configure qos network ingress ip-criteria renum

configure qos network ingress ipv6-criteria renum

Description

This command renumbers existing QoS policy criteria entries to properly sequence policy entries.

This can be required in some cases since the router exits when the first match is found and executes the actions in accordance with the accompanying action command. This requires that entries be sequenced correctly from most to least explicit.

Parameters

old-entry-number

Enter the entry number of an existing entry.

Values 1 to 65535

new-entry-number

Enter the new entry number to be assigned to the old entry.

Values 1 to 65535

Platforms

All

configure filter ipv6-exception renum

configure filter ipv6-filter renum

Description

This command renumbers existing MAC, IPv4/IPv6, IP exception filter, or IPv6 exception filter entries to properly sequence filter entries.

This may be required in some cases since the OS exits when the first match is found and executes the actions according to the accompanying action command. This requires that entries be sequenced correctly from most to least explicit.

Parameters

old-entry-id

Specifies the entry number of an existing entry, as a decimal integer.

Values 1 to 2097151

new-entry-id

Specifies the new entry-number to be assigned to the old entry, as a decimal integer.

Values 1 to 2097151

configure system security management-access-filter ip-filter renum

configure system security management-access-filter mac-filter renum

Description

This command renumbers existing management access filter entries for an IP(v4), IPv6, or MAC filter to re-sequence filter entries.

The exits on the first match found and executes the actions in accordance with the accompanying **action** command. This may require some entries to be re-numbered differently from most to least explicit.

Parameters

old-entry-number

Specifies the entry number of the existing entry.

Values 1 to 9999

new-entry-number

Specifies the new entry number that will replace the old entry number.

Values 1 to 9999

renumber

Syntax

renumber from *entry-id* **to** *entry-id*

Context

[Tree] (config>router>policy-options>policy-statement renumber)

Full Context

configure router policy-options policy-statement renumber

Description

This command allows the operator to renumber the existing entry ID to a new entry ID. When performing the renumbering action, the two entry IDs must be different. The existing (**from**) *entry-id* must exist. The new (**to**) *entry-id* must not exist.

Renumbering is not saved in the configuration because it is a performing action.

Parameters

from *entry-id*

Specifies the existing entry ID to be renumbered.

Values 1 to 4294967295

to *entry-id*

Specifies the new entry ID to be assigned.

Values 1 to 4294967295

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video reorder-audio)

Full Context

configure mcast-management multicast-info-policy bundle video reorder-audio

configure mcast-management multicast-info-policy bundle channel video reorder-audio

Description

This command configures the time, in milliseconds, by which the audio packets are reordered in the ad stream.

Configuring this parameter depends on what is configured on the A Server and the GOP sizes of the network stream. Typically, this configuration should match the A Server configuration.

The **no** form of the command removes the time value from the configuration.

Default

no reorder-audio

Parameters

time

Specifies the audio reorder time, in milliseconds.

Values 100 to 1000

Platforms

7450 ESS, 7750 SR, 7750 SR-s

Full Context

configure service vprn l2tp replace-result-code

configure router l2tp replace-result-code

Description

This command replaces CDN Result-Code 4, 5 and 6 on LNS with the Result Code 2. This is needed for interoperability with some implementation of LAC which only takes action based on CDN Result-Code 2 while ignoring CDN Result-Code 4, 5 and 6.

Default

no replace-result-code

Parameters

code

Specifies the L2TP Result codes that need to be replaced. Up to three codes can be specified.

Values cdn-tmp-no-facilities — CDN Result-Code 4 on LNS are replaced with the result code 2 before it is sent to LAC.

cdn-prem-no-facilities — CDN Result-Code 5 on LNS are replaced with the result code 2 before it is sent to LAC.

cdn-inv-dest — CDN Result-Code 6 on LNS are replaced with the result code 2 before it is sent to LAC.

39.75 replay-protection

replay-protection

Syntax

[**no**] **replay-protection**

Context

[Tree] (config>macsec>connectivity-association replay-protection)

Full Context

configure macsec connectivity-association replay-protection

Description

Specifies the size of the replay protection window.

This command must be configured to force packet discard when it has detected a packet that is not within the replay-window-size.

When replay protection is enabled, the sequence of the ID number of the received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay window size, the packet is counted by the receiving port and then discarded. For example, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is counted and discarded because it falls outside the parameters of the replay window size.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

Default

no replay-protection

39.77 replay-window-size

replay-window-size

Syntax

replay-window-size *number-of-packet*s

no replay-window-size

Context

[Tree] (config>macsec>connectivity-association replay-window-size)

Full Context

configure macsec connectivity-association replay-window-size

Description

This command specifies the size of the replay protection window.

This command must be configured to enable replay protection. When replay protection is enabled, the sequence of the ID number of received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving port. For example, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

When the *number-of-packets* variable is set to 0, all packets that arrive out-of-order are dropped.

The **no** form of this command reverts to the default value.

Default

replay-window-size 0

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

number-of-packets

Specifies the window for which the packets can arrive out of order.

Values 0 to 4294967294

39.79 replication-sid

replication-sid

Syntax

replication-sid *label* [*label*]

no replication-sid

Context

[Tree] (config>router>p2mp-sr-tree>replication-segment>sr-mpls>downstream-nodes replication-sid)

Full Context

configure router p2mp-sr-tree replication-segment segment-routing-mpls downstream-nodes replication-sid

Description

This command configures the replication SID or a SID list for the next hop of the P2MP SR tree replication segment.

When a SID list is configured, the replication SID is at the bottom of the stack and the unicast node or the adjacency SID is at the top of the stack. The SID at the top of the stack must be configured first in the list and the replication SID at the bottom of the list must be configured last in the list.

The **no** form of this command removes the replication SID.

Default

no replication-sid

Parameters

label

Specifies the label of the replication SID; up to a maximum of 11 labels.

Values 3, 16 to 1048575, 4294967295

Platforms

All

replication-sid

Syntax

replication-sid *ipv6-address*

no replication-sid

Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>p2mp-sr-tree>replication-segment>srv6>downstream-nodes replication-sid)

Full Context

configure router p2mp-sr-tree replication-segment segment-routing-v6 downstream-nodes replication-sid

Description

This command configures the outgoing replication SID for the next hop of the P2MP SR tree replication segment.

Note: Currently, the SRv6 replication SID does not support a SID list.

The **no** form of this command removes the replication SID.

Default

no replication-sid

Parameters

ipv6-address

Specifies the IPv6 replication SID, including the locator and the function. SR OS supports a 16-bit function from bit 64 to bit 80, with the locator configurable from bit 0 to 64 of the IPv6 address.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Context

[Tree] (config>port>ethernet report-alarm)

Full Context

configure port ethernet report-alarm

Description

This command specifies when and if to generate alarms and alarm clear notifications for this port.

Note:
For some DWDM transceivers, if the **configure port dwdm coherent rx-los-reaction squelch** command is disabled the signal-fail and no-am-lock alarm conditions are not reported when the media side of the transceiver has an RX LOS condition.

Parameters

signal-fail

Reports an Ethernet signal lost alarm.

remote

Reports remote faults.

local

Reports local faults.

no-frame-lock

Reports a 'not locked on the Ethernet framing sequence' alarm.

high-ber

Reports High Bit Error Rate.

no-block-lock

Reports 40G/100G PCS Lanes Not Block Locked.

no-am-lock

Reports 40G/100G PCS Alignment Marker Loss of Lock.

configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms report-alarm

configure mcast-management multicast-info-policy bundle channel video analyzer alarms report-alarm

configure mcast-management multicast-info-policy bundle video analyzer alarms report-alarm

Description

This command configures the type of alarm to monitor and raise through SNMP. The severity of alarms increases from TNC, to QoS, and then to POA. For example, if QoS alarms are configured, the analyzer only raises alarms and events related to QoS. The analyzer may raise alarms for POA events if they occur, but alarms for TNC are not sent.

Default

no report-alarm

Parameters

severity

Keyword to configure the type of alarm.

tnc

Specifies to monitor and raise alarms for TNC events.

qos

Specifies to monitor and raise alarms for QoS events.

poa

Specifies to monitor and raise alarms for POA events.

Context

[Tree] (config>card>mda>flex>member report-alarms)

Full Context

configure card mda flex member report-alarms

Description

This command configures reporting for the FlexE member when a configured condition is met.

The **no** form of this command removes report alarms.

Default

no report-alarms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

los

Keyword to trigger reporting when the PHY loses its signal.

high-ber

Keyword to trigger reporting when the system receives a high bit error rate (BER).

am-not-locked

Keyword to trigger reporting when the system is unable to achieve an alignment marker lock.

deskew-failed

Keyword to trigger reporting when the system is unable to deskew the PHY.

remote-phy-fault

Keyword to trigger reporting when the PHY receives reverse path forwarding (RPF).

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-s

report-alarms

Syntax

[**no**] **report-alarms** [**overhead-frame-not-locked**] [**deskew-failed**] [**local-phy-fault**] [**remote-phy-fault**] [**bad-group-number**] [**bad-phy-number**] [**bad-phy-instance-number**] [**flexe-map-mismatch**] [**client-calendar-error**] [**calendar-in-use-error**]

Context

[Tree] (config>card>mda>flex report-alarms)

Full Context

configure card mda flex report-alarms

Description

This command configures reporting for the MDA FlexE group where one or more instances detect a configured condition.

The **no** form of this command removes reporting for the configured condition.

Default

no report-alarms

Parameters

overhead-frame-not-locked

Keyword to trigger reporting when the group does not have overhead frame lock.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

deskew-failed

Keyword to trigger reporting when group members are not deskewed.

local-phy-fault

Keyword to trigger reporting when the system receives a local fault for PHY instances.

remote-phy-fault

Keyword to trigger reporting when the PHY receives RPF.

bad-group-number

Keyword to trigger reporting when the system receives an invalid group number for PHY instances.

am-not-locked

Keyword to trigger reporting when the system is unable to achieve an alignment marker lock.

bad-phy-number

Keyword to trigger reporting when the system receives an invalid PHY number on PHY instances.

bad-phy-instance-number

Keyword to trigger reporting when the system receives invalid PHY instance numbers.

flexe-map-mismatch

Keyword to trigger reporting when the system receives an invalid FlexE map for PHY instances.

calendar-in-use-error

Keyword to trigger reporting when the wrong calendar is in use for PHY instances.

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-s

Description

This command configures reporting when one or more PHY instances detect a configured condition.

The **no** form of this command removes reporting for the configured condition.

Default

no report-alarms-phy

Parameters

bad-crc

Keyword to trigger reporting when CRC error occurs on multiframe for PHY instances.

bad-group-number

Keyword to trigger reporting when the system receives an invalid group number for PHY instances.

client-calendar-error

Keyword to trigger reporting when the system detects the wrong calendar used for PHY instances.

multiframe-not-locked

Keyword to trigger reporting when the multiframe is not locked for PHY instances.

bad-phy-number

Keyword to trigger reporting when the system receives an invalid PHY number on PHY instances.

bad-phy-instance-number

Keyword to trigger reporting when the system receives invalid PHY instance numbers.

flexe-map-mismatch

Keyword to trigger reporting when the system receives an invalid FlexE map for PHY instances.

calendar-in-use-error

Keyword to trigger reporting when the wrong calendar is in use for PHY instances.

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-s

39.85 report-ip-address-event

report-ip-address-event

Syntax

[**no**] **report-ip-address-event**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>gx report-ip-address-event)

Full Context

configure subscriber-mgmt diameter-application-policy gx report-ip-address-event

Description

This command enables triggered CCR-u messages based on IP address allocation or de-allocation for the subscriber host.

If the requests for both IP address families (IPv4 and IPv6) arrive at approximately the same time, a single CCR-i is sent containing the IP addresses from both address families, IPv4 and IPv6 (NA, PD, or SLAAC). When the requests for IP addresses are not nearly simultaneous, the CCR-i contains only the IP address that was allocated first (the one that triggered the session creation). The request for the second IP address family, depending on configuration, triggers an additional CCR-u that will carry the IP address allocation update to the PCRF along with the UE_IP_ADDRESS_ALLOCATE (18) event. The CCR-u content mirrors the content of the CCR-i with the exception of already allocated IP address(es).

When this command is disabled, IP address-triggered CCR-u messages are not sent.

The **no** form of this command disables the command.

Default

report-ip-address-event

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

39.87 report-path-constraints

report-path-constraints

Syntax

report-path-constraints

no report-path-constraints

Context

[Tree] (config>router>pcep>pcc report-path-constraints)

Full Context

configure router pcep pcc report-path-constraints

Description

This command enables the inclusion of LSP path constraints in the PCE report messages sent from the PCC to a PCE.

In order for the PCE to know about the original constraints for an LSP which is delegated, but for which there is no prior state in its LSP database, such as if no PCReq message was sent for the same PLSP-ID, the following proprietary behavior is observed:

- PCC appends a duplicate of each of the LSPA, METRIC, and BANDWIDTH objects in the PCRpt message. The only difference between two objects of the same type is that the P-flag is set in the common header of the duplicate object to indicate that it is a mandatory object for processing by PCE.
- The value of the metric or bandwidth in the duplicate object contains the original constraint value, while the first object contains the operational value. This is applicable to hop metrics in the METRIC and BANDWIDTH objects only. The SR OS PCC does not support configuring a boundary on the path computation IGP or TE metrics.
- The path computation on the PCE must use the first set of objects when updating a path if the PCRpt contained a single set. If the PCRpt contained a duplicate set, PCE path computation must use the constraints in the duplicate set.

The **no** form of the command disables the above behavior in case of interoperability issues with third-party PCE implementations.

[Tree] (config>subscr-mgmt>sla-prof>ingress report-rate)

Full Context

configure subscriber-mgmt sla-profile egress report-rate

configure subscriber-mgmt sla-profile ingress report-rate

Description

This command configures the source for Tx and Rx connect speeds in AVP 38 (Rx Connect Speed) and AVP 24 (Tx Connect Speed) of an L2TP session established on a LAC.

The **no** form of this command reverts to the default.

Parameters

agg-rate-limit

Specifies that the rate (egress only) is taken from:

1. the agg-rate RADIUS override (RADIUS VSA "Alc-Subscriber-QoS-Override" in a RADIUS Access-Accept message) if present
2. the configured agg-rate-limit in the **config>subscr-mgmt>sub-prof>egr** context
3. fall back to the default (no report-rate)

scheduler-name

Specifies the rate taken from the **scheduler** *scheduler-name* up to 32 characters. If the **scheduler** *scheduler-name* is not present in the scheduler-policy configured in the **config>subscr-mgmt>sub-prof>egr** context, fall back to the default (no report-rate).

pppoe-actual-rate

Specifies rates taken from the DSL Line characteristics PPPoE tags (Actual Data Rate Upstream/Downstream) if present; otherwise fall back to the default (no report-rate).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policer-id

Specifies the rate taken from the policer with the specified ID.

Values 1 to 63

rfc5515-actual-rate

Puts the same value as the transmitted Actual-Data-Rate-Upstream AVP in the Rx-Connect-Speed AVP, and the same value as the transmitted Actual-Data-Rate-Downstream AVP in the Tx-Connect-Speed AVP

Platforms

Full Context

configure service epipe spoke-sdp control-channel-status request-timer

configure service vpls spoke-sdp control-channel-status request-timer

configure service cpipe spoke-sdp control-channel-status request-timer

Description

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478. This command cannot be used with a non-zero refresh-timer value.

Parameters

timer1

Specifies the interval, in seconds, at which pseudowire status messages, including a reliable delivery TLV with the "request" bit set, are sent.

Values 10 to 65535

timer2

specifies the timeout interval, in seconds, if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

Values 0, 3 to 60

multiplier

If a requesting node does not receive a valid response to a pseudowire status request within a number of seconds equal to the retry timer multiplied by this multiplier, then it will assume the pseudowire is down. This parameter is optional.

Values 3 to 20

configure system rollback rescue-location

Description

The location and filename of the rescue configuration is configurable to be local (on compact flash) or remote. The suffix .rc will be automatically appended to the filename when a rescue configuration file is saved. Trivial FTP (TFTP) is not supported for remote locations.

Default

no rescue location

Parameters

file-url

Specifies the URL or filename.

Values

local-url | *remote-url*	
local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length of up to 99 characters each
remote-url	[{ftp://}*login*:*pswd*@ *remote-locn*/][*file-path*] up to 255 characters, directory length of up to 99 characters each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]

© 2026 Nokia.

reserved-label-block

Syntax

reserved-label-block *name*

no reserved-label-block

Context

[Tree] (config>router>segment-routing>sr-policies reserved-label-block)

Full Context

configure router segment-routing sr-policies reserved-label-block

Description

This command associates a reserved label block with segment routing policies. The *name* must already exist. Reserved label blocks are configured under the **config**>**router**>**mpls-labels** hierarchy.

A locally-targeted segment routing policy (statically configured or BGP signaled) cannot be activated if its binding SID (BSID) is not an available label between the start-label and end-label of the referenced reserved label block.

The **no** form of this command removes any association of segment routing policies with a reserved label block.

Default

no reserved-label-block

Parameters

name

Specifies the name of a **reserved-label-block** that has already been configured, up to 64 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

All

reserved-label-block

Syntax

[**no**] **reserved-label-block** *name*

Context

[Tree] (config>anysec reserved-label-block)

Full Context

configure anysec reserved-label-block

Description

This command assigns the label block that is reserved for ANYsec encryption SID under the **configure router mpls-labels** context. Without this reserved block, ANYsec cannot assign any encryption SIDs. The encryption SID uniquely identifies the encrypting node within a network and avoids double encryption scenarios. The encryption SID can be assigned per encryption group. However, all encryption groups can have the same encryption SID.

To save label space, Nokia recommends limiting the number of encryption SIDs within a network.

The **no** form of this command removes a reserved label block.

Parameters

name

Specifies the name of the reserved label block.

Platforms

7750 SR-1, 7750 SR-12e, 7750 SR-s

Full Context

configure router mpls sr-te-resignal resignal-on-igp-event

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the ad hoc reoptimzation of all CSPF paths in the operational UP state of all SR-TE LSPs at the receipt of an IGP link event. The following link events are supported:

- link down
- link up
- IGP or TE metric change
- SRLG change
- admin group change

The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates all the paths in operational UP state of all SR-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops and labels, and computing a new CSPF path. MPLS programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops or labels of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls sr-te-resignal resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

The **no** form of this command disables ad hoc reoptimization of SR-TE LSPs.

Default

no resignal-on-igp-event

Platforms

All

resignal-on-igp-event

configure router mpls resignal-on-igp-event

Description

This command enables the ad hoc reoptimization of the active CSPF path of all RSVP-TE LSPs at the receipt of an IGP link event. The following link events are supported:

- link down
- link up
- IGP or TE metric change

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- SRLG change
- admin group change

The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates the active paths of all RSVP-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops, and computing a new CSPF path. MPLS signals and programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

The **no** form of this command disables ad hoc reoptimization of the active RSVP-TE LSPs.

39.111 resignal-on-igp-overload

resignal-on-igp-overload

Syntax

[**no**] **resignal-on-igp-overload**

Context

[Tree] (config>router>mpls resignal-on-igp-overload)

Full Context

configure router mpls resignal-on-igp-overload

Description

This command enables the resignaling of all RSVP-TE LSPs at the receipt of the IS-IS overload bit in the TE-DB.

Once the re-optimization is triggered, the behavior is the same as the timer-based resignal or the **delay** option of the manual-based resignal. MPLS forces the expiry of the resignal timer and requests the TE-DB to compute a new CSPF for each RSVP-TE LSP active path.

This re-optimization effectively causes the immediate move of transit RSVP-TE LSP paths away from the IS-IS node in overload.

By default, MPLS re-optimizes, using the MBB procedure, the transit paths away from the node in an IS-IS overload state only at the time a manual or timer-based resignal is performed for the LSP paths. MPLS does not act immediately on the receipt of the IS-IS overload bit.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note:
This command and the **retry-on-overload** command are mutually exclusive.

The **no** form of this command results in the MPLS not acting immediately to the request of the IS-IS overload bit.

Default

no resignal-on-overload

Platforms

All

resignal-on-igp-overload

Syntax

[**no**] **resignal-on-igp-overload**

Context

[Tree] (config>router>mpls>sr-te-resignal resignal-on-igp-overload)

Full Context

configure router mpls sr-te-resignal resignal-on-igp-overload

Description

This command enables the ad-hoc re-optimzation of the CSPF paths of all SR-TE LSPs when IS-IS receives an IS-IS overload bit advertisement from a remote router.

When this command is enabled on the router and an IGP overload bit is set in a Layer 1 or Layer 2 IS-IS LSP received from a remote router, MPLS performs an ad-hoc re-optimization of all the paths of all the SR-TE LSPs that have paths computed by the local CSPF. For each SR-TE LSP current path that transits the router in overload, the CSPF looks for a new path that avoids the router. For each SR-TE LSP current path that terminates on the router in overload, the CSPF checks if a better path exists. In both cases, if a new path is not found the system maintains the current path when operationally up.

The ad-hoc re-optimization triggers the timer-based re-optimization by forcing the resignal timer to expire. Therefore, the user must use the following command to configure the resignal timer for the SR-TE application.

```
configure router mpls sr-te-resignal resignal-timer
```

The **no** form of this command configures MPLS to not act immediately on an IS-IS overload bit from a remote router. MPLS will act on it at the next timer-based or manual re-optimization of the SR-TE LSPs.

Default

no resignal-on-igp-overload

39.112 resignal-timer

resignal-timer

Syntax

resignal-timer *minutes*

no resignal-timer

Context

[Tree] (config>router>mpls resignal-timer)

Full Context

configure router mpls resignal-timer

Description

This command specifies the value for the LSP resignal timer. The resignal timer is the time, in minutes, the software waits before attempting to resignal the LSPs.

When the resignal timer expires, if the new computed path for an LSP has a better metric than the current recorded hop list, an attempt is made to resignal that LSP using the make-before-break mechanism. If the attempt to resignal an LSP fails, the LSP continues to use the existing path and a resignal will be attempted the next time the timer expires.

The **no** form of this command disables timer-based LSP resignaling.

Default

no resignal-timer

Parameters

minutes

Specifies the time the software waits before attempting to resignal the LSPs.

Values 30 to 10080

Platforms

resignal-timer

Syntax

resignal-timer *minutes*

no resignal-timer

Context

[Tree] (config>router>mpls>sr-te-resignal resignal-timer)

Full Context

configure router mpls sr-te-resignal resignal-timer

Description

This command specifies the value for the SR-TE LSP resignal timer when the path computation method is set to the local CSPF or the PCE.

The resignal timer is the time, in minutes, MPLS waits before attempting to re-optimize all paths of all SR-TE LSPs. The re-optimization is performed by the local CSPF or the PCE, depending on the value of the parameter **path-computation-method**.

When local CSPF is used and the resignal timer expires, MPLS provides the current path of the SR-TE LSP and TE-DB updates the total IGP or TE metric of the current path and checks the validity of the hops and labels. CSPF then computes a new path for each SR-TE LSP. MPLS programs the new path only if the total metric of the new computed path is different than the updated metric of the current path, or if one or more hops or labels of the current path are invalid. Otherwise, the current path is considered to be one of the most optimal ECMP paths and is not updated in data path.

The **no** form of this command disables timer-based LSP resignaling.

Default

no resignal-timer

Parameters

minutes

Specifies the time, in minutes, the software waits before attempting to resignal the SR-TE LSPs.

configure service vprn bgp-evpn segment-routing-v6 resolution

Description

This command configures the resolution option for routes in the specified family.

The **no** form of the command reverts to the default.

Default

resolution route-table

Parameters

route-table

Keyword that specifies to resolve the route to the shortest-path SRv6 tunnel. If no such shortest-path tunnel is found, the resolution fails.

tunnel-table

Keyword that specifies to resolve the route directly to a tunnel in TTMv6. The system tries to find an SRv6 policy with a matching color and endpoint for BGP routes received with an SRv6 TLV and containing an SRv6 service SID in the IPv6 tunnel table. If none is found, the resolution fails.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fallback-tunnel-to-route-table

Keyword that specifies to first try resolving the route to a tunnel in the IPv6 tunnel table. If none is found in the IPv6 tunnel table, fall back to the shortest-path SRv6 resolution. If no such shortest-path tunnel is found in RTM, the resolution fails.

[Tree] (config>router>bgp>next-hop-res>shortcut-tunn>family resolution)

Full Context

configure router bgp next-hop-resolution shortcut-tunnel family resolution

Description

This command configures the resolution mode in the resolution of BGP prefixes using tunnels to BGP peers.

Parameters

any

Enables the binding to any supported tunnel type in BGP shortcut context following TTM preference.

filter

Enables the binding to the subset of tunnel types configured under **resolution-filter**.

disabled

Disables the resolution of BGP prefixes using tunnels to BGP peers.

Description

Commands in this context configure the subset of tunnel types that can be used in the resolution of BGP-EVPN or BGP-IPVPN routes within the automatic binding of BGP-EVPN or BGP-IPVPN MPLS service to tunnels to MP-BGP peers.

The following tunnel types are supported in a BGP-EVPN or BGP-IPVPN MPLS context: BGP, LDP, RIB-API, RSVP, SR-ISIS, SR-OSPF, SR-policy, SR-TE, UDP, and MPLS forwarding policy.

The user must set **resolution** to **filter** to activate the list of tunnel-types configured under **resolution-filter**.

Note:
UDP tunnels are created through import policies with action **create-udp-tunnel**.

39.116 resolve-root-using

resolve-root-using

Syntax

resolve-root-using {**ucast-rtm** | **mcast-rtm**}

Context

[Tree] (config>router>ldp resolve-root-using)

Full Context

configure router ldp resolve-root-using

Description

By default, MLDP resolves the FEC using the unicast RTM. When this command is set to **mcast-rtm**, MLDP will resolve the FEC using the multicast route table. The multicast route table does not include any IGP shortcuts, unlike the unicast RTM. MLDP cannot resolve a FEC using an IGP shortcut, so if IGP shortcuts are used for unicast, enable multicast MLDP lookups.

If this command is set to **mcast-rtm**:

- For FEC resolution using IGP, static or local, the ROOT in this FEC is resolved using the multicast RTM.
- A FEC being resolved using BGP is recursive, so the FEC next-hop (ASBR/ABR) is resolved using the multicast RTM first and, if this fails, it is resolved using the unicast RTM. This next-hop needs to be recursively resolved again using IGP/Static-Route or Local, this second resolution (recursive resolution) uses the multicast RTM only.
- In all cases, MLDP uses the unicast RTM to resolve the FEC and will not resolve the FEC if its next hop is resolved using an IGP shortcut.

Default

resolve-root-using ucast-rtm

Platforms

[Tree] (config>router>policy-options>policy-statement>default-action resolve-static)

Full Context

configure router policy-options policy-statement entry action resolve-static

configure router policy-options policy-statement default-action resolve-static

Description

This command has an affect only in BGP route-table-import policies and applies only to BGP IPv4 and IPv6 routes created by importing static routes with indirect next-hops. When such a route matches a policy entry with this action, the BGP next-hop is the resolved next-hop of the static route.

The **no** form of this command reverts to the default behavior, which copies the indirect next-hop of the static route into the BGP next-hop without resolving it further.

Default

no resolve-static

39.121 restart-backoff

restart-backoff

Syntax

restart-backoff initial-time *seconds* **max-time** *seconds*

no restart-backoff

Context

[Tree] (config>subscr-mgmt>pppoe-client-policy restart-backoff)

Full Context

configure subscriber-mgmt pppoe-client-policy restart-backoff

Description

This command configures backoff timer parameters that determine how often and how long the system will attempt to restart a PPPoE client after a failure. When a client first fails, the system immediately tries to re-establish connectivity. If this attempt is also unsuccessful, the system initiates a backoff timer and waits until it expires before attempting to restart the client again, to avoid flooding the BNG. The initial duration of the backoff timer is configured with the **initial-time** parameter. With each subsequent failure, the backoff timer is doubled until the configured **max-time** is reached.

The **no** form of this command reverts to the default.

Default

restart-backoff initial-time 30 max-time 600

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

initial-time seconds

Specifies the initial backoff time to wait before attempting a client restart.

Values 10 to 3600

max-time seconds

Specifies the maximum time to attempt client restarts.

Values 10 to 3600

configure service pw-template restrict-protected-src

configure service vpls spoke-sdp restrict-protected-src

configure service pw-template split-horizon-group restrict-protected-src

configure service vpls endpoint restrict-protected-src

Description

This command indicates how the agent will handle relearn requests for protected MAC addresses, either manually added using the mac-protect command or automatically added using the **auto-learn-mac-protect** command. While enabled all packets entering the configured SAP, spoke SDP, mesh SDP, or any SAP that is part of the configured split horizon group (SHG) is verified not to contain a protected source MAC address. If the packet is found to contain such an address, the action taken depends on the parameter specified on the **restrict-protected-src** command, namely:

- No parameter — The packet is discarded, an alarm is generated and the SAP, spoke SDP or mesh SDP is set operationally down. The SAP, spoke SDP or mesh SDP must be shut down and enabled (**no shutdown**) for this state to be cleared.
- **alarm-only** — The packet is forwarded, an alarm is generated but the source MAC is not learned on the SAP, spoke SDP or mesh SDP.
- **discard-frame** — The packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes in a given VPLS service. This parameter is only applicable to automatically protected MAC addresses.

When the **restrict-protected-src** is enabled on an SHG the action only applies to the associated SAPs (no action is taken by default for spoke SDPs in the SHG) and is displayed in the SAP show output as the oper state unless it is overridden by the configuration of **restrict-protected-src** on the SAP itself. To enable this function for spoke SDPs within a SHG, the **restrict-protected-src** must be enabled explicitly under the spoke SDP. If required, **restrict-protected-src** can also be enabled explicitly under specific SAPs within the SHG.

When this command is applied or removed, with either the **alarm-only** or **discard-frame** parameters, the MAC addresses are cleared from the related object.

The use of **restrict-protected-src discard-frame** is mutually exclusive with the configuration of manually protected MAC addresses within a given VPLS.

The **alarm-only** parameter is not supported on the 7750 SR-a, 7750 SR-1e/2e/3e, 7950 XRS, 7750 SR-1,or 7750 SR-1s/2s/7s/14s platforms.

The **no** form of the command reverts to the default.

Default

no restrict-protected-src

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

alarm-only

Specifies that the packet is forwarded, an alarm is generated but the source MAC is not learned on the SAP, spoke SDP, or mesh SDP.

Default no alarm-only

discard-frame

Specifies that the packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes within a given VPLS service.

Description

This command indicates how the system will forward packets destined for an unprotected MAC address, either manually added using the **mac-protect** command or automatically added using the **auto-learn-mac-protect** command. While enabled all packets entering the configured SAP or SAPs within a split horizon group (but not spoke or mesh-SDPs) will be verified to contain a protected destination MAC address. If the packet is found to contain a non-protected destination MAC, it will be discarded. Detecting a non-protected destination MAC on the SAP will not cause the SAP to be placed in the operationally down state. No alarms are generated.

If the destination MAC address is unknown, even if the packet is entering a restricted SAP, with **restrict-unprotected-dst** enabled, it will be flooded.

Default

no restrict-unprotected-dst

[Tree] (config>system>security>user restricted-to-home)

Full Context

configure system security user-template restricted-to-home

configure system security user restricted-to-home

Description

This command denies the user from accessing files outside of their local home directory. Files can be accessed locally by CLI file commands and output modifiers such as **>** (file redirect).

When enabled, the system denies all configuration save operations (such as **admin save**) via any management interface (such as CLI and NETCONF) unless **save-when-restricted** is enabled.

When **restricted-to-home** is configured, file access is denied unless the **home-directory** is configured and the directory is created by an administrator.

The **no** form of this command permits the user to access all files on the system and to remote files.

Default

restricted-to-home

Full Context

configure system script-control script-policy results

Description

This command is used to specify the location where the system writes the output of an event script's execution.

The **no** form of the command removes the file location from the configuration. Scripts will not execute if there is no result location defined.

Default

no results

Parameters

file-url

Specifies the location to send CLI output from script runs. The *file-url* is a location, directory, and filename prefix to which a data and timestamp suffix is added when the results files are created during a script run, as follows:

*file-url*_YYYYMMDD-hhmmss.uuuuuu.out

where:

YYYYMMDD — date

hhmmss — hours, minutes, and seconds

uuuuuu — microseconds (padded to 6 characters with leading zeros)

Values *local-url* | *remote-url*

local-url — [*cflash-id/*] [*file-path*] 167 chars max, including *cflash-idfile-path* 166 chars max

remote url — [{ftp:// | tftp://}*login*:*password*@*remote-location/*][*file-path*] 255 characters max directory length 99 characters max each

remote-location — [*hostname* | *ipv4-address* | *ipv6-address*]

ipv4-address — *a.b.c.d*

ipv6-address — x:x:x:x:x:x:x:x[-*interface*] x:x:x:x:x:x:d.d.d.d[-*interface*] x — [0 to FFFF]H d — [0 to 255]D interface — 32 characters max, for link local addresses

cflash-id — cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

[Tree] (config>port>network>egress>pool resv-cbs)

Full Context

configure port access egress pool resv-cbs

configure port access ingress pool resv-cbs

configure port network egress pool resv-cbs

Description

This command defines the percentage or specifies the sum of the pool buffers that are used as a guideline for CBS calculations for access and network ingress and egress queues. Two actions are accomplished by this command:

- A reference point is established to compare the currently assigned (provisioned) total CBS with the amount the buffer pool considers to be reserved. Based on the percentage of the pool reserved that has been provisioned, the over provisioning factor can be calculated.
- The size of the shared portion of the buffer pool is indirectly established. The shared size is important to the calculation of the instantaneous-shared-buffer-utilization and the average-shared-buffer-utilization variables used in Random Early Detection (RED) per packet slope plotting.

It is important to note that this command does not actually set aside buffers within the buffer pool for CBS reservation. The CBS value per queue only determines the point at which enqueuing packets are subject

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

to a RED slope. Oversubscription of CBS could result in a queue operating within its CBS size and still not able to enqueue a packet due to unavailable buffers. The resv-cbs parameter can be changed at any time.

If the total pool size is 10 Mb and the resv-cbs set to 5, the 'reserved size' is 500 kb.

The **no** form of this command clears all the adaptive configurations. There cannot be any adaptive sizing enabled for default **resv-cbs**.

Default

resv-cbs 30

Parameters

percent-or-default

Specifies the pool buffer size percentage.

Values 0 to 100, **default**

amber-alarm-action step *percent*

Specifies the percentage step-size for the reserved CBS size of the pool. When using the default value, the adaptive CBS sizing is disabled. To enable adaptive CBS sizing, **step** *percent* must be set to non-default value along with the **max** parameter. When reserved CBS is default adaptive CBS sizing cannot be enabled. The reserved CBS (Committed Burst Size) defines the amount of buffer space within the pool that is not considered shared.

Values 1 to 100

Default 0

max *percent*

Specifies the maximum percentage for the reserved CBS size of the pool. When using the default value, the adaptive CBS sizing is disabled. To enable adaptive CBS sizing, **max** value must be set to non-default value along with the **step** *percent*. When reserved CBS is default adaptive CBS sizing cannot be enabled. The reserved CBS (Committed Burst Size) defines the amount of buffer space within the pool that is not considered shared. Max reserved CBS must not be more than the reserved CBS.

Context

[Tree] (config>card>fp>egress>wred-queue-control resv-cbs)

Full Context

configure card fp egress wred-queue-control resv-cbs

Description

This command defines the amount of buffers within the WRED mega-pool that will be set aside for WRED queues operating within their configured CBS thresholds. **Note** that the **min** *percentage* and **max** *percentage* parameters must be set to the same value. The forwarding plane protects against WRED queue buffer starvation by setting aside a portion of the buffers within the WRED mega-pool. The WRED queue CBS threshold defines when a WRED queue requests buffers from reserved portion of the WRED mega-pool and when it starts requesting buffers from the shared portion of the mega-pool. With proper oversubscription provisioning, this prevents a seldom active queue from being denied a buffer from the mega-pool when the shared portion of the mega-pool is congested.

The WRED mega-slope reserve CBS size is controlled in the same manner as the overall sizing of the WRED mega-pool. A min and max parameter is provided to scope the range that the reserved portion based on percentages of the WRED mega-pool current size.

The **no** form of this command immediately restores the default min and max percentage values for sizing the WRED mega-pool CBS reserve.

Default

resv-cbs min 25.00 max 25.00

Parameters

min *percentage*

Specifies that the required keyword defines the minimum percentage of the WRED mega-pool buffers that will be applied to the CBS reserve. The value given for *percentage* must be less than or equal to the value given for the **max** *percentage*. Percentages are defined with an accuracy of hundredths of a percent in the nn.nn format (15.65 = 15.65%).

Values 0.00 to 99.99

Default 25.00

max *percentage*

Specifies that the required keyword defines the maximum percentage of the WRED mega-pool buffers that may be applied to the CBS reserve. The value given for *percentage* must be greater than or equal to the value given for the **min** *percentage*. Percentages are defined with an accuracy of hundredths of a percent in the nn.nn format (15.65 = 15.65%).

Values 0.01 to 99.99

Default 25.00

configure isa video-group watermark session ret

Description

This command sets the watermark to trigger the SNMP trap if the RET bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the bandwidth available is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

Default

ret 90

Parameters

percent

Specifies the percentage of the system resources per ISA.

Values 1 to 99

Full Context

configure service vpls proxy-nd evpn-local-es retention-timer

configure service vpls proxy-arp evpn-local-es retention-timer

Description

This command configures the expiration time for proxy-ARP and proxy-ND **evpn-local-es** entries. The timer starts when the EVPN MAC/IP advertisement route that created the entry is withdrawn, and it determines how long the entry associated with a local ESI is retained in the table. Values from 30 to 65535 seconds specify the duration the entry is kept before it expires.

While the timer is active, the router periodically sends ARP Requests or Neighbor Solicitations toward the local ES for the entry. If a response is received, the entry is converted to a dynamic entry. This command applies only to EVPN entries that match a local ES.

The **no** form of this command configures the timer to 0, which disables retention and removes **evpn-local-es** ARP or ND entries when the originating EVPN MAC/IP route is withdrawn.

Default

no retention-timer

[Tree] (config>service>vprn>evpn-neighbor-synchronization retention-timer)

Full Context

configure router evpn-neighbor-synchronization retention-timer

configure service vprn evpn-neighbor-synchronization retention-timer

Description

This command configures the timer that determines how long an EVPN ARP and ND entry is retained after the remote PE withdraws the MAC/IP route that originated it. The behavior for a synchronized ARP and ND entry is as follows:

- When the originating EVPN MAC/IP route is withdrawn, the retention timer starts, and the entry remains present until the timer expires.
- While the retention timer is active, the system attempts to refresh the entry by sending an ARP Request or Neighbor Solicitation to the IP owner. This refresh may occur at any point from the start of the timer until 30 seconds before it expires.
- ARP Requests and Neighbor Solicitations are staggered within the timeout period to prevent overloading the CPM transmitter when many entries require refreshing.

The **no** form of this command reverts to the default.

Default

no retention timer

Parameters

seconds

Specifies the retention timer, in seconds.

configure router ospf3 area virtual-link retransmit-interval

configure router ospf area virtual-link retransmit-interval

configure router ospf3 area interface retransmit-interval

configure router ospf area interface retransmit-interval

Description

This command specifies the length of time, in seconds, that OSPF will wait before retransmitting an unacknowledged link state advertisement (LSA) to an OSPF neighbor.

The value should be longer than the expected round trip delay between any two routers on the attached network. After the retransmit-interval expires and no acknowledgment has been received, the LSA will be retransmitted.

The **no** form of this command reverts to the default interval.

Default

retransmit-interval 5

Parameters

seconds

Specifies the retransmit interval in seconds expressed as a decimal integer.

Values 1 to 1800

Platforms

All

39.140 retransmit-time

retransmit-time

Syntax

retransmit-time *milli-seconds*

40 r Commands – Part III

40.1 retry

retry

Syntax

retry *count*

Context

[Tree] (config>aaa>l2tp-acct-plcy>radius-acct-server retry)

Full Context

configure aaa l2tp-accounting-policy radius-accounting-server retry

Description

This command configures the number of times the router attempts to contact the RADIUS server for authentication.

Note:
The retry count includes the first attempt.

The **no** form of this command reverts to the default value.

Default

retry 3 (the initial attempt as well as two retried attempts)

Parameters

count

Specifies the retry count.

Values 1 to 10

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

retry

Syntax

retry *minutes*

no retry

Context

[Tree] (config>service>vpls>bgp-evpn>mac-duplication retry)

Full Context

configure service vpls bgp-evpn mac-duplication retry

Description

Specifies the timer after which the MAC in hold-down state is automatically flushed and the mac-duplication process starts again. This value is expected to be equal to two times or more than that of window.

If **no** retry is configured, this implies that, when mac-duplication is detected, MAC updates for that MAC will be held down till the user intervenes or a network event (that flushes the MAC) occurs.

Default

retry 9

Parameters

minutes

Specifies the BGP EVPN MAC duplication retry in minutes.

Values 2 to 60

Platforms

All

retry

Syntax

retry *count*

no retry

configure system security radius retry

configure service vprn aaa remote-servers radius retry

configure system security dot1x radius-plcy retry

Description

This command configures the number of times the router attempts to contact the RADIUS server for authentication if there are problems communicating with the server.

The **no** form of this command reverts to the default value.

Default

retry 3

Parameters

count

Specifies the retry count.

Values 1 to 10

Platforms

All

retry

Syntax

retry *count*

no retry

Context

[Tree] (config>system>file-trans-prof retry)

Full Context

configure system file-transmission-profile retry

Description

This command specifies the number of retries on transport protocol level.

When the virtual router does not receive any data from a server (e.g., FTP or HTTP server) after the configured **timeout** *seconds*, the router may repeat the request to the server. The number of retries specifies the maximum number of repeated requests.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command disables the retry.

Default

no retry

Parameters

count

Specifies the number of retries.

Values 1 to 256

Platforms

All

retry

Syntax

retry *count*

Context

[Tree] (config>aaa>route-downloader retry-interval)

Full Context

configure aaa route-downloader retry-interval

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command sets the duration, in minutes, of the retry interval. The retry interval is the interval meant for the system to retry sending an Access Request message after the previous one was unanswered (not with an access reject but rather just a RADIUS failure or ICMP port unreachable). This timer is actually an exponential backoff timer that starts at **min** and is capped at **max** minutes.

The **no** form of this command reverts to the default values.

Default

retry-interval min 10 max 20

Parameters

min ***minimum***

Specifies the duration, in minutes, of the retry interval. This duration grows exponentially after each sequential failure.

Values 1 to 1440

max ***maximum***

Specifies the maximum duration, in minutes, of the retry interval.

Values 1 to 1440

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure router mpls lsp-template retry-limit

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure router mpls lsp retry-limit

Description

This optional command specifies the number of attempts software should make to re-establish the LSP after it has failed LSP. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the LSP path is put into the **shutdown** state.

Use the config router **mpls lsp** *lsp-name* **no shutdown** command to bring up the path after the retry-limit is exceeded.

For P2MP LSP that are created based on the LSP template, all S2Ls must attempt to retry-limit before the client application is informed of failure.

The **no** form of this command reverts to the default value.

Default

retry-limit 0 (no limit, retries forever)

Parameters

number

Specifies the number of times software will attempt to re-establish the LSP after it has failed. Allowed values are integers in the range of 0 to 10000.

Values 0 to 10000

Platforms

All

40.5 retry-on-igp-overload

retry-on-igp-overload

Syntax

[**no**] **retry-on-igp-overload**

Context

[Tree] (config>router>mpls retry-on-igp-overload)

Full Context

configure router mpls retry-on-igp-overload

Description

This command allows for the global configuration of the handling in the ingress LER of the LSP paths which transit an LSR that advertised the IS-IS overload bit.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

By default, MPLS re-optimizes using make-before-break (MBB) the transit paths away from the node in an IS-IS overload state only at the time a manual or timer-based re-signal is performed for the LSP paths. MPLS will not act immediately on the receipt of the IS-IS overload bit.

When this command is enabled, MPLS in the ingress LER immediately tears down and re-signals all LSP paths away from a transit LSR node which advertised the IS-IS overload bit.

LSP paths that terminate on the node that advertised the IS-IS overload bit are not acted on whether this command is enabled or disabled.

The **no** form of this command returns to the default behavior.

[Tree] (config>service>vpls>mac-move retry-timeout)

Full Context

configure service template vpls-template mac-move retry-timeout

configure service vpls mac-move retry-timeout

Description

This indicates the time in seconds to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

It is recommended that the retry-timeout value is larger or equal to 5s * cumulative factor of the highest priority port so that the sequential order of port blocking will not be disturbed by re-initializing lower priority ports.

A zero value indicates that the SAP will not be automatically re-enabled after being disabled. If, after the SAP is re-enabled it is disabled again, the retry timeout is increased with the provisioned retry timeout in order to avoid thrashing. For example, when retry-timeout is set to 15, it increments (15,30,45,60...).

The **no** form of this command reverts to the default value.

Default

retry-timeout 10 (when mac-move is enabled)

Parameters

timeout

Specifies the time, in seconds, to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

Values 0 to 120

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Syntax

return-path

Context

[Tree] (config>test-oam>link-meas>template>twl return-path)

Full Context

configure test-oam link-measurement measurement-template twamp-light return-path

Description

Commands in this context configure the return-path TLV for the test packet.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

40.9 return-path-bfd-sid

return-path-bfd-sid

Syntax

return-path-bfd-sid *ipv6-address*

no return-path-bfd-sid

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>srv6 return-path-bfd-sid)

Full Context

configure router segment-routing sr-policies static-policy segment-routing-v6 return-path-bfd-sid

Description

This command configures S-BFD session to echo mode and pushes an additional SRv6 SID in the SRH on S-BFD packets only.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The command applies to the initiator of the S-BFD sessions. The return path SID refers to a binding SID on an SRv6 policy configured on the far-end router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this SRv6 return path.

The **no** form of this command disables the controlled return-path SID and echo mode for S-BFD. If the command is deleted, the S-BFD session returns to asynchronous mode, and the initiator node does not push a return-path SID. Any S-BFD packets for this SRv6 policy that the terminating router receives are sent back using a routed return path.

Default

no return-path-bfd-sid

Parameters

ipv6-address

Specifies the IPv6 address.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

40.10 return-path-label

return-path-label

Syntax

return-path-label *label-value*

no return-path-label

Full Context

configure router mpls lsp-template bfd return-path-label

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure router mpls lsp primary bfd return-path-label

configure router mpls lsp bfd return-path-label

configure router mpls lsp secondary bfd return-path-label

configure router segment-routing maintenance-policy return-path-label

Description

This command configures the Seamless Bidirectional Forwarding Detection (S-BFD) session to echo mode and adds an additional MPLS label, referring to an MPLS-labeled reply path for the S-BFD packet, to the bottom of the label stack for the S-BFD packet.

The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

The **no** form of this command disables the controlled return-path label and echo mode for S-BFD. S-BFD returns to asynchronous mode and the initiator node does not push a return-path label. Any S-BFD packets for this LSP or path that the reflector receives are sent back using a routed return path.

Default

no return-path-label

Parameters

label-value

Specifies the label value.

Values 32 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure router mpls lsp-template bfd return-path-label
- configure router mpls lsp bfd return-path-label
- configure router mpls lsp primary bfd return-path-label
- configure router mpls lsp secondary bfd return-path-label

All

- configure router segment-routing maintenance-policy return-path-label

40.11 reuse

reuse

Syntax

reuse *integer*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no reuse

Context

[Tree] (config>router>policy-options>damping reuse)

Full Context

configure router policy-options damping reuse

Description

This command configures the reuse parameter for the route damping profile.

When the Figure of Merit (FoM) value falls below the **reuse** threshold, the route is once again considered valid and can be reused or included in route advertisements.

The **no** form of this command removes the reuse parameter from the damping profile.

Default

no reuse

Parameters

integer

Specifies the reuse value expressed as a decimal integer.

Values 1 to 20000

Platforms

All

40.12 reuse-ext-ip

reuse-ext-ip

Syntax

[**no**] **reuse-ext-ip**

Context

[Tree] (config>service>nat>pcp-server-policy reuse-ext-ip)

Full Context

configure service nat pcp-server-policy reuse-ext-ip

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the system to reuse the external IP address assigned to a subscriber when the requested well-known port or external IP mapping is not available.

The **no** form of this command causes a request for a well-known port to be allocated exactly as requested but on a different external IP address from the one that the subscriber is already using. This occurs if the requested well-known port is already allocated to another subscriber which is sharing the same external IP address. The existing external IP address is initially allocated to the subscriber by the virtue of initial traffic flow.

Default

no reuse-ext-ip

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

40.13 reverse-path

reverse-path

Syntax

[**no**] **reverse-path**

Context

[Tree] (config>router>mpls>mpls-tp>transit-path reverse-path)

Full Context

configure router mpls mpls-tp transit-path reverse-path

Description

This command enables the reverse path of an MPLS-TP reverse path to be created or edited.

The reverse path must be created after the forward path.

The **no** form of this command removes the reverse path. The reverse path must be removed before the forward path.

Default

no reverse-path

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

40.14 reverse-port-mappings

reverse-port-mappings

Syntax

[**no**] **reverse-port-mappings**

Context

[Tree] (config>service>vprn>nat>inside>deterministic>prefix-map>selector-mappings reverse-port-mappings)

[Tree] (config>router>nat>inside>deterministic>prefix-map>selector-mappings reverse-port-mappings)

Full Context

configure service vprn nat inside deterministic prefix-map selector-mappings reverse-port-mappings

configure router nat inside deterministic prefix-map selector-mappings reverse-port-mappings

Description

This command configures the router to allocate deterministic port blocks to subscribers in reverse (descending) order, starting from the last port block and progressing toward the first.

The **no** form of this command allocates port blocks in forward (ascending) order.

Default

no reverse-port-mappings

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

40.15 reverse-route

reverse-route

Syntax

reverse-route

Context

[Tree] (config>ipsec>tnl-temp reverse-route)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure ipsec tunnel-template reverse-route

Description

Commands in this context configure the dynamic LAN-to-LAN (DL2L) tunnel reverse-route options for the tunnel template.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

40.16 reverse-route-injection

reverse-route-injection

Syntax

[**no**] **reverse-route-injection**

Context

[Tree] (config>router>if>ipsec>ipsec-tunnel>dyn reverse-route-injection)

Full Context

configure service ies interface ipsec ipsec-tunnel dynamic-keying reverse-route-injection

configure service vprn interface sap ipsec-tunnel dynamic-keying reverse-route-injection

configure service vprn interface ipsec ipsec-tunnel dynamic-keying reverse-route-injection

configure router interface ipsec ipsec-tunnel dynamic-keying reverse-route-injection

Description

Commands in this context configure reverse route injection.

When reverse route injection is enabled, the system injects routes into the service based on the final TSr. One route is created for each TS in the TSr, with the prefix length as the longest number that covers the address range in the TS. The system removes the reverse route when the corresponding CHILD_SA is removed.

The **no** form of this command disables reverse route injection.

Default

no reverse-route-injection

- configure router interface ipsec ipsec-tunnel dynamic-keying reverse-route-injection

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel dynamic-keying reverse-route-injection

40.17 revert

revert

Syntax

revert {**latest-rb**| *checkpoint-id* | **rescue**} [**now**]

Context

[Tree] (admin>rollback revert)

Full Context

admin rollback revert

Description

This command initiates a configuration rollback revert operation that will return the configuration state of the node to a previously saved checkpoint. The rollback revert minimizes impacts to running services. There are no impacts in areas of configuration that did not change since the checkpoint. Configuration parameters that changed (or items on which changed configuration have dependencies) are first removed (revert to default) and the previous values are then restored (can be briefly service impacting in changed areas).

Parameters

latest-rb

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

checkpoint-id

Specifies the configuration to return to (which rollback checkpoint file to use). Checkpoint-id of 1 corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.

Values 1 to 9

rescue

Specifies to revert to the rescue checkpoint.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

now

Forces a rollback revert without any interactive confirmations (assumes 'y' for any confirmations that would have occurred).

Platforms

All

revert

Syntax

[**no**] **revert**

Context

[Tree] (config>system>sync-if-timing revert)

Full Context

configure system sync-if-timing revert

Description

This command allows the clock to revert to a higher priority reference if the current reference goes offline or becomes unstable. When the failed reference becomes operational, it is eligible for selection. When the mode is non-revertive, a failed clock source is not selected again.

Default

no revert

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

40.18 revert-members

revert-members

Syntax

revert-members [*1..8*]

no revert-members

Context

[Tree] (config>service>vprn>isis>link-group>level revert-members)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn isis link-group level revert-members

Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured **revert-members** threshold, the configured offsets are removed.

The **no** form of this command reverts the threshold back to the default, which is equal to the **oper-members** threshold value.

Default

no revert-members *oper-members*

Parameters

1..8

Specifies the number of revert members.

Values 1 to 8

Platforms

All

revert-members

Syntax

revert-members [*1..8*]

no revert-members

Context

[Tree] (config>router>isis>link-group>level revert-members)

Full Context

configure router isis link-group level revert-members

Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured revert-member threshold then the configured offsets are removed.

The **no** form of this command reverts the threshold back to the default which is equal to the oper-member threshold value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no revert-members oper-members

Parameters

1..8

Specifies the threshold for revertive members.

Values 1 to 8

Platforms

All

40.19 revert-time

revert-time

Syntax

revert-time *time*

no revert-time

Context

[Tree] (config>eth-tunnel revert-time)

Full Context

configure eth-tunnel revert-time

Description

This command configure how long to wait before switching back to the primary path after it has been restored to Ethernet tunnel.

The **no** form of this command disables the revert behavior, effectively setting the revert time to zero.

Default

no revert-time

Parameters

time

Specifies the re-activation delay, in seconds, for the primary path.

Values 1 to 720

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

revert-time

Syntax

revert-time *revert-time* | **infinite**

no revert-time

Context

[Tree] (config>service>vpls>endpoint revert-time)

Full Context

configure service vpls endpoint revert-time

Description

This command configures the time to wait before reverting to primary spoke-SDP.

In a regular endpoint the revert-time setting affects just the pseudowire defined as primary (precedence 0). For a failure of the primary pseudowire followed by restoration the revert-timer is started. After it expires the primary pseudowire takes the active role in the endpoint. This behavior does not apply for the case when both pseudowires are defined as secondary. For example, if the active secondary pseudowire fails and is restored it will stay in standby until a configuration change or a force command occurs.

Parameters

revert-time

Specifies the time to wait, in seconds, before reverting back to the primary spoke-SDP defined on this service endpoint, after having failed over to a backup spoke-SDP

Values 0 to 600

infinite

Specifying this keyword makes endpoint non-revertive

Platforms

All

revert-time

Syntax

revert-time {*revert-time* | **infinite**}

no revert-time

Context

[Tree] (config>mirror>mirror-dest>endpoint revert-time)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure mirror mirror-dest endpoint revert-time

Description

This command configures the time to wait before reverting to the primary spoke SDP. This command has an effect only when used in conjunction with an endpoint which contains a SDP of type 'primary'. It is ignored and has no effect in all other cases. The revert-timer is the delay in seconds the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

The **no** form of this command resets the timer to the default value of 0. This means that the mirror-service path is switched back to the endpoint primary sdp immediately after it comes back up.

Parameters

revert-time

Specifies a delay, in seconds, the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

Values 0 to 600

infinite

Forces the mirror or LI service path to never revert to the primary SDP as long as the currently active secondary SDP is UP.

Platforms

All

revert-time

Syntax

revert-time {*revert-time* | **infinite**}

no revert-time

Context

[Tree] (config>service>sdp>mixed-lsp-mode revert-time)

Full Context

configure service sdp mixed-lsp-mode revert-time

Description

This command configures the delay period the SDP must wait before it reverts to a higher priority LSP type when one becomes available.

The **no** form of the command resets the timer to the default value of 0. This means the SDP reverts immediately to a higher priority LSP type when one becomes available.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no revert-time

Parameters

revert-time

Specifies the delay period, in seconds, that the SDP must wait before it reverts to a higher priority LSP type when one becomes available. A value of zero means the SDP reverts immediately to a higher priority LSP type when one becomes available.

