used for all egress forwarding class redirections within the network QoS policy ID. The specified *queue-group-name* must exist as a port egress queue group on the port associated with the IP interface.

egress-instance *instance-id*

Specifies the identification of a specific instance of the queue-group.

Values 1 to 16384

Platforms

All

qos

Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers, which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC that needs to be redirected and optionally, for each traffic type (unicast, broadcast, unknown, or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface to which the pseudowire packets can be received. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-SDP inside a service, or to the ingress context of a pseudowire template, and specify the redirect queue-group name.
5. One or more spoke-SDPs can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as *policer-output-queues*.

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

- If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
- If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.

a queue-group policer followed by the per-FP ingress shared queues referred to as *policer-output-queues* if the ingress context of the network IP interface from which the packet is received is redirected to a queue-group (csc-policing). The only exceptions to this behavior are for packets received from a IES/VPRN spoke interface and from an R-VPLS spoke-SDP, which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP is used.

When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless of whether an instance of the named policer queue-group exists on the ingress FP on which the pseudowire packet is received. The user can apply a QoS filter matching the dot1.p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload IP header if the user enabled the **ler-use-dscp** option and the pseudowire terminates in IES or VPRN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface on which the pseudowire packet is received.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

Values 1 to 65535

fp- redirect-group *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length.

ingress-instance *instance-id*

Specifies the identification of a specific instance of the queue-group.

configure service pw-template egress qos

Description

This command is used to redirect PW packets to an egress port queue-group for the purpose of shaping.

The egress PW shaping provisioning model allows the mapping of one or more PWs to the same instance of queues, or policers and queues, that are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only, or policers and queues for each FC that needs to be redirected.
2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface that the PW packets can be forwarded on. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue- group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different PWs to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-SDP inside a service, or to the egress context of a PW template and specify the redirect queue-group name.

One or more spoke-SDPs can have their FCs redirected to use queues only, or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model.

1. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on. This queue can be a queue-group queue or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a PW packet.
2. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on.
3. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports that have network IP interfaces. The handling of this is dealt with in the data path as follows:
   - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- When a PW packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the PW packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

4. If a network QoS policy is applied to the egress context of a PW, any PW FC that is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the PW is redirected to exists and the redirection succeeds, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP is performed according to the relevant mappings of the {FC, profile} in the egress context of the network QoS policy applied to the PW. This is true regardless of whether an instance of the queue-group exists or not on the egress port the PW packet is forwarded to. If the packet's profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet's DEI/dot1p and the tunnel's DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the PW is redirected does not exist, the redirection command is failed. In this case, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/ dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface the PW packet is forwarded to.

The **no** version of this command removes the redirection of the PW to the queue-group.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name** *network-policy-name* variant can be used in all configuration modes.

Values 1 to 65535

queue-group-name

Specifies the name of the queue group template up to 32 characters in length.

instance-id

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

name network-policy-name

Specifies the network policy name. The value uniquely identifies the policy on the system, up to 64 characters.

Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers, which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC that needs to be redirected and optionally, for each traffic type (unicast or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface to which the pseudowire packets can be received. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-SDP inside a service, or to the ingress context of a pseudowire template, and specify the redirect queue-group name.
5. One or more spoke-SDPs can have their FCs redirected to use policers in the same policer queue-group instance.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as *policer-output-queues*.

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

- If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
- If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:
  - the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.
  - a queue-group policer followed by the per-FP ingress shared queues referred to as *policer-output-queues* if the ingress context of the network IP interface from which the packet is received is redirected to a queue-group. The only exceptions to this behavior are for packets received from a IES/VPRN spoke interface and from an R-VPLS spoke-SDP, which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP is used.

When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless of whether an instance of the named policer queue-group exists on the ingress FP on which the pseudowire packet is received. The user can apply a QoS filter matching the dot1-p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload IP header if the user enabled the **ler-use-dscp** option and the pseudowire terminates in IES or VPRN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface on which the pseudowire packet is received.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC which needs to be redirected and optionally for each traffic type (unicast or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface which the pseudowire packets can be received on. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-sdp inside a service or to the ingress context of a pseudowire template and specify the redirect queue-group name.

One or more spoke-sdps can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-sdp to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-sdp to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:
   - When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as "policer-output-queues”.
   - When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
4. If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

5. If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:
   - the ingress network shared queue for the packet's FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.
   - a queue-group policer followed by the per-FP ingress shared queues referred to as "policer-output-queues" Good received is redirected to a queue-group. The only exceptions to this behavior are for packets received from a IES/VPRN spoke interface and from a R-VPLS spoke-sdp which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet's FC defined in the network-queue policy applied to the ingress of the FP is used. When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless if an instance of the named policer queue-group exists on the ingress FP the pseudowire packet is received on. The user can apply a QoS filter matching the dot1p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload's IP header if the user enabled the ler-use-dscp option and the pseudowire terminates in IES or VPRN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface the pseudowire packet is received on.

The no version of this command removes the redirection of the pseudowire to the queue-group.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name** *network-policy-name* variant can be used in all configuration modes.

Values 1 to 65535

queue-group-name

Specifies the name of the queue group template up to 32 characters in length.

instance-id

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

name network-policy-name

Specifies the network policy name. The value uniquely identifies the policy on the system, up to 64 characters.

Full Context

configure service vpls vxlan network ingress qos

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is used to redirect traffic arriving on VXLAN tunnels in an EVPN VXLAN service as a single entity (per forwarding class) to policers in an ingress forwarding plane queue group for the purpose of rate-limiting.

For the policer to be used, the following must be true:

- The configured queue group template name must be applied to the forwarding plane on which the ingress traffic arrives using the instance id specified.
- The policer referenced in the FC-to-policer mappings in the ingress context of a network QoS policy must be present in the specified queue group template.

The command will fail if the queue group template name does not exist or if the policer specified in the network QoS policy does not exist in the queue group template. If the queue group template name with the specified instance is not applied to the forwarding plane on which the VXLAN traffic arrives, then this traffic will use the ingress network queues related to the network interface; however, the ingress classification is still based on the applied network QoS policy.

The unicast traffic can be redirected to a policer under the forwarding class **fp-redirect-group** command in the ingress section of a network QoS policy. Similarly, broadcast, unknown and multicast traffic can be redirected to a **broadcast-policer**, **unknown-policer** or **mcast-policer**, respectively, also under the forwarding class **fp-redirect-group** command in the ingress section of a network QoS policy.

Ingress classification is based on the configuration of the ingress section of the specified network QoS policy, noting that the dot1p and DSCP classification is based on the outer Ethernet header and IP header, and the use of **ler-use-dscp**, **ip-criteria** and **ipv6-criteria** statements are ignored.

When this command is applied, it overrides the QoS applied to the related network interfaces for traffic arriving on VXLAN tunnels in that service but does not affect traffic received on a spoke-SDP in the same service.

The **no** version of this command removes the redirection of VXLAN tunnel traffic from the queue group policers.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

Values 1 to 65535

queue-group-name

Specifies the name of the queue group template up to 32 characters in length

instance-id

Specifies the identification of a specific instance of the queue-group

Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP) for the Epipe SAP template.

Parameters

policy-id

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name** *sap-ingress-policy-name* variant can be used in all configuration modes.

Values 1 to 65535

shared-queuing

This keyword can only be specified on SAP ingress. Specify the ingress shared queue policy used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

multipoint-shared

This keyword can only be specified on SAP ingress. Multipoint shared queuing is a superset of shared queuing. When multipoint shared queuing keyword is set, as well as the unicast packets, multipoint packets also used shared queues.

Ingress unicast service queues are mapped one-for-one with hardware queues and unicast packets traverse the ingress forwarding plane twice, similar to the shared-queuing option. In addition, the multipoint queues defined in the ingress SAP QoS policy are not created. Instead, multipoint packets (broadcast, multicast and unknown unicast destined) are treated to the same dual pass ingress forwarding plane processing as unicast packets.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

Values Multipoint or not present

Default Present (the queue is created as non-multipoint)

sap-ingress-policy-name

The SAP ingress QoS policy name to associate with the SAP on ingress, up to 64 characters.

Full Context

configure service vpls sap ingress qos

Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the policy-id does not exist, an error will be returned.

The qos command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

When an ingress QoS policy is defined on IES ingress IP interface that is bound to a VPLS, the policy becomes associated with every SAP on the VPLS and augments the QoS policy that is defined on each SAP. Packets that are bridged will be processed using the policy defined on the VPLS SAP; packets that are routed will be processed using the policy defined in the IES IP interface-binding context.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, the default QoS policy is used.

The no form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

Parameters

policy-id

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

Values 1 to 65535

shared-queuing

This keyword can only be specified on SAP ingress. Specify the ingress shared queue policy used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

multipoint-shared

This keyword can only be specified on SAP ingress. Multipoint shared queuing is a superset of shared queuing. When multipoint shared queuing keyword is set, as well as the unicast packets, multipoint packets also used shared queues.

Ingress unicast service queues are mapped one-for-one with hardware queues and unicast packets traverse the ingress forwarding plane twice, similar to the shared-queuing option. In addition, the multipoint queues defined in the ingress SAP QoS policy are not created. Instead, multipoint packets (broadcast, multicast and unknown unicast destined) are treated to the same dual pass ingress forwarding plane processing as unicast packets.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

Values Multipoint or not present

Default Present (the queue is created as non-multipoint)

fp-redirect-group

Creates an instance of a named queue group template on the ingress forwarding plane of a specified IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command. The named queue group template can contain only policers. If it contains queues, then the command will fail.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

queue-group-name

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid ingress queue group template name, configured under the **configure qos queue-group-templates** context.

instance-id

Specifies the instance of the named queue group to be created on the IOM/IMM/XMA ingress forwarding plane.

configure service vprn network-interface qos

Description

This command associates a network Quality of Service (QoS) policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.

Associating a network QoS policy with a network interface is useful for the following purposes:

- To apply classification rules for determining the forwarding-class and profile of ingress packets on the interface.
- To associate ingress packets on the interface with a queue-group instance applied to the ingress context of the interface's forwarding plane (FP). (This is only applicable to interfaces on IOM4 and later cards.) The referenced ingress queue-group instance may have policers defined in order to rate limit ingress traffic on a per-forwarding class (and forwarding type: unicast vs. multicast) basis.
- To perform 802.1p, DSCP, IP precedence and/or MPLS EXP re-marking of egress packets on the interface.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- To associate egress packets on the interface with a queue-group instance applied to the egress context of the interface's port. The referenced egress queue-group instance may have policers and/or queues defined in order to rate limit egress traffic on a per-forwarding class basis.

The **no** form of this command removes the network QoS policy association from the network IP interface, and the QoS policy reverts to the default.

Default

no qos

Parameters

network-policy-id

An existing network policy ID to associate with the IP interface.

Values 1 to 65535

port-redirect-group *queue-group-name*

This optional parameter specifies the egress queue-group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an egress queue group applied to the egress context of the port associated with the IP interface.

egress-instance *instance-id*

Since multiple instances of the same egress queue-group can be applied to the same port this optional parameter is used to specify which particular instance to associate with this particular network IP interface.

Values 1 to 16384

fp- redirect-group *queue-group-name*

This optional parameter specifies the ingress queue-group used for all ingress forwarding-class redirections specified within the network QoS policy ID. The specified queue-group-name must exist as an ingress queue group applied to the ingress context of the forwarding plane associated with the IP interface.

ingress-instance *instance-id*

Since multiple instances of the same ingress queue-group can be applied to the same forwarding plane this parameter is required to specify which particular instance to associate with this particular network IP interface.

Values 1 to 16384

no qos

Context

[Tree] (config>service>vprn>network>ingress qos)

Full Context

configure service vprn network ingress qos

Description

This command is used to redirect unicast packets arriving on an automatically (using the **auto-bind-tunnel** command) or manually configured (using a **spoke-sdp** command, but not the **spoke-sdp** command under the VPRN IP interface) binding in a VPRN to a policer in an ingress forwarding plane queue-group for the purpose of rate-limiting.

For the policer to be used, the following must be true:

1. The configured queue group template name must be applied to the forwarding plane on which the ingress traffic arrives using the instance id specified.
2. The policer referenced in the FC-to-policer mappings in the ingress context of a network QoS policy must be present in the specified queue group template.

The command fails if the queue group template name does not exist or if the policer specified in the network QoS policy does not exist in the queue group template. If the queue group template name with the specified instance is not applied to the forwarding plane on which the VPRN binding unicast traffic arrives then this traffic uses the ingress network queues related to the network interface, however, the ingress classification is still based on the applied network QoS policy.

The unicast traffic can be redirected to a policer under the forwarding class **fp-redirect-group** command in the ingress section of a network QoS policy; any **fp-redirect-group multicast-policer, broadcast-policer** or **unknown-policer** commands are ignored for this traffic. Multicast traffic would use the ingress network queues or queue group related to the network interface.

Ingress classification is based on the configuration of the ingress section of the specified network QoS policy, noting that the dot1p and exp classification is based on the outer Ethernet header and MPLS label whereas the DSCP applies to the outer IP header if the tunnel encapsulation is GRE, or the DSCP in the first IP header in the payload if **ler-use-dscp** is enabled in the ingress section of the referenced network QoS policy.

When this command is applied, it overrides the QoS applied to the related network interfaces for unicast traffic arriving on bindings in that VPRN.

The **no** version of this command removes the redirection of VPRN binding traffic to the queue-group policers.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

Values 1 to 65535

fp-redirect-group *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length.

configure service ies video-interface video-sap egress qos

configure service vprn video-interface video-sap ingress qos

configure service vprn video-interface video-sap egress qos

Description

This command associates an existing egress or ingress QoS policy to a video interface. If the policy-id does not exist, an error will be returned. Attempts to associate a QoS policy of the wrong type returns an error. Only one QoS policy can be associated with a video interface at one time in the ingress and egress contexts. Attempts to associate a second QoS policy of a given type will return an error.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of the command removes the QoS policy association from the video interface, and the QoS policy reverts to the default.

Context

[Tree] (config>router>if qos)

Full Context

configure router interface qos

Description

This command associates a network Quality of Service (QoS) policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.

Associating a network QoS policy with a network interface is useful for the following purposes:

- To apply classification rules for determining the forwarding-class and profile of ingress packets on the interface.
- To associate ingress packets on the interface with a queue-group instance applied to the ingress context of the interface's forwarding plane (FP). The referenced ingress queue-group instance may have policers defined in order to rate limit ingress traffic on a per-forwarding class (and forwarding type: unicast vs. multicast) basis.
- To perform 802.1p, DSCP, IP precedence and/or MPLS EXP re-marking of egress packets on the interface.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- To associate egress packets on the interface with a queue-group instance applied to the egress context of the interface's port. The referenced egress queue-group instance may have policers and/or queues defined in order to rate limit egress traffic on a per-forwarding class basis.

The **no** form of this command removes the network QoS policy association from the network IP interface, and the QoS policy reverts to the default.

Default

no qos

Parameters

network-policy-id

Specifies an existing network policy ID to associate with the IP interface.

Values 1 to 65535

egress-port-redirect-group *queue-group-name*

This optional parameter specifies the egress queue-group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an egress queue group applied to the egress context of the port associated with the IP interface.

egress-instance *instance-id*

Since multiple instances of the same egress queue-group can be applied to the same port this optional parameter is used to specify which instance to associate with this specific network IP interface.

Values 1 to 16384

ingress-fp- redirect-group *queue-group-name*

This optional parameter specifies the ingress queue-group used for all ingress forwarding-class redirections specified within the network QoS policy ID. The specified queue-group-name must exist as an ingress queue group applied to the ingress context of the forwarding plane associated with the IP interface.

ingress-instance *instance-id*

Since multiple instances of the same ingress queue-group can be applied to the same forwarding plane this parameter is required to specify which instance to associate with this specific network IP interface.

no qos-policy-id-range

Context

[Tree] (config>qos>md-auto-id qos-policy-id-range)

Full Context

configure qos md-auto-id qos-policy-id-range

Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to QoS policies that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A QoS policy created with an explicitly-specified ID cannot use an ID in this range. In classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed which will cause any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>eth-cfm md-auto-id** command for further details.

Default

no qos-policy-id-range

© 2025 Nokia.

configure service ies subscriber-interface group-interface qos-route-lookup

configure service vprn subscriber-interface group-interface qos-route-lookup

configure service ies subscriber-interface group-interface ipv6 qos-route-lookup

Description

This command enables QoS classification of the ingress IP packets on an interface based on the QoS information associated with routes in the forwarding table.

If the optional **destination** parameter is specified and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the destination address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network QoS policy.

If the optional **source** parameter is specified and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the source address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network QoS policy.

If neither the optional **source** or **destination** parameter is present, then the default is **destination** address matching.

The functionality enabled by the qos-route-lookup command can be applied to IPv4 packets or IPv6 packets on an interface, depending on whether it is present at the interface context (applies to IPv4) or the interface>ipv6 context (applies to IPv6). The ability to specify source address based QoS lookup is not supported for IPv6. For the 7740 ESS, subscriber management group interfaces also do not support the source QPPB option.

The **no** form of this command reverts to the default.

Default

destination

Parameters

source

Enables QoS classification of incoming IP packets based on the source address matching a route with QoS information.

destination

Enables QoS classification of incoming IP packets based on the destination address matching a route with QoS information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

configure service ies interface qos-route-lookup

configure router interface ipv6 qos-route-lookup

configure service ies interface ipv6 qos-route-lookup

Description

This command specifies the IP address type used for QPPB-enabled per-packet QoS handling (in terms of FC and priority). When using QPPB, routes are associated with a QoS treatment (FC and optionally priority) through either explicit configuration or the route policy. If an IPv4 or IPv6 packet arrives on an interface where the configuration of this command applies to the packet, the QoS treatment of the packet is based on the route that matched the destination IP address or the route that matched the source IP address.

See "Enabling QPPB on an interface" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about QPPB.

The **no** form of this command configures the router to use the default destination address matching mode.

Default

no qos-route-lookup

Parameters

source

Keyword to enable QoS classification of incoming IP packets based on the source address. If the route matching the source address does not have QPPB information, the QoS classification of the packet remains as determined by the SAP ingress or network QoS policy.

destination

Keyword to enable QoS classification of incoming IP packets based on the destination address. If the route matching the destination address does not have QPPB information, the QoS classification of the packet remains as determined by the SAP ingress or network QoS policy.

source-and-dest

Keyword to enable QoS classification of incoming IP packets based on the destination address. If the route matching the destination address does not have QPPB information, QoS classification of incoming IP packets is based on the lookup of the source IP address. If neither the destination nor the source lookups find a route with QPPB information, the QoS classification of the packet remains as determined by the SAP ingress or network QoS policy.

Full Context

configure service vprn mld interface query-interval

configure service vprn mld query-interval

Description

This command specifies the frequency that the querier router transmits general host-query messages. The host-query messages solicit group membership information and are sent to the all-systems multicast group address, 224.0.0.1.

Default

query-interval 125

Parameters

seconds

The time frequency, in seconds, that the router transmits general host-query messages.

Values 2 to 1024

Platforms

All

All

query-interval

Syntax

query-interval *seconds*

no query-interval

Context

[Tree] (config>service>pw-template>igmp-snooping query-interval)

Full Context

configure service pw-template igmp-snooping query-interval

Description

This command configures the IGMP query interval. If the **send-queries** command is enabled, this parameter specifies the interval between two consecutive general queries sent by the system on this SAP or SDP.

The configured query-interval must be greater than the configured query-response-interval.

If send-queries is not enabled on this SAP or SDP, the configured query-interval value is ignored.

Default

query-interval 125

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

seconds

Specifies the time interval, in seconds, that the router transmits general host-query messages.

Values 2 to 1024

Platforms

All

37.15 query-last-listener-interval

query-last-listener-interval

Syntax

query-last-listener-interval *seconds*

no query-last-listener-interval

[Tree] (config>service>vprn>mld>group-interface query-last-listener-interval)

[Tree] (config>router>mld>group-interface query-last-listener-interval)

Full Context

configure router mld interface query-last-listener-interval

configure service vprn mld group-interface query-last-listener-interval

configure router mld group-interface query-last-listener-interval

Description

This command configures the frequency at which the querier router sends a group-specific query messages, including the messages sent in response to leave-group messages and is only applicable when the group interface is configured with the **no sub-hosts-only** command. The shorter the interval, the faster the loss of the last listener of a group can be detected. If nothing is configured, by default, the **query-last-listener-interval** takes the value defined in the **config>router>mld** context or in the **config>service>vprn>mld** context.

The **no** form of this command reverts to the default value.

Default

query-last-listener-interval 1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

seconds

Specifies the frequency, in seconds, at which query messages are sent.

Values 1 to 1023

Platforms

All

- configure router mld interface query-last-listener-interval

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure router mld group-interface query-last-listener-interval
- configure service vprn mld group-interface query-last-listener-interval

query-last-listener-interval

Syntax

query-last-listener-interval *seconds*

no query-last-listener-interval

Context

[Tree] (config>subscr-mgmt>mld-policy query-last-listener-interval)

Full Context

configure subscriber-mgmt mld-policy query-last-listener-interval

Description

This command configures the frequency at which the querier router sends a group-specific query messages, including the messages sent in response to leave-group messages. The shorter the interval, the faster the loss of the last member of a group can be detected. If nothing is configured, by default, the **query-last-listener-interval** takes the value defined in the **config>router>mld** context or in the **config>service>vprn>mld** context. It is highly recommended that all three query intervals be configured together on each MLD policy.

The **no** form of this command reverts to the default.

Parameters

seconds

Specifies the frequency, in seconds, at which query messages are sent.

Values 1 to 1023

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

no query-last-listener-interval

Context

[Tree] (config>service>vprn>mld query-last-listener-interval)

[Tree] (config>service>vprn>mld>if query-last-listener-interval)

Full Context

configure service vprn mld query-last-listener-interval

configure service vprn mld interface query-last-listener-interval

Description

This command specifies the Max Response Time inserted into Group-Specific Queries sent in response to Leave Group messages, and is also the amount of time between Group-Specific Query messages. This value may be tuned to modify the leave latency of the network. A reduced value results in reduced time to detect the loss of the last member of a group.

The **no** form of this command reverts to the default value.

Default

query-last-listener-interval 1

Parameters

seconds

Specifies the frequency, in seconds, at which Group-Specific-Query packets are transmitted.

Values 1 to 1023

Platforms

All

37.19 queue

queue

Syntax

queue *queue-id* {**ingress-only** | **egress-only** | **ingress-egress**}

no queue *queue-id*

Context

[Tree] (config>subscr-mgmt>cat-map>category queue)

Full Context

configure subscriber-mgmt category-map category queue

Description

This command configures a queue in this category.

The **no** form of this command reverts to the default.

Parameters

queue-id

Specifies the queue ID for this instances. Each queue nominated in the category map is monitored for activity (over a period of approximately 60 seconds), should the activity fall below the threshold value then a time is started. Whenever this timer exceeds the configured timeout under the idle-timeout the action (currently disconnect) is executed for that subscriber and all hosts under that given SLA-profile-instance.

Values 1 to 32

ingress-only

Specifies that ingress queues are defined in this category.

egress-only

Specifies that egress queues are defined in this category.

ingress-egress

Specifies that ingress and egress queues are defined in this category.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

queue

Syntax

queue *queue-id* [**create**]

no queue *queue-id*

Context

[Tree] (config>subscr-mgmt>acct-plcy>cr queue)

Full Context

configure subscriber-mgmt radius-accounting-policy custom-record queue

Description

This command specifies the queue-id for which counters are collected in this custom record. The counters that are collected are defined in egress and ingress counters.

The **no** form of this command reverts to the default value.

Parameters

queue-id

Specifies the queue-id for which counters are collected in this custom record.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

queue

Syntax

[**no**] **queue** *queue-id*

Context

[Tree] (config>subscr-mgmt>sla-prof>ingress>qos queue)

[Tree] (config>subscr-mgmt>sla-prof>egress>qos queue)

Full Context

configure subscriber-mgmt sla-profile ingress qos queue

configure subscriber-mgmt sla-profile egress qos queue

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

Commands in this context configure egress or ingress queue parameters. Parameters defined in the **config>qos>sap-egress** *policy-id* or the **config>qos>sap-ingress** *policy-id* context are overridden by parameters specified in the subscriber management SLA profile context.

The classification and the queue mapping are shared by all the hosts on the same complex that use the same QoS policy (specified in the **sla-profile** SAP egress and SAP ingress policy IDs).

The queues are shared by all the hosts (of the same subscriber) on the same SAP that are using the same SLA profile. Queues are instantiated when, on a given SAP, a host of a subscriber is the first to use a certain SLA profile. This instantiation is referred to as an SLA profile instance.

The **no** form of this command removes the *queue-id* from the SLA profile.

Parameters

queue-id

Specifies the queue ID for the SAP egress or ingress queue, expressed as a decimal integer. The ID uniquely identifies the queue within the profile.

Values 1 to 0

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

queue

Syntax

queue *queue-id* [**create**]

Full Context

configure port ethernet network egress queue-group queue-overrides queue

configure port ethernet access egress queue-group queue-overrides queue

Description

This command associates a queue for use in a queue group template. The defined queue-id acts as a repository for the default parameters for the queue. The template queue is created on each queue-group object which is created with the queue group template name. Each queue is identified within the template by a queue-id number. The template ensures that all queue groups created with the template's name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP egress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

The **no** form of this command removes the queue-id from the configuration.

configure qos sap-ingress fc queue

Description

This command overrides the default queue mapping for **fc** fc-name. The specified queue-id must exist within the policy before the mapping can be made. When the forwarding class mapping is executed, all traffic classified to fc-name on a SAP using this policy.

The **no** form of this command sets the queue-id back to the default queue for the forwarding class.

Default

queue 1

Parameters

queue-id

Specifies the SAP egress queue-id to be associated with the forwarding class. The queue-id must be an existing queue defined in sap-egress policy-id.

Values 1 — 8

Default 1

group *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified *queue-id* within the *queue-group-name*. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The queue-group-name are configured in the **config>qos>queue-group-templates** egress and ingress contexts. This parameter is used when policy-based queue group redirection is desired. That is, the specific queue group to redirect to is named in the QoS policy.

Context

[Tree] (config>qos>sap-ingress queue)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure qos sap-ingress queue

Description

This command creates the context to configure an ingress SAP QoS policy queue.

Explicit definition of an ingress queue's type is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When an ingress SAP QoS policy with multipoint queues is applied to an Epipe SAP, the multipoint queues are not created. When an ingress SAP QoS policy with multipoint queues is applied to an IES SAP, a multipoint queue will be created when PIM is enabled on the IES interface.

Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the SAP ingress QoS policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

Parameters

queue-id

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

Values 1 to 32

queue-type

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

perspective. A keyword can be specified at the time the queue is created. If an attempt to change the keyword after the queue is initially defined, an error is generated.

Values expedite, best-effort, auto-expedite

expedite — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

auto-expedite — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

Default auto-expedite

multipoint

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. If forwarding class unicast traffic is mapped to a multipoint queue, an error is generated and no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

Default non-multipoint (unicast queue)

queue-mode

Specifies the mode in which the queue is operating. This attribute is associated with the queue at the time of creation and cannot be modified thereafter.

Values **profile-mode**: When the queue is operating in the profile mode (or the color aware mode), the queue tries to provide the appropriate bandwidth to the packets with different profiles. The profiles are assigned according to the configuration of the forwarding class or the sub-forwarding class.

priority-mode: The queue is capable of handling traffic differently with two distinct priorities. These priorities are assigned by the stages preceding the queueing framework in the system. In priority mode, the queue does not have the functionality to support the profiled traffic and in such cases the queue will have a degraded performance.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

However, the converse is not valid and a queue in-profile mode should be capable of supporting the different priorities of traffic.

Default priority-mode

create

Keyword creates an ingress SAP QoS policy queue.

Platforms

All

queue

Syntax

queue *queue-id* [{**group** *queue-group-name* [**instance** *instance-id*] | **port-redirect-group-queue**}]

no queue

Context

[Tree] (config>qos>sap-egress>fc queue)

Full Context

configure qos sap-egress fc queue

Description

This command overrides the default queue mapping for **fc** fc-name. The specified queue ID must exist within the policy before the mapping can be made. When the forwarding class mapping is executed, all traffic is classified to fc-name on a SAP using this policy.

The **no** form of this command sets the queue-id back to the default queue for the forwarding class (queue 1).

Default

no queue

Parameters

queue-id

Specifies the SAP egress queue-id to be associated with the forwarding class. The queue-id must be an existing queue defined in sap-egress policy-id.

Values 1 to 8

Default 1

queue-group-name

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified *queue-id* within the *queue-group-name*. When the policy is applied,

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The queue-group-name are configured in the **config>qos>queue-group-templates** egress and ingress contexts. This parameter is used when policy-based queue group redirection is desired. That is, the specific queue group to redirect to is named in the QoS policy.

instance-id

This parameter is used to specify the specific instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

Values 1 to 40960

Default 1

port-redirect-group-queue

This keyword is used to mark a given forwarding class queue for redirection to an egress queue group queue. This is only used when the specific queue group instance is assigned at the time the QoS policy is applied to the SAP. This redirection model is known as SAP-based redirection.

Platforms

All

queue

Syntax

queue *queue-id* [*queue-type*] [**create**]

no queue *queue-id*

Context

[Tree] (config>qos>sap-egress queue)

Full Context

configure qos sap-egress queue

Description

This command creates the context to configure an egress service access point (SAP) QoS policy queue.

Explicit definition of an egress queue's type is supported. A single egress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **no** form of this command removes the *queue-id* from the SAP egress QoS policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

Parameters

queue-id

The ID for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

Values 1 to 32

queue-type

Specifies the method that system uses to service the queue from a hardware perspective. A keyword can be specified at the time the queue is created. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

Values **expedite** - Specifies that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort - Specifies that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

auto-expedite - Allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1, or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

Default auto-expedite

create

Creates an entry for the queue.

Platforms

All

queue

no queue *queue-id*

Context

[Tree] (config>qos>hs-attachment-policy queue)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure qos hs-attachment-policy queue

Description

This command defines how the specified queue-id is attached to the scheduler. A queue may have one of four attachment states:

- directly attached to a scheduler class
- attached to a WRR group which is attached to a scheduler class
- attached to a WRR group which is unattached
- unattached

The following items are rules for attachment:

- Only one queue or WRR group can be attached to a given scheduling class. If another queue or a WRR group is currently attached to the specified scheduling class, the queue's attachment command fails and the current attachment for the *queue-id* is unchanged.
- Queues must be attached to scheduler classes (directly or indirectly through a WRR group) in an ascending order.

  For example, if queue 3 is attached to scheduler class 2, queues 1 and 2 cannot be attached to scheduling classes 3 through 6 (or attached to a WRR group that is attached to scheduling classes 3 through 6).
- Up to six queues can be placed in any WRR group. These queues can all be in one WRR group or be spread between both WRR groups. Attempting to execute the **wrr-group** keyword on a seventh queue within the attachment policy fails.
- Queues must attach to WRR groups in contiguous order.
- WRR group 1 must have lower queue ID members than WRR group 2. Attempting to attach a queue ID to group 1 that is higher than any queue ID currently attached to group 2 fails with no change to the current attachment state for that queue ID. Attempting to attach a queue ID to group 2 that is lower than any queue ID currently attached to group 1 fails with no change to the current attachment state for that queue ID.
- WRR group 1 must have at least one attached member queue before queues can be attached to WRR group 2.
- Queues and WRR groups can be unattached at any time.
  - Unattached queues, or queues attached to an unattached WRR group, discard all received packets. Normal discard accounting is maintained.
  - The unattached state for an in-service queue or WRR group is intended for **hs-attachment-policy** editing purposes and is expected to be an intermediate state in this case.