Values 0 to 600

infinite

This keyword forces the SDP to never revert to another higher priority LSP type unless the currently active LSP type is down.

Platforms

All

revert-time

Syntax

revert-time *time*

no revert-time

Context

[Tree] (config>eth-ring revert-time)

Full Context

configure eth-ring revert-time

Description

This command configures the revert time for an Eth-Ring. It ranges from 60 seconds to 720 second by 1 second intervals.

The **no** form of this command means non-revertive mode and revert time is essentially 0, and the revert timers are not set.

Default

revert-time 300

Parameters

time

Specifies the guard-time, in seconds.

Values 60 to 720

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

40.20 revert-timer

revert-timer

Syntax

revert-timer *timer-value*

no revert-timer

Context

[Tree] (config>router>mpls>lsp revert-timer)

Full Context

configure router mpls lsp revert-timer

Description

This command configures a revert timer on an LSP. The timer starts when the LSP primary path recovers from a failure. The LSP reverts from a secondary path to the primary path when the timer expires, or when the secondary path fails.

The **no** form of this command cancels any currently outstanding revert timer. If the LSP is up when a no revert-timer is issued, the LSP will revert to the primary path. Otherwise the LSP reverts when the primary path is restored.

Default

no revert-timer

Parameters

timer-value

Specifies the amount of time, in one minute increments, between attempts to re-establish the LSP after it has failed.

Values 1 to 4320

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

revert-timer

Syntax

revert-timer *seconds*

no revert-timer

Context

[Tree] (config>router>mpls>fwd-policies>fwd-policy revert-timer)

Full Context

configure router mpls forwarding-policies forwarding-policy revert-timer

Description

This command configures the revert timer in an MPLS forwarding policy.

When the primary direct or indirect next hop is restored and is added back into the routing table, CPM waits for an amount of time equal to the user-programmed revert timer before activating it and updating the data path. However, if the backup direct or indirect next hop fails while the timer is running, CPM activates it and updates the data path immediately.

A value of 0 disables the revert timer; meaning the policy reverts immediately.

The **no** form of this command removes the revert timer from the MPLS forwarding policy.

Default

revert-timer 0

Parameters

seconds

Specifies the revert-timer value, in number of seconds.

Values 1 to 600

Platforms

All

revert-timer

Syntax

revert-timer *revert-timer*

no revert-timer

Context

[Tree] (config>router>segment-routing>maintenance-policy revert-timer)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router segment-routing maintenance-policy revert-timer

Description

This command configures the revert timer for SR Policy candidate paths.

The revert timer is started when the primary path (for example, the best preference programmed candidate path) recovers (for example, after the number of S-BFD sessions that are up is ≥ **threshold** and the **hold-down-timer** has expired) and switches back when the timer expires.

The **no** form of this command removes the revert timer from the SR policy.

Default

no revert-timer

Parameters

revert-timer

Specifies the revert timer, in minutes.

Values 1 to 4320

Platforms

All

40.21 revertive

revertive

Syntax

[**no**] **revertive**

configure service vprn mvpn provider-tunnel selective umh-rate-monitoring group source revertive-timer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service vprn mvpn provider-tunnel inclusive umh-rate-monitoring revertive-timer

Description

This command configures the timer value, after expiration, which causes the UMH to switch to the primary UMH after traffic is restored. This value must account for the traffic flapping from the primary UMH. If traffic flapping occurs, the timer resets.

The **no** form of this command leaves the UMH in standby mode, with no revertive behavior.

Default

no revertive-timer

Parameters

sec

Specifies the timer value, in seconds.

A value of 0 means revert immediately.

Values 0 to 3600

Platforms

All

40.23 revocation-check

revocation-check

Syntax

revocation-check {**crl** | **crl-optional**}

Context

[Tree] (config>system>security>pki>ca-profile revocation-check)

Full Context

configure system security pki ca-profile revocation-check

Description

This command specifies the revocation method the system uses to check the revocation status of certificate issued by the CA. If the **crl-optional** option is configured, when the user disables the **ca-profile**, the system tries to load the configured CRL (specified by the **crl-file** command). However, if the system fails to load the configured CRL for the following reasons, the system still brings the **ca-profile** operationally up, but leaves the CRL configured as non-existent:

- CRL file does not exist
- CRL is not properly encoded - maybe due to interrupted file transfer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- CRL does not match cert
- Wrong CRL version
- CRL expired

Note:
The **crl-optional** command option makes configuration of a valid CRL in a **ca-profile** optional. However, from a security point of view, it is important to always verify the revocation status of a certificate.

If the system needs to use the CRL of a specific CA profile to check the revocation status of an end-entity certificate, and the CRL is non-existent due to the preceding reasons, the system treats a case like this as being unable to get an answer from CRL and falls back to the next status verify method or default result.

If the system needs to check the revocation of a CA certificate in a certificate chain, and if the CRL is non-existent due to the preceding reasons, the system skips checking the revocation status of the CA certificate. For example, if CA1 is issued by CA2, if the revocation-check for CA2 is **crl-optional** and the CRL for CA2 is non-existent, the system does not check the certificate revocation status of CA1 and it is considered as "good”.

Note:
Users must shut down the **ca-profile** to change the **revocation-check** configuration.

Default

revocation-check crl

Parameters

crl

Specifies to use the configured CRL.

crl-optional

Specifies that the CRL is optional.

configure service vprn bgp-ipvpn mpls auto-bind-tunnel resolution-filter rib-api

Description

This command selects the RIB-API tunnel type.

This command enables tunnels programmed using the RibApi gRPC service to be used in resolving the next hops of routes imported into the EVPN service.

The **no** form of this command disables tunnels programmed using the RibApi gRPC service from being used in resolving the next hops.

Default

no rib-api

[Tree] (config>router>ospf3 rib-priority)

[Tree] (config>router>ospf rib-priority)

Full Context

configure router ospf3 rib-priority

configure router ospf rib-priority

Description

This command enables RIB prioritization for the OSPF protocol and specifies the prefix list used to select the specific routes that should be processed through the OSPF route calculation process at a higher priority.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command disables RIB prioritization at the associated level.

Default

no rib-priority high

Parameters

prefix-list-name

Specifies the prefix list, up to 32 characters, which is used to select the routes that are processed at a higher priority through the route calculation process.

Platforms

All

rib-priority

Syntax

rib-priority {**high**}

no rib-priority

Context

[Tree] (config>router>ospf>area>interface rib-priority)

[Tree] (config>router>ospf3>area>interface rib-priority)

Full Context

configure router ospf area interface rib-priority

configure router ospf3 area interface rib-priority

Description

This command enables RIB prioritization for the OSPF/OSPFv3 protocol. When enabled at the OSPF interface level, all routes learned through the associated OSPF interface are processed through the OSPF route calculation process at a higher priority.

The **no** form of this command disables RIB prioritization at the associated level.

Default

no rib-priority

Parameters

high

Specifies that the name of the prefix list which contains prefixes get high priority for RIB-download. The high priority prefixes are downloaded first to the RIB. In doing so, the convergence time for these prefixes is better.

Full Context

configure service vpls igmp-snooping robust-count

configure service vpls spoke-sdp igmp-snooping robust-count

configure service vpls mesh-sdp mld-snooping robust-count

configure service vpls mesh-sdp igmp-snooping robust-count

configure service vpls sap igmp-snooping robust-count

configure service vpls sap mld-snooping robust-count

configure service vpls spoke-sdp mld-snooping robust-count

Description

If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If this SAP or SDP is expected to be 'lossy', this parameter may be increased. IGMP snooping on this SAP or SDP is robust to (robust-count-1) packet losses.

If **send-queries** is not enabled, this parameter will be ignored.

Default

robust-count 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

robust-count

Specifies the robust count for the SAP or SDP

Values 2 to 7 (for **config>service>vpls>sap>igmp-snooping**) 1 to 255 (for **config>service>vpls>igmp-snooping**)

Platforms

All

robust-count

Syntax

robust-count *robust-count*

no robust-count

Context

[Tree] (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp robust-count)

Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping robust-count

Description

This command configures the IGMP robustness variable. If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If an MSAP or SDP is expected to be "lossy", this parameter may be increased. IGMP snooping on an MSAP or SDP is robust to (robust-count-1) packet losses.

If send-queries is not enabled, this parameter is ignored.

The **no** form of this command reverts to the default.

Default

robust-count 2

Parameters

robust-count

Specifies the robust count for the SAP or SDP.

Values 2 to 7

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

40.40 rollback-location

rollback-location

Syntax

rollback-location *file-url* /*rollback filename*

no rollback-location

Context

[Tree] (config>system>rollback rollback-location)

Full Context

configure system rollback rollback-location

Description

The location and name of the rollback checkpoint files is configurable to be local (on compact flash) or remote. The *file-url* must not contain a suffix (just a path/directory + filename). The suffixes for rollback checkpoint files are ".rb", ".rb.1", ..., ".rb.9" and are automatically appended to rollback checkpoint files.

Default

no rollback-location

Parameters

file-url

Specifies the URL or rollback filename.

Values

local-url | *remote-url*	
local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length of up to 99 characters each
remote-url	[{ftp://}*login*:*pswd*@ *remote-locn*/][*file-path*] up to 255 characters, directory length of up to 99 characters each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*] *x:x:x:x:x:x:d.d.d.d*[-*interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D *interface* - up to 32 characters each, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rollback-filename

Specifies the rollback file name.

Values suffixed with .rb, .rb.1 up to .9 during rollback checkpoint creation

Platforms

All

40.41 rollback-sync

rollback-sync

Syntax

rollback-sync

Context

[Tree] (admin>redundancy rollback-sync)

Full Context

admin redundancy rollback-sync

Description

This command copies the entire set of rollback checkpoint files from the active CPM to the standby CPM.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rollback-sync

Syntax

[**no**] **rollback-sync**

Context

[Tree] (config>redundancy rollback-sync)

Full Context

configure redundancy rollback-sync

Description

The operator can enable automatic synchronization of classic CLI rollback checkpoint files between the active CPM and standby CPM. When this automatic synchronization is enabled, a classic CLI **rollback save** causes the new classic CLI checkpoint file to be saved on both the active and standby CPMs. The suffixes of the old checkpoint files on both active and standby CPMs are incremented. Note that automatic sync only causes the one new checkpoint file to be copied to both CFs (the other checkpoint files are not automatically copied from active to standby but that can be done manually with **admin redundancy rollback-sync**).

Automatic synchronization of classic CLI rollback checkpoint files across CPMs is only performed if the rollback-location is configured as a local file-url (for example, "cf3:/rollback-files/rollback). Synchronization is not done if the rollback-location is remote.

The **config redundancy synchronize {boot-env | config}** and **admin redundancy synchronize {boot-env | config}** do not apply to classic CLI rollback checkpoint files. These commands do not manually or automatically sync classic CLI rollback checkpoint files. The **rollback-sync** command must be used to sync classic CLI rollback checkpoint files.

Default

no rollback-sync

Platforms

All

40.42 rollover

rollover

Syntax

rollover *minutes* [**retention** *hours*]

no rollover

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>log>file-id rollover)

Full Context

configure log file-id rollover

Description

This command configures how often an event or accounting log is rolled over or partitioned into a new file.

An event or accounting log is actually composed of multiple, individual files. The system creates a new file for the log based on the **rollover** time, expressed in minutes.

The *retention* option, expressed in hours, allows you to modify the default time to keep the file in the system. The retention time is based on the rollover time of the file.

If logs are needed to be retained for more than 16 days, use a CRON job to move the logs to a different location, either on a local drive or a remote server. For more information, contact Nokia support.

When multiple **rollover** commands for a *file-id* are entered, the last command overwrites the previous command.

The **no** form of this command reverts to the default values.

Default

rollover 1440 retention 12

Parameters

minutes

Specifies the rollover time, in minutes.

Values 5 to 10080

retention hours

Specifies the retention period in hours, expressed as a decimal integer. The retention time is based on the time creation time of the file. The file becomes a candidate for removal once the creation datestamp + rollover time + retention time is less than the current timestamp.

Default 12

Values 1 to 500

40.43 root

root

Syntax

root

Context

[Tree] (config>qos>policer-control-policy root)

Full Context

configure qos policer-control-policy root

Description

The **root** node contains the policer control policies configuration parameters for the root arbiter. Within the node, the parent policer's maximum rate limit can be set, the strict priority level, and fair threshold portions may be defined per priority level.

The root node always exists and does not need to be created.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

40.44 root-address

root-address

Syntax

root-address {*ip-address* | *ipv6-address*}

no root-address

Context

[Tree] (config>router>p2mp-sr-tree>p2mp-policy root-address)

Full Context

configure router p2mp-sr-tree p2mp-policy root-address

Description

This command configures the IP address of the P2MP SR tree root node of the P2MP policy. The root tree ID and the root address uniquely identify the P2MP policy on the root node.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the root address entry.

Parameters

ip-address

Specifies the IPv4 address.

Values a.b.c.d

zero-ipv4-address — 0.0.0.0

ipv6-address

Specifies the IPv6 address.

Values x:x:x:x:x:x:x:x

x:x:x:x:x:x:d.d.d.d

unspecified-ip — 0:0:0:0:0:0:0:0 or 0:0:0:0:0:0:0.0.0.0

Platforms

All

root-address

Syntax

root-address {*ip-address* | *ipv6-address*}

no root address

Context

[Tree] (config>router>p2mp-sr-tree>replication-segment root-address)

Full Context

configure router p2mp-sr-tree replication-segment root-address

Description

This command configures the replication segment with the IP address of the root node of the P2MP SR tree replication segment.

The **no** form of this command removes the root node address.

Parameters

ip-address

Specifies the IPv4 address.

Values a.b.c.d

zero-ipv4-address — 0.0.0.0

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6-address

Specifies the IPv6 address.

Values x:x:x:x:x:x:x:x

x:x:x:x:x:x:d.d.d.d

unspecified-ip — 0:0:0:0:0:0:0:0 or 0:0:0:0:0:0:0.0.0.0

Platforms

All

40.45 root-and-leaf

root-and-leaf

Syntax

[**no**] **root-and-leaf**

Context

[Tree] (config>service>vpls>provider-tunnel>inclusive root-and-leaf)

Full Context

configure service vpls provider-tunnel inclusive root-and-leaf

Description

This command configures the node to operate as both root and leaf of the I-PMSI in a specified VPLS/B-VPLS instance.

By default, a node will behave as a leaf-only node. When the node is leaf only for the I-PMSI of type P2MP RSVP LSP, no PMSI Tunnel Attribute is included in BGP-AD route update messages and therefore no RSVP P2MP LSP is signaled but the node can join RSVP P2MP LSP rooted at other PE nodes participating in this VPLS/B-VPLS service. The user must still configure a LSP template even if the node is a leaf only.

For the I-PMSI of type mLDP, the leaf-only node will join I-PMSI rooted at other nodes it discovered but will not include a PMSI Tunnel Attribute in BGP-AD route update messages. This way a leaf-only node will forward packets to other nodes in the VPLS/B-VPLS using the point-to-point spoke-SDPs.

The **no** version of this command re-instates the default value.

40.47 root-pool

root-pool

Syntax

[**no**] **root-pool** *root-pool-id*

Context

[Tree] (config>qos>hs-pool-policy>root-tier root-pool)

Full Context

configure qos hs-pool-policy root-tier root-pool

Description

Commands in this context configure root tier parameters. Within the **root-tier** context, root pools can be sized using the **allocation-weight** command or a slope policy can be associated with a root pool.

The **no** form of the command restores the default **allocation-weight** value and default slope policy to the specified root pool. Root pool 1 has a different default weight than root pools 2 through 16. The **no root-pool** command fails for root pools 2 through 16 if the root pool is currently the parent of a mid-tier pool.

Parameters

root-pool-id

Specifies the root pool ID. This is a required parameter when executing the **root-pool** command and specifies which root pool context is being entered.

Values 1 to 16

Platforms

7750 SR-7/12/12e

configure qos hs-pool-policy root-tier

Description

Commands in this context configure root pool parameters. Within the **root-tier** context, root pools can be sized using the **allocation-weight** command or a slope policy can be associated with a root pool.

Platforms

7750 SR-7/12/12e

40.49 round-robin-inactive-records

round-robin-inactive-records

Syntax

[**no**] **round-robin-inactive-records**

Context

[Tree] (config>mcast-mgmt>chassis-level round-robin-inactive-records)

Full Context

configure mcast-management chassis-level round-robin-inactive-records

Description

This command specifies whether initially inactive multicast records use the IOM default secondary multicast path or not. When enabled, the system redistributes newly populated inactive records among all available IOM multicast paths and multicast switch fabric planes. When disabled, the system continues to set all initially inactive multicast records to use the IOM default secondary multicast path.

The **no** form of this command reverts to the default.

route

Syntax

route index *index* [**realm** *realm-string*] [**application** *application*] [**create**]

no route index *index*

Context

[Tree] (config>aaa>diam>node>peer route)

Full Context

configure aaa diameter node peer route

Description

This command configures the index of the static route within the Diameter peer used to reach remote realms that are not directly connected to the origin realm, or to override the route preference (peer preference) of the directly-connected realms.

The **no** form of this command removes the route index information from the configuration.

Parameters

index

Specifies the index of the static route within the Diameter peer.

Values 1 to 15

realm-string

Specifies the destination realm reachable through this static route, up to 80 characters.

application

Specifies the ID of the Diameter application of the static route.

Values nasreq, gy, gx

create

Keyword used to create the route index. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

route-distinguisher

Syntax

route-distinguisher auto-rd

no route-distinguisher

route-distinguisher *rd*

Context

[Tree] (config>service>epipe>bgp route-distinguisher)

[Tree] (config>service>vpls>bgp route-distinguisher)

Full Context

configure service epipe bgp route-distinguisher

configure service vpls bgp route-distinguisher

Description

This command configures the Route Distinguisher (RD) component that will be signaled in the MP-BGP NLRI for L2VPN and EVPN families. This value will be used for BGP-AD, BGP VPLS and BGP multi-homing NLRI if these features are configured.

If this command is not configured, the RD is automatically built using the BGP-AD VPLS ID. The following rules apply:

- if BGP AD VPLS-id is configured and no RD is configured under BGP node - RD=VPLS-ID
- if BGP AD VPLS-id is not configured then an RD value must be configured under BGP node (this is the case when only BGP VPLS is configured)
- if BGP AD VPLS-id is configured and an RD value is also configured under BGP node, the configured RD value prevails

Values and format (6 bytes, other 2 bytes of type will be automatically generated)

Alternatively, the **auto-rd** option allows the system to automatically generate an RD based on the **bgp-auto-rd-range** command configured at the service level. For **BGP-EVPN** enabled VPLS and Epipe services, the **route-distinguisher** value can also be auto-derived from the **evi** value (**config>service>vpls>bgp-evpn>evi** or **config>service>epipe>bgp-evpn>evi**) if this command is not configured. See the **config>service>system>bgp-evpn>eth-seg>service-carving>manual evi** command description for more information.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-addr:comm-val

Specifies the IP address.

Values *ip-addr*: a.b.c.d

comm-val: 0 to 65535

as-number:ext-comm-val

Specifies the AS number.

Values *as-number*: 1 to 65535

ext-comm-val: 0 to 4294967295

auto-rd

The system will generate an RD for the service according to the IP address and range configured in the **bgp-auto-rd-range** command.

Platforms

All

route-distinguisher

40.54 route-distinguisher-list

route-distinguisher-list

Syntax

route-distinguisher-list *name*

no route-distinguisher-list *name*

Context

[Tree] (config>router>policy-options route-distinguisher-list)

Full Context

configure router policy-options route-distinguisher-list

Description

This command creates a list of entries used to match the RD in BGP routes of specific address families.

Parameters

name

Specifies the name of the RD list, up to 64 characters.

Platforms

All

route-distinguisher-list

Syntax

route-distinguisher-list *name*

no route-distinguisher-list *name*

Context

[Tree] (config>router>policy-options>policy-statement>entry>from route-distinguisher-list)

Full Context

configure router policy-options policy-statement entry from route-distinguisher-list

Description

This command configures a route distinguisher (RD) list as a match criterion for the policy statement entry.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This match condition is supported by policies applied as VRF import or BGP peer import policies. A BGP route can match a policy entry with this match criterion if the NLRI field contains an RD that is matched by at least one of the entries in the **route-distinguisher-list**.

BGP routes belonging to address families other than VPN-IPv4, VPN-IPv6, MCAST-VPN-IPv4, MCAST-VPN-IPv6, EVPN, FlowSpec-VPN IPv4, FlowSpec-VPN IPv6, MVPN-IPv4 or MVPN-IPv6 routes do not match policy entries with this match criterion.

Parameters

name

Specifies the (possibly parameterized) name of an RD list.

Platforms

All

40.55 route-downloader

route-downloader

Syntax

route-downloader *name* [**create**]

no route-downloader *name*

Context

[Tree] (config>aaa route-downloader)

Full Context

configure aaa route-downloader

Description

Commands in this context configure a route-downloader instance. The route-downloader is a process that uses radius access-request messages to a particular server. The server returns either an access-accept or access-deny message. Access-accept messages also contain the prefixes (in the form of static blackhole routes in various formats). Only a single route-downloader object can be created.

The **no** form of this command removes the name from the configuration. The object must be shutdown prior to deletion. No prefix is needed to delete an existing route-download object.

Parameters

name

Specifies the name of this RADIUS route downloader.

create

This keyword is mandatory while creating an instance of the route-download object.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

40.56 route-entry

route-entry

Syntax

[**no**] **route-entry** {*ip-prefix/length* | *ip-prefix netmask*}

[**no**] **route-entry** *ipv6-prefix/prefix-length*

Context

[Tree] (config>service>vprn>sub-if>grp-if>sap>static-host>managed-routes route-entry)

[Tree] (config>service>ies>sub-if>grp-if>sap>static-host>managed-routes route-entry)

Full Context

configure service vprn subscriber-interface group-interface sap static-host managed-routes route-entry

configure service ies subscriber-interface group-interface sap static-host managed-routes route-entry

Description

This command assigns a managed route to a specified subscriber host. As a consequence, a static route pointing subscriber-host IP address as a next hop is installed in the FIB.

The **no** form of this command removes the respective route. By default, there are no managed routes configured.

Parameters

ip-prefix/length

Specifies the IP prefix and length.

Syntax:

ip-prefix/length:	ip-prefix	a.b.c.d
	ip-prefix-length	1 to 32

netmask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (0.0.0.0 not allowed)

ipv6-prefix/prefix-length

Specifies the IPv6 prefix and prefix length.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	ipv6-prefix-length	1 to 128

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

40.57 route-exists

route-exists

Syntax

route-exists *expression*

no route-exists

Context

[Tree] (config>router>policy-options>policy-statement>entry>cond-expr route-exists)

Full Context

configure router policy-options policy-statement entry conditional-expression route-exists

Description

This command is used to specify a route existence expression to control evaluation of the policy entry. If the route existence expression evaluates to 'true' the matching and action commands of the policy entry are applied as normal. If the route existence expression evaluates to 'false' the entire policy entry is skipped and processing continues with the next entry; however, conditional expressions are only parsed when the route policy is used as a BGP export policy or VRF export policy.

Default

no route-exists

Parameters

expression

"["<pfx-list-name>"]" [all | none]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If neither the **all** nor the **none** keyword are used the match logic is 'any' – that is, the route expression evaluates as 'true' if any exact match entry in the referenced prefix-list has an active route in the route table associated with the policy.

all – the route expression evaluates as 'true' only if all the exact match entries in the referenced prefix-list have an active route in the route table associated with the policy.

none – the route expression evaluates as 'true' only if none of the exact match entries in the referenced prefix-list have an active route in the route table associated with the policy.

Context

[Tree] (config>router>nat>outside route-limit)

[Tree] (config>service>vprn>nat>outside route-limit)

Full Context

configure router nat outside route-limit

configure service vprn nat outside route-limit

Description

This command configures the router to a maximum limit of source subprefix routes that can be installed on the outside when the source IPv4 address is not translated (large scale stateful inbound filtering and DNAT-only functionality). If the actual number of generated routes exceeds this configured limit, the excess routes are not installed in the routing table, and a log message is generated.

The following commands, along with this command, are all interrelated. See the following commands for more information:

- **configure service vprn nat outside domain prefix**
- **configure router nat outside domain prefix**
- **configure service vprn nat inside large-scale nat66 hash-prefix**
- **configure router nat inside large-scale nat66 hash-prefix**

Default

route-limit 32768

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

limit

Specifies the maximum number of source sub-prefix routes that can be installed on the outside.

Values 1 to 131072

configure service vprn bgp monitor route-monitoring

Description

This command specifies if BMP sends pre-policy route monitoring messages, post-policy route monitoring messages, both types of messages, or none.

The **no** form of this command disables sending of route-monitoring messages.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

pre-policy

Enables sending pre-policy route monitoring messages using the pre-policy path attribute values, if available.

post-policy

Enables sending post-policy route monitoring messages using the post-policy path attribute values, if available.

configure service epipe bgp-evpn mpls route-next-hop

configure service epipe bgp-evpn segment-routing-v6 route-next-hop

configure service vpls bgp-evpn mpls route-next-hop

Description

This command configures the next hop of the EVPN routes.

Default

route-next-hop system-ipv4

Parameters

system-ipv4

Specifies the system IPv4 address as the next hop for the service EVPN routes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

system-ipv6

Specifies the system IPv6 address as the next hop for the service EVPN routes.

ip-address

Specifies the IPv4 address value as the next hop for the service EVPN.

Values a.b.c.d

Platforms

Full Context
configure log route-preference

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the primary and secondary routing preference for traffic generated for SNMP notifications and syslog messages. If the remote destination is not reachable through the routing context specified by primary route preference then the secondary routing preference will be attempted.

The **no** form of this command reverts to the default values.

Default

no route-preference

Parameters

primary

Specifies the primary routing preference for traffic generated for SNMP notifications and syslog messages.

Default outband

secondary

Specifies the secondary routing preference for traffic generated for SNMP notifications and syslog messages. The routing context specified by the secondary route preference will be attempted if the remote destination was not reachable by the primary routing preference, specified by primary route preference. The value specified for the secondary routing preference must be distinct from the value for primary route preference.

Default inband

inband

Specifies that the logging utility will attempt to use the base routing context to send SNMP notifications and syslog messages to remote destinations.

outband

Specifies that the logging utility will attempt to use the management routing context to send SNMP notifications and syslog messages to remote destinations.

none

Specifies that no attempt will be made to send SNMP notifications and syslog messages to remote destinations.

Platforms

Full Context

configure service vprn bgp rib-management ipv6 route-table-import

configure service vprn bgp rib-management label-ipv4 route-table-import

configure service vprn bgp rib-management ipv4 route-table-import

Description

This command specifies the name of a route policy to control the importation of active routes from the IP route table into one of the BGP RIBs.

If the **route-table-import** command is not configured, or if the command refers to an empty policy, all non-BGP routes from the IP route table are imported into the applicable RIB.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the **route-table-import** command is configured, then routes dropped or rejected by the configured policy are not installed in the associated RIB. Rejected routes cannot be advertised to BGP peers associated with the RIB, but they can still be used to resolve BGP next-hops of routes in that RIB. If the active route for a prefix is rejected by the **route-table-import** policy, then the best BGP route for that prefix in the BGP RIB can be advertised to peers as though it is used.

Aggregate routes are always imported into each RIB, independent of the **route-table-import** policy.

Route modifications specified in the actions of a **route-table-import** policy are ignored and have no effect on the imported routes.

Default

no route-table-import

Parameters

policy-name

Specifies the name of a policy-statement (up to 64 characters).

Platforms

All

[Tree] (config>service>epipe>bgp route-target)

Full Context

configure service vpls bgp-ad route-target

configure service vpls bgp route-target

configure service epipe bgp route-target

Description

This command configures the route target (RT) component that will be signaled in the related MP- BGP attribute to be used for BGP auto-discovery, BGP VPLS, BGP multi-homing and EVPN if these features are configured in this VPLS service, or for BGP multi-homing, BGP-VPWS and EVPN in case of Epipe services.

If this command is not used in VPLS services, the RT is built automatically using the VPLS ID. The extended community can have the same two formats as the VPLS ID, a two-octet AS-specific extended community, IPv4 specific extended community. For BGP EVPN enabled VPLS and Epipe services, the route target can also be auto-derived from the **evi** value (**config>service>vpls>bgp-evpn>evi** or **config>service>epipe>bgp-evpn>evi**) if this command is not configured.

Parameters

export *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

import *ext-community*

Specifies communities allowed to be accepted from remote PE neighbors.

no route-target-list [*comm-id*]

Context

[Tree] (config>router>bgp route-target-list)

Full Context

configure router bgp route-target-list

Description

This command specifies the route target(s) to be accepted from or advertised to peers. If the **route-target-list** is a non-null list, only routes with one or more of the given route targets are accepted from or advertised to peers.

The **route-target-list** is assigned at the global level and applies to all peers connected to the system.

This command is only applicable if the router is a route-reflector server.

The **no** form of this command with a specified route target community removes the specified community from the **route-target-list**. The **no** form of this command entered without a route target community removes all communities from the list.

Default

no route-target-list

Parameters

comm-id

Specifies up to 15 route target communities.

Values [**target:** {*ip-address*:*comm-val* | *2byte-asnumber*:*ext-comm-val* | *4byte-asnumber*:*comm-val*}

where:

- *ip-address* — a.b.c.d

40.70 route-unknown

route-unknown

Syntax

[**no**] **route-unknown** [{*ip-prefix/mask* | *ipv6-address/prefix-length*}]

Context

[Tree] (config>vrrp>policy>priority-event route-unknown)

Full Context

configure vrrp policy priority-event route-unknown

Description

This command creates a context to configure a route unknown priority control event that monitors the existence of a specific active IP route prefix within the routing table.

The **route-unknown** command configures a priority control event that defines a link between the VRRP priority control policy and the Route Table Manager (RTM). The RTM registers the specified route prefix as monitored by the policy. If any change (add, delete, new next hop) occurs relative to the prefix, the policy is notified and takes correct action according to the priority event definition. If the route prefix exists and is active in the routing table according to the conditions defined, the event is in the cleared state. If the route prefix is removed, becomes inactive or fails to meet the event criteria, the event is in the set state.

The command creates a **route-unknown** node identified by *prefix/mask-length* and containing event control commands.

Multiple unique (different *prefix/mask-length*) **route-unknown** event nodes can be configured within the **priority-event** node up to the maximum limit of 32 events.

The **route-unknown** command can reference any valid IP address mask-length pair. The IP address and associated mask length define a unique IP router prefix. The dynamic monitoring of the route prefix results in one of the event operational states listed in Table 110: Route-unknown Operational States.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 110: Route-unknown Operational States

route-unknown Operational State	Description
Set – non-existent	The route does not exist in the route table
Set – inactive	The route exists in the route table but is not being used
Set – wrong next hop	The route exists in the route table but does not meet the **next-hop** requirements
Set – wrong protocol	The route exists in the route table but does not meet the **protocol** requirements
Set – less specific found	The route exists in the route table but does is not an exact match and does not meet any **less-specific** requirements
Set – default best match	The route exists in the route table as the default route but the default route is not allowed for route matching
Cleared – less specific found	A less specific route exists in the route table and meets all criteria including the **less-specific** requirements
Cleared – found	The route exists in the route table manager and meets all criteria

An existing route prefix in the RTM must be active (used by the IP forwarding engine) to clear the event operational state. It may be less specific (the defined prefix may be contained in a larger prefix according to Classless Inter-Domain Routing (CIDR) techniques) if the event has the **less-specific** statement defined. The less specific route that incorporates the router prefix may be the default route (0.0.0.0) if the **less-specific allow-default** statement is defined. The matching prefix may be required to have a specific next hop IP address if defined by the event **next-hop** command. Finally, the source of the RTM prefix may be required to be one of the dynamic routing protocols or be statically defined if defined by the event **protocol** command. If an RTM prefix is not found that matches all the above criteria (if defined in the event control commands), the event is considered to be set. If a matching prefix is found in the RTM, the event is considered to be cleared.

When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

The **no** form of the command is used to remove the specific *prefix/mask-length* monitoring event. The event can be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances must be reevaluated. The events **hold-set** timer has no effect on the removal procedure.

Default

no route-unknown — No route unknown priority control events are defined for the priority control event policy.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-prefix/mask

The IP prefix address in dotted decimal notation and the subnet mask length expressed as a decimal integer associated with the IP *prefix* defining the route prefix to be monitored by the route unknown priority control event.

Values The following values apply to the 7750 SR, 7950 XRS, and 7450 ESS:

ip-prefix/mask:	ip-prefix	a.b.c.d (host bits must be 0)
	mask	0 to 32

ipv6-address/prefix-length

The IPv6 address of the host for which the specific event will monitor connectivity. The *ipv6-address* can only be monitored by a single event in this policy. The IPv6 address can be monitored by multiple VRRP priority control policies. The IPv6 address can be used in one or multiple **ping** requests. Each VRRP priority control **host-unreachable** and **ping** destined to the same *ipv6-address* is uniquely identified on a per message basis. Each session originates a unique identifier value for the ICMP echo request messages it generates. This allows received ICMP echo reply messages to be directed to the appropriate sending application.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0..FFFF]H
prefix-length	0 to 128

router

Syntax

router *router-instance*

router service *service-name*

no router

Context

[Tree] (config>aaa>diam>node router)

Full Context

configure aaa diameter node router

Description

This command references the routing-instance from which diameter peering connection is initiated.

The **no** form of this command reverts to the default.

Default

router "Base”

Parameters

router-instance

Specifies the router instance.

Values *router-name* | *vprn-svc-id*

router-name: Base, management Default - Base

vprn-svc-id: 1 to 2147483647

service-name

Specifies the service name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

router

Syntax

router *router-instance*

no router

Context

[Tree] (config>subscr-mgmt>wlan-gw>tunnel-query router)

Full Context

configure subscriber-mgmt wlan-gw tunnel-query router

Description

This command enables matching only on tunnels that are terminated in the specified routing instance.

The **no** form of this command disables matching on a routing instance.

Default

no router

Parameters

router-instance

Specifies the routing instance in the form of *router-name* or *vprn-svc-id*.

Values *router-name* — Base

vprn-svc-id — 1 to 2147483647

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

router

Syntax

router *router-instance*

router service-name *service-name*

no router

Context

[Tree] (config>aaa>radius-srv-plcy>servers router)

Full Context

configure aaa radius-server-policy servers router

Description

This command specifies the virtual router instance applicable for the set of configured RADIUS servers. This value cannot be changed once a RADIUS server is configured for this policy.

The **no** form of this command reverts to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

router-instance

Specifies the router instance.

Values

service-name	Service name, up to 64 characters.	
	router-instance:	router-name, service-id
	router-name:	Base, management
	service-id:	1 to 2147483647

service-name

Specifies the router name service-id up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

router

Syntax

router [*router-instance*] [**create**]

no router [*router-instance*]

Context

[Tree] (config router)

Full Context

configure router

Description

Commands in this context configure router parameters including interfaces, route policies and protocols. This command is also used to create CPM router instances.

For CPM router instances, this command enters or creates a user-created CPM router instance. A CPM router instance is a not a VPRN router instance. VPRN router instances are configured under **configure service vprn**. CPM router instances are the only type of non-VPRN router instances that can be created by a user, and they have a user-defined name. CPM router instances only use CPM/CCM ethernet ports as interfaces.

Parameters

router-instance

Specifies the router name or CPM router instance.

Values *router-instance* : *router name*

router-name	Base | management | *cpm-vr-name*
cpm-vr-name	[32 characters maximum]

Default Base

create

Mandatory keyword used to create a router instance. The create keyword requirement can be enabled or disabled in the **environment**>**create** context.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

router

Syntax

router *router-instance* **group** *tunnel-group-name*

router group *tunnel-group-name* **service-name** *service-name*

no router

Context

[Tree] (config>service>vpls>sap>l2tpv3-session router)

[Tree] (config>service>epipe>sap>l2tpv3-session router)

Full Context

configure service vpls sap l2tpv3-session router

configure service epipe sap l2tpv3-session router

Description

This command configures the service and L2TPv3 group to which this L2TPv3 session should be associated. The associated services are used to provide transport for the L2TPv3 tunnel. The service can be specified with either the service-name or router ID. The group name specifies the L2TPv3 group parameters that should be associated with the session.

The **no** form of this command deletes the router configuration.

Parameters

router-instance

Specifies the router name or service ID used to identify the router instance.

Values *router-instance*: *router-name* or *vprn-svc-id*

router-name	"Base"
vprn-svc-id	1 to 2147483647

Default Base

tunnel-group-name

Specifies the tunnel group name, up to 32 characters.

service-name

Specifies the service name, up to 64 characters.

Platforms

All

Context

[Tree] (config>system>file-trans-prof router)

Full Context

configure system file-transmission-profile router

Description

This command specifies the routing instance that the transport protocol uses.

Default

router Base

Parameters

router-instance

Specifies the router instance on which the file transmission connection will be established.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **router service** *vprn-service-name* variant can be used in all configuration modes.

Values {router-name | *vprn-svc-id*}

router-name: Base, management

router-name is an alias for input only. The *router-name* gets replaced with an id automatically by SR OS in the configuration).

vprn-svc-id: 1 to 2147483647

Default Base

service vprn-service-name

Identifies the service, up to 64 characters.

router service-name *service-name*

no router

Context

[Tree] (config>aaa>isa-radius-plcy>servers router)

Full Context

configure aaa isa-radius-policy servers router

Description

This command specifies the number of times the router attempts to contact the RADIUS server for authentication, if not successful the first time.

The **no** form of the command reverts to the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no router

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

router

Syntax

router *router-instance*

router service-name *service-name*

no router

Context

[Tree] (config>mirror>mirror-dest>encap>layer-3-encap router)

Full Context

configure mirror mirror-dest encap layer-3-encap router

Description

This command specifies the routing instance into which to inject the mirrored packets. The packets are forwarded in the routing instance based on the configurable destination IP address in the inserted IP header. If a mirror-dest is configured to inject into a VPRN service, then that VPRN service cannot be deleted. A mirror-dest with layer-3-encap is set to operationally down if the configured destination IP address is not reachable via an interface in the routing instance or service configured for the mirror-dest. No changes are allowed to the router configuration once a gateway is configured. A service must already exist before it is specified as a router-instance. VPRN and IES services share the same number space for the service-id, but IES services cannot be specified as the router-instance for routable LI encap.

Forwarding of routable encapsulated LI packets out an R-VPLS interface is not supported. A mirror-dest configured with routable encapsulation can be bound to a routing instance that also has an R-VPLS bound to it but the operator must ensure that the destination of the LI packets is not reachable via any R-VPLS interfaces. Any routable encapsulated LI packets that arrive at the egress of an R-VPLS interface are discarded. Parallel use of routable LI encapsulation and R-VPLS in the same routing instance is supported as long as the mirrored packets do not egress out the R-VPLS interface.

Default

router Base

Parameters

router-instance

Specifies the router instance.

Values <*router-name*> | <*service-id*>

router-name "Base", *name*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	service-id	1 to 2147483647

service-name

Specifies the service name, up to 64 characters.

Platforms

All

router

Syntax

router *router-instance*

no router

Context

[Tree] (config>li>mirror-dest-template>layer-3-encap router)

Full Context

configure li mirror-dest-template layer-3-encap router

Description

This command specifies the routing instance into which to inject the mirrored packets. The packets will be forwarded in the routing instance based on the configurable destination IP address in the inserted IP header. This parameter can be overridden by RADIUS.

If a mirror destination is configured to inject into a VPRN service, that VPRN service cannot be deleted. A mirror destination with Layer 3 encapsulation will be set to operationally down if the configured destination IP address is not reachable via an interface in the routing instance or service configured for the mirror destination. A service must exist before it is specified as a router instance. VPRN and IES services share the same number space for the service ID; however, IES services cannot be specified as the router instance for routable LI encapsulation.

Default

router "Base”

Parameters

router-instance

Specifies the router instance using the router name or service ID.

Values	*router-instance*	*router-name* | *vprn-svc-id*	
		router-name	"Base”

Context

[Tree] (config>oam-pm>session>ip router)

Full Context

configure oam-pm session ip router

Description

This command numerically references the source context from which the TWAMP Light packet is launched. The **router-instance** *router-instance* configuration, under the same context as the **router** command, is the preferred method for referencing. This method references the launch context by name, and not number, or alias that converts **service-name** to a number.

The **no** form of this command restores the default value.

Parameters

router-or-service

Specifies the numerical reference to the router instance or service. Well known router-name "Base" is allowed for convenience, but mapped numerically.

Values {*router-name* | *vprn-svc-id*}

router-name: Base

vprn-svc-id: 1 to 2147483647

The parameter *router-instance* is preferred for specifying the router or service.

service-name

Specifies the alias function that allows the service-name to be used converted and stored as service ID, up to 64 characters. The parameter *router-instance* is preferred for specifying the router or service.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Syntax

no router *router-instance* **interface** *interface-name*

router *router-instance* **interface** *interface-name* [**direction** {**ingress | egress | both**}]

Context

[Tree] (config>cflowd>collector>exp-filter>if-list router)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure cflowd collector export-filter interface-list router

Description

This command configures the interface flow data sent to this collector.

The **no** form of this command removes the specified interface from the **interface-list** filter.

Parameters

router-instance

Specifies the router instance ID associated with the interface name

Values *router-name* | *vprn-svc-id*

router-name: Base, management Default - Base

vprn-svc-id: 1 to 2147483647

interface-name

Specifies the interface name, up to 32 characters and must start with a letter, for the router to the service interface or SAP.

ingress

Keyword to specify that ingress flows are sent to the associated Cflowd Collector.

Default both

egress

Keyword to specify that egress flows are sent to the associated Cflowd Collector.

Default both

both

Keyword to specify that both ingress and egress flows are sent to the associated Cflowd Collector.

Default both

Platforms

All

router

Syntax

[**no**] **router** *router-instance*

Context

[Tree] (config>cflowd>collector>export-filter router)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure cflowd collector export-filter router

Description

This command allows the flow data from only specific router instances to be sent to the associated collector.

Multiple router instances can be configured by issuing the command multiple times with the different router-instances.

The **no** form of this command removes the specified router-instance restriction, which means flows from that router-instance will no longer be exported. If all router-instances are removed, then flows from all router instances are sent to the associated collector.

Default

no router

Parameters

router-instances

Specifies the router name or router instance VPRN service ID. Only "Base" is supported.

Values router-name: Base, management Default - management

vprn-svc-id: 1 to 2147483647

Platforms

All

router

Syntax

router {*router-name* | *vprn-svc-id*}

Context

Full Context

configure cflowd collector router

Description

This command configures the flow data sent to the associated collector to be sent within the specified router context. If this parameter is not specified, flow data is exported using the management routing context.

Default

router management

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

router-name

Specifies the router name.

Values Base, management

Default management

vprn-svc-id

Specifies the router instance VPRN service ID.

Values 1 to 2147483647

Platforms

All

router

Syntax

router *router-instance*

router service-name *service-name*

no router

Context

[Tree] (config>filter>redirect-policy router)

Full Context

configure filter redirect-policy router

Description

This command enhances VRF support in redirect policies. When a router instance is specified, the configured destination tests are run in the specified router instance, and the PBR action is executed in the specified router instance. If no destination is active or if the hardware does not support PBR action "next-hop router", action forward will be executed (i.e. routing will be performed in the context of the incoming interface routing instance).

The **no** form of the command preserves backward-compatibility. Tests always run in the "Base" routing instance context, and the PBR action executes in the routing context of the ingress interface that the filter using this redirect policy is deployed on.

Default

no router

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

router-instance

Specifies a router instance in the form of **router-name** or **service-id**.

Values **router-name** — Base

service-id — Specifies an existing Layer 3 service [1 to 2147483647]

service-name

Specifies the name of a configured Layer 3 service.

Platforms

All

router

Syntax

router {**eq** | **neq**} *router-instance* [**regexp**]

no router

Context

[Tree] (config>log>filter>entry>match router)

Full Context

configure log filter entry match router

Description

This command specifies the log event matches for the router instance using a special vrtr-name format used by the logging system.

The **no** form of this command removes the log event matches.

Parameters

eq

Determines if the matching criteria should be equal to the specified value.

neq

Determines if the matching criteria should not be equal to the specified value.

router-instance

Specifies a router name, up to 32 characters, to be used in the match criteria. The router-instance in this command is a name for a router instance in a special format used in the logging system (called the vrtr-name). Examples of vrtr-names include **Base** and **vprn101** (where 101 is the service-id of the VPRN service). It represents the router instance that generated the log event.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of the specified router instance. When the **regexp** keyword is specified, the string in the **router** command is a regular expression string that is matched against the vrtr-name string in the log event being filtered.

[Tree] (config>service>vprn>bgp router-id)

Full Context

configure service vprn router-id

configure service vprn ospf router-id

configure service vprn bgp router-id

Description

This command sets the router ID for a specific VPRN context.

When configuring the router ID in the base instance of OSPF it overrides the router ID configured in the **config>router** context. The default value for the base instance is inherited from the configuration in the **config>router** context. If the router ID in the **config>router** context is not configured, the following applies:

- The system uses the system interface address (which is also the loopback address).
- If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

If neither the router ID nor system interface are defined, the router ID from the Base router context is inherited.

This is a **required** command when configuring multiple instances and the instance being configured is not the base instance.

When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for the instance, or reboot the entire router.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

The **no** form of this command removes the router ID definition from the given VPRN context.

Default

no router-id

Parameters

ip-address

The IP address must be given in dotted decimal notation.

Full Context

configure router mpls srlg-database router-id

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

Commands in this context configure the link members of SRLG groups for a specific router in the network. The user must also use this command to enter the local interface SRLG membership into the user SRLG database. Use by CSPF of all interface SRLG membership information of a specific router ID may be temporarily disabled by shutting down the node. If this occurs, CSPF assumes these interfaces have no SRLG membership association.

The **no** form of this command will delete all interface entries under the router ID.

Parameters

ip-address

Specifies the router ID for this system. This must be the router ID configured under the Base router instance, the base OSPF instance or the base IS-IS instance.

Platforms

All

router-id

Syntax

router-id *ip-address*

no router-id

Context

[Tree] (config>router router-id)

Full Context

configure router router-id

Description

This command configures the router ID for the router instance.

The router ID is used by both OSPF and BGP routing protocols in this instance of the routing table manager. IS-IS uses the router ID value as its system ID.

When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is initialized, the new router ID is used. This can result in an interim period of time when different protocols use different router IDs.

It is possible to configure SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for each protocol that uses the router ID, or restart the entire router.

The system uses the system interface address which is also the loopback address. If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the configured value and the last 32 bits of the chassis MAC address are used.

Default

no router-id

Parameters

ip-address

Specifies the 32 bit router ID expressed in dotted decimal notation or as a decimal value.

Platforms

All

router-id

Syntax

router-id *ip-address*

no router-id

Context

[Tree] (config>router>bgp router-id)

Full Context

configure router bgp router-id

Description

This command specifies the router ID to be used with this BGP instance.

Changing the BGP router ID on an active BGP instance causes the BGP instance to restart with the new router ID.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

When no **router-id** is configured for BGP, the system interface IP address is used.

Default

no router-id

Parameters

ip-address

Specifies the router ID, expressed as any non-zero value in the range 0.0.0.1 to 255.255.255.255 (or when converted to decimal it can have any value in the range 1-4294967295). It is recommended to use the system IPv4 address.

Syntax

[**no**] **router-instance** *service-id*

Context

[Tree] (config>router>static-route-entry>leak-dest router-instance)

Full Context

configure router static-route-entry leak-destination router-instance

Description

This command configures the static route leak destination router instance.

When a VPRN service is added to the list of VPRNs that receive a leaked copy of the static route, the static route is leaked into that VPRN if the following conditions are met:

- all configured next hops of the static route are direct next hops
- the static route is an active route, or it is capable of immediately becoming an active route when a more-preferred route for the same prefix is removed

Static routes leaked using this method appear as "VPN Leak" protocol routes in the route table of the VPRN.

When a VPRN receives a packet that matches a "VPN Leak" route that leaked using this method, the packet is forwarded according to the configuration of the static route in the GRT, even if the static route is currently non-best in the GRT.

The **no** form of this command removes the configuration.

Parameters

service-id

Specifies the service ID.

Values 1 to 2147483647 | svc-name: up to 64 characters

Platforms

All

Context

[Tree] (config>service>vpls>proxy-nd router-unsolicited-na-flood-evpn)

Full Context

configure service vpls proxy-nd router-unsolicited-na-flood-evpn

Description

This command controls whether the system floods router unsolicited Neighbor Advertisements to EVPN. The NA messages impacted by this command are NA messages with the following flags: S=0 and R=1.

The **no** form of the command will only flood to local SAPs/binds but not to EVPN destinations. This is only recommended in networks where CEs are routers directly connected to the PEs. Networks using aggregation switches between the host/routers and the PEs should flood unsolicited NA messages in EVPN to ensure that the remote caches are updated and BGP does not miss the advertisement of these entries.

Default

router-unsolicited-na-flood-evpn

configure service vprn pim rp

Description

This command enables access to the context to configure the rendezvous point (RP) of a PIM protocol instance.

A Nokia PIM router acting as an RP must respond to a PIM register message specifying an SSM multicast group address by sending stop register message(s) to the first hop router. It does not build an (S, G) shortest path tree toward the first hop router. An SSM multicast group address can be either from the SSM default range of 232/8 or from a multicast group address range that was explicitly configured for SSM.

Default

rp enabled when PIM is enabled.

Platforms

Routers use a set of available rendezvous points distributed in Bootstrap messages to get the proper group-to-RP mapping. A set of routers within a domain are also configured as candidate RPs (C-RPs); typically, these will be the same routers that are configured as candidate BSRs.

Every multicast group has a shared tree through which receivers learn about new multicast sources and new receivers learn about all multicast sources. The rendezvous point (RP) is the root of this shared tree.

Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source/rendezvous point. However, the operator can specify the following:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- use the unicast route table only
- use the multicast route table only or
- use both the route tables

The **no** form of this command reverts to the default.

Default

rpf-table rtable-u

Parameters

rtable-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

rtable-u

Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

both

Will always look up first in the multicast route table and, if there is a route, it will use it. If PIM does not find a route in the first lookup, it will try to find it in the unicast route table. Rtable-m is checked before rtable-u.

Description

This command configures the sequence of route tables used to find an RPF interface for a multicast route.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

By default, only the unicast route table is looked up to calculate RPF interface towards the source or rendezvous point. The user can specify the following options:

- use the unicast route table only
- use the multicast route table only
- use both route tables

The **no** form of this command configures the router to only use the unicast route table.

Default

no rpf-table

Parameters

rtable-m

Keyword to specify that only the multicast route table is used by the multicast protocol (PIM) for IPv4 RPF checks. This route table contains routes submitted by static routes, IS-IS and OSPF.

rtable-u

Keyword to specify that only the unicast route table is used by the PIM for IPv4 RPF checks. This route table contains routes submitted by all the unicast routing protocols.

both

Keyword to specify that the multicast route table is used first by the PIM for checks. If the multicast route table lookup fails, the unicast route table is used.

Syntax

rpfv core

rpfv mvpn

rpfv core mvpn

no rpfv [**core**] [**mvpn**]

Context

[Tree] (config>router>pim rpfv)

Full Context

configure router pim rpfv

Description

This command enables RPF Vector processing for Inter-AS Rosen MVPN Option-B and Option-C. The **rpfv** must be enabled on every node for Inter-AS Option B/C MVPN support.

If **rpfv** is configured, MLDP inter-AS resolution cannot be used. These two features are mutually exclusive.

The **no** form of this command reverts to the default.

Default

no rpfv

Parameters

mvpn

Enables MVPN RPF vector processing for Inter-AS Option B/C MVPN based on RFC 5496 and RFC 6513. If a core RPF vector is received, it will be dropped before a message is processed.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

core

Enables core RPF vector (no RD) processing for Inter-AS Option B/C MVPN, which allows SR OS interoperability as P-router with third-party vendors that do not encode RD in the RPF vector for Inter-AS MVPN.

core mvpn

Enables core RPF vector (no RD) processing for Inter-AS Option B/C MVPN, which allows SR OS interoperability as P-router with third-party vendors that do not encode RD in the RPF vector for Inter-AS MVPN.

The **no** version of this command disables RPF Vector processing. If RPF vector is received in a PIM join message, the vector will be removed before local processing of PIM message starts.

Platforms

All

40.93 rpki-session

rpki-session

Syntax

[**no**] **rpki-session** *ip-address*

Context

[Tree] (config>router>origin-validation rpki-session)

Full Context

configure router origin-validation rpki-session

Description

This command configures a session with an RPKI local cache server by using the RPKI-Router protocol. It is over these sessions that the router learns dynamic VRP entries expressing valid origin AS and prefix associations. SR OS supports the RPKI-Router protocol over TCP/IPv4 or TCP/IPv6 transport. The router can set up an RPKI-Router session using the base routing table (in-band) or the management router (out-of-band). Configure the command in the **config**>**router management** instance to configure a session using the management port.

Default

no rpki-session

Parameters

ip-address

Specifies the IPv4 address or an IPv6 address. If the IPv6 address is link-local then the interface name must be appended to the IPv6 address after a hyphen (-).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

no rpl-node

Context

[Tree] (config>eth-ring rpl-node)

Full Context

configure eth-ring rpl-node

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the G.8032 ring protection link type as owner or neighbor. The **no** form of the command means this node is not connected to an RPL link. When RPL owner or neighbor is specified either the a or b path must be configured with the **rpl-end** command. An owner is responsible for operation of the rpl link. Configuring the RPL as neighbor is optional (can be left as no rpl-node) but if the command is used the nbr is mandatory.

On a sub-ring without virtual channel it is mandatory to configure sub-ring non-virtual-link on all nodes on the sub-ring to propagate the R-APS messages around the sub-ring.

The **no** form of this command removes the RPL link.

Default

no rpl-node

Parameters

owner

Specifies the owner link type.

nbr

Specifies the neighbor link type.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context

[Tree] (config>router>bgp>next-hop-res>labeled-routes rr-use-route-table)

Full Context

configure router bgp next-hop-resolution labeled-routes rr-use-route-table

Description

This command enables BGP to perform a lookup of IGP routes in the route table to resolve the BGP next-hop of label-IPv4 and label-IPv6 routes. This is useful for a Route Reflector (RR) that does not participate in tunnel signaling protocols such as LDP and RSVP and therefore, does not have tunnels to resolve the BGP next-hops of label-unicast routes.

Configure the **disable-route-table-install** command before you configure the **rr-use-route-table** command because forwarding would otherwise be incorrect for cases where label routes are resolved this way.

Default

no rr-use-route-table

configure service vprn bgp-evpn mpls auto-bind-tunnel resolution-filter rsvp

configure service epipe bgp-evpn mpls auto-bind-tunnel resolution-filter rsvp

Description

This command selects the RSVP-TE tunnel type.

The **rsvp** value instructs BGP to search for the best metric RSVP LSP to the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest **tunnel-id**.

The **no** form of this command removes the RSVP-TE tunnel type.

Default

no rsvp

Platforms

All

rsvp

Syntax

[**no**] **rsvp**

Context

[Tree] (config>router rsvp)

Full Context

configure router rsvp

Description

Commands in this context configure RSVP protocol parameters. RSVP is not enabled by default and must be explicitly enabled (**no shutdown**).

RSVP is used to set up LSPs. RSVP should be enabled on all router interfaces that participate in signaled LSPs.

The **no** form of this command deletes this RSVP protocol instance and removes all configuration parameters for this RSVP instance. To suspend the execution and maintain the existing configuration, use the **shutdown** command. RSVP must be shutdown before the RSVP instance can be deleted. If RSVP is not shutdown, the **no rsvp** command does nothing except issue a warning message on the console indicating that RSVP is still administratively enabled.

rsvp-resv-style

Syntax

rsvp-resv-style [**se** | **ff**]

Context

[Tree] (config>router>mpls>lsp rsvp-resv-style)

Full Context

configure router mpls lsp rsvp-resv-style

Description

This command specifies the RSVP reservation style, shared explicit (se) or fixed filter (ff). A reservation style is a set of control options that specify a number of supported parameters. The style information is part of the LSP configuration.

Default

rsvp-resv-style se

Parameters

ff

Fixed filter is single reservation with an explicit scope. This reservation style specifies an explicit list of senders and a distinct reservation for each of them. A specific reservation request is created for data packets from a particular sender. The reservation scope is determined by an explicit list of senders.

se

Shared explicit is shared reservation with a limited scope. This reservation style specifies a shared reservation environment with an explicit reservation scope. This reservation style creates a single reservation over a link that is shared by an explicit list of senders. Because each sender is explicitly listed in the RESV message, different labels can be assigned to different sender-receiver pairs, thereby creating separate LSPs.

Parameters

rsvp-te

Specifies whether LSP Self Ping is enabled on RSVP-TE LSPs.

Values enable, disable

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rsvp-te

Syntax

rsvp-te *value*

no rsvp-te

Context

[Tree] (config>router>mpls>tunnel-table-pref rsvp-te)

Full Context

configure router mpls tunnel-table-pref rsvp-te

Description

This command configures the tunnel table preference for RSVP-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default.

Default

rsvp-te 7

Parameters

value

Specifies the tunnel table preference value for RSVP-TE LSP.

Values 1 to 255

Default 7

Platforms

All

rsvp-te

Syntax

[**no**] **rsvp-te**

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter rsvp-te)

Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter rsvp-te

Description

This command enables the use of RSVP-TE sourced tunnel entries in the TTM to resolve the associated static route next-hop.

The rsvp-te value instructs the code to search for the set of lowest metric RSVP-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of RSVP-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of RSVP-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value will be selected.

A P2P auto-lsp that is instantiated via an LSP template can be selected in TTM when resolution is set to any. However, Nokia does not recommend configuring an auto-lsp name explicitly under the rsvp-te node as the auto-generated name can change if the node reboots, which will blackhole the traffic of the static route.

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if rt-payload-type)

Full Context

configure mcast-management multicast-info-policy video-policy video-interface rt-payload-type

Description

This command describes the format to be used by Retransmission (RT) server to send retransmission packets. The RET server interface allows the payload type within the retransmission packets to be configured.

Default

rt-payload-type 99 — Indicates that the frames will be sent in the RFC 4588, *RTP Retransmission Payload Format*, format.

Parameters

payload-type

Indicates the format expected for received retransmission packets. The value 33 indicates that the frames will be received as originally sent. A value between 96 and 127 indicates the dynamic payload type value (per RFC 3551) to be used for RFC 4588 formatted retransmission packets.

Values 33, 96 to 127

Full Context

configure mcast-management multicast-info-policy bundle channel source-override video rt-server

configure mcast-management multicast-info-policy bundle video rt-server

configure mcast-management multicast-info-policy bundle channel video rt-server

Description

This command enables and configures the upstream retransmission server configuration parameters.

The **no** form of the command removes the upstream retransmission server configuration and implies the configuration is inherited from a higher context or from the default policy.

Default

no rt-server – The upstream retransmission server settings are inherited.

Parameters

disable

This keyword explicitly disables the upstream retransmission server within the policy. For the default bundle within the default Multicast Information Policy, the **no** form of the command and the disable keyword have the same meaning and imply the server is disabled.

ip-address

The IP address of the upstream retransmission server.

port ***num***

The UDP port to use to send RET requests to the upstream RET server.

Full Context

configure service vprn l2tp rtm-debounce-time

configure router l2tp rtm-debounce-time

Description

This command configures the amount of time, in milliseconds, that the system waits before declaring an L2TP tunnel down when the remote endpoint IP address cannot be resolved to an active IP route in the local routing table.

The default behavior is for the L2TP tunnel to not be declared down based on the remote endpoint IP address reachability.

The **no** form of this command returns the **rtm-debounce-time** to a value of 0.

Default

no rtm-debounce-time

Parameters

debounce-time

Specifies the amount of time, in milliseconds, that the system waits before declaring the associated L2TP tunnel as down.

Values 0 to 5000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rtr-adv-lsa-limit [*1..4294967295*] [**log-only**] [**threshold** *percent*] **overload-timeout** *seconds*

no rtr-adv-lsa-limit

Context

[Tree] (config>service>vprn>ospf rtr-adv-lsa-limit)

Full Context

configure service vprn ospf rtr-adv-lsa-limit

Description

This command configures the maximum number of LSAs OSPF can learn from another router, in order to protect the system from a router that accidentally advertises a large number of LSAs. When the number of advertised LSAs reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, OSPF goes into overload.

The **overload-timeout** option allows the administrator to control how long OSPF is in overload as a result of the advertised LSA limit being reached. At the end of this duration of time the system automatically attempts to restart OSPF. One possible value for the **overload-timeout** is **forever**, which means OSPF is never restarted automatically and this corresponds to the default behavior when the **overload-timeout** option is not configured.

The **no** form of this command removes the **rtr-adv-lsa-limit**.

Default

rtr-adv-lsa-limit forever

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, overload is not set.

percent

The threshold value (as a percentage) that triggers a warning message to be sent.

Values 0 to 100

seconds

Specifies duration in seconds before restarting OSPF.

Values 1 to 1800

Platforms

All

rtr-adv-lsa-limit

Syntax

rtr-adv-lsa-limit *limit* [**log-only**] [**threshold** *percent*]

rtr-adv-lsa-limit *limit* [**log-only**] [**threshold** *percent*] [**overload-timeout** {*seconds* | **forever**}]

no rtr-adv-lsa-limit

Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the roundtrip delay threshold for each RAT type to be used for a congestion detection algorithm (if applicable).

The **no** form of this command reverts to the default value.

Default

rtt-threshold-rat 173

Parameters

rat-type

Specifies the 3GPP RAT type.

Values utran, geran, wlan, gan, hspa-evol, eutran, virtual, eutran-nb, ehrpd, hrpd, cdma-1x, umb, wifi, nr, lte-m

rtt-threshold

Specifies the parameter used by the DEM-GW algorithm that determines ANL congestion or subscriber congestion in the case of NLB-DEM. It specifies the maximum acceptable round trip time (RTT), under no congestion, in milliseconds. Any measured RTT above the threshold is considered an indication of possible congestion.

Values 0 to 500

Platforms

configure application-assurance group aa-sub-congestion-detection rtt-threshold-tolerance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the ANL roundtrip delay threshold tolerance used by the DEM gateway algorithm to determine ANL-level or subscriber-level congestion.

Default

rtt-threshold-tolerance 50

Parameters

tolerance

Specifies the ratio, in percentage, of RTTs above the configured threshold (**rtt-threshold**) over the total RTT measurements.

The ratio is calculated as follows, measured across a one-minute period:

rtt-threshold-tolerance = #(RTTs > **rtt-threshold**)/ (Total #RTTs)

If the **rtt-threshold-tolerance** ratio is exceeded, the ANL is declared congested.

Values 0 to 100

Default 50

Platforms

[Tree] (config>service>nat>map-domain>mapping-rule rule-prefix)

Full Context

configure service nat map-e-domain mapping-rule rule-prefix

configure service nat map-domain mapping-rule rule-prefix

Description

This command configures a MAP rule IPv6 prefix.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the MAP rule IPv6 prefix.

Parameters

rule-prefix

Specifies the IPv6 MAP rule prefix.

Values <ipv6-prefix>/<ipv6-prefix-length>
ipv6-prefix: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D
prefix-length: 0 to 64

Platforms

7750 SR-1, 7750 SR-s

- configure service nat map-e-domain mapping-rule rule-prefix

7750 SR-1, 7750 SR-s, VSR

- configure service nat map-domain mapping-rule rule-prefix

40.124 run-as-user

run-as-user

Syntax

run-as-user *user-name*

no run-as-user

Context

[Tree] (config>python>python-script run-as-user)

Full Context

configure python python-script run-as-user

Description

This command configures a user that is different from the current user of the session. Script authentication, authorization, accounting, and any activity within the script is run as the specified user.

This user must be locally configured, and script authorization will use the user's local AAA profile even if remote authorization is configured.

The **no** form of this command specifies that the current user of the session is used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no run-as-user

Parameters

user-name

Specifies the name of the user, up to 32 characters, that is used to run the script.

Platforms

All

40.125 rx-discard-on-ndf

rx-discard-on-ndf

Syntax

rx-discard-on-ndf {**bm** | **bum** | **none**}

Context

[Tree] (config>service>vpls>vxlan rx-discard-on-ndf)

Full Context

configure service vpls vxlan rx-discard-on-ndf

Description

This command, supported by static and BGP-EVPN VXLAN binds, determines the type of traffic that the Non Designated Forwarder (NDF) PE discards in an EVPN multi-homed Ethernet Segment. It is only relevant when the VXLAN instance is associated to a network-interconnect-vxlan ES. The option BM is the default option and discards BM on reception (unicast, known and known is allowed). The option BUM discards any BUM frame on reception. Option none allows any BUM traffic on reception.

Default

rx-discard-on-ndf bm

Parameters

bm

Discards Broadcast and Multicast on the EVPN Non Designated Forwarder (NDF) router, but not Unknown Unicast.

bum

Discards Broadcast, Multicast and Unknown Unicast traffic on the NDF.

none

Allows Broadcast, Multicast or Unknown Unicast traffic on the NDF.

40.128 rx-los-reaction

rx-los-reaction

Syntax

rx-los-reaction {**squelch**}

no rx-los-reaction

Context

[Tree] (config>port>dwdm>coherent rx-los-reaction)

Full Context

configure port dwdm coherent rx-los-reaction

Description

This command configures the reaction to an RX LOS.

Note:
If **rx-los-reaction squelch** is disabled for some coherent DWDM transceivers, the transceiver only reports local fault alarms when an RX LOS condition occurs; however, the port returns to service faster after the LOS condition is cleared. For these transceivers, if **rx-los-reaction squelch** is enabled, there is better visibility of individual alarms (for example, signal-fail, local fault, and no-am-lock), but the port takes longer to return to service after the LOS condition is cleared.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

squelch

Specifies to squelch (turn off) the transmit signal on RX LOS.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

41.2 s-tag

s-tag

Syntax

s-tag *qtag1* **c-tag-range** *qtag2* [**to** *qtag2*]

no s-tag *qtag1* **c-tag-range** *qtag2*

Context

[Tree] (config>service>system>bgp-evpn>eth-seg>qinq s-tag)

Full Context

configure service system bgp-evpn ethernet-segment qinq s-tag

Description

This command determines the inner VIDs (for a specified outer VID) associated with the virtual Ethernet Segment on a specific qinq port or LAG based on the following:

- Values *, null, 0 to 4094 are allowed.
- Any SAP for which the outer and inner service-delimiting qtags match the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:10.* will not match port 1/1/1, s-tag 10 c-tag-range 10 to 100.
- A maximum of 8 ranges (including the s-tag ranges) are allowed in the qinq context.
- A c-tag range can be composed of a single qtag.
- Shutting down the ES is not required before making changes.
- A qtag included in the **s-tag-range** command cannot be included in the s-tag qtag of this command.

Note:
Not all qtag1 and qtag2 combinations are valid for values 0, *, and null. The following combinations are allowed:

- s-tag 0 c-tag-range *
- s-tag * c-tag-range *
- s-tag * c-tag-range null
- s-tag null c-tag-range null
- s-tag X c-tag-range 0 (where: X=1 to 4094)
- s-tag X c-tag-range * (where: X=1 to 4094)

The **no** form of the command removes the configured range. Only the first qtag1 value is required to remove the range.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

qtag1

Specifies the outer VID for the c-tag range.

Values *, null, 0 to 4094

qtag2

Specifies the inner VID for the c-tag range. When configuring a range of qtags (and not a single value), the second qtag1 value must be greater than the value of the first qtag1.

Values *, null, 0 to 4094

Platforms

All

configure test-oam service-activation-testhead service-test service-stream frame-payload ethernet s-tag

Description

Commands in this context configure service VLAN tag (s-tag) information specification.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

41.3 s-tag-range

s-tag-range

Syntax

s-tag-range *qtag1* [**to** *qtag1*]

no s-tag-range *qtag1*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>system>bgp-evpn>eth-seg>qinq s-tag-range)

Full Context

configure service system bgp-evpn ethernet-segment qinq s-tag-range

Description

This command determines the VIDs associated with the virtual Ethernet Segment on a specific qinq port or LAG based on the following considerations:

- Values *, 0 to 4094 are allowed.
- Any SAP for which the service-delimiting qtag matches the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:0.* will not match port 1/1/1, s-tag-range 100.
- Maximum 8 ranges are allowed in the qinq context.
- A range can be composed of a single qtag.
- Shutting down the ES is not required before making changes in the q-tag-range.

The **no** form of the command removes the configured range. Only the first qtag1 value is required to remove the range.

Parameters

qtag1

Specifies the outer VID. When configuring a range of qtags (and not a single value), the second qtag1 value must be greater than the first qtag1.

Values *, 0 to 4094

Platforms

All

41.4 s1-release

s1-release

Syntax

[**no**] **s1-release**

Context

[Tree] (config>subscr-mgmt>acct-plcy>triggered-updates>gc s1-release)

Full Context

configure subscriber-mgmt radius-accounting-policy triggered-updates gtp-change s1-release

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the router to send an interim accounting update when an S1 release (idle) procedure is performed.

The **no** form of the command configures the router not to send an interim accounting update when an S1 release (idle) procedure is performed.

Default

no s1-release

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

41.6 s2l-path

s2l-path

Syntax

[**no**] **s2l-path** *path-name* **to** *ip-address*

Context

[Tree] (config>router>mpls>lsp>primary-p2mp-instance s2l-path)

Full Context

configure router mpls lsp primary-p2mp-instance s2l-path

Description

This command creates a root-to-leaf (S2L) sub-LSP path for the primary instance of a P2MP LSP. The primary instance of a P2MP LSP is modeled as a set of root-to-leaf (S2L) sub-LSPs. The root, for example, head-end node, triggers signaling using one path message per S2L path. The leaf sub-LSP paths are merged at branching points.

Each S2L sub-LSP is signaled in a separate path message. Each leaf node will respond with its own RESV message. A branch LSR node will forward the path message of each S2L sub-LSP to the downstream LSR without replicating it. It will also forward the RESV message of each S2L sub-LSP to the upstream LSR without merging it with the RESV messages of other S2L sub-LSPs of the same P2MP LSP. The same is done for subsequent refreshes of the path and RESV states.

The S2L paths can be empty paths or can specify a list of explicit hops. The path name must exist and must have been defined using the **config>router>mpls>path** command. The same path name can be re-used by more than one S2L of the primary P2MP instance. However, the **to** keyword must have a unique argument per S2L as it corresponds to the address of the egress LER node.

This command is not supported on the 7450 ESS.

Parameters

path-name

Specifies the name of the path which consists of up to 32 alphanumeric characters.

to ***ip-address***

Specifies the IP address of the egress router.

Use subject to Terms available at: www.nokia.com/terms.

41.7 sa-db

sa-db

Syntax

sa-db [**group** *grpAddr*] [**source** *srcAddr*] [**rp** *rpAddr*]

no sadb

Context

[Tree] (debug>router>msdp sa-db)

Full Context

debug router msdp sa-db

Description

This command enables debugging for MSDP SA requests.

The **no** form of this command disables the MSDP SA database debugging.

Parameters

grpAddr

Debugs the IP address of the group.

srcAddr

Debugs the source IP address.

rpAddr

Debugs the specified RP address.

Platforms

All

41.8 sa-mac

sa-mac

Syntax

sa-mac *ieee-address* **da-mac** *ieee-address*

no sa-mac

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>mirror>mirror-dest>sap>egress>ip-mirror sa-mac)

Full Context

configure mirror mirror-dest sap egress ip-mirror sa-mac

Description

This command configures the source and destination MAC addresses for IP mirroring.

The **no** form of this command reverts to the default.

Parameters

sa-mac ***ieee-address***

Specifies the source MAC address. Multicast, Broadcast and zeros are not allowed.

da-mac ***ieee-address***

Specifies the destination MAC address. Zeros are not allowed.

Platforms

All

41.9 sa-timeout

sa-timeout

Syntax

sa-timeout *seconds*

no sa-timeout

Context

[Tree] (config>service>vprn>msdp sa-timeout)

Full Context

configure service vprn msdp sa-timeout

Description

This command configures the value for the SA entries in the cache. If these entries are not refreshed within the timeout value, they are removed from the cache. Normally, the entries are refreshed at least once a minute. But under high load with many of MSDP peers, the refresh cycle could be incomplete. A higher timeout value (more then 90) could be useful to prevent instabilities in the MSDP cache.

Default

90

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

seconds

Specifies the time, in seconds, to wait for a response from the peer before declaring the peer unavailable.

Values 90 to 600

Platforms

All

sa-timeout

Syntax

sa-timeout *seconds*

no sa-timeout

Context

[Tree] (config>router>msdp sa-timeout)

Full Context

configure router msdp sa-timeout

Description

This command configures the timeout interval for the SA entries in the cache. If these entries are not refreshed within the timeout interval, they are removed from the cache. Normally, the entries are refreshed at least once a minute, but under high load with many MSDP peers, the refresh cycle could be incomplete. A higher timeout value (greater than 90) is useful to prevent instabilities in the MSDP cache.

The **no** form of this command reverts to the default timeout interval of 90 seconds.

Default

no sa-timeout

Parameters

seconds

Specifies the time, in seconds, to wait for a response from the peer before declaring the peer unavailable.

Values 90 to 600

Platforms

All

41.10 saa

saa

Syntax

saa

Context

[Tree] (config saa)

Full Context

configure saa

Description

Commands in this context configure the Service Assurance Agent (SAA) tests.

Platforms

All

saa

Syntax

saa *test-name* [**owner** *test-owner*] {**start** | **stop**} [**no-accounting**]

Context

[Tree] (oam saa)

Full Context

oam saa

Description

This command starts or stops an SAA test that is not configured as continuous.

Parameters

test-name

Specifies the name of the SAA test, up to 32 characters. The test name must already be configured in the **config>saa>test** context.

test-owner

Specifies the owner of an SAA operation, up to 32 characters. If a *test-owner* value is not specified, the default owner is used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default "TiMOS CLI"

start

Starts the test. A test cannot be started if the same test is still running.

A test cannot be started if it is in a shut-down state. An error message and log event is generated to indicate a failed attempt to start an SAA test run. A test cannot be started if it is in a continuous state.

stop

Stops a test in progress. A test cannot be stopped if it is not in progress. A log message is generated to indicate that an SAA test run has been aborted. A test cannot be stopped if it is in a continuous state.

no-accounting

Disables the recording results in the accounting policy. When specifying **no-accounting** the MIB record produced at the end of the test is not added to the accounting file. It uses one of the three MIB rows available for the accounting module for collection.

configure service epipe spoke-sdp pw-path-id saii-type2

configure service cpipe spoke-sdp pw-path-id saii-type2

configure service vpls spoke-sdp pw-path-id saii-type2

Description

This command configures the Source Individual Attachment Identifier (SAII) for an MPLS-TP spoke-sdp. If this is configured on a spoke-sdp for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the taii-type2 of the mate spoke-sdp.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

global-id

Specifies the global ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values 0 to 4294967295

node-id

Specifies the node ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values a.b.c.d or 0 to 4294967295

ac-id

Specifies the attachment circuit ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

Values 1 to 4294967295

Platforms

[Tree] (config>filter>ip-filter>entry sample-profile)

Full Context

configure filter ipv6-filter entry sample-profile

configure filter ip-filter entry sample-profile

Description

This command allows traffic matching of an IPv4 or IPv6 filter to be sampled for cflowd processing using a specific sample profile.

This command is only compatible if the associated interface is configured for interface-based sampling and is only supported for ingress sampling.

An IP filter can only specify a single alternate sample profile for cflowd sampling, but that sample profile can be used in multiple entries.

The **no** form of this command removes the specified sampling profile from the configuration. Cflowd continues to process traffic based on the default or configured interface cflowd sampling profile.

Default

no sample-profile

Parameters

sample-profile-id

Specifies the cflowd sample profile to be used for packets matching this filter entry.

Values 1 to 5

Platforms

All

41.16 sample-rate

sample-rate

Syntax

sample-rate [*rate*]

Context

[Tree] (config>cflowd>sample-profile sample-rate)

© 2026 Nokia.

configure service vprn interface cflowd-parameters sampling

configure service ies subscriber-interface group-interface cflowd-parameters sampling

configure service ies interface cflowd-parameters sampling

Description

This command enables and configures the cflowd sampling behavior to collect traffic flow samples through a router for analysis.

This command can be used to configure the sampling parameters for unicast and multicast traffic separately. If sampling is not configured for either **unicast** or **multicast** traffic, then that type of traffic will not be sampled.

If cflowd is enabled without either **egress-only** or **both** keywords specified or with the **ingress-only** keyword specified, then only ingress sampling is enabled on the associated IP interface.

The **no** form of this command disables the associated type of traffic sampling.

Parameters

unicast | multicast

Specifies unicast or multicast sampling.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

type

Specifies the cflowd sampling type on the specific virtual router interface.

Values acl — Specifies ACL cflowd analysis be applied to the specified virtual router interface.

interface — Specifies interface cflowd analysis be applied to the specified virtual router interface

direction

Specifies the direction of the cflowd analysis that is applied to the specified virtual router interface.

Values ingress-only — Specifies an ingress only direction of the cflowd analysis be applied to the specified virtual router interface.

egress-only — Specifies an egress only direction of the cflowd analysis be applied to the specified virtual router interface.

both — Specifies both ingress and egress direction of the cflowd analysis be applied to the specified virtual router interface.

profile-id

Defines the sampling rate profile to be associated with this interface.

Values 1 to 5

Full Context

configure router interface cflowd-parameters sampling

Description

This command enables and configures the cflowd sampling behavior to collect traffic flow samples through a router for analysis.

This command can be used to configure the sampling parameters for unicast and multicast traffic separately. If sampling is not configured for either unicast or multicast traffic, then that type of traffic will not be sampled.

If cflowd is enabled without either **egress-only** or **both** specified or with the **ingress-only** keyword specified, then only ingress sampling will be enabled on the associated IP interface.

The **no** form of this command disables the associated type of traffic sampling on the associated interface.

Default

no sampling

Parameters

unicast

Specifies that the sampling command will control the sampling of unicast traffic on the associated interface/SAP.

multicast

Specifies that the sampling command will control the sampling of multicast traffic on the associated interface/SAP.

type

Specifies whether the traffic sampling is based on an **acl** match, or all traffic entering or exiting the associated interface.

Values **acl** — Specifies that the sampled traffic is controlled via an IP traffic filter entry with the action "filter-sample” configured.

interface — Specifies that all traffic entering or exiting the interface is subject to sampling.

direction

Specifies the direction to collect traffic flow samples.

Values **ingress-only** — Enables ingress sampling only on the associated interface.

egress-only — Enables egress sampling only on the associated interface.

both — Enables both ingress and egress cflowd sampling.

profile

Specifies the sampling profile to be associated with this interface.

Context

[Tree] (config>service>vpls sap)

Full Context

configure service vpls sap

Description

This command creates or configures a SAP within a service. A SAP is a combination of port and encapsulation parameters that identifies the SAP on the interface and within the 7450 ESS or 7750 SR. Each SAP must be unique. All SAPs must be explicitly created within a service or on an IP interface.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it is created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **configure port** *port-id* **ethernet mode access** command. Channelized TDM ports are always access ports (TDM applies to the 7750 SR only).

If a port is shut down, all SAPs on that port become operationally down. When a service is shut down, SAPs for the service are not displayed as operationally down although all traffic traversing the service is discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For IES, the IP interface must be shut down before the SAP on that interface may be removed.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

port-id

Specifies the physical port ID in the *slot/mda/port* format.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the card in the slot has MDAs installed, the *port-id* must be in the slot_number/MDA_number/port_number [.channel] format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

group-name

Specifies the name of the split horizon group to which the SAP belongs. This parameter applies to the 7450 ESS or 7750 SR only.

capture-sap

Specifies a capturing SAP in which triggering packets are sent to the CPM. Non-triggering packets captured by the capture SAP are dropped. This parameter applies to the 7450 ESS or 7750 SR only.

create

Keyword used to create a SAP instance. The **create** keyword requirement can be enabled or disabled in the **environment create** context.

root-leaf-tag

Specifies a SAP as a root leaf tag SAP. Only SAPs of the form dot1q (for example, 1/1/1:X) or qinq (for example, 1/1/1:X.Y, 1/1/1:X.*) are supported. The default E-Tree SAP type is a root AC, if *root-leaf-tag* **(**or *leaf-ac***)** is not specified at SAP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

leaf-tag-vid

Specifies to replace the outer SAP-ID for leaf traffic. The leaf tag VID is only significant between peering VPLS but the values must be consistent on each end.

leaf-ac

Specifies a SAP as a leaf access (AC) SAP. The default E-Tree SAP type is root AC if **leaf-ac** (or **root-leaf-tag**) is not specified at SAP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

configure service epipe sap

Description

This command creates a SAP within a service. A SAP is a combination of port and encapsulation parameters that identify the SAP on the interface and within the device. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP does not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down, although all traffic traversing the service is discarded.

The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

Ethernet SAPs support **null**, **dot1q**, and **qinq** for all routers.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For IES, the IP interface must be shutdown before the SAP on that interface may be removed.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP.

port-id

Specifies the physical port ID.

If the card in the slot has MDAs installed, the *port-id* must be in the slot_number/MDA_number/port_number format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

endpoint

Keyword used to add a SAP endpoint association.

no endpoint

Keyword used to remove the association of a SAP or a spoke SDP with an explicit endpoint name.

create

Keyword used to create a SAP instance. The **create** keyword requirement can be enabled or disabled in the **environment create** context.

qtag-normalization

Keyword to enable Q-tag normalization.

tag

Specifies the value for tag normalization. The tag value is pushed as the S-tag (outer tag) into the frames coming from this SAP and sent to EVPN. On network ingress, the inner and outer VLAN tags are looked up and the frames matching this value and the normalized C-tag value are sent to the associated SAP.

Values 1 to 4094

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

s-tag

Specifies the value for tag normalization. The tag value is pushed as the S-tag (outer tag) into the frames coming from this SAP and sent to EVPN. On network ingress, the inner and outer VLAN tags are looked up and the frames matching this value and the normalized C-tag value are sent to the associated SAP.

Values 1 to 4094

c-tag

Specifies the value for tag normalization. The tag value is pushed as the C-tag (inner tag) into the frames coming from this SAP and sent to EVPN. On network ingress, the inner and outer VLAN tags are looked up and the frames matching this value and the normalized S-tag value are sent to the associated SAP.

Values 1 to 4094

rfc9744-encoding

Keyword to encode the S-tag in compliance with RFC 9744. S-tag values are, by default, encoded in the upper 12 bits of the 32-bit Ethernet tag ID in AD per-EVI routes. However, RFC 9744 mandates that the 24-bit service identifier within the Ethernet tag ID is right-aligned.

configure service vprn subscriber-interface group-interface sap

Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the router. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP will not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **configure port** *port-id* **ethernet mode access** command.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down although all traffic traversing the service will be discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

Note:
Configure an IES interface as a loopback interface by issuing the **loopback** command instead of the **sap** *sap-id* command. The loopback flag cannot be set on an interface where a SAP is already defined and a SAP cannot be defined on a loopback interface.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For Internet Enhanced Service (IES), the IP interface must be shutdown before the SAP on that interface may be removed. The no form of this command causes the ptp-hw-assist to be disabled.

Default

No SAPs are defined.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port-id

Specifies the physical port ID in the *slot/mda/port* format.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the slot_number/MDA_number/port_number format. For example 61/2/3 specifies port 3 on MDA 2 in slot 61.

Table 111: Port ID Syntax

null	*port-id* | lag-*id*

Context

[Tree] (config>mirror>mirror-dest sap)

Full Context

configure mirror mirror-dest sap

Description

This command creates a service access point (SAP) within a mirror destination service. The SAP is owned by the mirror destination service ID.

The SAP is defined with port and encapsulation parameters to uniquely identify the (mirror) SAP on the interface and within the box. The specified SAP may be defined on an Ethernet access port with a dot1q, null, or q-in-q encapsulation type.

Only one SAP can be created within a **mirror-dest** service ID. If the defined SAP has not been created on any service within the system, the SAP is created and the context of the CLI will change to the newly created SAP. In addition, the port cannot be a member of a multi-link bundle, APS group or IMA bundle.

If the defined SAP exists in the context of another service ID, **mirror-dest** or any other type, an error is generated.

Mirror destination SAPs can be created on Ethernet interfaces that have been defined as an access interface. If the interface is defined as network, the SAP creation returns an error.

When the **no** form of this command is used on a SAP created by a mirror destination service ID, the SAP with the specified port and encapsulation parameters is deleted.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

no-endpoint

Removes the association of a SAP or a sdp with an explicit endpoint name.

name

Specifies the name of the endpoint associated with the SAP.

sap

Syntax

sap *sap-id* {[**egress**] [**ingress**]}

no sap *sap-id* [**egress**] [**ingress**]

Context

[Tree] (config>mirror>mirror-source sap)

Full Context

configure mirror mirror-source sap

Description

This command enables mirroring of traffic ingressing or egressing a service access port (SAP). A SAP that is defined within a mirror destination cannot be used in a mirror source. The mirror source SAP referenced by the *sap-id* is owned by the service ID of the service in which it was created. The SAP is only referenced in the mirror source name for mirroring purposes. The mirror source association does not need to be removed before deleting the SAP from its service ID. If the SAP is deleted from its service ID, the mirror association is removed from the mirror source.

More than one SAP can be associated within a single **mirror-source**. Each SAP has its own **ingress** and **egress** parameter keywords to define which packets are mirrored to the mirror destination.

The SAP must be valid and properly configured. If the associated SAP does not exist, an error occurs and the command will not execute.

The same SAP cannot be associated with multiple mirror source definitions for ingress packets.

The same SAP cannot be associated with multiple mirror source definitions for egress packets.

If a particular SAP is not associated with a mirror source name, then that SAP will not have mirroring enabled for that mirror source.

Note that the ingress and egress options cannot be supported at the same time on a CEM encap-type SAP. The options must be configured in either the ingress **or** egress contexts (applies to the 7750 SR and 7950 XRS).

The **no** form of this command disables mirroring for the specified SAP. All mirroring for that SAP on ingress and egress is terminated. Mirroring of packets on the SAP can continue if more specific mirror criteria is configured. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition is removed.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

egress

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

ingress

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination before the ingress packet modification.

Platforms

All

configure li li-source sap

Description

This command creates a service access point (SAP) within an LI configuration. The specified SAP must define a FastE, GigE, or XGigE, or XGigE access port with a dot1q, null, or q-in-q encapsulation type.

When the **no** form of this command is used on a SAP, the SAP with the specified port and encapsulation parameters is deleted.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

egress

Specifies that the router perform lawful intercept on egress traffic. Packets egressing the SAP are mirrored to the mirror destination after egress packet modification.

ingress

Specifies that the router perform lawful intercept on ingress traffic. Packets ingressing the SAP are mirrored to the mirror destination before ingress packet modification.

The mirror source association does not need to be removed before deleting the SAP from its service ID. If the SAP is deleted from its service ID, the mirror association is removed from the mirror source.

More than one SAP can be associated within a single **mirror-source**. Each SAP has its own **ingress** and **egress** parameter keywords to define which packets are mirrored to the mirror destination.

The SAP must be valid and properly configured. If the associated SAP does not exist, an error occurs and the command does not execute.

The same SAP cannot be associated with multiple mirror source definitions for ingress packets.

The same SAP cannot be associated with multiple mirror source definitions for egress packets.

If a particular SAP is not associated with a mirror source name, then that SAP does not have mirroring enabled for that mirror source.

Note that the ingress and egress options cannot be supported at the same time on a CEM encap-type SAP. The options must be configured in either the ingress **or** egress contexts (applies to the 7750 SR and 7950 XRS).

The **no** form of this command disables mirroring for the specified SAP. All mirroring for that SAP on ingress and egress is terminated. Mirroring of packets on the SAP can continue if more specific mirror criteria is configured. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition is removed.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

egress

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ingress

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination before the ingress packet modification.

Syntax

sap *sap-id* [**create**]

no sap *sap-id*

Context

[Tree] (config>system>satellite>local-forward sap)

Full Context

configure system satellite local-forward sap

Description

This command configures a Service Access Point (SAP) used in satellite local forward instances defined in the system.

The **no** form of this command removes the satellite access point from the local-forward instance.

Parameters

eth-sat-id

Specifies the satellite access point in the local-forward instance in the *esat-id*/*slot*/*port* format.

Values		
	esat	keyword
	id	1 to 20

lag-id

Specifies the LAG identifier, expressed as an integer,

Values		
	lag	keyword
	id	1 to 800

qtag1

Specifies the qtag value.

Values 1 to 4094

no sap

Context

[Tree] (config>li>li-fltr>li-mac-fltr>entry>match sap)

Full Context

configure li li-filter li-mac-filter entry match sap

Description

This command specifies the QinQ SAP to match from the Epipe or VPLS service, where the s-tag must be a value and the outer-tag must be of type *. This filter match is used in conjunction with match criteria **outer-tag** where the outer-tag must also be provisioned for the entry match on the QinQ packet to activate.

The match criteria SAP must be an exact match with the QinQ configured on the Epipe or VPLS service. An associated outer-tag must be provisioned to match on the QinQ packet. For example, SAP 1/1/1:1.*, where the outer-tag is "*", and an outer-tag of 1 would perform LI on 1/1/1:1.1 on a 1/1/1:1.* SAP.

The **no** form of this command removes the QinQ SAP as the match criterion.

Default

no sap

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

Values

configure service vpls proxy-arp dynamic sap

Description

This command configures the proxy ARP or ND entry for creation when the ARP or neighbor advertisement (NA) packet for the configured IP address is received on the configured SAP. This command can be configured in combination with the **configure service vpls proxy-arp dynamic mac-list** or **configure service vpls proxy-nd dynamic mac-list** command for the entry. In this case, the MAC of the ARP or NA message and the SAP on which the ARP or NA packet is received are both checked before creating the entry.

The **no** form of this command removes the SAP as the match criterion.

Default

no sap

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

Values

41.21 sap-egress

sap-egress

Syntax

sap-egress {*policy-id* | *policy-name*} [**create**] [**name** *name*]

no sap-egress {*policy-id* | *policy-name*}

Context

[Tree] (config>qos sap-egress)

Full Context

configure qos sap-egress

Description

This command is used to create or edit a Service Egress QoS policy. The egress policy defines the SLA for service packets as they egress on the SAP.

Policies are templates that can be applied to multiple services as long as the scope of the policy is template. The queues defined in the policy are not instantiated until a policy is applied to a service.

Sap-egress policies determine queue mappings based on ingress DSCP, IP precedence, dot1p, and IPv4 or IPv6 match criteria. Multiple queues can be created per forwarding class and each queue can have different CIR or PIR parameters.

Egress SAP QoS policies allow the definition of queues and the mapping of forwarding classes to those queues. Each queue needs to have a relative CIR for determining its allocation of QoS resources during periods of congestion. A PIR can also be defined that forces a hard limit on the packets transmitted through the queue. When the forwarding class is mapped to the queue, a DSCP, IP precedence, or dot1p value can optionally be specified.

The sap-egress policy with *policy-id* 1 is the default sap-egress QoS policy and is applied to service egress SAPs when an explicit policy is not specified or removed. The default sap-egress policy cannot be modified or deleted.

By default, all forwarding classes map to queue 1.

Any changes made to an existing policy, using any of the sub-commands, will be applied immediately to all egress SAPs where this policy is applied. For this reason, when many changes are required on a policy, it is highly recommended that the policy be copied to a work area *policy-id*. That work-in-progress policy can be modified until complete, then written over the original policy-id. Use the **config qos copy** command to maintain policies in this manner.

The **no** form of this command deletes the sap-egress policy. A policy cannot be deleted until it is removed from all service SAPs where it is applied. When a sap-egress policy is removed from a SAP, the SAP will revert to the default sap-egress *policy-id* 1.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

policy-id

The *policy-id* uniquely identifies the policy on the router.

Values 1 to 65535

policy-name

The *policy-name* uniquely identifies the policy.

Values 64 characters maximum.

create

Required parameter when creating a SAP QoS egress policy.

name

Configures an optional policy name which adds a name identifier to a specific policy to then use that policy name in configuration references as well as display and use policy names in show commands throughout the system. This helps the service provider or administrator to identify and manage sap-egress policies within the SR OS platforms.

All sap-egress policies are required to assign a policy ID to initially create a policy. However, either the policy ID or the policy name can be used to identify and reference a specific policy once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *policy-id* as the name.

Values 64 characters maximum

All

sap-egress

Syntax

sap-egress *src-pol dst-pol* [**overwrite**]

Context

[Tree] (config>qos>copy sap-egress)

Full Context

configure qos copy sap-egress

Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

Example:

```
– SR>config>qos# copy sap-egress 1 1010
– MINOR: CLI Destination "1010" exists use {overwrite}.
– SR>config>qos# copy sap-egress 1 1010 overwrite
```

src-pol dst-pol

Indicates that the source policy ID and the destination policy ID are SAP egress policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

Values 1 to 65535

sap-id

Syntax

sap-id *sap-string*

no sap-id

Context

[Tree] (config>service>dynsvc>ladb>user>idx sap-id)

Full Context

configure service dynamic-services local-auth-db user-name index sap-id

Description

This command specifies the dynamic data service SAP that is created. A dynamic service SAP ID uniquely identifies a dynamic data service instance. For a local authenticated dynamic service data trigger, one of the dynamic service SAP IDs must be the data trigger SAP.

The **no** form of this command removes the **sap-id** from the configuration.

Parameters

sap-string

Specifies a string representing the dynamic service SAP ID (only SAPs on Ethernet ports and LAGs are valid), up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

41.24 sap-ingress

sap-ingress

Syntax

sap-ingress {*policy-id* | *policy-name*} [**create**] [**name** *name*]

no sap-ingress {*policy-id* | *policy-name*}

Context

[Tree] (config>qos sap-ingress)

Full Context

configure qos sap-ingress

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is used to create or edit the ingress policy. The ingress policy defines the SLA enforcement that service packets receive as they ingress a SAP. SLA enforcement is accomplished through the definition of queues that have Forwarding Class (FC), Fair Information Rate (FIR), Committed Information Rate (CIR), Peak Information Rate (PIR), Committed Burst Size (CBS), and Maximum Burst Size (MBS) characteristics.

Policies in effect are templates that can be applied to multiple services as long as the **scope** of the policy is template. Queues defined in the policy are not instantiated until they are assigned to at least one forwarding class and a policy is applied to a service SAP.

It is possible that a SAP ingress policy will include the **dscp** map command, the **dot1p** map command, and an IP or MAC match criteria. When multiple matches occur for the traffic, the order of precedence will be used to arrive at the final action. The order of precedence is as follows:

1. 802.1p bits
2. DSCP
3. IP quintuple or MAC headers

The SAP ingress policy with *policy-id* 1 is a system-defined policy applied to services when no other policy is explicitly specified. The system SAP ingress policy cannot be modified or deleted. The default SAP ingress policy defines one unicast and one multipoint queue associated with all forwarding classes, with an FIR of zero, a CIR of zero, and a PIR of line rate.

Any changes made to the existing policy, using any of the sub-commands, are applied immediately to all services where this policy is applied. For this reason, when many changes are required on a policy, it is recommended that the policy be copied to a work area policy ID. That work-in-progress policy can be modified until complete, then written over the original policy-id. Use the **config>qos>copy** command to maintain policies in this manner.

The **no** form of this command deletes the SAP ingress policy. A policy cannot be deleted until it is removed from all services where it is applied.

Parameters

policy-id

The *policy-id* uniquely identifies the policy.

Values 1 to 65535

policy-name

The *policy-name* uniquely identifies the policy.

Values 64 characters maximum

create

Required parameter when creating a SAP QoS ingress policy.

name *name*

Configures an optional policy name which adds a name identifier to a specific policy to then use that policy name in configuration references as well as display and use policy names in show commands throughout the system. This helps the service provider and administrator to identify and manage sap-ingress policies within the SR OS platforms.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

All sap-ingress policies are required to assign a policy ID to initially create a policy. However, either the policy ID or the policy name can be used to identify and reference a specific policy after it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *policy-id* as the name.

Values 64 characters

Platforms

All

sap-ingress

Syntax

sap-ingress *src-pol dst-pol* [**overwrite**]

Context

[Tree] (config>qos>copy sap-ingress)

Full Context

configure qos copy sap-ingress

Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters

overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

Example:

```
– SR>config>qos# copy sap-egress 1 1010
– MINOR: CLI Destination "1010" exists use {overwrite}.
– SR>config>qos# copy sap-egress 1 1010 overwrite
```

src-pol dst-pol

Indicates that the source policy ID and the destination policy ID are SAP ingress policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

Values 1 to 65535

41.25 sap-limit

sap-limit

Syntax

sap-limit [*limit*]

no sap-limit

Context

[Tree] (config>service>dynsvc>policy sap-limit)

Full Context

configure service dynamic-services dynamic-services-policy sap-limit

Description

This command specifies a limit for the number of dynamic data service instances (SAPs) that can be setup simultaneously using a specific dynamic services policy.

A value of zero (0) means the policy is drained: existing dynamic data services can be modified and torn down but no new dynamic data services can be setup.

Default

sap-limit 1

Parameters

limit

Specifies the number of dynamic data service SAPs that can be setup simultaneously using this dynamic services policy.

Values 0 to 131072

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

41.29 sap-template

sap-template

Syntax

sap-template *sap-template*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no sap-template

Context

[Tree] (config>service>vpls>wlan-gw sap-template)

Full Context

configure service vpls wlan-gw sap-template

Description

This command specifies the VPLS SAP template that is applied on the internal SAPs created for communication between the VPLS and the ISAs.

The **no** form of this command removes the SAP template.

Parameters

sap-template

Specifies the existing SAP template to apply. The template is created in the **config>service>template** context.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

sap-template

Syntax

sap-template *name* [**create**]

no sap-template *name*

Context

[Tree] (config>subscr-mgmt sap-template)

Full Context

configure subscriber-mgmt sap-template

Description

This command configures a template that specifies parameters for automatically generated subscriber SAPs, for example, when creating CUPS sessions. A template with the name "default" is used if no specific name is provided, but this must be manually provisioned.

The **no** form of this command removes the template.

Parameters

name

Specifies the name of the PFCP association, up to 32 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

create

Keyword used to create the SAP template.

Platforms

41.30 sap-template-binding

sap-template-binding

Syntax

sap-template-binding *name/id*

no sap-template-binding

Context

[Tree] (config>service>vpls>vpls-group sap-template-binding)

Full Context

configure service vpls vpls-group sap-template-binding

Description

This command configures the binding to a SAP template to be used to instantiate SAPs in the data VPLS using as input variables the VLAN IDs generated by the vid-range command.

The **no** form of this command removes the binding and deletes the related SAP instances. The command will fail if any of the affected VPLS instances have either a provisioned SAP or an active MVRP declaration/registration or if the related vpls-group is in no shutdown state. Any changes to the **sap-template-binding** require the **vpls-group** to be in **shutdown** state. New control SAP additions to the management VPLS are allowed as long as data VPLS instantiations/removals for vpls-groups are not in progress. Control SAPs can be removed at any time generating the removal of related data SAPs from the data VPLS. The **shutdown** or **no shutdown** state for the control SAPs does not have any effect on data SAPs instantiated with this command.

Default

no sap-template-binding

Parameters

name

Specifies the name of the VPLS template

Values ASCII character string

id

Specifies the ID of the VPLS template

Context

[Tree] (config>qos>fp-resource-policy>aggregate-shapers>queue-sets>default-size saps)

Full Context

configure qos fp-resource-policy aggregate-shapers queue-sets default-size saps

Description

This command configures the default queue-set size for SAPs.

Parameters

size

Specifies the size of the queue sets.

Values 2 to 8

non-shaper-queues

Specifies that subscribers will not use hardware aggregate shapers on FPs where the FP resource policy is applied.

Platforms

7750 SR-1, 7750 SR-s

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

41.32 sat-type

sat-type

Syntax

sat-type *sat-type* [**port-template** *template-name*] **dynamic-uplink uplink-distribution** *maximum uplink distribution for resiliency*

sat-type *sat-type* [**port-template** *template-name*]

no sat-type

Context

[Tree] (config>system>satellite>eth-sat sat-type)

Full Context

configure system satellite eth-sat sat-type

Description

This command configures the type of satellite variant for the associated satellite chassis.

The **no** form of this command deletes the **sat-type** configuration.

Default

no sat-type

Parameters

sat-type

Specifies the satellite type. Configuration of the following variants is supported:

es24-1gb-sfp

Specifies the 24xGE (SFP) + 4x10GE Ethernet satellite.

es24-1gb-tx

Specifies the 24xGE (copper) + 4x10GE Ethernet satellite or the 24-port copper + PoE Ethernet satellite.

es24-sasmxp-1gb-sfp

Specifies the 7210 SAS-Mxp as an Ethernet satellite.

es24-sass-1gb-sfp

Specifies the 7210 SAS-S 24xGE (SFP) + 4x10GE Ethernet satellite.

es24-sfpp+8-sfp28+2-qsfp28

Specifies the 7250 IXR-e 24SFP+ 8SFP28 2QSFP28 satellite.

es32-qsfp28+4-qsfpdd

Specifies the 7250 IXR-X1 satellite.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

es48-1gb-sfp

Specifies the 48xGE (SFP) + 4x10GE Ethernet satellite.

es48-1gb-tx

Specifies the 48xGE (copper) + 4x10GE Ethernet satellite or the 48-port copper + PoE Ethernet satellite.

es48-sass-1gb-sfp

Specifies the 7210 SAS-S 48xGE (SFP) + 4x10GE Ethernet satellite.

es48-sfpp+6-qsfp28

Specifies the 7250 IXR-s satellite.

es6-qsfpdd+48-sfp56

Specifies the 7250 IXR-Xs satellite.

es64-10gb-sfpp+4-100gb-qsfp28

Specifies the 64x10GE + 4xQSFP28 Ethernet satellite.

template-name

Specifies the name for the associated port template.

dynamic-uplink

Keyword to enable dynamic uplink resilience for the Ethernet satellite.

maximum uplink distribution for resiliency

Specifies the forwarding complex used for satellite uplink association to the ports.

Values single-complex – all uplinks for the associated satellite must be connected to ports using a single forwarding complex.

dual-complex – all uplinks for the associated satellite can be connected to ports using at the most two forwarding complexes. This value optimizes the resources across the two complexes.

Description

This command is required to save LI configuration parameters.

Platforms

All

save

Syntax

save [*cflash-id*]

Context

[Tree] (bof save)

Full Context

bof save

Description

This command uses the boot option parameters currently in memory and writes them from the boot option file to the specified compact flash.

The BOF must be located in the root directory of the internal or external compact flash drives local to the system and have the mandatory filename of *bof.cfg*.

If a location is not specified, the BOF is saved to the default compact flash drive (cf3:) on the active CPM (typically the CPM in slot A, but the CPM in slot B could also be acting as the active CPM). The slot name is not case-sensitive. You can use upper or lowercase "A" or "B".

Command usage:

- **bof save** — saves the BOF to the default drive (cf3:) on the active CPM (either in slot A or B)
- **bof save cf3:** — saves the BOF to cf3: on the active CPM (either in slot A or B)

To save the BOF to a compact flash drive on the standby CPM (for example, the redundant (standby) CPM is installed in slot B), specify -A or -B option.

Command usage:

- **bof save cf3-A:** — saves the BOF to cf3: on CPM in slot A whether it is active or standby
- **bof save cf3-B:** — saves the BOF to cf3: on CPM in slot B whether it is active or standby

The slot name is not case-sensitive. You can use upper or lowercase "A" or "B".

The **bof save** and **show bof** commands allow you to save to or read from the compact flash of the standby CPM. Use the **show card** command to determine the active and standby CPM (A or B).

Default

Saves must be explicitly executed. The BOF is saved to cf3: if a location is not specified.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

flash-id

Specifies the compact flash ID where the *bof.cfg* is to be saved.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default cf3:

save

Syntax

save [**comment** *comment*] [**rescue**]

Context

[Tree] (admin>rollback save)

Full Context

admin rollback save

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

If the optional **rescue** keyword is not used, this command saves a rollback checkpoint at the location and with the filename specified by the rollback-location with a suffix of .rb. The previously saved checkpoints will have their suffixes incremented by one (.rb.1 becomes .rb.2, and so on). If there are already as many checkpoint files as the maximum number supported, then the last checkpoint file is deleted.

If the **rescue** keyword is used, then this command saves the current operational configuration as a rescue configuration at the location and with the filename specified by the rescue location. The filename will have the suffix .rc appended.

Parameters

comment-string

Specifies a comment, up to 255 characters, that is associated with the checkpoint.

rescue

Saves the rescue checkpoint instead of a normal rollback checkpoint.

Platforms

All

save

Syntax

save [*file-url*] [**detail**] [**index**]

scaling-profile

Syntax

scaling-profile *scaling-profile-id*

Context

[Tree] (config>isa>nat-group scaling-profile)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure isa nat-group scaling-profile

Description

This command determines profiles for NAT scaling. Lower profile numbers allocate less resources, therefore, supporting lower scaling.

Contact your Nokia representative for more information about NAT scaling figures in each profile.

Default

scaling-profile profile1

Parameters

scaling-profile-id

Specifies the name of the profile, up to 32 characters.

Values ESA-VM supports three scaling profiles, while VSR-I supports only two.

- profile1 is a low scaling profile that requires 8 CPU cores and 32 GB of DRAM memory per ESA-VM
- profile2 is a medium scaling profile that requires 11 CPU cores and 96 GB of DRAM memory per ESA-VM
- profile3 is a high scaling profile that requires 15 CPU cores and 115 GB of DRAM memory per ESA-VM

For the number of required CPU control cores on a VSR-I in relation to profiles, see the Sysinfo section in the Virtualized Service Router Installation and Setup Guide.

For the amount of required memory on VSR-I in relation to profiles, see the Software Release Notes, section VM Memory Requirements by Function Mix.

41.41 sched-run-min-int

sched-run-min-int

Syntax

sched-run-min-int *percent-of-default*

no sched-run-min-int

Context

[Tree] (config>card>virt-sched-adj sched-run-min-int)

Full Context

configure card virtual-scheduler-adjustment sched-run-min-int

Description

This command overrides the default minimum time that must elapse before a virtual scheduler may redistribute bandwidth based on changes to the offered rates of member policers or queues. A minimum run interval is enforced to allow a minimum amount of "batching" queue changes before reacting to the changed rates. This minimum interval is beneficial since the periodic function of determining policer or queue offered rates is performed sequentially and the interval allows a number policer and queue rates to be determined before determining the distribution of bandwidth to the policers and queues.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The default minimum scheduler run interval is 0.5 seconds. The sched-run-min-int command uses a percent value to modify the default interval.

The **no** form of this command restores the default minimum scheduler run interval for all virtual schedulers on the card.

Default

no sched-run-min-int

Parameters

percent-of-default

Specifies that the percent-of-default parameter is required and is used to modify the default minimum scheduler run interval for all virtual schedulers on the card. Defining 100.00 percent is equivalent to removing the override (restoring the default) for the minimum scheduler run interval.

Values 0.01% to 1000.00%

Default 100.00%

Platforms

All

schedule-type *schedule-type*

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update schedule-type)

Full Context

configure system security pki ca-profile auto-crl-update schedule-type

Description

This command specifies the schedule type for auto CRL update. The system supports two types:

- **periodic**: — The system will download a CRL periodically at the interval configured via the **periodic-update-interval** command. For example, if the periodic-update-interval is 1 day, then the system will download a CRL every 1 day. The minimal periodic-update-interval is 1 hour.
- **next-update-based** — The system will download a CRL at the time = Next_Update_of_existing_CRL *minus* pre-update-time. For example, if the Next-Update of the existing CRL is 2015-06-30 06:00 and pre-update-time is 1 hour, then the system will start downloading at 2015-06-30, 05:00.

Default

schedule-type next-update-based

Parameters

schedule-type

Specifies the type of time scheduler to update the CRL.

Values periodic, next-update-based

Full Context

configure subscriber-mgmt sub-profile ingress scheduler-policy scheduler

configure subscriber-mgmt sub-profile egress scheduler-policy scheduler

Description

This command provides a way to override parameters of the existing scheduler associated with the egress or ingress scheduler policy. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child (take bandwidth from a scheduler in a higher tier).

The **no** form of this command reverts to the default.

Parameters

scheduler-policy-name

Specify an existing scheduler policy name.

pir-rate

Specify the pir-rate, in kilobits, to override the administrative PIR used by the scheduler. When the **rate** command is executed, a valid PIR setting must be explicitly defined. Fractional values are not allowed and must be specified as a positive integer.

Values 1 to 3200000000, max

cir-rate

The **cir** parameter overrides the administrative CIR used by the scheduler. When the **rate** command is executed, a CIR setting is optional. The sum keyword specifies that the CIR be used as the summed CIR values of the children schedulers or queues. Fractional values are not allowed and must be given as a positive integer.

Syntax

scheduler *scheduler-name* [**create**]

no scheduler *scheduler-name*

Context

[Tree] (config>service>vpls>sap>egress>sched-override scheduler)

Full Context

configure service vpls sap egress scheduler-override scheduler

Description

This command overrides specific attributes of the specified scheduler name.

A scheduler defines a bandwidth control that limits each child (other schedulers, policers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created has policers, queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword **create**), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause policers, queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce service level agreements (SLAs).

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword create), an error occurs and the current CLI context does not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs and the command does not execute, nor does the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error occurs, the command does not execute, and the CLI context does not change.

The **no** form of this command removes the scheduler name from the configuration.

Parameters

scheduler-name

Specifies name of the scheduler

Values Valid names consist of any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

create

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable create is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

Full Context

configure qos sap-egress policer scheduler-parent

Description

This command defines an optional parent scheduler that governs the available bandwidth given to a policer in addition to the PIR setting of the policer. When multiple schedulers, queues, or policers share a child status with the parent scheduler, the **weight** or **level** parameters define how this policer contends with the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

other children for the bandwidth of the parent. This command and the configuration of a SAP policer **port-parent** or **parent** arbiter are mutually exclusive.

Multiple schedulers can exist in different scheduler policies with the same *scheduler-name*; in this command, the associated *scheduler-name* pertains to a scheduler that should exist on the SAP as the policy is applied and the policer is created. When the policer is created on the SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly applied or indirectly applied (through a multiservice customer site) to the SAP. The policer accepts packets, but is not bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP. The SAP to which the policer belongs displays an orphan policer status with the SapEgressPolicerMismatch flag in the **show service sap-using** output. The orphaned state of the policer is automatically cleared when the *scheduler-name* becomes available on the SAP.

The parent scheduler can be made unavailable by the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the policer enters the orphaned state. The policer automatically returns to normal operation when the parent scheduler is available again.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and no error message is returned. When a parent association has been removed, the former child policer attempts to operate based on its configured rate parameter.

Removing the parent association on the policer within the policy takes effect immediately on all policers using the SAP QoS policy.

Default

no scheduler-parent

Parameters

scheduler-name

Scheduler names are configured in the **config>qos>scheduler-policy>tier** context. There are no checks performed at the time of definition to ensure that the *scheduler-name* exists within an existing scheduler policy. For the policer to use the defined *scheduler-name*, the scheduler must exist on each SAP that the policer is created on. If a *scheduler-name* does not exist on the SAP, the policer operates in an orphaned state. Each parental association must be explicitly defined.

Values Any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

weight

Defines the relative weight of this policer in comparison with other child policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name* at the above-CIR priority level defined by the **level** parameter.

All weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority at the configured level and are not

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

Values 0 to 100

Default 1

level

Defines the level of hierarchy when compared with other policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name*.

Children of the parent scheduler with a lower priority will not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight

Defines the relative weight of this policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent *scheduler-name* at the within-CIR priority level defined by the **cir-level** parameter.