When an **hs-attachment-policy** is initially created, all queues and both WRR groups default to the unattached state. Each queue and WRR group attachment state must be explicitly configured.

The **no** form of the command reverts to the default unattached attachment state for queue ID. The command fails if the specified *queue-id* is currently in a WRR group and removing the queue from that group causes the queue IDs for that group to become discontinuous.

Default

queue *queue-id* unattached

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

queue-id

Specifies the queue identifier for the HS attachment policy queue. This parameter is required when executing the command.

Values 1 to 8

sched-class

Specifies a direct attachment between the *queue-id* and one of the six scheduling classes. A value of 1 through 6 must accompany the **sched-class** keyword representing the queue's attached scheduling class. The **sched-class**, **group**, and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **queue** attachment command is executed.

class-id

Specifies the scheduling class that is associated with this *queue-id*.

Values 1 to 6

wrr-group

Specifies the inclusion of the *queue-id* in either WRR group 1 or WRR group 2. A value of 1 or 2 must accompany the **wrr-group** keyword representing the queue's attached WRR group number. Queues placed in a WRR group must have contiguous queue IDs. The **sched-class**, **group**, and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **queue** attachment command is executed.

wrr-group-id

Specifies the WRR group to which the queue-id is to be attached.

Values 1, 2

unattached

Indicates that the *queue-id* is not attached to any scheduling class or WRR group. An unattached queue does not forward any packets. The **sched-class**, **group**, and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **queue** attachment command is executed.

Context

[Tree] (config>qos>network-queue>fc queue)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure qos network-queue fc queue

Description

Commands in this context configure a QoS network-queue policy queue.

Explicit definition of an ingress queue's type status is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint traffic.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When a QoS policy with multipoint queues is applied to an Epipe or IES SAP, the multipoint queues are not created. Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the network-queue policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

Parameters

queue-id

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

Values 1 to 32

multipoint

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be used to forward multicast, broadcast, or unknown unicast ingress traffic.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated, and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

Default Non-multipoint (unicast queue)

queue-type

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the network-queue policy. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

Values expedite, best-effort, auto-expedite

expedite — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

auto-expedite — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

Context

[Tree] (config>qos>qgrps>ing>queue-group queue)

Full Context

configure qos queue-group-templates ingress queue-group queue

Description

This command creates a queue for use in a queue group template. When created, the defined queue-id acts as a repository for the default parameters for the queue. The template queue is created on each queue-group object that is created with the queue group template name. Each queue is identified within the template by a queue-id number. The template ensures that all queue groups created with the template name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP ingress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

When a queue within a template is mapped by a forwarding class on any object, the queue may be edited, but not deleted.

The **no** form of this command removes a template queue from the queue group template. If the queue is specified as a forwarding class redirection target in any SAP ingress QoS policy, the command will fail.

Parameters

queue-id

This required parameter identifies the queue that will either be created or edited within the queue group template.

Values 1 to 32

multipoint

This optional keyword creates an ingress multipoint queue. Multipoint queues in a queue group may be used by ingress VPLS for forwarding types multicast, broadcast or unknown within a forwarding class. For ingress IES and VPRN access SAPs, only multicast is supported. Multipoint queues are only supported on ingress queue group templates.

Default non-multipoint (unicast queue)

queue-type

The queue types are mutually exclusive.

Values **expedite —** This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

Default best-effort

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

queue-mode

These keywords are optional and mutually exclusive when creating a new template queue. The keywords specify how the queue manages ingress explicitly profiled packets.

Values **profile-mode** — Overrides the default priority mode of the queue and allows the adoption of color aware profiling within the queue. Forwarding classes and subclasses may be explicitly defined as in-profile or out-of-profile. Out-of-profile classified packets bypass the CIR rate associated with the queue, reserving it for the undefined or in-profile classified packets. If the template queue is not defined as profile-mode and the packet redirected to the queue is explicitly out-of-profile based on the classification rules, the queues within-CIR bandwidth may be consumed by the packet.

priority-mode — Defines that the SAP ingress QoS policy priority classification result will be honored by the queue. Priority mode is the default mode of the queue. High-priority packets are allowed into the queue up to the MBS defined for the queue. Low-priority packets are discarded at the low-priority MBS threshold that is derived from applying the low drop-tail percentage to the queue's MBS.

create

configure qos queue-group-templates egress queue-group fc queue

Description

This command is used to map the forwarding class to the specified *queue-id*. The specified *queue-id* must exist within the egress queue group template. When a queue is defined in a forwarding class mapping, that queue cannot be deleted unless the forwarding class mapping is moved to another queue within the template. Other criteria may also exist preventing the queue from being deleted from the template such as an applied SAP egress QoS policy mapping to the queue.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

queue-id

The specified *queue-id* must exist within the egress queue group template.

Values 1 to 8

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

queue

Syntax

queue *queue-id* [*queue-type*] [**create**]

no queue *queue-id*

Context

[Tree] (cfg>qos>qgrps>egr>queue-group queue)

Full Context

configure qos queue-group-templates egress queue-group queue

Description

This command creates a queue for use in a queue group template. When created, the defined *queue-id* acts as a repository for the default parameters for the queue. The template queue is created on each queue group object that is created with the queue group template name. Each queue is identified within the template by a queue ID. The template ensures that all queue groups created with the template name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP egress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

Parameters

queue-id

Specifies the queue ID. The specified *queue-id* must exist within the egress queue group template.

Values 1 to 8

queue-type

Specifies the method that the system uses to service the queue from a hardware perspective.

Values expedite, best-effort

expedite — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

Default best-effort

Platforms

All

queue

Syntax

queue *queue-id*

no queue

Context

[Tree] (config>qos>shared-queue>fc queue)

Full Context

configure qos shared-queue fc queue

Description

This command overrides the default unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a non-multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unicast traffic (this includes all traffic, even broadcast and multicast for services) on a SAP using this policy is forwarded using the *queue-id*.

The **no** form of this command sets the unicast (point-to-point) *queue-id* back to the default queue for the forwarding class (queue 1).

Parameters

queue-id

The *queue-id* parameter specified must be an existing non-multipoint queue defined in the **config>qos>sap-ingress** context. For the 7950 XRS, this is not configurable in the policer-output-queues profile.

Values Any valid non-multipoint *queue-id* in the policy including 1 and 3 through 32.

Default 1

queue

Syntax

queue *queue-id* [*queue-type*] [**multipoint**] [**create**]

no queue *queue-id*

Context

[Tree] (config>qos>shared-queue queue)

Full Context

configure qos shared-queue queue

Description

This command creates the context to configure a shared queue QoS policy queue.

Explicit definition of an ingress queue's type is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort by the hardware schedulers. The queue type can be overridden within the policy.

On the 7450 ESS, the expedited hardware schedulers are used to enforce expedited access to internal switch fabric destinations. The hardware status of the queue must be defined at the time of queue creation within the policy.

Parameters

queue-id

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

Values 1 to 32

queue-type

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the SAP ingress policy. If an attempt to change the keyword after the queue is initially defined, an error is generated.

expedite — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

auto-expedite — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When auto-expedite is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1, or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2) the queue automatically falls back to non-expedited status.

Default **auto-expedite**

multipoint

This keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. If forwarding class unicast traffic is mapped to a multipoint queue, an error is generated and no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

queue *queue-id* [**multipoint**] [*queue-type*] [**create**]

no queue *queue-id*

Context

[Tree] (config>qos>network-queue queue)

Full Context

configure qos network-queue queue

Description

This command enters the context to configure a QoS network-queue policy queue.

Explicit definition of an ingress queue's type status is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint traffic.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a QoS policy with multipoint queues is applied to an Epipe or IES SAP, the multipoint queues are not created. Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the network-queue policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

Parameters

queue-id

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

Values 1 to 32

multipoint

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be used to forward multicast, broadcast, or unknown unicast ingress traffic.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated, and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

Default Non-multipoint (unicast queue)

queue-type

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the network-queue policy. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

Values expedite, best-effort, auto-expedite

expedite — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

auto-expedite — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

Default auto-expedite

37.20 queue-delay

queue-delay

Syntax

queue-delay *delay*

no queue-delay

Context

[Tree] (config>qos>qgrps>egr>qgrp>queue queue-delay)

Full Context

configure qos queue-group-templates egress queue-group queue queue-delay

Description

This command configures the target queue delay for packets forwarded through the queue. It is used to determine the related queue parameters based on the administrative PIR of the queue. This command and the **mbs** command are mutually exclusive.

In order to change between the **mbs** and **queue-delay** parameters, the current parameter must be removed before adding the new parameter; that is, changing from **mbs** to **queue-delay** requires a **no mbs** before the **queue-delay** is configured and changing from **queue-delay** to **mbs** requires a **no queue-delay** before the **mbs** is configured.

If **queue-delay** is configured for an egress queue group queue, it is not possible to override the MBS for that queue.

The **no** form of this command disables the determination of the queue parameters based on the queue delay.

Default

no queue-delay

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a queue-group instance in the network ingress context of a forwarding plane.

Only a queue-group containing policers can be instantiated. If the queue-group template contains policers and queues, the queues are not instantiated. If the queue-group contains queues only, the instantiation in the data path is failed.

One or more instances of the same policer queue-group name and/or a different policer queue-group name can be created on the network ingress context of a forwarding plane.

The queue-group-name must be unique within all network ingress and access ingress queue groups in the system. The queue-group instance-id must be unique within the context of the forwarding plane.

The **no** form of this command deletes the queue-group instance from the network ingress context of the forwarding plane.

Parameters

queue-group-name

Specifies the name of the queue group template up to 32 characters.

instance-id

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

create

Keyword used to create the queue-group instance.

[Tree] (config>port>ethernet>access>ing queue-group)

[Tree] (config>port>ethernet>access>egr queue-group)

Full Context

configure port ethernet access ingress queue-group

configure port ethernet access egress queue-group

Description

This command creates an ingress or egress queue group on an Ethernet port. A queue group is a collection of queues identified by a group name. Queue groups created on access ports are used as an alternative queue destination for SAPs.

Within a SAP, a forwarding class may be redirected from the local SAP queue to a port queue group queue. The forwarding classes from multiple SAPs may be redirected to the same queue group which can be used to minimize the number of per-SAP queues.

Queue groups may be created on both access and network oriented ports. When the port is in access mode, the queue groups must be created within the port access node.

Within the access node, queue groups are also configured as ingress or egress. Access ingress queue groups can only be used by ingress SAP forwarding classes and only a single ingress queue group per port is supported. Multiple access egress queue groups may be created on a single port and are used by

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

egress SAP forwarding classes. The instance-id parameter identifies different instances of the same queue group template. Creating multiple queue groups with a different instance ID but the same queue group name results in separate queue groups being created on the port. The instance-id parameter is only valid for egress queue groups on access ports.

When the queue group is created in an ingress port context, the group-name must be an existing ingress queue group template. Similarly, queue groups created in an egress port context must have a group-name of an existing egress queue group template. Two ingress queue groups with the same name cannot be created on the same port. Two egress queue groups can only be created on the same port with the same queue group template name if they have different instance-id values.

The queues defined in the template are created on the queue group. The queue parameters within the template are used as the default queue parameters for each queue in the queue group. The default queue parameters for each queue may be overridden on the queue group with specific queue parameters.

Each queue group supports the application of a scheduler-policy for the purpose of managing the queues within the group into an aggregate SLA. The queues defined within the template may be configured with parent scheduler defining the mapping of a queue to one of the schedulers within the scheduler policy. Egress queue groups also support the **agg-rate** parameter and the queues in the egress template support the port-parent command. Each command is used for configuring egress port virtual scheduling behavior.

Each queue group allows the application of an accounting policy and the ability to enable and disable collecting statistics. The statistics are derived from the queue counters on each queue within the queue group. The accounting policy defines which queue counters are collected and to which accounting file they will be written.

A queue group does not have an administrative shutdown or no shutdown command. A queue group is considered to be always on once created.

When creating a queue group, the system will attempt to allocate queue resources based on the queues defined in the queue group template. If the appropriate queue resources do not currently exist, the queue group will not be created. Ingress port queue groups do not support the shared-queuing or multipoint-shared queuing behavior.

When the queue group is created on a LAG (Link Aggregation Group), it must be created on the primary port member. The primary port member is the port with the lowest port ID based on the slot, MDA position and port number on the MDA. A queue group created on the primary LAG port will be automatically created on all other port members. If a new port is being added to a LAG with an existing queue group, the queue group must first be created on the port prior to adding the port to the LAG. If the LAG queue group has queue overrides, the queue overrides must also be defined on the port queue group prior to adding the port to the LAG.

A port queue group cannot be removed from the port when a forwarding class is currently redirected to the group. All forwarding class redirections must first be removed prior to removing the queue group.

Parameters

queue-group-name

The group-name parameter is required when executing the port queue-group command. The specified group-name must exist as an ingress or egress queue group template depending on the ingress or egress context of the port queue group. Only a single queue group may be created on an ingress port. Multiple queue groups may be created on an egress port.

instance-id

Specifies the identification of a specific instance of the queue-group.

[Tree] (config>qos>copy queue-group-egress)

Full Context

configure qos copy queue-group-egress

Description

This command copies an existing **queue-group-egress** *queue-group-name* to another **queue-group-egress** *queue-group-name*. The **copy** command is a configuration level maintenance tool used to create new entries using an existing mapping policy name. If **overwrite** is not specified, an error occurs if the destination policy exists.

Parameters

src-name

Specifies the existing source **queue-group-egress** *queue-group-name*, up to 32 characters, from which the **copy** command attempts to copy.

dst-name

Specifies the destination **queue-group-ingress** *queue-group-name*, up to 32 characters, to which the copy command attempts to copy.

overwrite

Use this parameter when the **queue-group-egress** *dst-name* already exists. If it does, everything in the existing destination **queue-group-egress** *dst-name* is completely overwritten with the contents of the **queue-group-egress** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI Destination "qge2" exists - use {overwrite}.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make" manner and therefore should be handled with care.

37.24 queue-group-ingress

queue-group-ingress

Syntax

queue-group-ingress *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy queue-group-ingress)

Full Context

configure qos copy queue-group-ingress

Description

This command copies an existing **queue-group-ingress** to another **queue-group-ingress**. The **copy** command is a configuration level maintenance tool used to create new entries using an existing mapping policy name. If **overwrite** is not specified, an error occurs if the destination policy exists.

Parameters

src-name

Specifies the existing source **queue-group-ingress**, up to 32 characters, from which the **copy** command attempts to copy.

dst-name

Specifies the destination **queue-group-ingress**, up to 32 characters, to which the copy command attempts to copy.

overwrite

Use this parameter when the **queue-group-ingress** *dst-name* already exists. If it does, everything in the existing destination **queue-group-ingress** *dst-name* is completely overwritten with the contents of the **queue-group-ingress** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI Destination "qgitest2" exists - use {overwrite}.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make" manner and therefore should be handled with care.

37.25 queue-group-redirect-list

queue-group-redirect-list

Syntax

queue-group-redirect-list *redirect-list-name*

no queue-group-redirect-list

Context

[Tree] (config>service>ies>if>sap>ingress queue-group-redirect-list)

[Tree] (config>service>ies>if>sap>egress queue-group-redirect-list)

Full Context

configure service ies interface sap ingress queue-group-redirect-list

configure service ies interface sap egress queue-group-redirect-list

Description

This command applies a queue group redirect list to the ingress or egress of an interface SAP within an IES or VPRN service. The redirect list is used to redirect traffic to different instances of the default queue group. This command requires the prior configuration of a default queue group instance, this being the queue group instance specified with the QoS policy under the SAP ingress or egress.

The **no** version of this command removes the queue group redirect list from the SAP.

Parameters

redirect-list-name

Specifies the name of the queue group redirect list up to 32 characters in length.

Platforms

All

queue-group-redirect-list

Syntax

37.27 queue-instance-accounting

queue-instance-accounting

Syntax

queue-instance-accounting [**interim-update**]

no queue-instance-accounting

Context

[Tree] (config>subscr-mgmt>acct-plcy queue-instance-accounting)

Full Context

configure subscriber-mgmt radius-accounting-policy queue-instance-accounting

Description

This command enables per queue-instance-accounting. A stream of accounting messages (START/INTERIM-UPDATE/STOP) is generated per queuing instance. A queuing instance is equivalent to an sla-profile instance. Accounting session id is generated per queuing instance and this accounting session id cannot be included in RADIUS Access-Request message. Queue instance counters represent volume based aggregation for all hosts sharing the queuing instance.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

CoA and LI is supported based on the acct-session-id of the queuing instance.

The **no** form of this command reverts to the default.

Default

queue-instance-accounting interim-update

Parameters

interim-update

Specifies whether accounting messages are sent for the queue-instance. The queue-instance is the SLA profile instance.

Platforms

37.30 queue-parameters

queue-parameters

Syntax

queue-parameters

Context

[Tree] (config>mcast-mgmt>bw-plcy>t2-paths>secondary-path queue-parameters)

[Tree] (config>mcast-mgmt>bw-plcy>t2-paths>primary-path queue-parameters)

Full Context

configure mcast-management bandwidth-policy t2-paths secondary-path queue-parameters

configure mcast-management bandwidth-policy t2-paths primary-path queue-parameters

Description

Commands in this context configure queue parameters. This command defines the individual parameters for the queues through which multicast packets are forwarded into the switch fabric on each path.

The individual path queues may be viewed as shared queues. All multicast packets forwarded through the switch fabric associated with one of the paths traverses bypass the normal queuing behavior. Instead of being forwarded through the normal service or network multicast queue, a single queue associated with the multicast path is used. To retain billing and diagnostic information, the forwarding and discard statistics for the service or network queue the packet would have traversed without ingress multicast management is used to account for each packet's behavior.

Note:
Any ingress scheduling policy functions attempting to manage the service or network multicast queues is only able to read the statistics of the multicast queues and not able to manage the queues dynamic rate since the packets are flowing through different, non-managed queues. Since this is the case, multicast queues parented to a scheduling policy should be parented to the root scheduler at the highest priority without any rate limitation. Any ingress rate limiting for multicast traffic is performed by the multicast path bandwidth manger based on each records priority and a possible "black-hole" rate threshold.

All queues created for ingress multicast path management are automatically created by the system out of the system reserved queue space. Each queue is created as an expedited queue.

When forwarding through the queues, each packets forwarding class is ignored. However, the forwarding class is retained for proper egress processing. The packets expressed or implied profile is also ignored within the ingress path queues. A packets congestion priority is derived from the records cong-priority-threshold evaluation result as indicated by the policy or multicast-info-policy. The **cong-priority-threshold** sets the high or low congestion priority of a record based on the records preference value. Within each multicast information policy bundle the **cong-priority-threshold** *preference-level* is set with a value from 0 to 7 and defines the threshold at which all records with a preference equal to or higher than the defined preference is treated as congestion priority high. Multicast records with a preference lower than the defined

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

class threshold is treated as congestion priority low. Low-priority packets use the low drop-tail threshold of the queue, while high-priority packets use the standard MBS value. In the event of path congestion, low-priority packets are discarded first, leaving room for the higher priority packets.

For the primary and secondary paths, a single queue exists for each path and every packet forwarded through the path by the bandwidth manager uses that queue.

queues

Syntax

queues all

no queues

Context

[Tree] (config>subscr-mgmt>sla-prof>aggregate-qos-stats>egress queues)

Full Context

configure subscriber-mgmt sla-profile aggregate-qos-stats egress queues

Description

This command configures which types of queues are used to calculate the total egress aggregate statistics. This can include all static queues that are configured in a QoS SAP-egress policy and all dynamic queues that are created on demand, according to the session needs.

The **no** form of this command removes all the queues from the statistics calculation.

Default

queues all

Parameters

all

Keyword that specifies to select all static and dynamic queues for the aggregate QoS egress statistics calculation.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

37.34 queues-hqos-manageable

queues-hqos-manageable

Syntax

[**no**] **queues-hqos-manageable**

Context

[Tree] (config>qos>qgrps>egr>qgrp queues-hqos-manageable)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure qos queue-group-templates egress queue-group queues-hqos-manageable

Description

This command specifies that the queues within this egress queue group template are to be managed by the Hierarchical QoS (HQoS) process when the template is applied to an Ethernet access egress or network egress context. It is applicable to all egress queue group templates, including the default **policer-output-queues** template.

The **no queues-hqos-manageable** command must be configured for access egress queue groups that are used for post-policer traffic in order to prevent HQoS from measuring the traffic through a policer managed by HQoS then again through a post-policer access egress queue group queue.

Avoid scenarios that result in traffic being either not being measured or being measured twice by HQoS as they will cause the HQoS result to be inaccurate.

A template configured for **no queues-hqos-manageable** cannot be applied to an Ethernet network egress context. Any egress queue group templates applied to an Ethernet network egress context cannot be configured as **no queues-hqos-manageable**. The configuration of **no queues-hqos-manageable** and the configuration of policers and queue **packet-byte-offset** within the egress queue group template are mutually exclusive.

When a queue group template with **no queues-hqos-manageable** is configured under a port's Ethernet access egress context, the configuration of an aggregate rate or scheduler policy is not permitted under that context, nor are parent overrides for any of the queues in the queue group. If a port scheduler is configured on the port, the queue group queues are not parented to the port scheduler.

The **no** form of this command specifies that queues within this egress queue group are not managed by HQoS.

Default

queues-hqos-manageable

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, VSR

configure subscriber-mgmt radius-accounting-policy

Description

This command specifies a subscriber RADIUS based accounting policy.

The **no** form of this command removes the policy name from the configuration.

Parameters

name

The name of the policy. The string is case-sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

create

Keyword used to create a RADIUS accounting policy instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy

Syntax

radius-accounting-policy *nat-accounting-policy*

no radius-accounting-policy

Context

[Tree] (config>isa>wlan-gw-group>nat radius-accounting-policy)

Full Context

configure isa wlan-gw-group nat radius-accounting-policy

Description

This command configures the RADIUS accounting policy to use for each MDA in this ISA group.

The **no** form of this command removes the accounting policy from the configuration.

Parameters

nat-accounting-policy

Specifies the RADIUS accounting policy up to 32 characters.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy

Syntax

radius-accounting-policy *rad-acct-plcy-name*

no radius-accounting-policy

Context

[Tree] (config>app-assure>group>statistics>aa-sub radius-accounting-policy)

Full Context

configure application-assurance group statistics aa-sub radius-accounting-policy

Description

This command specifies an existing subscriber RADIUS based accounting policy to use for AA. RADIUS Accounting policies are configured in the **config>app-assure>radius-accounting-policy** context.

Default

no radius-accounting-policy

Parameters

rad-acct-plcy-name

Specifies the name of the policy. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Description

This command specifies an existing subscriber RADIUS-based accounting policy to use for AA. RADIUS accounting policies are configured in the **config>app-assure>radius-accounting-policy** context.

Default

no radius-accounting-policy

Parameters

rad-acct-plcy-name

Specifies the policy name. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

create

Keyword used to create the policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy

Syntax

radius-accounting-policy *name* [**create**]

no radius-accounting-policy *name*

Context

[Tree] (config>ipsec radius-accounting-policy)

Full Context

configure ipsec radius-accounting-policy

Description

This command specifies an existing RADIUS accounting policy to use to collect accounting statistics on this subscriber profile by RADIUS. This command is used independently of the **collect-stats** command.

Parameters

name

Specifies an existing RADIUS based accounting policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy

Syntax

radius-accounting-policy *nat-accounting-policy*

no radius-accounting-policy

Context

[Tree] (config>isa>nat-group radius-accounting-policy)

Full Context

configure isa nat-group radius-accounting-policy

Description

This command specifies the RADIUS accounting policy to use for each MDA in this ISA group.

The **no** form of the command removes the policy ID from the configuration.

Default

no radius-accounting-policy

Parameters

nat-accounting-policy

Reference to the nat-accounting-policy which defines:

Source IP addresses that are assigned to BB-ISA cards.

Parameters related to RADIUS server itself.

List of RADIUS attributes that are included in accounting messages.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

radius-attr vendor *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*] [**transaction**] [**encoding** *encoding-type*] {**address** | **hex** | **integer** | **string**} **value** *attribute-value*

no radius-attr type *attribute-type* [**extended-type** *attribute-ext-type*]

no radius-attr type *attribute-type* [**extended-type** *attribute-ext-type*] {**address** | **hex** | **integer** | **string**} **value** *attribute-value*

no radius-attr vendor *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*]

no radius-attr vendor *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*] {**address** | **hex** | **integer** | **string**} [**value**] *attribute-value*

Context

[Tree] (debug>router>radius radius-attr)

Full Context

debug router radius radius-attr

Description

This command specifies the RADIUS attribute filter of command **debug router radius**.

Parameters

attribute-type

Specifies the RADIUS attribute type.

Values 1 to 255

attribute-ext-type

Specifies the RADIUS attribute extended type (RFC 6929).

Values 1 to 255

address

Specifies the value is a IPv4 or IPv6 address/prefix/subnet.

string

Specifies the value is a ASCII string.

integer

Specifies the value is a integer.

hex

Specifies the value is a binary string in hex format, such as "\0xAB01FE”.

attribute-value

Specifies the value of the RADIUS attribute.

Values address <ipv4-address> | <ipv6-address> | <ipv6-prefix/prefix-length>

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D
ipv6-prefix-length [0 to 128]	
hex	[0x0 to 0xFFFFFFFF (up to 506 hex nibbles)]
integer	[0 to 4294967295]
string	ascii-string (up to 253 characters)

transaction

Specifies that the system outputs both request and response packets in the same session even if the response packet does not include the filter attribute.

vendor-id

Specifies the vendor ID for the vendor specific attribute.

Values 0 to 16777215

encoding-type

Specifies the size of the vendor-type and vendor-length in bytes. It is a two digitals string: "xy", x is the size of vendor-type, range from 1 to 4; y is the size of vendor-length, range from 0 to 2; it is "11" by default.

Values type-size:1 to 4, length-size: 0 to 2

38.6 radius-auth-policy

radius-auth-policy

Syntax

radius-auth-policy *radius-authentication-policy-name*

no radius-auth-policy

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>subscr-mgmt>gtp>apn-policy>apn radius-auth-policy)

Full Context

configure subscriber-mgmt gtp apn-policy apn radius-auth-policy

Description

This command configures the RADIUS authentication policy with which the GTP connection is authenticated.

The **no** form of this command removes the authentication policy. Only new session setups are affected.

Default

no radius-auth-policy

Parameters

radius-authentication-policy-name

Specifies the name of the authentication policy to be used, up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

38.7 radius-authentication

radius-authentication

Syntax

radius-authentication

Context

[Tree] (config>subscr-mgmt>vrgw>brg>brg-profile radius-authentication)

38.8 radius-authentication-policy

radius-authentication-policy

Syntax

radius-authentication-policy *name*

no radius-authentication-policy

Context

[Tree] (config>service>vprn>if>sap>ipsec-gw radius-authentication-policy)

[Tree] (config>service>ies>if>sap>ipsec-gw radius-authentication-policy)

Full Context

configure service vprn interface sap ipsec-gw radius-authentication-policy

configure service ies interface sap ipsec-gw radius-authentication-policy

Description

This command configures the policy used for the IKEv2 remote-access tunnels terminated on the IPsec gateway. The **radius-authentication-policy** is defined under **config>ipsec** context.

Parameters

name

Specifies the name of an existing RADIUS authentication policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

radius-authentication-policy

Syntax

radius-authentication-policy *name* [**create**]

no radius-authentication-policy *name*

Context

[Tree] (config>ipsec radius-authentication-policy)

Full Context

configure ipsec radius-authentication-policy

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the RADIUS authentication policy associated with this IPsec gateway.

Parameters

name

Specifies an existing RADIUS authentication policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

38.9 radius-authentication-server

radius-authentication-server

Syntax

radius-authentication-server

Context

[Tree] (config>subscr-mgmt>auth-plcy radius-authentication-server)

Full Context

configure subscriber-mgmt authentication-policy radius-authentication-server

Description

Commands in this context define RADIUS authentication server attributes under a specific session authentication policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

38.10 radius-coa-port

radius-coa-port

Syntax

radius-coa-port {*port-number*}

no radius-coa-port

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>aaa radius-coa-port)

Full Context

configure aaa radius-coa-port

Description

This command configures the system-wide UDP port number that RADIUS is listening on for CoA and Disconnect messages.

The **no** form of this command reverts to the default.

Default

radius-coa-port 3799

Parameters

port-number

Specifies the UDP port number for RADIUS CoA and disconnect messages.

Values 1647, 1700, 1812, 3799

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

38.11 radius-plcy

radius-plcy

Syntax

radius-plcy *name*

no radius-plcy

Context

[Tree] (config>port>ethernet>dot1x radius-plcy)

Full Context

configure port ethernet dot1x radius-plcy

Description

This command references the RADIUS policy to be used for 802.1x authentication. An 802.1x RADIUS policy must be configured (**config**>**system**>**security**>**dot1x**) before it is associated to a port. If the RADIUS policy ID does not exist, an error is returned. Only one 802.1x RADIUS policy can be associated with a port at a time.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the RADIUS policy association.

Default

no radius-plcy

Parameters

name

Specifies an existing 802.1x RADIUS policy name, up to 32 characters.

Platforms

All

radius-plcy

Syntax

radius-plcy *name* [**create**]

Context

[Tree] (config>system>security>dot1x radius-plcy)

Full Context

configure system security dot1x radius-plcy

Description

This command creates the context to configure RADIUS server parameters for 802.1x network access control on the router.

Note:
The RADIUS server configured under the config>system>security>dot1x>radius-plcy context authenticates clients who get access to the data plane of the router as opposed to the RADIUS server configured under the **config>system>radius** context which authenticates CLI login users who get access to the management plane of the router.

The **no** form of this command removes the RADIUS server configuration for 802.1x.

Platforms

All

Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility radius-proxy-cache

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility radius-proxy-cache

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the RADIUS-proxy server to allow subscribers created via data-triggered authentication to create an entry. This RADIUS proxy cache entry allows efficient handling of UE mobility.

Parameters

router-instance

Specifies the router instance.

Values

router-name	Base
service-id	1 to 2147483647

server-name

Specifies the server name up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

38.14 radius-proxy-server

radius-proxy-server

Syntax

[**no**] **radius-proxy-server router** *router-instance* **name** *server-name*

Context

[Tree] (config>subscr-mgmt>vrgw>brg>brg-profile radius-proxy-server)

Full Context

configure subscriber-mgmt vrgw brg brg-profile radius-proxy-server

Description

This command enables BRG processing on the specified RADIUS proxy server. Whenever an Access-Accept message is received with the attribute Alc-BRG-Id present, this triggers the creation of a BRG. The BRG uses the **brg-profile** specified in the Access-Accept message or fall back to this BRG profile. When the specified **radius-proxy-server** has a cache enabled, no cache entries are created for a transaction identified as BRG. A RADIUS proxy server can only be listed in one BRG profile.

This command can be executed multiple times.