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100, with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

Values 0 to 100

Default 1

cir-level

Defines the level of hierarchy when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If the **cir-level** parameter is set to a value of 0 (the default value), the policer does not receive bandwidth during the schedulers within-CIR pass and the **cir-weight** parameter is ignored. If the **cir-level** parameter is 1 or greater, the **cir-weight** parameter is used.

Values 0 to 8 (8 is the highest priority)

Default 0

configure qos sap-ingress policer scheduler-parent

Description

This command defines an optional parent scheduler that governs the available bandwidth given to a policer in addition to the PIR setting of the policer. When multiple schedulers, queues, or policers share a child status with the parent scheduler, the **weight** or **level** parameters define how this policer contends with the other children for the bandwidth of the parent. This command and the configuration of a SAP policer **scheduler-parent** or **parent** arbiter are mutually exclusive.

Multiple schedulers can exist in different scheduler policies with the same *scheduler-name*; in this command, the associated *scheduler-name* pertains to a scheduler that should exist on the SAP as the policy is applied and the policer is created. When the policer is created on the SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly applied or indirectly applied (through a multiservice customer site) to the SAP. The policer accepts packets, but is not bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP.

The parent scheduler can be made unavailable by the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the policer enters the orphaned state. The policer automatically returns to normal operation when the parent scheduler is available again.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and no error message is returned. When a parent association has been removed, the former child policer attempts to operate based on its configured rate parameter.

Removing the parent association on the policer within the policy takes effect immediately on all policers using the SAP QoS policy.

Default

no scheduler-parent

Parameters

scheduler-name

Scheduler names are configured in the **config>qos>scheduler-policy>tier** context. There are no checks performed at the time of definition to ensure that the *scheduler-name* exists within an existing scheduler policy. For the policer to use the defined *scheduler-name*, the scheduler must exist on each SAP that the policer is created on. If a *scheduler-name* does

© 2026 Nokia.

not exist on the SAP, the policer operates in an orphaned state. Each parental association must be explicitly defined.

Values Any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

weight

Defines the relative weight of this policer in comparison with other child policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name* at the above-CIR priority level defined by the **level** parameter.

All weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority at the configured level and are not serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

Values 0 to 100

Default 1

level

Defines the level of hierarchy when compared with other policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name*.

Children of the parent scheduler with a lower priority will not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight

Defines the relative weight of this policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent *scheduler-name* at the within-CIR priority level defined by the **cir-level** parameter.

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100, with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

configure service vprn subscriber-interface group-interface sap ingress scheduler-policy

configure service vprn subscriber-interface group-interface sap egress scheduler-policy

configure service ies subscriber-interface group-interface sap ingress scheduler-policy

configure service ies sap egress scheduler-policy

Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by ingress SAP queues or egress SAP policers and queues associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the SAP policers or queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler. The SAPs that have policers or queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers or queues. When the **no** form of this command executed, the customer site ingress or egress node will not contain an applied scheduler policy.

Parameters

scheduler-policy-name:

Specifies the scheduler policy name to apply to an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress queues or egress policers and queues created on associated SAPs.

Values Any existing valid scheduler policy name.

scheduler-policy *scheduler-policy-name* [**create**]

no scheduler-policy *scheduler-policy-name*

Context

[Tree] (config>qos scheduler-policy)

Full Context

configure qos scheduler-policy

Description

Each scheduler policy is divided up into groups of schedulers based on the tier each scheduler is created under. A tier is used to give structure to the schedulers within a policy and define rules for parent scheduler associations.

The **scheduler-policy** command creates a scheduler policy or allows editing of an existing policy. The policy defines the hierarchy and operating parameters for virtual schedulers. Creating a policy does not create the schedulers; it only provides a template for the schedulers to be created when the policy is associated with a SAP or multiservice site.

Each scheduler policy must have a unique name within the context of the system. Modifications made to an existing policy are executed on all schedulers that use the policy. This can cause queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce SLAs.

If a *scheduler-policy-name* does not exist, it is assumed that an attempt is being made to create a new policy. The success of the command execution is dependent on the following:

1. The maximum number of scheduler policies has not been configured.
2. The provided scheduler-policy-name is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of scheduler policies has been exceeded, a configuration error occurs, the command will not execute, and the CLI context will not change.

If the provided scheduler-policy-name is invalid according to the criteria below, a name syntax error occurs, the command will not execute, and the CLI context will not change.

Parameters

scheduler-policy-name

The name of the scheduler policy.

Values Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

configure service customer multi-service-site ingress scheduler-policy

configure service customer multi-service-site egress scheduler-policy

Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by SAP queues or, at egress only, policers associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the SAP policers and queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler.

The SAPs that have ingress queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers and queues. When the **no scheduler-policy** command is executed, the customer site ingress or egress node will not contain an applied scheduler policy.

Parameters

scheduler-policy-name

Applies an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress or egress queues and egress policers managed by HQoS created on associated SAPs.

Values Any existing valid scheduler policy name up to 32 characters in length.

scheduler-policy *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy scheduler-policy)

Full Context

configure qos copy scheduler-policy

Description

This command copies existing QoS policy entries for a QoS policy to another QoS policy.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

If **overwrite** is not specified, an error will occur if the destination policy exists.

Parameters

src-name dst-name

Indicates that the source policy and the destination policy are scheduler policy. Specify the source policy that the copy command will attempt to copy from and specify the destination policy to which the command will copy a duplicate of the policy.

overwrite

Forces the destination policy name to be copied as specified. When forced, everything in the existing destination policy will be completely overwritten with the contents of the source policy.

Description

This command overrides the scheduling class configuration in the HS scheduler policy applied to the port egress. The scheduling class rate or weight within the WRR group can be overridden.

The **no** form of this command removes the scheduling class override parameters from the port egress configuration.

Parameters

class

Specifies the scheduling class.

Values 1 to 6

rate

Specifies the explicit maximum frame based bandwidth limit, in megabits per second, for this HS scheduler policy scheduling class. The **rate** keyword must be followed by either the keyword **max** or a rate specified in megabits per second.

Values 1 to 100000, max

The **max** keyword specifies that a limit is not enforced for the specified class. The **max** keyword is mutually exclusive to the rate value and when specified, must directly follow the **rate** keyword. Setting the rate of the class will fail when the class is currently a member of a group.

weight-in-group

Specifies the weight the HS scheduler policy should apply to this scheduling class within the group in which it belongs. The *weight-in-group* parameter must follow the **weight** keyword and is used to specify the relative weight of class to the other scheduling classes within the group. Setting the weight will fail if the scheduling class is not currently configured in a group.

configure qos hs-scheduler-policy scheduling-class

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the behavior of a specific scheduling class on all HSQ schedulers associated with the policy. The **scheduler-class** command performs one of two operations: it configures a maximum rate for the scheduling class or places the scheduling class into the weighted scheduling group. The two operations are mutually exclusive.

By default, none of the scheduling classes are members of the weighted scheduling group and each class is set to a rate limit of **max** (no rate limit applied).

Specifying Scheduling Class Rate (or Removing the Scheduling Class from Group) — If the **scheduling-class** command is executed with the **rate** keyword specified, either **max** or a specified rate value must follow. If a *class-id was* previously mapped into the weighted scheduling group, the class is removed from the group. However, if removing the class from the group causes the group to no longer have contiguous class members, the command fails with no effect on the specified class. A "non-contiguous grouping error" is returned. The lowest or highest members within a weighted group must be removed prior to removing the middle members. For example, if scheduling classes 3, 4, and 5 were members of weighted group 1, class 4 cannot be removed first.

This command using the **rate** keyword also fails when an override for the group weight is in place on the scheduling class within a scheduler associated with the policy. The override expects the class to be associated with a weighted scheduling group and the policy rate definition is attempting to remove the class from the group. An "override mismatch" error is generated, specifying the scheduling object where the override exists.

After a rate has been successfully defined for a scheduling class, the specified rate is automatically updated on all HSQ scheduler instances associated with the scheduling policy. The exception is where the scheduler instance has a local override for the rate on the scheduling class.

Specifying Scheduling Class Weighted Group Membership — If the **scheduling-class** command is executed with the **group** keyword specified, the group ID value of 1 must follow. The corresponding optional **weight** keyword is used to specify the weight of the scheduling class within the group. If weight is not specified, the default weight of 1 is used. If the specified scheduling class is not contiguous with the other scheduling classes in the group, the command fails with no change to the current state of the scheduling class and a "non-contiguous grouping" error is returned, specifying the weighted scheduling group and the current group members.

The **scheduling-class** command fails using the **group** keyword when a rate override for the scheduling class exists on an HSQ scheduler instance associated with the policy. The rate override for the scheduling class indicates the class is directly attached to a strict priority level, conflicting with the policy **group** keyword trying to place the class in the specified group. The command fails without affecting the scheduling class definition on the policy and returns an error specifying the scheduling object where the override exists.

Other Override Constraints — The scheduling overrides cannot change or remove a scheduling class from a policy-defined weighted group membership.

The **no** form of the command returns the scheduling class represented by *class-id* to the default behavior. The default behavior for a scheduling class is to not be a member of the weighted scheduling class group and have a rate set to **max**. The **no scheduling-class** command fails if the scheduling class is currently a member of the weighted scheduling class group and a weight override is in effect on a scheduling object for the class, in which case an error is returned.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

class-id

Specifies the scheduling class for HS scheduler policy. The *class-id* value is a required parameter that specifies which scheduling class the scheduling-class command is acting upon.

Values 1 to 6

group-id

Specifies the group this HS scheduler policy scheduling class belongs to. The **group** and the **rate** keywords are mutually exclusive when executing this command. A group ID value of 1 must follow the **group** keyword. The **group** keyword removes the class ID from its inherent strict scheduling level and places it into the specified group ID. The associated **weight** parameter is optional and is used to specify the weight of a class ID within the weighted scheduling class group. Specifying the **group** parameter while an override for the scheduling class exists for rate causes the **scheduling-class** command to fail.

Values 1

weight-in-group

Specifies the weight the HS scheduler policy should apply to this scheduling class within the group in which it belongs. This keyword is optional and must follow the **group** parameter when specified. The *weight-in-group* parameter must follow the **weight** keyword and is used to specify the relative weight of the *class-id* to the other scheduling classes within the group. If the group is specified without the **weight** parameter, a default weight of 1 is used.

Values 1 to 127

rate

Specifies the explicit maximum frame-based bandwidth limit, in megabits per second, for this HS scheduler policy scheduling class. The **rate** and **group** keywords are mutually exclusive. Either the **rate** or **group** keyword must be specified when executing this command. When specified, the **rate** keyword must be followed by either the keyword **max** or a rate specified in megabits per second. The specified rate can be overridden at the port Ethernet egress using the scheduler override functions. A newly-created HS scheduler policy defaults each scheduling class to have its rate set to **max** and the weighted scheduling class group has no members.

Values 1 to 100000, max

The **max** keyword specifies that a limit is not enforced for the specified class ID and that the class ID is not a member of a weighted scheduling class group. The **max** keyword and the *rate* value are mutually exclusive; when **max** is specified, it must directly follow the **rate** keyword. Setting the rate of the class fails when the class currently has a group weight override defined on a scheduling object.

41.49 schema-path

schema-path

Syntax

schema-path *url-string*

no schema-path

Context

[Tree] (config>system>management-interface schema-path)

Full Context

configure system management-interface schema-path

Description

This command specifies the schema path where the SR OS YANG modules can be placed by the user before using a <get-schema> request. Nokia recommends that the URL string not exceed 135 characters for the <get-schema> request to work correctly with all schema files.

If this command is not configured, the software upgrade process manages the YANG schema files to ensure the schema files are synchronized with the software image on both the primary and standby CPM.

The **no** form of this command reverts to the default value.

Default

no schema-path

Parameters

url-string

Specifies the schema path URL up to 180 characters. However, Nokia recommends that the string shall not exceed 135 characters to ensure that the <get-schema> request works properly with *all* schema files.

Description

This command configures the filter policy scope as exclusive, template, embedded or system.

The scope of the policy cannot be changed when:

- the scope is **template** and the policy is applied to one or more services or network interfaces
- the scope is **embedded** and the policy is embedded by another policy

Changing the scope to/from system is only allowed when a policy is not active and the policy has no entries configured.

The **no** form of the command sets the scope of the policy to the default of **template**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

scope template

Parameters

exclusive

Specifies that the policy can only be applied to a single entity. Attempting to assign the policy to a second entity will result in an error message.

template

Specifies that the policy can be applied to multiple entities.

embedded

Specifies that the policy cannot be applied directly. The policy defines embedded filter rules, which are embedded by other exclusive/template/system filter policies. The **embedded** scope is supported for IPv4 and IPv6 filter policies only.

system

Specifies that the policy defines system-wide filter rules. To apply system policy rules, activate system filter and chain exclusive/template ACL filter policy to the system filter. The **system** scope is supported for IPv4 and IPv6 filter policies only.

Description

This command copies a local file to a remote host file system. It uses ssh for data transfer, and uses the same authentication and provides the same security as ssh. The following prompt appears:

"Are you sure (y/n)?" The destination must specify a user and a host.

Parameters

local-file-url

Specifies the local source file or directory.

Values

[*cflash-id/*] *file-path*	up to 200 characters
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

destination-file-url

Specifies the destination file.

Values

*destination-file-**: *user@hostname:file-path* - up to 255 characters

user	up to 32 characters
hostname	[*dns-name* | *ipv4-address* | "["*ipv6-address*"]"]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses
dns-name	up to 128 characters
file-path	up to 200 characters, directory length up to 99 characters

user

Specifies the SSH user.

hostname

Specifies the remote host IP address of DNS name.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

file-path

Specifies the destination path.

router-instance

Specifies the router name or the VPRN service ID.

Values

router-instance: *router-name* | *vprn-svc-id*

router-name: "Base" | "management" | "vpls-management"

vprn-svc-id: 1 to 2147483647

force

Keyword that forces an immediate copy of the specified file. The command **file scp** *local-file-url destination-file-url* [**router** *router-instance*] **force** executes the command without displaying a user prompt message.

service-name

Specifies the service name used to identify the router instance. The service name can be a maximum of 64 characters long.

script-parameters-4 *param-string4*

no script-parameters-4

Context

[Tree] (config>service>dynsvc>ladb>user>idx script-parameters-4)

Full Context

configure service dynamic-services local-auth-db user-name index script-parameters-4

Description

This command specifies the fourth part of parameters as input to the dynamic data service Python script. The concatenation of all four script-parameters strings are passed to the Python script and must be formatted as function-key <dictionary>. The function-key specifies which Python functions is called, and <dictionary> contains the actual parameters in a Python dictionary structure format. The **no** form of this command removes the **script-parameters-4** from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

param-string4

Specifies a string representing parameters that are used as input for the dynamic service Python script, up to 250 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

41.64 script-policy

script-policy

Syntax

script-policy *name*

no script-policy

Context

[Tree] (config>service>dynsvc>policy script-policy)

Full Context

configure service dynamic-services dynamic-services-policy script-policy

Description

This command specifies the radius script policy to be used to setup the dynamic data services. The script-policy configuration cannot be changed when there are active dynamic data services referencing the policy.

The **no** form of this command removes the script-policy from the configuration. This is only allowed when there are no active dynamic data services referencing this policy.

Parameters

name

Specifies the RADIUS script policy name.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

script-policy

Syntax

script-policy *policy-name* [**owner** *policy-owner*]

no script-policy

Context

[Tree] (config>system>cron>schedule script-policy)

Full Context

configure system cron schedule script-policy

Description

This command is used to configure the CLI script policy.

Parameters

policy-name

Specifies the name of the policy. Can be up to 32 characters.

policy-owner

Specifies the name of the policy owner. Can be up to 32 characters.

The owner is an arbitrary name and not necessarily a user name. Commands in the scripts are not authorized against the owner. The **configure system security cli-script authorization** *x* **cli-user** command determines the user context against which commands in the scripts are authorized.

Default "TiMOS CLI"

Platforms

All

sd-threshold

Syntax

sd-threshold *threshold* [**multiplier** *multiplier*]

no sd-threshold

Context

[Tree] (config>esa>crc-monitor sd-threshold)

Full Context

configure esa crc-monitor sd-threshold

Description

This command configures the error rate at which to declare the signal degrade (SD) condition on an Ethernet interface. The value represents M*10E-N, a ratio of errored frames over total frames received over W seconds of the sliding window. The CRC errors on the interface are sampled once per second. A

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

default of 10 seconds is used when no additional **window-size** is configured. If you ommit the **multiplier** value or configure **no sd-threshold**, the multiplier returns to the default value of 1.

Note: Crossing the configured SD threshold raises a log event.

The **no** form of this command removes the configuration.

Default

no sd-threshold

Parameters

threshold

Specifies the SD threshold.

Values 1 to 9

multiplier

Specifies the SD multiplier.

Values 1

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

sd-threshold

Syntax

sd-threshold *threshold* [**coefficient** *coefficient*]

Context

[Tree] (config>port>otu sd-threshold)

Full Context

configure port otu sd-threshold

Description

This command defines the error rate at which to declare the signal degrade (SD) condition.

The parameters define an error rate of (*coefficient*/10) * 10E-*threshold*. For example, **sd-threshold 5 coefficient 20** defines an error rate of (20/10) * 10E-5, or 2 * 10E-5, or 0.000 02.

The SD threshold must be:

- greater than the SF threshold.
- 5 or higher before setting **sf-sd-method** to **bip8**.

The **coefficient** parameter is only used when **sf-sd-method** is set to **fec**. When **sf-sd-method** is set to **bip8**, **coefficient** is considered to have the value of 10.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

threshold

Specifies the exponent for the SD threshold value.

Values 5 to 9 when **sf-sd-method** is **bip8**
3 to 9 when **sf-sd-method** is **fec**

Default 7

coefficient

Specifies the coefficient for the SD threshold value.

Values 10 to 99

Default 10

Platforms

Full Context

configure lag efm-member-template link-monitoring errored-frame sd-threshold

configure port ethernet efm-oam link-monitoring errored-frame sd-threshold

Description

The option defines the number of errored frames within the configured window which indicates the port has gone beyond an acceptable error rate and should be considered degraded. This is a first level warning that a port may be suspect. This generates an information log event message only and will be recorded in the Port event index but has no port level actions when the error count is equal to or greater than the threshold. This value must be lower than or equal to the sf-threshold value.

The **no** value of this option disables the sd-threshold.

Default

no sd-threshold

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

errored-frames

Specifies the number of errored frames within the configured window which indicates the port has become degraded.

Values 1 to 1000000

Platforms

7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

sd-threshold

Syntax

sd-threshold *threshold* [**multiplier** *multiplier*]

no sd-threshold

Context

[Tree] (config>port>ethernet>sym-mon sd-threshold)

Full Context

configure port ethernet symbol-monitor sd-threshold

Description

This command specifies the error rate at which to declare the Signal Degrade condition on an Ethernet interface. The value represents M*10E-N a ratio of symbol errors over total symbols received over W seconds of the sliding window. The symbol errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or no sd-threshold is specified the multiplier will return to the default value of 1.

Default

no sd-threshold

Parameters

threshold

Specifies the rate of symbol errors.

Values 1 to 9

multiplier

Specifies the multiplier used to scale the symbol error ratio.

Values 1 to 9

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

41.74 sd-threshold-clear

sd-threshold-clear

Syntax

sd-threshold-clear *threshold* [**coefficient** *coefficient*]

Context

[Tree] (config>port>otu sd-threshold-clear)

Full Context

configure port otu sd-threshold-clear

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command defines the signal degrade (SD) threshold clear value.

When the bit error rate falls below this value, the SD condition is cleared. The parameters define an error rate of (*coefficient*/10) * 10E-*threshold*. For example, **sd-threshold-clear 7 coefficient 10** defines an error rate of (10/10) * 10E-7, or 10E-7, or 0.000 000 1.

This SD threshold clear setting is valid only when **sf-sd-method** is set to **fec**.

Parameters

threshold

Specifies the exponent for the SD threshold clear value.

Values 3 to 10

Default 8

coefficient

Specifies the coefficient for the SD threshold clear value.

Values 10 to 99

Default 10

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

41.75 sdp

sdp

Syntax

sdp *sdp-id* [**sync-tag** *sync-tag*] [**create**]

no sdp *sdp-id*

Context

[Tree] (config>redundancy>multi-chassis>peer>sync sdp)

Full Context

configure redundancy multi-chassis peer sync sdp

Description

This command specifies the manually configured spoke SDPs to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing these spoke SDPs with the multi-chassis peer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Manually configured spoke SDPs with the specified *sdp-id* are synchronized according to the synchronization tag. If synchronization is required only for a subset of the spoke SDPs using the configured SDP, the **range** sub-command should be used. The **range** command and the **sync-tag** parameters are mutually exclusive.

The synchronization of PIM snooping is only supported for manually configured spoke SDPs but is not supported for spoke SDPs configured within an endpoint.

The synchronization of PIM snooping is not supported on any of the following when used with the configured *sdp-id*:

- Mesh SDPs
- Spoke SDPs in non-VPLS services
- BGP-AD/BGP-VPLS (FEC 129) spoke SDPs
- Spoke SDPs configured in endpoints
- Pseudowire SAPs
- ESM-over-MPLS Pseudowires

Non-existent spoke SDPs may be specified. If these spoke SDPs are created at a later time, then all states on the spoke SDPs are synchronized according to the synchronization tag and the synchronization protocols enabled.

A synchronization tag can be changed by entering the same command with a different synchronization tag. Changing the synchronization tag removes all states relating to the previous synchronization tag for the SDP and a new synchronization tag state is created.

Parameters

sdp-id

Specifies the SDP of the spoke SDPs to be synchronized with the multi-chassis peer.

Values 1 to 32767

sync-tag

Specifies a synchronization tag, up to 32 characters, to be used when synchronizing with the multi-chassis peer.

create

Creates the SDP instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Full Context

configure service system bgp-evpn ethernet-segment sdp

Description

This command configures an *sdp-id* associated to the Ethernet-Segment. If the Ethernet-Segment is configured as **all-active**, then only a lag or PW port can be associated to the Ethernet-Segment. If the Ethernet-Segment is configured as **single-active**, then lag, port or sdp can be associated to the Ethernet-Segment. In any case, only one of the four objects can be configured in the Ethernet-Segment. A specified SDP can be part of only one Ethernet-Segment. Only user-configured SDPs can be added to an Ethernet-Segment.

Default

no sdp

Parameters

sdp-id

Specifies the IP address.

Values 1 to 17407

configure service sdp

Description

This command creates or edits a service destination point (SDP). SDPs must be explicitly configured.

An SDP is a logical mechanism that ties a far-end router to a particular service without having to specifically define far-end SAPs. Each SDP represents a method to reach another router.

One method is IP Generic Router Encapsulation (GRE), which has no state in the core of the network. GRE does not specify a specific path to the far-end router. A GRE-based SDP uses the underlying IGP routing table to find the best next hop to the far-end router.

The second method is Multi-Protocol Label Switching (MPLS) encapsulation. A router supports both signaled and non-signaled Label Switched Paths (LSPs) through the network. Non-signaled paths are defined at each hop through the network. Signaled paths are communicated by protocol from end-to-end using Resource Reservation Protocol (RSVP). Paths may be manually defined or a constraint-based routing protocol (such as OSPF-TE or CSPF) can be used to determine the best path with specific constraints. An LDP LSP can also be used for an SDP when the encapsulation is MPLS. The use of an LDP LSP type or an RSVP/Static LSP type are mutually exclusive except when the mixed-lsp option is enabled on the SDP.

Segment routing is another MPLS tunnel type and is used to allow service binding to an SR tunnel programmed in TTM by OSPF or IS-IS. The SDP of type **sr-isis** or **sr-ospf** can be used with the **far-end** option. The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-isis** and **sr-ospf** tunnel types.

L2TPv3-over-IPv6 transport is also an option for 7750 SR and 7950 XR Ethernet Pipe (Epipe) Services. Like GRE, L2TPv3 is stateless in the core of the network, as well as on the service nodes as the L2TPv3 control plane functionality is disabled for this SDP type. A unique source and destination IPv6 address combined with TX and RX Cookie values are used to ensure that the SDP is bound to the correct service.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

SDPs are created and then bound to services. Many services may be bound to a single SDP. The operational and administrative state of the SDP controls the state of the SDP binding to the service.

If the *sdp-id* does not exist, a new SDP is created. When creating an SDP, either the **gre, mpls, or l2tpv3** keyword must be specified. SDPs are created in the admin down state (**shutdown**) and the **no shutdown** command must be executed once all relevant parameters are defined and before the SDP can be used.

If *sdp-id* exists, the current CLI context is changed to that SDP for editing and modification. For editing an existing SDP, neither the **gre, mpls**, or **l2tpv3** keyword is specified. If a keyword is specified for an existing *sdp-id*, an error is generated and the context of the CLI will not be changed to the specified *sdp-id*.

The **no** form of this command deletes the specified SDP. Before an SDP can be deleted, it must be administratively down (shutdown) and not bound to any services. If the specified SDP is bound to a service, the **no sdp** command will fail generating an error message specifying the first bound service found during the deletion process. If the specified *sdp-id* does not exist an error will be generated.

Parameters

sdp-id

Specifies the SDP identifier.

Values 1 to 32767

gre

Specifies the SDP will use GRE to reach the far-end router. The GRE encapsulation of the MPLS service packet uses the base 4-byte header as per RFC 2890. The optional fields Checksum (plus Reserved field), Key, and Sequence Number are not inserted. Only one GRE SDP can be created to a given destination address. Multiple GRE SDPs to a single destination address serve no purpose as the path taken to reach the far end is determined by the IGP which will be the same for all SDPs to a given destination and there is no bandwidth reservation in GRE tunnels.

mpls

Specifies the SDP will use MPLS encapsulation and one or more LSP tunnels to reach the far-end device. Multiple MPLS SDPs may be created to a given destination device. Multiple MPLS SDPs to a single destination device are helpful when they use divergent paths.

l2tpv3

Specifies the SDP will use L2TPv3-over-IPv6 encapsulation for the 7750 SR or 7950 XRS. One SDP is created per service, regardless of whether the far-end node is common or not. Unique local and far-end addresses are configured for every L2TPv3 SDP type. The local address must exist on the local node.

eth-gre-bridged

Configures the SDP as an L2oGRE tunnel that is terminated on an FPE-based PW port. Only the end-points of such a tunnel (the far-end IPv4/IPv6 address or local-end IPv4/IPv6 address) are allowed to be configured under this SDP.

41.76 sdp-exclude

sdp-exclude

Syntax

[**no**] **sdp-exclude** *group-name*

Context

[Tree] (config>service>pw-template sdp-exclude)

Full Context

configure service pw-template sdp-exclude

Description

This command configures SDP admin group constraints for a pseudowire template.

The admin group name must have been configured or the command is failed. The user can execute the command multiple times to include or exclude more than one admin group. The sdp-include and sdp-exclude commands can only be used with the **use-provisioned-sdp** or **prefer-provisioned-sdp** options. If the same group name is included and excluded within the same pseudowire template, only the exclude option will be enforced.

Any changes made to the admin group sdp-include and sdp-exclude constraints will only be reflected in existing spoke-sdps after the following command has been executed:

tools>perform>service>eval-pw-template>allow-service-impact

When the service is bound to the pseudowire template, the SDP selection rules will enforce the admin group constraints specified in the sdp-include and sdp-exclude commands.

In the SDP selection process, all provisioned SDPs with the correct far-end IP address, the correct tunnel-far-end IP address, and the correct service label signaling are considered. The SDP with the lowest admin metric is selected. If more than one SDP with the same lowest metric are found then the SDP with the highest sdp-id is selected. The type of SDP, GRE or MPLS (BGP/RSVP/LDP) is not a criterion in this selection.

The selection rule with SDP admin groups is modified such that the following admin-group constraints are applied upfront to prune SDPs that do not comply:

- if one or more **sdp-include** statement is part of the PW template, then an SDP that is a member of one or more of the included groups will be considered. With the **sdp-include** statement, there is no preference for an SDP that belongs to all included groups versus one that belongs to one or fewer of the included groups. All SDPs satisfying the admin-group constraint will be considered and the selection above based on the lowest metric and highest sdp-id is applied.
- if one or more **sdp-exclude** statement is part of the PW template, then an sdp that is a member of any of the excluded groups will not be considered.

SDP admin group constraints can be configured on all router services that makes use of the pseudowire template (BGP-AD VPLS service, BGP-VPLS service, and FEC129 VLL service). In the latter case, only support at a T-PE node is provided.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the SDP admin group constraints from the pseudowire template.

Parameters

group-name

Specifies the name of the SDP admin group. A maximum of 32 characters can be entered.

Platforms

All

41.77 sdp-group

sdp-group

Syntax

sdp-group

Context

[Tree] (config>service sdp-group)

Full Context

configure service sdp-group

Description

This command configures the SDP membership in admin groups.

The user can enter a maximum of one (1) admin group name at once. The user can execute the command multiple times to add membership to more than one admin group. The admin group name must have been configured or the command is failed. Admin groups are supported on an SDP of type GRE and of type MPLS (BGP/RSVP/LDP). They are also supported on an SDP with the mixed-lsp-mode option enabled.

The **no** form of this command removes this SDP membership to the specified admin group.

no sdp-id-range

Context

[Tree] (config>fwd-path-ext sdp-id-range)

Full Context

configure fwd-path-ext sdp-id-range

Description

This command reserves an SDP ID range used by the FPE based PW-Port and VXLAN termination applications.

Each configured FPE based PW-Port is associated with two internal SDPs (one in each direction) whose id(s) are allocated from the configured sdp-id-range.

When the FPE is associated to VXLAN termination, an internal SDP is allocated from the configured sdp-id-range and is used for R-VPLS services that terminate VXLAN IPv6. A spoke-sdp per VXLAN IPv6 R-VPLS service is created on that SDP for egress processing of the packets. Sdp-id-range cannot be modified if any of its IDs are currently in use.

Default

no sdp-id-range

Parameters

from *id*

Specifies the start of the SDP ID range (inclusive).

Values 1 to 32767

to *id*

Specifies the end of the SDP ID range.

Values 1 to 32767

41.80 sdp-mtu

sdp-mtu

Syntax

sdp-mtu *orig-sdp-id* **size-inc** *start-octets end-octets* [**step** *step-size*] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (oam sdp-mtu)

Full Context

oam sdp-mtu

Description

Performs MTU Path tests on an SDP to determine the largest path-mtu supported on an SDP. The **size-inc** parameter can be used to easily determine the **path-mtu** of a given SDP-ID. The forwarding class is assumed to be Best-Effort Out-of-Profile. The message reply is returned with IP/GRE encapsulation from the far-end router. OAM request messages sent within an IP/GRE SDP must have the 'DF' IP header bit set to 1 to prevent message fragmentation.

To terminate an **sdp-mtu** in progress, use the CLI break sequence <Ctrl-C>.

Parameters

orig-sdp-id

Specifies the *sdp-id* to be used by **sdp-ping,** expressed as a decimal integer. The far-end address of the specified **sdp-id** is the expected *responder-id* within each reply received. The specified *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reach the far end. This can be IP/GRE or MPLS. If *orig-sdp-id* is invalid or administratively down or unavailable, the SDP echo request message is not sent and an appropriate error message is displayed (once the **interval** timer expires, **sdp-ping** attempts to send the next request, if required).

Values 1 to 32767

start-octets

Specifies the beginning size in octets of the first message sent for an incremental MTU test, expressed as a decimal integer.

Values 40 to 9786

end-octets

Specifies the ending size in octets of the last message sent for an incremental MTU test, expressed as a decimal integer. The specified value must be greater than *start-octets*.

Values 40 to 9786

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

step-size

Specifies the number of octets to increment the message size request for each message sent for an incremental MTU test, expressed as a decimal integer. The next size message is not sent until a reply is received or three messages have timed out at the current size.

If the incremented size exceeds the *end-octets* value, no more messages are sent.

Values 1 to 512

Default 32

timeout

Specifies the *timeout* parameter in seconds, expressed as a decimal integer. This value is used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

interval

Specifies the *interval* parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the *interval* is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

41.81 sdp-ping

sdp-ping

Syntax

sdp-ping *orig-sdp-id* [**resp-sdp** *resp-sdp-id*] [**fc** *fc-name* [**profile** { **in** | **out**}]] [**size** *octets*] [**count** *send-count*] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (oam sdp-ping)

[Tree] (config>saa>test>type sdp-ping)

Full Context

oam sdp-ping

configure saa test type sdp-ping

Description

This command tests SDPs for uni-directional or round trip connectivity and performs SDP MTU Path tests.

The **sdp-ping** command accepts an originating SDP-ID and an optional responding SDP-ID. The size, number of requests sent, message time-out and message send interval can be specified. All **sdp-ping** requests and replies are sent with PLP OAM-Label encapsulation, as a *service-id* is not specified.

For round trip connectivity testing, the **resp-sdp** keyword must be specified. If **resp-sdp** is not specified, a uni-directional SDP test is performed.

To terminate an **sdp-ping** in progress, use the CLI break sequence <Ctrl-C>.

An **sdp-ping** response message indicates the result of the **sdp-ping** message request. When multiple response messages apply to a single SDP echo request/reply sequence, the response message with the highest precedence is displayed. Table 112: sdp-ping Response Messages shows the response messages sorted by precedence.

Table 112: sdp-ping Response Messages

Result of Request	Displayed Response Message	Precedence
Request time out without reply	Request Timeout	1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Result of Request	Displayed Response Message	Precedence
Request not sent due to non-existent *orig-sdp-id*	Orig-SDP Non-Existent	2
Request not sent due to administratively down *orig-sdp-id*	Orig-SDP Admin-Down	3
Request not sent due to operationally down *orig-sdp-id*	Orig-SDP Oper-Down	4
Request terminated by user before reply or time out	Request Terminated	5
Reply received, invalid *origination-id*	Far End: Originator-ID Invalid	6
Reply received, invalid *responder-id*	Far End: Responder-ID Error	7
Reply received, non-existent *resp-sdp-id*	Far End: Resp-SDP Non-Existent	8
Reply received, invalid *resp-sdp-id*	Far End: Resp-SDP Invalid	9
Reply received, *resp-sdp-id* down (admin or oper)	Far-end: Resp-SDP Down	10
Reply received, No Error	Success	11

Parameters

orig-sdp-id

Specifies the SDP ID to be used by **sdp-ping,** expressed as a decimal integer. The far-end address of the specified SDP-ID is the expected *responder-id* within each reply received. The specified SDP-ID defines the encapsulation of the SDP tunnel encapsulation used to reach the far end. This can be IP/GRE or MPLS. If *orig-sdp-id* is invalid or administratively down or unavailable for some reason, the SDP Echo Request message is not sent and an appropriate error message is displayed (once the **interval** timer expires, **sdp-ping** attempts to send the next request if required).

Values 1 to 32767

resp-sdp-id

Specifies the return SDP-ID to be used by the far-end router for the message reply for round trip SDP connectivity testing. If *resp-sdp-id* does not exist on the far-end router, terminates on another router different than the originating router, or another issue prevents the far-end router from using *resp-sdp-id*, the SDP echo reply is sent using generic IP/GRE OAM encapsulation. The received forwarding class (as mapped on the ingress network interface for the far end) defines the forwarding class encapsulation for the reply message.

Values 1 to 32767

Default null. Use the non-SDP return path for message reply.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fc-name

Specifies the parameter to be used to indicate the forwarding class of the SDP encapsulation. The actual forwarding class encoding is controlled by the network egress DSCP or LSP-EXP mappings.

The DSCP or LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end router that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message.

The DSCP or LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router. This is displayed in the response message output upon receipt of the message reply.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the SDP encapsulation.

Default out

octets

Specifies the **size** parameter in octets. This parameter is used to override the default message size for the **sdp-ping** request. Changing the message size is a method of checking the ability of an SDP to support a **path-mtu**. The size of the message does not include the SDP encapsulation, VC-Label (if applied) or any DLC headers or trailers.

When the OAM message request is encapsulated in an IP/GRE SDP, the IP 'DF' (Do Not Fragment) bit is set. If any segment of the path between the sender and receiver cannot handle the message size, the message is discarded. MPLS LSPs are not expected to fragment the message either, as the message contained in the LSP is not an IP packet.

Values 72 to 9786

Default 72

send-count

Specifies the number of messages to send. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

Values 1 to 100

Default 1

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of time out, the test is marked complete and no more packets is processed for any of those request probes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 10

Default 5

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

Values 1 to 10

Multiple Response Connectivity Tests — When the connectivity test count is greater than one (1), a single line is displayed per SDP echo request send attempt.

The request number is a sequential number starting with 1 and ending with the last request sent, incrementing by one (1) for each request. This should not be confused with the *message-id* contained in each request and reply message.

A response message indicates the result of the message request. Following the response message is the round trip time value. If any reply is received, the round trip time is displayed.

After the last reply has been received or response timed out, a total is displayed for all messages sent and all replies received. A maximum, minimum and average round trip time is also displayed. Error response and timed out requests do not apply towards the average round trip time.

Description

This command specifies the context for the configuration of seamless BFD initiator parameters that are global to this router.

The **no** form of this command removes the context.

Platforms

All

41.83 search

search

Syntax

search *base-dn*

no search

Context

[Tree] (config>system>security>ldap>server search)

Full Context

configure system security ldap server search

Description

This command configures the LDAP **search** command. The search *base-dn* tells the server which part of the external directory tree to search. The search DN uses the same LDAP attribute as *root-dn*. For example, to search a public-key for an SSH generated for a Nokia vendor, one might use "dc=public-key,dc=nokia,dc=com”.

The **no** version of this command removes the search DN; as such, no search is possible on the LDAP server.

Parameters

base-dn

Specifies the base domain name used in the search, up to 512 characters.

Context

[Tree] (config>service>ies>if secondary)

Full Context

configure service ies interface secondary

Description

This command assigns a secondary IP address or IP subnet/broadcast address format to the interface.

The **no** form of this command reverts to the default.

Default

no secondary

Parameters

ip-address

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that is used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

mask

Specifies the subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that is used in a logical and function to derive the local subnet of the IP address. Allowed values are dotted decimal addresses in the range 128.0.0.0 – 255.255.255.254.

Note:
A mask of 255.255.255.255 is reserved for system IP addresses.

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

broadcast

Overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) is received by the IP interface. (Default: host-ones)

all-ones

Specifies the broadcast address used by the IP interface for this IP address is 255.255.255.255, also known as the local broadcast.

host-ones

Specifies that the broadcast address used by the IP interface for this IP address is the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default broadcast address used by an IP interface. The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

igp-inhibit

Signals that the given secondary IP interface should not be recognized as a local interface by the running IGP. For OSPF and IS-IS, this means that the specified secondary IP interfaces are not injected and used as passive interfaces and are not advertised as internal IP interfaces into the IGP's link state database. For RIP, this means that these secondary IP interfaces do not source RIP updates.

tag-value

Specifies the administrative tag value associated with an interface IP address.

Values 1 to 4294967295

srrp-instance

Specifies the SRRP instance ID that this interface route needs to track.

Values 1 to 4294967295

Platforms

Context

[Tree] (config>service>vprn>nw-if secondary)

[Tree] (config>service>vprn>if secondary)

Full Context

configure service vprn network-interface secondary

configure service vprn interface secondary

Description

This command assigns a secondary IP address to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. Each address can be configured in an IP address, IP subnet, or broadcast address format.

Caution:
Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

Default

no secondary

Parameters

ip-address

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

mask

Specifies the subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. Allowed values are dotted-decimal addresses in the range 128.0.0.0 – 255.255.255.254. A mask of 255.255.255.255 is reserved for system IP addresses.

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

broadcast

Optional parameter that overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed. This parameter does not affect the type of broadcasts that can be received by

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface. *(Default: host-ones)*

all-ones

The **all-ones** keyword following the **broadcast** parameter specifies the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

host-ones

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default used by an IP interface.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

igp-inhibit

Optional parameter that signals that the given secondary IP interface should not be recognized as a local interface by the running IGP. For OSPF and IS-IS, this means that the specified secondary IP interfaces will not be injected and used as passive interfaces, and will not be advertised as internal IP interfaces into the IGP's link-state database. For RIP, this means that these secondary IP interfaces will not source RIP updates.

tag-value

Specifies the administrative tag value associated with an interface IP address.

Values 1 to 4294967295

srrp-instance

Specifies the SRRP instance ID that this interface route needs to track.

Platforms

All

secondary

Syntax

[**no**] **secondary** *path-name*

Context

[Tree] (config>router>mpls>lsp secondary)

Full Context

configure router mpls lsp secondary

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies an alternative path that the LSP uses if the primary path is not available. This command is optional and is not required if the **config router mpls lsp** *lsp-name* **primary** *path-name* command is specified. After the switch over from the primary to the secondary, the system continuously tries to revert to the primary path. The switch back to the primary path is based on the **retry-timer** interval.

For RSVP-TE LSPs, up to eight secondary paths can be specified (or seven if a primary is configured). For SR-TE LSPs, up to three paths of any type (with a maximum of one primary) can be configured. By default, a secondary path is non-standby unless the **standby** keyword is configured. All non-standby secondary paths are considered equal and the first available path is used.

The system does not switch among secondary paths. The system starts the signaling (RSVP-TE) or programming (SR-TE) of all non-standby secondary paths at the same time. Retry counters are maintained for each unsuccessful attempt. After the retry limit is reached on a path, the system does not attempt to signal the path and administratively shuts down the path. The first successfully established non-standby secondary path is made the active path for the LSP.

The **no** form of this command removes the association between this *path-name* and *lsp-name*. All specific configurations for this association are deleted. The secondary path must be shut down prior to deleting it. The **no secondary** *path-name* command does not result in any action except a warning message on the console indicating that the secondary path is administratively up.

Parameters

path-name

Specifies the case-sensitive alphanumeric name label for the LSP path, up to 64 characters.

Platforms

All

secondary

Syntax

secondary {*ip-address*/*mask* | *ip-address netmask*} [**broadcast** {**all-ones** | **host-ones**}] [**igp-inhibit**] [**track-srrp** *srrp-instance*] [**tag** *tag-value*]

no secondary {*ip-address/mask* | *ip-address netmask*}

Context

Full Context

configure router interface secondary

Description

This command assigns additional IP addresses to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. Each address can be configured in an IP address, IP subnet, or broadcast address format.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Caution:
Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP-in-IP protocols are active on an access interface.

The **no** form of this command removes the secondary address from the interface.

Default

no secondary

Parameters

ip-address

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values 1.0.0.0 to 223.255.255.255

/

The forward slash is a parameter delimiter that separates the *ip-address* portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the *ip-addr*, the "*/*" and the *mask-length* parameter. If a forward slash does not immediately follow the *ip-addr*, a dotted decimal mask must follow the prefix.

mask

Specifies the subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the *ip-address* from the *mask* parameter. The *mask* parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1 to 32. A mask length of 32 is reserved for system IP addresses.

Values 1 to 32

netmask

Specifies the subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. A mask of 255.255.255.255 is reserved for system IP addresses.

Values 128.0.0.0 to 255.255.255.255

broadcast

Optional parameter that overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones,** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface.

all-ones

The **all-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

host-ones

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask* with all the host bits set to binary 1. This is the default broadcast address used by an IP interface.

igp-inhibit

The secondary IP address should not be recognized as a local interface by the running IGP.

tag-value

Specifies the administrative tag value associated with an interface IP address.

Values 1 to 4294967295

srrp-instance

Specifies the SRRP instance ID that this interface route needs to track.

configure router interface ipsec ipsec-tunnel manual-keying security-association

configure service ies interface ipsec ipsec-tunnel manual-keying security-association

configure service vprn interface sap ipsec-tunnel manual-keying security-association

Description

This command configures the information required for manual keying SA creation.

The **no** form of this command removes the **security-association** parameters from the configuration.

Parameters

security-entry-id

Specifies the ID of an SA entry.

Values 1 to 16

authentication-key *hex-string*

Specifies an authentication key.

Values none or 0x0 to 0xFFFFFFFF...(max 128 hex nibbles)

encryption-key *hex-string*

Specifies the key used for the encryption algorithm.

Values none or 0x0 to 0xFFFFFFFF...(max 64 hex nibbles)

spi *spi*

Specifies the Security Parameter Index (SPI) used to look up the instruction to verify and decrypt the incoming IPsec packets when the direction is inbound. When the direction is outbound, the SPI that will be used in the encoding of the outgoing packets. The remote node can use this SPI to lookup the instruction to verify and decrypt the packet.

Values 256 to 16383

transform *transform-id*

Specifies the transform entry that will be used by this SA entry. This object should be specified for all the entries created which are manual SAs. If the value is dynamic, then this value is irrelevant and will be zero.

Values 1 to 2048

direction

Specifies the direction of an IPsec tunnel.

Syntax

security-association spi *spi* **authentication-key** *authentication-key* **encryption-key** *encryption-key* [**crypto** | **hash** | **hash2** | **hash3** | **custom**]

no security-association spi *spi*

Context

[Tree] (config>grp-encryp>encryp-keygrp security-association)

Full Context

configure group-encryption encryption-keygroup security-association

Description

This command is used to create a security association for a specific SPI value in a key group. The command is also used to enter the authentication and encryption key values for the security association, or to delete a security association.

The SPI value used for the security association is a node-wide unique value, meaning that no two security associations in any key group on the node may share the same SPI value.

Keys are entered in cleartext. After configuration, they are never displayed in their original, cleartext form. Keys are displayed in an encrypted form, which is indicated by the system-appended **crypto** keyword when an **info** or an **admin>save** command is run. For security reasons, keys encrypted on one node are not usable on other nodes (that is, keys are not exchangeable between nodes).

The **no** form of the command removes the security association and related key values from the list of security associations for the key group. If the **no** form of the command is attempted using the same SPI value that is configured for **active-outbound-sa**, then a warning is issued and the command is blocked. If the **no** form of the command is attempted on the last SPI in the key group and the key group is configured on a service, then the command is blocked.

Parameters

spi

Specifies the SPI ID of the SPI being referenced for the security association.

Values 1 to 127

authentication-key

Specifies the authentication key for the SPI, in hexadecimal format. The number of characters in the hexadecimal string must be 64 or 128, depending on whether the authentication algorithm is set to sha256 or sha512, respectively.

encryption-key

Specifies the encryption key for the SPI, in hexadecimal format. The number of characters in the hexadecimal string must be 32 or 64, depending on whether the encryption algorithm is set to aes128 or aes256, respectively.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

crypto

Displays the keys showing on the CLI **info** display in an encrypted form.

Full Context

configure service vprn interface sap ipsec-tunnel security-policy

configure service vprn interface ipsec ipsec-tunnel security-policy

configure router interface ipsec ipsec-tunnel security-policy

configure service ies interface ipsec ipsec-tunnel security-policy

Description

This command configures an IPsec security policy. The policy may then be associated with static IPsec tunnels defined in the same routing instance.

With **strict-match** parameter enabled, when a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a re-key request, then ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry.

If there is no match, then the setup fails, and TS_UNACCEPTABLE is sent.

If there is a match, but there is an existing CHILD_SA for the matched security policy, then the setup fails, and NO_PROPOSAL_CHOSEN.

If there is a match, and there is not CHILD_SA for the matched entry, then the subnet is sent in the matched security-policy entry as TSi and TSr, and the CHILD_SA is created.

Default

no security-policy

Parameters

security-policy-id

Specifies the IPsec security policy entry that the tunnel will use.

Values 1 to 32768

strict-match

Enables strict match of security-policy entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel security-policy

Full Context

configure anysec mpls service-encryption encryption-group security-termination-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the security termination policy that identifies the set of attributes for locally terminating tunnels for the specified encryption group.

The security termination policy (secTP) for tunnel encryption contains the tunnel protocol information, IGP instance, and flex algorithm, in addition to the local IP address, which identifies the system IP or loopback IP used to identify the local underlaying tunnel for the encrypted service. This local IP must match the BGP source IP or TLDP source IP and is the IP address that identifies the SR tunnel terminating on the router for the service that is using the specified secTP.

Multiple encryption groups can have the same secTP.

The **no** form of this command removes the security termination policy.

Default

no security-termination-policy

Parameters

policy

Specifies the security termination policy name, up to 64 characters.

Platforms

7750 SR-1, 7750 SR-12e, 7750 SR-s

security-termination-policy

Syntax

security-termination-policy *policy*

no security-termination-policy

41.112 segment

segment

Syntax

segment [*segment-id*] [**create**]

no segment *segment-id*

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>seg-list segment)

Full Context

configure router segment-routing sr-policies static-policy segment-list segment

Description

This command creates the context to configure a segment inside a segment-list of a statically-defined segment routing policy candidate path.

A segment list of a statically-defined SR policy candidate path of type **sr-mpls** can only accept a segment of type **mpls-label**.

A segment list of a statically-defined SR policy candidate path of type **srv6** can only accept a segment of type **srv6-sid**. However, you can mix SRv6 segments derived from both classic SRv6 and micro-segment SRv6 locators.

The **no** form of this command deletes the segment context.

Default

no segment

Parameters

segment-id

Specifies the segment ID number.

Values 1 to 11 (for segment ID type **mpls-label**)

1 to 7 (for segment ID type **srv6-sid**) in a classic SRv6 policy candidate path

1 to 24 (for segment ID type **srv6-sid**) in a micro-segment SRv6 policy candidate path

create

Keyword used to create the list.

configure router isis segment-routing

Description

Commands in this context configure segment routing parameters within a given IGP instance.

Segment routing adds to IS-IS and OSPF routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

specific adjacency of the node (interface or next-hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as Segment ID (SID).

When segment routing is used together with MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and in traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS or OSPF instance, the router will perform the following operations:

1. Advertise the Segment Routing Capability Sub-TLV to routers in all areas/levels of this IGP instance. However, only neighbors with which it established an adjacency interprets the SID or label range information and use it for calculating the label to swap to or push for a given resolved prefix SID.
2. Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node-SID flag) set. Then the segment routing module programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
3. Assign and advertise automatically an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
4. Resolve received prefixes and if a prefix SID sub-TLV exists, the Segment Routing module programs the ILM with a swap operation and also an LTN with a push operation both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in a given IGP instance, the main SPF and LFA SPF are computed normally and the primary next-hop and LFA backup next-hop for a received prefix are added to RTM without the label information advertised in the prefix SID sub-TLV.

configure router ospf segment-routing

configure router ospf3 segment-routing

Description

Commands in this context configure segment routing parameters within an IGP instance.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Segment routing adds to IS-IS, OSPF, or OSPF3 routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a specific adjacency of the node (interface or next hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as a segment ID (SID).

When segment routing is used together with the MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS, OSPF, or OSPF3 instance, the router will perform the following operations:

- Advertise the Segment Routing Capability sub-TLV to routers in all areas or levels of the IGP instance. However, only neighbors with which the IGP instance established an adjacency will interpret the SID and label range information and use it for calculating the label to swap to or push for a particular resolved prefix SID.
- Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node SID flag) set. The segment routing module then programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
- Automatically assign and advertise an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
- Resolve received prefixes, and if a prefix SID sub-TLV exists, the segment routing module programs the ILM with a swap operation and programs an LSP ID to NHLFE (LTN) with a push operation, both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in an IGP instance, the main SPF and LFA SPF are computed normally and the primary next hop and LFA backup next hop for a received prefix are added to the RTM without the label information advertised in the prefix SID sub-TLV.

configure service vpls bgp-evpn sel-mcast-advertisement

Description

This command enables the advertisement of BGP EVPN Selective Multicast Ethernet Tag (SMET) routes.

The **no** form of this command disables the advertisement of BGP EVPN SMET routes.

Default

no sel-mcast-advertisement

Platforms

All

42.5 selection-criteria

selection-criteria

Syntax

selection-criteria [**best-port** | **highest-count** | **highest-weight**] [**slave-to-partner**] [**subgroup-hold-time** *hold-time*]

no selection-criteria

Context

[Tree] (config>lag selection-criteria)

Full Context

configure lag selection-criteria

Description

This command specifies which selection criteria should be used to select the active sub-group. If there is a tie for highest-count or highest-weight, the LAG will prefer the port with the lowest priority. If that does not break the tie, the currently active subgroup will stay active (that is, non-revertive behavior).

The **no** form of this command reverts to the default value.

Default

selection-criteria highest-count

Parameters

highest-count

Selects a sub-group with the highest number of eligible members as an active sub-group (not applicable to "power-off" mode of operations).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

highest-weight

Selects a sub-group with the highest aggregate weight as an active subgroup (not applicable to "power-off" mode of operations). Aggregate weight is calculated as the sum of (65535 - port priority) all ports within a sub-group.

best-port

Selects a sub-group containing the port with highest priority port as an active subgroup. In case of equal port priorities, the sub-group containing the port with the lowest port-id is chosen.

slave-to-partner

The **slave-to-partner** keyword specifies that it, together with the selection criteria, should be used to select the active sub-group. An eligible member is a LAG-member link which can potentially become active. This means it is operationally up (not disabled) for use by the remote side. The **slave-to-partner** keyword can be used to control whether or not this latter condition is taken into account.

hold-time

Applicable with LACP enabled. Specifies the optional delay timer for switching to a newly selected active sub-group from the existing active sub-group. The timer delay applies only if the existing sub-group remains operationally up.

Values

not specified	Equivalent to specifying a value of 0. Specifies no delay and to switchover immediately to a new candidate active sub-group.
0 to 2000	Integer specifying the timer value in 10ths of a second.
infinite	Do not switchover from existing active sub-group if the subgroup remains UP. Manual switchover possible using tools perform lag force command.

selective-label-ip

Syntax

selective-label-ip {**no-install** | **route-table-install-only**}

no selective-label-ip

Context

[Tree] (config>router>bgp selective-label-ip)

Full Context

configure router bgp selective-label-ip

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures **selective-label-ip** for the BGP level.

The **no-install** option conserves labeled route table space on BGP-LU **next-hop-self** route reflectors. This option causes BGP-LU routes to be reflected downstream via the ABR with the **next-hop-self** update. BGP-LU routes are not installed to local MPLS tables or routing tables for use by local services.

The **route-table-install-only** option conserves labeled route table space on BGP-LU **next-hop-self** route reflectors and allows these routes to be used for IP transport, unlike the **no-install** option. When the **route-table-install-only** option is used, learned BGP-LU routes are also reflected downstream via the ABR with the **next-hop-self** update. BGP-LU routes are not installed to local MPLS tables for use by local services. These routes are installed to the RTM and used for the best route selection process.

Note: If local services need to use BGP-LU routes, the **no-install** and **route-table-install-only** options should not be used.

The default **no** form of this command installs BGP-LU routes to the datapath for local services and makes them available to the RTM for IP next-hop selection.

Default

no selective-label-ip

Parameters

no-install

Specifies that BGP-LU routes are not installed to local MPLS tables or routing tables.

route-table-install-only

Specifies the installation of BGP-LU routes to the RTM. BGP-LU routes are not installed to local MPLS tables for use by local services.

selective-label-ip-prioritization

Syntax

[**no**] **selective-label-ip-prioritization**

Context

[Tree] (config>router>bgp selective-label-ip-prioritization)

Full Context

configure router bgp selective-label-ip-prioritization

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables selective-label IP prioritization for BGP labeled IPv4 and IPv6 routes.

When this command is configured, every received labeled IPv4 and IPv6 route that is potentially usable by a local service is automatically prioritized for fast control plane reconvergence. When the reachability of a BGP next-hop changes, these labeled IPv4 and IPv6 routes are updated into the route table first, along with other routes manually tagged as high priority by import policies.

A /32 or /128 labeled unicast route (and associated BGP-LU tunnel) is determined to be potentially usable by a local service if one of the following conditions is met:

- the route matches the far-end address of a user-provisioned SDP of an Layer 2 service and the SDP is configured to use BGP tunnels as transport
- the route matches the BGP next-hop address of a BGP-EVPN or IP VPN route, and this VPN route is either imported into a local service or readvertised by the router acting as a next-hop-self route-reflector or a model-B ASBR

The **no** form of this command disables selective-label IP prioritization for BGP.