The **no** form of this command removes BRG processing for the specified **radius-proxy server**.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

router-instance

Specifies the ID of the VRF where the proxy server is located.

server-name

Specifies the name of the RADIUS proxy server.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>service>vprn>nat>inside>subscriber-identification radius-proxy-server)

Full Context

configure router nat inside subscriber-identification radius-proxy-server

configure service vprn nat inside subscriber-identification radius-proxy-server

Description

This command configures RADIUS proxy server parameters. This is a reference to a RADIUS accounting proxy server in Subscriber Aware Large Scale NAT44 application. RADIUS accounting proxy server will cache attributes related to a BNG subscriber as they are received in standard accounting messages (RFC 2866). Radius accounting proxy server can be configured in any routing instance within 7750 SR.

Parameters

router *router-instance*

Specifies the routing instance in which the RADIUS accounting proxy is configured.

name *server-name*

Specifies the name reference to the RADIUS accounting proxy server that is instantiated in 7750 SR.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure router radius-server

Description

Commands in this context configure the RADIUS server under router or VPRN service.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

38.17 radius-server-policy

radius-server-policy

Syntax

radius-server-policy *policy-name*

no radius-server-policy

Context

[Tree] (config>aaa>l2tp-acct-plcy radius-server-policy)

Full Context

configure aaa l2tp-accounting-policy radius-server-policy

Description

This command references an existing **radius-server-policy** (available under the **config>aaa** context) for use in subscriber management authentication and accounting.

When configured in an authentication-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-authentication-server context
- accept-authorization-change
- coa-script-policy
- accept-script-policy
- request-script-policy

When configured in a radius-accounting-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-accounting-server context
- acct-request-script-policy

The **no** form of this command removes the radius-server-policy reference from the configuration.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no radius-server-policy

Parameters

policy-name

Specifies the RADIUS server policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-server-policy

Syntax

radius-server-policy *policy-name* [**create**]

no radius-server-policy *policy-name*

Context

[Tree] (config>aaa radius-server-policy)

Full Context

configure aaa radius-server-policy

Description

This command creates a radius-server-policy.

A RADIUS server policy can be used in

- radius-proxy, for application like EAP authentication for WIFI access
- authentication policy, for Enhanced Subscriber Management authentication
- RADIUS accounting policy, for Enhanced Subscriber Management accounting
- dynamic data service RADIUS accounting
- AAA route downloader

The **no** form of this command removes the policy name from the configuration.

Parameters

policy-name

Specifies the name of the radius-server-policy up to 32 characters.

create

Keyword used to create a radius-server-policy name. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- request-script-policy

When configured in a radius-accounting-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-accounting-server context
- acct-request-script-policy

The **no** form of this command removes the radius-server-policy reference from the configuration.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no radius-server-policy

Parameters

radius-server-policy-name

Specifies the RADIUS server policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

radius-server-policy

Syntax

radius-server-policy *policy-name*

no radius-server-policy

Context

[Tree] (config>subscr-mgmt>vrgw>brg>brg-profile radius-server-policy)

Full Context

configure subscriber-mgmt vrgw brg brg-profile radius-server-policy

Description

This command allows the vRGW to authenticate on the BRG's behalf. This is required if the BRG does not perform authentication itself using the radius proxy. The vRGW originates a valid Access Request using the BRG ID as a username.

The **no** form of this command removes the RADIUS server policy from the configuration. Setting up of an unauthenticated BRG will now fail.

Default

no radius-server-policy

Parameters

policy-name

Specifies the RADIUS server policy, up to 32 characters, to apply in this subscriber authentication policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>port>ethernet>dot1x radius-server-policy)

Full Context

configure port ethernet dot1x radius-server-policy

Description

This command configures the RADIUS policy with IPv4/IPv6 in base routing and VPRN. The current RADIUS policy can be found under the **configure>aaa>radius-server-policy** context.

The RADIUS servers for the policy are configured under **configure>router>radius-server** or **configure>service>vprn>radius-server** context.

The RADIUS policy is assigned under dot1x using the **radius-server-policy** command. When the RADIUS policy is configured, both authorization and accounting are performed via the same server.

The **no** form of this command allows authorization and accounting via different servers.

Default

no radius-server-policy

Parameters

policy-name

Specifies the RADIUS server policy, up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. When the policy name is configured, both authorization and accounting are done via this server.

policy-name-auth

Specifies the AAA RADIUS server policy for dot1x authorization only; up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. The policy name authorization is used if the user needs a different server for authorization.

policy-name-acct

Specifies the AAA RADIUS server policy for dot1x accounting only; up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. The policy name accounting is used if the user needs a different server for accounting.

Full Context

configure service ies subscriber-interface group-interface ipoe-session radius-session-timeout

configure service vprn subscriber-interface group-interface ipoe-session radius-session-timeout

Description

This command specifies how to interpret the session-timeout coming from a RADIUS VSA in an Access-Accept or CoA message.

The value of this command can only be changed on wlan-gw group interfaces.

The **no** form of this command to resets the default behavior.

Default

radius-session-timeout absolute (backward compatible on wlan-gw group interfaces)

Parameters

backwards-compatible

Specifies that the VSA is interpreted as an IPv4 lease time if the Alc-Lease-Time attribute is not present and an absolute timeout otherwise. The VSA is treated the same as for non-ipoe session DHCP hosts.

ignore

Specifies that the VSA meaning is irrelevant for IPoE session and should be ignored.

absolute

Specifies that the VSA would be treated as a timeout starting from the moment the IPoE session is set up.

range

Syntax

range *vc-id-range* [**sync-tag** *sync-tag*]

no range *vc-id-range*

Context

[Tree] (config>redundancy>multi-chassis>peer>sync>sdp range)

Full Context

configure redundancy multi-chassis peer sync sdp range

Description

This command specifies a range of VC IDs for manually configured spoke SDPs to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing each range with the multi-chassis peer. The **range** command and the configuration of a synchronization tag on the parent **sdp** command are mutually exclusive.

To synchronize a single spoke SDP, the *start-vc-id* should be the same as the *end-vc-id*. If the configured *end-vc-id* is lower than the *start-vc-id*, the **range** command fails.

The synchronization tag can be changed by entering the same command with a different synchronization tag. Changing the synchronization tag removes all states relating to the previous synchronization tag for the SDP and a new synchronization tag state is created.

Multiple **range** commands can be configured, however, overlapping ranges for the same SDP (*sdp-id*) are not permitted.

The synchronization of PIM snooping is only supported for manually configured spoke SDPs but is not supported for spoke SDPs configured within an endpoint. See PIM Snooping for IPv4 Synchronization for service support.

The synchronization of the PIM snooping state is not supported on any of the following when used with the configured *sdp-id*:

- mesh SDPs
- spoke SDPs in non-VPLS services
- BGP-AD/BGP-VPLS (FEC 129) spoke SDPs
- spoke SDPs configured in endpoints
- pseudowire SAPs
- ESM-over-MPLS pseudowires

Non-existent spoke SDPs may be specified. If these spoke SDPs are created at a later time, then all states on the spoke SDPs are synchronized according to the synchronization tag and the synchronization protocols enabled. The **sync-tag** can be changed by entering the same command with a different **sync-tag** value. If the synchronization tag is changed, then all states for the previous **sync-tag** are removed for the SDP configured in the command and the state is then built for the new synchronization tag.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

vc-id-range

Specifies a non-overlapping range of VC IDs for the spoke SDPs of the SDP to be synchronized with the multi-chassis peer.

Values *start-vc-id-end-vc-id*

start-vc-id: 1 to 4294967295

end-vc-id: 1 to 4294967295

sync-tag

Specifies a synchronization tag, up to 32 characters, to be used when synchronizing with the multi-chassis peer.

Full Context

configure service vpls sap managed-vlan-list range

Description

This command configures a range of VLANs on an access port that are to be managed by an existing management VPLS.

This command is only valid when the VPLS in which it is entered was created as a management VPLS, and when the SAP in which it was entered was created on an Ethernet port with encapsulation type of dot1q or qinq, or on a SONET/SDH port with encapsulation type of bcp-dot1q.

To modify the range of VLANs, first the new range should be entered and afterwards the old range removed.

The **no** form of this command removes the VLAN range from this configuration.

Parameters

vlan-range

Specifies the VLAN start value and VLAN end value. The end-vlan must be greater than start-vlan. The format is <start-vlan>-<end-vlan>.

Values start-vlan: 1 to 4094

end-vlan: 1 to 4094

[Tree] (config>service>vpls>sap>static-isid range)

Full Context

configure service vpls spoke-sdp static-isid range

configure service vpls sap static-isid range

Description

This command identifies a set of ISIDs for I-VPLS services that are external to SPBM. These ISIDs are advertised as supported locally on this node unless an altered by an isid-policy. This allows communication from I-VPLS services external to SPBM through this node. The SAP may be a regular SAP or MC-LAG SAP. The spoke-SDP may be an active/standby spoke. When used with MC-LAG or active/stand-by PWs the conditional static-mac must be configured. ISIDs declared this way become part of the ISID multicast and consume MFIBs. Multiple SPBM static-isid ranges are allowed under a SAP/spoke-SDP.

The static-isids are associated with a remote B-MAC that must be declared as a static-mac for unicast traffic. ISIDs are advertised as if they were attached to the local B-MAC. Only remote I-VPLS ISIDs need to be defined. In the MFIB, the group MACs are then associated with the active SAP or spoke-SDP. An

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ISID policy may be defined to suppress the advertisement of an ISID if the ISID is primary used for unicast services. The following rules govern the usage of multiple ISID statements:

- overlapping values are allowed:
  - isid from 301 to 310
  - isid from 305 to 315
  - isid 316
- the minimum and maximum values from overlapping ranges are considered and displayed. The above entries will be equivalent with "ISID from 301 to 316” statement.
- there is no consistency check with the content of ISID statements from other entries. The entries will be evaluated in the order of their IDs and the first match will cause the implementation to execute the associated action for that entry.

The **no** form of this command removes all the previous statements under one interface

no isid value | from value to higher-value - removes a specific ISID value or range. Must match a previously used positive statement: for example if the command "isid 316 to 400” was used using "no isid 316 to 350” will not work but "no isid 316 to 400 will be successful.

Parameters

range-id

Sets context for specified entry ID for the static-isids

Values 1— 8191

isid-value

Configures the ISID or the start of an ISID range. Specifies the ISID value in 24 bits. When just one present identifies a particular ISID to be used for matching.

Values 0 to 16777215

to isid

Identifies upper value in a range of ISIDs to be used as matching criteria

Values 0 to 16777215

create

This keyword is mandatory when creating a range instance.

Full Context

configure router rsvp rapid-retransmit-time

Description

This command defines the value of the Rapid Retransmission Interval. It is used in the re-transmission mechanism to handle unacknowledged message_id objects and is based on an exponential back-off timer.

Re-transmission interval of a RSVP message with the same message_id = 2 * rapid-retransmit-time interval of time.

The node stops re-transmission of unacknowledged RSVP messages:

- If the updated back-off interval exceeds the value of the regular refresh interval.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the number of re-transmissions reaches the value of the **rapid-retry-limit** parameter, whichever comes first.

The Rapid Retransmission Interval must be smaller than the regular refresh interval configured in **config>router>rsvp>refresh-time**.

The **no** form of this command reverts to the default value.

Default

rapid-retransmit-time 5

Parameters

hundred-milliseconds

Specifies the rapid retransmission interval, in hundred-milliseconds (for example, enter "6" for a 600 millisecond retransmit time).

Values 1 to 100, in units of 100 ms.

no rapid-update

Context

[Tree] (config>router>bgp rapid-update)

Full Context

configure router bgp rapid-update

Description

This command enables and disables BGP rapid update for specified address families.

If rapid update is enabled for a set of address families, and a route belonging to a family in that set is received by the router and chosen for propagation to certain BGP peers, the remaining time on the MRAI timer of these peers is ignored and the route is transmitted immediately, along with all other pending routes for these peers (including routes of address families not specified in the **rapid-update** command).

The **rapid-update** command overrides the peer-level **min-route-advertisement** (**config>router>bgp min-route-advertisement**, **config>router>bgp>group min-route-advertisement**, **config>router>bgp>group>neighbor min-route-advertisement**) time and applies the minimum setting (0 seconds) to routes belonging to specified address families; routes of other address families continue to be advertised according to the session-level MRAI setting.

The **no** form of this command disables rapid update for all address families.

Default

no rapid-update

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

l2-vpn

Specifies the BGP rapid update for the 12-byte Virtual Switch Instance identifier (VSI-ID) value consisting of the 8-byte route distinguisher (RD) followed by a 4-byte value.

mvpn-ipv4

Specifies BGP rapid update for the mvpn-ipv4 address family. The mvpn-pv4 address is a variable size value consisting of the 1-byte route type, 1-byte length and variable size that is route type specific. Route type defines encoding for the route type specific field. Length indicates the length in octets of the route type specific field.

mdt-safi

Specifies BGP rapid update for the mdt-safi address family. The address is a 16-byte value consisting of 12-byte route distinguisher (RD) followed by a 4-byte group address.

mvpn-ipv6

Specifies BGP rapid update for the mvpn-ipv6 address family.

evpn

Specifies BGP rapid update for the evpn address family by including or removing EVPN routes from the set of routes that can trigger rapid update.

label-ipv4

Includes or removes label-ipv4 routes from the set of routes that can trigger rapid update.

label-ipv6

Includes or removes label-ipv6 routes from the set of routes that can trigger rapid update.

vpn-ipv4

Includes or removes vpn-ipv4 routes from the set of routes that can trigger rapid update.

vpn-ipv6

Includes or removes vpn-ipv6 routes from the set of routes that can trigger rapid update.

mcast-vpn-ipv4

Includes or removes mcast-vpn-ipv4 routes from the set of routes that can trigger rapid update.

mcast-vpn-ipv6

Includes or removes mcast-vpn-ipv6 routes from the set of routes that can trigger rapid update.

no rate

Context

[Tree] (config>subscr-mgmt>sla-prof>egress>qos>queue rate)

Full Context

configure subscriber-mgmt sla-profile egress qos queue rate

Description

This command defines the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent command's *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

Parameters

pir-rate

Defines the administrative PIR rate, in kb/s, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queues **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 2000000000, max

Default max

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

cir-rate

Defines the administrative CIR rate, kb/s, for the queue. The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and must be given as a positive integer.

Values 0 to 2000000000, max

Default 0

Context

[Tree] (config>subscr-mgmt>sla-prof>ingress>qos>queue rate)

Full Context

configure subscriber-mgmt sla-profile ingress qos queue rate

Description

This command defines the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. For SAP ingress, the CIR also defines the rate that packets are considered in-profile by the system. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent command's *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP ingress or SAP egress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

configure subscriber-mgmt sla-profile ingress qos policer rate

configure subscriber-mgmt sla-profile egress qos policer rate

Description

This command is used to configure the policer’s metering and optional profiling rates. The metering rate is used by the system to configure the policer’s PIR leaky bucket’s decrement rate while the profiling rate configures the policer’s CIR leaky bucket’s decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packets size. If the bucket fills faster than how much is decremented per packet, the bucket’s depth eventually reaches it's exceed (CIR) or

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and is discarded. If the packet is not red, it may be green or yellow based on the conforming or exceeding state from the CIR bucket.

When a packet is red neither the PIR or CIR bucket depths are incremented by the packets size. When the packet is yellow the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command restores the default metering and profiling rate to a policer.

Parameters

{max | *rate*}

Specifies the packet byte offset. Specifying the keyword **max** or an explicit **rate** (in kilobits per second) parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used is equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

Values max or 1 to 2000000000

cir {max | *rate*}

Specifies the packet byte offset. The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword **max** or an explicit **rate** (in kilobits per second) parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used is equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

Values max or 0 to 2000000000

Full Context

configure service vpls sap egress queue-override queue rate

configure service ies interface sap egress queue-override queue rate

configure service vpls sap ingress queue-override queue rate

configure service ies interface sap ingress queue-override queue rate

Description

This command overrides specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters.

The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (max, 0).

Default

rate max cir 0

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

pir-rate

Defines the administrative PIR rate, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be configured as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 6400000000, **max**

Default max

cir-rate

Overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be configured as a positive integer.

Values 0 to 6400000000, **max**

Default 0

Syntax

rate *pir-rate* [**cir** *cir-rate*]

no rate

Context

[Tree] (config>service>vpls>sap>egress>sched-override>scheduler rate)

Full Context

configure service vpls sap egress scheduler-override scheduler rate

Description

This command overrides specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its policers, child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler because of insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler assumes that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

Default

rate max cir sum

Parameters

pir-rate

Specifies the PIR rates. The **pir** parameter accepts a step multiplier value that specifies the multiplier used to determine the PIR rate at which the queue operates. A value of 0 to 100000000 or the keyword **max** is accepted. Any other value results in an error without modifying the current PIR rate.

To calculate the actual PIR rate, the rate described by the queue's **rate** is multiplied by the *pir-rate*.

The SAP ingress context for PIR is independent of the defined forwarding class (fc) for the queue. The default **pir** and definable range is identical for each class. The PIR in effect for a queue defines the maximum rate at which the queue is allowed to forward packets in a given second, shaping the queue's output.

The PIR parameter for SAP ingress queues do not have a negate (**no**) function. To return the queue's PIR rate to the default value, that value must be specified as the PIR value.

Values 1 to 6400000000, max

Default max

cir-rate

Specifies the CIR rate. The **cir** parameter accepts a step-multiplier value that specifies the multiplier used to determine the CIR rate at which the queue operate. A value of 0 to 250 or the keyword max is accepted. Any other value results in an error without modifying the current CIR rate.

To calculate the actual CIR rate, the rate described by the **rate pir** *pir-rate* is multiplied by the *cir-rate*. If the **cir** is set to max, then the CIR rate is set to infinity.

The context for CIR is dependent on the defined forwarding class (fc) for the queue. The default CIR and definable range is different for each class. The CIR in effect for a policer or queue defines both its profile (in or out) marking level as well as the relative importance compared to other queues for scheduling purposes during congestion periods.

Values 0 to 6400000000, max, sum

[Tree] (config>card>fp>ingress>access>qgrp>policer-over>plcr rate)

Full Context

configure card fp ingress network queue-group policer-override policer rate

configure card fp ingress access queue-group policer-override policer rate

Description

This command configures the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on its packet size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches it's exceeded (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow based on the conforming or exceeding state from the CIR bucket.

When a packet is red neither the PIR nor the CIR bucket depths are incremented by the packets size. When the packet is yellow the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command reverts to the default metering and profiling rate of a policer.

Parameters

{*rate* | max}

Specifying the keyword **max** or an explicit *rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the policer is first created, the metering rate defaults to max. The *kilobits-per-second* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

Values **max** or 1 to 2000000000

cir {max | *rate*}

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword max or an explicit *rate* parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *kilobits-per-second* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to max.

Values **max** or 0 to 2000000000

Full Context

configure port ethernet access ingress queue-group queue-overrides queue rate

configure port ethernet access egress queue-group queue-overrides queue rate

configure port ethernet network egress queue-overrides queue rate

Description

This command specifies the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **rate** is performed under the **hs-wrr-group** within the egress queue group template.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

Default

rate max cir 0 - The max default specifies the amount of bandwidth in kilobits per second (thousand bits per second). The max value is mutually exclusive to the pir-rate value.

Parameters

pir-rate

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

© 2025 Nokia.

[Tree] (config>port>ethernet>access>egr>qgrp>sched-override>scheduler rate)

Full Context

configure port ethernet access ingress queue-group scheduler-override scheduler rate

configure port ethernet access egress queue-group scheduler-override scheduler rate

Description

This command can be used to override specific attributes of the specified scheduler rate. The rate command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler because of insufficient offered load or limits to their own maximum rates.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler assumes that an infinite amount of bandwidth is available and allow all child policers, queues, and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

Parameters

pir-rate

Specifies the PIR rate, in kilobits per second. Any other value results in an error without modifying the current PIR rate.

Values 1 to 6400000000, **max**

cir-rate

Specifies the CIR rate, in kilobits per second. If the CIR is set to **max**, then the CIR rate is set to infinity. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

Values 0 to 6400000000, **sum**, **max**

Default

rate max

Parameters

rate

Specifies the maximum rate in kilobits per second. When the **max** keyword follows the **rate** keyword, the bandwidth limitation is removed from the aggregate or class. The **max** keyword is mutually exclusive to the **rate** parameter. Either **max** or a rate value must follow the **rate** keyword.

Values 1 to 100000000, max

Platforms

7750 SR-7/12/12e

rate

Syntax

rate *kilobits-per-second*

no rate

[Tree] (config>service>ipipe>sap>egress>agg-rate rate)

Full Context

configure service epipe sap egress agg-rate rate

configure service cpipe sap egress agg-rate rate

configure service ipipe sap egress agg-rate rate

Description

This command defines the enforced aggregate rate for all queues associated with the agg-rate context. A rate must be specified for the agg-rate context to be considered to be active on the context's object (SAP, subscriber, Vport, and so on).

The **no** form of this command removes an explicit rate value from the aggregate rate returning it to its default value.

Parameters

kilobits-per-second

The enforced aggregate rate for all queues associated with the agg-rate context, in kilobits per second.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 6400000000, **max**

configure service ipipe sap ingress policer-override policer rate

configure service epipe sap ingress policer-override policer rate

configure service ipipe sap egress policer-override policer rate

configure service epipe sap egress policer-override policer rate

Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** rate command is used to restore the policy defined metering and profiling rate to a policer.

Parameters

rate *rate*

Specifies the policer instance metering rate for the PIR leaky bucket, in kilobits per second. The integer value is multiplied by 1000 to derive the actual rate in bits per second.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 6400000000

cir *rate*

Specifies the overriding value for the policy-derived profiling rate of the policer, in kilobits per second. The integer value is multiplied by 1000 to derive the actual rate in bits per second.

Values 0 to 6400000000

max

Uses the maximum policer rate, equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR or CIR used is equivalent to **max**.

configure service ipipe sap ingress queue-override queue rate

configure service epipe sap ingress queue-override queue rate

configure service ipipe sap egress queue-override queue rate

configure service cpipe sap egress queue-override queue rate

configure service epipe sap egress queue-override queue rate

configure service cpipe sap ingress queue-override queue rate

Description

This command can be used to override specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters.

The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile and then out-of-profile packets are preferentially queued by the system

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

Default

rate max cir 0

Parameters

pir-rate

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 6400000000, **max**

Default max

cir-rate

The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

Values 0 to 6400000000, **max**, **sum**

Default 0

configure service ipipe sap ingress scheduler-override scheduler rate

configure service epipe sap ingress scheduler-override scheduler rate

configure service epipe sap egress scheduler-override scheduler rate

configure service cpipe sap ingress scheduler-override scheduler rate

configure service ipipe sap egress scheduler-override scheduler rate

Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child policers, queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child policers or queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child policers, queues, and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the values configured in the applied scheduler policy.

Parameters

pir-rate

The **pir** parameter accepts the **max** keyword or a value in kilobits per second. Any other value will result in an error without modifying the current PIR rate.

Values 1 to 6400000000, **max**

cir cir-rate

The **cir** parameter accepts a value in kilobits per second or the **max** keyword. Any other value will result in an error without modifying the current CIR rate.

If the **cir** parameter is set to **max**, then the CIR rate is set to infinity but bounded by the PIR rate.

The **sum** keyword specifies that the CIR will be used as the summed CIR values of the children schedulers, policers, or queues.

Values 0 to 6400000000, **max**, **sum**

Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** form of this command removes the **rate** override so that the **rate** configured for the policer in the applied SAP egress QoS policy is used.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

{*rate* | max}

Specifying the keyword **max** or an explicit kilobits per second parameter directly following the rate override command is required and identifies the policer instance's metering rate for the PIR leaky bucket. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

Values 1 to 6400000000, **max**

cir {max | *rate*}

The optional **cir** keyword is used to override the policy derived profiling rate of the policer. Specifying the keyword **max** or an explicit kilobits per second parameter directly following the **cir** keyword is required. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

Values 0 to 6400000000, **max**

[Tree] (config>service>ies>if>sap>ingress>sched-override>scheduler rate)

Full Context

configure service ies interface sap egress scheduler-override scheduler rate

configure service ies interface sap ingress scheduler-override scheduler rate

Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

Parameters

pir-rate

The **pir** parameter accepts a value in kilobits per second, or the keyword **max**. Any other value will result in an error without modifying the current PIR rate.

Values 1 to 6400000000, **max**

cir-rate

This parameter accepts a step-multiplier value that specifies the multiplier used to determine the CIR rate at which the queue will operate. A value in kilobits per second or the keywords **max** or **sum** is accepted. Any other value will result in an error without modifying the current CIR rate.

If the **cir** is set to max, then the CIR rate is set to infinity but is restricted by the PIR rate.

The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

For **egress>sched-override>scheduler** and **ingress>sched-override>scheduler**:

Values 0 to 6400000000, **max**, **sum**

configure service vprn interface sap ingress policer-override policer rate

Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** form of this command restores the policy defined metering and profiling rate to a policer.

Parameters

{*rate* | max}

Specifying the keyword **max** or an explicit kilobits per second parameter directly following the rate override command is required and identifies the policer instance's metering rate for the PIR leaky bucket. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

Values 1 to 6400000000, **max**

cir {max | *rate*}

The optional **cir** keyword is used to override the policy derived profiling rate of the policer. Specifying the keyword **max** or an explicit kilobits per second parameter directly following the **cir** keyword is required. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

configure service vprn interface sap ingress queue-override queue rate

configure service vprn interface sap egress queue-override queue rate

Description

This command can be used to override specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

Default

rate max cir 0

Parameters

pir-rate

Defines the administrative PIR rate, in kb/s, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 6400000000, **max**

Default max

cir-rate

Defines the administrative CIR rate, in kb/s, for the queue. The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

Values 0 to 6400000000, **max**

Default 0

Context

[Tree] (config>service>vprn>if>sap>ingress>sched-override>scheduler rate)

[Tree] (config>service>vprn>if>sap>egress>sched-override>scheduler rate)

Full Context

configure service vprn interface sap ingress scheduler-override scheduler rate

configure service vprn interface sap egress scheduler-override scheduler rate

Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child policers and queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

Parameters

pir-rate

Specifies the PIR rate for the scheduler. The **pir** parameter accepts a value in kb/s, or the **max** keyword. Any other value will result in an error without modifying the current PIR rate.

Values 1 to 6400000000, **max**

cir-rate

Specifies the CIR rate for the scheduler. The **cir** parameter accepts a value in kb/s, or the **max** or **sum** keywords. Any other value will result in an error without modifying the current CIR rate.

If the **cir** is set to **max**, then the CIR rate is set to infinity, but is limited by the *pir-rate*.

If the **cir** is set to **sum**, then the CIR rate is set to the summed CIR values of the children schedulers, policers, or queues.

Values 0 to 6400000000, **max**, **sum**

configure application-assurance group policer tod-override rate

configure application-assurance group policer rate

Description

This command configures the administrative PIR and CIR for bandwidth policers and flow setup rate limits for flow policers. The actual rate sustained by the flow can be limited by other policers that may be applied to that flow's traffic. This command does not apply to flow-count-limit policers.

The **cir** option is applicable only to dual-bucket bandwidth policers. It is recommended to configure flow setup rate subscriber-level policer for AA subscribers to ensure fair usage of flow resources between AA subscribers.

The **no** form of this command resets the values to defaults.

Default

rate max cir 0

Parameters

pir-rate

Specifies an integer for the PIR rate in kb/s for bandwidth policers.

Values 1 to 100000000, **max** or flows/sec

cir-rate

Specifies an integer for the CIR rate in kb/s.

Values 0 to 100000000, **max**

Description

This command configures the sampling rate for the recorded http host, a sampling rate of 10 will sample one out of 10 http-host.

Parameters

sample-rate

Specifies the sample rate.

Values 1 to 10000

Default 100

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of a configuration with http-host entries ending with ".com" as a result of the expression filter configuration. It will not record any other HTTP host values since the default-filter-action set to no-record. The http-host entries analyzed by the recorder in the first place are http-host-app-filter-candidates.

Output Example

```
7750# show debug
debug
    application-assurance
        group 1:1
            http-host-recorder
                filter
                    default-filter-action no-record
                    expression 1 http-host eq "*.com$" record
                    record http-host-app-filter-candidates
                exit
                rate 100
                no shutdown
            exit
        exit
    exit
exit
```

Full Context

configure qos policer-control-policy tier arbiter rate

Description

This command is used to define the maximum bandwidth an instance of the arbiter can receive from its parent tier 1 arbiter or the root arbiter. The arbiter instance enforces this limit by calculating the bandwidth each of its child policers should receive relative to their offered loads, parenting parameters, and individual rate limits, and using that derived rate as a child PIR decrement rate override. The override will not exceed the child policer's administrative rate limit and the aggregate of all the child PIR decrement rates will not exceed the specified arbiter rate limit.

The arbiter's policy defined rate value may be overridden at the SAP or sub-profile where the **policer-control-policy** is applied. Specifying an override prevents the arbiter from being removed from the policer control policy until the override is removed.

The **no** form of this command is used to remove a rate limit from the arbiter at the policer control policy level. The policy level rate limit for the arbiter will return to the default value of **max**. The **no rate** command has no effect on instances of the arbiter where a rate limit override has been defined.

Default

rate max

Parameters

rate

Enter an integer representing the rate limit in kilobits per second.

Values 1 to 6400000000, **max**

max

When **max** is specified, the arbiter does not enforce a rate limit on its child policers or arbiters other than the individual rate limits enforced at the child level.

configure qos sap-egress policer rate

Description

This command is used to configure the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packet's size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceed (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow, based on the conforming or exceeding state from the CIR bucket.

When a packet is red, neither the PIR nor CIR bucket depths are incremented by the packets size. When the packet is yellow, the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command is used to restore the default metering and profiling rate to a policer.

Parameters

{max | *pir-rate*}

Specifying the keyword **max** or an explicit *pir-rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The *pir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

Values 1 to 6400000000, **max**

cir {max | *cir-rate*}

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword max or an explicit *cir-rate* parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *cir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to max.

Values 0 to 6400000000, **max**

configure qos sap-ingress queue rate

Description

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue.

The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. For SAP ingress, the CIR also defines the rate that packets are considered in-profile by the system, unless **cir-non-profiling** is configured. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next-hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The FIR defines an additional rate at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the SAP ingress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0, 0).

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

rate max cir 0 fir 0

Parameters

pir-rate

Defines the administrative PIR, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and the value must be given as a positive integer.

The actual PIR is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 6400000000, **max**

Default max

cir-rate

The **cir** parameter overrides the default administrative CIR, in kilobits per second, used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual CIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 0 to 6400000000, **max**

Default 0

fir-rate

The **fir** parameter overrides the default administrative FIR, in kilobits per second, used by the queue. When the **rate** command is executed, an FIR setting is optional. When the **rate** command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual FIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

Values 0 to 6400000000, **max**

Default 0

police

Specifies that traffic feeding into the queue instance above the specified PIR rate will be dropped. When the **police** keyword is defined, only the PIR rate may be overridden.

configure qos sap-egress queue rate

Description

This command defines the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled as in- or out-of-profile throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

Default

rate max cir 0

configure qos network-queue queue rate

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue.

The PIR defines the percentage that the queue can transmit packets through the switch fabric (for ingress queues) or out of an egress port (for egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available bandwidth.