Default

no selective-label-ip-prioritization

Full Context

configure router bgp group selective-label-ipv4-install

configure router bgp selective-label-ipv4-install

configure router bgp group neighbor selective-label-ipv4-install

Description

This command enables selective download for BGP label-ipv4 routes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this command is configured so that it applies to a BGP session, label-ipv4 routes received on this session are marked as invalid if they are not needed for any eligible service. A /32 label-ipv4 route is determined to be required if one of the following applies:

1. It matches the far-end address of a manually configured or auto-created SDP Layer 2 VLL or VPLS service and the SDP is configured to use BGP tunnels as transport.
2. It matches the IPv4 BGP next hop of a BGP-EVPN route and this EVPN route is either imported into a VPLS service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
3. It matches the IPv4 BGP next hop of a VPN-IPv4 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
4. It matches the IPv4 address in the IPv4-mapped IPv6 address of a VPN IPv6 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.

The **no** form of this command at the top (**config>router>bgp**) level disables the selective installation functionality. The **no** form of this command at the **group** or **neighbor** level causes the setting to be inherited from a higher level configuration.

42.10 selective-learned-fdb

selective-learned-fdb

Syntax

[**no**] **selective-learned-fdb**

Context

[Tree] (config>service>vpls selective-learned-fdb)

Full Context

configure service vpls selective-learned-fdb

Description

This command determines which line cards FDB entries are allocated on for MAC addresses in the VPLS service in which the command is configured.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

By default, FDB entries for MAC addresses in VPLS services are allocated on all line cards in the system. Enabling **selective-learned-fdb** causes FDB entries to be allocated only on the line cards on which the service has a configured object, which includes all line cards:

- on which a SAP is configured
- which have ports configured in a LAG SAP
- which have ports configured in an Ethernet tunnel SAP
- which have ports configured on a network interface (which also may be on a LAG) when the service has a mesh or spoke-SDP, VXLAN or EVPN-MPLS configured

Only MAC addresses with a type "L" or "Evpn" in the **show** output displaying the FDB can be allocated selectively, unless a MAC address configured as a conditional static MAC address is learned dynamically on an object other than its monitored object; this can be displayed with type "L" or "Evpn" but is allocated as global because of the conditional static MAC configuration.

The **no** form of this command returns the FDB MAC address entry allocation mode to its default where FDB entries for MAC addresses are allocated on all line cards in the system.

Default

no selective-learned-fdb

Description

Commands in this context configure deterministic NAT mappings via selector bits.

This command enables deterministic NAT mappings based on the IP address and port selector bits derived from the host portion of the configured prefix. The selector bits (for both IP address and port) fully occupy the available host bit space.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this context is enabled, the source IP addresses are interleaved across the outside IP addresses. The stride between these interleaved source addresses that are mapped to the same outside IP address is determined by the configured selector bits.

Deterministic port blocks can be assigned in either ascending (forward) or descending (reverse) order.

This behavior contrasts with the legacy sequential-fill mapping, where source IP addresses are mapped sequentially to each outside IP address until it is fully used, before moving to the next. In the legacy mode, deterministic port block allocation is only supported in ascending (forward) order.

Deleting this context disables selector-based mappings and reverts the configuration to the legacy sequential-fill mode.

configure service vprn ripng group send

configure service vprn rip send

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the type of RIP messages sent to RIP neighbors. This control can be issued at the global, group or interface level. The default behavior sends RIPv2 messages with the multicast (224.0.0.9) destination address.

If **version-1** is specified, the router only listens for and accepts packets sent to the broadcast address.

The **no** form of this command resets the type of messages sent back to the default value.

Default

no send

Parameters

broadcast

Send RIPv2 formatted messages to the broadcast address.

multicast

Send RIPv2 formatted messages to the multicast address.

none

Do not send any RIP messages (i.e. silent listener).

version-1

Send RIPv1 formatted messages to the broadcast address.

both

Send both RIP v1 & RIP v2 updates to the broadcast address.

Description

This command specifies if RIPng are sent to RIP neighbors or not and what type of IPv6 address is to be used to deliver the messages.

This control can be issued at the global, group or interface level.

The **no** form of the command reverts to the default value.

Default

send ripng

Parameters

ripng

Specifies RIPng messages to be sent to the standard multicast address (FF02::9).

none

Specifies not to send any RIPng messages (i.e. silent listener).

unicast

Specifies to send RIPng updates as unicast messages to the defined unicast address configured through the **unicast-address** command. This option is only allowed within the neighbor context.

Syntax

send-acct-stop-on-fail {[**on-request-failure**] [**on-reject**] [**on-accept-failure**]}

no send-acct-stop-on-fail

Context

[Tree] (config>subscr-mgmt>auth-policy send-acct-stop-on-fail)

Full Context

configure subscriber-mgmt authentication-policy send-acct-stop-on-fail

Description

This command activates the reporting of RADIUS authentication failures of a PPPoE session to a RADIUS accounting server with an Accounting Stop message.

Three failure categories can be enabled separately:

- **on-request-failure**: All failure conditions between the sending of an Access-Request and the reception of an Access-Accept or Access-Reject.
- **on-reject**:
- **on-accept-failure**: All failure conditions that appear after receiving an Access-Accept and before successful instantiation of the host or session.

The RADIUS accounting policy to be used for sending the Accounting Stop messages must be obtained prior to RADIUS authentication via local user database pre-authentication.

The **no** form of this command reverts to the default.

Parameters

on-request-failure

Specifies that an accounting stop message is sent when a RADIUS Access-Request message could not be sent (for example, there is no server configured, or timeout).

on-reject

Specifies that an accounting stop message is sent when an Access-Reject is received.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

on-accept-failure

Specifies that an accounting stop message is sent a failure occurred after the reception of a RADIUS Access-Accept message (such as a duplicate IP address).

Context

[Tree] (config>service>vpls>pbb send-bvpls-evpn-flush)

Full Context

configure service vpls pbb send-bvpls-evpn-flush

Description

This command triggers ISID-based C-MAC flush signaling in the PBB-EVPN. When the command is enabled in an I-VPLS service, a B-MAC/ISID route is sent for the I-VPLS ISID.

Default

no send-bvpls-evpn-flush

Platforms

All

42.16 send-bvpls-flush

send-bvpls-flush

Syntax

send-bvpls-flush {[**all-but-mine**] [**all-from-me**]}

no send-bvpls-flush

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vpls>pbb send-bvpls-flush)

Full Context

configure service vpls pbb send-bvpls-flush

Description

This command enables generation of LDP MAC withdrawal "flush-all-from-me” in the B-VPLS domain when the following triggers occur in the related IVPLS:

- MC-LAG failure
- Failure of a local SAP
- Failure of a local pseudowire/SDP binding

A failure means transition of link SAP/pseudowire to either down or standby status.

This command does not require send-flush-on-failure in B-VPLS to be enabled on an IVPLS trigger to send an MAC flush into the BVPLS.

Default

no send-bvpls-flush

Parameters

all-but-mine

Specifies to send an LDP flush all-but-mine and also sent into the B-VPLS. Both parameters can be set together.

all-from-me

Specifies to send an LDP flush-all-from and when STP initiates a flush, it is sent into the B-VPLS using LDP MAC flush all-from-me. Both parameters can be set together.

Full Context

configure ipsec cert-profile entry send-chain

Description

Commands in this context configure the send-chain in the **cert-profile entry**.

The configuration of this command is optional, by default system will only send the certificate specified by **cert** command in the selected entry to the peer. This command allows system to send additional CA certificates to the peer. These additional CA certificates must be in the certificate chain of the certificate specified by the **cert** command in the same entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

send-chain

Syntax

[**no**] **send-chain**

Context

[Tree] (config>system>security>tls>cert-profile>entry send-chain)

Full Context

configure system security tls cert-profile entry send-chain

Description

This command enables the sending of certificate authority (CA) certificates, and enters the context to configure send-chain information.

By default, the system only sends the TLS server certificate or TLS client certificate specified by the **cert** command. If CA certificates are to be sent using send-chain, they must be in the chain of certificates specified by the **config**>**system**>**security**>**pki**>**ca-profile** command. The specification of the send-chain is not necessary for a working TLS profile if the TLS peer has the CA certificate used to sign the server or client certificate in its own trust anchor.

For example, given a TLS client running on SR OS, the ROOT CA certificate resides on the TLS server, but the subsequent SUB-CA certificate needed to complete the chain resides within SR OS. The **send-chain** command allows these SUB-CA certificates to be sent from SR OS to the peer to be authenticated using the ROOT CA certificate that resides on the peer.

The **no** form of the command disables the send-chain.

Default

no send-chain

42.19 send-default

send-default

Syntax

send-default [**ipv4**] [**ipv6**] [**export-policy** *export-policy*]

no send-default

Context

[Tree] (config>router>bgp>group send-default)

[Tree] (config>router>bgp>group>neighbor send-default)

[Tree] (config>router>bgp send-default)

Full Context

configure router bgp group send-default

configure router bgp group neighbor send-default

configure router bgp send-default

Description

This command enables the advertisement of a default route. When this command is configured to apply to an IBGP or EBGP session, the default route for IPv4 or IPv6 is automatically added to the Adj_RIB-OUT of that peer. The advertised default routes are unrelated to any default routes installed in the FIB of the local router.

If a BGP export policy allows an active default route in the FIB of the local router to be advertised and conflict with this command, the artificially generated default route overrides the advertisement of the installed default route.

The artificially generated default route is not matched by BGP export policies. To modify its attributes or decide whether it should be advertised (based on a conditional expression), a route policy must be created and referenced by the **export-policy** parameter. Only conditional entries with an action and no from or to criteria are parsed. If there are no such entries, only the default action is applied.

The **no** form of this command restores the default behavior. At the group and neighbor levels, the default behavior is to inherit the configuration from a higher level. At the instance level, the default behavior is to neither generate nor inject a default route.

Default

no send-default

Parameters

ipv4

Generates and advertises an IPv4 default route (0/0).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6

Generates and advertises an IPv6 default route (::/0).

export-policy

Specifies the name of a route policy, up to 64 characters. Only the route modifications in the matching conditional-expression entry or the default action are applied. These modifications change the attributes of the advertised default routes.

Context

[Tree] (config>service>vpls send-flush-on-failure)

Full Context

configure service vpls send-flush-on-failure

Description

This command enables sending out flush-all-from-me messages to all LDP peers included in affected VPLS, in the event of physical port failures or "operationally down" events of individual SAPs. This feature provides an LDP-based mechanism for recovering a physical link failure in a dual-homed connection to a VPLS service. This method provides an alternative to RSTP solutions where dual homing redundancy and recovery, in the case of link failure, is resolved by RSTP running between a PE router and CE devices. If the endpoint is configured within the VPLS and send-flush-on-failure is enabled, flush-all-from-me messages will be sent out only when all spoke-SDPs associated with the endpoint go down.

This feature cannot be enabled on management VPLS.

Default

no send-flush-on-failure

Full Context

configure router bgp group neighbor outbound-route-filtering extended-community send-orf

configure router bgp group outbound-route-filtering extended-community send-orf

configure router bgp outbound-route-filtering extended-community send-orf

Description

This command instructs the router to negotiate the send capability in the BGP outbound route filtering (ORF) negotiation with a peer.

This command also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD.

The **no** form of this command causes the router to remove the send capability in the BGP ORF negotiation with a peer.

The **no** form also causes the router to send an ORF remove action for a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer.

If the *comm-id* parameters are not exclusively route target communities then the router will extract appropriate route targets and use those. If, for some reason, the *comm-id* parameters specified contain no route targets, then the router will not send an ORF.

Default

no send-orf

Parameters

comm-id

Specifies up to 32 community policies, which must consist exclusively of route target extended communities. If it is not specified, then the ORF policy is automatically generated from configured route target lists, accepted client route target ORFs and locally configured route targets.

configure service vprn bgp group link-bandwidth send-to-ebgp

Description

This command configures BGP to allow link-bandwidth extended community to be sent in routes advertised to EBGP peers in the scope of the command, as long the routes belong to one of the listed address families.

The link-bandwidth extended community is encoded as a non-transitive type. This means that by default it should not be attached to any route advertised to an EBGP peer and it should be discarded when received in any route from an EBGP peer. This command overrides the standard behavior.

Up to three families may be configured.

The **no** form of this command restores the default behavior of stripping the link-bandwidth extended community from any route advertised to an EBGP peer.

Default

no send-to-ebgp

Parameters

family

Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the encapsulation to be advertised with the EVPN routes for the service. The encapsulation is encoded in RFC 5512-based tunnel encapsulation extended communities.

When used in the **bgp-evpn**>**mpls** context, the supported options are none (**no send-tunnel-encap**), **mpls**, **mplsoudp** or both.

When used in the **bgp-evpn**>**vxlan** context, the supported options are **send-tunnel-encap** (the router signals a VXLAN value) or **no send-tunnel-encap** (no encapsulation extended community is sent).

Default

send-tunnel-encap mpls (in the **config**>**service**>**vpls**>**bgp-evpn**>**mpls** context)

send-tunnel-encap (in the **config**>**service**>**vpls**>**bgp-evpn**>**vxlan** context)

Parameters

mpls

Specifies the MPLS-over-UDP encapsulation value in the RFC 5512 encapsulation extended community.

mplsoudp

Specifies the MPLS encapsulation value in the RFC 5512 encapsulation extended community.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the router to send the special URL indicator urn:ietf:params:capport:unrestricted in DHCP, DHCPv6, and RA messages, to indicate to the client that no captive portal is enabled. This allows the client to disable all portal detection logic, thereby optimizing the user experience.

The **no** form of this command disables the sending of the special indicator when no captive portal is enabled.

Default

no send-unrestricted-portal-url

sender-id

Syntax

sender-id local *local-name*

sender-id system

no sender-id

Context

[Tree] (config>eth-cfm>system sender-id)

Full Context

configure eth-cfm system sender-id

Description

This command allows the operator to include the configured "system name” (chassis3) or a locally configured value in ETH-CFM PDUs sent from MEPs and MIPs. The operator may only choose one of these options to use for ETH-CFM. MEPs include the **sender-id** TLV for CCM (not sub second CCM enabled MEPs), LBM/LBR, and LTM/LTR. MIPs include this value in the LBR and LTR PDUs.

Note:
LBR functions reflect all TLVs received in the LBM unchanged, including the SenderID TLV.

Parameters

local-name

Specifies a local alphanumeric string different from the "system name” chassis(3) value that can be used for other means, up to 45 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

system

Allows ETH-CFM to use the configured "system name" value as the chassis(3).

no server *index*

Context

[Tree] (config>subscr-mgmt>auth-plcy>radius-auth-server server)

Full Context

configure subscriber-mgmt authentication-policy radius-authentication-server server

Description

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to sixteen RADIUS servers can be configured at any one time in a RADIUS authentication policy. Only five can be used for authentication, all other servers should be configured as coa-only servers. RADIUS servers are accessed in order from lowest to highest index for authentication or accounting requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server index from the configuration.

Parameters

server-index

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 16 (a maximum of 5 authentication servers)

ip-address

Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

key

Specifies the secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

Values secret-key: Up to 20 characters.

hash-key: Up to 33 characters.

hash2-ke: Up to 55 characters.

hash | hash2 | hash3 | custom

Keywords to specify the value is in a protected format. See “Configuration secrets” in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.

port-num

Specifies the UDP port number on which to contact the RADIUS server for authentication.

Values 1 to 65535

coa-only

Specifies Change-of-Authorization Messages only. Servers that are marked with the coa-only flag will not be used for authentication, but they is able to accept RADIUS CoA messages, independent of the accept-authorization-change setting in the authentication policy.

For authentication purposes, the maximum number of servers is 5. All other servers may only be used as coa-only servers.

limit

Specifies the maximum number of outstanding RADIUS authentication requests for this authentication server.

Values 1 to 4096

Default The default value when not configured is 4096

[Tree] (config>router>radius-proxy server)

[Tree] (config>service>vprn>radius-proxy server)

Full Context

configure router radius-proxy server

configure service vprn radius-proxy server

Description

This command creates a RADIUS-proxy server in the corresponding routing instance. The proxy server can be configured for the purpose of proxying authentication or accounting or both.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If a WLAN-GW ISA group is specified, then the RADIUS proxy server is instantiated on the set of ISAs in the specified wlan-gw group. The RADIUS messages from the AP are load-balanced to these ISAs. The ISA that processes the RADIUS message then hashes this message to the ISA that anchors the UE. The hash is based on UE MAC address (required to be present in the calling-station-id attribute) in the RADIUS message.

If the **create** parameter is not specified, then this command enters configuration context of the specified RADIUS-proxy server.

The **no** form of this command removes the server-name and parameters from the radius-proxy configuration.

Parameters

server-name

Specifies the name of the RADIUS-proxy server.

create

Specifies that the system will create the specified RADIUS-proxy server.

purpose

Specifies the purpose the RADIUS-proxy server.

Values accounting — proxy accounting packets

authentication — proxy authentication packets

group-id

Specifies the WLAN-GW ISA group.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server

Syntax

server *ipv6-address* [*ipv6-address*]

no server [*ipv6-address* [*ipv6-address*]]

Context

[Tree] (config>service>ies>sub-if>wlan-gw>pool-manager>dhcp6-client server)

Full Context

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client server

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client server

Description

This specifies the DHCPv6 servers that are used for requesting addresses.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the server. This cannot be executed while any DHCPv6 client application is not shut down.

Parameters

ipv6-address

Specifies up to 8 unicast IPv6 addresses of a DHCP6 server.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

server

Syntax

server *index* **address** *ip-address* **secret** *key* [{**hash** | **hash2** | **hash3** | **custom**}] [**port** *port*]

server *index* **address** *ip-address* **tls-client-profile** *profile* [**tls-sni-host-name** *dns-name*] [**tls-port** *port*]

no server *index*

Context

[Tree] (config>system>security>tacplus server)

[Tree] (config>service>vprn>aaa>rmt-srv>tacplus server)

Full Context

configure system security tacplus server

configure service vprn aaa remote-servers tacplus server

Description

This command adds a TACACS+ server and configures its IP address, index, and key values.

Up to five TACACS+ servers can be configured at any one time. TACACS+ servers are accessed in order from the lowest index to the highest index for authentication requests.

When a TLS client profile is configured, TACACS+ packets can optionally be sent over TLS instead of obfuscated with MD5 and a shared secret.

The **no** form of this command removes the server from the configuration.

Default

No TACACS+ servers are configured.

Parameters

index

Specifies the index for the TACACS+ server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from the lowest index to the highest index.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 5

ip-address

Specifies the IP address of the TACACS+ server. Two TACACS+ servers cannot be configured with the same IP address. An error message is generated if a duplicate server address is specified.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D

key

Specifies the secret key, up to 128 characters in length, for access to the TACACS+ server. This secret key must match the password configured on the TACACS+ server.

Values Up to 128 characters in length.

hash | hash2 | hash3 | custom

Keyword used to specify that the value is in a protected format. See “Configuration secrets” in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.

port

Specifies the TCP destination port to the TACACS+ server when using a shared secret.

Values 0 to 65535

profile

Specifies the TLS client profile used to encrypt TACACS+ communication. When configured, TACACS+ messages are sent using TLS.

dns-name

Specifies the DNS hostname sent in the TLS SNI extension of the ClientHello handshake message when connecting to this TACACS+ server over TLS. When not configured, TACACS+ uses the server address.

tls-port *port*

Specifies the TCP destination port for the TLS connection to the TACACS+ server.

Values Up to 65535

configure service ies interface sap ipsec-gw dhcp server

configure service vprn interface sap ipsec-gw dhcp server

Description

This command specifies up to eight DHCPv4 server addresses for DHCPv4-based address assignment. If multiple server addresses are specified, the first advertised DHCPv4 address received is chosen.

Default

no server

Parameters

ip-address

Specifies up to eight unicast IPv4 addresses.

Values ipv4-address a.b.c.d

router-instance

Specifies the router instance ID used to reach the configured server address.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **server** *ip-address* **service-name** *service-name* variant can be used in all configuration modes.

Values {router-name | *vprn-svc-id*}

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vprn-svc-id: 1 to 2147483647

router-name: *router-name* is an alias for input only. The *router-name* gets replaced with an id automatically by SR OS in the configuration).

Default Base

service-name

Specifies the name of the IES or VPRN service used to reach the configured server address, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>aaa>isa-radius-plcy>servers server)

Full Context

configure aaa isa-radius-policy servers server

Description

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Up to five RADIUS servers can be configured at any one time. RADIUS servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of the command removes the server from the configuration.

Parameters

server-index

The index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 10 (a maximum of 5 accounting servers)

create

Keyword used to create the server index.

Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>if>dhcp server)

Full Context

configure router interface dhcp server

Description

This command specifies a list of servers where requests will be forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP relay to work. If there are multiple servers then the request is forwarded to all of the servers in the list. There can be a maximum of eight DHCP servers configured.

The flood command is applicable only in the VPLS case. There is a scenario with VPLS where the VPLS node only wants to add Option 82 information to the DHCP request to provider per-subscriber information, but it does not do full DHCP relay. In this case, the server is set to "flood". This means the DHCP request is still a broadcast and is sent through the VPLS domain. A node running at Layer 3 further upstream then can perform the full Layer 3 DHCP relay function.

Default

no server

Parameters

server

Specifies the DHCP server IP address. A maximum of eight servers can be specified in a single statement.

Platforms

All

server

Syntax

server *ipv6-address* [*ipv6-address*]

no server

Syntax

server [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address* | **ptp**} [**key-id** *key-id* | **authentication-keychain** *keychain-name*] [**version** *version*] [**prefer**]

no server [**router** *router-instance* | **service-name** *service-name*] {*ip address* | *ipv6-address* | **ptp**}

Context

[Tree] (config>system>time>ntp server)

Full Context

configure system time ntp server

Description

This command configures the node to operate in client mode with the NTP server specified in the address field of this command.

If the internal PTP process is used as a source of time for System Time and OAM time then it must be specified as a server for NTP. If PTP is specified, the **prefer** parameter must be specified. After PTP has established a UTC traceable time from an external grandmaster it is always the source for time into NTP, even if PTP goes into time holdover. PTP applies only to the 7450 ESS and 7750 SR.

Using the internal PTP time source for NTP promotes the internal NTP server to stratum 1 level, which may impact the NTP network topology.

The **no** form of this command removes the server with the specified address from the configuration.

Parameters

router-instance

Specifies the routing context that contains the interface in the form of *router-name* or *service-id*.

Values *router-name* — Base | Management

service-id — 1 to 2147483647

Default Base

service name

Specifies the service name for the VPRN, up to 64 characters. CPM routing instances are not supported.

ip-address

Configures the IPv4 address of an external NTP server.

Values a.b.c.d

ipv6-address

Configures the IPv6 address of an external NTP server.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

key-id

Specifies the key ID that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP server. If an NTP packet is received by this node, the authentication key-id, type, and key value must be valid, otherwise the packet is rejected and an event/trap generated. This is an optional parameter.

Values 1 to 255

keychain-name

Identifies the keychain name, up to 32 characters.

version

Configures the NTP version number that is expected by this node. This is an optional parameter.

Values 2 to 4

Default 4

ptp

Configures the internal PTP process as a time server into the NTP process. The **prefer** parameter is mandatory with this server option.

prefer

Specifies that, when configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, the new entry overrides the old entry.

Context

[Tree] (config>system>security>radius server)

[Tree] (config>service>vprn>aaa>rmt-srv>radius server)

Full Context

configure system security radius server

configure service vprn aaa remote-servers radius server

Description

This command adds a RADIUS server and configures the IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. For authentication requests, RADIUS servers are accessed in order from the lowest to highest index until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

When a TLS profile is assigned to a RADIUS server, the communication automatically switches from UDP to TCP, if a secret key is also configured. When a TLS profile is removed from a RADIUS server, the communication automatically switches from TCP to UDP, if a secret key is also configured. In both cases, the server is not recreated internally, so statistics are preserved.

The **no** form of this command removes the server from the configuration.

Default

no server

Parameters

server-index

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 5

ip-address

Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values		
	ipv4-address	a.b.c.d (host bits must be 0)
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0..FFFF]H
		d: [0..255]D

secret

Specifies the secret key and enables RADIUS over UDP for the RADIUS server.

key

Specifies the secret key for the RADIUS server, up to 64 characters. This secret key must match the key on the RADIUS server.

hash | hash2 | hash3 | custom

Keywords to specify the value is in a protected format. See “Configuration secrets” in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.

tls-client-profile

Specifies the TLS profile and enables RADIUS over TLS for the RADIUS server.

profile

Specifies the TLS profile name, up to 32 characters.

authenticator

Specifies the hash algorithm used to authenticate RADIUS Access-Request, Access-Accept, Access-Reject, Access-Challenge, Accounting-Request, and Accounting-Response packets.

md5

Specifies the MD5 hash algorithm for the RADIUS server.

sm3

Specifies the SM3 hash algorithm for the RADIUS server.

Platforms

Description

This command adds a Dot1x server and configures the Dot1x server IP address, index, and key values.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Up to five Dot1x servers can be configured at any one time. Dot1x servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other Dot1x servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

Default

no server

Parameters

server-index

Specifies the index for the Dot1x server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 5

ip-address

Specifies the IP address of the Dot1x server. Two Dot1x servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

key

Specifies the secret key, up to 128 characters, to access the Dot1x server. This secret key must match the password on the Dot1x server.

hash | hash2 | hash3 | custom

Keywords to specify the value is in a protected format. See “Configuration secrets” in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.

acct-port

Specifies the UDP port number on which to contact the RADIUS server for accounting requests.

auth-port

Specifies a UDP port number to be used as a match criteria.

Values 1 to 65535

server-type

Specifies the server type.

Values authorization, accounting, combined

		x - [0 to FFFF]H
		d - [0 to 255]D
	prefix-length	[1 to 128]

server-name

Specifies an optional server name for a given server address.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server-address

Syntax

server-address {eq | neq} *ip-address*

server-address {**eq** | **neq**} **ip-address** *masked-ip-address* **netmask** *netmask*

server-address {**eq** | **neq**} **dns-ip-cache** *dns-ip-cache-name*

server-address {**eq** | **neq**} **ip-prefix-list** *ip-prefix-list-name*

no server-address

Context

[Tree] (config>app-assure>group>policy>app-filter>entry server-address)

Full Context

configure application-assurance group policy app-filter entry server-address

Description

This command configures the server address to use in application definition. The server IP address may be the source or destination, network or subscriber IP address and may include the use of netmasks.

The **no** form of this command restores the default (removes the server address from application criteria defined by this entry).

Default

no server-address

Parameters

eq

Specifies a comparison operator that the value configured and the value in the flow are equal.

neq

Specifies a comparison operator that the value configured differs from the value in the flow.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ip-address

Specifies a valid unicast address.

Values		
	ipv4-address	a.b.c.d[/mask]
		mask - [1..32]
	ipv6-address	x:x:x:x:x:x:x:x/prefix-length
		x:x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D
		prefix-length [1..128]

netmask

Specifies an IPv4 or IPv6 address mask.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit)
		x:x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D

masked-ip-address

Specifies a valid unicast IPv4 or IPv6 address.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit)
		x:x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D

dns-ip-cache-name

Specifies a DNS IP cache name, up to 32 characters.

ip-prefix-list-name

Specifies the name of an IP prefix list, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

server-address

Syntax

server-address *ip-address* [**version** *version-number*] [**normal** | **preferred**]

[**interval** *seconds*]

no server-address *ip-address*

Context

[Tree] (config>system>time>sntp server-address)

Full Context

configure system time sntp server-address

Description

This command creates an SNTP server for unicast client mode.

Parameters

ip-address

Specifies the IP address of the SNTP server.

Values a.b.c.d

version-number

Specifies the SNTP version supported by this server.

Values 1 to 3

Default 3

normal | preferred

Specifies the preference value for this SNTP server. When more than one time-server is configured, one server can have preference over others. The value for that server should be set to **preferred**. Only one server in the table can be a preferred server.

Default normal

seconds

Specifies the frequency at which this server is queried.

Values 64 to 1024

Default 64

42.41 server-cipher-list

server-cipher-list

Syntax

server-cipher-list

Context

[Tree] (config>system>security>ssh server-cipher-list)

Full Context

configure system security ssh server-cipher-list

Description

Commands in this context configure a list of allowed ciphers by the SSH server.

Platforms

All

server-cipher-list

Syntax

server-cipher-list *name* [**create**]

no server-cipher-list *name*

Context

[Tree] (config>system>security>tls server-cipher-list)

Full Context

configure system security tls server-cipher-list

Description

This command creates the cipher list that is compared against cipher lists sent by the client to the server in the client hello message. The list contains all ciphers that are supported and desired by SR OS for use in the TLS session. The first common cipher found in both the server and client cipher lists will be chosen. As such, the most desired ciphers should be added at the top of the list.

The **no** form of the command removes the cipher list.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

name

Specifies the name of the server cipher list, up to 32 characters in length.

create

Keyword used to create the server cipher list.

Platforms

All

42.42 server-group-list

server-group-list

configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server server-id

configure router dhcp6 local-dhcp-server server-id

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server server-id

Description

This command allows the operator to customize the **server-id** attribute of a DHCPv6 message (such as DHCPv6 advertise and reply). By default, the **server-id** uses DUID-ll derived from the chassis link layer address. Operators have the option to use a unique identifier by using the **duid-en** (vendor based on an enterprise number). There is a maximum length associated with the customizable hex-string and ascii-string.

The **no** form of this command reverts to the default.

Default

server-id duid-ll

Parameters

hex-string

Specifies a DUID system ID in a hex format.

Values 0x0 to 0xFFFFFFFF (maximum 116 hex nibbles)

ascii-string

Specifies a DUID system ID in an ASCII format, up to 58 characters.

duid-ll

Specifies that the DUID system ID is derived from the system link layer address.

duid-en

Specifies the enterprise number.

Full Context

configure service dynamic-services dynamic-services-policy accounting-2 server-policy

configure service dynamic-services dynamic-services-policy accounting-1 server-policy

Description

This command configures the radius server policy to be used for dynamic data services RADIUS accounting.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the radius server policy from the configuration. This is only allowed when there are no active dynamic data services referencing this policy.

Parameters

policy-name

Specifies the name of the radius server policy.

Values Up to 32 characters maximum

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server-policy

Syntax

server-policy *policy-name*

no server-policy

Context

[Tree] (config>service>dynsvc>plcy>auth server-policy)

Full Context

configure service dynamic-services dynamic-services-policy authentication server-policy

Description

This command configures the RADIUS server policy to be used for RADIUS authentication of data-triggered dynamic services.

Local authentication and RADIUS authentication are mutually exclusive.

The **no** form of this command removes the server policy from the configuration and disables RADIUS authentication.

Parameters

policy-name

Specifies a RADIUS server policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

42.49 server-port

server-port

Syntax

server-port {**eq** | **neq** | **gt** | **lt**} *port-num*

server-port {**eq** | **neq**} **range** *start-port-num end-port-num*

server-port {**eq**} {*port-num* | **range** *start-port-num end-port-num*} {**first-packet-trusted** | **first-packet-validate**}

server-port {**eq** | **neq**} **port-list** *port-list-name*

server-port {**eq**} **port-list** *port-list-name* {**first-packet-trusted** | **first-packet-validate**}

no server-port

Context

[Tree] (config>app-assure>group>policy>app-filter>entry server-port)

Full Context

configure application-assurance group policy app-filter entry server-port

Description

This command specifies the server TCP or UDP port number to use in the application definition.

The **no** form of this command restores the default (removes server port number from application criteria defined by this app-filter entry).

Default

no server-port (the server port is not used in the application definition)

Parameters

eq

Specifies that the value configured and the value in the flow are equal.

neq

Specifies that the value configured differs from the value in the flow.

gt

Specifies all port numbers greater than server-port-number match.

lt

Specifies all port numbers less than server-port-number match.

port-list-name

Specifies a named port list containing a set or range of ports.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port-num

Specifies a valid server port number.

Values 0 to 65535

start-port-num, end-port-num

Specifies the starting or ending port number.

Values 0 to 65535

Server Port Options:

The following options are available:

- **No option specified:** TCP/UDP port applications with full signature verification:
  - AA ensures that other applications that can be identified do not run over a well-known port.
  - Application-aware policy applied once signature-based identification completes (likely requiring several packets).
- **first-packet-validate:** TCP/UDP trusted port applications with signature verification:
  - Application identified using well known TCP/UDP port based filters and re-identified once signature identification completes.
  - AA policy applied from the first packet of a flow while continuing signature-based application identification. Policy re-evaluated once the signature identification completes, allowing to detect improper/unexpected applications on a well-known port.
- **first-packet-trusted:** TCP/UDP trusted port applications - no signature verification:
  - Application identified using well known TCP/UDP port based filters only.
  - Application Aware policy applied from the first packet of a flow.
  - No signature processing assumes operator/customer trusts that no other applications can run on the well-known TCP/UDP port (statistics collected against trusted_tcp or trusted_udp protocol).

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server-port

42.50 server-san-dns-auth

server-san-dns-auth

Syntax

server-san-dns-auth *dns-domain-name*

no server-san-dns-auth

Context

[Tree] (config>router>origin-validation>rpki-session>tls-transport-security server-san-dns-auth)

Full Context

configure router origin-validation rpki-session tls-transport-security server-san-dns-auth

Description

This command configures the DNS domain name used to authenticate the SAN field in the TLS certificate presented by the RPKI cache server.

The DNS domain name is used only to authenticate the SAN field. It is not used for DNS resolution or to set the destination address of the RPKI session.

If this command is not configured, TLS does not authenticate the SAN field and accepts the SAN value presented in the server certificate.

The **no** form of this command removes the DNS domain name used for SAN authentication.

Default

no server-san-dns-auth

Parameters

dns-domain-name

Specifies the DNS domain name used to authenticate the SAN field in the cache server certificate, up to 255 characters.

no service

Context

[Tree] (config>system>security>pki>ca-profile>ocsp service)

Full Context

configure system security pki ca-profile ocsp service

Description

This command specifies the service or routing instance that used to contact OCSP responder. This applies to OCSP responders that either configured in CLI or defined in AIA extension of the certificate to be verified.

The responder-url will also be resolved by using the DNS server configured in the configured routing instance.

With VPRN services, the system checks whether the specified service ID or service name is an existing VPRN service at the time of CLI configuration. Otherwise the configuration fails.

Parameters

service-id

Specifies an existing service ID to be used in the match criteria.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **service name** *service-name* variant can be used in all configuration modes.

Values service-id: 1 to 2147483647 base-router: 0

name service-name

Identifies the service, up to 64 characters.

Use subject to Terms available at: www.nokia.com/terms.

42.59 service-activation-testhead

service-activation-testhead

Syntax

service-activation-testhead service-test *service-test-name* { **start** | **stop**}

Context

[Tree] (oam service-activation-testhead)

Full Context

oam service-activation-testhead

Description

This command start or stops a service activation testhead service test.

Parameters

service-test-name

Specifies a preconfigured service test name, up to 64 characters.

start

Keyword to start a service test. The software allows only one instance of a service test to be run for the specified *service-test-name*. If the user attempts to start another instance of a service test for the same *service-test-name* while the current instance is still running, the following error message is displayed: "MINOR: CLI #238 Configuration change failed validation - service test is already executing”.

stop

Keyword to stop a service test. If the user attempts to stop a service test that is already complete, the following error message is displayed: "MINOR: CLI #238 Configuration change failed validation - service test is not executing”.

Syntax

[**no**] **service-id-lag-hashing**

Context

[Tree] (config>system>load-balancing service-id-lag-hashing)

Full Context

configure system load-balancing service-id-lag-hashing

Description

This command enables enhanced VLL LAG service ID hashing. This command improves the LAG spraying of VLL service packets and is applied only when both ECMP and LAG hashing are performed by the same router. By default, the ECMP interface and LAG link for all packets on the VLL service are selected based on a direct modulo operation of the service ID. This command enhances distribution and hashes the service ID prior to the LAG link modulo operation when an ECMP link modulo operation is performed.

The **no** form of the command preserves the default behavior of VLL LAG service ID hashing.

Context

[Tree] (config>service>md-auto-id service-id-range)

Full Context

configure service md-auto-id service-id-range

Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to services that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A service created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

Default

no service-id-range

Parameters

start *service-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

Values 1 to 2147483647

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

end ***service-id***

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

[Tree] (config>service>template>vpls-template service-mtu)

[Tree] (config>service>vpls service-mtu)

Full Context

configure service template vpls-template service-mtu

configure service vpls service-mtu

Description

This command configures the service payload (Maximum Transmission Unit – MTU), in bytes, for the service. This MTU value overrides the service-type default MTU. The **service-mtu** defines the payload capabilities of the service. It is used by the system to validate the SAP and SDP binding's operational state within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, then the SAP will be placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP will be able to transition to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service will be placed in an inoperative state. If the service MTU is equal to or less than the path MTU, then the SDP binding will be placed in an operational state.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, then all associated SAP and SDP binding operational states are automatically re-evaluated.

For i-VPLS and Epipes bound to a b-VPLS, the service-mtu must be at least 18 bytes smaller than the b-VPLS service MTU to accommodate the PBB header.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

Default

service-mtu 1514

Parameters

octets

The following table displays MTU values for specific VC types.

Table 113: MTU Values

VC-Type	Example Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

[Tree] (config>service>cpipe service-mtu)

[Tree] (config>service>epipe service-mtu)

Full Context

configure service ipipe service-mtu

configure service cpipe service-mtu

configure service epipe service-mtu

Description

This command configures the service payload in bytes, for the service. The configured Maximum Transmission Unit (MTU) value overrides the service-type default MTU. The **service-mtu** command defines the payload capabilities of the service. It is used by the system to validate the operational state of the SAP and SDP binding within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP transitions to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, the SDP binding is placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, all associated SAP and SDP binding operational states are automatically reevaluated.

Binding operational states are automatically reevaluated.

For I-VPLS and Epipes bound to a B-VPLS, the service MTU must be at least 18 bytes smaller than the B-VPLS service MTU to accommodate the PBB header.

Because this connects a Layer 2 to a Layer 3 service, adjust the service MTU under the Epipe service. The MTU that is advertised from the Epipe side is service MTU minus EtherHeaderSize.

Note:
In the **configure**>**service**>**epipe** context, the **adv-service-mtu** command can be used to override the configured MTU value used in T-LDP signaling to the far-end of an Epipe spoke-sdp. The **adv-service-mtu** command is also used to validate the value signaled by the far-end PE. For more information, see **adv-service-mtu** command.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

By default, if **no service-mtu** is configured, the MTU value is (1514 - 14) = 1500.

Default

no service-mtu 1508 (for Apipe, Fpipe)

no service-mtu 1500 (for Ipipe)

no service-mtu 1524 (for Epipe)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 114: MTU Values lists the MTU values for specific VC types.

Table 114: MTU Values

SAP VC-Type	Example: Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

Parameters

configure service system bgp-evpn ethernet-segment service-id service-range

Description

This command associates a specified service range to a virtual ES, along with the **network-interconnect-vxlan** command. Up to eight service ranges per VXLAN instance can be configured, where the ranges may overlap. The service range may be configured before the service.

The **no** form of this command removes the association of the service range to the virtual ES for the configured VXLAN instance.

Parameters

svc-id

Specifies which service range will be associated with the virtual Ethernet Segment.

Values 1 to 2147483647

Platforms

All

service-range

Syntax

service-range *startid-endid* [**start-vlan-id** *startvid*]

no service-range

Context

[Tree] (config>service>vpls>vpls-group service-range)

Full Context

configure service vpls vpls-group service-range

Description

This command configures the service ID and implicitly the VLAN ID ranges to be used as input variables for related VPLS and SAP templates to pre-provision "data" VPLS instances and related SAPs using the service ID specified in the command. If the **start-vlan-id** is not specified then the service-range values are used for vlan-ids. The data SAPs will be instantiated on all the ports used to specify SAP instances under the related control VPLS.

Modifications of the service id and vlan ranges are allowed with the following restrictions.

- service-range increase can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state
  - By creating a new vpls-group
- service-range decrease can be achieved in two ways:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Allowed when vpls-group is in shutdown state; when **shutdown** command is executed the associated service instances are deleted.
- Allowed when vpls-group is in no shutdown state and has completed successfully instantiating services.
- In both cases, only the services that do not have user configured SAPs will be deleted. Otherwise the above commands are rejected. Existing declarations or registrations do not prevent service deletion.

- start-vlan-id change can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state
  - At the time of range decrease by increasing the start-vlan-id which can be done when vpls-group is in no shutdown state and has completed successfully instantiating services

The **no** form of this command removes the specified ranges and deletes the pre-provisioned VPLS instances and related SAPs. The command will fail if any of the VPLS instances in the affected ranges have a provisioned SAP.

Default

no service-range

Parameters

startid-endid

Specifies the range of service IDs

Values 1 to 2147483647

startvid

Specifies the starting VLAN ID; it provides a way to set aside a service ID range that is not the same as the VLAN range and allows for multiple MVRP control-VPLSs to control same VLAN range on different ports.

42.74 service-test

service-test

Syntax

service-test *name* [**create**]

no service-test

Context

[Tree] (config>test-oam>sath service-test)

Full Context

configure test-oam service-activation-testhead service-test

Description

This command creates a service test. Commands in this context configure the service test parameters.

The service test must be in the **shutdown** state before any commands under the **service-test** context can be configured or modified. If the service test is in the **no shutdown** state, command parameters cannot be modified.

The **no** form of this command removes the service test.

Parameters

name

Specifies a name, up to 64 characters, for the service test profile.

create

Mandatory keyword to instantiate the template.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

configure subscriber-mgmt gtp serving-network

Description

This command configures the Operator Identifier part (MCC and MNC) of the APN.

The **no** form of this command removes the values from the profile.

Default

no serving-network

Parameters

mcc-value

Specifies the Mobile Country Code (MCC) portion of the Serving Network.

Values 3 digits

mnc-value

Specifies the Mobile Network Code (MNC) portion of the Serving Network.

Values 2 or 3 digits

session

Syntax

session *session-name* [**test-family** [**ethernet** | **ip** | **mpls**] [**session-type** {**proactive** | **on-demand**}] **create**]

no session *session-name*

Context

[Tree] (config>oam-pm session)

Full Context

configure oam-pm session

Description

This command creates the individual session containers that house the test-specific configuration parameters. As this session context provides only a container abstract to house the individual test functions, it cannot be shut down. Individual test sessions within the container may be shut down. No values, parameters, or configuration within this context may be changed if any individual test is active. In the classic CLI, changes can only be made when all tests within the context are shut down. The description configuration is an exception to this requirement.

The **no** form of this command deletes the session.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

session-name

Specifies the session name, up to 32 characters.

test-family

Specifies the type family and sets the context for the individual parameters.

Values **ethernet** — Specifies that the test is based on the Ethernet layer.

ip — Specifies that the test is based on the IP layer.

mpls — Specifies that the test is based on the MPLS layer.

session-type

Specifies the test session test type.

Values **proactive** — Sets the type to always on, with an immediate start and no stop.

on-demand — Sets the type to on-demand, with an immediate start and no stop, or a stop based on the offset.

Default proactive

create

Keyword to create the PM session.

Platforms

42.79 session-accounting

session-accounting

Syntax

session-accounting [**interim-update**] [**host-update**]

no session-accounting

Context

[Tree] (config>subscr-mgmt>acct-plcy session-accounting)

Full Context

configure subscriber-mgmt radius-accounting-policy session-accounting

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables per session accounting mode. In per session accounting mode, the acct-session-id is generated per session. This acct-session-id is uniformly included in all accounting messages (START/INTERIM-UPDATE/STOP) and it can be included in RADIUS Access-Request message.

This accounting mode of operation can be used only in PPPoE environment with dual-stack host in which case both hosts (IPv4 and IPv6) are considered part of the same session. In addition to regular interim-updates, *triggered* interim-updates are sent by a host joining or leaving the session.

When an IPv4/v6 address is allocated, or released from a dual-stack host, a triggered interim-update message is immediately sent. This triggered interim-update message reflects the change in the IP address. The triggered interim-update has no effect on the interval at which the regular interim updates are scheduled.

Accounting counters are based on the queue counters and as such are aggregated for all host sharing the queues within an sla-profile instance.

CoA and LI is supported based on the acct-session-id of the session.

The **no** form of this command reverts to the default.

Parameters

interim-update

Specifies to enable interim updates. Without this keyword only START and STOP accounting messages are generated when the session is established or terminated. This is equivalent to a time-based accounting where only the duration of the session is required.

host-update

Indicates that host updates messages are sent. INTERIM-UPDATE messages can be generated (volume based accounting) by selecting this keyword.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router l2tp session-assign-method

configure service vprn l2tp session-assign-method

Description

This command configures the session assignment method.

The **no** form of this command reverts to the default value.

Default

no session-assign-method

Parameters

weighted

Specifies that the sessions are shared between the available tunnels. If necessary, new tunnels are set up until the maximum number is reached. The distribution aims at an equal ratio of the actual number of sessions to the maximum number of sessions.

weighted-random

Enhances the weighted algorithm such that when there are multiple tunnels with an equal number of sessions (equal weight), LAC randomly selects a tunnel.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-assign-method

Syntax

session-assign-method {**existing-first** | **weighted** | **weighted-random**}

no session-assign-method

Context

[Tree] (config>router>l2tp>group session-assign-method)

[Tree] (config>service>vprn>l2tp>group session-assign-method)

Full Context

configure router l2tp group session-assign-method

configure service vprn l2tp group session-assign-method

Description

This command specifies how new sessions are assigned to one of the set of suitable tunnels that are available or could be made available.

The **no** form of this command reverts to the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

session-assign-method existing-first

Parameters

existing-first

Specifies that all new sessions are placed by preference in the existing tunnels.

weighted

Specifies that the sessions are shared between the available tunnels. If necessary, new tunnels are set up until the maximum number is reached. The distribution aims at an equal ratio of the actual number of sessions to the maximum number of sessions.

weighted-random

Enhances the weighted algorithm such that when there are multiple tunnels with an equal number of sessions (equal weight), LAC randomly selects a tunnel.

Context

[Tree] (config>subscr-mgmt>gtp>peer-profile session-hold-time)

Full Context

configure subscriber-mgmt gtp peer-profile session-hold-time

Description

This command configures, in seconds, the time that a GTP session context is held after the corresponding UE is disconnected. If the same UE re-connects to this system before this time has elapsed, its GTP session context is re-used. When the timer expires, the GTP session context is cleared.

The **no** form of this command reverts to the default.

Default

session-hold-time 30

Parameters

remaining-lease-time

Specifies that the timer is equal to the UE's DHCP remaining lease time.

seconds

Specifies the time, in seconds, to hold a GTP session after its UE is disconnected.

Values 0 to 3600

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

42.84 session-id

session-id

Syntax

session-id *session-id*

no session-id

configure li li-source nat nat64-lsn-sub session-id

configure li li-source nat dslite-lsn-sub session-id

configure li li-source nat l2-aware-sub session-id

configure li li-source nat ethernet-header session-id

configure li li-source nat classic-lsn-sub session-id

Description

This command configures the session ID that is inserted into the packet header for all mirrored packets of the associated LI source entry. This session ID can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs.

The session ID is only valid and used for mirror services that are configured with **ip-udp-shim** routable encapsulation (**config>mirror>mirror-dest>encap>ip-gre-shim**).

For all types of li-source entries (filter, nat, sap, or subscriber), when the mirror service is configured with **ip-udp-shim** routable encapsulation, a session-id field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value is inserted. When a mirror service is configured with **ip-gre** routable encapsulation, no *session-id* is inserted and none should be specified against the **li-source** entries.

The **no** form of this command removes the *session-id* from the configuration which results in the default value being used.

Default

no session-id (an id of 0, or no id)

Parameters

session-id

Specifies the value to insert into the header of the mirrored packets.

Values 1 to 4,294,967,295 (32b)

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

session-id

Syntax

session-id [*session-id*]

no session-id

Context

[Tree] (config>li>li-source>wlan-gw session-id)

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure li li-source wlan-gw session-id

Description

This command configures the session ID inserted in the packet header for all mirrored packets of the associated li-source. When the mirror-service is configured with the **ip-udp-shim** routable encapsulation, session-id field (as part of the routable encapsulation) is always present in the mirrored packets. The session-id can be used by the LIG to identify a particular LI session to which the packet belongs.

Parameters

session-id

Specifies the session ID inserted in the LI header.

Values 1 to 4294967295

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

session-id

Syntax

session-id *session-id*

no session-id

Context

42.86 session-key

session-key

Syntax

session-key sap mac [**cid**] [**rid**]

no session-key

Context

[Tree] (config>subscr-mgmt>ipoe-plcy session-key)

Full Context

configure subscriber-mgmt ipoe-session-policy session-key

Description

This command configures the key to logically group subscriber hosts that belong to the same dual stack end device in an IPoE session.

The SAP and MAC address are always part of the IPoE session key. Optionally the Circuit-Id/Interface-Id or Remote-Id can be added to the session key.

The **no** form of this command reverts to the default.

Default

session-key sap mac

Parameters

sap

Includes the SAP as part of the IPoE session key. The **sap** parameter is mandatory and cannot be removed from the key.

mac

Includes the MAC address as part of the IPoE session key. The **mac** parameter is mandatory and cannot be removed from the key.

cid

Optionally adds the DHCPv4 Relay Agent Circuit-Id (Option 82, sub Option 1) and DHCPv6 Interface-Id (Option 18) field to the IPoE session key.

rid

Optionally adds the DHCPv4 Relay Agent Remote-Id (Option 82, sub Option 2) and DHCPv6 Remote-Id (Option 37) field to the IPoE session key. For DHCPv6, the enterprise number is excluded from the key.

sap and **mac** are mandatory parameters while **cid** and **rid** are optional and mutually exclusive. Valid IPoE session key parameters are: **sap mac**, **sap mac cid** and **sap mac rid**.

configure router l2tp session-limit

configure service vprn l2tp group tunnel session-limit

configure service vprn l2tp session-limit

configure router l2tp group tunnel session-limit

configure service vprn l2tp group session-limit

Description

This command configures the session limit.

This command configures the L2TP session limit for the router. The value controls how many L2TP sessions will be allowed within a given context (system, group, tunnel).

L2TP is connection-oriented. The L2TP Network Server (LNS) and LAC maintain state for each call that is initiated or answered by an LAC. An L2TP session is created between the LAC and LNS when an end-to-end PPP connection is established between a remote system and the LNS. Datagrams related to the PPP connection are sent over the tunnel between the LAC and LNS. There is a one-to-one relationship between established L2TP sessions and their associated calls.

The **no** form of this command removes the value from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no session-limit

Parameters

session-limit

Specifies the allowed number of sessions within the given context.

Values 1 to 131071

[**no**] **session-optimized-stop**

Context

[Tree] (config>subscr-mgmt>sub-prof>rad-acct session-optimized-stop)

Full Context

configure subscriber-mgmt sub-profile radius-accounting session-optimized-stop

Description

This command optimizes a RADIUS Accounting Stop message for a PPPoE session termination (specifically for session accounting mode when the host update is enabled). By default when a PPPoE session terminates, the system removes a dual stack host in sequence, one host at a time. Therefore, the system will generate a RADIUS accounting interim for each host termination until only the final host is left. The final host will generate a final accounting stop message. Enabling this command will trigger a single Stop RADIUS accounting message and include information of all hosts without the host updates.

Full Context

configure subscriber-mgmt ipoe-session-policy session-timeout

Description

This command defines the time in seconds between 1 second and 360 days before the IPoE session is disconnected. The default value is unlimited session timeout.

The **no** form of this command reverts to the default.

Parameters

timeout

Specifies the session timeout in seconds.

Values 1 to 31104000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

42.96 set-password

set-password

Syntax

set-password

Context

[Tree] (admin>system>security>os-security set-password)

Full Context

admin system security os-security set-password

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the OS security password.

If a security password already exists, the user must input the current password when prompted, before the system allows the configuration of a new password. The password must be between 12 and 32 characters, and cannot contain any non-printable characters, spaces, or double quotes ("). For each incorrect password attempt, the initial unsuccessful authentication wait period is doubled. This wait period applies to all users. Entering the correct password resets the wait period to the initial value for all users.

42.97 set-secret

set-secret

Syntax

set-secret

Context

[Tree] (admin>system>security>storage-encryption>primary-secret set-secret)

Full Context

admin system security storage-encryption primary-secret set-secret

Description

This command sets or changes the primary secret used as a base secret for encryption of items, such as hash3 configuration shared secrets. The user is prompted to enter the secret twice. If a primary secret is already set on this system, the user must enter the old secret to change it.

Setting or changing the primary secret will cause the main configuration to be saved to disk.

If the user is setting the primary secret on a replacement chassis as part of a chassis failure recovery, it is essential to run this command on the new chassis before copying the old configuration file from the failed chassis to the new chassis.

42.98 set-time

set-time

Syntax

set-time *date time*

Context

[Tree] (admin set-time)

Full Context

admin set-time

Description

This command sets the local system time.

The time entered should be accurate for the time zone configured for the system. The system will convert the local time to UTC before saving to the system clock which is always set to UTC. This command does not take into account any daylight saving offset if defined.

If SNTP or NTP is enabled (no shutdown) then this command cannot be used.

Parameters

date

Specifies the local date and time accurate to the minute in the YYYY/MM/DD format.

Values *YYYY* is the four-digit year

MM is the two-digit month

DD is the two-digit date

time

Specifies the time (accurate to the second) in the *hh*:*mm[:ss]* format. If no seconds value is entered, the seconds are reset to :00.

Values *hh* is the two-digit hour in 24 hour format (00=midnight, 12=noon)*mm* is the two-digit minute

Default 0

severity

Syntax

severity {**emergency** | **alert** | **critical** | **error** | **warning** | **notice** | **informational** | **debug**}

no severity

Context

[Tree] (config>log>log-id severity)

Full Context

configure log log-id severity

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the minimum syslog severity for events sent to the OpenConfig /system/messages container. This command applies only to **log-id** 102, the default non-deletable **log-id** used for the OpenConfig messages model.

The **no** form of this command removes the syslog severity. If the severity is not configured, log events of all severities are sent.

Parameters

emergency

Keyword to configure emergency events as the minimum syslog severity.

alert

Keyword to configure alert events as the minimum syslog severity.

critical

Keyword to configure critical events as the minimum syslog severity.

error

Keyword to configure error events as the minimum syslog severity.

warning

Keyword to configure warning events as the minimum syslog severity.

notice

Keyword to configure notice events as the minimum syslog severity.

informational

Keyword to configure informational events as the minimum syslog severity.

debug

Keyword to configure debug events as the minimum syslog severity.

42.104 sf-sd-method

sf-sd-method

Syntax

sf-sd-method {**bip8** | **fec**}

Context

[Tree] (config>port>otu sf-sd-method)

Full Context

configure port otu sf-sd-method

Description

This command specifies the method used to determine the signal failure (SF) and signal degrade (SD) alarms. When the **bip8** method is selected, the SM-BIP8 errors are used. When the **fec** method is selected, the FEC corrected bits are used.

The following rules must be followed:

- The port's OTU must be enabled to set or change the **sf-sd-method**.
- The FEC mode must be **enhanced** or **g709** before setting **sf-sd-method** to **fec**.
- The SF threshold must be 5 or higher before setting **sf-sd-method** to **bip8**.

Default

sf-sd-method fec

Parameters

bip8

Specifies that SM-BIP8 errors are used to declare the presence of the SF and SD conditions.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fec

Specifies that FEC corrected bit errors are used to declare the presence of the SF and SD conditions.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

42.105 sf-threshold

sf-threshold

Syntax

sf-threshold *threshold* [**multiplier** *multiplier*]

no sf-threshold

Context

[Tree] (config>esa>crc-monitor sf-threshold)

Full Context

configure esa crc-monitor sf-threshold

Description

This command configures the error rate at which to declare the signal failure (SF) condition on an Ethernet interface. The value represents M*10E-N, errored frames over total frames received over W seconds of the sliding window. The CRC errors on the interface are sampled once per second. A default of 10 seconds is used when no additional **window-size** is configured. If you omit the **multiplier** value or configure **no sf-threshold**, the multiplier returns to the default value of 1.

Note: Crossing the configured signal failure (SF) threshold causes the router ESA port to enter an operational state of down when the router side detects the SF, or the port is shut down when the ESA detects the SF, which triggers redundancy for all configured ISA groups.

The **no** form of this command removes the configuration.

Default

no sf-threshold

Parameters

threshold

Specifies the SF threshold.

Values 1 to 9

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

multiplier

Specifies the SF multiplier.