The CIR defines the percentage at which the system prioritizes the queue over other queues competing for the same bandwidth.

The CIR can be used by the queue's **port-parent** commands **cir-level** and **cir-weight** parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent port scheduler.

The FIR defines an additional percentage at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR percentage.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the network queue policy with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the network queue policy.

The **no** form of the command returns all queues created with the *queue-id* by association with the network queue policy to the default PIR, CIR, and FIR parameters.

Default

rate 100 cir 0 fir 0

Parameters

percent

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the rate allowed for the queue. When the **rate** command is executed, a valid *percent* (PIR setting) must be explicitly defined. When the **rate** command has not been executed, the default PIR of **100** is assumed. Fractional values are not allowed, and the value must be given as a positive integer.

The actual PIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 100

Default 100

cir ***percent***

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the CIR allowed for the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly

[Tree] (config>qos>qgrps>egr>qgrp>policer rate)

Full Context

configure qos queue-group-templates ingress queue-group policer rate

configure qos queue-group-templates egress queue-group policer rate

Description

This command is used to configure the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packet's size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceed (CIR) or

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow, based on the conforming or exceeding state from the CIR bucket.

When a packet is red, neither the PIR nor CIR bucket depths are incremented by the packets size. When the packet is yellow, the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **no** form of this command is used to restore the default metering and profiling rate to a policer.

Parameters

{max | *pir-rate*}

Specifying the keyword **max** or an explicit *pir-rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The *pir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

Values **max**, 1 to 2000000000

cir {max | *cir-rate*}

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword max or an explicit *cir-rate* parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *cir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to max.

Values **max,** 0 to 2000000000

Context

[Tree] (config>qos>queue-group-templates>ingress>queue-group>queue rate)

Full Context

configure qos queue-group-templates ingress queue-group queue rate

Description

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. For SAP ingress, the CIR also defines the rate that packets are considered in-profile by the system, unless **cir-non-profiling** is configured. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The FIR defines an additional rate at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the ingress queue group template with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR, CIR, and FIR parameters (**max**, 0, 0).

Default

rate max cir 0 fir 0

Parameters

pir-rate

Defines the administrative PIR, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

been executed, the default PIR of **max** is assumed. Fractional values are not allowed and the value must be given as a positive integer.

The actual PIR is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 2000000000 kb/s, **max**

Default max

cir-rate

The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and the value must be given as a positive integer. The actual CIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 2000000000 kb/s, **max**

Default 0

fir-rate

The **fir** parameter overrides the default administrative FIR used by the queue. When the rate command is executed, an FIR setting is optional. When the rate command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual FIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

Values 1 to 2000000000 kb/s, **max**

Default 0

police

Specifies that traffic feeding into the queue instance above the specified rate is dropped.

Context

[Tree] (config>qos>queue-group-templates>egress>queue-group>queue rate)

Full Context

configure qos queue-group-templates egress queue-group queue rate

Description

This command defines the administrative PIR and the administrative CIR parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress port. Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled as in- or out-of-profile throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR for all queues created through the association of the egress queue group template with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

Default

rate max cir 0

Parameters

pir-rate

Defines the administrative PIR rate, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 200000000 kb/s, **max**

Default max

rate

Syntax

rate *pir-rate* [**cir** *cir-rate*]

no rate

Context

[Tree] (config>qos>scheduler-policy>tier>scheduler rate)

Full Context

configure qos scheduler-policy tier scheduler rate

Description

The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's within-CIR distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

pir *pir*

Specifies the PIR rate of the scheduler in kb/s or it can be set to the maximum using the max keyword.

Values 1 to 6400000000, **max**

Default max

cir *cir*

Specifies the CIR rate of the scheduler in kb/s or it can be set to the maximum using the max keyword. The sum keyword can also be used, which sets the CIR to the sum of child CIR values.

Values 0 to 6400000000, **max, sum**

Context

[Tree] (config>qos>shared-queue>queue rate)

Full Context

configure qos shared-queue queue rate

Description

This command defines the administrative PIR, the administrative CIR, and the administrative FIR parameters for the queue.

The PIR defines the percentage that the queue can transmit packets through the switch fabric (for ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by over-subscription factors or available bandwidth.

The CIR defines the percentage at which the system prioritizes the queue over other queues competing for the same bandwidth.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for the queue created with the *queue-id*.

Parameters

percent

Defines the percentage of the FP ingress capacity for the max rate allowed for the queue. When the **rate** command is executed, a valid percent (PIR) setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and the value must be given as a positive integer.

Values 1 to 100, **max**

Default 100

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

cir *percent*

Defines the percentage of the FP ingress capacity for the CIR allowed for the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and the value must be given as a positive integer.

Values 0 to 100, **max**

Default 0

fir *percent*

Defines the percentage of the FP ingress capacity for the FIR allowed for the queue. When the **rate** command is executed, a FIR setting is optional. When the **rate** command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed. Fractional values are not allowed and the value must be given as a positive integer. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

[Tree] (config>service>cust>multi-service-site>egress>sched-override>scheduler rate)

Full Context

configure service customer multi-service-site ingress scheduler-override scheduler rate

configure service customer multi-service-site egress scheduler-override scheduler rate

Description

This command overrides specific attributes of the specified scheduler rate.

The **rate** command defines the maximum bandwidth that the scheduler can offer its child policers, queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the scheduler's amount of bandwidth to be considered during the parent schedulers 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child policers or queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's to the PIR and CIR parameters to the value configured in the applied scheduler policy.

Parameters

pir-rate

Specifies the PIR rate.

Values 1 to 6400000000, **max**

Default **max**

cir-rate

Specifies the CIR rate.

If the *cir-rate* is set to **max**, then the CIR rate is set to infinity. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers or queues.

Values 0 to 6400000000, **max**, **sum**

Default **sum**

configure system security dist-cpu-protection policy protocol dynamic-parameters rate

Description

This command configures the rate and burst tolerance for the policer in either a packet rate or a bit rate.

The actual hardware may not be able to perfectly rate limit to the exact configured parameters. In this case, the configured parameters will be adapted to the closest supported rate. The actual (operational) parameters can be seen in CLI, for example, **show service id** *33* **sap** 1/1/3:33 **dist-cpu-protection detail**.

If the *kilobits-per-second* parameter value is configured as max, then the policer is effectively disabled (always conforming).

If the *size* parameter value is configured as 0, then all packets are considered as nonconforming.

Default

rate packets max within 1 initial-delay 0

Parameters

packets | kbps

specifies that the rate is either in units of packets per interval or in units of kilobits per second. The packets option would typically be used for lower rates (for example, for per-subscriber DHCP rate limiting) while the kbps option would typically be used for higher rates (for example, per-interface BGP rate limiting).

ppi

Specifies packets per interval.

Values 0 to 255, max

max = disable the policer (always conforming)

packets 0 = all packets considered nonconforming

seconds

Specifies the length of the ppi rate measurement interval.

Values 1 to 32767

packets

Specifies the number of packets allowed (even at line rate) in an initial burst (or a burst after the policer bucket has drained to zero) in addition to the normal *ppi*. This would typically be set to a value that is equal to the number of received packets in several full handshakes/negotiations of the particular protocol.

Values 0 to 255

kilobits-per-second

Specifies the kilobits per second.

Values 1 to 20000000, max

size

Specifies the tolerance for the kbps rate.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0 to 4194304

Default 10

bytes | kilobytes

Specifies that the units of the mbs size parameter are either in bytes or kilobytes.

Full Context

configure test-oam service-activation-testhead service-test service-stream rate

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the CIR that must be validated for a specific stream. If configured, the PIR value must be greater than or equal to the CIR value.

The service activation testhead generates traffic up to the specified rate based on the **test-types** command, as follows.

- For **type cir**, traffic is generated at a rate up to the configured CIR.
- For **type cir-pir**, traffic is generated at a rate up to the configured PIR.
- For **type policing**, traffic is generated at a rate up to 125% of the configured PIR.
- For **type performance**, traffic is generated at a rate up to the configured PIR.

The **no** form of this command reverts to the default values.

Default

no rate

Parameters

cir-rate-in-kbps

Specifies the CIR rate, in kb/s, which overrides the default CIR value. The configured value must be a positive integer; fractional values are not allowed. If the **rate** command is not executed, or the CIR parameter is not explicitly specified, the default CIR value applies.

Values 1 to 400,000,000

pir-rate-in-kbps

Specifies the PIR rate, in kb/s, which overrides the default administrative PIR value. The configured value must be a positive integer; fractional values are not allowed. If the **rate** command is not executed or the PIR parameter is not explicitly specified, the default PIR value applies.

Values 1 to 400,000,000

configure card virtual-scheduler-adjustment rate-calc-min-int

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command overrides the default minimum time that must elapse before a policer or queue's offered rate may be recalculated. A minimum time between offered rate calculations is enforced to both prevent inaccurate estimation of the offered rate and excessive input to the virtual scheduler process.

In order to smooth out rapidly fluctuating offered rates, the system averages the measured offered rate with a window of previously measured offered traffic statistics and knowledge of the time between the samples.

The window size is defined by the "rate calculation minimum interval" with offered traffic statistics being read at most four times within the window. Any previous measured offered statistics within the window are used in the averaging function. Note that if there are large numbers of samples required, for example when a large number of queues are running HQoS, then it may be that a time greater than the "rate calculation minimum interval" passes before another sample of the offered statistics can be taken for a queue. In this case, in order to calculate an offered rate, HQoS will always use two samples, the current and the previous. In this case, using a smaller **rate-calc-min-int** will have no effect on the responsiveness of HQoS to queue rate changes.

The system separates policers and queues into fast and slow categories and maintains a separate "rate calculation minimum interval" for each type. The default for each type are as follows:

Slow Queue: 1.0 seconds

Fast Queue: 0.25 seconds

The actual minimum rate calculation interval may be increased or decreased by using the fast-queue and/or slow-queue keywords (which are also applicable for policers managed by HQoS) followed by a percent value which is applied to the default interval. The default slow-queue threshold rate is 1 Mb/s. Once a policer or queue is categorized as slow, its rate must rise to 1.5 Mb/s before being categorized as a fast policer or queue. The categorization threshold may be modified by using the **slow-queue-threshold** command.

The **no** form of this command restores the default fast queue and slow queue minimum rate calculation interval.

Default

no rate-calc-min-int

Parameters

percent-of-default

Specifies that the fast-queue percent-of-default parameter is optional and is used to modify the default minimum rate calculation time for "fast" queues. Defining 100.00 percent is equivalent to removing the override (restoring the default) on the fast queue minimum rate calculation time.

Values 0.01% to 1000.00%

Default 100.00%

percent-of-default

Specifies that the slow-queue percent-of-default parameter is optional and is used to modify the default minimum rate calculation time for "slow" queues. Defining 100.00 percent is equivalent to removing the override (restoring the default) on the slow queue minimum rate calculation time.

Description

This command configures the maximum rate limit at which syslog messages are sent. Once the rate limit is exceeded, NAT flow logs will be buffered. Overload condition is characterized by exhaustion of this buffer space. This condition can occur due to imposed rate limit or the software speed limit. Once the buffer space is exhausted, new flow creation will be denied, and the teardown of the existing flows will be delayed until the buffer space becomes available.

The **no** form of the command removes the maximum rate limit from the configuration.

Parameters

packets-per-second

Specifies the packet rate limit in seconds.

Values 10 to 2147483647

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rate-limit policer *policer-name*

Context

[Tree] (config>filter>ip-filter>entry>action rate-limit)

Full Context

configure filter ip-filter entry action rate-limit

Description

This command configures the rate-limit value for traffic matching this filter entry. Rate-limit policers are configured with MBS equals CBS equals 10 ms of the rate and high-prio-only equals 0.

Traffic can also be rate limited based on **extracted-traffic**, **packet-length**, **ttl**, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

Parameters

value

Specifies the **rate-limit** *value* in kb/s (default) or packets per second (pps). A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

Values 0 to 2000000000 kb/s, max

0 to 100000000 pps, max

mbs-value

Specifies the maximum burst size in bytes. This parameter can only be specified when the **rate-limit** *value* unit is **kbps**.

Values 0 to 268435456

extracted-traffic

Specifies rate-limit packets both extracted to the CPM and matching the filter entry match criteria.

packet-length

Specifies rate-limit packets matching both the filter entry match criteria and the *packet-length value* defined in the **rate-limit** action statement. Packets matching the filter entry match criteria and not matching the *packet-length* value, as defined in the **rate-limit** action statement, are implicitly forwarded with no further match in the following filter entries.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values **lt** — Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies "equal to”.

packet-length-value

Specifies the packet length value for the rate limit action.

Values 0 to 65535

range

Specifies an inclusive range. When **range** is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

expression

Specifies the hexadecimal pattern to match; up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

mask

Specifies the mask for the pattern expression, up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

offset-type

Specifies the starting point reference for the offset-value of this pattern.

Values layer-3, layer-4, data, dns-qtype

offset-value

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

Values 0 to 255

ttl-value

Specifies rate-limit packets matching both the filter entry match criteria and the TTL value defined in the *rate-limit* action statement. Packets matching the filter entry match criteria and not matching the TTL value, as defined in the *rate-limit* action statement, are implicitly forwarded with no further match in the following filter entries.

Values 0 to 255

policer-name

Specifies the policer name to use for rate-limiting traffic, up to 32 characters.

Platforms

All

rate-limit

Syntax

rate-limit *value*

Context

[Tree] (config>filter>mac-filter>entry>action rate-limit)

Full Context

configure filter mac-filter entry action rate-limit

Description

This command sets the rate limit for the traffic matching both the filter entry match criteria and the *packet-length-value* defined in the **rate-limit action** statement.

Packets matching the filter entry match criteria and not matching the *packet-length-value* defined in the **rate-limit action** statement are implicitly forwarded with no further match in subsequent filter entries.

Rate limit packets matching both the filter entry match criteria and the *ttl-value* are defined in the **action rate-limit** statement.

Packets matching the filter entry match criteria and not matching the *ttl-value* defined in the **rate-limit action** statement are implicitly forwarded with no further match in the following filter entries.

Parameters

value

Specifies the **rate-limit** *value* in kb/s. A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

Values 0 to 2000000000 kb/s | max

Context

[Tree] (config>filter>ipv6-filter>entry>action rate-limit)

Full Context

configure filter ipv6-filter entry action rate-limit

Description

This command configures the rate-limit value for traffic matching this filter entry.

Traffic can also be rate-limited based on **extracted-traffic**, **payload-length**, **hop-limit**, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card.
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

Parameters

value

Specifies the **rate-limit** *value* in kb/s (default) or packets per second (pps). A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

Values 0 to 2000000000 kb/s, max

0 to 100000000 pps, max

mbs-value

Specifies the maximum burst size in bytes. This parameter can only be specified when the **rate-limit** *value* unit is **kbps**.

Values 0 to 268435456

extracted-traffic

Specifies packets extracted to the CPM.

hop-limit

Specifies the hop limit value for the rate limit action.

Values **lt** — Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies "equal to”.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hop-limit-value

Specifies the hop limit value for the rate limit action.

Values 0 to 255

range

Specifies an inclusive range. When the **range** parameter is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

expression

Specifies the hexadecimal pattern to match; up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

mask

Specifies the mask for the pattern expression, up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

offset-type

Specifies the starting point reference for the offset-value of this pattern.

Values layer-3, layer-4, data, dns-qtype

offset-value

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

Values 0 to 255

payload-length

Specifies rate-limit packets matching both the filter entry match criteria and the *payload-length-value* defined in the **rate-limit** action statement. Packets matching the filter entry match criteria and not matching the *payload-length-value,* as defined in the **rate-limit** action statement, are implicitly forwarded with no further match in the following filter entries.

Values **lt** — Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies "equal to”.

payload-length-value

Specifies the payload length value for the rate limit action.

Values 0 to 65535

policer-name

Specifies the policer name to use for rate-limiting traffic, up to 32 characters.

configure subscriber-mgmt ancp ancp-policy egress rate-monitor

configure subscriber-mgmt ancp ancp-policy ingress rate-monitor

Description

This command configures the rate monitor level.

The **no** form of this command removes the value from the configuration.

Parameters

kilobit-per-second

Specifies the rate below which the system generates an event.

Values 0 to 4294967295

alarm

When the monitored rate is below the configured value the system generates an alarm (trap) to the management system. The trap includes the rate as well as the ANCP policy name and the ANCP string.

38.35 rate-percentage

rate-percentage

Syntax

rate-percentage *rate-percentage*

no rate-percentage

Context

[Tree] (config>app-assure>group>policer rate-percentage)

Full Context

configure application-assurance group policer rate-percentage

Description

This command indirectly configures the rate used by Access-Network-Location (ANL) policers. Because ANL total bandwidth is dynamically measured and estimated by AA, this command allows the operator to configure the ratio of that measured bandwidth to be used by the ANL policer as the policer rate.

The **no** form of this command resets the values to defaults.

Default

no rate-percentage

Parameters

rate-percentage

Specifies an integer value that specifies a percentage that is applied against the ANL estimate maximum bandwidth to produce the actual rate that is used by the policer when ANL congestion occurs.

Values 0 to 200 (0: means drop all traffic)

Default 0

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rate-percentage-stage2

Syntax

rate-percentage-stage2 *rate-percentage*

no rate-percentage-stage2

Context

[Tree] (config>app-assure>group>policer rate-percentage-stage2)

Full Context

configure application-assurance group policer rate-percentage-stage2

Description

This command indirectly configures the rate used by Access-Network-Location (ANL) policers. Because ANL stage2 total bandwidth is dynamically measured and estimated by AA, this command allows the operator to configure the ratio of that measured bandwidth to be used by the ANL stage2 policer as the policer rate.

The **no** form of this command reverts to the default.

Parameters

rate-percentage

Specifies an integer value that specifies a percentage that is applied to the ANL estimated maximum bandwidth to produce the actual rate that is used by the policer when ANL stage2 congestion occurs. A value of 0 means that all traffic is dropped.

Values 0 to 200

Default 0

[Tree] (config>subscr-mgmt>ancp>policy>ingress rate-reduction)

Full Context

configure subscriber-mgmt ancp ancp-policy egress rate-reduction

configure subscriber-mgmt ancp ancp-policy ingress rate-reduction

Description

This command defines a constant rate reduction to the rate specified by the DSLAM. The **rate-reduction** command should be used if the node should adjust the rate to a value that is offset (for example by a fixed multicast dedicated bandwidth) compared to the total available on the DSLAM.

When set, the rate is:

DSLAM_RATE*adjust-rate/100 — rate-reduction

The **no** form of this command removes the value from the configuration.

Parameters

kilobits-per-second

Specifies the rate reduction to be applied for this subscriber.

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure subscriber-mgmt sla-profile egress bonding-selection rate-thresholds

Description

This command configures the rate thresholds that are required before decreasing or increasing the preferred link's weight with the specified change percentage.

The low threshold value must be lower than the high threshold value.

The **no** form of this command reverts to the default.

Default

rate-thresholds high 90 low 80

Parameters

high-percentage

Specifies the high threshold, as a percentage of the reference rate.

Values 56 to 99

low-percentage

Specifies the low threshold, as a percentage of the reference rate.

Values 55 to 98

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

38.41 rd

rd

Syntax

rd *file-url* **rf**

rd *file-url* [**force**]

Context

[Tree] (file rd)

Full Context

file rd

Description

If the directory is empty, the **rd** command is used to remove it. The **force** option executes the command without prompting the user to confirm the action.

If the directory contains files and/or subdirectories, the **rf** parameter must be used to remove the directory.

Example:

```
A:nE1>file cf1:\ # rd test
Are you sure (y/n)? y
Deleting directory cf1:\test ..MINOR: CLI Cannot delete cf1:\test.
A:nE1>file cf1:\ # rd test force
Deleting directory cf1:\test .MINOR: CLI Cannot delete cf1:\test.

A:nE1>file cf1:\ # rd testbase rf
Deleting all subdirectories and files in specified directory. y/n ?y
Deleting directory cf1:\testbase\testbase1 ..OK
Deleting directory cf1:\test .OK
```

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

file-url

Specifies the directory to be removed.

Values

local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each
remote-url	[{ftp:// | tftp://}*login*:*pswd@remote-locn/*][*file-path*]
	up to 247 characters
	directory length up to 99 characters each
remote-locn	[hostname | ipv4-address | [ipv6-address]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rf

Forces a recursive delete.

force

Forces an immediate deletion of the specified directory. The **rd** *file-url* **force** command executes the command without displaying a user prompt message.

Full Context

configure router policy-options route-distinguisher-list rd-entry

Description

This command creates a route distinguisher (RD) entry in the RD list, containing an IPv4 address or ASN and the assigned number.

The **no** form of the command deletes the RD entry from the list.

Parameters

rd

Specifies a route distinguisher matching an entry in one of the following formats:

- *a.b.c.d*/*m:** – RD in IPv4 format with a wildcard character (such as 10.0.0.0/16:*)
- *a.b.c.d*/*m:n* – RD in IPv4 format with a specific number (such as 10.0.0.2/32:535)
- *asn*:* – RD in ASN format with a wildcard character (such as 65000:*)
- *asn*:*n* – RD in ASN format with a specific number (such as 65000:535)

See the "Route distinguishers" section of the *7450 ESS, 7750 SR, 7950 XRS, and VSR Layer 3 Services Guide: IES and VPRN* for information about Type values.

38.46 re-establish-session

re-establish-session

Syntax

re-establish-session padr

no re-establish-session

Context

[Tree] (config>subscr-mgmt>ppp-policy re-establish-session)

Full Context

configure subscriber-mgmt ppp-policy re-establish-session

Description

This command enables host to reconnect and override existing session.

If disabled and a subscriber abruptly terminates a PPP sessions without sending a PADT to the BNG, the BNG denies any reconnect attempts until the stale PPP session has expired. With this, enabled re-establish-session eliminates the waiting period by allowing immediate PPP reconnection attempts.

The **no** form of this command reverts to the default.

Parameters

padr

Specifies that the existing session will be deleted upon reception of the PPPoE Active Discovery Request (PADR).

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure system security management-interface classic-cli read-algorithm

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies how encrypted configuration secrets are interpreted, and which encryption types are accepted, when secrets are input into the system or read from a configuration file (for example at system bootup time).

The **no** form of this command reverts to the default value.

Default

read-algorithm all-hash

Parameters

hash

Specifies hash. Use this option to transport a phrase between modules and nodes. In this case the write-algorithm should be **hash** as well.

hash2

Specifies hash2 which is module-specific.

custom

Specifies the custom encryption to management interface.

all-hash

Specifies that the system accepts hash or hash2.

[Tree] (config>service>vprn>if>sap>gre-tunnel reassembly)

[Tree] (config>service>ies>if>sap>gre-tunnel reassembly)

[Tree] (config>isa>tunnel-group reassembly)

Full Context

configure service vprn interface sap gre-tunnel reassembly

configure service ies interface sap gre-tunnel reassembly

configure isa tunnel-group reassembly

Description

This command configures IP packet reassembly for IPsec and GRE tunnels supported by an MS-ISA. The **reassembly** command at the tunnel-group level configures IP packet reassembly for all IPsec and GRE tunnels associated with the tunnel-group. The **reassembly** command at the GRE tunnel level configures IP packet reassembly for that one specific GRE tunnel, overriding the tunnel-group configuration.

The **no** form of this command disables IP packet reassembly.

Default

no reassembly (tunnel-group level)

reassembly (gre-tunnel level)

Parameters

wait

Specifies the maximum number of milliseconds that the ISA tunnel application will wait to receive all fragments of a particular IPsec or GRE packet. If one or more fragments are still missing when this limit is reached the partially reassembled datagram is discarded and an ICMP time exceeded message is sent to the source host (if allowed by the ICMP configuration of the sending interface). Internally, the configured value is rounded up to the nearest multiple of 100 ms.

Values 1 to 5000

Default 2000 (tunnel-group level)

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reassembly

Syntax

[**no**] **reassembly**

Full Context

configure router l2tp group mlppp reassembly-timeout

configure service vprn l2tp group mlppp reassembly-timeout

configure service vprn l2tp group tunnel mlppp reassembly-timeout

configure router l2tp group tunnel mlppp reassembly-timeout

Description

This command is applicable only to LNS. It determines the time during which the LNS keeps fragments of the same packet in the buffer before it discards them. The assumption is that if the fragments do not arrive within certain time, the chance is that they were lost somewhere in the network. In this case the partial packet cannot be reassembled and all fragments that has arrived up to this point and are stored in the buffer IS discarded to free up the buffer. Otherwise, a condition arises in which partial packets are held in the buffer until the buffer is exhausted.

The configuration under the tunnel hierarchy overrides the configuration under the group hierarchy.

The **no** form of this command reverts to the default.

Default

reassembly-timeout 1000

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

timeout

Specifies the reassembly timeout value.

Values 100, 1000 milliseconds

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the lease rebind timer (T2) via LUDB.

The T2 time is the time at which the client contacts any available addressing authority to extend the lifetimes of DHCPv6 leases. T2 is a time duration relative to the current time expressed in units of seconds.

The IP addressing authority controls the time at which the client contacts the addressing authority to extend the lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an IA. At time T1 for an IA, the client initiates a Renew/Reply message exchange to extend the lifetimes on any addresses in the IA. The client includes an IA option with all addresses/prefixes currently assigned to the IA in its Renew message. Recommended values for T1 and T2 are .5 and .8 times the shortest preferred lifetime of the addresses/prefixes in the IA that the addressing authority is willing to extend, respectively.

The configured rebind timer should always be longer than or equal to the renew timer.

The T1 and T2 are carried in the IPv6 address option that is within the IA.

The **no** form of this command reverts to the default.

Default

rebind-timer min 48

Parameters

rebind-timer

Specifies the preferred lifetime.

Values	**days** *days*	0 to 14
	hrs *hours*	0 to 23
	min *minutes*	0 to 59
	sec *seconds*	0 to 9

38.58 reboot

reboot

Syntax

reboot [**active** | **standby** | **upgrade**] [**now**]

Context

[Tree] (admin reboot)

Full Context

admin reboot

Description

This command reboots the router or one CPM and can also be used to force an upgrade of the system boot ROMs.

If no options are specified, the user is prompted to confirm the reboot operation. Answering yes (y) will result in both CPMs and all IOMs rebooting.

```
ALA-1>admin# reboot
Are you sure you want to reboot (y/n)?
```

Parameters

active

Reboots the active CPM.

Default active

standby

Reboots the standby CPM.

Default active

upgrade

Forces card firmware to be upgraded during chassis reboot. This option should only be used if it has been indicated as required in the Release Notes or by Nokia technical support. Normally, the 7450 ESS, 7750 SR, 7950 XRS, and VSR router OS automatically performs firmware upgrades on CPMs and XCM/IOM cards without the need for the **upgrade** keyword.

When the **upgrade** keyword is specified, a chassis flag is set for the BOOT Loader (boot.ldr) and on the subsequent boot of the OS on the chassis, firmware images on CPMs, XCMs, and IOMs will be upgraded automatically.

Firmware on CPMs, XCMs, or IOMs that are installed in a running chassis will be upgraded automatically. For example, if a card is inserted as the result of a hot swap, and the card

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

has a firmware version that is no longer compatible with the SR OS image running on the chassis, then the firmware on the card will be automatically upgraded before the card is brought online.

If the card firmware is upgraded, a chassis cardUpgraded (event 2032) log event is generated. The corresponding SNMP trap for this log event is tmnxEqCardFirmwareUpgraded.

During any firmware upgrade, automatic or manual, it is imperative that during the upgrade procedure:

- Power must not be switched off or interrupted.
- The system must not be reset.
- No cards are inserted or removed.

Any of the above conditions may render cards inoperable requiring a return of the card for resolution.

The time required to upgrade the firmware on the cards in the chassis depends on the number of cards to be upgraded. The progress of a firmware upgrade can be monitored at the console.

now

Forces a reboot of the router immediately without an interactive confirmation.

Platforms

All

reboot

Syntax

reboot [**now**] **upgrade**

Context

[Tree] (admin>satellite>eth-sat reboot)

Full Context

admin satellite eth-sat reboot

Description

The command initiates an administrative reboot of the specified Ethernet-satellite chassis.

Parameters

now

Causes the satellite to reboot immediately without further prompts or interactive confirmation.

upgrade

Causes the satellite to update its firmware image during chassis reboot.

configure service vprn rip group neighbor receive

configure service vprn ripng group neighbor receive

configure service vprn ripng group receive

configure service vprn rip receive

Description

This command configures the type(s) of RIP updates that will be accepted and processed.

If **both** or **version-2** is specified, the RIP instance listens for and accepts packets sent to the broadcast and multicast (224.0.0.9) addresses.

If **version-1** is specified, the router only listens for and accepts packets sent to the broadcast address.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This control can be issued at the global, group or interface level. The default behavior accepts and processes both RIPv1 and RIPv2 messages.

The **no** form of this command resets the type of messages accepted to both.

Default

no receive

Parameters

both

Accept RIP updates in either Version 1 or Version 2 format.

none

Do not accept and RIP updates.

version-1

Router should only accept RIP updates in Version 1 format.

version-2

Router should only accept RIP updates in Version 2 format.

configure router rip group receive

configure router rip group neighbor receive

configure router ripng group neighbor receive

configure router rip receive

Description

This command configures the types of RIP updates that will be accepted and processed.

If **both** or **version-2** is specified, the RIP instance listens for and accepts packets sent to the broadcast and multicast (224.0.0.9) addresses.

If **version-1** is specified, the router only listens for and accept packets sent to the broadcast address.

This control can be issued at the global, group or interface level. The default behavior is to accept and process both RIPv1 and RIPv2 messages.

The **no** form of the command reverts to the default value.

Default

receive both – in the config>router>rip context

receive version-1 – in the config>router>ripng context

Parameters

both

Specifies that RIP updates in either version 1 or version 2 format will be accepted.

none

Specifies that RIP updates will not be accepted.

version-1

Specifies that RIP updates in version 1 format only will be accepted.

version-2

Specifies that RIP updates in version 2 format only will be accepted.

38.61 receive-interval

receive-interval

Syntax

receive-interval *receive-interval*

no receive-interval

Context

[Tree] (config>lag>bfd>family receive-interval)

Full Context

configure lag bfd family receive-interval

Description

This command specifies the receive timer used for micro-BFD session over the associated LAG links.

The **no** form of this command removes the receive timer from the configuration.

Default

receive-interval 100

Parameters

receive-interval

Specifies the interval value, in milliseconds.

Values 10 to 100000

Default 100 for CPM3 or later, 1000 for all others

Platforms

All

receive-interval

Syntax

receive-interval *receive-interval*

no receive-interval

Context

[Tree] (config>router>bfd>bfd-template receive-interval)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router bfd bfd-template receive-interval

Description

This command specifies the receive timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.

The **no** form of this command reverts to the default value.

Default

receive-interval 100

Parameters

receive-interval

Specifies the receive interval. The minimum interval that can be configured is hardware dependent.

Values 10 ms to 100,000 ms in 1 ms intervals

Default 10 ms for CPM3 or higher; 1 second for other hardware

Platforms

All

receive-interval

Syntax

receive-interval *receive-interval*

no receive-interval

Context

[Tree] (config>router>lsp-bfd>tail-end receive-interval)

Full Context

configure router lsp-bfd tail-end receive-interval

Description

This command configures the LSP BFD minimum receive interval for the tail end of LSP BFD sessions.

The **no** form of this command reverts to the default value.

Default

receive-interval 1000

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

receive-interval

Specifies the receive interval, in milliseconds.

Values 100 to 1000

Default 1000

configure service vprn msdp group peer receive-msdp-msg-rate

configure service vprn msdp group receive-msdp-msg-rate

configure service vprn msdp peer receive-msdp-msg-rate

Description

This command limits the number of Multicast Source Discovery Protocol (MSDP) messages that are read from the TCP session. It is possible that an MSDP/ RP router may receive a large number of MSDP protocol message packets in a particular source active message.

After the number of MSDP packets (including source active messages) defined in the threshold have been processed, the rate of all other MSDP packets is rate limited by no longer accepting messages from the TCP session until the time (seconds) has elapsed.

The **no** form of this command reverts this active-source limit to default operation.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no receive-msdp-msg-rate

Parameters

number

Defines the number of MSDP messages (including source active messages) that are read from the TCP session per the number of seconds.

Values 10 to 10000

Default 0

interval *seconds*

Defines the time that, together with the *number* parameter, defines the number of MSDP messages (including source active messages) that are read from the TCP session within the configured number of seconds.

Values 1 to 600

Default 0

threshold number

The number of MSDP messages can be processed before the MSDP message rate limiting function described above is activated; this is particularly of use during at system startup and initialization.

Values 1 to 1000000

Default 0

Full Context

configure router msdp group peer receive-msdp-msg-rate

configure router msdp group receive-msdp-msg-rate

configure router msdp receive-msdp-msg-rate

configure router msdp peer receive-msdp-msg-rate

Description

This command configures the limit for the number of MSDP messages that are read from the TCP session.

An MSDP or RP router may receive a large number of MSDP protocol message packets in an SA message. After the number of processed MSDP packets (including SA messages) reaches the specified limit, the rate of all other MSDP packets is rate limited. The router stops accepting messages from the TCP session until the specified time interval has elapsed.

The **no** form of this command sets no limit on the number of MSDP and SA limit messages that are accepted.

Default

no receive-msdp-msg-rate

Parameters

number

Specifies the maximum number of MSDP messages (including SA messages) to read from the TCP session in the configured time interval.

Values 10 to 10000

seconds

Specifies the time interval, in seconds, for which to limit the maximum number of MSDP messages that are read from the TCP session.

Values 1 to 600

threshold

Specifies the maximum number of MSDP messages that can be processed before the MSDP message rate limiting function is activated; this parameter is useful during system startup and initialization.

Values 1 to 1000000

no reclassify-using-qos

Context

[Tree] (config>service>ies>if>vpls>egress reclassify-using-qos)

Full Context

configure service ies interface vpls egress reclassify-using-qos

Description

The reclassify-using-qos command is used to specify a sap-egress QoS policy that will be used to reclassify the forwarding class and profile of egress routed packets on the VPLS or I-VPLS service. When routed packets associated with the IP interface egress a VPLS SAP, the reclassification rules within the sap-egress QoS policy applied to the SAP are always ignored (even when reclassify-using-qos is not defined).

Any queues or policers defined within the specified QoS policy are ignored and are not created on the VPLS egress SAPs. Instead, the routed packets continue to use the forwarding class mappings, queues and policers from the sap-egress QoS policy applied to the egress VPLS SAP.

While the specified sap-egress policy ID is applied to an IP interface it cannot be deleted from the system.

The **no** form of this command removes the sap-egress QoS policy used for reclassification from the egress IP interface. When removed, IP routed packets will not be reclassified on the egress SAPs of the VPLS service attached to the IP interface.

Parameters

policy-id

Specifies the SAP egress QoS policy ID. This parameter is required when executing the reclassify-using-qos command. The specified SAP egress QoS ID must exist within the system or the command fails.

Platforms

Full Context

configure router mpls lsp secondary record

configure router mpls lsp primary record

configure router mpls lsp-template record

configure router mpls lsp primary-p2mp-instance record

Description

This command enables recording of all the hops that an LSP path traverses. Enabling **record** increases the size of the PATH and RESV refresh messages for the LSP since this information is carried end-to-end along the path of the LSP. The increase in control traffic per LSP may impact scalability.

The config>router>mpls>lsp>primary-p2mp-instance>record command is not supported on the 7450 ESS.

The **no** form of this command disables the recording of all the hops for the given LSP. There are no restrictions as to when the **no** command can be used. The **no** form of this command also disables the **record-label** command.

Default

record

record

Syntax

record {**all-hosts** | **http-host-app-filter-candidates**}

Context

[Tree] (debug>app-assure>group>http-host>filter record)

Full Context

debug application-assurance group http-host-recorder filter record

Description

This command configures which http-host are selected for the http-host-recorder. It is either any http-host values going through the AA ISA or the http-host corresponding to flows not matching a string based app-filter.

For the feature to work it is required to configure at least one app-filter to catch the HTTP protocol signature.

Parameters

all-hosts | http-host-app-filter-candidates

Specifies which hosts the recorder will record

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values	all-hosts, http-host-app-filter-candidates
Default	http-host-app-filter-candidates

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

record

Syntax

[**no**] **record** *record-name*

Context

[Tree] (config>log>acct-policy record)

Full Context

configure log accounting-policy record

Description

This command adds the accounting record type to the accounting policy that is forwarded to the configured accounting file. A record name can only be used in one accounting policy. To obtain a list of all record types that can be configured, use the **show log accounting-records** command.

Note:
aa, video, and subscriber records are not applicable to the 7950 XRS.

To configure an accounting policy for access ports, select a service record (for example, service-ingress-octets). To change the record name to another service record, enter the **record** command with the new record name and it replaces the old record name.

When configuring an accounting policy for network ports, select a network record. To change the record name to another network record, enter the **record** command with the new record name and it replaces the old record name.

If the change required modifies the record from network to service or from service to network, then the old record name must be removed using the **no** form of this command.

Only one record can be configured in a single accounting policy. For example, if an accounting-policy is configured with an **access-egress-octets** record, to change it to a **service-ingress-octets** record, use the **no record** command under the accounting-policy to remove the old record first, and then enter the **service-ingress-octets** record.

Note:
Collecting excessive statistics can adversely affect the CPU utilization and take up large amounts of storage space.

The **no** form of this command removes the record type from the policy.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

38.74 record-stats

record-stats

Syntax

record-stats {**delay** | **loss** | **delay-and-loss**}

no record-stats

Context

[Tree] (config>oam-pm>session>ip>twamp-light record-stats)

Full Context

configure oam-pm session ip twamp-light record-stats

Description

This option provides the ability to determine which statistics are recorded. The TWAMP-Light PDU can report on both delay and loss using a single packet. The operator may choose which statistics they would like to report. Only delay recording is on by default. All other metrics are ignored. In order to change what is being recorded and reported, the TWAMP-Light session must be shutdown. This is required because the single packet approach means the base statistics are shared between the various datasets. Issuing a **no shutdown** command clears previous all non-volatile memory for the session and allocate new memory blocks. All the parameters under this context are mutually exclusive.

The **no** version of the command restores the default "delay” only.

Default

record-stats delay

Parameters

delay

Specifies report on delay using a single packet..

loss

Specifies to report on loss using a single packet..

delay-and-loss

Specifies to report on both delay and loss using a single packet.

configure router l2tp failover recovery-method

configure router l2tp group failover recovery-method

configure service vprn l2tp group failover recovery-method

configure router l2tp group tunnel failover recovery-method

Description

This command sets the recovery method to be used for newly created tunnels.

The **no** form of this command reverts to the default.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

recovery-method mcs on config>router>l2tp>failover and config>service>vprn>l2tp>failover

recovery-method default on config>router>l2tp>group>failover

recovery-method default on config>router>l2tp>group>tunnel>failover

recovery-method default on config>service>vprn>l2tp>group>failover

recovery-method default on config>service>vprn>l2tp>group>tunnel>failover

Parameters

method

Describes how a pair of redundant LAC peers recover tunnel and session state (sequence numbers, for example) immediately after a failover.

Note:
While failover is enabled, the tunnels and sessions proper are always kept synchronized between the redundant pair, regardless of the recovery method for the sequence numbers when a failover really occurs.

Values **mcs** — Specifies that the stateful information is recovered from the failover peer directly, using Multi-Chassis Redundancy Synchronization (MCS).

recovery-tunnel — Specifies that the stateful information is recovered as described in RFC 4951, *Fail Over Extensions for Layer 2 Tunneling Protocol (L2TP)*. This method uses a recovery tunnel to the L2TP peer to pass the stateful information.

default — Specifies that the actual value must be derived from another object of the same type with a wider scope. Takes the value of the next higher level (not available in **config>router>l2tp>failover** and **config>service>vprn>l2tp>failover**).

Platforms

38.85 redirect-policy

redirect-policy

Syntax

redirect-policy *redirect-policy-name* [**create**]

no redirect-policy *redirect-policy-name*

Context

[Tree] (config>filter redirect-policy)

Full Context

configure filter redirect-policy

Description

This command, creates a configuration context for the specified redirect policy.

The **no** form of the command removes the redirect policy from the filter configuration only if the policy is not referenced in a filter and the filter is not in use (applied to a service or network interface).

Parameters

redirect-policy-name

Specifies the redirect policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes. There is no limit to the number of redirect policies that can be configured.

create

This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

Platforms

All

redirect-policy

Syntax

redirect-policy *redirect-policy-name* **destination** *ip-address*

no redirect-policy *redirect-policy-name* [**destination** *ip-address*]

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure filter redirect-policy-binding redirect-policy

Description

This command adds the destination (specified by its IP address) of a redirect-policy (specified by its name) to the binding. An error is thrown if either the destination does not exist for the specified redirect-policy or if the redirect-policy does not exist.

The **no** form of the command removes from the binding from all the destinations of the specified redirect-policy, or only the specified destination.

Parameters

redirect-policy-name

Specifies the name of the redirect-policy (up to 32 characters) as the destination that is to be added to the binding.

ip-address

The IP address of the destination. This can be an IPv4 or IPv6 address.

Values

ipv4-address:	a.b.c.d.
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

redirect-policy-binding *name* [**create**]

no redirect-policy-binding *name*

Context

[Tree] (config>filter redirect-policy-binding)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure filter redirect-policy-binding

Description

This command creates a redirect-policy binding (specified by its name) in case it does not exist and, enters the context associated with it. When a redirect-policy binding is created, no destination is associated to this binding by default and the binding operator is set to AND.

The **no** form of this command deletes the redirect-policy binding and all the associated configuration information.

Parameters

name

Specifies the name of the binding. Possible values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotations.

create

This keyword is required to create the binding if it does not exist. This has no effect when used with an existing binding.

Platforms

All

38.87 redirect-url

redirect-url

Syntax

redirect-url *redirect-url*

no redirect-hurl

Context

[Tree] (config>app-assure>group>http-redirect redirect-url)

Full Context

configure application-assurance group http-redirect redirect-url

Description

This command configures the http redirect URL which is the URL (page) that the user is redirected to when an HTTP redirect takes effect.

The operator can select the URL arguments to include in the redirect-url using either a specific template-id or by configuring the redirect-url using any of the supported macro substitution keywords. Only ESM and ESM-MAC sub types support $MAC, $SAP, $CID, and $RID macro substitution.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the redirect-url field from the configuration.

Parameters

redirect-url

Specifies the URL of the landing page

Values **macro substitutions**:

$CATID	The category ID.
$CATNAME	The category name of the URL.
$URL	The Request-URI in the HTTP GET Request received.
$SUB	A string that represents the subscriber ID.
$IP	A string that represents the IP address of the subscriber host.
$RTRID	A string that represents the router ID.
$URLPRM	The HTTP URL parameter associated with the subscriber.
$MAC	A string that represents the MAC address of the subscriber host.
$SAP	A string that represents a SAP ID.
$CID	A string that represents the circuit-id or interface-id of the subscriber host (hexadecimal format).
$RID	A string that represents the remote-id of the subscriber host (hexadecimal format).

38.90 redirection-policy

redirection-policy

Syntax

redirection-policy *policy-name*

no redirection-policy

Context

[Tree] (config>subscr-mgmt>igmp-policy redirection-policy)

Full Context

configure subscriber-mgmt igmp-policy redirection-policy

Description

This command will apply multicast redirection action to the subscriber. The redirection action along with the redirected interface (and possibly service id) is defined in the referenced policy-name. IGMP messages is redirected to an alternate interface if that alternate interface has IGMP enabled. The alternate interface does not have to have any multicast groups registered via IGMP. Currently all IGMP messages are redirected and there is no ability to selectively redirect IGMP messages based on match conditions (multicast-group address, source IP address, and so on). Multicast redirection is supported between VPRN services and also between interfaces within the Global Routing Context. Multicast Redirection is not supported between the VPRN services and the Global Routing Table (GRT).

IGMP state is maintained per subscriber host and per redirected interface. Traffic is however forwarded only on the redirected interface.

The **no** form of this command reverts to the default value.

Parameters

policy-name

Specifies the redirection policy to be applied to this host IGMP policy up to 32 characters. This is a policy defined in the **config>router>policy-option>policy-statement** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>subscr-mgmt>mld-policy redirection-policy)

Full Context

configure subscriber-mgmt mld-policy redirection-policy

Description

This command applies multicast redirection action to the subscriber. The redirection action along with the redirected interface (and possibly service id) is defined in the referenced policy-name. MLD messages is redirected to an alternate interface if that alternate interface has MLD enabled. The alternate interface does not have to have any multicast groups registered via MLD. Currently all MLD messages are redirected and there is no ability to selectively redirect MLD messages based on match conditions (multicast-group address, source IP address, and so on). Multicast redirection is supported between VPRN services and also between interfaces within the Global Routing Context. Multicast Redirection is not supported between the VPRN services and the Global Routing Table (GRT).

MLD state is maintained per subscriber host and per redirected interface. Traffic is however forwarded only on the redirected interface.

The **no** form of this command removes the policy name from the configuration.

Parameters

policy-name

Specifies a redirection policy name up to 32 characters. This is a regular policy defined under the **configure>router>policy-option>policy-statement** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service ies subscriber-interface group-interface icmp redirects

configure service ies interface icmp redirects

configure service vprn interface icmp redirects

Description

This command configures the rate for Internet Control Message Protocol (ICMP) redirect messages issued on the router interface.

When routes are not optimal on this router and another router on the same subnetwork has a better route, the router can issue an ICMP redirect to alert the sending node that a better route is available.

The **redirects** command enables the generation of ICMP redirects on the router interface. The rate at which ICMP redirects is issued can be controlled with the optional *number* and *seconds* parameters by

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

indicating the maximum number of redirect messages that can be issued on the interface for a given time interval.

The **no** form of this command disables the generation of ICMP redirects on the router interface.

Default

redirects 100 10

Parameters

number

Specifies the maximum number of ICMP redirect messages to send. This parameter must be specified with the *second* parameter.

Values 10 to 1000

seconds

Specifies the time frame in seconds used to limit the *number* of ICMP redirect messages that can be issued.

Values 1 to 60

Platforms

All

configure subscriber-mgmt group-interface-template ipv4 icmp redirects

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the ICMPv4 redirect messages that are generated when routes are not optimal on the router and the node needs to be alerted that another router on the same subnetwork has a better route available.

When disabled, ICMPv4 redirects are not generated.

The **no** form of this command disables generation of redirect messages.

Default

redirects number 100 seconds 10

Parameters

number

Specifies the number of ICMPv4 redirects that are issued in the time frame specified by the *seconds* parameter.

Values 10 to 1000

Default 100

seconds

Specifies the time, in seconds, that is used to limit the number of ICMPv4 redirects issued.

Values 1 to 60

Default 10

[Tree] (config>router>if>icmp redirects)

Full Context

configure router interface icmp redirects

Description

This command enables and configures the rate for ICMP redirect messages issued on the router interface.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When routes are not optimal on this router, and another router on the same subnetwork has a better route, the router can issue an ICMP redirect to alert the sending node that a better route is available.

The **redirects** command enables the generation of ICMP redirects on the router interface. The rate at which ICMP redirects are issued can be controlled with the optional *number* and *time* parameters by indicating the maximum number of redirect messages that can be issued on the interface for a given time interval.

By default, generation of ICMP redirect messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP redirects on the router interface.

Default

redirects 100 10 — Maximum of 100 redirect messages in 10 seconds.

Parameters

number

The maximum number of ICMP redirect messages to send, expressed as a decimal integer. This parameter must be specified with the *time* parameter.

Values 10 to 1000

seconds

The time frame, in seconds, used to limit the *number* of ICMP redirect messages that can be issued, expressed as a decimal integer.

Values 1 to 60

Context

[Tree] (config>router>if>ipv6>icmp6 redirects)

Full Context

configure router interface ipv6 icmp6 redirects

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the rate for ICMPv6 redirect messages. When configured, ICMPv6 redirects are generated when routes are not optimal on the router and another router on the same subnetwork has a better route to alert that node that a better route is available.

The **no** form of this command disables ICMPv6 redirects.

Default

redirects 100 10 (when IPv6 is enabled on the interface)

Parameters

number

Limits the number of redirects issued per the time frame specified in *seconds* parameter.

Values 10 to 1000

seconds

Determines the time frame, in seconds, that is used to limit the number of redirects issued per time frame.

Values 1 to 60

39.2 redistribute-delay

redistribute-delay

Syntax

redistribute-delay *redistribute-delay*

no redistribute-delay

Context

[Tree] (config>router>ospf>timers redistribute-delay)

[Tree] (config>router>ospf3>timers redistribute-delay)

Full Context

configure router ospf timers redistribute-delay

configure router ospf3 timers redistribute-delay

Description

This command sets the internal OSPF hold down timer for external routes being redistributed into OSPF.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Shorting this delay can speed up the advertisement of external routes into OSPF but can result in additional OSPF messages if that source route is not yet stable.

The **no** form of this command resets the timer value back to the default value.

Note:
The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is greater than or equal to 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default

redistribute-delay 1000

Parameters

redistribute-delay

Specifies the OSPF redistribution hold down time in milliseconds for external routes being advertised into OSPF.

Values 0 to 1000

Platforms

All

39.3 redistribute-external

redistribute-external

Syntax

39.4 redo

redo

Syntax

redo [*count*]

Context

[Tree] (candidate redo)

Full Context

candidate redo

Description

This command reapplies the changes to the candidate that were removed using a previous undo. All undo or redo history is lost when the operator exits **edit-cfg** mode.

A **redo** command is blocked if another user has made changes in the same CLI branches that would be impacted during the redo.

Parameters

count

Specifies the number of previous changes to reapply.

Values 1 to 50

Default 1

Platforms

All

39.5 reduced-prompt

reduced-prompt

Syntax

reduced-prompt [*no-of-nodes-in-prompt*]

no reduced-prompt

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (environment reduced-prompt)

Full Context

environment reduced-prompt

Description

This command configures the maximum number of higher CLI context levels to display in the CLI prompt for the current CLI session. This command is useful when configuring features that are several node levels deep, causing the CLI prompt to become too long. By default, the CLI prompt displays the system name and the complete context in the CLI.

The number of *nodes* specified indicates the number of higher-level contexts that can be displayed in the prompt. For example, if reduced prompt is set to 2, the two highest contexts from the present working context are displayed by name with the hidden (reduced) contexts compressed into a ellipsis ("…").

```
A:ALA-1>environment# reduced-prompt 2
A:ALA-1>config>router# interface to-103
A:ALA-1>...router>if#
```

The setting is not saved in the configuration. It must be reset for each CLI session or stored in an **exec** script file.

The **no** form of the command reverts to the default.

Default

no reduced-prompt

Parameters

no-of-nodes-in-prompt

Specifies the maximum number of higher-level nodes displayed by name in the prompt, expressed as a decimal integer.

Values 0 to 15

Default 2

configure redundancy

Description

This command allows the user to perform redundancy operations.

Associated commands include the following in the **admin>redundancy** context:

- **force-switchover** - Forces a switchover to the standby CPM card.
- **now** - Switch to standby CPM.

  Switching to the standby displays the following message.

  ```
  WARNING: Configuration and/or Boot options may have changed since the last save.

  Are you sure you want to switchover (y/n)?
  ```
- **synchronize** - Synchronizes the secondary CPM.

redundancy

Syntax

redundancy {**active-active** | **active-standby** | **l2aware-bypass**}

no redundancy

Context

[Tree] (config>isa>nat-group redundancy)

Full Context

configure isa nat-group redundancy

Description

This command configures intra-chassis redundancy mode for the NAT group.

Default

redundancy active-standby

Parameters

active-active

Specifies the mode in which all MS-ISAs in a NAT group are active. If one or two MS-ISAs in the system fail, the remaining active MS-ISA accepts the load from the failed MS-ISAs.

active-standby

Specifies the mode in which one or more MS-ISAs in the NAT group are in standby mode. While in standby mode, MS-ISAs do not process traffic. Traffic is diverted to the standby MS-ISA only when the active MS-ISA fails, at which point the standby becomes active.

l2-aware-bypass

Specifies that when an ISA MDA fails, NAT reroutes its traffic based on the regular destination address lookup. This resiliency mode is applicable only to L2-Aware NAT. When the MS-ISA fails, its traffic is routed via regular routing (destination-based lookup). The assumption is that traffic is sent to an external NAT device that serves as a backup NAT device.

no redundant-interface

Context

[Tree] (config>subscr-mgmt>up-resiliency>fsg-template redundant-interface)

Full Context

configure subscriber-mgmt up-resiliency fate-sharing-group-template redundant-interface

Description

This command configures downstream traffic shunting from a standby BNG-UP to an active BNG-UP. Downstream traffic that is received for standby sessions is sent over the redundant interface to the active BNG-UP. This requires the configuration of the **multi-chassis-shunt-id** command in the service that receives the session traffic.

The **no**form of the command removes the configuration.

Parameters

service-id

Specifies the name of the VPRN or IES service that contains the redundant interface, up to 64 characters. This can be different from the service where session traffic is terminated.

interface-name

Specifies the redundant interface name, up to 32 characters. It must exist within the configured *service-id*.

no ref-order

Context

[Tree] (config>system>sync-if-timing ref-order)

Full Context

configure system sync-if-timing ref-order

Description

The synchronous equipment timing subsystem can lock to different timing reference inputs, those specified in the **ref1**, **ref2**, **bits**, **synce**, **ptp**, and **gnss** command configuration. This command organizes the priority order of the timing references.

If a reference source is disabled, then the clock from the next reference source as defined by **ref-order** is used. If all reference sources are disabled, then clocking is derived from a local oscillator.

If a **sync-if-timing** reference is linked to a source port that is operationally down, the port is no longer qualified as a valid reference.

For 7450 ESS and 7750 SR systems with two CPM modules, the system distinguishes between the BITS inputs on the active and standby CPMs. The active CPM will use its BITS input port providing that port is qualified. If the local port is not qualified, then the active CPM will use the BITS input port from the standby CPM as the next priority reference. For example, the normal **ref-order** of **bits ref1 ref2** will actually be **bits** (active CPM), followed by **bits** (standby CPM), followed by **ref1**, followed by **ref2**.

For 7950 XRS systems with two CPMs and two CCMs, the system distinguishes between the BITS inputs on the CCMs associated with the active and standby CPMs. The active CPM will use the BITS input port on the associated CCM, provided that the port is qualified. If the local port is not qualified, then the active CPM will use the BITS input port from the CCM associated with the standby CPM as the next priority reference. For example, the normal ref-order of **bits ref1 ref2** will actually be **bits** (active CCM), followed by **bits** (standby CCM), followed by **ref1**, followed by **ref2**.

The SyncE/1588 port of the CPM or CCM can be used as a frequency input reference. It shares internal resources with the BITS input ports and so only one can be used at a time. The BITS port shall have priority, if BITS input is enabled, then the SyncE port cannot be enabled.

Similar to the BITS input ports, when the **synce** reference is enabled and in the **ref-order**, the system distinguishes between the **synce** inputs on the active and standby CPM/CCMs. The active CPM/CCM uses its **synce** input port if that port is qualified. If the local port is not qualified, the active CPM uses the synce input port from the standby CPM/CCM as the next priority reference. For example, the **ref-order** of **synce ref1 ref2** will actually be synce (active CPM/CCM), followed by **synce** (standby CPM/CCM), followed by **ref1**, followed by **ref2**.

The **no** form of the command resets the reference order to the default values.

Default

bits synce ref1 ref2 ptp gnss (7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1-x-48D, 7750 SR-1-x-92S, 7750 SR-1se, 7750 SR-2se)

bits synce ref1 ref2 ptp (7750 SR-7, 7750 SR-12 and 7750 SR-12e with CPM-5, 7950 XRS-20, 7950 XRS-20e, 7750 SR-7s, 7750 SR-14s, 7450 ESS-7, 7450 ESS-12)

no reference-bandwidth

Context

[Tree] (config>service>vprn>isis reference-bandwidth)

Full Context

configure service vprn isis reference-bandwidth

Description

This command configures the reference bandwidth that provides the basis of bandwidth relative costing.

In order to calculate the lowest cost to reach a specific destination, each configured level on each interface must have a cost. If the reference bandwidth is defined, then the cost is calculated using the following formula:

cost = reference – bandwidth # bandwidth

If the reference bandwidth is configured as 10 Gigabits (10,000,000,000), a 100 M/bps interface has a default metric of 100. In order for metrics in excess of 63 to be configured, wide metrics must be deployed. (See **wide-metrics-only** in the **config>router>isis** context.)

If the reference bandwidth is not configured, all interfaces have a default metric of 10.

The **no** form of this command reverts to the default value.

Default

no reference-bandwidth — No reference bandwidth is defined. All interfaces have a metric of 10.

Parameters

Zetta-bps

Specifies the reference bandwidth in zettabits per second, expressed as a decimal integer.

Values 1 to 18

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Exa-bps

Specifies the reference bandwidth in exabits per second, expressed as a decimal integer.

Values 1 to 999

[Tree] (config>service>vprn>ospf reference-bandwidth)

Full Context

configure service vprn ospf3 reference-bandwidth

configure service vprn ospf reference-bandwidth

Description

This command configures the reference bandwidth in kilobits per second (kb/s) that provides the reference for the default costing of interfaces based on their underlying link speed.

The default interface cost is calculated as follows:

cost = reference–bandwidth # bandwidth

The default *reference-bandwidth* is 100,000,000 kb/s or 100 Gb/s, so the default auto-cost metrics for various link speeds are as follows:

- 10 Mb/s link default cost of 10000
- 100 Mb/s link default cost of 1000
- 1 Gb/s link default cost of 100
- 10 Gb/s link default cost of 10
- 40 Gb/s link default cost of 2
- 100 Gb/s link default cost of 1
- 400 Gb/s link default cost of 1

Note:
The default **reference-bandwidth** value must be manually configured to a higher value if interface speeds are greater than 100 Gb/s, and metrics based on link speed are used. When the default **reference-bandwidth** value is used, a metric of 1 is set on all interface speeds ≥ 100 Gb/s. For example, 100 GE, 100 GE LAG, 400 GE, and 400 GE LAG interfaces will all have a metric of 1.

If the reference bandwidth is configured as 10 Gb (reference-bandwidth 10000000000), a 100 Mb/s interface has a default metric of 100.

When a very large reference bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, OSPF automatically reverts to the maximum configurable cost metric.

The reference-bandwidth command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** *metric* command configured in the **config>router>ospf>area>if** *ip-int-name* context.

The **no** form of this command reverts the reference bandwidth to the default value.

Default

reference-bandwidth 100000000

Parameters

bandwidth-in-kbps

Specifies the reference bandwidth in kilobits per second expressed as a decimal integer.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 4000000000

Context

[Tree] (config>router>isis reference-bandwidth)

Full Context

configure router isis reference-bandwidth

Description

This command configures the reference bandwidth that provides the basis of bandwidth relative costing.

To calculate the lowest cost to reach a specific destination, each configured level on each interface must have a cost. If the reference bandwidth is defined, then the cost is calculated using the following formula:

cost = reference-bandwidth # bandwidth

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the reference bandwidth is configured as 10 Gb (**reference-bandwidth** 10000000000), a 100 Mb/s interface has a default metric of 100. To configure metrics in excess of 63, wide metrics must be deployed (see **wide-metrics-only** in the **config>router>isis** context).

When a large **reference-bandwidth** value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, IS-IS automatically reverts to the maximum configurable cost metric.

If the reference bandwidth is not configured, then all interfaces have a default metric of 10.

The **no** form of this command reverts to the default value.

Default

no reference-bandwidth

Parameters

bandwidth-in-kbps

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

Values 1 to 18446744073709551615

Zetta-bps

Specifies the reference bandwidth in zettabits per second, expressed as a decimal integer.

Values 1 to 18

Exa-bps

Specifies the reference bandwidth in exabits per second, expressed as a decimal integer.

Values 1 to 999

Peta-bps

Specifies the reference bandwidth in petabits per second, expressed as a decimal integer.

Values 1 to 999

Tera-bps

Specifies the reference bandwidth in terabits per second, expressed as a decimal integer.

Values 1 to 999

Giga-bps

Specifies the reference bandwidth in gigabits per second, expressed as a decimal integer.

Values 1 to 999

Mega-bps

Specifies the reference bandwidth in megabits per second, expressed as a decimal integer.

Values 1 to 999

Kilo-bps

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

no reference-bandwidth

Context

[Tree] (config>router>ospf reference-bandwidth)

[Tree] (config>router>ospf3 reference-bandwidth)

Full Context

configure router ospf reference-bandwidth

configure router ospf3 reference-bandwidth

Description

This command configures the reference bandwidth in kilobits per second (kb/s) that provides the reference for the default costing of interfaces based on their underlying link speed.

The default interface cost is calculated as follows:

cost = reference-bandwidth # bandwidth

The default *reference-bandwidth* is 100,000,000 kb/s or 100 Gb/s, the default auto-cost metrics for various link speeds are as follows:

- 10 Mb/s link default cost of 10000
- 100 Mb/s link default cost of 1000
- 1 Gb/s link default cost of 100
- 10 Gb/s link default cost of 10
- 100 Gb/s link default cost of 1
- 400 Gb/s link default cost of 1

Note:
The default reference-bandwidth must be manually configured to a higher value if interface speeds are greater than 100 Gb/s, and metrics based on link speed are used. When the default reference-bandwidth is used, a metric of 1 is set on all interface speeds ≥ 100 Gb/s. For example, 100 GE, 100 GE LAG, 400 GE, and 400 GE LAG interfaces will all have a metric of 1.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the reference bandwidth is configured as 10 Gb (reference-bandwidth 10000000000), a 100 Mb/s interface has a default metric of 100.

When a very large reference bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, OSPF automatically reverts to the maximum configurable cost metric.

The **reference-bandwidth** command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** *metric* command configured in the **config>router>ospf>area>interface** *ip-int-name* context.

The **no** form of this command reverts to the default value.

Default

reference-bandwidth 100000000

Parameters

bandwidth-in-kbps

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

Values 1 to 18446744073709551615

39.17 reflect-pad

reflect-pad

Syntax

[**no**] **reflect-pad**

Context

[Tree] (config>oam-pm>session>mpls>dm reflect-pad)

Full Context

configure oam-pm session mpls dm reflect-pad

Description

This command enables copying the padding in each MPLS-DM query to the response.

When padding is included in the DM frame the option exists to reflect the padding back in the direction of the source or remove the padding. The removal of the pad-tlv is good practice when using unidirectional tunnels such as RSVP.