Values 1

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

sf-threshold

Syntax

sf-threshold *threshold* [**coefficient** *coefficient*]

Context

[Tree] (config>port>otu sf-threshold)

Full Context

configure port otu sf-threshold

Description

This command defines the error rate at which to declare the signal failure (SF) condition.

The parameters define an error rate of (*coefficient*/10) * 10E-*threshold*. For example, **sf-threshold 5 coefficient 20** defines an error rate of (20/10) * 10E-5, or 2 * 10E-5, or 0.000 02.

The SF threshold must be the following:

- less than the SD threshold
- 5 or higher before setting **sf-sd-method** to **bip8**

The **coefficient** parameter is only used when **sf-sd-method** is set to **fec**. When **sf-sd-method** is set to **bip8**, **coefficient** is considered to have the value of 10.

Parameters

threshold

Specifies the exponent for the SF threshold value.

Values 3 to 6 when **sf-sd-method** is **bip8**

3 to 8 when **sf-sd-method** is **fec**

Default 5

coefficient

Specifies the coefficient for the SF threshold value.

Values 10 to 99

Default 10

no sf-threshold

Context

[Tree] (config>port>ethernet>sym-mon sf-threshold)

Full Context

configure port ethernet symbol-monitor sf-threshold

Description

This command specifies the error rate at which to declare the Signal Fail condition on an Ethernet interface. The value represents M*10E-N symbol errors over total symbols received over W seconds of the sliding window. The symbol errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or no sf-threshold is specified, the multiplier will return to the default value of 1.

Default

no sf-threshold

Parameters

threshold

Specifies the rate of symbol errors.

Values 1 to 9

multiplier

Specifies the multiplier used to scale the symbol error ratio.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 9

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sf-threshold

Syntax

sf-threshold *threshold* [**multiplier** *multiplier*]

no sf-threshold

Context

[Tree] (config>port>ethernet>crc-monitor sf-threshold)

Full Context

configure port ethernet crc-monitor sf-threshold

Description

This command specifies the error rate at which to declare the Signal Fail condition on an Ethernet interface. The value represents M*10E-N errored frames over total frames received over W seconds of the sliding window. The CRC errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or **no sf-threshold** is specified the multiplier will return to the default value of 1.

Default

no sf-threshold

Parameters

threshold

Specifies the threshold value.

Values 1 to 9

multiplier

Specifies the multiplier value.

Values 1 to 9

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

42.106 sf-threshold-clear

sf-threshold-clear

Syntax

sf-threshold-clear *threshold* [**coefficient** *coefficient*]

Context

[Tree] (config>port>otu sf-threshold-clear)

Full Context

configure port otu sf-threshold-clear

Description

This command defines the signal failure (SF) threshold clear value.

When the bit error rate falls below this value, the SF condition is cleared. The parameters define an error rate of (*coefficient*/10) * 10E-*threshold*. For example, **sf-threshold-clear 7 coefficient 10** defines an error rate of (10/10) * 10E-7, or 10E-7, or 0.000 000 1.

This SF threshold clear setting is valid only when **sf-sd-method** is set to **fec**.

Parameters

threshold

Specifies the exponent for the SF threshold clear value.

Values 3 to 9

Default 6

coefficient

Specifies the coefficient for the SF threshold clear value.

Values 10 to 99

Default 10

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

42.108 sfm

sfm

Syntax

sfm *sfm-name*

no sfm *sfm-name*

Context

[Tree] (config sfm)

Full Context

configure sfm

Description

Commands in this context configure the specified SFM.

The **no** form of this command removes the SFM configuration for the specified SFM.

Parameters

sfm-name

Specifies the SFM identifier.

Values 1 to 4

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

42.109 sfm-loss-threshold

sfm-loss-threshold

Syntax

sfm-loss-threshold *num-sfm*

no sfm-loss-threshold

Context

[Tree] (config>system>switch-fabric sfm-loss-threshold)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure system switch-fabric sfm-loss-threshold

Description

This command sets the number of SFMs that are permitted to fail before the system goes into SFM overload state. This command is only applicable on the 7750 SR-7s and the 7750 SR-14s. Users can select the SFM limit based on the number possible for the system minus one. For the 7750 SR-7s this is a value of 3 and for the 7750 SR-14s this is a value of 7.

For networks that can accommodate more SFM failures than the default value, this command allows the selection of the number of SFMs to fail prior to the system going into SFM overload state.

The **no** form of this command reverts the threshold to the default value.

Default

7750 SR-7s: sfm-loss-threshold 1

7750 SR-14s: sfm-loss-threshold 2

Parameters

num-sfm

Specifies the number of SFMs permitted to fail before SFM overload state.

Values 1 to 7

Platforms

7750 SR-7s, 7750 SR-14s

42.110 sfm-type

sfm-type

Syntax

42.115 sham-link

sham-link

Syntax
sham-link *ip-int-name ip-address*

Context
[Tree] (config>service>vprn>ospf>area sham-link)

Full Context
configure service vprn ospf area sham-link

Description
This command is similar to a virtual link with the exception that metric must be included in order to distinguish the cost between the MPLS-VPRN link and the backdoor.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-int-name

The local interface name used for the sham-link. This is a mandatory parameter and interface names must be unique within the group of defined IP interfaces for **config>router>if**, **config>service>ies>if** and **config>service>vprn>if** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters, the entire string must be enclosed between double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message will be returned.

ip-address

The IP address of the sham-link neighbor in IP address dotted decimal notation. This parameter is the remote peer of the sham link's IP address used to set up the sham-link. This is a mandatory parameter and must be a valid IP address.

Platforms

All

42.116 sham-neighbor

configure service ies subscriber-interface group-interface wlan-gw egress shaping

Description

This command configures the granularity of the egress shaping for wlan-gw on this group interface.

The **no** form of this command removes the parameter from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

per-tunnel

Specifies that a separate shaper is applied to each wlan-gw tunnel.

per-retailer

Specifies that a separate shaper is applied to each retailer Mobile Network Operator's fraction of the wlan-gw tunnel payload.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

42.120 shared-circuit-id

shared-circuit-id

Syntax

[**no**] **shared-circuit-id**

Context

[Tree] (config>service>ies>sub-if>grp-if shared-circuit-id)

[Tree] (config>service>vprn>sub-if>grp-if shared-circuit-id)

Full Context

configure service ies subscriber-interface group-interface shared-circuit-id

configure service vprn subscriber-interface group-interface shared-circuit-id

Description

If configured, circuit-id in DHCPv4 Option82 is used to authenticate DHCPv6. If DHCPv6 is received before DHCPv4, it is dropped. Also, a SLAAC host is created based on DHCPv4 authentication if RADIUS returns IPv6 framed-prefix. The IPv6oE host is deleted if the linked IPv4oE host is deleted due to DHCP release or lease time-out. The linkage between IPv4 and IPv6 is based on SAP and MAC address. The sharing of circuit-id from DHCPv4 for authentication of DHCPv6 (or SLAAC) allows 7750 SR to work around lack of support for LDRA on access nodes.

The **no** form of this command reverts to the default.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure port network egress pool monitor-pool-depth alarm-thresholds shared-pool-in-use

configure port access egress pool monitor-pool-depth alarm-thresholds shared-pool-in-use

configure card fp ingress network pool monitor-pool-depth alarm-thresholds shared-pool-in-use

configure port access ingress pool monitor-pool-depth alarm-thresholds shared-pool-in-use

Description

This command configures the threshold for the shared pool in use.

A tmnxSharedPoolUseThreshExcd trap is generated when the shared pool usage exceeds this threshold percentage. When the usage returns below the threshold percentage, the tmnxSharedPoolUseThreshNotExcd trap is generated

The **no** form of this command removes the threshold on which to alarm.

Default

no shared-pool-in-use

Parameters

percentage

Specifies the shared pool in-use alarm threshold.

Values 0.01 to 100.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

42.123 shared-queue

shared-queue

Syntax

shared-queue *policy-name* [**create**]

no shared-queue *policy-name*

Context

[Tree] (config>qos shared-queue)

Full Context

configure qos shared-queue

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

Commands in this context modify the QoS default shared-queue policy.

Parameters

policy-name

The name of the default shared-queue policy.

Values default

Platforms

All

shared-queue

Syntax

shared-queue *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy shared-queue)

Full Context

configure qos copy shared-queue

Description

This command copies an existing **shared-queue** to another **shared-queue**. The **copy** command is a configuration level maintenance tool used to create new entries using an existing mapping policy name. If **overwrite** is not specified, an error occurs if the destination policy exists.

Parameters

src-name

Specifies the existing source **shared-queue**, up to 32 characters, from which the **copy** command attempts to copy.

dst-name

Specifies the destination **shared-queue**, up to 32 characters, to which the copy command attempts to copy.

overwrite

Use this parameter when the **shared-queue** *dst-name* already exists. If it does, everything in the existing destination **shared-queue** *dst-name* is completely overwritten with the contents of the **shared-queue** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI Destination "sqtest10" exists - use {overwrite}.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make" manner and therefore should be handled with care.

[Tree] (config>router>mpls shortcut-local-ttl-propagate)

Full Context

configure router ldp shortcut-local-ttl-propagate

configure router mpls shortcut-local-ttl-propagate

Description

This command configures the TTL handling of locally generated packets for all LSP shortcuts originating on this ingress LER. It applies to all LDP or RSVP LSPs that are used to resolve static routes, BGP routes, and IGP routes.

The user can enable or disable the propagation of the TTL from the header of an IP packet into the header of the resulting MPLS packet independently for local and transit packets forwarded over an LSP shortcut.

Local IP packets include ICMP Ping, traceroute, and OAM packets, that are destined to a route that is resolved to the LSP shortcut. Transit IP packets are all IP packets received on any IES interface and destined to a route that is resolved to the LSP shortcut

By default, the feature propagates the TTL from the header of locally generated IP packets into the label stack of the resulting MPLS packets forwarded over the LSP shortcut. This is referred to as Uniform mode.

When the **no** form of this command is enabled, TTL propagation is disabled on all locally generated IP packets, including ICMP Ping, traceroute, and OAM packets, that are destined to a route that is resolved to the LSP shortcut. In this case, a TTL of 255 is programmed onto the pushed label stack. This is referred to as Pipe mode.

Context

[Tree] (config>router>bgp>next-hop-resolution shortcut-tunnel)

Full Context

configure router bgp next-hop-resolution shortcut-tunnel

Description

This command creates the context to configure the tunnel types that can be used to resolve unlabeled IPv4 and IPv6 BGP routes.

The following tunnel types are supported for resolving IPv4 routes and IPv6 routes with IPv4-mapped IPv6 next-hop addresses: bgp, ldp, rsvp, sr-isis, sr-ospf, sr-policy and sr-te. In this context:

- **bgp** — refers to IPv4 tunnels created by receiving BGP label-unicast IPv4 routes for /32 IPv4 prefixes.
- **ldp** — refers to /32 and shorter length LDP FEC prefixes imported into the tunnel table. For IPv4 NLRI, BGP selects the LDP FEC that is the longest-prefix-match (LPM) of the BGP next-hop address. For IPv6 NLRI, BGP selects the /32 FEC that is an exact match of the BGP next-hop address.
- **rsvp** — refers to RSVP tunnels in the tunnel table to IPv4 destinations. This option allows BGP to use the best metric RSVP LSP to the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface of the remote BGP router. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel id.
- **sr-ospf** — refers to SR tunnels (shortest path) to IPv4 destinations reachable by the OSPF protocol. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference OSPF instance. In case of a tie, the OSPF instance with the lowest metric SR tunnel is selected over the lowest numbered OSPF instance.
- **sr-ospf3** — refers to SR tunnels (shortest path) to IPv4 destinations reachable by the OSPFv3 protocol. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference OSPFv3 instance. In case of a tie, the OSPFv3 instance with the lowest metric SR tunnel is selected over the lowest numbered OSPFv3 instance.
- **sr-isis** — refers to SR tunnels (shortest path) to IPv4 destinations reachable by the IS-IS protocol. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference IS-IS instance. In case of a tie, the IS-IS instance with the lowest metric SR tunnel is selected over the lowest numbered IS-IS instance.
- **sr-policy** — refers to SR policies that are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73 or AFI 2/SAFI 73). BGP resolves an IPv4 route with an IPv4 next-hop address or an IPv6 route with IPv4-mapped IPv6 next-hop address using a SR policy selected by applying the following procedure in preference order:
  - **IPv4 endpoint**

    The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the SR policy.
  - **null IPv4 endpoint (0.0.0.0)**

    The highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.
  - **null IPv6 endpoint (0::0)**

    The highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- **sr-te** — refers to traffic engineered (TE) SR tunnels. This option allows BGP to use the best metric IPv4 SR-TE tunnel to the address of the BGP next hop. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID.
- **udp** — refers to MPLSoUDPoIPv4 tunnels set up by action of the BGP import policies.

The following tunnel types are supported for resolving IPv6 routes with IPv6 next-hops that are not IPv4-mapped IPv6 addresses: ldp, sr-isis, sr-ospf3, sr-te, and sr-policy. In this context:

- **ldp** — refers to /128 LDP FEC prefixes in the tunnel table. BGP selects the /128 FEC that is an exact match of the BGP next-hop address.
- **sr-isis** — refers to SR tunnels (shortest path) to IPv6 destinations reachable by the IS-IS protocol. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference IS-IS instance. In case of a tie, the IS-IS instance with the lowest metric SR tunnel is selected over the lowest numbered IS-IS instance.
- **sr-ospf3** — refers to SR tunnels (shortest path) to IPv6 destinations reachable by the OSPFv3 protocol. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference OSPFv3 instance. In case of a tie, the OSPFv3 instance with the lowest metric SR tunnel is selected over the lowest numbered OSPFv3 instance.
- **sr-te** — refers to traffic engineered (TE) SR tunnels. This option allows BGP to use the best metric IPv6 SR-TE tunnel to the address of the BGP next hop. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID.
- **sr-policy** — refers to SR policies that are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73 or AFI 2/SAFI 73). BGP resolves an IPv6 route with an IPv6 next hop that is not an IPv4-mapped IPv6 address using a SR policy selected by applying the following procedure in preference order:
  - **IPv6 endpoint**

    The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the IPv6 route must match the color of the SR policy.
  - **null IPv6 endpoint (0.::0)**

    The highest numbered color extended community attached to the IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.
  - **null IPv4 endpoint (0.0.0.0)**

    The highest numbered color extended community attached to the IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

Context

[Tree] (admin>certificate>cmpv2 show-request)

Full Context

admin certificate cmpv2 show-request

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command displays current the CMPv2 pending request toward the specified CA. If there is no pending request, the last pending request is displayed including the status (success/fail/rejected) and the receive time of last CMPv2 message from server.

The following information is included in the output:

- Request type, original input parameter (password is not displayed), checkAfter and reason in of last PollRepContent, time of original command input.

Parameters

ca-profile-name

Specifies a ca-profile name, up to 32 characters. If not specified, the system will display pending requests of all ca-profiles.

Platforms

Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The operational state of the entity, as well as the operational state of any entities contained within it, is disabled. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command places the entity into an administratively enabled state.

Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The operational state of the entity, as well as the operational state of any entities contained within it, is disabled. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

The **no** form of this command places the entity into an administratively enabled state.

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>subscr-mgmt>shcv-policy>trigger shutdown)

Full Context

configure subscriber-mgmt shcv-policy trigger shutdown

Description

This command administratively disables the SHCV triggers.

The **no** form of this command administratively enables the the SHCV triggers.

Default

no shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>vprn>static-route-entry>follow shutdown)

[Tree] (config>subscr-mgmt>shcv-policy>periodic shutdown)

Full Context

configure service vprn static-route-entry follow shutdown

configure subscriber-mgmt shcv-policy periodic shutdown

Description

This command administratively disables the periodic connectivity verification.

The **no** form of this command administratively enables the periodic connectivity verification.

Default

no shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

- configure service vprn static-route-entry follow shutdown

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure subscriber-mgmt shcv-policy periodic shutdown

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>ies>sub-if>grp-if>ipoe-session shutdown)

[Tree] (config>service>vpls>sap>ipoe-session shutdown)

[Tree] (config>service>vprn>sub-if>grp-if>ipoe-session shutdown)

Full Context

configure service ies subscriber-interface group-interface ipoe-session shutdown

configure service vpls sap ipoe-session shutdown

configure service vprn subscriber-interface group-interface ipoe-session shutdown

Description

The **shutdown** command enables or disables IPoE session management on a group interface or capture SAP.

A **shutdown** of the IPoE session CLI hierarchy on a group-interface clears all active IPoE sessions on that interface, resulting in a deletion of all corresponding subscriber hosts.

On wlan-gw group interfaces it is not possible to disable an IPoE session.

The **no** form of this command reverts to the default.

Default

shutdown

no shutdown on wlan-gw group interfaces

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Description

The **shutdown** command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they can be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

Shutting down a subscriber interface on a 7750 SR will operationally shut down all child group interfaces and SAPs. Shutting down a group interface on a 7750 SR will operationally shut down all SAPs that are part of that group-interface.

The **no** form of this command puts an entity into the administratively enabled state.

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

If the AS number was previously changed, the BGP AS number inherits the new value.

Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

Context

[Tree] (config>card>fp>egress>wred-queue-control shutdown)

Full Context

configure card fp egress wred-queue-control shutdown

Description

This command enables or disables egress WRED queue support on the forwarding plane. By default, WRED queue support is disabled (shutdown). While disabled, the various wred-queue-control commands may be executed on the forwarding plane and SAP egress QoS policies and egress queue group templates with wred-queue enabled may be applied to egress SAPs and port, respectively. The forwarding plane will allocate WRED pools to the WRED queues and the appropriate WRED mega-pool size and CBS reserve size will be calculated, but the WRED mega-pool will be empty and all buffers will be allocated to the default mega-pool. Each WRED queue will be mapped to its appropriate default pool.

Once the **no shutdown** command is executed, the calculated WRED mega-pool buffers will be moved from the default mega-pool to the WRED mega-pool. The WRED mega-pool CBS reserve size will be applied and each egress WRED queue will be moved from its default mega-pool buffer pool to its WRED pool within the WRED mega-pool hierarchy.

The **no** form of this command enables WRED queuing on an egress forwarding plane.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[**no**] **shutdown**

Context

[Tree] (config>port>ethernet>efm-oam>link-monitoring shutdown)

[Tree] (config>lag>efm-member-template>link-monitoring shutdown)

Full Context

configure port ethernet efm-oam link-monitoring shutdown

configure lag efm-member-template link-monitoring shutdown

Description

This command enables the link monitoring function. Issuing a no shutdown will start the process. Issuing a shutdown will clear any previously established negative conditions that were a result of the link monitoring process on this port and all collected data. This also controls the advertising capabilities.

The **no** form of this command activates the link monitoring function.

Default

shutdown

Platforms

All

- configure port ethernet efm-oam link-monitoring shutdown

7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

- configure lag efm-member-template link-monitoring shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>port>ethernet>dot1x>macsec>sub-port shutdown)

Full Context

configure port ethernet dot1x macsec sub-port shutdown

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command shuts down the MACsec under this sub-port specifically, including MKA negotiation. In the shutdown state, this port is not MACsec capable and all PDUs will be transmitted and expected without encryption and authentication.

The **no** form of this command puts the port in MACsec-enabled mode. A valid CA, different than any other CA configured on any other sub-port of this port and also a *max-peer* value larger than 0 must be configured. In MACsec-enabled mode, packets are sent in cleartext until the MKA session is up, and if the **rx-must-be-encrypted** is set on the port, all incoming packets with no MACsec encapsulations are dropped.

Full Context

configure service vpls provider-tunnel inclusive shutdown

Description

This command administratively enables and disables the service.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>vpls>proxy-arp shutdown)

[Tree] (config>service>vpls>proxy-nd shutdown)

Full Context

configure service vpls proxy-arp shutdown

configure service vpls proxy-nd shutdown

Description

This command enables and disables the proxy-ARP and proxy-nd functionality. ARP/GARP/ND messages will be snooped and redirected to the CPM for lookup in the proxy-ARP/proxy-ND table. The proxy-ARP/proxy-ND table is populated with IP->MAC pairs received from different sources (EVPN, static, dynamic). When the **shutdown** command is issued, it flushes the dynamic/EVPN dup proxy-ARP/proxy-ND table entries and instructs the system to stop snooping ARP/ND frames. All the static entries are kept in the table as *inactive*, regardless of their previous *Status*.

configure router ldp interface-parameters interface ipv4 shutdown

configure router ldp aggregate-prefix-match shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted. For an LDP interface, the **shutdown** command exists under the main interface context and under each of the interface IPv4 and IPv6 contexts.

- **shutdown** under the **interface** context brings down both IPv4 and IPv6 Hello adjacencies and stops Hello transmission in both contexts.
- **shutdown** under the **interface** IPv4 or IPv6 contexts brings down the Hello adjacency and stops Hello transmission in that context only.

The user can also delete the entire IPv4 or IPv6 context under the interface with the **no ipv4** or **no ipv6** command which in addition to bringing down the Hello adjacency will delete the configuration.

The **no** form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the **shutdown** and **no shutdown** states are always indicated in system generated configuration files.

configure router mpls shutdown

configure router mpls ingress-statistics p2p-template-lsp shutdown

configure router mpls lsp primary-p2mp-instance shutdown

configure router mpls lsp primary shutdown

configure router mpls interface shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The **config**>**router**>**mpls**>**ingr-stats**>**p2mp-template-lsp**> **shutdown** command is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

The **config**>**router**>**mpls**>**lsp**>**primary-p2mp-instance**> **shutdown** is not supported on the 7450 ESS.

MPLS is not enabled by default and must be explicitly enabled (**no shutdown**).

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command places the entity into an administratively enabled state.

Context

[Tree] (config>app-assure>group>transit-ip>diameter shutdown)

Full Context

configure application-assurance group transit-ip-policy diameter shutdown

Description

This command removes all transit AA subscribers created via Diameter on this transit AA subscriber IP policy and clears all corresponding Diameter sessions.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>isa>aa-grp>overload-sub-quarantine shutdown)

Full Context

configure isa application-assurance-group overload-sub-quarantine shutdown

Description

This command disables the overload subscriber detection algorithm in the ISA group for the purpose of quarantining an overloaded subscriber. It is possible to manually quarantine an AA subscriber even when this command is disabled (**shutdown**).

The **no** form of this command enables the overload subscriber detection algorithm in the ISA group. When enabled, each ISA monitors the traffic on a continuous basis to identify AA subscribers that occupy more than their fair share of ISA resources and need to be quarantined.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>nat>map-domain>mapping-rule shutdown)

Full Context

configure service nat map-domain mapping-rule shutdown

Description

This command enables or disables a rule within a MAP domain. A MAP rule can be enabled (**no shutdown**) only when all parameters within the rule are defined. Disabling a rule within an instantiated MAP domain will withdraw the rule IPv4 routes and disable forwarding for the rule.

Interactions:

config>service>vprn>nat>map>map-domain *domain-name*

config>service>router>nat>map>map-domain *domain-name*

Shutdown of an instantiated MAP rule disables the rule (the rule routes will be withdrawn and forwarding will be disabled).

configure router interface vrrp shutdown

configure router interface ipv6 vrrp shutdown

configure vrrp policy shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables an entity.

Default

no shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown** [**active**] [**standby**]

[**no**] **shutdown** [*cflash-id*]

Context

[Tree] (file shutdown)

Full Context

file shutdown

Description

This command shuts down (unmounts) the specified CPM(s).

Use the **no shutdown** [**active**] [**standby**] command to enable one or both CPM.

Use the **no shutdown** [*cflash-id*] command to enable a compact flash (cf1:, cf2:, or cf3:) on the CPM/CCM. The **no shutdown** command can be issued for a specific slot when no compact flash is present. When a flash card is installed in the slot, the card will be activated upon detection.

In redundant systems, use the **no shutdown** command on cf3: on both SF/CPMs or CCMs in order to facilitate synchronization. See the **config>redundancy synchronize** command.

Note:
The **shutdown** command must be issued prior to removing a flash card. If no parameters are specified, then the drive referred to by the current working directory will be shut down.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

LED Status Indicators

Table 119: LED Status Indicators lists the possible states for the compact flash and their LED status indicators.

Table 119: LED Status Indicators

State	Description
Operational	If a compact flash is present in a drive and operational (no shutdown), the respective LED is lit green. The LED flickers when the compact flash is accessed. **Note:** Do not remove the compact flash during a read/write operation.
Flash defective	If a compact flash is defective, the respective LED blinks amber to reflect the error condition and a trap is raised.
Flash drive shut down	When the compact flash drive is shut down and a compact flash present, the LED is lit amber. In this state, the compact flash can be ejected.
No compact flash present, drive shut down	If no compact flash is present and the drive is shut down the LED is unlit.
No compact flash present, drive enabled	If no compact flash is present and the drive is not shut down the LED is unlit.
Ejecting a compact flash	The compact flash drive should be shut down before ejecting a compact flash card. The LED should turn to solid (not blinking) amber. This is the only mode to safely remove the flash card. If a compact flash drive is not shut down before a compact flash is ejected, the LED blinks amber for approximately 5 seconds before shutting off.

The **shutdown** or **no shutdown** state is not saved in the configuration file. Following a reboot all compact flash drives are in their default state.

Default

no shutdown

Parameters

cflash-id

Specifies the compact flash slot ID to be shut down or enabled. If *cflash-id* is specified, the drive is shut down or enabled. If no *cflash-id* is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, then the active CPM is assumed.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default the current compact flash device

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

active

Specifies that all drives on the active CPM are shutdown or enabled.

standby

Specifies that all drives on the standby CPM are shutdown or enabled.

When both **active** and **standby** keywords are specified, then all drives on both CPM are shutdown.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>satellite>eth-sat shutdown)

Full Context

configure system satellite eth-sat shutdown

Description

This command disables the associated satellite.

If the associated satellite is active, the satellite will not be reset but all satellite client ports will be shut down.

If the satellite is not active but attempts to associate with the host, the satellite chassis will be brought up according to the satellite configuration but all client ports will be shut down.

The **no** form of this command removes the shutdown state and all client ports on active satellites will be brought back up.

Default

shutdown

Platforms

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>ptp>peer shutdown)

Full Context

configure system ptp peer shutdown

Description

This command disables or enables a specific PTP peer. Shutting down a peer sends cancel unicast negotiation messages on any established unicast sessions. When shutdown, all received packets from the peer are ignored.

If the clock-type is **ordinary slave** or **boundary**, and PTP is **no shutdown**, the last enabled peer cannot be shutdown. This prevents the user from having PTP enabled without any peer configured and enabled.

Default

no shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>ptp>port shutdown)

Full Context

configure system ptp port shutdown

Description

This command disables or enables a specific PTP port. When shutdown, all PTP Ethernet messages are dropped on the IOM They will not be counted in the PTP message statistics. No PTP packets are transmitted by the node toward this port.

If the clock-type is **ordinary slave** or **boundary**, and PTP is **no shutdown**, the last enabled port or peer cannot be shutdown. This prevents the user from having PTP enabled without any means to synchronize the local clock to a parent clock.

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>test-oam>link-meas>template shutdown)

Full Context

configure test-oam link-measurement measurement-template shutdown

Description

This command administratively enables and disables the measurement template. The **measurement-template** can be referenced even if it is disabled. The template must be administratively enabled to transmit probes on any associated IP interface. The template configuration can be modified even if it is administratively enabled. The template can be administratively disabled even if interfaces are actively registered with the template. When the template configuration is modified, all registered IP interfaces start from the initial state and enter a first reporting scenario. This is true even if the template is administratively disabled and enabled, and no configuration changes are made.

The **no** form of this command disables the measurement template.

43 s Commands – Part III

43.1 sid

sid

Syntax

sid label *value*

Context

[Tree] (config>router>isis>segm-rtng>adjacency-set sid)

[Tree] (config>router>ospf>segm-rtng>adjacency-set sid)

Full Context

configure router isis segment-routing adjacency-set sid

configure router ospf segment-routing adjacency-set sid

Description

This command allows a static SID value to be assigned to an adjacency set in IS-IS or OSPF segment routing.

The **label** option specifies the value is assigned to an MPLS label.

The **no** form of this command removes the adjacency SID.

Parameters

label value

Specifies the value of adjacency SID label.

Values 18432 to 524287 | 1048575 (FP4 only)

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

43.2 sid-action

sid-action

Syntax

sid-action *action*

no sid-action

Context

[Tree] (config>router>p2mp-sr-tree>replication-segment>sr-mpls sid-action)

Full Context

configure router p2mp-sr-tree replication-segment segment-routing-mpls sid-action

Description

This command configures the SID action to take for the replication segment of the P2MP SR tree.

The **no** form of this command removes the SID action.

Default

no sid-action

Parameters

action

Specifies the name of the SID action.

Values **push** — Specifies that an outgoing SID list is pushed and forwarded on to the corresponding programmed outgoing interfaces.

pop — Specifies that on the leaf node the incoming SID is popped on the underlay packet forwarded to the host.

swap — Specifies, if an incoming SID is configured, that the SID is swapped with an outgoing SID or SID list and forwarded to the corresponding OIF.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

43.3 sid-allocation

sid-allocation

Syntax

sid-allocation {**sequential** | **random**}

no sid-allocation

Context

[Tree] (config>subscr-mgmt>ppp-policy sid-allocation)

Full Context

configure subscriber-mgmt ppp-policy sid-allocation

Description

This command configures the method for allocating the PPPoE session ID.

For both **sequential** and **random** options, the session ID range is 1 to 8191.

The **no** form of this command reverts to the default.

Default

sid-allocation sequential

Parameters

sequential

Specifies for PPPoE sessions with the same client MAC address and active on the same SAP, to allocate the session ID in sequential order starting with

ID = 1.

random

Specifies for PPPoE sessions with the same client MAC address and active on the same SAP, to allocate a unique session ID in random order.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

43.4 sid-length

sid-length

Syntax

sid-length *sid-length*

Context

[Tree] (conf>router>sr>srv6>micro-segment sid-length)

Full Context

configure router segment-routing segment-routing-v6 micro-segment sid-length

Description

This command configures the length of the micro-segments.

Default

sid-length 16

Parameters

sid-length

Specifies the length of micro-segments, in bits.

Values 16

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

43.5 sid-map

sid-map

Syntax

sid-map node-sid {**index** *value* [**range** *value*]} **prefix** {{*ip-address*/*mask*} | {*ip-address*} {*netmask*}} [**set-flags** {**s**}] [**level** { **1** | **2** | **1/2**}] [**clear-n-flag**]

no sid-map node-sid index *value*

Context

[Tree] (config>router>isis>segm-rtng>mapping-server sid-map)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router isis segment-routing mapping-server sid-map

Description

This command configures the Segment Routing mapping server database in IS-IS.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value can be entered. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. The user can enter the first prefix with a mask lower than 32 and the SID or label binding TLV is advertised, but the routers will not resolve these prefix SIDs and will generate a trap.

By setting the S-flag, the user can indicate to the IS-IS routers in the rest of the network that the flooding scope of the SID or label binding TLV is the entire domain. In that case, a router receiving the TLV advertisement should leak it between ISIS levels. If leaked from level 2 to level 1, the D-flag must be set and once set the TLV cannot be leaked back into level 2. Otherwise, the S-flag is clear by default and the TLV must not be leaked by routers that receive the mapping server advertisement.

Note that the SR OS does not leak this TLV between IS-IS instances and does not support the multi-topology SID/Label Binding TLV format.

In addition, the user can specify the mapping server own flooding scope for the generated SID or label binding TLV using the **level** option. This option allows the user to narrow the flooding scope configured under the router IS-IS level-capability for a one or more SID or label binding TLVs if required. The default flooding scope of the mapping server is Layer 1 or Layer 2, which can be narrowed by the value configured under the router IS-IS level-capability.

The A-flag and M-flag are not supported by the mapping server feature. The mapping client ignores the flags.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix or range of prefixes, a prefix-SID sub-TLV within a ISIS SID or label binding TLV in that instance. The flooding scope of the TLV from the mapping server is determined as explained above. No further check of the reachability of that prefix in the mapping server route table is performed. Additionally, no check is performed if the SID index is a duplicate of an existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Parameters

index

Specifies the node SID index for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

Values 0 to 4294967295

value

Specifies the node SID range for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

Values 0 to 65535

ip-address/mask

Specifies the IP address and mask.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values *ip-address:* **a.b.c.d.** (host bits must be 0)

mask: **0 to 32**

ip-address netmask

Specifies the IP address netmask.

Values **a.b.c.d.** (network bits all 1 and host bits all 0)

set-flags

Specifies the flooding scope of the SID/Label binding TLV.

Default **S-flag clear**

The TLV is not leaked by routers receiving the mapping server advertisement

level {1 | 2| 1/2}

Configures the mapping server own flooding scope for the generated SID/Label binding TLV.

Default 1/2

clear-n-flag

Specifies whether the node-sid flag (N-flag) should be cleared in a SID Label Binding TLV.

Platforms

All

sid-map

Syntax

sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*]

sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*] **scope** {**area** *area-id* | **as**}

no sid-map node-sid index *index-value*

Context

[Tree] (config>router>ospf>segm-rtng>mapping-server sid-map)

Full Context

configure router ospf segment-routing mapping-server sid-map

Description

This command configures the Segment Routing mapping server database in OSPF.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. If the user enters the first prefix with a mask lower than 32, the OSPF

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Extended Prefix Range TLV is advertised but a router which receives it will not resolve SID and instead originates a trap.

The user specifies the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV using the scope option. There is no default value. If the scope is a specific area, then the TLV is flooded only in that area.

An ABR that propagates an intra-area OSPF Extended Prefix Range TLV flooded by the mapping server in that area into other areas, sets the inter-area flag (IA-flag). The ABR also propagates the TLV if received with the inter-area flag set from other ABR nodes but only from the backbone to leaf areas and not vice-versa. However, if the exact same TLV is advertised as an intra-area TLV in a leaf area, the ABR will not flood the inter-area TLV into that leaf area.

Note: SR OS does not leak this TLV between OSPF instances.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix, or range of prefixes, a prefix-SID sub-TLV within a OSPF Extended Prefix Range TLV in that instance. The flooding scope of the TLV from the mapping server is determined as previously explained. No further check of the reachability of that prefix in the mapping server route table is performed and no check if the SID index is duplicate with some existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Default

no prefix-sid-range

Parameters

index index-value

Specifies the index.

Values 0 to 4294967295

range range-value

Specifies the range.

Values 1 to 65535

prefix ip-address/mask

Specifies the IP address in dotted decimal notation.

Values ip-address/mask:

- ip-address a.b.c.d (host bits must be 0)

mask: 0 to 132

netmask

Specifies the netmask.

Values netmask — a.b.c.d (network bits all 1 and host bits all 0)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

area area-id

Configures the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV.

Values ip-address | 0 to 4294967295

Platforms

All

43.6 sid-protection

sid-protection

Syntax

[**no**] **sid-protection**

Context

[Tree] (config>router>isis>interface sid-protection)

Full Context

configure router isis interface sid-protection

Description

This command enables or disables adjacency SID protection by LFA and remote LFA.

While LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternates** option in IS-IS or OSPF at the LER and LSR, there are applications where the user wants traffic to never divert from the strict hop computed by CSPF for a SR-TE LSP. In that case, the user can disable protection for all adjacency SIDs formed over a given network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

Default

sid-protection

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sid-protection

Syntax

[**no**] **sid-protection**

Context

[Tree] (config>router>ospf>area>interface sid-protection)

Full Context

configure router ospf area interface sid-protection

Description

This command enables or disables adjacency SID protection by LFA and remote LFA.

LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternate** option in IS-IS or OSPF at the LER and LSR. However, may be applications where the user never wants traffic to divert from the strict hop computed by CSPF for an SR-TE LSP. In this case, the user can disable protection for all adjacency SIDs formed over a particular network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

Default

sid-protection

43.7 signal-cnr-mask

signal-cnr-mask

Syntax

signal-cnr-mask *ratio value*

Context

[Tree] (config>port>gnss signal-cnr-mask)

Full Context

configure port gnss signal-cnr-mask

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the signal strength CNR mask in dB-Hz, which provides a method of filtering satellites used by the system. Satellites with a low CNR ratio provide degraded accuracy. Signals from satellites below the configured minimum CNR are not used. This command is supported on platforms that have one or more embedded GNSS receivers.

Default

30

Parameters

ratio-value

Specifies the signal strength CNR mask in dB-Hz.

Values 0 to 37

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se

43.8 signaling

signaling

Syntax

signaling *signaling*

Context

[Tree] (config>service>epipe>spoke-sdp-fec signaling)

Full Context

configure service epipe spoke-sdp-fec signaling

Description

This command enables a user to configure this router as the active or passive T-PE for signaling this MS-PW, or to automatically select whether this T-PE is active or passive based on the prefix. In an active role, this endpoint initiates MS-PW signaling without waiting for a T-LDP label mapping message to arrive from the far end T-PE. In a passive role, it will wait for the initial label mapping message from the far end before sending a label mapping for this end of the PW. In auto mode, if the SAII has the greater prefix value, then the router will initiate MS-PW signaling without waiting for a label mapping message from the far end. However, if the TAII has the greater value prefix, then the router will assume that the far end T-PE will initiate MS-PW signaling and will wait for that label mapping message before responding with a T-LDP label mapping message for the MS-PW in the reverse direction.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command means that the router T-PE automatically selects the which router will initiate MS-PW signaling based on the prefix values configured in the SAII and TAII of the spoke SDP, as previously described.

Default

signaling auto

Parameters

signaling

Configures this router as the active T-PE for signaling this MS-PW.

Values auto, master

Platforms

All

signaling

Syntax

signaling {**off** | **tldp** | **bgp**}

Context

[Tree] (config>service>sdp signaling)

Full Context

configure service sdp signaling

Description

This command specifies the signaling protocol used to obtain the ingress and egress pseudowire labels in frames transmitted and received on the SDP. When signaling is *off* then labels are manually configured when the SDP is bound to a service. The signaling value can only be changed while the administrative status of the SDP is down. Additionally, the signaling can only be changed on an SDP if that SDP is not in use by BGP-AD or BGP-VPLS. BGP signaling can only be enabled if that SDP does not already have pseudowires signaled over it.

Note:
If the **tldp** option is selected as the mechanism for exchanging service labels over an MPLS or GRE SDP and the T-LDP session is automatically established, an explicit T-LDP session that is subsequently configured takes precedence over the automatic T-LDP session. However, if the explicit, manually-configured session is then removed, the system does not revert to the automatic session and the automatic session is also deleted. To address this, recreate the T-LDP session by disabling and re-enabling the SDP using the **shutdown** and **no shutdown** commands.

The **no** form of this command is not applicable. To modify the signaling configuration, the SDP must be administratively shut down and then the signaling parameter can be modified and re-enabled.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

signaling tldp

Parameters

off

Ingress and egress signal auto-labeling is not enabled. If this parameter is selected, then each service using the specified SDP must manually configure VPN labels. This configuration is independent of the SDP's transport type, GRE, MPLS (RSVP or LDP).

tldp

Ingress and egress pseudowire signaling using T-LDP is enabled. Default value used when BGP AD automatically instantiates the SDP.

bgp

Ingress and egress pseudowire signaling using BGP is enabled. Default value used when BGP VPLS automatically instantiates the SDP.

configure log accounting-policy custom-record significant-change

Description

This command configures the significant change required to generate the record. The custom record is only generated when the change in the reference counters equals or exceeds the configured (non-zero) significant change value. Only the reference counters for which there are corresponding counters configured under the related queues and policers are used for the significant change comparison. For reference queues and policers, the change applies to the sum of all configured reference queue and policer counters. When no reference counters are configured or **significant-change** is zero, the significant change reporting is not active.

Default

significant-change 0

Parameters

delta

Specifies the delta change (significant change) that is required for the custom record to be written to the XML file.

Values 0 to 4294967295 (For custom-record-aa-sub only values 0 or 1 are supported.)

Context

[Tree] (config>port>ethernet single-fiber)

Full Context

configure port ethernet single-fiber

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables packet gathering and redirection of IP packets from a single fiber (RX) port of the Ethernet and redistributes packets to other interfaces through either static routes or policy-based forwarding.

This parameter can be applied in conjunction with the strip-label command. If they are applied together, the port must have the single-fiber option configured before it can be associated with an interface that is configured with the strip-label option.

Once a port is configured with single-fiber, traffic will no longer be transmitted out of that port. This command can be used in conjunction with strip-label.

Default

no single-fiber

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure service ies subscriber-interface group-interface sap static-host-mgmt mac-learning-options single-mac

configure service vprn subscriber-interface group-interface sap static-host-mgmt mac-learning-options single-mac

Description

This command controls how the SAP learns the IPv6 static host MAC address. Enabling this command indicates that this particular SAP only has one subscriber and only has one MAC address for all hosts. With this parameter enabled, the subscriber's NS and RS source MAC address is used to automatically populate the subscriber MAC address. To allow this auto-populate behavior, the subscriber's NS and RS source IP must be of type link local address.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

43.17 single-sfm-overload

single-sfm-overload

Syntax

single-sfm-overload [**holdoff-time** *holdoff-time*]

no single-sfm-overload

Context

[Tree] (config>service>vprn single-sfm-overload)

Full Context

configure service vprn single-sfm-overload

Description

This command configures OSPF, OSPFv3 and IS-IS to set overload when the router has fewer than the full set of SFMs functioning, which reduces forwarding capacity. Setting overload enables a router to still participate in exchanging routing information, but routes all traffic away from it.

The conditions to set overload are as follows:

- 7950 XRS-20, 7750 SR-12/SR-7, and 7450 ESS-12/ESS-7 platforms: if an SF/CPMs fails, the protocol will set the overload
- 7950-40 XRS and 7750 SR-12e platforms: if two SFMs fail (a connected pair on the XRS-40) the protocol will set the overload

The **no** form of this command configures the router to not set overload if an SFM fails.

Default

no single-sfm-overload

Parameters

holdoff-time

Specifies the delay between detecting SFM failures and setting overload.

Values 1 to 600 seconds

Default 0 seconds

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS, VSR

43.21 site-activation-timer

site-activation-timer

Syntax

site-activation-timer *seconds*

no site-activation-timer

Context

[Tree] (config>redundancy>bgp-multi-homing site-activation-timer)

Full Context

configure redundancy bgp-multi-homing site-activation-timer

Description

This command defines the amount of time the service manager will keep the local sites in standby status, waiting for BGP updates from remote PEs before running the DF election algorithm to decide whether the site should be unblocked. The timer is started when one of the following event occurs only if the site is operationally up:

- Manual site activation using "no shutdown” at site-id level or at member object(s) level (for example, SAP(s) or PW(s)
- Site activation after a failure

The **no** form of this command sets the value to 2.

Default

no site-activation-timer

Parameters

seconds

Specifies the timer, in seconds.

Values 1 to 100

Platforms

All

site-activation-timer

Syntax

site-activation-timer *seconds*

site-min-down-timer *seconds*

no site-min-down-timer

Context

[Tree] (config>redundancy>bgp-multi-homing site-min-down-timer)

Full Context

configure redundancy bgp-multi-homing site-min-down-timer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the BGP multi-homing site minimum down time. When this value is set and the site goes operationally down, it remains operationally down for at least the length of time configured by this timer, regardless of whether other state changes might cause the site to go operationally up. This timer is restarted every time the site transitions from operationally up to down.

This timer is optimized in the following circumstances:

- If the site goes down on the DF but there are no BGP multi-homing peers with the same site in an up state, this timer is not used.
- If the site goes down on the DF but there are no active BGP multi-homing peers, this timer is not used.
- If this timer is active and a BGP multihoming update is received from the DF indicating its site is down, this timer is immediately terminated and the BGP multihoming algorithm is triggered to determine whether this PE should become the DF.

The **no** form of this command removes the value from the configuration.

Default

no site-min-down-timer

Parameters

seconds

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 1 to 100

Platforms

All

site-min-down-timer

Syntax

site-min-down-timer *min-down-time*

no site-min-down-timer

Context

[Tree] (config>service>vpls>site site-min-down-timer)

Full Context

configure service vpls site site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The above operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the **site-min-down-timer** is not started and is not used.
- If the s**ite-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to the default value.

Default

Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

Parameters

min-down-time

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 0 to 100 seconds

Platforms

All

site-min-down-timer

Syntax

site-min-down-timer *min-down-time*

no site-min-down-timer

Context

[Tree] (config>test-oam>icmp>ping-template size)

Full Context

configure test-oam icmp ping-template size

Description

This command configures the size of the Data field (in other words, padding) of the outgoing ICMP echo packet. Minimum packet sizes should be used to test connectivity. Larger packet size should only be used if there is a requirement to spot-check large packet size issues on a very limited number of tests and should not be used for normal connectivity testing. Packet sizes should never be configured to require fragmentation anywhere along the path. Exceeding these recommendations will negatively affect the scale and performance of icmp ping check testing.

The **no** form of this command reverts to the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

size 56

Parameters

octets

Specifies the size of the ICMP echo ping padding field, in octets.

Values 12 to 9786

Platforms

Full Context

configure test-oam service-activation-testhead frame-size-template size-u

Description

This command configures the Ethernet frame size for the letter "u", which is user-defined.

Parameters

bytes

Specifies the Ethernet frame value, in bytes.

Values 64 to 9212

Default 2000

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

43.36 skip-gtp-ipv4-alloc

skip-gtp-ipv4-alloc

Syntax

[**no**] **skip-gtp-ipv4-alloc**

Context

[Tree] (config>subscr-mgmt>gtp>apn-policy>apn skip-gtp-ipv4-alloc)

Full Context

configure subscriber-mgmt gtp apn-policy apn skip-gtp-ipv4-alloc

Description

This command enables the ability to skip IPv4 address assignment using a GTP session setup response when PCO "allocation via NAS" is not present in a GTP session creation request. Without this configuration, IPv4 address allocation is done using GTP session setup response, even in absence of the PCO "allocation via NAS" in a GTP session setup request.

The **no** form of this command reverts to IPv4 address allocation using GTP.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

43.45 slice-size

slice-size

Syntax

slice-size *slice-size*

no slice-size

Context

[Tree] (config>mirror>mirror-dest slice-size)

Full Context

configure mirror mirror-dest slice-size

Description

This command enables mirrored frame truncation and specifies the maximum size, in bytes, of a mirrored frame that can be transmitted to the mirror destination.

This command enables mirroring larger frames than the destination packet decode equipment can handle. It also allows conservation of mirroring resources by limiting the size of the packet stream through the router and the core network.

When defined, the mirror **slice-size** creates a threshold that truncates a mirrored frame to a specific size. For example, if the value of 256 bytes is defined, a frame larger than 256 bytes will only have the first 256 bytes transmitted to the mirror destination. The original frame is not affected by the truncation. The mirrored frame size may increase if encapsulation information is added during transmission through the network core or out the mirror destination SAP to the packet/protocol decode equipment.

The actual capability of the router to transmit a sliced or non-sliced frame is also dictated by the mirror destination SDP **path-mtu** or the mirror destination SAP physical MTU. Packets that require a larger MTU than the mirroring destination supports are discarded if the defined **slice-size** does not truncate the packet to an acceptable size.

Notes:

- When configuring IP mirroring, packet slice is rejected as an incorrect option as it will cause IP packets to be rejected by the next hop with an IP header verification error.
- Slice-size is not supported by CEM encap-types or IP-mirroring.

The **no** form of this command disables mirrored packet truncation.

Parameters

slice-size

Specifies the number of bytes to which mirrored frames are truncated, expressed as a decimal integer.

Values 128 to 9216

configure port access egress pool slope-policy

configure port access ingress pool slope-policy

configure port network egress pool slope-policy

Description

This command specifies an existing slope policy which defines high and low priority RED slope parameters and the time average factor. The policy is defined in the **config>qos>slope-policy** context.

Default

slope-policy default

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

name

Specifies the policy name, a string up to 32 characters.

Platforms

All

slope-policy

Syntax

slope-policy *slope-policy-name*

no slope-policy

Context

[Tree] (config>card>fp>egress>wred-queue-control slope-policy)

Full Context

configure card fp egress wred-queue-control slope-policy

Description

This command configures WRED slopes within the WRED mega-pool. The WRED slopes in the WRED mega-pool are used when WRED queues are requesting buffers from the mega-pool while they are over their CBS threshold. Once over the CBS threshold, the WRED queue stops receiving buffers from the CBS reserve in the mega-pool and starts competing for buffers in the shared portion of the mega-pool. If the packet resulting in the buffer request is inplus-profile, the packet will be associated with the highplus-slope. In-profile packets are associated with the high slope. Out-of-profile packets are associated with the low slope. Exceed-profile packets are associated with the exceed slope. While the queue is within its CBS threshold, the slopes are ignored.

Within the defined slope-policy, each slope is enabled or disabled (no shutdown or shutdown) and each slope's geometry is defined as percentages of shared portion depth. If a slope is shutdown, the related traffic uses the minimum of the queue MBS and egress WRED megapool size as a drop tail.

The slope-policy also defines the time average factor (TAF) value that is used to determine how the pool's weighted average depth is calculated. The higher the factor, the slower the average depth tracks the actual pool depth.

The **no** form of this command reverts to the default slope policy to the WRED mega-pool.

Default

slope-policy default

Parameters

slope-policy-name

Specifies which slope policy the system should apply to the WRED mega-pool. When slope-policy is not executed, the WRED mega-pool will use the default slope policy. The defined slope policy must already exist or the command will fail. 32 characters maximum.

Full Context

configure qos hs-pool-policy root-tier root-pool slope-policy

configure qos hs-pool-policy mid-tier mid-pool slope-policy

Description

This command specifies the slope policy to be used to define the high, low, and exceed slopes within the pool. The slope (high, low, or exceed) used on the egress queue for the packet that generated the buffer request is also used in the mid-pool from the applied slope policy. The pool's current allocation amount is applied to the appropriate slope to derive the buffer rejection probability. The probability value is compared to a randomly-generated number. If the probability decision generates a rejection decision or the buffer pool has no remaining free buffers, the buffer request fails and the arriving packet is discarded. Otherwise, a buffer is allocated as long as the port-class and root-tier buffer pools also honor the buffer request.

The **no** form of the command restores the default slope policy to the associated pool.

Default

slope-policy _tmnx_hs_default

Parameters

policy-name

Specifies the slope policy associated with this pool, up to 32 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7750 SR-7/12/12e

Full Context

configure qos hs-port-pool-policy std-port-class-pools class-pool slope-policy

configure qos hs-port-pool-policy alt-port-class-pools class-pool slope-policy

Description

This command specifies the slope policy that is used to define the high, low, and exceed slopes within the port-class pool. The slope used on the egress queue for the packet that generated the buffer request is also used in the class-pool. The pool's current allocation amount is applied to the appropriate slope to derive the buffer rejection probability. The probability value is compared to a randomly generated number. If the probability decision generates a rejection or the buffer pool has no remaining free buffers, the buffer request fails and the arriving packet is discarded. Otherwise, a buffer is allocated as long as the mid-tier and root-tier buffer pools also honor the buffer request.

The **no** form of the command restores the default slope policy to the associated class-pool.

Default

slope-policy _tmnx_hs_default

Parameters

policy-name

Specifies the policy name, up to 32 characters. This parameter is required when executing the **slope-policy** command and must refer to an existing slope policy within the system. If a slope policy with the specified name does not exist, the **slope-policy** command fails without modifying the slope behavior on the pool. A non-existent slope-policy error is generated. After a slope policy is associated with any HSQ queue or buffer pool, the policy cannot be deleted.

Context

[Tree] (config>qos>copy slope-policy)

Full Context

configure qos copy slope-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters

slope-policy

Indicates that the source policy ID and the destination policy ID are slope policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

```
ALA-7>config>qos# copy slope-policy default sp1
MINOR: CLI Destination "sp1" exists - use {overwrite}.
ALA-7>config>qos#overwrite
```

Full Context

configure router mpls mpls-tp protection-template slow-psc-timer

Description

This command configures the slow timer value to be used for protection switching coordination (PSC) packets for MPLS-TP linear protection (RFC 6378).

Default

slow-psc-timer 5

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

interval

Specifies the slow timer interval in seconds.

Values 5 to 60

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

43.49 slow-queue-threshold

slow-queue-threshold

Syntax

slow-queue-threshold *kilobits-per-second*

no slow-queue-threshold

Context

[Tree] (config>card>virt-sched-adj slow-queue-threshold)

Full Context

configure card virtual-scheduler-adjustment slow-queue-threshold

Description

This command overrides the system default rate threshold where policers and queues are placed in the "slow" queue category. Slow rate policers and queues use a different minimum rate calculation interval time than fast rate queues. The rate is determined based on the previous calculated offered rate for the policer or queue.

The default slow policer or queue rate is 1 Mb/s. The fast rate is derived by multiplying the slow rate by a factor of 1.5 resulting in a default fast rate of 1.5 Mb/s. The slow-queue-threshold command uses a "Kilobit-Per-Second" value to modify the default slow queue rate threshold and indirectly changes the fast queue rate threshold.

The **no** form of this command restores the default slow queue and fast rate thresholds.

Default

no slow-queue-threshold

Parameters

kilobits-per-second

Specifies that the kilobit-per-second parameter is required and is used to modify the default slow rate threshold. Defining a value of 0 forces all policers and queues to be

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

treated as fast rate. Defining a value of 1000 (1 Mb/s) returns the threshold to the default value and is equivalent to executing **no slow-queue-threshold**.

The fast rate threshold is derived by multiplying the new slow rate threshold by a factor of 1.5.

Values 0 to 1000000 kb/s

Default 1000 kb/s

43.52 snap-pid

snap-pid

Syntax

snap-pid *snap-pid*

no snap-pid

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match snap-pid)

Full Context

configure qos sap-ingress mac-criteria entry match snap-pid

Description

Configures an IEEE 802.3 LLC SNAP Ethernet frame PID value to be used as a service ingress QoS policy match criterion.

This is a 2-byte protocol id that is part of the IEEE 802.3 LLC SNAP Ethernet Frame that follows the 3-byte OUI field.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The **snap-pid** match criteria is independent of the OUI field within the SNAP header. Two packets with different 3-byte OUI fields, but the same PID field, will both match the same policy entry based on a snap-pid match criteria.

The **no** form of this command removes the snap-pid value as the match criteria.

Default

no snap-pid

Parameters

snap-pid

The 2-byte snap-pid value to be used as a match criterion in hexadecimal.

Values 0x0000 to 0xFFFF

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vprn>log snmp-trap-group)

Full Context

configure service vprn log snmp-trap-group

Description

This command creates the context to configure a group of SNMP trap receivers and their operational parameters for a specific *log-id*.

A group specifies the types of SNMP traps and specifies the log ID that will receive the group of SNMP traps. The user must configure a trap group before SNMP traps can be sent.

To suppress the generation of all alarms and traps, see the **event-control** command. To suppress alarms and traps that are sent to this log-id, see the **filter** command. After alarms and traps are generated, they can be directed to one or more SNMP trap groups. Log events that can be forwarded as SNMP traps are always defined on the main event source.

The **no** form of this command deletes the SNMP trap group.

Parameters

log-id* | *log-name

Specifies the log ID or name (up to 32 characters).

Values *log-id*: 1 to 100

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

name *log-name*

Specifies an optional log name of a log configured in the **log-id** context, up to 32 characters, that can be used to refer to the log after it is created. Alarms and traps cannot be sent to the trap receivers until a valid *log-id* exists.

Platforms

configure service vpls sap dhcp snoop

configure service vprn nw-if dhcp snoop

configure service vpls mesh-sdp dhcp snoop

configure service vprn interface dhcp option snoop

configure service vpls spoke-sdp dhcp snoop

Description

This command enables snooping of DHCP or DHCP6 messages on the SAP or SDP. Enabling DHCP or DHCP6 snooping on interfaces (SAPs and SDP bindings) is required where DHCP or DHCP6 messages important to lease state table population are received, or where Option 82 information is to be inserted. This includes interfaces that are in the path to receive messages from either DHCP or DHCP6 servers or from subscribers.

The **no** form of this command disables DHCP or DHCP6 snooping on the specified SAP or SDP binding.