This command uses the mandatory TLV type 0, instructing the responder to include the pad TLV from the response. The no form of this command uses the optional TVL type 128, instructing the responder to remove the pad TLV from the response.

The **no** form of this command disables copying the padding in each MPLS-DM query to the response.

39.18 reflector

reflector

Syntax

reflector [**udp-port** *udp-port-number*] [**create**]

no reflector

Context

[Tree] (config>router>twamp-light reflector)

[Tree] (config>service>vprn>twamp-light reflector)

Full Context

configure router twamp-light reflector

configure service vprn twamp-light reflector

Description

This command configures a TWAMP Light session reflector parameters and to enable TWAMP Light functionality with the **no shutdow**n command. The **udp-port** keyword and value must be specified with the **create** keyword. An error message is generated if the specific UDP port is unavailable.

Parameters

udp-port-number

Specifies the UDP port number. A strictly enforced restricted range has been introduced. The TWAMP Light session reflector must be brought in line with this new restriction prior upgrading or rebooting from any previous release if there is an active TWAMP Light session reflector configured. Failure to do so prevents an ISSU operation from proceeding and fails to activate any reflector outside of the enforced range.

Note that in the Two-Way Active Measurement Protocol Light (TWAMP Light) section for a complete description. This parameter is required and specifies the destination udp-port that the session reflector uses to listen for TWAMP Light packets. The session controller launching the TWAMP Light packets must be configured with the same destination UDP port as part of the TWAMP Light test. The IES service uses the destination UDP port that is configured under the **router** context. Only one UDP port can be configured per unique context.

Values 862, 64364 to 64373

39.19 refresh-reduction

refresh-reduction

Syntax

[**no**] **refresh-reduction**

Context

[Tree] (config>router>rsvp>interface refresh-reduction)

Full Context

configure router rsvp interface refresh-reduction

Description

This command enables the use of the RSVP overhead refresh reduction capabilities on this RSVP interface.

When this option is enabled, a node will enable support for three capabilities. It will accept bundles RSVP messages from its peer over this interface, it will attempt to perform reliable RSVP message delivery to

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

its peer, and will use summary refresh messages to refresh path and resv states. The reliable message delivery must be explicitly enabled by the user after refresh reduction is enabled. The other two capabilities are enabled immediately.

A bundle message is intended to reduce overall message handling load. A bundle message consists of a bundle header followed by one or more bundle sub-messages. A sub-message can be any regular RSVP message except another bundle message. A node will only process received bundled RSVP messages but will not generate them.

When reliable message delivery is supported by both the node and its peer over the RSVP interface, an RSVP message is sent with a message_id object. A message_id object can be added to any RSVP message when sent individually or as a sub-message of a bundled message.

if the sender sets the ack_desired flag in the message_id object, the receiver acknowledges the receipt of the RSVP message by piggy-backing a message_ack object to the next RSVP message it sends to its peer. Alternatively, an ACK message can also be used to send the message_ack object. In both cases, one or many message_ack objects could be included in the same message.

The router supports the sending of separate ACK messages only but is capable of processing received message_ack objects piggy-backed to hop-by-hop RSVP messages, such as path and resv.

The router sets the ack_desired flag only in non-refresh RSVP messages and in refresh messages which contain new state information.

A retransmission mechanism based on an exponential backoff timer is supported in order to handle unacknowledged message_id objects. The RSVP message with the same message_id is retransmitted every 2 * rapid-retransmit-time interval of time. The rapid-retransmit-time is referred to as the rapid retransmission interval as it must be smaller than the regular refresh interval configured in the **config>router>rsvp>refresh-time** context. There is also a maximum number of retransmissions of an unacknowledged RSVP message rapid-retry-limit. The node will stop retransmission of unacknowledged RSVP messages whenever the updated backoff interval exceeds the value of the regular refresh interval or the number of retransmissions reaches the value of the rapid-retry-limit parameter, whichever comes first. These two parameters are configurable globally on a system in the **config>router>rsvp** context.

Refresh summary consists of sending a summary refresh message containing a message_id list object. The fields of this object are populated each with the value of the message_identifier field in the message_id object of a previously sent individual path or resv message. The summary refresh message is sent every refresh regular interval as configured by the user using the refresh-time command in the **config>router>rsvp** context. The receiver checks each message_id object against the saved path and resv states. If a match is found, the state is updated as if a regular path or resv refresh message was received from the peer. If a specific message_identifier field does not match, then the node sends a message_id_nack object to the originator of the message.

The above capabilities are referred to collectively as "refresh overhead reduction extensions”. When the refresh-reduction is enabled on an RSVP interface, the node indicates this to its peer by setting a "refresh-reduction-capable” bit in the flags field of the common RSVP header. If both peers of an RSVP interface set this bit, all the above three capabilities can be used. Furthermore, the node monitors the settings of this bit in received RSVP messages from the peer on the interface. As soon as this bit is cleared, the router stops sending summary refresh messages. If a peer did not set the "refresh-reduction-capable” bit, a node does not attempt to send summary refresh messages.

However, if the peer did not set the "refresh-reduction-capable” bit, a node, with refresh reduction enabled and reliable message delivery enabled, will still attempt to perform reliable message delivery with this peer. If the peer does not support the message_id object, it returns an error message "unknown object class”. In this case, the node retransmits the RSVP message without the message_id object and reverts to using this method for future messages destined to this peer. The RSVP Overhead Refresh Reduction is supported

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

with both RSVP P2P LSP path and the S2L path of an RSVP P2MP LSP instance over the same RSVP instance.

The **no** form of this command reverts to the default value.

Default

no refresh-reduction

Platforms

All

39.20 refresh-reduction-over-bypass

refresh-reduction-over-bypass

Syntax

refresh-reduction-over-bypass [**enable** | **disable**]

Context

[Tree] (config>router>rsvp refresh-reduction-over-bypass)

Full Context

configure router rsvp refresh-reduction-over-bypass

Description

This command enables the refresh reduction capabilities over all bypass tunnels originating on this PLR node or terminating on this Merge Point (MP) node.

By default, this is disabled. Since a bypass tunnel may merge with the primary LSP path in a node downstream of the next-hop, there is no direct interface between the PLR and the MP node and it is possible the latter will not accept summary refresh messages received over the bypass.

When disabled, the node as a PLR or MP will not set the "Refresh-Reduction-Capable” bit on RSVP messages pertaining to LSP paths tunneled over the bypass. It will also not send Message-ID in RSVP messages. This effectively disables summary refresh.

Full Context

configure router origin-validation rpki-session refresh-time

Description

This command is used to configure the **refresh-time** and **hold-time** intervals that are used for liveness detection of the RPKI-Router session. The **refresh-time** defaults to 300 seconds and is reset whenever a Reset Query PDU or Serial Query PDU is sent to the cache server. When the timer expires, a new Serial Query PDU is sent with the last known serial number.

The **hold-time** specifies the length of time in seconds that the session is to be considered UP without any indication that the cache server is alive and reachable. The timer defaults to 600 seconds and must be at least 2x the refresh-time (otherwise the CLI command is not accepted). Reception of any PDU from the cache server resets the hold timer. When the **hold-time** expires, the session is considered to be DOWN and the stale timer is started.

Default

no refresh-time

configure service vprn subscriber-interface group-interface dhcp relay-proxy

configure service vprn subscriber-interface dhcp relay-proxy

configure service ies interface dhcp relay-proxy

configure service ies subscriber-interface dhcp relay-proxy

Description

This command enables the DHCPv4 relay proxy function on the interface. The command has no effect when no dhcp servers are configured (DHCPv4 relay not configured). By default, unicast DHCPv4 release messages are forwarded transparently.

A relay proxy enhances the relay such that it also relays unicast client DHCPv4 REQUEST messages (lease renewals).

- In the upstream direction, update the source IP address and add the gateway IP address (gi-address) field before sending the message to the intended DHCP server (the message is not broadcasted to all configured DHCP servers.
- In the downstream direction, remove the gi-address and update the destination IP address to the address of the `yiaddr` (your IP address) field.

The optional **release-update-src-ip** parameter updates the source IP address of a DHCP RELEASE message with the address used for relayed DHCPv4 messages.

The optional **siaddr-override** *ip-address* parameter enables DHCP server IP address hiding towards the client. This parameter requires that **lease-populate** is enabled on the interface. The DHCP server ip address is required for the address hiding function and is stored in the lease state record. The client interacts with the relay proxy as if it is the DHCP server. In all DHCP messages to the client, the value of following header fields and DHCP options containing the DHCP server IP address is replaced with the configured <*ip-address*>:

- the "source IP address” field in the IP DHCPv4 packet header
- the "siaddr” field in the DHCPv4 header if not equal to zero in the message received from the server
- the Server Identification option (DHCPv4 option 54) if present in the original server message
- the source IP address field in the IP packet header

DHCP OFFER selection during initial binding is done in the relay-proxy. Only the first DHCP OFFER message is forwarded to the client. Subsequent DHCP OFFER messages from different servers are silently dropped.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

release-update-src-ip

Updates the source IP address of a DHCP RELEASE message with the address used for relayed DHCPv4 messages.

ip-address

Enables DHCPv4 server address hiding towards the DHCPv4 client and activates DHCPv4 OFFER selection in case multiple DHCP servers are configured. The *ip-address* can be any local address in the same routing instance. If DHCP relay lease-split is enabled, **siaddr-override** *ip-address* has priority over the **emulated-server** *ip-address* configured in the proxy-server and is used as the source IP address.

release-timeout

Syntax

release-timeout *seconds*

no release-timeout

Context

[Tree] (config>subscr-mgmt>pfcp-association release-timeout)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure subscriber-mgmt pfcp-association release-timeout

Description

This command configures the time to wait to clean up the PFCP association after administratively disabling it and requesting a shutdown to the BNG CPF. If the BNG CPF does not gracefully remove the PFCP association before the timer expires, the full association and all related sessions are forcefully removed.

The **no** form of this command reverts to the default.

Default

release-timeout 3600

Parameters

seconds

Specifies the wait time, in seconds, for cleanup of the PFCP association.

Values 30 to 3600

Note:
The PFCP protocol encoding does not allow the full range of configured values. The system automatically rounds up the configured value to the nearest value allowed by the protocol. For more information about the protocol encoding, see 3GPP TS 29.244 8.2.78.1.

39.35 reliable-delivery

reliable-delivery

Syntax

[**no**] **reliable-delivery**

Context

[Tree] (config>router>rsvp>if>refresh-reduction reliable-delivery)

Full Context

configure router rsvp interface refresh-reduction reliable-delivery

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables reliable delivery of RSVP messages over the RSVP interface. When refresh-reduction is enabled on an interface and reliable-delivery is disabled, the router will send a message_id and not set ACK desired in the RSVP messages over the interface. The router does not expect an ACK and but will accept it if received. The node will also accept message ID and reply with an ACK when requested. In this case, if the neighbor set the "refresh-reduction-capable" bit in the flags field of the common RSVP header, the node will enter summary refresh for a specific message_id it sent regardless if it received an ACK or not to this message from the neighbor.

Finally, when 'reliable-delivery' option is enabled on any interface, RSVP message pacing is disabled on all RSVP interfaces of the system, for example, the user cannot enable the **msg-pacing** option in the **config>router>rsvp** context, and error message is returned in CLI. Conversely, when the **msg-pacing** option is enabled, the user cannot enable the reliable delivery option on any interface on this system. An error message is also generated in CLI after such an attempt.

The **no** form of this command reverts to the default value.

Default

no reliable-delivery

Platforms

All

39.36 reload

reload

Syntax

reload type {**cert** | **key** | **cert-key-pair**} *filename* **protocol** *protocol* [**key-file** *filename*]

Context

[Tree] (admin>certificate reload)

Full Context

admin certificate reload

Description

This command reloads imported certificate or key file or both at the same time. This command is typically used to update certificate or key file without shutting down **ipsec-tunnel/ipsec-gw/cert-profile/ca-profile**. Note that **type cert** and **type key** is deprecated in a future release. Use **type cert-key-pair** instead. Instead of **type cert** use **type key** instead.

- If the new file exists and valid, then for each tunnel using it:
  - If the key matches the certificate, then the new file is downloaded to the MS-ISA to be used the next time. Tunnels currently up are not affected.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

– If the key does not match the certificate:
  - If **cert** and **key** configuration is used instead of **cert-profile** then the tunnel is brought down.
  - If **cert-profile** is used, then **cert-profile** is brought down. The next authentication fails while the established tunnels are not affected.

If the new file does not exists or somehow invalid (bad format, does not contain right extension, and so on), then this command will abort.

In the case of **type cert-key-pair**, if the new file does not exist or is invalid or **cert** and **key** do not match, then this command aborts with an error message.

Parameters

type

Specifies what item will be reloaded.

cert

Specifies that a certificate cache will be reloaded.

key

Specifies that a key cache will be reloaded.

cert-key-pair

Specifies that a paired certificate and key cache will be reloaded.

filename

Up to 95 characters.

protocol

Specifies which protocol the certificate will be reloaded for.

Values ipsec, tls

configure filter ip-filter entry action remark

configure filter ip-filter entry action extended-action remark

configure filter ipv6-filter entry action remark

configure filter ipv6-filter entry action extended-action remark

Description

This command enables and configures the remarking of the DiffServ Code Points of packets matching the criteria of the IPv4/IPv6 filter policy entry, in conjunction with a PBR action. Packets are remarked regardless of QoS-based in-profile or out-of-profile classification. QoS-based DSCP remarking is overridden. If the status of the PBR target is tracked and it is down, the extended action will not be executed; otherwise, the extended action will be performed.

Parameters

dscp-name

Specifies the DSCP value to write.

Values be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

Context

[Tree] (config>qos>network>egress remarking)

Full Context

configure qos network egress remarking

Description

This command remarks both customer traffic and egress network IP interface traffic; VPRN customer traffic is not remarked. The remarking is based on the forwarding class to DSCP and LSP EXP bit mapping defined under the egress node of the network QoS policy.

Normally, packets that ingress on network ports have either the DSCP or, for MPLS packets, LSP EXP bit set by an upstream router. The packets are placed in the appropriate forwarding class based on the DSCP-to-forwarding class mapping or the LSP EXP-to-forwarding class mapping. The DSCP or LSP EXP bits of such packets are not altered as the packets egress this router, unless **remarking** is enabled.

Remarking can be required if this router is connected to a different DiffServ domain where the DSCP-to-forwarding class mapping is different.

Normally, no remarking is necessary when all router devices are in the same DiffServ domain.

The network QoS policy supports an egress flag that forces remarking of packets that were received on trusted IES and network IP interfaces. This provides the capability of remarking without regard to the ingress state of the IP interface on which a packet was received. The effect of the egress network remark trusted state on each type of ingress IP interface and trust state is listed in Table 107: Ingress IP Interface Type and Trust State Effect on Egress Network Remarking.

The remark trusted state has no effect on packets received on an ingress VPRN IP interface.

Table 107: Ingress IP Interface Type and Trust State Effect on Egress Network Remarking

Ingress IP Interface Type and Trust State	Egress Network IP Interface Trust Remark Disabled (Default)	Egress Network IP Interface Trust Remark Enabled
IES Non-Trusted (Default)	Egress Remarked	Egress Remarked
IES Trusted	Egress Not Remarked	Egress Remarked
VPRN Non-Trusted	Egress Remarked	Egress Remarked
VPRN Trusted (Default)	Egress Not Remarked	Egress Not Remarked
Network Non-Trusted	Egress Remarked	Egress Remarked
Network Trusted (Default)	Egress Not Remarked	Egress Remarked

The **no** form of this command resets the configuration to the default behavior.

Default

no remarking — Remarking disabled in the Network QoS policy.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

force

Specifies that all IP routed traffic egressing the associated network interface will have its EXP, DSCP, P-bit, and DE bit setting remarked as defined in the associated QoS policy. Only bit fields configured in the QoS policy will be remarked; all others will be left untouched or set based on the default if the fields were not present at ingress.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service template vpls-template remote-age

configure service vpls remote-age

Description

This command specifies the aging time for remotely learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance.

In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or with a service destination point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Like in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time). In each VPLS service instance, there are independent aging timers for local learned MAC and remote learned MAC entries in the FDB. The **remote-age** timer specifies the aging time for remote learned MAC addresses. To reduce the amount of signaling required between switches configure this timer larger than the **local-age** timer.

The **no** form of this command returns the remote aging timer to the default value.

Default

remote-age 900

Parameters

seconds

Specifies the aging time for remote MACs expressed in seconds

Values 60 to 86400

remote-ip

Syntax

remote-ip *ip-address*

no remote-ip

Context

[Tree] (config>service>ies>if>sap>ip-tunnel remote-ip)

Full Context

configure service ies interface sap ip-tunnel remote-ip

Description

This command configures the primary destination IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the remote-ip address contains an IPv6 address it must be a global unicast address.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no remote-ip

Parameters

ip-address

An IPv4 address or an IPv6 address.

Platforms

All

remote-ip

Syntax

remote-ip *ip-address*

no remote-ip

Context

[Tree] (config>service>vprn>if>sap>ip-tunnel remote-ip)

Full Context

configure service vprn interface sap ip-tunnel remote-ip

Description

This command sets the primary destination IPv4 address of GRE encapsulated packets associated with a particular GRE tunnel. If this address is reachable in the delivery service (there is a route) then this is the destination IPv4 address of GRE encapsulated packets sent by the delivery service.

The **no** form of this command deletes the destination address from the GRE tunnel configuration.

Parameters

ip-address

Specifies the destination IPv4 address of the GRE tunnel.

Values 1.0.0.0 to 223.255.255.255

Platforms

All

remote-ip

Syntax

remote-ip {*ip-prefix/prefix-length* | *ip-prefix netmask* | **any**}

Context

[Tree] (config>router>ipsec>sec-plcy>entry remote-ip)

[Tree] (config>service>vprn>ipsec>sec-plcy>entry remote-ip)

Full Context

configure router ipsec security-policy entry remote-ip

configure service vprn ipsec security-policy entry remote-ip

Description

This command configures the remote (from the tunnel) IP prefix/mask for the policy parameter entry.

Only one entry is necessary to describe a potential flow. The **local-ip** and **remote-ip** commands can be defined only once. The system evaluates:

- the local IP as the source IP when traffic is examined in the direction of the flows from private to public and as the destination IP when traffic flows from public to private
- the remote IP as the source IP when traffic flows public to private and as the destination IP when traffic flows from private to public

Parameters

ip-prefix

Specifies the destination address of the aggregate route in dotted decimal notation.

Values a.b.c.d (host bits must be 0)

prefix-length 1 to 32

netmask

Specifies the subnet mask in dotted decimal notation.

any

keyword to specify that it can be any address.

Platforms

VSR

- configure router ipsec security-policy entry remote-ip

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

39.47 remote-ip-address

remote-ip-address

Syntax

remote-ip-address *ip-address*

no remote-ip-address

Context

[Tree] (config>lag>bfd>family remote-ip-address)

Full Context

configure lag bfd family remote-ip-address

Description

This command specifies the IPv4 or IPv6 address of the BFD destination.

The **no** form of this command removes this address from the configuration.

Default

no remote-ip-address

Parameters

ip-address

Specifies the IP address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x:-[0 to FFFF]H

39.48 remote-ip-range-start

remote-ip-range-start

Syntax

remote-ip-range-start *ip-address*

no remote-ip-range-start

Context

[Tree] (config>isa>nat-group>inter-chassis-redundancy remote-ip-range-start)

Full Context

configure isa nat-group inter-chassis-redundancy remote-ip-range-start

Description

This command configures the first IPv4 address that is assigned to a first member ISA on the remote node. The remaining member ISAs on the remote node are assigned the consecutive IP addresses starting from the first IP address. These IP addresses are used to communicate between the ISAs on redundant nodes for the purpose of flow synchronization. Traffic from the first local IP address (member ISA), is sent to the first IP address from the remote IP range.

Note: These IP addresses are added to the routing table under the protocol "NAT" within the routing context where they are configured. The user can then export the IP addresses into the network using routing policies to ensure reachability. These IP addresses effectively become routes with no relation to any local interface on the router.

The **no** form of this command removes the ip-address from the configuration.

Default

no remote-ip-range-start

Parameters

ip-address

Specifies the first IPv4 address, in the a.b.c.d format, from the range assigned to the first member ISA on the remote node.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

39.53 remote-mepid

remote-mepid

Syntax

remote-mepid *mep-id* **remote-mac** {*unicast-da* | **default**}

no remote-mepid *mep-id*

Context

[Tree] (config>eth-cfm>domain>assoc remote-mepid)

Full Context

configure eth-cfm domain association remote-mepid

Description

This command configures the remote MEP ID. Optionally, the operator may configure a unicast MAC address associated with the remote MEP. This unicast value replaces the default Layer 2 class 1 multicast address that is typically associated with ETH-CC packets.

Note:
This command is not supported with sub second CCM intervals. The *unicast-da* parameter may only be configured when a single remote MEP exists in the association.

The **no** form of this command removes the peer information.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

mep-id

Specifies the peer MEP ID.

Values 1 to 8191

unicast-da

Specifies the unicast MAC destination address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx or default

default — Removes the remote MAC unicast address and reverts back to class 1 multicast address.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

remote-mepid

Syntax

remote-mepid *mep-id*

no remote-mepid

Context

[Tree] (config>oam-pm>session>ethernet remote-mepid)

Full Context

configure oam-pm session ethernet remote-mepid

Description

This command specifies the remote MEP ID as an alternative to the static **dest-mac** *ieee-address*. When the **remote-mepid** option is configured as an alternative to the **dest-mac**, the domain and association information of the **source mep** within the session is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled. Peer MEP MAC addresses are learned and maintained by the ETH-CC protocol.

The **no** form of this command removes this session parameter.

Parameters

mep-id

Specifies the remote MEP ID of the peer within the association.

Values 1 to 8191

Platforms

All

configure service vprn subscriber-interface group-interface remote-proxy-arp

configure service ies interface remote-proxy-arp

configure service ies subscriber-interface group-interface remote-proxy-arp

configure service vprn interface remote-proxy-arp

Description

This command enables remote proxy ARP on the interface.

Remote proxy ARP is similar to proxy ARP. It allows the router to answer an ARP request on an interface for a subnet that is not provisioned on that interface. This allows the router to forward to the other subnet on behalf of the requester. To distinguish remote proxy ARP from local proxy ARP, local proxy ARP performs a similar function but only when the requested IP is on the receiving interface.

The **no** form of this command reverts to the default.

39.58 remote-source

remote-source

Syntax

[**no**] **remote-source**

Context

[Tree] (config>mirror>mirror-dest remote-source)

Full Context

configure mirror mirror-dest remote-source

Description

This command is used on a destination router in a remote mirroring solution. The mirroring (packet copy) is performed on the source router and sent via an SDP to the destination router. Remote mirroring requires remote source configuration on the destination router.

Remote mirroring allows a destination router to terminate SDPs from multiple remote source routers. This allows consolidation of packet sniffers or analyzers at a single or small set of points in a network (for example, a sniffer or analyze farm, or lawful interception gateway).

A **remote-source** entry must be configured on the destination router for each source router from which mirrored traffic is being sent via SDPs.

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The emote source configuration is not applicable when routable LI encapsulation is being used on the mirror source router. The remote source configuration is only used when a source router is sending mirrored traffic to a destination router via SDPs.

Two types of remote-source entries can be configured:

- far end
- spoke SDP

Certain remote source types are applicable with certain SDP types. For descriptions of the command usage in the **mirror-dest** context, see the **far-end** and **spoke-sdp** commands.

The **no** form of this command removes all remote-source entries.

39.60 remote-ve-name

remote-ve-name

Syntax

[**no**] **remote-ve-name** *name*

Context

[Tree] (config>service>epipe>bgp-vpws remote-ve-name)

Full Context

configure service epipe bgp-vpws remote-ve-name

Description

This command creates or edits a remote-ve-name. A single remote-ve-name can be created per BGP VPWS instance if the service is single-homed or uses a single pseudowire to connect to a pair of dual-homed systems. When the service requires active/standby pseudowires to be created to remote dual-homed systems then two remote-ve-names must be configured.

This context defines the remote PE to which a pseudowire will be signaled.

remote-ve-name commands can be added even if bgp-vpws is not shutdown.

The **no** form of this command removes the configured remote-ve-name from the bgp vpws node. It can be used when the BGP VPWS status is either shutdown or "no shutdown”.

Parameters

name

Specifies a site name up to 32 characters in length.

Platforms

All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

39.61 remove

remove

Syntax

[**no**] **remove**

Context

[Tree] (config>service>vprn>bgp>attribute-set remove)

Full Context

configure service vprn bgp attribute-set remove

Description

This command configures BGP to ignore and silently discard ATTR_SETs in BGP routes received from PE-CE peers of the VPRN. The discarded ATTR_SETs do not affect BGP best-path selection in the VPRN, and they do not appear in the VPN-IP routes that result from the VRF export of the BGP routes. Nokia recommends enabling this command in most deployments.

The **no** form of this command configures BGP to ignore ATTR_SETs in BGP routes received from PE-CE peers of the VPRN without discarding them. This allows the ATTR_SETs to propagate between CE devices connected to the VPRN and to other PE devices when the BGP routes are exported as VPN-IP routes.

Note: If the configuration of this command is changed, ROUTE_REFRESH messages are sent to all PE-CE peers of the VPRN.

Default

no remove

[Tree] (config>service>vprn>bgp remove-private)

Full Context

configure service vprn bgp group neighbor remove-private

configure service vprn bgp group remove-private

configure service vprn bgp remove-private

Description

When this command is configured private AS numbers are removed or replaced when they are found inside the AS path of BGP routes advertised to peers within the scope of the command.

The set of AS numbers that are defined by IANA as private are in the range of 64512 to 65534, and 4200000000 to 4294967294, inclusive. In SR OS, this command also removes ASN 65535 and ASN 4294967295, which are reserved values.

The **no** form of this command (at the BGP instance level) implements the default behavior, private AS numbers are allowed without restriction or modification in routes advertised to peers.

Default

no remove-private

Parameters

limited

This keyword instructs BGP to process private ASNs only up to the first public ASN encountered. Private ASNs beyond that first public AS will not be stripped or replaced.

skip-peer-as

This keyword instructs BGP to not strip or replace a private ASN from the AS-Path if that ASN is the same as the BGP peer AS number.

replace

When this keyword is configured, private ASNs are not stripped. Each occurrence is replaced by the ASN of the advertising BGP router (the ASN the router advertised to its peer in its OPEN message). When the **replace** keyword is not configured, private ASNs are stripped, subject to influence by the other keyword options. This generally results in a shortening of AS_PATH length.

renew

Syntax

renew est-profile *name* **cert** *cert-filename* **key** *key-filename* [**hash-alg** *hash-algorithm*] **output** *output-cert-filename* [**validate-cert-chain**] [**force**]

Context

[Tree] (admin>certificate>est renew)

Full Context

admin certificate est renew

Description

This command renews an imported certificate (specified by the **cert** *cert-filename*) with a Certificate Authority (CA) using the EST protocol specified by the **est-profile** name, with an imported private key specified the key parameter. The key can be either the key of the certificate to be renewed or a new key.

The authentication between system and EST server is specified by the est-profile.

The **hash-alg** *hash-alorithm* parameter is used to generate the CSR (Certificate Signing Request) in the EST request message.

Parameters

name

Specifies EST profile name, up to 32 characters

cert-filename

Specifies the certificate file name, up to 95 characters

key-filename

Specifies the file name of a key, up to 95 characters

hash-algorithm

Specifies the hash algorithm to be used in a certificate request.

Values sha1, sha224, sha256, sha384, sha512

output-cert-filename

Specifies the output cert file name, up to 200 characters

configure router dhcp6 local-dhcp-server pool prefix renew-timer

configure service vprn dhcp6 local-dhcp-server pool prefix renew-timer

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server renew-timer

Description

This command configures the lease renew time (T1) via LUDB.

The T1 is the time at which the client contacts the addressing authority to extend the lifetimes of the DHCPv6 leases (addresses or prefixes). T1 is a time duration relative to the current time expressed in units of seconds.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The IP addressing authority controls the time at which the client contacts the addressing authority to extend the lifetimes on assigned addresses through the T1 and T2 parameters assigned to an IA. At time T1 for an IA, the client initiates a Renew/Reply message exchange to extend the lifetimes on any addresses in the IA. The client includes an IA option with all addresses currently assigned to the IA in its Renew message. Recommended values for T1 and T2 are .5 and .8 times the shortest preferred lifetime of the addresses in the IA that the addressing authority is willing to extend, respectively.

The configured renew timer should always be smaller than or equal to the rebind timer.

The T1 and T2 are carried in the IPv6 address option that is within the IA.

The **no** form of this command reverts to the default.

Default

renew-timer min 30

Parameters

renew-timer

Specifies the preferred lifetime.

Values	**days** *days*	0 to 7
	hrs *hours*	0 to 23
	min *minutes*	0 to 59
	sec *seconds*	0 to 59

39.75 replay-protection

replay-protection

Syntax

[**no**] **replay-protection**

Context

[Tree] (config>macsec>connectivity-association replay-protection)

Full Context

configure macsec connectivity-association replay-protection

Description

Specifies the size of the replay protection window.

This command must be configured to force packet discard when it has detected a packet that is not within the replay-window-size.

When replay protection is enabled, the sequence of the ID number of the received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay window size, the packet is counted by the receiving port and then discarded. For example, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is counted and discarded because it falls outside the parameters of the replay window size.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

Default

no replay-protection

replay-window-size *number-of-packet*s

no replay-window-size

Context

[Tree] (config>macsec>connectivity-association replay-window-size)

Full Context

configure macsec connectivity-association replay-window-size

Description

This command specifies the size of the replay protection window.

This command must be configured to enable replay protection. When replay protection is enabled, the sequence of the ID number of received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving port. For example, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

When the *number-of-packets* variable is set to 0, all packets that arrive out-of-order are dropped.

The **no** form of this command reverts to the default value.

Default

replay-window-size 0

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[Tree] (config>router>p2mp-sr-tree>replication-segment>srv6>downstream-nodes replication-sid)

Full Context

configure router p2mp-sr-tree replication-segment segment-routing-v6 downstream-nodes replication-sid

Description

This command configures the outgoing replication SID for the next hop of the P2MP SR tree replication segment.

Note: Currently, the SRv6 replication SID does not support a SID list.

The **no** form of this command removes the replication SID.

Default

no replication-sid

Parameters

ipv6-address

Specifies the IPv6 replication SID, including the locator and the function. SR OS supports a 16-bit function from bit 64 to bit 80, with the locator configurable from bit 0 to 64 of the IPv6 address.

Values	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

configure port tdm e3 report-alarm

configure port tdm ds3 report-alarm

Description

This command enables logging of DS-3 and E-3 alarms for a DS-3/E-3 port or channel.

The **no** form of this command disables logging of the specified alarms.

Parameters

ais

Reports alarm indication signal errors. When configured, **ais** alarms are not raised and cleared.

Default **ais** alarms are issued

los

Reports loss of signal errors. When configured, **los** traps are not raised and cleared.

Default **los** traps are issued

oof

Reports out-of-frame errors. When configured, **oof** alarms are not raised and cleared.

Default **oof** alarms are not issued

rai

Reports resource availability indicator events. When configured, **rai** events are not raised and cleared.

Default **rai** alarms are not issued

looped

Reports looped packets errors.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default **looped** alarms are not issued

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

report-alarm

Syntax

[**no**] **report-alarm** [**signal-fail**] [**remote**] [**local**] [**no-frame-lock**] [**high-ber**] [**no-block-lock**] [**no-am-lock**] [**duplicate-lane**]

Context

[Tree] (config>port>ethernet report-alarm)

Full Context

configure port ethernet report-alarm

Description

This command specifies when and if to generate alarms and alarm clear notifications for this port.

Note:
For some DWDM transceivers, if the **configure port dwdm coherent rx-los-reaction squelch** command is disabled the signal-fail and no-am-lock alarm conditions are not reported when the media side of the transceiver has an RX LOS condition.

Parameters

signal-fail

Reports an Ethernet signal lost alarm.

remote

Reports remote faults.

local

Reports local faults.

no-frame-lock

Reports a 'not locked on the Ethernet framing sequence' alarm.

high-ber

Reports High Bit Error Rate.

no-block-lock

Reports 40G/100G PCS Lanes Not Block Locked.

no-am-lock

Reports 40G/100G PCS Alignment Marker Loss of Lock.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

duplicate-lane

Reports 40G/100G PCS Duplicate Lane Marker.

configure mcast-management multicast-info-policy bundle channel video analyzer alarms report-alarm

configure mcast-management multicast-info-policy bundle video analyzer alarms report-alarm

configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms report-alarm

Description

This command configures the type of alarm to monitor and raise through SNMP. The severity of alarms increases from TNC, to QoS, and then to POA. For example, if QoS alarms are configured, the analyzer only raises alarms and events related to QoS. The analyzer may raise alarms for POA events if they occur, but alarms for TNC are not sent.

Default

no report-alarm

Parameters

severity

Keyword to configure the type of alarm.

tnc

Specifies to monitor and raise alarms for TNC events.

qos

Specifies to monitor and raise alarms for QoS events.

poa

Specifies to monitor and raise alarms for POA events.

Full Context

configure port otu report-alarms

Description

This command enables OTU alarms. Specify specific alarms to add to the list of reported alarms.

The **no** form of this command disables OTU alarm reporting.

Default

loc, los, lof, lom, otu-ber-sf, otu-bdi, fec-sf

Parameters

alarms

Refer to Table 108: Alarm Descriptions for alarm descriptions.

Table 108: Alarm Descriptions

Alarm	Description
loc	Loss of clock.
lof	Loss of OTU framing.
lom	Loss of Multi-frame.
los	Loss of signal transitions on the data.
otu-ais	OTU Alarm Indication Signal (all 1s, overwrites all OTU overhead, even framing bytes).
otu-ber-sf	SM Signal Fail (based on BPI8).
otu-ber-sd	SM Signal Degrade (based on BPI8).
otu-bdi	SM Backward defect indication.
otu-tim	SM Trace Id Mismatch.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Alarm	Description
otu-iae	SM Incoming Alignment Error.
otu-biae	SM Backward Incoming Alignment Error.
fec-sf	Signal Fail (based on FEC corrected bits).
fec-sd	Signal Degrade (based on FEC corrected bits).
fec-fail	FEC Mode mismatch (EFEC-GFEC) or High Uncorrectable rate (>10E-2).
fec-uncorr	One or More Uncorrectable FEC errors.
odu-ais	ODU Alarm Indication Signal.
odu-oci	ODU Open connection Indication.
odu-lck	ODU Locked.
odu-bdi	PM Backward Defect indication.
odu-tim	PM Trace Id Mismatch.
opu-plm	OPU PSI Payload Type Mismatch.

Description

This command configures reporting for the FlexE member when a configured condition is met.

The **no** form of this command removes report alarms.

Default

no report-alarms

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

los

Keyword to trigger reporting when the PHY loses its signal.

high-ber

Keyword to trigger reporting when the system receives a high bit error rate (BER).

am-not-locked

Keyword to trigger reporting when the system is unable to achieve an alignment marker lock.

deskew-failed

Keyword to trigger reporting when the system is unable to deskew the PHY.

remote-phy-fault

Keyword to trigger reporting when the PHY receives reverse path forwarding (RPF).

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-s

configure card mda flex report-alarms

Description

This command configures reporting for the MDA FlexE group where one or more instances detect a configured condition.

The **no** form of this command removes reporting for the configured condition.

Default

no report-alarms

Parameters

overhead-frame-not-locked

Keyword to trigger reporting when the group does not have overhead frame lock.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

deskew-failed

Keyword to trigger reporting when group members are not deskewed.

local-phy-fault

Keyword to trigger reporting when the system receives a local fault for PHY instances.

remote-phy-fault

Keyword to trigger reporting when the PHY receives RPF.

bad-group-number

Keyword to trigger reporting when the system receives an invalid group number for PHY instances.

am-not-locked

Keyword to trigger reporting when the system is unable to achieve an alignment marker lock.

bad-phy-number

Keyword to trigger reporting when the system receives an invalid PHY number on PHY instances.

bad-phy-instance-number

Keyword to trigger reporting when the system receives invalid PHY instance numbers.

flexe-map-mismatch

Keyword to trigger reporting when the system receives an invalid FlexE map for PHY instances.

calendar-in-use-error

Keyword to trigger reporting when the wrong calendar is in use for PHY instances.

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-s

Description

This command configures reporting when one or more PHY instances detect a configured condition.

The **no** form of this command removes reporting for the configured condition.

Default

no report-alarms-phy

Parameters

bad-crc

Keyword to trigger reporting when CRC error occurs on multiframe for PHY instances.

bad-group-number

Keyword to trigger reporting when the system receives an invalid group number for PHY instances.

client-calendar-error

Keyword to trigger reporting when the system detects the wrong calendar used for PHY instances.

multiframe-not-locked

Keyword to trigger reporting when the multiframe is not locked for PHY instances.

bad-phy-number

Keyword to trigger reporting when the system receives an invalid PHY number on PHY instances.

bad-phy-instance-number

Keyword to trigger reporting when the system receives invalid PHY instance numbers.

flexe-map-mismatch

Keyword to trigger reporting when the system receives an invalid FlexE map for PHY instances.

calendar-in-use-error

Keyword to trigger reporting when the wrong calendar is in use for PHY instances.

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>gx report-ip-address-event)

Full Context

configure subscriber-mgmt diameter-application-policy gx report-ip-address-event

Description

This command enables triggered CCR-u messages based on IP address allocation or de-allocation for the subscriber host.

If the requests for both IP address families (IPv4 and IPv6) arrive at approximately the same time, a single CCR-i is sent containing the IP addresses from both address families, IPv4 and IPv6 (NA, PD, or SLAAC). When the requests for IP addresses are not nearly simultaneous, the CCR-i contains only the IP address that was allocated first (the one that triggered the session creation). The request for the second IP address family, depending on configuration, triggers an additional CCR-u that will carry the IP address allocation update to the PCRF along with the UE_IP_ADDRESS_ALLOCATE (18) event. The CCR-u content mirrors the content of the CCR-i with the exception of already allocated IP address(es).

When this command is disabled, IP address-triggered CCR-u messages are not sent.

The **no** form of this command disables the command.

Default

report-ip-address-event

39.87 report-path-constraints

report-path-constraints

Syntax

report-path-constraints

no report-path-constraints

Context

[Tree] (config>router>pcep>pcc report-path-constraints)

Full Context

configure router pcep pcc report-path-constraints

Description

This command enables the inclusion of LSP path constraints in the PCE report messages sent from the PCC to a PCE.

In order for the PCE to know about the original constraints for an LSP which is delegated, but for which there is no prior state in its LSP database, such as if no PCReq message was sent for the same PLSP-ID, the following proprietary behavior is observed:

- PCC appends a duplicate of each of the LSPA, METRIC, and BANDWIDTH objects in the PCRpt message. The only difference between two objects of the same type is that the P-flag is set in the common header of the duplicate object to indicate that it is a mandatory object for processing by PCE.
- The value of the metric or bandwidth in the duplicate object contains the original constraint value, while the first object contains the operational value. This is applicable to hop metrics in the METRIC and BANDWIDTH objects only. The SR OS PCC does not support configuring a boundary on the path computation IGP or TE metrics.
- The path computation on the PCE must use the first set of objects when updating a path if the PCRpt contained a single set. If the PCRpt contained a duplicate set, PCE path computation must use the constraints in the duplicate set.

The **no** form of the command disables the above behavior in case of interoperability issues with third-party PCE implementations.

Full Context

configure subscriber-mgmt sla-profile ingress report-rate

configure subscriber-mgmt sla-profile egress report-rate

Description

This command configures the source for Tx and Rx connect speeds in AVP 38 (Rx Connect Speed) and AVP 24 (Tx Connect Speed) of an L2TP session established on a LAC.

The **no** form of this command reverts to the default.

Parameters

agg-rate-limit

Specifies that the rate (egress only) is taken from:

1. the agg-rate RADIUS override (RADIUS VSA "Alc-Subscriber-QoS-Override” in a RADIUS Access-Accept message) if present
2. the configured agg-rate-limit in the **config>subscr-mgmt>sub-prof>egr** context
3. fall back to the default (no report-rate)

scheduler-name

Specifies the rate taken from the **scheduler** *scheduler-name* up to 32 characters. If the **scheduler** *scheduler-name* is not present in the scheduler-policy configured in the **config>subscr-mgmt>sub-prof>egr** context, fall back to the default (no report-rate).

pppoe-actual-rate

Specifies rates taken from the DSL Line characteristics PPPoE tags (Actual Data Rate Upstream/Downstream) if present; otherwise fall back to the default (no report-rate).

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policer-id

Specifies the rate taken from the policer with the specified ID.

Values 1 to 63

rfc5515-actual-rate

Puts the same value as the transmitted Actual-Data-Rate-Upstream AVP in the Rx-Connect-Speed AVP, and the same value as the transmitted Actual-Data-Rate-Downstream AVP in the Tx-Connect-Speed AVP

Full Context

configure service cpipe spoke-sdp control-channel-status request-timer

configure service vpls spoke-sdp control-channel-status request-timer

configure service epipe spoke-sdp control-channel-status request-timer

Description

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478. This command cannot be used with a non-zero refresh-timer value.

Parameters

timer1

Specifies the interval, in seconds, at which pseudowire status messages, including a reliable delivery TLV with the "request" bit set, are sent.

Values 10 to 65535

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

timer2

specifies the timeout interval, in seconds, if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

Values 0, 3 to 60

multiplier

If a requesting node does not receive a valid response to a pseudowire status request within a number of seconds equal to the retry timer multiplied by this multiplier, then it will assume the pseudowire is down. This parameter is optional.

Values 3 to 20

Platforms

Full Context

configure service vprn interface spoke-sdp control-channel-status request-timer

configure service vprn redundant-interface spoke-sdp control-channel-status request-timer

Description

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478. This command is mutually exclusive with a non-zero refresh-timer value.

Parameters

request-timer-secs

Specifies the interval, in seconds, at which pseudowire status messages, including a reliable delivery TLV, with the "request" bit set, are sent.

Values 10 to 65535

retry-timer *retry-timer-secs*

Specifies the timeout interval, in seconds, if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0, 3 to 60

timeout-multiplier *multiplier*

Specifies the multiplier, in seconds. If a requesting node does not receive a valid response to a pseudowire status request within this multiplier times the retry timer, then it assume the pseudowire is down. This parameter is optional.

Values 3 to 15

configure router segment-routing sr-policies reserved-label-block

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command associates a reserved label block with segment routing policies. The *name* must already exist. Reserved label blocks are configured under the **config**>**router**>**mpls-labels** hierarchy.

A locally-targeted segment routing policy (statically configured or BGP signaled) cannot be activated if its binding SID (BSID) is not an available label between the start-label and end-label of the referenced reserved label block.

The **no** form of this command removes any association of segment routing policies with a reserved label block.

Default

no reserved-label-block

Parameters

name

Specifies the name of a **reserved-label-block** that has already been configured, up to 64 characters.

Platforms

All

reserved-label-block

Syntax

[**no**] **reserved-label-block** *name*

Context

[Tree] (config>anysec reserved-label-block)

Full Context

configure anysec reserved-label-block

Description

This command assigns the label block that is reserved for ANYsec encryption SID under the **configure router mpls-labels** context. Without this reserved block, ANYsec cannot assign any encryption SIDs. The encryption SID uniquely identifies the encrypting node within a network and avoids double encryption scenarios. The encryption SID can be assigned per encryption group. However, all encryption groups can have the same encryption SID.

To save label space, Nokia recommends limiting the number of encryption SIDs within a network.

The **no** form of this command removes a reserved label block.

Parameters

name

Specifies the name of the reserved label block.

39.108 resignal-on-igp-event

resignal-on-igp-event

Syntax

[**no**] **resignal-on-igp-event**

Context

[Tree] (config>router>mpls>sr-te-resignal resignal-on-igp-event)

Full Context

configure router mpls sr-te-resignal resignal-on-igp-event

Description

This command enables the ad hoc reoptimzation of all CSPF paths in the operational UP state of all SR-TE LSPs at the receipt of an IGP link event. The following link events are supported:

- link down
- link up
- IGP or TE metric change
- SRLG change
- admin group change

The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates all the paths in operational UP state of all SR-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops and labels, and computing a new CSPF path. MPLS programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops or labels of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls sr-te-resignal resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

The **no** form of this command disables ad hoc reoptimization of SR-TE LSPs.

Default

no resignal-on-igp-event

Syntax

[**no**] **resignal-on-igp-event**

Context

[Tree] (config>router>mpls resignal-on-igp-event)

Full Context

configure router mpls resignal-on-igp-event

Description

This command enables the ad hoc reoptimization of the active CSPF path of all RSVP-TE LSPs at the receipt of an IGP link event. The following link events are supported:

- link down
- link up
- IGP or TE metric change
- SRLG change
- admin group change

The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates the active paths of all RSVP-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops, and computing a new CSPF path. MPLS signals and programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

The **no** form of this command disables ad hoc reoptimization of the active RSVP-TE LSPs.

39.109 resignal-on-igp-overload

resignal-on-igp-overload

Syntax

[**no**] **resignal-on-igp-overload**

Context

[Tree] (config>router>mpls resignal-on-igp-overload)

Full Context

configure router mpls resignal-on-igp-overload

Description

This command enables the resignaling of all RSVP-TE LSPs at the receipt of the IS-IS overload bit in the TE-DB.

Once the re-optimization is triggered, the behavior is the same as the timer-based resignal or the **delay** option of the manual-based resignal. MPLS forces the expiry of the resignal timer and requests the TE-DB to compute a new CSPF for each RSVP-TE LSP active path.

This re-optimization effectively causes the immediate move of transit RSVP-TE LSP paths away from the IS-IS node in overload.

By default, MPLS re-optimizes, using the MBB procedure, the transit paths away from the node in an IS-IS overload state only at the time a manual or timer-based resignal is performed for the LSP paths. MPLS does not act immediately on the receipt of the IS-IS overload bit.

Note:
This command and the **retry-on-overload** command are mutually exclusive.

The **no** form of this command results in the MPLS not acting immediately to the request of the IS-IS overload bit.

Default

no resignal-on-overload

Platforms

All

resignal-on-igp-overload

Syntax

[**no**] **resignal-on-igp-overload**

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>mpls>sr-te-resignal resignal-on-igp-overload)

Full Context

configure router mpls sr-te-resignal resignal-on-igp-overload

Description

This command enables the ad-hoc re-optimzation of the CSPF paths of all SR-TE LSPs when IS-IS receives an IS-IS overload bit advertisement from a remote router.

When this command is enabled on the router and an IGP overload bit is set in a Layer 1 or Layer 2 IS-IS LSP received from a remote router, MPLS performs an ad-hoc re-optimization of all the paths of all the SR-TE LSPs that have paths computed by the local CSPF. For each SR-TE LSP current path that transits the router in overload, the CSPF looks for a new path that avoids the router. For each SR-TE LSP current path that terminates on the router in overload, the CSPF checks if a better path exists. In both cases, if a new path is not found the system maintains the current path when operationally up.

The ad-hoc re-optimization triggers the timer-based re-optimization by forcing the resignal timer to expire. Therefore, the user must use the following command to configure the resignal timer for the SR-TE application.

```
configure router mpls sr-te-resignal resignal-timer
```

The **no** form of this command configures MPLS to not act immediately on an IS-IS overload bit from a remote router. MPLS will act on it at the next timer-based or manual re-optimization of the SR-TE LSPs.

configure router mpls resignal-timer

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the value for the LSP resignal timer. The resignal timer is the time, in minutes, the software waits before attempting to resignal the LSPs.

When the resignal timer expires, if the new computed path for an LSP has a better metric than the current recorded hop list, an attempt is made to resignal that LSP using the make-before-break mechanism. If the attempt to resignal an LSP fails, the LSP continues to use the existing path and a resignal will be attempted the next time the timer expires.

The **no** form of this command disables timer-based LSP resignaling.

Default

no resignal-timer

Parameters

minutes

Specifies the time the software waits before attempting to resignal the LSPs.

resignal-timer *minutes*

no resignal-timer

Context

[Tree] (config>router>mpls>sr-te-resignal resignal-timer)

Full Context

configure router mpls sr-te-resignal resignal-timer

Description

This command specifies the value for the SR-TE LSP resignal timer when the path computation method is set to the local CSPF or the PCE.

The resignal timer is the time, in minutes, MPLS waits before attempting to re-optimize all paths of all SR-TE LSPs. The re-optimization is performed by the local CSPF or the PCE, depending on the value of the parameter **path-computation-method**.

When local CSPF is used and the resignal timer expires, MPLS provides the current path of the SR-TE LSP and TE-DB updates the total IGP or TE metric of the current path and checks the validity of the hops and labels. CSPF then computes a new path for each SR-TE LSP. MPLS programs the new path only if the total metric of the new computed path is different than the updated metric of the current path, or if one or

configure service vprn bgp-evpn segment-routing-v6 resolution

configure router bgp segment-routing-v6 family resolution

configure service vpls bgp-evpn segment-routing-v6 resolution

Description

This command configures the resolution option for routes in the specified family.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of the command reverts to the default.

Default

resolution route-table

Parameters

route-table

Keyword that specifies to resolve the route to the shortest-path SRv6 tunnel. If no such shortest-path tunnel is found, the resolution fails.

tunnel-table

Keyword that specifies to resolve the route directly to a tunnel in TTMv6. The system tries to find an SRv6 policy with a matching color and endpoint for BGP routes received with an SRv6 TLV and containing an SRv6 service SID in the IPv6 tunnel table. If none is found, the resolution fails.

fallback-tunnel-to-route-table

Keyword that specifies to first try resolving the route to a tunnel in the IPv6 tunnel table. If none is found in the IPv6 tunnel table, fall back to the shortest-path SRv6 resolution. If no such shortest-path tunnel is found in RTM, the resolution fails.

resolution

Syntax

resolution {**any** | **disabled** | **filter**}

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop resolution)

Full Context

configure router static-route-entry indirect tunnel-next-hop resolution

Description

This command determines the resolution mode for the associated static route to a tunnel next hop.

Default

resolution any

Parameters

any

Allows the associated static route to be resolved to any active entry in the TTM, following the TTM preference order.

disabled

Disables the resolution of the associated static route to any active entry in the TTM. As a result, the static route can only be resolved via IP RTM resolution of the static route's next hop.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

filter

Allows the associated static route to be resolved to active tunnels in the TTM using the resolution-filter restrictions.

[Tree] (config>service>vpls>proxy-arp>dynamic resolve)

Full Context

configure service vpls proxy-nd dynamic resolve

configure service vpls proxy-arp dynamic resolve

Description

This command configures the frequency at which a resolve message is sent. The resolve message is an ARP-request or NS message flooded to all the non-EVPN endpoints in the service irrespective of the current status of the **unknown-arp-request-flood-evpn** or **unknown-ns-flood-evpn** commands.

Default

resolve 5

Parameters

minutes

Specifies the frequency in minutes at which the **resolve** message is issued.

Values 1 to 60

Default 5

Platforms

All

resolve

Syntax

[**no**] **resolve**

Context

[Tree] (configure>service>vprn>bgp-evpn>vxlan>gateway-ip resolve)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[Tree] (configure>service>vprn>bgp-evpn>mpls>gateway-ip resolve)

Full Context

configure service vprn bgp-evpn vxlan gateway-ip resolve

configure service vprn bgp-evpn mpls gateway-ip resolve

Description

This command configures the router to resolve IP prefix routes with a non-zero GW-IP to either EVPN-IFL-HOST routes that match the GW-IP or to local R-VPLS interfaces if the GW-IP is associated with a local R-VPLS interface.

The **no** form of this command does not resolve IP prefix routes with a non-zero GW-IP value.

Default

no resolve

Platforms

7750 SR-1, 7750 SR-s

- configure service vprn bgp-evpn vxlan gateway-ip resolve

All

- configure service vprn bgp-evpn mpls gateway-ip resolve

39.114 resolve-root-using

resolve-root-using

Syntax

resolve-root-using {**ucast-rtm** | **mcast-rtm**}

Context

[Tree] (config>router>ldp resolve-root-using)

Full Context

configure router ldp resolve-root-using

Description

By default, MLDP resolves the FEC using the unicast RTM. When this command is set to **mcast-rtm**, MLDP will resolve the FEC using the multicast route table. The multicast route table does not include any IGP shortcuts, unlike the unicast RTM. MLDP cannot resolve a FEC using an IGP shortcut, so if IGP shortcuts are used for unicast, enable multicast MLDP lookups.

If this command is set to **mcast-rtm**:

- For FEC resolution using IGP, static or local, the ROOT in this FEC is resolved using the multicast RTM.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- A FEC being resolved using BGP is recursive, so the FEC next-hop (ASBR/ABR) is resolved using the multicast RTM first and, if this fails, it is resolved using the unicast RTM. This next-hop needs to be recursively resolved again using IGP/Static-Route or Local, this second resolution (recursive resolution) uses the multicast RTM only.
- In all cases, MLDP uses the unicast RTM to resolve the FEC and will not resolve the FEC if its next hop is resolved using an IGP shortcut.

Default

resolve-root-using ucast-rtm

Platforms

All

39.115 resolve-static

resolve-static

Syntax

[**no**] **resolve-static**

Context

[Tree] (config>router>policy-options>policy-statement>entry>action resolve-static)

[Tree] (config>router>policy-options>policy-statement>default-action resolve-static)

Full Context

configure router policy-options policy-statement entry action resolve-static

configure router policy-options policy-statement default-action resolve-static

Description

This command has an affect only in BGP route-table-import policies and applies only to BGP IPv4 and IPv6 routes created by importing static routes with indirect next-hops. When such a route matches a policy entry with this action, the BGP next-hop is the resolved next-hop of the static route.

The **no** form of this command reverts to the default behavior, which copies the indirect next-hop of the static route into the BGP next-hop without resolving it further.

Default

no resolve-static

39.119 restart-backoff

restart-backoff

Syntax

restart-backoff initial-time *seconds* **max-time** *seconds*

no restart-backoff

Context

[Tree] (config>subscr-mgmt>pppoe-client-policy restart-backoff)

Full Context

configure subscriber-mgmt pppoe-client-policy restart-backoff

Description

This command configures backoff timer parameters that determine how often and how long the system will attempt to restart a PPPoE client after a failure. When a client first fails, the system immediately tries to re-establish connectivity. If this attempt is also unsuccessful, the system initiates a backoff timer and waits until it expires before attempting to restart the client again, to avoid flooding the BNG. The initial duration of the backoff timer is configured with the **initial-time** parameter. With each subsequent failure, the backoff timer is doubled until the configured **max-time** is reached.

The **no** form of this command reverts to the default.

Default

restart-backoff initial-time 30 max-time 600

Parameters

initial-time seconds

Specifies the initial backoff time to wait before attempting a client restart.

Values 10 to 3600

max-time seconds

Specifies the maximum time to attempt client restarts.

Values 10 to 3600

Platforms

Full Context

configure service vpls proxy-arp restrict-non-configured-ip-address

configure service vpls proxy-nd restrict-non-configured-ip-address

Description

This command configures whether all the configured dynamic IP address entries are considered the only authorized entries in the proxy ARP or ND table. ARP or ND packets coming from a unauthorized sender IP addresses are dropped. Therefore, unauthorized IP addresses are not learned in the proxy ARP or ND table, and ARP requests or neighbor solicitations (NS) coming from a unauthorized sender IP addresses are not replied to, unless the **sponge-mac** option is configured.

The **no** form of this command does not drop ARP or ND packets coming from a unauthorized sender IP addresses.

Parameters

sponge-mac

Keyword to specify that ARP requests or NSs from an unauthorized IP address are not learned in the proxy ARP or ND table and ARP requests or NSs from an unauthorized IP address are replied with the configured sponge MAC address. Any IP address that is not configured as proxy ARP, ND dynamic ARP, or neighbor IP address is considered unauthorized and dropped.

mac-address

Specifies the MAC address.

The configured sponge MAC address is not installed in the FDB or advertised in EVPN. If needed, the sponge MAC address can be configured as a static MAC in the same service in the node or a remote node.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

configure service vpls spoke-sdp restrict-protected-src

configure service pw-template restrict-protected-src

configure service vpls split-horizon-group restrict-protected-src

configure service pw-template split-horizon-group restrict-protected-src

Description

This command indicates how the agent will handle relearn requests for protected MAC addresses, either manually added using the mac-protect command or automatically added using the **auto-learn-mac-protect** command. While enabled all packets entering the configured SAP, spoke SDP, mesh SDP, or any SAP that is part of the configured split horizon group (SHG) is verified not to contain a protected source MAC address. If the packet is found to contain such an address, the action taken depends on the parameter specified on the **restrict-protected-src** command, namely:

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- No parameter — The packet is discarded, an alarm is generated and the SAP, spoke SDP or mesh SDP is set operationally down. The SAP, spoke SDP or mesh SDP must be shut down and enabled (**no shutdown**) for this state to be cleared.
- **alarm-only** — The packet is forwarded, an alarm is generated but the source MAC is not learned on the SAP, spoke SDP or mesh SDP.
- **discard-frame** — The packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes in a given VPLS service. This parameter is only applicable to automatically protected MAC addresses.

When the **restrict-protected-src** is enabled on an SHG the action only applies to the associated SAPs (no action is taken by default for spoke SDPs in the SHG) and is displayed in the SAP show output as the oper state unless it is overridden by the configuration of **restrict-protected-src** on the SAP itself. To enable this function for spoke SDPs within a SHG, the **restrict-protected-src** must be enabled explicitly under the spoke SDP. If required, **restrict-protected-src** can also be enabled explicitly under specific SAPs within the SHG.

When this command is applied or removed, with either the **alarm-only** or **discard-frame** parameters, the MAC addresses are cleared from the related object.

The use of **restrict-protected-src discard-frame** is mutually exclusive with the configuration of manually protected MAC addresses within a given VPLS.

The **alarm-only** parameter is not supported on the 7750 SR-a, 7750 SR-1e/2e/3e, 7950 XRS, 7750 SR-1,or 7750 SR-1s/2s/7s/14s platforms.

The **no** form of the command reverts to the default.

Default

no restrict-protected-src

Parameters

alarm-only

Specifies that the packet is forwarded, an alarm is generated but the source MAC is not learned on the SAP, spoke SDP, or mesh SDP.

Default no alarm-only

discard-frame

Specifies that the packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes within a given VPLS service.

Default no discard-frame

restrict-protected-src

Syntax

restrict-protected-src discard-frame

no restrict-protected-src

Context

[Tree] (config>service>vpls>pbb>backbone-vpls restrict-protected-src)

Full Context

configure service vpls pbb backbone-vpls restrict-protected-src

Description

This command indicates how the agent handles relearn requests for protected MAC addresses, either manually added using the **mac-protect** command or automatically added using the **auto-learn-mac-protect** command. While enabled, all packets entering the configured SAP, spoke SDP, mesh SDP, or any SAP that is part of the configured split horizon group (SHG) is verified not to contain a protected source MAC address. If the packet is found to contain such an address, the action taken depends on the parameter specified on the **restrict-protected-src** command, namely:

- No parameter — The packet is discarded, an alarm is generated and the SAP, spoke SDP or mesh SDP will be set as operationally down. The SAP, spoke SDP or mesh SDP must be shutdown and enabled (no shutdown) for this state to be cleared.
- **discard-frame** — The packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes in a specified VPLS service. This parameter is only applicable to automatically protected MAC addresses.

When the **restrict-protected-src** is enabled on an SHG, the action only applies to the associated SAPs (no action is taken by default for spoke-SDPs in the SHG) and is displayed in the SAP show output as the oper state unless it is overridden by the configuration of **restrict-protected-src** on the SAP itself. To enable this function for spoke SDPs within a SHG, the **restrict-protected-src** must be enabled explicitly under the spoke SDP. If required, **restrict-protected-src** can also be enabled explicitly under specific SAPs within the SHG.

When this command is applied or removed, with the **discard-frame** parameter, the MAC addresses are cleared from the related object.

The use of **restrict-protected-src discard-frame** is mutually exclusive with the configuration of manually protected MAC addresses within a specified VPLS.

Default

no restrict-protected-src

Parameters

discard-frame

Specifies that the packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes within a specified VPLS service

Full Context

configure service vpls restrict-unprotected-dst

configure service vpls split-horizon-group restrict-unprotected-dst

configure service pw-template split-horizon-group restrict-unprotected-dst

configure service vpls sap restrict-unprotected-dst

Description

This command indicates how the system will forward packets destined for an unprotected MAC address, either manually added using the **mac-protect** command or automatically added using the **auto-learn-mac-protect** command. While enabled all packets entering the configured SAP or SAPs within a split horizon group (but not spoke or mesh-SDPs) will be verified to contain a protected destination MAC address. If the packet is found to contain a non-protected destination MAC, it will be discarded. Detecting a non-protected destination MAC on the SAP will not cause the SAP to be placed in the operationally down state. No alarms are generated.

If the destination MAC address is unknown, even if the packet is entering a restricted SAP, with **restrict-unprotected-dst** enabled, it will be flooded.

Description

This command denies the user from accessing files outside of their local home directory. Files can be accessed locally by CLI file commands and output modifiers such as **>** (file redirect).

When enabled, the system denies all configuration save operations (such as **admin save**) via any management interface (such as CLI and NETCONF) unless **save-when-restricted** is enabled.

When **restricted-to-home** is configured, file access is denied unless the **home-directory** is configured and the directory is created by an administrator.

The **no** form of this command permits the user to access all files on the system and to remote files.

[Tree] (config>port>network>egress>pool resv-cbs)

Full Context

configure port access ingress pool resv-cbs

configure port access egress pool resv-cbs

configure port network egress pool resv-cbs

Description

This command defines the percentage or specifies the sum of the pool buffers that are used as a guideline for CBS calculations for access and network ingress and egress queues. Two actions are accomplished by this command:

- A reference point is established to compare the currently assigned (provisioned) total CBS with the amount the buffer pool considers to be reserved. Based on the percentage of the pool reserved that has been provisioned, the over provisioning factor can be calculated.
- The size of the shared portion of the buffer pool is indirectly established. The shared size is important to the calculation of the instantaneous-shared-buffer-utilization and the average-shared-buffer-utilization variables used in Random Early Detection (RED) per packet slope plotting.