Default

no snoop

Platforms

43.57 sntp

sntp

Syntax

[**no**] **sntp**

Context

[Tree] (config>system>time sntp)

Full Context

configure system time sntp

Description

This command creates the context to edit the Simple Network Time Protocol (SNTP).

SNTP can be configured in either broadcast or unicast client mode. SNTP is a compact, client-only version of the NTP. SNTP can only receive the time from SNTP/NTP servers. It cannot be used to provide time services to other systems.

The system clock is automatically adjusted at system initialization time or when the protocol first starts up.

When the time differential between the SNTP/NTP server and the system is more than 2.5 seconds, the time on the system is gradually adjusted.

SNTP is created in an administratively enabled state (**no shutdown**).

The **no** form of the command removes the SNTP instance and configuration. SNTP does not need to be administratively disabled when removing the SNTP instance and configuration.

software-repository

Syntax

software-repository *repository-name*

no software-repository

Context

[Tree] (config>system>satellite>eth-sat software-repository)

Full Context

configure system satellite eth-sat software-repository

Description

This command binds the specified software repository to the associated satellite. The software repository is used to locate and serve the correct software image to the satellite at boot time.

The configured software repository is only used when the satellite boots. Changing the software repository for an active satellite does not have an effect until the next time a satellite boots.

A satellite cannot be booted if there is no software repository defined for it.

The **no** form of the command removes the software repository.

Default

no software-repository

Parameters

repository-name

Specifies a string, up to 32 characters, that uniquely identifies the software repository.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>system software-repository)

Full Context

configure system software-repository

Description

This command creates or deletes an instance of a software repository. The instance is identified by a repository name.

A software repository is used to obtain files to upgrade software on certain subsystems of the router (for example, Ethernet satellites).

Up to three locations can be specified within a software repository for the router to access files in the repository. The router will first attempt to access the file at the primary location. If the primary location is not configured or the files are not found at the primary location, then the router will attempt to access the files at the secondary location. If the secondary location is not configured or the files are not found at the secondary location, then the router will attempt to access the files at the tertiary location. If the tertiary location is not configured or the files are not found at the tertiary location, then the software repository access will fail.

The **no** form of the command removes the software repository.

Parameters

repository-name

Specifies a string, up to 32 characters, that uniquely identifies the software repository.

create

Specifies the keyword required when the software-repository context is first created. Once the context is created, it can be accessed without the **create** keyword.

Description

This command specifies a IPv4 or IPv6 unicast address that sends data on an interface. This enables a multicast receiver host to signal a router the group to receive multicast traffic from, and from the sources that the traffic is expected.

The **source** command is mutually exclusive with the specification of individual sources for the same group.

The **source** command in combination with the group is used to create a specific (S,G) static group entry.

Static (s,g) entries cannot be entered when a starg is already created.

Use the **no** form of this command to remove the source from the configuration.

Parameters

ip-address

Specifies the IPv4 unicast address

src-ipv6-address

Specifies the IPv6 unicast address.

Platforms

All

source

Syntax

source *ip-address*

no source

[Tree] (config>service>ies>if>sap>ip-tunnel source)

Full Context

configure service vprn interface sap ip-tunnel source

configure service ies interface sap ip-tunnel source

Description

This command configures the source IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The IPv4 or IPv6 address must belong to the one of the IP subnets associated with the public SAP interface of the tunnel-group. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the source address contains an IPv6 address it must be a global unicast address.

The **no** form of this command deletes the source address from the tunnel configuration. The tunnel must be administratively shutdown before issuing the **no source** command.

Default

no source

Parameters

ip-address

Specifies an IPv4 address or an IPv6 address.

Values

ipv4-address	a.b.c.d	
ipv6-address		x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d

Parameters

ip-address

Specifies the IP address that will be sending data.

Platforms

All

source

Syntax

[**no**] **source** *unicast-ip-prefix/mask*

Context

[Tree] (config>service>vprn>msdp source)

Full Context

configure service vprn msdp source

Description

This command limits the number of active source messages the router accepts from sources in the specified address range.

If the prefix and mask provided is already a configured then this command only provides the context to configure the parameters pertaining to this active source-message filter.

If the prefix and mask provided is not already a configured, then the source node instance must be created and the context to configure the parameters pertaining to this node should be provided. In this case, the $ prompt to indicate that a new entity (source) is being created should be used.

The source active msdp messages are not rate limited based on the source address range.

The **no** form of this message removes the source active rate limiter for this source address range.

Parameters

unicast-ip-prefix

Specifies the IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area.

Values ip-prefix/mask: ip-prefix a.b.c.d (host bits must be 0)

mask

Specifies the subnet mask for the range expressed as a decimal integer mask length or in dotted decimal notation.

Values 0 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

Platforms

All

configure application-assurance group access-network-location source

Description

This command configures location sources for the dynamic experience management. The location source types are, for example, 3G and congestion point.

Default

source mobile-3g

Parameters

source-type

Specifies the location or access technology.

Values **access-point** — Provides Dynamic Experience Management (DEM) for the WLGW access point.

Note:
The access points do not need to support the Nokia CEA function.

level

Specifies which congestion point within the specified source-type to monitor for congestion.

Values **MAC+VLAN** — WLGW access point (MAC) and radio (VLAN).

Note:
The access points do not need to support the Nokia CEA function.

Full Context

configure oam-pm session ethernet source

Description

This command configures the source launch point identification Y.1731 parameters that are used by the individual tests within the session. If an MEP matching the configuration does not exist, the session is allowed to become active; however, the frames sent frames and received as seen under the **show oam-pm statistics session** command is zero. The preferred reference to the MEP launch point is by *admin-name*. Therefore, the syntax **source mep** *mep-id* **domain-name** *admin-name* **association-name** *admin-name* should be used.

The **no** form of this command removes this session parameter.

Parameters

mep-id

Specifies the maintenance association endpoint identifier of the launch point.

Values 1 to 8191

md-index

Specifies the maintenance domain (MD) index value of the launch point. The **domain-name** *admin-name* parameter is preferred for specifying the domain information.

Values 1 to 4294967295

ma-index

Specifies the maintenance association (MA) index value of the launch point. The **association-name** *ma-name* parameter is preferred for specifying the association information.

Values 1 to 4294967295

admin-name

Specifies the name reference for the maintenance domain (MD), or the association (MA) *admin-name* value of the launch point, up to 64 characters.

Platforms

All

Full Context

configure oam-pm session ip source

Description

This command defines the source IP address that the session controller (launch point) uses for the test. The source address must be a local resident IP address in the context; otherwise, the response packets are processed by the TWAMP Light application. Only source addresses configured as part of TWAMP tests can process the reflected TWAMP packets from the Session-Reflector.

The **no** form of this command removes the source address parameters.

Parameters

source

Indicates the launch point.

ip-address

Specifies the source IP address that the session controller (launch point) uses for the test.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

source

Syntax

source {**line-ref** | **internal-clock**}

Context

[Tree] (config>system>sync-if-timing>bits>output source)

Full Context

configure system sync-if-timing bits output source

Description

This command configures the values used to identify the source of the BITS (Building Integrated Timing Supply) output. This is either the signal recovered directly from ref1, ref2 or ptp, or it is the output of the node's central clock. The directly recovered signal would be used when the BITS output signal is feeding into an external standalone timing distribution device (BITS/SASE). The specific directly recovered signal

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

used is the best of the available signals based of the QL and/or the ref-order. The central clock output would be used when no BITS/SASE device is present and the BITS output signal is used to monitor the quality of the recovered clock within the system.

Default

source line-ref

Parameters

line-ref

Specifies that the BITS output timing is selected from one of the input references, without any filtering.

internal-clock

Specifies that the BITS output timing is driven from the system timing.

Platforms

configure subscriber-mgmt authentication-policy radius-authentication-server source-address

configure subscriber-mgmt radius-accounting-policy radius-accounting-server source-address

Description

This command configures the source address of the RADIUS packet.

The system IP address must be configured in order for the RADIUS client to work. See Configuring a System Interface in the Router Configuration Guide.

Note:
The system IP address must only be configured if the source-address is not specified. When the **no source-address** command is executed, the source address is determined at the moment the request is sent. This address is also used in the nas-ip-address attribute: over there it is set to the system IP address if **no source-address** was given.

The **no** form of this command reverts to the default value.

Default

System IP address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-address

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure aaa diameter node source-address

Description

This command configures the IPv4 source address that the SR OS node uses for its peering connection.

The **no** form of this command removes the IP address from the configuration.

Default

no source-address

Parameters

ip-address

Specifies an IP prefix for the IP match criterion in dotted-decimal notation.

Values 0.0.0.0 **to** 255.255.255.255

allow-connections

Keyword used to accept inter-peering connection on the configured source IPv4 address. A listening TCP socket is opened on the Diameter node within the corresponding router context, IP address, and Diameter port. When this keyword is enabled, each Diameter node within the same routing context in SR must be configured with a unique IP address.

The peer initiating the connection must be an inter-chassis peer. Specifically, the Origin-Host in the CER message must match the locally configured peer identity.

Platforms

no source-address

Context

[Tree] (config>router>ldp>lsp-bfd source-address)

Full Context

configure router ldp lsp-bfd source-address

Description

This command configures the source address of periodic LSP ping packets and BFD control packets for LSP BFD sessions that are associated with LDP prefixes in the prefix list. The system IP address is used by default. If the system IP address is not routable from the far-end node of the BFD session, then an alternate routable IP address that is local to the source node should be used.

Default

no source-address

Parameters

ip-address

Specifies a routable IPv4 or IPv6 address that is local to the node.

Values *ipv4-address* — a.b.c.d

ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

Syntax

source-address

Context

[Tree] (config>system>security source-address)

Full Context

configure system security source-address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the IP source address that is used in all unsolicited packets sent by the application.

The configured source address applies only to packets transmitted in-band (for example, a network port on an IOM). Packets transmitted out-of-band on the management interface on the CPM Ethernet port use the address of the CPM Ethernet port as the IP source address in the packet.

When a source address is specified for the **ptp** application, the port-based 1588 hardware timestamping assist function will be applied to PTP packets matching the IPv4 address of the router interface used to ingress the SR/ESS or IP address specified in this command. If the IP address is removed, then the port-based 1588 hardware timestamping assist function will only be applied to PTP packets matching the IPv4 address of the router interface.

source-address

Syntax

source-address *ipv6-address*

no source-address

Context

[Tree] (config>router>segment-routing>srv6 source-address)

Full Context

configure router segment-routing segment-routing-v6 source-address

Description

This command configures the global default source IPv6 address used in the SA field of the outer IPv6 header of the SRv6 encapsulated packet. This value is inherited in the BGP and service contexts by default, but can be overwritten in each context. A maximum of 16 address values can be configured in all contexts in the system.

There is no default value for this command. A default source IPv6 address must be configured in this context or in the BGP or service context. The system does not check if the entered address is a valid local address.

The **no** form of this command removes the source IPv6 address from the configuration.

Parameters

ipv6-address

Specifies the source IPv6 address of the SRv6.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

no source-address-range

Context

[Tree] (config>aaa>isa-radius-plcy>servers source-address-range)

Full Context

configure aaa isa-radius-policy servers source-address-range

Description

This command specifies the first IP address in the range of IPv4 addresses that are assigned to a BB-ISA in a given NAT group for NAT RADIUS accounting. The IP addresses are unique within the NAT group and are used to bind the RADIUS client instantiated on each BB-ISA card. The number of IPv4 addresses allocated is equal to the number of BB-ISAs in a NAT group that are enabled for NAT RADIUS accounting. Although only the first IPv4 address is explicitly configured with this command, each internally allocated IPv4 address associated with the BB-ISA card can be seen in the routing table (via show commands) as /32 with protocol designation 'NAT'.

Default

no source-address-range

Parameters

start-ip-address

The starting IP address of the IP address range.

Values 0.0.0.0 - 255.255.255.255

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-bmac

Syntax

source-bmac *ieee-address*

no source-bmac

Context

[Tree] (config>service>pbb source-bmac)

Full Context

configure service pbb source-bmac

Description

This command configures the source B-VPLS MAC address to use with PBB and provisions a chassis level source B-MAC.

Parameters

ieee-address

The MAC address assigned to the B-MAC. The value should be input in either a xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

Platforms

All

source-bmac

Syntax

source-bmac *ieee-address*

Context

[Tree] (config>service>vpls>pbb source-bmac)

Full Context

configure service vpls pbb source-bmac

Description

This command configures the base source B-MAC for the B-VPLS. The first 32 bits must be the same with what is configured in the MC-LAG peer. If not configured here, it will inherit the chassis level B-MAC configured under the new PBB object added in the previous section. If the **use-sap-bmac** command is

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

on, the value of the last 16 bits (lsb) of the source B-MAC must be part of the **reserved-source-bmac-lsb** configured at chassis level, under service PBB component. If that is not the case, the command will fail.

Platforms

All

43.69 source-bmac-lsb

source-bmac-lsb

Syntax

source-bmac-lsb *MAC-Lsb* [**es-bmac-table-size** *size*]

no source-bmac-lsb

Context

[Tree] (config>service>system>bgp-evpn>eth-seg source-bmac-lsb)

Full Context

configure service system bgp-evpn ethernet-segment source-bmac-lsb

Description

This command configures the least significant two bytes of the B-MAC used as the source B-MAC for packets generated from the Ethernet-Segment in PBB-EVPN.

When the multi-homing mode is **all-active**, this value and the first high order four bytes must match on all the PEs that are part of the same Ethernet-Segment.

The **es-bmac-table-size** parameter modifies the default value (8) for the maximum number of virtual bmacs that can be associated to the Ethernet-Segment, that is, the es-bmacs. When the **source-bmac-lsb** is configured, the associated **es-bmac-table-size** is reserved out of the total FDB. The es-bmac will consume a separate B-MAC per B-VPLS that is linked to an Ethernet-Segment.

Parameters

MAC-Lsb

Specifies the two least significant bytes of the es-bmac.

Values 1 to 65535, or xx-xx or xx:xx

size

Specifies the reserved space in the FDB for a specified es-bmac. By default the system reserves 8 entries for a specified Ethernet-Segment B-MAC.

Values 1 to 511999

Default 8

no source-bmac-lsb

Context

[Tree] (config>service>sdp source-bmac-lsb)

Full Context

configure service sdp source-bmac-lsb

Description

This command defines the 16 least significant bits (lsb) which, when combined with the 32 most significant bits of the PBB **source-bmac**, are used as the virtual backbone MAC associated with this SDP. The virtual backbone MAC is used as the source backbone MAC for traffic received on a PBB EPIPE spoke-SDP with **use-sdp-bmac** configured (that is, a redundant pseudowire) and forwarded into the B-VPLS domain.

The control-pw-vc-id defines VC identifier of the spoke-SDP relating to the control pseudowire whose status is to be used to determine whether SPBM advertises this virtual backbone MAC. This is a mandatory parameter when the **source-bmac-lsb** is added or changed. The spoke SDP must have the parameter **use-sdp-bmac** for the control pseudowire to be active.

Default

no source-bmac-lsb

Parameters

mac-lsb

Specifies the 16 least significant bits of the virtual backbone MAC associated with this SDP.

Values 1 to 65535 or xx-xx or xx:xx

control-pw-vc-id *vc-id*

Specifies the VC identifier of the control pseudowire.

Values 1 to 4294967295

Parameters

index

Specifies the index value.

Values 1 to 255

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

all

Deletes all the source class indices.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

source-class

Syntax

source-class [*value*]

no source-class

Context

[Tree] (config>router>policy-options>policy-statement>default-action source-class)

[Tree] (config>router>policy-options>policy-statement>entry>action source-class)

Full Context

configure router policy-options policy-statement default-action source-class

configure router policy-options policy-statement entry action source-class

Description

This command specifies the policy accounting source class index to associate with matched routes.

Parameters

value

Specifies the default operational source-class for this policy statement.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

43.71 source-destination-prefix

source-destination-prefix

Syntax

[**no**] **source-destination-prefix**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>cflowd>collector>aggregation source-destination-prefix)

Full Context

configure cflowd collector aggregation source-destination-prefix

Description

This command configures cflowd aggregation based on source and destination prefixes.

The **no** form of this command removes this type of aggregation from the collector configuration.

Platforms

All

configure service vprn subscriber-interface group-interface sap static-host managed-routes route-entry cpe-check source-ip-address

Description

This command configures the source IP address used in ICMP messages. When not specified, the system uses the address of the appropriate address family.

The **no** form of this command removes the IP address.

Parameters

ip-address

Specifies the source IP address.

Values ipv4-prefix: a.b.c.d

ipv6-prefix:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure subscriber-mgmt shcv-policy layer-3 source-ip-origin

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command selects the source IP address to be used for SHCV messages.

The **no** form of this command reverts to the default.

Parameters

interface

Specifies to use the interface IP as the source address of SHCV.

vrrp

Specifies to use the VRRP configured IP as the source address of SHCV.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

43.75 source-mac

source-mac

Syntax

source-mac *ieee-address*

no source-mac

Context

[Tree] (config>subscr-mgmt>shcv-policy>vpls source-mac)

Full Context

configure subscriber-mgmt shcv-policy vpls source-mac

Description

Specifies the MAC address to be used as source address for connectivity verification in a VPLS service.

The **no** form of this command reverts to the default.

Parameters

ieee-address

Specifies the 48-bit MAC address in the xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Use subject to Terms available at: www.nokia.com/terms.

43.76 source-override

source-override

Syntax

source-override *ip-address* [**create**]

no source-override *ip-address*

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel source-override)

Full Context

configure mcast-management multicast-info-policy bundle channel source-override

Description

This command defines a multicast channel parameter override context for a specific multicast sender within the channel range. The specified sender's IP address must be the same IP type, IPv4 or IPv6, as defined in the **channel** command.

The **no** form of this command removes the specified sender override context from the channel range.

Parameters

ip-address

Specifies either an IPv4 or IPv6 address and must be the same IP type as the containing **channel** command range.

Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

create

The **create** keyword is required if creating a new source override when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the specified source override IP address already exists.

source-prefix

Syntax

[**no**] **source-prefix**

Context

[Tree] (config>cflowd>collector>aggregation source-prefix)

Full Context

configure cflowd collector aggregation source-prefix

Description

This command configures cflowd aggregation based on source prefix information.

The **no** form of this command removes this type of aggregation from the collector configuration.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

source-prefix

Syntax

no source-prefix

source-prefix *ipv6-address/prefix-length*

Context

[Tree] (config>aaa>isa-radius-plcy>servers>ipv6 source-prefix)

Full Context

configure aaa isa-radius-policy servers ipv6 source-prefix

Description

This command configures an IPv6 prefix containing individual /128 addresses. These addresses are used as the source address for connections to IPv6 RADIUS servers.

The prefix must be large enough to accommodate all BB-ISAs or ESA VMs in the system.

The **no** form of this command removes the IPv6 prefix.

Default

no source-prefix

Parameters

ipv6-address/prefix-length

Specifies an IPv6 address and prefix length for the address.

Values		
	ipv6-prefix:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	prefix-length:	0 to 128

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-prefix

Syntax

source-prefix *ip-prefix/length* **nat-policy** *nat-policy-name*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no source-prefix *ip-prefix/length*

Context

[Tree] (config>service>vprn>nat>inside source-prefix)

[Tree] (config>router>nat>inside source-prefix)

Full Context

configure service vprn nat inside source-prefix

configure router nat inside source-prefix

Description

This command configures the source prefix used to identify traffic for NAT processing. After the traffic is diverted to the ESA-VM or vISA, its source IP address is checked to determine if it belongs to the configured prefix. If it does, the traffic is processed by NAT, otherwise, it is dropped.

The **no** form of this command removes the source prefix used to identify traffic for NAT processing.

Parameters

nat-policy-name

Specifies the NAT policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

43.79 source-prefix-list

source-prefix-list

Syntax

source-prefix-list *prefix-list-name*

no source-prefix-list

Context

[Tree] (config>service>vprn>nat>inside source-prefix-list)

[Tree] (config>router>nat>inside source-prefix-list)

Full Context

configure service vprn nat inside source-prefix-list

configure router nat inside source-prefix-list

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command references the **nat-prefix-list** that contains source IP addresses on the inside (private side).

The source IP addresses on the inside must be known in advance in a **dnat-only** instance. This is required so the corresponding routes can be installed in the routing table and thus the downstream traffic is properly routed towards the MS-ISAs where the original translation was performed (and state is kept).

In the **dnat-only** case, it is mandatory that the inside (private side) and the outside (public side) are in separated VPRNs.

Parameters

prefix-list-name

Specifies the name, up to 32 characters in length, of the NAT prefix list that contains the source IP addresses (original IP addresses).

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

43.80 source-prefix-only

source-prefix-only

Syntax

[**no**] **source-prefix-only**

Context

[Tree] (config>router>nat>inside>traffic-identification source-prefix-only)

[Tree] (config>service>vprn>nat>inside>traffic-identification source-prefix-only)

Full Context

configure router nat inside traffic-identification source-prefix-only

configure service vprn nat inside traffic-identification source-prefix-only

Description

This command enables the identification of traffic that is subject to NAT processing based on the source IP address in the packet.

Traffic is diverted to the ESA-VM or vISA for NAT processing using a configured destination prefix or a IPv4 filter. When this command is configured, after traffic arrives on the ESA-VM or vISA, the source IP address in the packet determines whether the traffic is processed by NAT or dropped. If the source IP address belongs to the configured source-prefix, traffic is processed by NAT. Otherwise, it is discarded.

Use the following commands to configure the source prefix:

configure service vprn nat inside source-prefix

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure router nat inside source-prefix

If traffic identification based on the source IP address is disabled, all traffic arriving to the ESA-VM or vISA is subject to NAT processing.

The **no** form of this command disables the identification of traffic that is subject to NAT processing.

Default

no source-prefix-only

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

43.81 source-specific-mcac

source-specific-mcac

Syntax

[**no**] **source-specific-mcac**

Context

[Tree] (config>router>mcac>policy source-specific-mcac)

Full Context

configure router mcac policy source-specific-mcac

Description

This command specifies that both multicast group and multicast source are used for MCAC accounting. For example, if multiple, multicast joins are for the same multicast group but each are a different multicast source, the MCAC accounts for for each multicast group and source combination.

If the multicast source is configured as a subnet instead of an address, the MCAC automatically accounts for every source address within the subnet.

If the multicast source is not configured, the MCAC only accounts for the multicast groups and ignores the source address from the multicast joins. In other words, only one source is accounted for.

The **no** form of this specifies that only the multicast group is used for MCAC accounting. The multicast source address is not used for MCAC accounting. For example, if multiple, multicast joins are for the same multicast group but each with a different multicast source, the MCAC only accounts for the multicast group once.

Default

no source-specific-mcac

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

source-specific-mcac

Syntax

source-specific-mcac {**true** | **false** | **use-policy-settings**}

Context

[Tree] (config>router>mcac>policy>bundle source-specific-mcac)

Full Context

configure router mcac policy bundle source-specific-mcac

Description

This command configures configures the the MCAC policy accounting behavior.

Default

source-specific-mcac false

Parameters

true

Keyword used to specify that both multicast group and multicast source are used for MCAC accounting. For example, if multiple, multicast joins are for the same multicast group but each has a different multicast source, the MCAC accounts for for each multicast group and source combination.

false

Keyword used to specify that only the multicast group is used for MCAC accounting. The multicast source address is not used for MCAC accounting. For example, if multiple, multicast joins are for the same multicast group but each has a different multicast source, the MCAC only accounts for the multicast group once.

use-policy-setting

Keyword used to specify that the bundle uses the source-specific accounting setting in the MCAC policy level.

Full Context

configure test-oam twamp twamp-light source-udp-port-pools

Description

Commands in this context configure the source UDP port pool allocation for TWAMP Light applications.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

43.84 source-vtep

source-vtep

Syntax

source-vtep *ip-address*

no source-vtep

Context

[Tree] (cfg>service>vprn>vxlan source-vtep)

Full Context

configure service vprn vxlan source-vtep

Description

This command enables the router to use the configured IPv4 address as the tunnel source IP address (source VTEP) when originating VXLAN-encapsulated packets for this VPRN service. This command does modify the next hop of the EVPN IFL routes advertised for the VPRN service.

When unconfigured, the system uses the IPv4 address as the VTEP source.

The **no** form of this command removes the IPv4 address as the source VTEP.

Default

no source-vtep

Parameters

ip-address

Specifies the source VTEP IP address.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

43.85 source-vtep-security

source-vtep-security

Syntax

[**no**] **source-vtep-security**

Context

[Tree] (config>service>vpls>vxlan source-vtep-security)

Full Context

configure service vpls vxlan source-vtep-security

Description

This command enables the outer IP Source Address lookup of incoming VXLAN packets, and discards those coming from untrusted VTEPs. The list of trusted VTEPs is shown in the **show service vxlan** command. Specifically, it shows the existing learned EVPN VTEPs (always trusted), and the statically configured VTEPs in any service (Epipe and VPLS).

The command is supported in VXLAN instances with static egress VTEPs or VXLAN instances with EVPN created VTEPs.

The **no** version of this command disables the outer IP source address lookup.

Default

no source-vtep-security

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>service>vpls spb)

Full Context

configure service vpls sap spb

configure service vpls spoke-sdp spb

configure service vpls spb

Description

This command enables Shortest Path Bridging (SPB) on a B-VPLS instance. SPB uses IS-IS that supports multiple instances, therefore an instance must be specified. The declaration of SPB in this context is the control configuration for the SPB. This is an SPB management interface and it manages the configuration for IS-IS. Various parameters that define this SPB instance are configured under this SPB instance. Several of the parameters are shared with other B-VPLS service instances using SPB.

SPB enables an instance of IS-IS protocol with the **no shutdown** command. Alternatively, the IS-IS protocol instance under SPB is disabled with the **shutdown** command in the **config>service>vpls b-vpls>spb** context.

A Forwarding Identifier (FID) is optionally specified which is an abstraction of the BVID used for forwarding in SPB. When no FID is configured the control VPLS is advertised with FID value 1. When a FID value is specified, the control VPLS is advertised and associated with the FID value specified. The default algorithm for any FID declared or implicit is low-path-id. When a FID is specified, the ect-algorithm can be specified for the FID and changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID for a control instance cannot be changed after it is created. To change a FID the SPB component would have to be shutdown, deleted and re-created with a new FID.

Note:
SPB operates with disable-learning, disable aging and discard-unknown. The state of these commands is ignored when SPB is configured.

Default

no spb

Parameters

isis-instance

Specifies the instance ID for an SPB IS-IS instance.

Values 1024 to 2047 (4 available)

Default 1024

FID

Specifies the FID value.

Values 1 to 4095

no spbm-control-vpls

Context

[Tree] (config>service>vpls spbm-control-vpls)

Full Context

configure service vpls spbm-control-vpls

Description

This command associates a user B-VPLS with a particular control B-VPLS and a FID. The ECT algorithm and the behavior of unicast and multicast come from the association to the FID.

A Forwarding Identifier (FID) is specified which is an abstraction of the BVID used for forwarding in SPB. The ect-algorithm is associated with the FID and can be changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID must be independent from the FID assigned to other services.

Parameters

service-id

The B-VPLS service identifier.

Values 1 to 2147483647 | *svc-name*: 64 characters max

fid

The forwarding identifier.

Values 1 to 4095

43.90 spe-address

spe-address

Syntax

spe-address *global-id:prefix*

no spe-address

Context

[Tree] (config>service>pw-routing spe-address)

Full Context

configure service pw-routing spe-address

Description

This command configures a single S-PE Address for the node to be used for dynamic MS-PWs. This value is used for the pseudowire switching point TLV used in LDP signaling, and is the value used by pseudowire status signaling to indicate the PE that originates a pseudowire status message. Configuration of this parameter is mandatory to enable dynamic MS-PW support on a node.

If the S-PE Address is not configured, spoke-sdps that use dynamic MS-PWs and pw-routing local-prefixes cannot be configured on a T-PE. Furthermore, the node will send a label release for any label mappings received for FEC129 AII type 2.

The S-PE Address cannot be changed unless the dynamic ms-pw configuration is removed. Furthermore, changing the S-PE Address will also result in all dynamic MS-PWs for which this node is an S-PE being released. It is recommended that the S-PE Address should be configured for the life of an MS-PW configuration after reboot of the router.

The **no** form of this command removes the configured S-PE Address.

Default

no spe-address

Parameters

global-id

Specifies a 4-octet value that is unique to the service provider. For example, the global ID can contain the 2-octet or 4-octet value of the provider's Autonomous System Number (ASN).

Values

<global-id:prefix>:	<global-id>:{<prefix>| <ipaddress>}
global-id	1 to 4294967295
prefix	1 to 4294967295

speed {**10** | **100** | **1000** | **10000** | **25000** | **40000** | **50000** | **100000**}

Context

[Tree] (config>port>ethernet speed)

Full Context

configure port ethernet speed

Description

For ports that support multiple speeds, this command configures the port speed to be used. This applies to the following:

- fast Ethernet when autonegotiate is disabled
- 10/100/1000 Ethernet when autonegotiate is disabled
- 10/1G ports supporting 10G SFP+ or 1G SFP
- 40/100G ports supporting QSFP28s on non-connector-based MDAs

If the port is configured to autonegotiate this parameter is ignored. Speed cannot be configured for ports that are part of a Link Aggregation Group (LAG).

Default

dependent on port type

Parameters

10

Sets the link to 10 Mb/s speed.

100

Sets the link to 100 Mb/s speed.

1000

Sets the link to 1000 Mb/s speed.

© 2026 Nokia.

43.94 spf-wait

spf-wait

Syntax

spf-wait *spf-wait* [**spf-initial-wait** *spf-initial-wait*] [**spf-second-wait** *spf-second-wait*]

no spf-wait

Context

[Tree] (config>service>vpls>spb>timers spf-wait)

Full Context

configure service vpls spb timers spf-wait

Description

This command defines the maximum interval between two consecutive SPF calculations in milliseconds. Timers that determine when to initiate the first, second, and subsequent SPF calculations after a topology change occurs can be controlled with this command.

Subsequent SPF runs (if required) occur at exponentially increasing intervals of the *spf-second-wait* interval. For example, if the *spf-second-wait* interval is 1000, the next SPF runs after 2000 milliseconds, and then the next SPF runs after 4000 milliseconds, and so on, until it reaches the *spf-wait* value. The SPF interval stays at *spf-wait* value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval drops back to *spf-initial-wait*.

Note: The effective timer granularity is 10 ms and applies uniformly to all three parameters — **spf-wait**, **spf-initial-wait** and **spf-second-wait**. Timer values are rounded down to the nearest granularity. For example, a configured value of 550 ms is internally rounded down to 540 ms.

Default

no spf-wait

Parameters

spf-wait

Specifies the maximum interval in milliseconds between two consecutive SPF calculations.

Values 10 to 120000

Default 10000

spf-initial-wait

Specifies the initial SPF calculation delay in milliseconds after a topology change.

Values 10 to 100000

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 1000

spf-second-wait

Specifies the hold time in milliseconds between the first and second SPF calculation.

43.95 spi

spi

Syntax

spi *spi*

no spi

Context

[Tree] (config>ipsec>static-sa spi)

Full Context

configure ipsec static-sa spi

Description

This command configures the SPI key value for an IPsec manual SA.

This command specifies the SPI (Security Parameter Index) used to lookup the instruction to verify and decrypt the incoming IPsec packets when the value of the **direction** command is **inbound**.

The SPI value specifies the SPI that will be used in the encoding of the outgoing packets when the when the value of the **direction** command is **outbound**. The remote node can use this SPI to lookup the instruction to verify and decrypt the packet.

If **no spi** is selected, then this static SA cannot be used.

The **no** form of this command reverts to the default value.

Default

no spi

Parameters

spi

Specifies the security parameter index for this SA.

Values 256 to 16383

Syntax

spi-range-index *1..4*

no spi-range-index

Context

[Tree] (config>isa>tunnel-grp spi-range-index)

Full Context

configure isa tunnel-group spi-range-index

Description

This command configures the SPI range index value for the tunnel group. Each index value corresponds to a subrange of SPI values from the entire SPI space to allocate to the tunnel group.

This command must be configured with a unique value across all multichassis peering systems in following cases:

- A multichassis-enabled tunnel group contains ESA-VMs with weight.
- The **active-mda-number** configurations of a tunnel group are different on different peering systems.

See the *7450 ESS, 7750 SR, and VSR Multiservice ISA and ESA Guide* for more information.

The tunnel group must be shut down to modify the SPI range allocation.

The **no** form of this command removes the SPI range allocation for the tunnel group.

Default

no spi-range-index

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

1..4

Specifies the SPI range index value.

Full Context

configure subscriber-mgmt local-user-db ipoe host identification-strings spi-sharing-group-id

configure subscriber-mgmt local-user-db ppp host identification-strings spi-sharing-group-id

Description

This command configures the SLA Profile Instance (SPI) sharing group identifier for an IPoE or PPPoE session. It overrides the default SPI sharing method (**def-instance-sharing**) configured in the SLA profile.

When an spi-sharing-group-id is configured, the IPoE or PPPoE session shares the SLA Profile Instance with other IPoE or PPPoE sessions from the same subscriber that: have the same SLA profile associated, are active on the same SAP, and have the same group identifier.

Configuring an **spi-sharing-group-id** *group-id* for an IPoE host, when the IPoE session is disabled on the group interface, results in a setup failure.

The **no** form of this command returns the SPI sharing group identifier to its default.

Parameters

group-id

Specifies the SPI group identifier.

Values 0 to 65535

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn bgp group neighbor split-horizon

configure service vprn bgp group split-horizon

configure service vprn bgp split-horizon

Description

This command enables the use of split-horizon. When applied globally, to a group, or a specific peer, split-horizon prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

The configuration default is **no split-horizon**, meaning that no effort is taken to prevent a best route from being reflected back to the sending peer.

Caution:
Use of the **split-horizon** command may have a detrimental impact on peer and route scaling and therefore operators are encouraged to use it only when absolutely needed.

The **no** form of this command disables split horizon command which allows the lower level to inherit the setting from an upper level.

configure service vprn ripng split-horizon

configure service vprn rip group neighbor split-horizon

configure service vprn ripng group neighbor split-horizon

configure service vprn ripng group split-horizon

Description

This command enables the use of split-horizon. RIP uses split horizon with poison reverse to protect from such problems as "counting to infinity". Split horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **no** form of this command disables the **split-horizon** command, which allows the lower level to inherit the setting from an upper level.

Default

split-horizon enable

Parameters

enable

Enables split horizon and poison reverse.

disable

Enables split horizon without poison reverse. This allows the routes to be readvertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular, if no value is set (**no split-horizon**), the lower level inherits the setting from the less-specific level.

configure router ripng split-horizon

configure router rip split-horizon

configure router rip group split-horizon

configure router rip group neighbor split-horizon

configure router ripng group neighbor split-horizon

Description

This command enables the use of split-horizon.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

RIP uses split-horizon with poison-reverse to protect from such problems as "counting to infinity". Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **split-horizon disable** command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (**no split-horizon**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command disables split horizon command which allows the lower level to inherit the setting from an upper level.

Default

enabled

Parameters

enable

Specifies enable split horizon and poison reverse.

disable

Specifies disable split horizon allowing routes to be re-advertised on the same interface on which they were learned with the advertised metric incremented by the **metric-in** value.

Context

[Tree] (config>service>vpls split-horizon-group)

Full Context

configure service vpls split-horizon-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a new split horizon group for the VPLS instance. Traffic arriving on a SAP or spoke-SDP within this split horizon group will not be copied to other SAPs or spoke-SDPs in the same split horizon group.

A split horizon group must be created before SAPs and spoke-SDPs can be assigned to the group.

The split horizon group is defined within the context of a single VPLS. The same group-name can be re-used in different VPLS instances.

Up to 30 split horizon groups can be defined per VPLS instance. Half are supported in i-VPLS.

The **no** form of this command removes the group name from the configuration.

Default

A split horizon group is by default not created as a residential-group.

Parameters

group-name

Specifies the name of the split horizon group to which the SDP belongs

residential-group

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

a) SAPs which are members of this Residential Split Horizon Group will have:

- Double-pass queuing at ingress as default setting (can be disabled)
- STP disabled (cannot be enabled)
- ARP reply agent enabled per default (can be disabled)
- MAC pinning enabled per default (can be disabled)
- Downstream broadcast packets are discarded thus also blocking the unknown, flooded traffic
- Downstream multicast packets are allowed when IGMP snooping is enabled

b) Spoke SDPs which are members of this Residential Split Horizon Group will have:

- Downstream multicast traffic supported
- Double-pass queuing is not applicable
- STP is disabled (can be enabled)
- ARP reply agent is not applicable (dhcp-lease-states are not supported on spoke-SDPs)
- MAC pinning enabled per default (can be disabled)

Full Context

configure service vpls bgp-evpn mpls split-horizon-group

configure service vpls bgp-evpn segment-routing-v6 split-horizon-group

Description

This command allows the user to configure an explicit split-horizon-group for all BGP-EVPN MPLS or SRv6 destinations that can be shared by other SAPs and/or spoke SDPs. The use of explicit split-horizon-groups for EVPN-MPLS or SRv6 and spoke SDPs allows the integration of VPLS and EVPN-MPLS or SRv6 networks.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the **split-horizon-group** command for **bgp-evpn>mpls/srv6** contexts is not used, the default split-horizon-group (that contains all the EVPN destinations) is still used, but it is not possible to refer to it on SAPs/spoke SDPs. User-configured split-horizon-groups can be configured within the service context. The same group-name can be associated to SAPs, spoke SDPs, pw-templates, pw-template-bindings and EVPN-MPLS or SRv6 destinations. The configuration of **bgp-evpn>mpls/srv6> split-horizon-group** is only allowed if **bgp-evpn>mpls/srv6** is shutdown; no changes are allowed when **bgp-evpn>mpls/srv6** is **no shutdown**.

When the SAPs and/or spoke SDPs (manual or BGP-AD-discovered) are configured within the same **split-horizon-group** as the EVPN-MPLS or SRv6 endpoints, MAC addresses are still learned on them but they are not advertised in BGP-EVPN. If provider-tunnel is enabled in the bgp-evpn service, the SAPs and SDP bindings that share the same split-horizon-group of the EVPN-MPLS provider-tunnel are brought operationally down if the point-to-multipoint tunnel is operationally up.

Default

no split-horizon-group

Parameters

name

Specifies the split-horizon-group name.

split-horizon-group

Syntax

split-horizon-group *group-name*

no split-horizon-group

Context

[Tree] (config>service>pw-template split-horizon-group)

Full Context

configure service pw-template split-horizon-group

Description

This command creates a new split horizon group (SGH).

Comparing a "residential" SGH and a "regular" SHG is that a residential SHG:

- Has different defaults for the SAP or SDP that belong to this group (ARP reply agent enabled (SAP only), MAC pinning enabled). These can be disabled in the configuration.
- Does not allow enabling spanning tree (STP) on a SAP. It is allowed on an SDP.
- Does not allow for downstream broadcast (broadcast/unknown unicast) on a SAP. It is allowed on an SDP.
- On a SAP, downstream multicast is only allowed when IGMP is enabled (for which an MFIB state exists; only IP multicast); on a SDP, downstream mcast is allowed.

When the feature was initially introduced, residential SHGs were also using ingress shared queuing by default to increase SAP scaling.

A residential SAP (SAP that belongs to a RSHG) is used to scale the number of SAPs in a single VPLS instance. The limit depends on the hardware used and is higher for residential SAPs (where there is no need for egress multicast replication on residential SAPs) than for regular SAPs. Therefore, residential SAPs are useful in residential aggregation environments (for example, triple play networks) with a VLAN/subscriber model.

The **no** form of the command removes the group name from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

group-name

Specifies the name of the split horizon group to which the SDP belongs.

residential-group

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

- SAPs which are members of this Residential Split Horizon Group will have:
  - Double-pass queuing at ingress as default setting (can be disabled)
  - STP disabled (cannot be enabled)
  - ARP reply agent enabled per default (can be disabled)
  - MAC pinning enabled per default (can be disabled)
  - Downstream Broadcast packets are discarded thus also blocking the unknown, flooded traffic
  - Downstream Multicast packets are allowed when IGMP snooping is enabled
- Spoke SDPs which are members of this Residential Split Horizon Group will have:
  - Downstream multicast traffic supported
  - Double-pass queuing is not applicable
  - STP is disabled (can be enabled)
  - ARP reply agent is not applicable on the 7750 SR and 7450 ESS (dhcp-lease-states are not supported on spoke SDPs)
  - MAC pinning enabled per default (can be disabled)

Context

[Tree] (config>service>vpls spoke-sdp)

Full Context

configure service vpls spoke-sdp

Description

This command binds a service to an existing SDP.

A spoke SDP is treated like a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other ports (other spoke and mesh SDPs or SAPs) and not transmitted on the port where the traffic was received.

The SDP operational state determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

To associate an SDP with a VPLS service, the SDP must be predefined in the **configure service sdp** context. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* exists, a binding is created between that *sdp-id* and the service.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end 7450 ESS or 7750 SR devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected. After the SDP binding is removed, no packets are forwarded to the far-end router.

Parameters

sdp-id

Specifies the SDP identifier.

Values 1 to 32767

vc-id

Specifies the virtual circuit identifier.

Values 1 to 4294967295

vc-type

Keyword that overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value that represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. Changing the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ether, vlan

ether

Keyword that defines the VC type as Ethernet. The **ethernet**, **vlan,** and **vpls** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding (hex 5).

vlan

Keyword that defines the VC type as VLAN. The **ethernet**, **vlan,** and **vpls** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. The VLAN VC-type requires at least one dot1Q tag within each encapsulated Ethernet packet transmitted to the far end.

group-name

Keyword that specifies the name of the split horizon group to which the SDP belongs.

leaf-ac

Keyword that specifies a SDP as a leaf access (AC) SDP. The default E-Tree SAP type is root AC if **leaf-ac** (or **root-leaf-tag**) is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

create

Keyword used to create the spoke SDP. The create keyword requirement can be enabled or disabled in the **environment>create** context.

endpoint

Keyword that specifies the service endpoint to which this SDP bind is attached. The service ID of the SDP binding must match the service ID of the service endpoint.

no endpoint

Keyword that removes the association of a spoke-SDP with an explicit endpoint name.

root-leaf-tag

Keyword that specifies a tagging spoke-SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this SDP binding is a tag SDP that will use a default VID tag of 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

leaf-ac

Keyword that specifies an access (AC) spoke-SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP binding type is a root-ac if *leaf-ac* or *root-leaf-tag* is not specified at SDP creation. This option is only available when the VPLS is

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

Platforms

spoke-sdp

Syntax

[**no**] **spoke-sdp** *sdp-id*

Context

[Tree] (config>service>vprn spoke-sdp)

Full Context

configure service vprn spoke-sdp

Description

This command binds a service to an existing service destination point (SDP).

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPRN service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end 7750 SR devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Parameters

sdp-id

Specifies the SDP identifier. Allowed values are integers in the range of 1 and 17407 for existing SDPs.

vc-id

Specifies the virtual circuit identifier.

Values 1 to 4294967295

Full Context

configure service epipe spoke-sdp

Description

This command binds a service to an existing SDP. A spoke SDP is equivalent to a traditional bridge "port", where flooded traffic received on the spoke SDP is replicated on all other "ports" (including other spoke and mesh SDPs or SAPs), and not transmitted on the port on which it was received.

The SDP has an operational state that determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

To associate an SDP with an Epipe, VPLS, VPRN, or VPRN service, the SDP must be predefined in the **configure service sdp** context. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* exists, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated with and bound to a service; otherwise, no far-end devices can participate in the service.

This command can also be used to associate a GRE tunnel carrying Ethernet payload with an Epipe and terminate it on a PW port referenced within the same Epipe service. The spoke SDP represents a L2oGRE tunnel with SDP delivery type set to **eth-gre-bridged**. With this configuration, the **vc-id** is unused since there is no multiplexing of Ethernet payload within the same tunnel. The **vc-id** value is included only to maintain the expected spoke SDP structure within an Epipe service. For L2oGRE tunnels, the **vc-id** can be set to any arbitrary value within its configurable range.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected. After it is removed, no packets are forwarded to the far-end router.

Default

No *sdp-id* is bound to a service.

Parameters

sdp-id

Specifies the SDP identifier.

Values 1 to 17407

vc-id

Specifies the virtual circuit identifier. The VC-ID is not used with L2TPv3 SDPs or L2oGRE tunnels, however, it must be configured.

Values 1 to 4294967295

vc-type

Keyword that specifies the VC type, which overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value that represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the **dot1q** value expected by the far-end provider equipment. A change of the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ethernet

ether

Keyword used to specify the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. If the VC type is not defined, the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type**; it restores the default VC type for the spoke SDP binding.

vlan

Keyword used to specify the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a VLAN tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined, the default is Ethernet for spoke SDP bindings.

The VLAN VC-type requires at least one dot1q tag within each encapsulated Ethernet packet transmitted to the far end.

Note: The system expects a symmetrical configuration with its peer. Specifically, it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions may not function for asymmetrical configurations as they would for symmetrical configurations, resulting in unexpected behavior.

no-endpoint

Keyword used to remove the association of a spoke SDP with an explicit endpoint name.

endpoint-name

Specifies the name of the service endpoint.

icb

Keyword used to specify the spoke SDP as an inter-chassis backup SDP binding.

no spoke-sdp *sdp-id:vc-id*

Context

[Tree] (config>service>vprn>aarp-interface spoke-sdp)

Full Context

configure service vprn aarp-interface spoke-sdp

Description

This command binds a service to an existing SDP. A spoke SDP is treated like the equivalent of a traditional bridge port where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Default

no spoke-sdp

Parameters

sdp-id

Specifies the SDP identifier.

Values 1 to 17407

vc-id

The virtual circuit identifier. The VC-ID is not used with L2TPv3 SDPs, however it must be configured.

Values 1 to 4294967295

create

Keyword used to create the spoke SDP.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

spoke-sdp

Syntax

spoke-sdp *sdp-id:vc-id* [**create**] [**no-endpoint**]

spoke-sdp *sdp-id:vc-id* [**create**] **endpoint** *name* [**icb**]

no sdp *sdp-id:vc-id*

Context

[Tree] (config>mirror>mirror-dest>remote-source spoke-sdp)

[Tree] (config>mirror>mirror-dest spoke-sdp)

Full Context

configure mirror mirror-dest remote-source spoke-sdp

configure mirror mirror-dest spoke-sdp

Description

This command binds an existing (mirror) service distribution path (SDP) to the mirror destination service ID.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Spoke SDPs are used to send and receive mirrored traffic between mirror source and destination routers in a remote mirroring solution. A spoke SDP configured in the remote-source context (**remote-src>spoke-sdp**) is used on the destination router. A spoke SDP configured in the mirror service context (**mirror-dest>spoke-sdp**) is used on the source router.

The destination node should be configured with **remote-src>spoke-sdp** entries when using L2TPv3, MPLS-TP or LDP IPv6 LSP SDPs in the remote mirroring solution. For all other types of SDPs, r**emote-source>far-end** entries should be used.

Spoke SDPs are not applicable when routable LI encapsulation is employed (mirror-dest>encap).

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The **no** form of this command removes the SDP binding from the mirror destination service.

Default

An SDP ID is bound to a mirror destination service ID. If no SDP is bound to the service, the mirror destination will be local and cannot be sent to another router over the core network.

Parameters

sdp-id:vc-id

Specifies a locally unique SDP identification (ID) number. The SDP ID must exist. If the SDP ID does not exist, an error will occur and the command will not execute.

For mirror services, the *vc-id* defaults to the *service-id*. However, there are scenarios where the *vc-id* is being used by another service. In this case, the SDP binding cannot be created. So, to avoid this, the mirror service SDP bindings now accepts *vc-ids*.

Values 1 to 17407

no-endpoint

Removes the association of a SAP or a SDP with an explicit endpoint name.

name

Specifies the name of the endpoint associated with the SAP.

icb

Indicates that the SDP is of type Inter-Chassis Backup (ICB). This is a special pseudowire used for MC-LAG and pseudowire redundancy application.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. The ICB SDP cannot be added to the endpoint if the SAP is not part of a MC-LAG instance. This means that all other SAP types cannot exist on the same endpoint as an ICB SDP since non Ethernet SAP cannot be part of a MC-LAG instance. Conversely, a SAP which is not part of a MC-LAG instance cannot be added to an endpoint which already has an ICB SDP.

An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

Default Null. The user should explicitly configure this option at create time. The user can remove the ICB type simply by retyping the SDP configuration without the **icb** keyword.

Syntax

spoke-sdp *sdp-id:vc-id* [**create**]

no spoke-sdp *sdp-id:vc-id*

Context

[Tree] (config>service>vprn>ip-mirror-interface spoke-sdp)

Full Context

configure service vprn ip-mirror-interface spoke-sdp

Description

This command binds a service to an existing SDP.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with the VPRN service. SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router. The spoke SDP must be shut down before it can be deleted from the configuration.

Parameters

sdp-id

Specifies SDP identifier.

Values 1 to 32767

vc-id

Specifies the virtual circuit identifier.

Values 1 to 4294967295

create

Keyword used to create an IP mirror interface.

43.103 spoke-sdp-fec

spoke-sdp-fec

Syntax

spoke-sdp-fec

spoke-sdp-fec *spoke-sdp-fec-id* [**fec** *fec-type*] [**aii-type** *aii-type*] [**create**]

spoke-sdp-fec *spoke-sdp-fec-id* **no-endpoint**

spoke-sdp-fec *spoke-sdp-fec-id* [**fec** *fec-type*] [**aii-type** *aii-type*] [**create**] **endpoint** *name* [**icb**]

Context

[Tree] (config>service>epipe spoke-sdp-fec)

Full Context

configure service epipe spoke-sdp-fec

Description

This command binds a service to an existing service destination point (SDP), using a dynamic MS-PW.

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

When using dynamic MS-PWs, the particular SDP to bind-to is automatically selected based on the Target Attachment Individual Identifier (TAII) and the path to use, specified under spoke SDP FEC. The selected SDP will terminate on the first hop S-PE of the MS-PW. Therefore, an SDP must already be defined in the config>service>sdp context that reaches the first hop router of the MS-PW. The router will in order to associate an SDP with a service. If an SDP to that is not already configured, an error message is generated. If the sdp-id does exist, a binding between that sdp-id and the service is created.

It differs from the spoke-sdp command in that the spoke-sdp command creates a spoke SDP binding that uses a pseudowire with the PW ID FEC. However, the spoke-sdp-fec command enables pseudowires with other FEC types to be used. Only the Generalized ID FEC (FEC129) may be specified using this command.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Parameters

spoke-sdp-fec-id

An unsigned integer value identifying the spoke SDP.

Values 1 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fec-type

An unsigned integer value for the type of the FEC used by the MS-PW.

Values 129 to 130

aii-type

An unsigned integer value for the Attachment Individual Identifier (AII) type used to identify the MS-PW endpoints.

Values 1 to 2

endpoint-name

Specifies the name of the service endpoint.

no endpoint

Adds or removes a spoke SDP association.

icb

Configures the spoke SDP as an inter-chassis backup SDP binding.

Full Context

configure service vprn pim spt-switchover-threshold

Description

This command configures a shortest path tree (SPT tree) switchover threshold for a group prefix.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

grp-ip-address

Specifies the multicast group address.

grp-ipv6-address

Specifies the multicast group address.

prefix-length

Specifies the address prefix length.

Values		
	grp-ipv6-address	: x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x [0 to FFFF]H
		d [0 to 255]D
	prefix-length	[1 to 128]

mask

Defines the mask of the multicast-ip-address.

Values 4 to 32

netmask

The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

spt-threshold

Specifies the configured threshold in kilobits per second (kb/s) for the group to which this (S,G) belongs. For a group G configured with a threshold, switchover to SPT for an (S,G) is attempted only if the (S,G)'s rate exceeds this configured threshold.

Platforms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router pim spt-switchover-threshold

Description

This command configures shortest path (SPT) tree switchover thresholds for group prefixes.

PIM-SM routers with directly connected routers receive multicast traffic initially on a shared tree rooted at the Rendezvous Point (RP). Once the traffic arrives on the shared tree and the source of the traffic is known, a switchover to the SPT tree rooted at the source is attempted.

For a group that falls in the range of a prefix configured in the table, the corresponding threshold value determines when the router should switch over from the shared tree to the source specific tree. The switchover is attempted only if the traffic rate on the shared tree for the group exceeds the configured threshold.

In the absence of any matching prefix in the table, the default behavior is to switchover when the first packet is seen. In the presence of multiple prefixes matching a given group, the most specific entry is used.

The **no** form of this command removes the parameters from the PIM configuration.

Parameters

grp-ipv4-prefix

Specifies the group IPv4 multicast address in dotted decimal notation.

Values a.b.c.d

ipv4-prefix-length

Specifies the length of the IPv4 prefix.

Values 4 to 32

netmask

Specifies the netmask associated with the IPv4 prefix, expressed in dotted decimal notation. Network bits must be 1, and host bits must be 0.

Values a.b.c.d

grp-ipv6-prefix

Specifies the group IPv6 multicast address in hexadecimal notation.

Values xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

xx — 0 to FF (hex)

ipv6-prefix-length

Specifies the length of the IPv6 prefix.

Values 8 to 128

spt-threshold

Specifies the configured threshold in kilobits per second (kb/s) for a group prefix. A switchover is attempted only if the traffic rate on the shared tree for the group exceeds this

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configured threshold. When the **infinity** keyword is specified, no switchover will occur at any time, regardless of the traffic level is detected.

configure service vpls spoke-sdp eth-cfm squelch-ingress-ctag-levels

configure service vpls mesh-sdp eth-cfm squelch-ingress-ctag-levels

Description

This command defines the levels of the ETH-CFM packets that are silently discarded on ingress into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding plus an additional VLAN, up to a maximum tag length of two tags. All ETH-CFM packets inbound to the SAP or SDP binding that match the configured levels are dropped without regard for any other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option. The list of levels must be a complete contiguous list from 0 up to the highest level to be dropped. The command must be retyped in complete form to modify a previous configuration, if the operator does not want to delete it first. Entering the command without any valid level information removes the command from the configuration and disables the feature.

The **no** form of this command removes the silent discarding of previously matching ETH-CFM PDUs.

Default

no squelch-ingress-ctag-levels

Parameters

configure service vprn bgp-evpn mpls auto-bind-tunnel resolution-filter sr-isis

Description

This command selects the SR tunnel type programed by an IS-IS instance in TTM.

When the **sr-isis**, **sr-ospf**, or **sr-ospf3** command is enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the OSPF, OSPFv3, or IS-IS instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

The **no** form of this command disables the SR-ISIS setting for the auto-bind tunnel.

Full Context

configure router policy-options policy-statement default-action sr-label-index

configure router policy-options policy-statement entry action sr-label-index

Description

This command associates a BGP segment-routing label index value with all /32 BGP labeled IPv4 routes matching the entry or policy **default-action**.

Note:
Avoid using this action in a policy entry that matches more than one /32 label-ipv4 route, otherwise SID conflicts are created.

The **sr-label-index** action only takes effect in BGP peer import policies (and only on received /32 label-ipv4 routes) and in route-table-import policies associated with the label-ipv4 RIB.

The **prefer-igp** applies only in a route-table-import policy. If **prefer-igp** is specified and BGP segment-routing uses **prefix-sid-range global**, then BGP tries, as a first priority, to use the IGP segment routing label index for the IGP route matched by the **route-table-import** policy. If the IGP route does not have an SID index, or **prefer-igp** is not configured or **prefix-sid-range** is not **global**, BGP tries to use the label index value specified by this command.

When this action occurs in a policy applied as a peer-import policy, it can add a prefix SID attribute to a received /32 label-ipv4 route that was not sent with this attribute, or it can replace the received prefix SID attribute with a new one.

If this command specifies an index value that causes a SID conflict with another BGP route, then all conflicting BGP routes are re-advertised with label values based on dynamic allocation rather than SID-based allocation.

If this command specifies an index value that causes a SID conflict with an IGP route, the BGP route is re-advertised with a label value based on dynamic allocation rather than an SID-based allocation.

The **no** form of this command causes matched BGP routes to be advertised without any new or changed prefix SID attributes.