It is important to note that this command does not actually set aside buffers within the buffer pool for CBS reservation. The CBS value per queue only determines the point at which enqueuing packets are subject to a RED slope. Oversubscription of CBS could result in a queue operating within its CBS size and still not able to enqueue a packet due to unavailable buffers. The resv-cbs parameter can be changed at any time.

If the total pool size is 10 Mb and the resv-cbs set to 5, the 'reserved size' is 500 kb.

The **no** form of this command clears all the adaptive configurations. There cannot be any adaptive sizing enabled for default **resv-cbs**.

Default

resv-cbs 30

Parameters

percent-or-default

Specifies the pool buffer size percentage.

Values 0 to 100, **default**

amber-alarm-action step ***percent***

Specifies the percentage step-size for the reserved CBS size of the pool. When using the default value, the adaptive CBS sizing is disabled. To enable adaptive CBS sizing, **step** *percent* must be set to non-default value along with the **max** parameter. When reserved CBS is default adaptive CBS sizing cannot be enabled. The reserved CBS (Committed

© 2025 Nokia.

no resv-cbs

Context

[Tree] (config>card>fp>egress>wred-queue-control resv-cbs)

Full Context

configure card fp egress wred-queue-control resv-cbs

Description

This command defines the amount of buffers within the WRED mega-pool that will be set aside for WRED queues operating within their configured CBS thresholds. **Note** that the **min** *percentage* and **max** *percentage* parameters must be set to the same value. The forwarding plane protects against WRED queue buffer starvation by setting aside a portion of the buffers within the WRED mega-pool. The WRED queue CBS threshold defines when a WRED queue requests buffers from reserved portion of the WRED mega-pool and when it starts requesting buffers from the shared portion of the mega-pool. With proper oversubscription provisioning, this prevents a seldom active queue from being denied a buffer from the mega-pool when the shared portion of the mega-pool is congested.

The WRED mega-slope reserve CBS size is controlled in the same manner as the overall sizing of the WRED mega-pool. A min and max parameter is provided to scope the range that the reserved portion based on percentages of the WRED mega-pool current size.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command immediately restores the default min and max percentage values for sizing the WRED mega-pool CBS reserve.

Default

resv-cbs min 25.00 max 25.00

Parameters

min *percentage*

Specifies that the required keyword defines the minimum percentage of the WRED mega-pool buffers that will be applied to the CBS reserve. The value given for *percentage* must be less than or equal to the value given for the **max** *percentage*. Percentages are defined with an accuracy of hundredths of a percent in the nn.nn format (15.65 = 15.65%).

Values 0.00 to 99.99

Default 25.00

max *percentage*

Specifies that the required keyword defines the maximum percentage of the WRED mega-pool buffers that may be applied to the CBS reserve. The value given for *percentage* must be greater than or equal to the value given for the **min** *percentage*. Percentages are defined with an accuracy of hundredths of a percent in the nn.nn format (15.65 = 15.65%).

Values 0.01 to 99.99

Default 25.00

configure isa video-group watermark bandwidth ret

configure isa video-group watermark session ret

Description

This command sets the watermark to trigger the SNMP trap if the RET bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the bandwidth available is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

Default

ret 90

Parameters

percent

Specifies the percentage of the system resources per ISA.

configure service vprn ospf3 area interface retransmit-interval

configure service vprn ospf area interface retransmit-interval

configure service vprn ospf area virtual-link retransmit-interval

configure service vprn ospf3 area virtual-link retransmit-interval

Description

This command specifies the length of time, in seconds, that OSPF will wait before retransmitting an unacknowledged link state advertisement (LSA) to an OSPF neighbor.

The value should be longer than the expected round trip delay between any two routers on the attached network. Once the retransmit interval expires and no acknowledgment is received, the LSA is retransmitted.

The **no** form of this command reverts to the default interval.

Default

retransmit-interval 5

Parameters

seconds

The retransmit interval in seconds expressed as a decimal integer.

Values 1 to 3600

Platforms

All

retransmit-interval

Syntax

retransmit-interval *seconds*

no retransmit-interval

40 r Commands – Part III

40.1 retry

retry

Syntax

retry *count*

Context

[Tree] (config>aaa>l2tp-acct-plcy>radius-acct-server retry)

Full Context

configure aaa l2tp-accounting-policy radius-accounting-server retry

Description

This command configures the number of times the router attempts to contact the RADIUS server for authentication.

Note:
The retry count includes the first attempt.

The **no** form of this command reverts to the default value.

Default

retry 3 (the initial attempt as well as two retried attempts)

Parameters

count

Specifies the retry count.

Values 1 to 10

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

retry

Syntax

retry *count*

Context

[Tree] (config>app-assure>rad-acct-plcy>server retry)

Full Context

configure application-assurance radius-accounting-policy radius-accounting-server retry

Description

This command configures the number of times the router attempts to contact the RADIUS accounting server if a response to the initial message is not received.

The **no** form of this command reverts to the default value.

Default

retry 3

Parameters

count

Specifies the retry count.

Values 1 to 10

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

retry

retry

Syntax

retry *minutes*

no retry

Context

[Tree] (config>service>vpls>bgp-evpn>mac-duplication retry)

Full Context

configure service vpls bgp-evpn mac-duplication retry

Description

Specifies the timer after which the MAC in hold-down state is automatically flushed and the mac-duplication process starts again. This value is expected to be equal to two times or more than that of window.

If **no** retry is configured, this implies that, when mac-duplication is detected, MAC updates for that MAC will be held down till the user intervenes or a network event (that flushes the MAC) occurs.

Default

retry 9

Parameters

minutes

Specifies the BGP EVPN MAC duplication retry in minutes.

Values 2 to 60

Platforms

All

retry

Syntax

retry *count*

no retry

configure system security dot1x radius-plcy retry

configure system security radius retry

configure service vprn aaa remote-servers radius retry

Description

This command configures the number of times the router attempts to contact the RADIUS server for authentication if there are problems communicating with the server.

The **no** form of this command reverts to the default value.

Default

retry 3

Parameters

count

Specifies the retry count.

Values 1 to 10

Platforms

All

retry

Syntax

retry *count*

no retry

Context

[Tree] (config>system>file-trans-prof retry)

Full Context

configure system file-transmission-profile retry

Description

This command specifies the number of retries on transport protocol level.

When the virtual router does not receive any data from a server (e.g., FTP or HTTP server) after the configured **timeout** *seconds*, the router may repeat the request to the server. The number of retries specifies the maximum number of repeated requests.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command disables the retry.

Default

no retry

Parameters

count

Specifies the number of retries.

Values 1 to 256

Platforms

All

retry

Syntax

retry *count*

Context

Context

[Tree] (config>aaa>route-downloader retry-interval)

Full Context

configure aaa route-downloader retry-interval

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command sets the duration, in minutes, of the retry interval. The retry interval is the interval meant for the system to retry sending an Access Request message after the previous one was unanswered (not with an access reject but rather just a RADIUS failure or ICMP port unreachable). This timer is actually an exponential backoff timer that starts at **min** and is capped at **max** minutes.

The **no** form of this command reverts to the default values.

Default

retry-interval min 10 max 20

Parameters

min ***minimum***

Specifies the duration, in minutes, of the retry interval. This duration grows exponentially after each sequential failure.

Values 1 to 1440

max ***maximum***

Specifies the maximum duration, in minutes, of the retry interval.

Values 1 to 1440

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure router mpls lsp retry-limit

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure router mpls lsp-template retry-limit

Description

This optional command specifies the number of attempts software should make to re-establish the LSP after it has failed LSP. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the LSP path is put into the **shutdown** state.

Use the config router **mpls lsp** *lsp-name* **no shutdown** command to bring up the path after the retry-limit is exceeded.

For P2MP LSP that are created based on the LSP template, all S2Ls must attempt to retry-limit before the client application is informed of failure.

The **no** form of this command reverts to the default value.

Default

retry-limit 0 (no limit, retries forever)

Parameters

number

Specifies the number of times software will attempt to re-establish the LSP after it has failed. Allowed values are integers in the range of 0 to 10000.

Values 0 to 10000

Platforms

All

40.5 retry-on-igp-overload

retry-on-igp-overload

Syntax

[**no**] **retry-on-igp-overload**

Context

[Tree] (config>router>mpls retry-on-igp-overload)

Full Context

configure router mpls retry-on-igp-overload

Description

This command allows for the global configuration of the handling in the ingress LER of the LSP paths which transit an LSR that advertised the IS-IS overload bit.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

By default, MPLS re-optimizes using make-before-break (MBB) the transit paths away from the node in an IS-IS overload state only at the time a manual or timer-based re-signal is performed for the LSP paths. MPLS will not act immediately on the receipt of the IS-IS overload bit.

When this command is enabled, MPLS in the ingress LER immediately tears down and re-signals all LSP paths away from a transit LSR node which advertised the IS-IS overload bit.

LSP paths that terminate on the node that advertised the IS-IS overload bit are not acted on whether this command is enabled or disabled.

The **no** form of this command returns to the default behavior.

Syntax

retry-timeout *timeout*

no retry-timeout

Context

[Tree] (config>service>template>vpls-template>mac-move retry-timeout)

[Tree] (config>service>vpls>mac-move retry-timeout)

Full Context

configure service template vpls-template mac-move retry-timeout

configure service vpls mac-move retry-timeout

Description

This indicates the time in seconds to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

It is recommended that the retry-timeout value is larger or equal to 5s * cumulative factor of the highest priority port so that the sequential order of port blocking will not be disturbed by re-initializing lower priority ports.

A zero value indicates that the SAP will not be automatically re-enabled after being disabled. If, after the SAP is re-enabled it is disabled again, the retry timeout is increased with the provisioned retry timeout in order to avoid thrashing. For example, when retry-timeout is set to 15, it increments (15,30,45,60...).

The **no** form of this command reverts to the default value.

Default

retry-timeout 10 (when mac-move is enabled)

Parameters

timeout

Specifies the time, in seconds, to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

Values 0 to 120

Platforms

All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

retry-timeout

Syntax

retry-timeout *seconds*

no retry-timeout

Context

[Tree] (config>system>security>tacplus retry-timeout)

[Tree] (config>service>vprn>aaa>rmt-srv>tacplus retry-timeout)

Full Context

configure system security tacplus retry-timeout

configure service vprn aaa remote-servers tacplus retry-timeout

Description

This command configures the maximum timeout before retrying requests when health checks are disabled and all TACACS+ servers are operationally down. Set the value of this timer to a lower value or disable it to increase the interactive responsiveness of AAA requests after the servers become unreachable.

The **no** form of this command removes the retry timeout and requests are sent immediately.

Default

retry-timeout 300

Parameters

seconds

Specifies the maximum timeout, in seconds, before retrying requests.

Values 1 to 300

Default 300

no retry-timer

Context

[Tree] (config>service>epipe>spoke-sdp-fec retry-timer)

Full Context

configure service epipe spoke-sdp-fec retry-timer

Description

This command specifies a retry-timer for the spoke SDP. This is a configurable exponential back-off timer that determines the interval between retries to reestablish a spoke SDP if it fails and a label withdraw message is received with the status code "AII unreachable".

The **no** form of this command reverts the timer to its default value.

Default

retry-timer 30

Parameters

retry-timer

The initial retry-timer value in seconds.

Values 10 to 480

Platforms

All

retry-timer

Syntax

retry-timer *seconds*

no retry-timer

Context

[Tree] (config>router>mpls>lsp-template retry-timer)

[Tree] (config>router>mpls>lsp retry-timer)

Full Context

configure router mpls lsp-template retry-timer

configure router mpls lsp retry-timer

Description

This command configures the time (in s), for LSP re-establishment attempts after it has failed. The retry time is jittered to +/- 25% of its nominal value.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For P2MP LSP created based on LSP template, all S2Ls must attempt to retry-limit before client application is informed of failure.

The **no** form of this command reverts to the default value.

Default

retry-timer 30

Parameters

seconds

Specifies the amount of time (in s), between attempts to re-establish the LSP after it has failed. Allowed values are integers in the range of 1 to 600.

Values 1 to 600

Platforms

All

retry-timer

Syntax

retry-timer *secs*

no retry-timer

return-path-bfd-sid *ipv6-address*
no return-path-bfd-sid

Context
[Tree] (conf>router>segment-routing>sr-policies>policy>srv6 return-path-bfd-sid)

Full Context
configure router segment-routing sr-policies static-policy segment-routing-v6 return-path-bfd-sid

Description
This command configures the Seamless Bidirectional Forwarding Detection (S-BFD) session to echo mode and pushes an additional SRv6 SID in the SRH on S-BFD packets only.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The command applies to the initiator of the S-BFD sessions. The return path SID refers to a binding SID on a SRv6 policy configured on the far-end router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this SRv6 return path.

The **no** form of this command disables the controlled return-path SID and echo mode for S-BFD. If the command is deleted, the S-BFD session returns to asynchronous mode and the initiator node does not push a return-path SID. Any S-BFD packets for this SRv6 policy that the terminating router receives are sent back using a routed return path.

Parameters

ipv6-address

Specifies the IPv6 address.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

Platforms

configure router segment-routing maintenance-policy return-path-label

Description

This command configures the Seamless Bidirectional Forwarding Detection (S-BFD) session to echo mode and adds an additional MPLS label, referring to an MPLS-labeled reply path for the S-BFD packet, to the bottom of the label stack for the S-BFD packet.

The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

The **no** form of this command disables the controlled return-path label and echo mode for S-BFD. S-BFD returns to asynchronous mode and the initiator node does not push a return-path label. Any S-BFD packets for this LSP or path that the reflector receives are sent back using a routed return path.

Default

no return-path-label

Parameters

label-value

Specifies the label value.

Values 32 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure router mpls lsp primary bfd return-path-label

40.11 reuse

reuse

Syntax

reuse *integer*

no reuse

Context

[Tree] (config>router>policy-options>damping reuse)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router policy-options damping reuse

Description

This command configures the reuse parameter for the route damping profile.

When the Figure of Merit (FoM) value falls below the **reuse** threshold, the route is once again considered valid and can be reused or included in route advertisements.

The **no** form of this command removes the reuse parameter from the damping profile.

Default

no reuse

Parameters

integer

Specifies the reuse value expressed as a decimal integer.

Values 1 to 20000

Platforms

All

40.12 reuse-ext-ip

reuse-ext-ip

Syntax

[**no**] **reuse-ext-ip**

Context

[Tree] (config>service>nat>pcp-server-policy reuse-ext-ip)

Full Context

configure service nat pcp-server-policy reuse-ext-ip

Description

This command enables the system to reuse the external IP address assigned to a subscriber when the requested well-known port or external IP mapping is not available.

The **no** form of this command causes a request for a well-known port to be allocated exactly as requested but on a different external IP address from the one that the subscriber is already using. This occurs if the requested well-known port is already allocated to another subscriber which is sharing the same external IP address. The existing external IP address is initially allocated to the subscriber by the virtue of initial traffic flow.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

40.15 revert

revert

Syntax

revert {**latest-rb**| *checkpoint-id* | **rescue**} [**now**]

Context

[Tree] (admin>rollback revert)

Full Context

admin rollback revert

Description

This command initiates a configuration rollback revert operation that will return the configuration state of the node to a previously saved checkpoint. The rollback revert minimizes impacts to running services. There are no impacts in areas of configuration that did not change since the checkpoint. Configuration parameters that changed (or items on which changed configuration have dependencies) are first removed (revert to default) and the previous values are then restored (can be briefly service impacting in changed areas).

Parameters

latest-rb

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

checkpoint-id

Specifies the configuration to return to (which rollback checkpoint file to use). Checkpoint-id of 1 corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 9

rescue

Specifies to revert to the rescue checkpoint.

now

Forces a rollback revert without any interactive confirmations (assumes 'y' for any confirmations that would have occurred).

Platforms

All

revert

Syntax

[**no**] **revert**

Context

[Tree] (config>system>sync-if-timing revert)

Full Context

configure system sync-if-timing revert

Description

This command allows the clock to revert to a higher priority reference if the current reference goes offline or becomes unstable. When the failed reference becomes operational, it is eligible for selection. When the mode is non-revertive, a failed clock source is not selected again.

Default

no revert

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context

[Tree] (config>service>vprn>isis>link-group>level revert-members)

Full Context

configure service vprn isis link-group level revert-members

Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured **revert-members** threshold, the configured offsets are removed.

The **no** form of this command reverts the threshold back to the default, which is equal to the **oper-members** threshold value.

Default

no revert-members *oper-members*

Parameters

1..8

Specifies the number of revert members.

Values 1 to 8

Platforms

All

revert-members

Syntax

revert-members [*1..8*]

no revert-members

Context

[Tree] (config>router>isis>link-group>level revert-members)

Full Context

configure router isis link-group level revert-members

Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured revert-member threshold then the configured offsets are removed.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command reverts the threshold back to the default which is equal to the oper-member threshold value.

Default

no revert-members oper-members

Parameters

1..8

Specifies the threshold for revertive members.

Values 1 to 8

revert-time

Syntax

revert-time *revert-time* | **infinite**

no revert-time

Context

[Tree] (config>service>vpls>endpoint revert-time)

Full Context

configure service vpls endpoint revert-time

Description

This command configures the time to wait before reverting to primary spoke-SDP.

In a regular endpoint the revert-time setting affects just the pseudowire defined as primary (precedence 0). For a failure of the primary pseudowire followed by restoration the revert-timer is started. After it expires the primary pseudowire takes the active role in the endpoint. This behavior does not apply for the case when both pseudowires are defined as secondary. For example, if the active secondary pseudowire fails and is restored it will stay in standby until a configuration change or a force command occurs.

Parameters

revert-time

Specifies the time to wait, in seconds, before reverting back to the primary spoke-SDP defined on this service endpoint, after having failed over to a backup spoke-SDP

Values 0 to 600

infinite

Specifying this keyword makes endpoint non-revertive

Platforms

All

revert-time

Syntax

revert-time {*revert-time* | **infinite**}

no revert-time

Context

[Tree] (config>mirror>mirror-dest>endpoint revert-time)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure mirror mirror-dest endpoint revert-time

Description

This command configures the time to wait before reverting to the primary spoke SDP. This command has an effect only when used in conjunction with an endpoint which contains a SDP of type 'primary'. It is ignored and has no effect in all other cases. The revert-timer is the delay in seconds the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

The **no** form of this command resets the timer to the default value of 0. This means that the mirror-service path is switched back to the endpoint primary sdp immediately after it comes back up.

Parameters

revert-time

Specifies a delay, in seconds, the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

Values 0 to 600

infinite

Forces the mirror or LI service path to never revert to the primary SDP as long as the currently active secondary SDP is UP.

Platforms

All

revert-time

Syntax

revert-time {*revert-time* | **infinite**}

no revert-time

Context

[Tree] (config>service>sdp>mixed-lsp-mode revert-time)

Full Context

configure service sdp mixed-lsp-mode revert-time

Description

This command configures the delay period the SDP must wait before it reverts to a higher priority LSP type when one becomes available.

The **no** form of the command resets the timer to the default value of 0. This means the SDP reverts immediately to a higher priority LSP type when one becomes available.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no revert-time

Parameters

revert-time

Specifies the delay period, in seconds, that the SDP must wait before it reverts to a higher priority LSP type when one becomes available. A value of zero means the SDP reverts immediately to a higher priority LSP type when one becomes available.

Values 0 to 600

infinite

This keyword forces the SDP to never revert to another higher priority LSP type unless the currently active LSP type is down.

Platforms

All

revert-time

Syntax

revert-time *time*

no revert-time

Context

[Tree] (config>eth-ring revert-time)

Full Context

configure eth-ring revert-time

Description

This command configures the revert time for an Eth-Ring. It ranges from 60 seconds to 720 second by 1 second intervals.

The **no** form of this command means non-revertive mode and revert time is essentially 0, and the revert timers are not set.

Default

revert-time 300

Parameters

time

Specifies the guard-time, in seconds.

Values 60 to 720

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

40.18 revert-timer

revert-timer

Syntax

revert-timer *timer-value*

no revert-timer

Context

[Tree] (config>router>mpls>lsp revert-timer)

Full Context

configure router mpls lsp revert-timer

Description

This command configures a revert timer on an LSP. The timer starts when the LSP primary path recovers from a failure. The LSP reverts from a secondary path to the primary path when the timer expires, or when the secondary path fails.

The **no** form of this command cancels any currently outstanding revert timer. If the LSP is up when a no revert-timer is issued, the LSP will revert to the primary path. Otherwise the LSP reverts when the primary path is restored.

Default

no revert-timer

Parameters

timer-value

Specifies the amount of time, in one minute increments, between attempts to re-establish the LSP after it has failed.

Values 1 to 4320

Platforms

All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

revert-timer

Syntax

revert-timer *seconds*

no revert-timer

Context

[Tree] (config>router>mpls>fwd-policies>fwd-policy revert-timer)

Full Context

configure router mpls forwarding-policies forwarding-policy revert-timer

Description

This command configures the revert timer in an MPLS forwarding policy.

When the primary direct or indirect next hop is restored and is added back into the routing table, CPM waits for an amount of time equal to the user-programmed revert timer before activating it and updating the data path. However, if the backup direct or indirect next hop fails while the timer is running, CPM activates it and updates the data path immediately.

A value of 0 disables the revert timer; meaning the policy reverts immediately.

The **no** form of this command removes the revert timer from the MPLS forwarding policy.

Default

revert-timer 0

Parameters

seconds

Specifies the revert-timer value, in number of seconds.

Values 1 to 600

Platforms

All

revert-timer

Syntax

revert-timer *revert-timer*

no revert-timer

Context

[Tree] (config>router>segment-routing>maintenance-policy revert-timer)

© 2025 Nokia.

configure service vprn mvpn provider-tunnel selective umh-rate-monitoring group source revertive-timer

Description

This command configures the timer value (in seconds) after which to revert to the primary UMH after traffic is restored. This value must account for the traffic flapping from the primary UMH. If there is traffic flapping, the timer resets and starts over.

The **no** form of the command means that there is no revertive behavior.

Default

no revertive-timer

Parameters

sec

Specifies the timer value (in seconds).

Values 1 to 3600

Platforms

All

40.21 revocation-check

revocation-check

Syntax

revocation-check {**crl** | **crl-optional**}

Context

[Tree] (config>system>security>pki>ca-profile revocation-check)

Full Context

configure system security pki ca-profile revocation-check

Description

This command specifies the revocation method the system uses to check the revocation status of certificate issued by the CA. If the **crl-optional** option is configured, when the user disables the **ca-profile**, the system tries to load the configured CRL (specified by the **crl-file** command). However, if the system fails to load the configured CRL for the following reasons, the system still brings the **ca-profile** operationally up, but leaves the CRL configured as non-existent:

- CRL file does not exist
- CRL is not properly encoded - maybe due to interrupted file transfer
- CRL does not match cert

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Wrong CRL version
- CRL expired

Note:
The **crl-optional** command option makes configuration of a valid CRL in a **ca-profile** optional. However, from a security point of view, it is important to always verify the revocation status of a certificate.

If the system needs to use the CRL of a specific CA profile to check the revocation status of an end-entity certificate, and the CRL is non-existent due to the preceding reasons, the system treats a case like this as being unable to get an answer from CRL and falls back to the next status verify method or default result.

If the system needs to check the revocation of a CA certificate in a certificate chain, and if the CRL is non-existent due to the preceding reasons, the system skips checking the revocation status of the CA certificate. For example, if CA1 is issued by CA2, if the revocation-check for CA2 is **crl-optional** and the CRL for CA2 is non-existent, the system does not check the certificate revocation status of CA1 and it is considered as "good".

Note:
Users must shut down the **ca-profile** to change the **revocation-check** configuration.

Default

revocation-check crl

Parameters

crl

Specifies to use the configured CRL.

crl-optional

Specifies that the CRL is optional.

40.35 robust-count

robust-count

Syntax

robust-count *robust-count*

no robust-count

Context

[Tree] (config>service>vpls>sap>mld-snooping robust-count)

[Tree] (config>service>vpls>mesh-sdp>igmp-snooping robust-count)

[Tree] (config>service>vpls>igmp-snooping robust-count)

[Tree] (config>service>vpls>sap>igmp-snooping robust-count)

[Tree] (config>service>vpls>mesh-sdp>mld-snooping robust-count)

[Tree] (config>service>vpls>spoke-sdp>mld-snooping robust-count)

[Tree] (config>service>vpls>spoke-sdp>igmp-snooping robust-count)

Full Context

configure service vpls sap mld-snooping robust-count

configure service vpls mesh-sdp igmp-snooping robust-count

configure service vpls igmp-snooping robust-count

configure service vpls sap igmp-snooping robust-count

configure service vpls mesh-sdp mld-snooping robust-count

configure service vpls spoke-sdp mld-snooping robust-count

configure service vpls spoke-sdp igmp-snooping robust-count

Description

If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If this SAP or SDP is expected to be 'lossy', this parameter may be increased. IGMP snooping on this SAP or SDP is robust to (robust-count-1) packet losses.

If **send-queries** is not enabled, this parameter will be ignored.

Default

robust-count 2

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

robust-count

Specifies the robust count for the SAP or SDP

Values 2 to 7 (for **config>service>vpls>sap>igmp-snooping**) 1 to 255 (for **config>service>vpls>igmp-snooping**)

Platforms

All

robust-count

Syntax

robust-count *robust-count*

no robust-count

Context

[Tree] (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp robust-count)

Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping robust-count

Description

This command configures the IGMP robustness variable. If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If an MSAP or SDP is expected to be "lossy", this parameter may be increased. IGMP snooping on an MSAP or SDP is robust to (robust-count-1) packet losses.

If send-queries is not enabled, this parameter is ignored.

The **no** form of this command reverts to the default.

Default

robust-count 2

Parameters

robust-count

Specifies the robust count for the SAP or SDP.

Values 2 to 7

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

40.38 rollback-location

rollback-location

Syntax

rollback-location *file-url* /*rollback filename*

no rollback-location

Context

[Tree] (config>system>rollback rollback-location)

Full Context

configure system rollback rollback-location

Description

The location and name of the rollback checkpoint files is configurable to be local (on compact flash) or remote. The *file-url* must not contain a suffix (just a path/directory + filename). The suffixes for rollback checkpoint files are ".rb", ".rb.1", ..., ".rb.9" and are automatically appended to rollback checkpoint files.

Default

no rollback-location

Parameters

file-url

Specifies the URL or rollback filename.

Values

local-url | *remote-url*	
local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length of up to 99 characters each
remote-url	[{ftp://}*login*:*pswd*@ *remote-locn*/][*file-path*] up to 255 characters, directory length of up to 99 characters each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*] *x:x:x:x:x:x:d.d.d.d*[-*interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D *interface* - up to 32 characters each, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rollback-filename

Specifies the rollback file name.

Values suffixed with .rb, .rb.1 up to .9 during rollback checkpoint creation

Platforms

All

40.39 rollback-sync

rollback-sync

Syntax

rollback-sync

Context

[Tree] (admin>redundancy rollback-sync)

Full Context

admin redundancy rollback-sync

Description

This command copies the entire set of rollback checkpoint files from the active CPM CF to the standby CPM CF.

Platforms

All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rollback-sync

Syntax

[**no**] **rollback-sync**

Context

[Tree] (config>redundancy rollback-sync)

Full Context

configure redundancy rollback-sync

Description

The operator can enable automatic synchronization of classic CLI rollback checkpoint files between the active CPM and standby CPM. When this automatic synchronization is enabled, a classic CLI **rollback save** causes the new classic CLI checkpoint file to be saved on both the active and standby CPMs. The suffixes of the old checkpoint files on both active and standby CPMs are incremented. Note that automatic sync only causes the one new checkpoint file to be copied to both CFs (the other checkpoint files are not automatically copied from active to standby but that can be done manually with **admin redundancy rollback-sync**).

Automatic synchronization of classic CLI rollback checkpoint files across CPMs is only performed if the rollback-location is configured as a local file-url (for example, "cf3:/rollback-files/rollback). Synchronization is not done if the rollback-location is remote.

The **config redundancy synchronize {boot-env | config}** and **admin redundancy synchronize {boot-env | config}** do not apply to classic CLI rollback checkpoint files. These commands do not manually or automatically sync classic CLI rollback checkpoint files. The dedicated **rollback-sync** command must be used to sync classic CLI rollback checkpoint files.

Default

no rollback-sync

Platforms

All

40.40 rollover

rollover

Syntax

rollover *minutes* [**retention** *hours*]

no rollover

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>log>file-id rollover)

Full Context

configure log file-id rollover

Description

This command configures how often an event or accounting log is rolled over or partitioned into a new file.

An event or accounting log is actually composed of multiple, individual files. The system creates a new file for the log based on the **rollover** time, expressed in minutes.

The *retention* option, expressed in hours, allows you to modify the default time to keep the file in the system. The retention time is based on the rollover time of the file.

If logs are needed to be retained for more than 16 days, use a CRON job to move the logs to a different location, either on a local drive or a remote server. For more information, contact Nokia support.

When multiple **rollover** commands for a *file-id* are entered, the last command overwrites the previous command.

The **no** form of this command reverts to the default values.

Default

rollover 1440 retention 12

Parameters

minutes

Specifies the rollover time, in minutes.

Values 5 to 10080

retention hours

Specifies the retention period in hours, expressed as a decimal integer. The retention time is based on the time creation time of the file. The file becomes a candidate for removal once the creation datestamp + rollover time + retention time is less than the current timestamp.

Default 12

Values 1 to 500

40.41 root

root

Syntax

root

Context

[Tree] (config>qos>policer-control-policy root)

Full Context

configure qos policer-control-policy root

Description

The **root** node contains the policer control policies configuration parameters for the root arbiter. Within the node, the parent policer's maximum rate limit can be set, the strict priority level, and fair threshold portions may be defined per priority level.

The root node always exists and does not need to be created.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

40.42 root-address

root-address

Syntax

root-address *ip-address*

no root-address

Context

[Tree] (config>router>p2mp-sr-tree>p2mp-policy root-address)

Full Context

configure router p2mp-sr-tree p2mp-policy root-address

Description

This command configures the IP address of the P2MP SR tree root node of the P2MP policy. The root tree ID and the root address uniquely identify the P2MP policy on the root node.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the root address entry.

Parameters

ip-address

Specifies the IPv4 address of the root node.

Values a.b.c.d

Platforms

All

root-address

Syntax

root-address *ip-address*

no root address

Context

[Tree] (config>router>p2mp-sr-tree>replication-segment root-address)

Full Context

configure router p2mp-sr-tree replication-segment root-address

Description

This command configures the replication segment with the IP address of the root node of the P2MP SR tree replication segment.

The **no** form of this command removes the root node address.

Parameters

ip-address

Specifies the IPv4 address.

Values a.b.c.d

Platforms

All

40.43 root-and-leaf

root-and-leaf

Syntax

[**no**] **root-and-leaf**

Context

[Tree] (config>service>vpls>provider-tunnel>inclusive root-and-leaf)

Full Context

configure service vpls provider-tunnel inclusive root-and-leaf

Description

This command configures the node to operate as both root and leaf of the I-PMSI in a specified VPLS/B-VPLS instance.

By default, a node will behave as a leaf-only node. When the node is leaf only for the I-PMSI of type P2MP RSVP LSP, no PMSI Tunnel Attribute is included in BGP-AD route update messages and therefore no RSVP P2MP LSP is signaled but the node can join RSVP P2MP LSP rooted at other PE nodes participating in this VPLS/B-VPLS service. The user must still configure a LSP template even if the node is a leaf only.