Default

no sr-label-index

Parameters

value

Specifies the BGP segment routing label index to associate with the matched route or routes.

Values 0 to 52487

param-name

Specifies the **type** parameter variable name, up to 32 characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

prefer-igp

A keyword that is applicable only in **route-table-import** policies, to instruct BGP to borrow the SID index from the IGP route if it has an SID index and the **prefix-sid-range** is **global**.

Context

[Tree] (config>router>mpls-labels sr-labels)

Full Context

configure router mpls-labels sr-labels

Description

This command configures the range of the Segment Routing Global Block (SRGB). It is a label block which is used for assigning labels to segment routing prefix SIDs originated by this router. This range is carved from the system dynamic label range and is not instantiated by default.

This is a reserved label and once configured it cannot be used by other protocols such as RSVP, LDP, and BGP to assign a label dynamically.

Default

no sr-labels

Parameters

start-value

Specifies the start label value in the SRGB

Values 18432 to 524287 | 1048575 (FP4 or FP5 only)

The label value is selectable within the dynamic label range which begins anywhere from 32 to 18432 (default).

end-value

Specifies the end label value in the SRGB

Values 18432 to 524287 | 1048575 (FP4 or FP5 only)

The label value is selectable within the dynamic label range which begins anywhere from 32 to 18432 (default).

Syntax

sr-mpls-local {**none** | **all**}

Context

[Tree] (config>router>ttl-propagate sr-mpls-local)

Full Context

configure router ttl-propagate sr-mpls-local

Description

This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the Base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy.

This command configures TTL or hop-limit propagation for CPM originated IP packets. Use the **sr-mpls-transit** command to configure TTL or hop-limit propagation for transit IP packets.

Default

sr-mpls-local all

Parameters

none

Keyword to specify that the IP TTL or hop limit is not propagated into the segment routing transport label stack.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

all

Keyword to specify that the IP TTL or hop limit is propagated to all labels in the segment routing transport label stack.

sr-mpls-transit

Syntax

sr-mpls-transit {**none** | **all**}

Context

[Tree] (config>router>ttl-propagate sr-mpls-transit)

Full Context

configure router ttl-propagate sr-mpls-transit

Description

This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the Base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy.

This command configures TTL or hop-limit propagation for transit IP packets. Transit IP packets are packets of Base router prefixes received on an access interface or a network interface (with or without tunnel encapsulation) and whose FIB lookup results in forwarding them over an SR-MPLS tunnel. Use the **sr-mpls-local** command to configure TTL or hop-limit propagation for CPM originated IP packets.

Default

sr-mpls-transit all

Parameters

none

Keyword to specify that the IP TTL or hop limit is not propagated into the segment routing transport label stack.

all

Keyword to specify that the IP TTL or hop limit is propagated to all labels in the segment routing transport label stack.

configure router bgp next-hop-resolution shortcut-tunnel family resolution-filter sr-policy

Description

This command enables the use of SR policies to resolve the next hop of BGP routes.

The SR policies are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73 or AFI 2/SAFI 73). BGP resolves an IPv4 route with an IPv4 next-hop address or an IPv6 route with IPv4-mapped IPv6 next-hop address using an SR policy selected by applying the following procedure in preference order:

- **IPv4 endpoint**

  The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the labeled IPv4 or IPv6 route must match the color of the SR policy.

- **null IPv4 endpoint (0.0.0.0)**

  The highest numbered color extended community attached to the labeled IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

- **null IPv6 endpoint (0::0)**

  The highest numbered color extended community attached to the labeled IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

BGP resolves an IPv6 route with an IPv6 next hop that is not an IPv4-mapped IPv6 address using an SR policy selected by applying the following procedure in preference order:

- **IPv6 endpoint**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the labeled IPv6 route must match the color of the SR policy.

- **null IPv6 endpoint (0.::0)**

  The highest numbered color extended community attached to the labeled IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

- **null IPv4 endpoint (0.0.0.0)**

  The highest numbered color extended community attached to the labeled IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

The **no** form of this command disables SR policies for next-hop resolution.

[Tree] (config>router>policy-options>policy-statement>default-action sr-return-path-bfd-label)

Full Context

configure router policy-options policy-statement entry action sr-return-path-bfd-label

configure router policy-options policy-statement default-action sr-return-path-bfd-label

Description

This command configures an additional MPLS label to add to the bottom of the label stack for the S-BFD packet and sets the S-BFD session to echo mode.

This command applies to the initiator of the S-BFD sessions. The label value can either be a binding SID for an SR policy or another MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through the MPLS return path. This value takes precedence over the return path label value in a maintenance policy (configured using the **configure router segment-routing maintenance-policy return-path-label** command) that is also applied as the policy-statement action. This command can only be configured if the **sr-maintenance-policy** command is also configured.

The **no** form of this command deletes the label value. If this command is not configured and there is no **return-path-label** command configuration in the maintenance policy that is also applied as an action, S-BFD returns to asynchronous mode and no return path label is pushed by the initiator node. S-BFD packets for this LSP or path received by the reflector are routed through the IGP path.

Default

no sr-return-path-bfd-label

Parameters

value

Specifies the label value.

Values 32 to 1048575

param-name

Specifies the parameter name to use as the label value, which can be up to 32 characters and must start and end with an at sign (@).

Description

This command enables support for SR-TE PCE-initiated LSPs.

The **no** form of this command removes SR-TE PCE-initiated LSP support. All PCE-initiated SR-TE LSPs are deleted.

Platforms

All

sr-te

Syntax

sr-te *value*

no sr-te

Context

[Tree] (config>router>mpls>tunnel-table-pref sr-te)

Full Context

configure router mpls tunnel-table-pref sr-te

Description

This command configures the tunnel table preference for an SR-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default

sr-te 8

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

value

Specifies the tunnel table preference value for SR-TE LSP.

Values 1 to 255

Default 8

Platforms

All

sr-te

Syntax

[**no**] **sr-te**

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter sr-te)

Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter sr-te

Description

The sr-te value instructs the code to search for the set of lowest metric SR-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of SR-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of SR-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value are selected.

no sr-te

Context

[Tree] (config>router>ospf>traffic-engineering-options sr-te)

Full Context

configure router ospf traffic-engineering-options sr-te

Description

This command configures the advertisement of TE attributes of each link on a per-application basis. Two applications are supported in SR OS: RSVP-TE and SR-TE. Although the **legacy** mode of advertising TE attributes is supported, additional configurations are possible.

The **no** form of this command deletes the context.

Default

no sr-te

Parameters

legacy

Advertises the TE attributes for MPLS-enabled SR links using TE Opaque LSAs.

Note:
Do not configure the **legacy** mode if the network has both RSVP-TE and SR-TE attributes and the links are not congruent.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

application-specific-link-attributes

Advertises TE information for MPLS-enabled SR links using the new Application Specific Link Attributes (ASLA) TLVs.

Platforms

All

sr-te

Syntax

[**no**] **sr-te**

Context

[Tree] (config>oam-pm>session>ip>tunnel>mpls sr-te)

Full Context

configure oam-pm session ip tunnel mpls sr-te

Description

This command configures specification of SR-TE specific tunnel information that is used to transport the test packets. Entering this context removes all other tunnel type options configured under the **configure oam-pm session ip tunnel mpls** context. Only a single **mpls** type can be configured for an OAM-PM session.

The **no** form of this command removes the SR-TE LSP name from the configuration.

Default

no override

Parameters

tcp-port

Specifies the source TCP port to be used in the test TCP header.

Values 0 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

All

43.122 sr-te-lsp

sr-te-lsp

Syntax

[**no**] **sr-te-lsp** *lsp-name*

Context

[Tree] (config>service>sdp sr-te-lsp)

Full Context

configure service sdp sr-te-lsp

Description

This command configures an MPLS SDP of LSP type SR-TE.

The user can specify up to 16 SR-TE LSP names. The destination address of all LSPs must match that of the SDP far-end option. Service data packets are sprayed over the set of LSPs in the SDP using the same procedures as for tunnel selection in ECMP. Each SR-TE LSP can, however, have up to 32 next-hops at the ingress LER when the first segment is a node SID-based SR tunnel. Thus, the service data packet is forwarded over one of a maximum of 16x32 next-hops.

The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-te** tunnel type.

The signaling protocol for the service labels for an SDP using a SR-TE LSP can be configured to static (**off**), T-LDP (**tldp**), or BGP (**bgp**).

Platforms

All

43.124 src-access-list

src-access-list

Syntax

src-access-list *list-name*

no src-access-list *list-name*

Context

[Tree] (config>system>security>snmp src-access-list)

Full Context

configure system security snmp src-access-list

Description

This command configures a list of source IP addresses used to validate SNMPv1 and SNMPv2c requests after the list is associated with one or more SNMPv1 and SNMPv2c communities.

A source access list referenced by one or more **community** instances is used to verify the source IP addresses of an SNMP request using the community, regardless of the VPRN/VRF interface (or "Base" interface) on which the request arrived. For example, if an SNMP request arrives on an interface in VPRN

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

"100" but the request is referencing a community, the source IP address in the packet is validated against the source address list configured for the community. This occurs regardless of whether the request is destined to a VPRN interface address and the VPRN has SNMP access enabled, or the request is destined to the base system address via GRT leaking. If the source IP address of the request message does not match the IP address of any of the **src-host** entries contained in the list, the request is discarded and logged as an SNMP authentication failure.

Caution:
Using source access list validation can impact the time it takes for an SR OS node to reply to an SNMP request. Nokia recommends keeping the lists short by including only the addresses that are needed, and to place SNMP managers that send the highest volume of requests, such as the NSP NFM-P, at the top of the list.

A maximum of 16 source access lists can be configured. Each source access lists can contain a maximum of 16 source hosts.

The **no** form of this command removes the named source access list. Users cannot remove a source access list that is referenced by one or more **community** instances.

Parameters

list-name

Specifies the name or key of the source access list. This parameter must begin with a letter (a-z or A-Z).

Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a matching condition for the GSN IP address. The IP address value is checked only against the source IP address of the GTP packets that contain an APN IE or an IMSI IE.

Parameters

ip address

Specifies a valid unicast address associated with the IMSI-APN filter entry.

Values		
	ipv4-address	a.b.c.d[/mask]
		mask - [1..32]
	ipv6-address	x:x:x:x:x:x:x:x/prefix-length
		x:x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D
		prefix-length [1..128]

ip-prefix-list-name

Specifies an IP address prefix list for the source IP address match criteria, up to 32 characters.

Platforms

Description

This command configures a source IP address entry used to validate SNMPv1 and SNMPv2c requests.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the specified entry.

Parameters

host-name

Specifies a name for the entry, up to 32 characters.

ip-address

Specifies an allowed IPv4 or IPv6 source address for SNMP requests.

Values

ipv4-address — a.b.c.d (host bits must be 0)

ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

Full Context

configure qos sap-ingress ip-criteria entry match src-ip

configure qos sap-egress ip-criteria entry match src-ip

Description

This command configures a source IPv4 address range to be used as an SAP QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask; for example, 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

Default

no src-ip

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

prefix-list-name

Specifies the IPv4 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Description

This command configures a source IPv4 or IPv6 address range to be used as a network QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, when specifying an IPv4 address, 10.1.0.0/16 or 10.1.0.0 255.255.0.0 can be used.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-list-name

Specifies an IPv4 prefix list which contains IPv4 address prefixes to be matched.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

mask

Specifies the length of the ipv6-address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

ipv6-prefix-list-name

Specifies an IPv6 prefix list which contains IPv6 address prefixes to be matched.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Description

This command configures a source IPv4 or IPv6 address range to be used as an IP filter or IP exception match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, 10.1.0.0/16 for IPv4. The conventional notation of 10.1.0.0 255.255.0.0 may also be used for IPv4.

The **no** form of this command removes the source IP address match criterion.

Default

no src-ip

Parameters

ip-address

Specifies the destination IPv4 address specified in dotted-decimal notation.

Values a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted-decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ip-prefix-list or ipv6-prefix-list *prefix-list-name*

Specifies to use a list of IP prefixes, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies an IPv6 prefix for the IP match criterion in hex digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0..FFFF]H
d: [0..255]D

prefix-length

Specifies whether a the IPv6 prefix length for the specified *ipv6-address* expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0..FFFF]H
d: [0..255]D

Context

[Tree] (config>system>security>mgmt-access-filter>ip-filter>entry src-ip)

Full Context

configure system security management-access-filter ip-filter entry src-ip

Description

This command configures a source IP address range or an IP prefix list to be used as a management access filter match criterion.

The **no** form of this command removes the source IP address match criterion.

Default

no src-ip

Parameters

ip-prefix

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

mask

Specifies the subnet mask length expressed as a decimal integer.

Values 1 **to** 32 (mask length), 0.0.0.0 **to** 255.255.255.255 (dotted decimal)

netmask

Specifies the dotted quad equivalent of the mask length.

Values 0.0.0.0 to 255.255.255.255

ip-prefix-list-name

Specifies the IP prefix list used as a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes .

Full Context

configure system security management-access-filter ipv6-filter entry src-ip

Description

This command configures a source IPv6 address range or an IPv6 prefix list to be used as a management access filter match criterion. This command only applies to the 7750 SR and 7950 XRS.

The **no** form of this command removes the source IPv6 address match criterion.

Default

no src-ip

Parameters

ipv6-address/prefix-length

Specifies the IPv6 address for the IPv6 match criterion in dotted decimal notation. An IPv6 IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:0:217A.

Values		
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0..FFFF]H
		d: [0..255]D
	prefix-length	1 to 128

ipv6-prefix-list-name

Specifies the IPv6 prefix list used a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes .

Platforms

All

src-ip

Syntax

src-ip [*ipv6-address*/ *prefix-length* | **ip-prefix-list** *prefix-list-name* [*prefix-list-name*...(up to 16 max)]]

no src-ip

Full Context

configure system security cpm-filter ip-filter entry match src-ip

Description

This command specifies the IP address to match the source IP address of the packet.

To match on the source IP address, specify the address and its associated mask, such as 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used.

The **no** form of this command removes the source IP address match criterion.

Default

no src-ip

Parameters

ipv6-address/prefix-length

Specifies the IP address for the match criterion in dotted-decimal notation. An IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:0:217A.

Values

ipv4-address	a.b.c.d (host bits must be 0)
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses
prefix-length	1 to 128

ip-prefix-list

Creates a list of IPv4 prefixes for match criteria in IPv4 ACL and CPM filter policies.

ip-prefix-list-name

Specifies a string of printable ASCII characters, up to 32 characters. If special characters are used, the string must be enclosed within double quotes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

44 s Commands – Part IV

44.1 src-ip-address

src-ip-address

Syntax

src-ip-address *ip-address*

no src-ip-address

Context

[Tree] (config>saa>test>type-multi-line>lsp-trace>sr-policy src-ip-address)

[Tree] (config>saa>test>type-multi-line>lsp-ping src-ip-address)

[Tree] (config>saa>test>type-multi-line>lsp-ping>sr-policy src-ip-address)

Full Context

configure saa test type-multi-line lsp-trace sr-policy src-ip-address

configure saa test type-multi-line lsp-ping src-ip-address

configure saa test type-multi-line lsp-ping sr-policy src-ip-address

Description

This command configures the source IP address. This option is used when an OAM packet must be generated from a different address than the node's system interface address. For example, when the OAM packet is sent over an LDP LSP and the LDP LSR-ID of the corresponding LDP session to the next hop is set to an address other than the system interface address.

The **no** form of this command removes the configuration.

Parameters

ip-address

Specifies the source IP address.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

Platforms

All

44.2 src-ipv4-address

src-ipv4-address

Syntax

src-ipv4-address *a.b.c.d*

no src-ipv4-address

Context

[Tree] (config>test-oam>build-packet>header>ipv4 src-ipv4-address)

[Tree] (debug>oam>build-packet>packet>field-override>header>ipv4 src-ipv4-address)

Full Context

configure test-oam build-packet header ipv4 src-ipv4-address

debug oam build-packet packet field-override header ipv4 src-ipv4-address

Description

This command defines the source IPv4 address to be used in the IPv4 header.

The **no** form of this command removes the source IPv4 address.

Default

src-ipv4-address 0.0.0.0

Parameters

a.b.c.d

Specifies the IPv4 source address to be used in the IPv4 header.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

44.3 src-ipv6-address

src-ipv6-address

Syntax

src-ipv6-address *ipv6-address*

no src-ipv6-address

Context

[Tree] (config>test-oam>build-packet>header>ipv6 src-ipv6-address)

[Tree] (debug>oam>build-packet>packet>field-override>header>ipv6 src-ipv6-address)

Full Context

configure test-oam build-packet header ipv6 src-ipv6-address

debug oam build-packet packet field-override header ipv6 src-ipv6-address

Description

This command defines the source IPv6 address to be used in the IPv6 header.

The **no** form of the removes the source IPv6 address.

Parameters

ipv6-address

Specifies the IPv6 source address to be used in the IPv6 header.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	0 to FFFF]H
	d:	[0 to 255]D

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

44.4 src-mac

src-mac

Syntax

src-mac *ieee-address*

no src-mac

Context

[Tree] (config>redundancy>mc>peer>mcr>l3ring>node>cv src-mac)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify src-mac

Description

This command specifies the source MAC address used for the ring-node connectivity verification of this ring node.

If all zeros are specified, the MAC address of the system management processor (CPM) is used.

The **no** form of this command reverts to the default.

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Platforms

All

src-mac

Syntax

src-mac *ieee-address*

no src-mac

Context

[Tree] (config>redundancy>mc>peer>mcr>node>cv src-mac)

Full Context

configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify src-mac

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the source MAC address used for the Ring-Node Connectivity Verification of this ring node.

A value of all zeros (000000000000 H (0:0:0:0:0:0)) specifies that the MAC address of the system management processor (CPM) is used.

Default

no src-mac

Parameters

ieee-address

Specifies the source MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

All

src-mac

Syntax

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>li>li-filter>li-mac-filter>entry>match src-mac)

Full Context

configure li li-filter li-mac-filter entry match src-mac

Description

This command configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the source mac as the match criteria.

Parameters

ieee-address

Specifies the 48-bit IEEE mac address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

Specifies a 48-bit mask. The following table describes the format styles to configure the 48-bit mask.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 120: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFF000000

Default 0xFFFFFFFFFFFF (exact match)

Values 0x00000000000000 to 0xFFFFFFFFFFFF

Platforms

All

src-mac

Syntax

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match src-mac)

Full Context

configure qos sap-ingress mac-criteria entry match src-mac

Description

This command configures a source MAC address or range to be used as a service ingress QoS policy match criterion.

The **no** form of this command removes the source mac as the match criteria.

Default

no src-mac

Parameters

ieee-address

Enter the 48-bit IEEE MAC address to be used as a match criterion.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

This 48-bit mask can be configured using the following formats:

Table 121: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure all packets with a source MAC OUI value of 00-03-FA to be subject to a match condition, the entry should be specified as: 003FA000000 0xFFFFFF000000

Values 0x00000000000000 to 0xFFFFFFFFFFFF (hex)

Default 0xFFFFFFFFFFFF (hex) (exact match)

Platforms

All

[Tree] (config>filter>mac-filter>entry>match src-mac)

Full Context

configure filter ipv6-filter entry match src-mac

configure filter ip-filter entry match src-mac

configure filter mac-filter entry match src-mac

Description

Configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of the command removes the source mac as the match criteria.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no src-mac

Parameters

ieee-address

Specifies the 48-bit IEEE MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit; both upper and lower case are supported.

ieee-address-mask

Specifies the 48-bit mask to match a range of MAC address values.

To configure so that all packets with a source MAC OUI value of 00:03:FA are subject to a match condition then the entry should be specified as: 00:03:FA:00:00:00 FF:FF:FF:00:00:00

Default ff:ff:ff:ff:ff:ff (exact match)

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is an hexadecimal digit; both upper and lower case are supported.

Platforms

All

src-mac

Syntax

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>system>security>mgmt-access-filter>mac-filter>entry>match src-mac)

Full Context

configure system security management-access-filter mac-filter entry match src-mac

Description

This command configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the source mac as the match criteria.

Default

no src-mac

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ieee-address

Specifies the 48-bit IEEE mac address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

Specifies a 48-bit mask that can be configured using the formats listed in Table 122: ieee-address-mask Formats:

Table 122: ieee-address-mask Formats

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFF000000

Default 0xFFFFFFFFFFFF (exact match)

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries entry match src-port

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries entry match src-port

Description

This command configures the source port match condition.

The **no** form of this command reverts to the default.

Parameters

lt | gt | eq

Specifies the operators.

src-port-number

Specifies the source port number as a decimal hex or binary.

Values 0 to 65535

dst-port-number

Specifies the destination port number as a decimal hex or binary.

Values 0 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

src-port

Syntax

src-port {**eq** | **neq**} *port-num*

src-port {**eq** | **neq**} **port-list** *port-list-name*

src-port {**eq** | **neq**} **range** *start-port-num end-port-num*

no src-port

Context

[Tree] (config>app-assure>group>policy>aqp>entry>match src-port)

Full Context

configure application-assurance group policy app-qos-policy entry match src-port

Description

This command specifies a source IP port, source port list, or source range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no src-port

Parameters

eq

Specifies that a successful match occurs when the flow matches the specified port.

neq

Specifies that a successful match occurs when the flow does not match the specified port.

port-num

Specifies the source port number.

Values 0 to 65535

start-port-num end-port-num

Specifies the start or end source port number.

Values 0 to 65535

port-list-name

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

src-port

Syntax

src-port {**eq** | **gt** | **lt**} *port-num*

src-port port-list *port-list-name*

src-port range *start-port-num end-port-num*

no src-port

Context

[Tree] (config>app-assure>group>sess-fltr>entry>match src-port)

Full Context

configure application-assurance group session-filter entry match src-port

Description

This command specifies a source IP port, source port list, or source range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no src-port

Parameters

eq

Specifies that a successful match occurs when the flow matches the specified port.

gt

Specifies all port numbers greater than the port-number match.

lt

Specifies all port numbers less than the port-number match.

port-num

Specifies the source port number.

Values 0 to 65535

start-port-num end-port-num

Specifies the start or end source port number.

Values 0 to 65535

port-list-name

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

src-port

Syntax

src-port {**eq** | **neq**} *port-num*

no src-port

Context

[Tree] (debug>app-assure>group>traffic-capture>match src-port)

Full Context

debug application-assurance group traffic-capture match src-port

Description

This command configures debugging on a source port.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

src-port

Syntax

src-port {**lt** | **gt** | **eq**} *src-port-number*

src-port range *src-port-number src-port-number*

no src-port

Context

[Tree] (config>li>li-filter>li-ip-filter>entry>match src-port)

[Tree] (config>li>li-filter>li-ipv6-filter>entry>match src-port)

Full Context

configure li li-filter li-ip-filter entry match src-port

configure li li-filter li-ipv6-filter entry match src-port

Description

This command configures a source TCP or UDP port number or port range for an IP LI filter match criterion. Note that an entry containing Layer 4 match criteria will not match non-initial (second, third, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the source port match criterion.

Parameters

lt

Specifies all port numbers less than *src-port-number* match.

gt

Specifies all port numbers greater than *src-port-number* match.

eq

Specifies that *src-port-number* must be an exact match.

src-port-number

Specifies the source port number to be used as a match criteria expressed as a decimal integer.

Values [0..65535]D
[0x0..0xFFFF]H
[0b0..0b1111111111111111]B

configure qos sap-egress ipv6-criteria entry match src-port

configure qos sap-ingress ipv6-criteria entry match src-port

configure qos sap-ingress ip-criteria entry match src-port

Description

This command configures a source TCP or UDP port number or port range for a SAP QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

Default

no src-port

Parameters

{lt | gt | eq} *src-port-number*

The TCP or UDP port numbers to match, specified as less than (**lt**), greater than (**gt**), or equal to (**eq**) to the source port value, specified as a decimal integer.

Values 1 to 65535 (decimal)

range *startend*

The range of TCP or UDP port values to match, specified as between the *start* and *end* source port values inclusive.

Values 1 to 65535 (decimal)

Description

This command configures a source TCP or UDP port number, port range, or a port list for a network QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

Default

no src-port

Parameters

lt

Keyword used to specify TCP or UDP port numbers to match that are less than the source port value.

gt

Keyword used to specify TCP or UDP port numbers to match that are greater than the source port value.

eq

Keyword used to specify TCP or UDP port numbers to match that are equal to the source port value.

src-port-number

The source port value, specified as a decimal integer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 65535

port-list-name

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

start

Specifies the starting range of TCP or UDP source port values to match.

Values 1 to 65535

end

Specifies the end range of TCP or UDP source port values to match.

Values 1 to 65535

Platforms

configure filter ipv6-filter entry match src-port

configure filter ip-exception entry match src-port

configure filter ipv6-exception entry match src-port

configure filter ip-filter entry match src-port

Description

This command configures a source TCP, UDP, or SCTP port number, port range, or port match list for an IP filter or IP exception match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly, an entry containing "**src-port eq** 0" match criterion, may match non-initial

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fragments when the source port value is not present in a packet fragment and other match criteria are also met.

The **no** form of this command removes the source port match criterion.

Default

no src-port

Parameters

lt | gt | eq

Specifies the operator to use relative to *src-port-number* for specifying the port number match criteria.

lt – specifies that all port numbers less than *src-port-number* match

gt – specifies that all port numbers greater than *src-port-number* match

eq – specifies that *src-port-number* must be an exact match

src-port-number

Specifies the source port number to be used as a match criterion expressed as a decimal integer, and in hexadecimal or binary format. The following value is for decimal integer format only.

Values 0 to 65535

port-list-name

Specifies to use a list of ports referred to by *port-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

src-port-number

Specifies inclusive port range between two src-port-number values.

Platforms

no src-udp-port

Context

[Tree] (config>test-oam>link-meas>template>twl src-udp-port)

Full Context

configure test-oam link-measurement measurement-template twamp-light src-udp-port

Description

This command configures a source UDP port to be used by the link measurement tests linked to this template.

Unless required, Nokia suggests that the link measurement dynamically select an available source UDP port from the dynamic range. Before a UDP port in the configurable range can be configured as a source it must be owned by the application. Use the **config**>**test-oam**>**twamp**>**twamp-light**> **source-udp-port-pools**>**port**>**pool-type** command to map the port range to the application.

To use a source port in this range for link-measurement, the selected port number must have a **pool-type link-measurement** configured. The source UDP port must be owned by the application prior to the configuration under the application. A configured **source-udp-port** cannot be used when multiple tests are configured between the same source IP, destination IP and destination UDP port. A conflict may occur when non-unique addressing is used between two peers. A conflicting situation may occur when tests between peers are using IPv6 discovery and the link-local addresses on both nodes are the same. Other conflicts exist, such as, multiple tests between peers using the same source and destination IP system address instead of an interface address. When this condition exists, the operational state of the link-measurement test is operationally down with a failure condition UdpPortUnavailable.

The **no** form of the command removes the port number from the link measurement template.

Default

no src-udp-port

Parameters

port-number

Specifies the source UDP port number.

Values 64374 to 64383

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

srlg

Syntax

[**no**] **srlg**

Context

[Tree] (config>router>mpls>lsp>secondary srlg)

Full Context

configure router mpls lsp secondary srlg

Description

This command enables the use of the SRLG constraint in the computation of a secondary path for an LSP at the head-end LER. The command is configurable for both RSVP-TE and SR-TE LSPs.

When SRLG is enabled, CSPF includes the SRLG constraint in the computation of the secondary LSP path if **path-computation-method local-cspf** is configured on the LSP. CSPF returns the list of SRLG groups along with the ERO during primary path CSPF computation. At a subsequent establishment of a secondary path with the SRLG constraint, the MPLS task again queries CSPF by providing the list of SRLG group numbers to be avoided. CSPF prunes all links with interfaces that belong to the same SRLGs as the interfaces included in the ERO of the primary path. If CSPF finds a path, the secondary path is set up. If a path is not found, MPLS keeps retrying the requests to CSPF.

An SRLG enabled secondary or standby path of the LSP configured with a value of the **path-computation-method** command other than **local-cspf** remains operationally down with a failure code of srlgPrimaryCspfDisabled(25).

When an LSP is administratively enabled, the SRLG-enabled secondary path is not tried if the first attempt to bring up the primary path is in progress. The SRLG enabled secondary path is kept down temporarily with failure code srlgPrimaryPathDown(26). After this first attempt, MPLS begins setting up the SRLG-

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

enabled standby paths. If primary path computation fails or primary path was not configured, MPLS requests CSPF to compute the secondary path using an empty primary SRLG list. The SRLG *disjoint* state field shows *True* in this scenario.

If the primary path is re-optimized, has undergone MBB, or has come back up after being down, the MPLS task check determines if any SRLG secondary paths should be re-signaled. If MPLS finds that a secondary path is no longer SRLG disjointed, and therefore becomes ineligible, MPLS puts it on a delayed MBB immediately after the expiry of the retry timer. If MBB fails at the first try, the secondary path is torn down and the path is put on retry if not active. If the secondary path is active, then it is only torn down and resignaled when the primary path is activated. The secondary path can remain active even when ineligible while the revert timer to activate the primary path is still running.

If the primary goes down while active, the LSP uses the path of an eligible SRLG secondary path if it is up. If all secondary eligible SRLG paths are down, MPLS uses a non-SRLG secondary path, if configured and up. While the LSP is using a non-SRLG secondary path, if an eligible SRLG secondary path comes back up, MPLS switches the path of the LSP to the eligible SRLG secondary path. As soon as a path for the primary is successfully computed by CSPF, MPLS schedules the delay retry MBB for the secondary path using the new SRLG list.

If the primary path goes down while inactive, for example it is waiting for the revert timer to expire, MPLS resets the SRLG list of the primary to empty and changes the state of all secondary paths, including the currently active one, to the Disjointed state. A delay retry MBB is still performed but results in no change to the active secondary path.

A secondary path that becomes ineligible as a result of an update to the SRLG membership list of the primary path has the ineligibility status removed on any of the following events:

- a successful delay retry MBB of the secondary SRLG path that makes it eligible again
- the secondary path goes down. MPLS puts the standby on retry at the expiry of the retry timer. If successful, it becomes eligible. If not successful after the retry-timer expires or the number of retries reached the number configured under the **retry-limit** parameter, it is left down.

Once the primary path of the LSP is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface that the primary path is using is not considered until the next opportunity the primary path is re-signaled. The primary path may be re-signaled due to a failure or to a make-before-break operation. Make-before-break occurs as a result of a global revertive operation, a timer based or manual re-optimization of the LSP path, or an operator change to any of the path constraints.

Once an SRLG secondary path is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface the secondary path is using is not considered until the next opportunity when the secondary path is re-signaled. The secondary path is re-signaled due to a failure, to a re-signaling of the primary path, or to a make before break operation. Make-before-break occurs as a result of a timer based or manual re-optimization of the secondary path, or an operator change to any of the path constraints of the secondary path, except for enabling or disabling the **srlg** command itself. Enabling or disabling the **srlg** command on an active secondary or on an active or inactive secondary standby path causes the path to be torn down and re-signaled.

In addition, the user-configured **include** or **exclude** admin group statements for a secondary path are also checked together with the SRLG constraints by CSPF.

The following behavior of the feature is specific to the SR-TE LSP.

- An SRLG-enabled SR-TE LSP secondary path with SID label hops remains operational with failure code srlgPathWithSidHops(59).
- An SR-TE LSP uses IGP advertised link SRLG information in the TE database. It does not support the use of SRLG information in the static user SRLG database (**configure router mpls srlg-database**).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Delay Retry MBB for making a non-disjointed path a disjointed one is not supported with an SR-TE LSP. Instead, the system performs a break-before-make (that is, teardown and retry) operation. If a non-disjointed path is the active path of the LSP, that path is torn down and retried after the router switches to another path (for example, after **revert-timer** expires). If the non-disjointed path is not an active path, it is torn down and retried immediately.

The **no** form of this command reverts to the default value.

[Tree] (config>router>route-next-hop-policy>template srlg-enable)

Full Context

configure router route-next-hop-policy template srlg-enable

Description

This command configures the SRLG constraint into the route next-hop policy template.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this command is applied to a prefix, the LFA SPF will attempt to select an LFA next-hop, among the computed ones, which uses an outgoing interface that does not participate in any of the SLRGs of the outgoing interface used by the primary next-hop.

The SRLG criterion is applied before running the LFA next-hop selection algorithm.

The **no** form deletes the SRLG constraint from the route next-hop policy template.

Default

no srlg-enable

Syntax

srlg-frr [**strict**]

no srlg-frr

Context

[Tree] (config>router>mpls srlg-frr)

Full Context

configure router mpls srlg-frr

Description

This command enables the use of the SRLG constraint in the computation of FRR bypass or detour to be associated with any primary LSP path on this system.

When this option is enabled, CSPF includes the SRLG constraint in the computation of a FRR detour or bypass for protecting the primary LSP path.

CSPF prunes all links with interfaces that belong to the same SRLG as the interface that is being protected, that is, the outgoing interface at the PLR the primary path is using. If one or more paths are found, the MPLS task will select one based on best cost and will signal the bypass/detour. If not found and the user has included the **strict** option, the bypass/detour is not setup and the MPLS task will keep retrying the request to CSPF. Otherwise, if a path exists that meets the other TE constraints, other than the SRLG one, the bypass/detour is setup.

A bypass or a detour LSP path is not intended to be SRLG disjoint from the entire primary path. Only the SRLGs of the outgoing interface at the PLR that the primary path is using are avoided.

When the MPLS task is searching for an SRLG bypass tunnel to associate with the primary path of the protected LSP, it will first check if any configured manual bypass LSP with CSPF enabled satisfies the SRLG constraints. The search skips any non-CSPF manual bypass LSP because there is no ERO

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

returned to check the SRLG constraint. If no path is found, the task will check if an existing dynamic bypass LSP satisfies the SRLG and other primary path constraints. If not found, it will make a request to CSPF.

Once the primary path of the LSP is configured and is operationally up, subsequent changes to the SRLG group membership of an interface the primary path is using are not considered by the MPLS task at the PLR for bypass/detour association until the next opportunity the bypass LSP path or the primary path is resignaled. The path may be resignaled due to a failure or a Make-Before-Break (MBB) operation. MBB occurs as a result of a global revertive operation, a timer based or manual re-optimization of the bypass LSP or LSP primary path, or a user update of the primary path constraints.

Once the bypass or detour path is set up and is operationally up, subsequent changes to the SRLG group membership of an interface the bypass/detour path is using are not considered by the MPLS task at the PLR until the next opportunity when the association with the primary LSP path is rechecked. The association is rechecked if the bypass path is re-optimized using the timer or manual resignal MBB. Detour paths cannot be re-optimized separately from the primary path.

Enabling or disabling **srlg-frr** command only takes effect when the LSP primary path or the bypass path is resignaled. The user can either wait for the resignal timer to expire or cause the paths to be resignaled immediately by executing, at the ingress LER, the manual resignal command for the LSP primary path or for the bypass LSP path.

A MPLS interface can belong to a maximum of 64 SRLG groups. The SRLG groups are configured using the **config>router>if-attribute>srlg-group** command. The SRLG groups that an RSVP interface belong to are configured using the **srlg-group** command in the **config>router>mpls>interface** context.

The **no** form of this command reverts to the default value.

Default

no srlg-frr

Parameters

strict

Specifies the name of the SRLG group within a virtual router instance.

Values no srlg-frr (default) srlg-frr (non-strict) srlg-frr **strict** (strict)

configure router mpls interface srlg-group

configure service ies interface if-attribute srlg-group

configure router interface if-attribute srlg-group

configure service vprn interface if-attribute srlg-group

Description

This command configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface.

An interface can belong to up to 64 SRLG groups. However, each single operation of the **srlg-group** command allows a maximum of five (5) groups to be specified at a time. Once an SRLG group is bound to one or more interface, its value cannot be changed until all bindings are removed.

The configured SRLG membership is applied in all levels/areas the interface is participating in. The same interface cannot have different memberships in different levels/areas.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

The **no** form of this command deletes one or more of the SRLG memberships of an interface. The user can also delete all memberships of an interface by not specifying a group name.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain. Each single operation of the **srlg-group** command allows a maximum of 5 groups to be specified at a time.

Platforms

All

Context

[Tree] (config>router>if-attribute srlg-group)

Full Context

configure router if-attribute srlg-group

Description

This command defines a Shared Risk Link Group (SRLG) which can be associated with an IP or MPLS interface.

SRLG is used to tag IP or MPLS interfaces which share a specific fate with the same identifier. For example, an SRLG group identifier could represent all links which use separate fibers but are carried in the same fiber conduit. If the conduit is accidentally cut, all the fiber links are cut which means all interfaces using these fiber links will fail.

The user first configures locally on each router the name and identifier of each SRLG group. A maximum of 1024 SRLGs can be configured per system.

The user then configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface. A maximum of 64 SRLGs can be applied to a given interface.

When SRLGs are applied to MPLS interfaces, CSPF at an LER will exclude the SRLGs of interfaces used by the LSP primary path when computing the path of the secondary path. CSPF at an LER or LSR will also exclude the SRLGs of the outgoing interface of the primary LSP path in the computation of the path of the FRR backup LSP. This provides path disjointness between the primary path and the secondary path or FRR backup path of an LSP.

When SRLGs applied to IES, VPRN, or network IP interfaces, they are evaluated in the route next-hop selection by adding the **srlg-enable** option in a route next-hop policy template applied to an interface or a set of prefixes. For instance, the user can enable the SRLG constraint to select a LFA next-hop for a prefix which avoids all interfaces that share fate with the primary next-hop.

The following provisioning rules are applied to SRLG configuration. The system will reject the creation of a SRLG if it re-uses the same name but with a different group value than an existing group. The system will also reject the creation of an SRLG if it re-uses the same group value but with a different name than an existing group.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

A user may specify a penalty weight (**penalty-weight**) associated with an SRLG. This controls the likelihood of paths with links sharing SRLG values with a primary path being used by a bypass or detour LSP. The higher the penalty weight, the less desirable it is to use the link with a given SRLG.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain.

group-value

Specifies the integer value associated with the group. The association of group name and value should be unique within an IP/MPLS domain.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0 to 4294967295

penalty-weight

Specifies the integer value of the penalty weight that is assigned to the SRLG group

[Tree] (config>service>ies>sub-if>grp-if srrp)

Full Context

configure service vprn subscriber-interface group-interface srrp

configure service ies subscriber-interface group-interface srrp

Description

This command creates a Subscriber Router Redundancy Protocol (SRRP) instance on a group IP interface. An SRRP instance manages all subscriber subnets within the group interfaces subscriber IP interface or other subscriber IP interfaces that are associated through a wholesale/retail relationship. Only one unique SRRP instance can be configured per group interface.

The **no** form of this command removes an SRRP instance from a group IP interface. Once removed, the group interface ignores ARP requests for the SRRP gateway IP addresses that may exist on subscriber subnets associated with the group IP interface. Then the group interface stops routing using the redundant IP interface associated with the group IP interface and will stop routing with the SRRP gateway MAC address. Ingress packets destined to the SRRP gateway MAC will also be silently discarded. This is the same behavior as a group IP interface that is disabled (shutdown).

The **no** form of this command removes the SRRP ID from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no srrp

Parameters

srrp-id

Specifies a 32 bit instance ID that must be unique to the system. The instance ID must also match the instance ID used by the remote router that is participating in the same SRRP context. SRRP is intended to perform a function similar to VRRP where adjacent IP hosts within local subnets use a default gateway to access IP hosts on other subnets.

Full Context

configure fwd-path-ext fpe srv6

Description

This command configures whether the SRv6 FPE application type is used for the origination or termination of SRv6 tunnels.

The origination or termination of SRv6 on services requires the configuration of a dedicated SRv6 FPE and cannot share the same FPE. A single FPE can be configured for SRv6 origination. One or more FPEs can be configured for SRv6 termination, where a termination SRv6 FPE is assigned one or more configured locators. Transit SRv6 routers do not need SRv6 FPEs.

The **no** form of this command disables SRv6 on an FPE.

Default

no srv6

Parameters

origination

Keyword used to specify the origination FPE application type.

routed-vpls

Keyword used to specify the creation of internal SDPs for handling R-VPLS traffic when SRv6 origination is configured for the specified FPE.

termination

Keyword used to specify the termination FPE application type.

[Tree] (config>router>pcep>pce>cap-adv srv6)

Full Context

configure router pcep pcc capability-advertisement srv6

configure router pcep pce capability-advertisement srv6

Description

This command configures the advertisement of SRv6 capability, which is the mechanism used by PCEP speakers to signal their support for SRv6 functionalities. This command is needed for establishing an SRv6-enabled PCEP session and for the PCE to correctly compute and manage SRv6 paths. By exchanging this information, PCEP ensures that network devices and the centralized controller collaborate to optimize services over an SRv6-enabled network.

Note:
For SR policy SRv6, **sr-policy** and **srv6** must be enabled together, because PCEP extensions for SRv6 are only supported with SR policy. If multipath is required, **sr-policy**, **srv6** and **multi-path** must be enabled.

The **no** form of this command disables SRv6 capability advertising.

Full Context

configure router policy-options policy-statement default-action srv6-return-path-bfd-sid

configure router policy-options policy-statement entry action srv6-return-path-bfd-sid

Description

This command configures the initiator's S-BFD session to echo mode and pushes an additional SRv6 SID in the SRH for S-BFD packets. This only applies when the session is sent on the imported SRv6 policy.

The return-path SID refers to a binding SID on an SRv6 policy configured on the far-end router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this SRv6 return path. The **no** form of this command disables the controlled return-path SID and echo mode for S-BFD.

Default

no srv6-return-path-bfd-sid

Parameters

ipv6-address

Specifies the IPv6 address.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

param-name

Specifies the parameter variable name, up to 32 characters. Policy parameters must start and end with an at-sign (@).

Full Context

configure router policy-options policy-statement entry from srv6-sid-prefix

Description

This command configures either the name of a prefix policy variable or an IPv6 prefix and prefix length, as match criterion for a BGP route.

Note: If the name of a prefix policy variable is the match criterion, the name must start and end with an at sign (@).

A BGP route matches this criterion if it has an SRv6 TLV, and the SID or micro-segment (uSID) value in that TLV is matched by the bits of the IPv6 prefix (up to the specified prefix length).

This match criterion is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.

Default

no srv6-sid-prefix

Parameters

ipv6-prefix/prefix-length

Specifies the IPv6 address and prefix length.

Values

ipv6-prefix:	x:x:x:x:x:x:x:x (host bits must be 0)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
prefix-length:	0 to 128

param-name

Specifies the name of a prefix policy variable, which can be up to 32 characters and must start and end with an at sign (@)

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

no srv6-tlv

Context

[Tree] (config>router>policy-options>policy-statement>entry>from srv6-tlv)

Full Context

configure router policy-options policy-statement entry from srv6-tlv

Description

This command configures whether the entry matches a BGP route with a prefix SID attribute containing an SRv6 TLV. This match criterion is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.

Note: Routes of the MVPN family do not match to entries with the SRv6 TLV condition, regardless of whether this command is configured to **present** or **not-present**.

The **no** form of this command disables the router from taking whether a BGP route has a prefix SID attribute containing an SRv6 TLV into consideration when matching a BGP route with the entry.

Default

no srv6-tlv

Parameters

present

Specifies that a BGP route only matches this entry if it has a prefix SID attribute containing an SRv6 TLV.

not-present

Specifies that a BGP route only matches this entry if it does not have a prefix SID attribute containing an SRv6 TLV.

configure qos sap-ingress mac-criteria entry match ssap

Description

This command configures an Ethernet 802.2 LLC SSAP value or range for an ingress SAP QoS policy match criterion.

This is a 1-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The **no** form of this command removes the ssap match criterion.

Default

no ssap

Parameters

ssap-value

The 8-bit ssap match criteria value in hex.

Values 0x00 to 0xFF (hex)

ssap-mask

This is optional and can be used when specifying a range of ssap values to use as the match criteria.

This 8-bit mask can be configured using the following formats.

Table 123: Format Styles to Configure Mask

Format Style	Format Syntax	Example

Description

This command configures an Ethernet 802.2 LLC SSAP value or range for a MAC filter match criterion.

This is a one-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria.

The **no** form of the command removes the ssap match criterion.

Default

no ssap

Parameters

ssap-value

Specifies the 8-bit ssap match criteria value in decimal, hexadecimal or binary.

Values 0 to 255

ssap-mask

Specifies an optional parameter that may be used when specifying a range of ssap values to use as the match criteria.

This 8 bit mask and the ssap value can be configured as described in Table 124: 8-bit Mask Syntax.

Table 124: 8-bit Mask Syntax

Format Style	Format Syntax	Example
Decimal	DDD	240
Hexadecimal	0xHH	0xF0
Binary	0bBBBBBBBB	0b11110000

Values 0 to 255

ssap

Syntax

ssap *ssap-value* [*ssap-mask*]

no ssap

Context

[Tree] (config>system>security>mgmt-access-filter>mac-filter>entry>match ssap)

Full Context

configure system security management-access-filter mac-filter entry match ssap

Description

This command configures an Ethernet 802.2 LLC SSAP value or range for a MAC filter match criterion.

This is a one-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria. Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for information about MAC Match Criteria Exclusivity Rules fields that are exclusive based on the frame format.

The **no** form of this command removes the SSAP match criterion.

Default

no ssap

Parameters

ssap-value

Specifies the 8-bit SSAP match criteria value in hex.

Values 0x00 to 0xFF

ssap-mask

Specifies a range of SSAP values to use as the match criteria.

44.32 ssh

ssh

Syntax

ssh *host* [**-l** *username*] [**-v** *ssh-version*] [{**router** *router-instance* | **service-name** *service-name*}] [**re-exchange-min** *minutes*] [**re-exchange-mbyte** *megabytes*] [**-i** *private-key-filename*] [**-p** *port*]

Context

[Tree] (ssh)

Full Context

ssh

Description

This command initiates a client SSH session with the remote host and is independent from the administrative or operational state of the SSH server. However, to be the target of an SSH session, the SSH server must be operational. This command also allows the user to initiate an SSH session, with a key reexchange, based on maximum megabytes or minutes, whichever occurs first. If the reexchange options are not set, the default behavior does not perform a key reexchange.

Quitting SSH while in the process of authentication is accomplished by either executing a ctrl-c or "~." (tilde and dot), assuming the "~" is the default escape character for the SSH session.

Parameters

host

Specifies the remote host for the SSH session.

Values

host: *user@hostname* - [up to 255 characters]	
user	up to 32 characters
hostname	[*dns-name* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface: up to 32 characters, mandatory for link local addresses

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

dns-name up to128 characters

username

Specifies the user name to use when opening the SSH session, up to 32 characters.

router-instance

Specifies the router name or service ID.

Values *router-instance*: *router-name* or *vprn-svc-id*

router-name "Base", "management", "vpls-management"

vprn-svc-id 1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

minutes

Specifies the time interval after which the SSH client will initiate the key reexchange.

Values 1 to 1440 minutes

megabytes

Specifies the number of megabytes, on a SSH session, after which the SSH client will initiate the key reexchange.

Values 1 to 64000 MB

private-key-filename

Specifies the name of the file containing the private key for public-key authentication on the SR OS SSH client, up to 255 characters. (The public key must be provided to the SSH server.) When using the *private-key-filename* option, if the file containing the private key is encrypted, the system asks for the password to decrypt the file.

port

Specifies the listening port for the SR OS SSH client to establish the SSH session with the SSH server.

Values 1 to 65535

44.35 ssh-private-key-file

ssh-private-key-file

Syntax

ssh-private-key-file *file-url* [**passphrase** *passphrase* | *hash-passphrase* | *hash2-passphrase* | *custom-passphrase*] [**hash** | **hash2** | **hash3** | **custom**]

no ssh-private-key-file

Context

[Tree] (config>mirror>mirror-dest>pcap ssh-private-key-file)

Full Context

configure mirror mirror-dest pcap ssh-private-key-file

Description

This command configures an SSH client private key file for user authentication instead of a password. The client private key file is encrypted and must be decrypted with a passphrase before it can be used.

The **no** form of this command removes the client private key file.

Parameters

file-url

Specifies the client private key file name.

Values

local-url	[*cflash-id*/][*file-path*] 180 characters maximum length, including the cflash-id directory length of 99 characters maximum each
remote-url	[{ftp | tftp | sftp}://*login*:*pswd*@*remote-locn*/][*file-path*]
ftp, tftp	up to 199 characters
sftp	up to 512 characters
remote-locn	{hostname | ipv4-address | [ipv6-address] }[:port]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses

44.36 ssh-reply

ssh-reply

Syntax

[**no**] **ssh-reply**

Context

[Tree] (config>service>ies>if>vrrp ssh-reply)

Full Context

configure service ies interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner vrrp virtual-router-id nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

All

ssh-reply

Syntax

[**no**] **ssh-reply**

Context

[Tree] (config>service>vprn>if>vrrp ssh-reply)

Full Context

configure service vprn interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instance's IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner **vrrp** *virtual-router-id* nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply

Platforms

All

ssh-reply

Syntax

[**no**] **ssh-reply**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>if>vrrp ssh-reply)

Full Context

configure router interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH requests directed at the virtual router instance IP addresses. This command is only applicable to IPv4.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses.

This limitation can be disregarded for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ssh-reply** command enables the non-owner master to reply to SSH requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Correct login and CLI command authentication is still enforced.

When **ssh-reply** is not enabled, SSH requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH requests regardless of the **ssh-reply** setting.

The **ssh-reply** command is only available in non-owner **vrrp** nodal context.

By default, SSH requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command discards all SSH request messages destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply — SSH requests to the virtual router instance IP addresses are discarded.

44.43 stable-pool-sizing

stable-pool-sizing

Syntax

[**no**] **stable-pool-sizing**

Context

[Tree] (config>card>fp stable-pool-sizing)

Full Context

configure card fp stable-pool-sizing

Description

This command provides a stable buffer pool allocation environment for all default port buffer pools on a forwarding plane. This stable environment is provided at the expense of optimal buffer allocation between the various port buffer pools. Normally, port pools are sized according to a ports relative bandwidth with other ports and the ability of a port to use pool buffers. As an example, on a forwarding plane with two potential MDAs and only one equipped, the normal behavior is to provide all available default pool buffers to the ports on the currently equipped MDA. If a second MDA is equipped in the future, buffers are freed from the existing MDA and provided to the ports on the new MDA. Stable pool sizing alters this behavior by reserving buffers for both MDAs whether they are equipped or not thus preventing a resizing event when an MDA is equipped. In addition, existing ports on a module always receive their maximum bandwidth share of buffers independent on any sub-rate condition that may currently exist. This provides a stable amount of buffers to other ports on the module independent of link or configuration events that may occur on the port.

Stable pool sizing preserves the ability to modify the effective bandwidth used to determine a port's relative share of the available buffers through the use of the ing-percentage-of-rate and egr-percentage-of-rate commands under the port configuration. Changing the values associated with these commands will cause

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

a reevaluation of buffer distribution and thus a possible resizing of pools on each port within the module. These commands have no effect on ports associated with other modules on the forwarding plane.

Stable pool sizing may be enabled or disabled at any time on a forwarding plane. The system will dynamically change the pool sizes according to the stable pool sizing state.

When a port connector breakout is configured, its ports is included in the stable pool sizing calculation. Consequently, adding or removing a port connector breakout to or from the configuration will cause the buffer pool allocation to be recalculated even when stable pool sizing is enabled.

The **no** form of this command disables stable pool sizing on a forwarding plane. Existing buffer pools are resized according to normal pool sizing behavior.

Description

This command enables IS-IS multi-instance (MI) as described in draft-ginsberg-isis-mi-bis-01. Multiple instances allow instance-specific adjacencies to be formed that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV identifying the instance and the topology to which the PDU belongs. A single topology is supported in each instance, so the instance-specific topology identifier (ITID) is set to 0 and cannot be changed.

The **standard-multi-instance** (based on draft-ginsberg-isis-mi-bis-01) and **iid-tlv-enable** (based on draft-ietf-isis-mi-02) commands cannot be configured in the same instance, because the MAC addresses and PDUs from the two standards are incompatible.

The **no** form of this command removes the **standard-multi-instance** configuration.

All

44.49 standby

standby

Syntax

[**no**] **standby**

Context

[Tree] (config>router>mpls>lsp>secondary standby)

Full Context

configure router mpls lsp secondary standby

Description

The secondary path LSP is normally signaled once the primary path LSP fails. The **standby** keyword ensures that the secondary path LSP is signaled and maintained indefinitely in a hot standby state. Standby paths are selected in preference to non-standby secondary paths. When multiple standby secondary paths exist, then the path-preference is used to determine the order in which the paths are selected. If multiple standby secondary paths have the same, lowest, path-preference value then the system will select the path with the lowest up-time. When the primary path is re-established then the traffic is switched back to the primary path LSP.

The **no** form of this command specifies that the secondary LSP is signaled when the primary path LSP fails.

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service epipe endpoint standby-signaling-slave

configure service epipe spoke-sdp standby-signaling-slave

Description

When this command is enabled, the node will block the transmit forwarding direction of a spoke SDP based on the pseudowire standby bit received from a T-LDP peer.

This command is present at the endpoint level as well as the spoke SDP level. If the spoke SDP is part of an explicit-endpoint, it will not be possible to change this setting at the spoke SDP level. An existing spoke SDP can be made part of the explicit endpoint only if the settings do not conflict. A newly created spoke SDP, which is part of a specific explicit-endpoint, will inherit this setting from the endpoint configuration.

This command is mutually exclusive with an endpoint that is part of an mc-lag, mc-aps or an ICB.

If the command is disabled, the node assumes the existing independent mode of behavior for the forwarding on the spoke SDP.

configure qos slope-policy low-slope start-avg

configure qos slope-policy high-slope start-avg

configure qos slope-policy exceed-slope start-avg

configure qos slope-policy highplus-slope start-avg

Description

This command sets the exceed, low, high, or highplus Random Early Detection (RED) slope position for the shared buffer average utilization value where the packet discard probability starts to increase above zero. The percent parameter is expressed as a percentage of the shared buffer size.

The **no** form of this command restores the start-avg value to the default setting. If the max-avg setting is smaller than the default, an error will occur and the start-avg setting will not be changed to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

start-avg 85 - Highplus slope default is 85% buffer utilization before discard probability starts to increase above zero.

start-avg 70 — High slope default is 70% buffer utilization before discard probability starts to increase above zero.

start-avg 50 — Low slope default is 50% buffer utilization before discard probability starts to increase above zero.

start-avg 30 — Exceed slope default is 30% buffer utilization before discard probability starts to increase above zero.

Parameters

percent

The percentage of the shared buffer space for the buffer pool at which point the drop probability starts to increase above zero. The value entered must be less than or equal to the current setting of **max-avg**. If the entered value is greater than the current value of **max-avg**, an error will occur and no change will take place.

configure router dhcp6 local-dhcp-server failover startup-wait-time

configure router dhcp server pool failover startup-wait-time

configure router dhcp local-dhcp-server failover startup-wait-time

Description

This command enables the startup wait time during which each peer waits after the initialization process before assuming the active role for the prefix designated as local or access-driven. This is to avoid transient issues during the initialization process.

The **startup-wait-time** should be configured to an interval in which, after boot, both nodes can set up an MCS TCP link and start MCS. The timer is restarted each time the server downloads a lease from the MCS database and stops when the last state record from the peer is synchronized. The next state is (PRE-)NORMAL, unless the timer times out or is forced to stop via the tools command (**tools>perform>router>dhcp** or **dhcp6>local-dhcp-server** *server-name*>**pool**/**failover**>**abort-startup-wait**), in which case the local DHCP server transitions immediately to the COMMUNICATIONS-INTERRUPTED state.

configure subscriber-mgmt sla-profile egress qos policer stat-mode

configure subscriber-mgmt sla-profile ingress qos queue stat-mode

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is used to configure the forwarding plane octet and packet counters of a policer or queue to count packets of a specific type or state. For example separate counters for IPv4/IPv6 or separate counters for offered high and low priority policed traffic.

For policers, this command overrides the policer stat-mode configuration as defined in the sap-ingress or sap-egress qos policy. For details on sap-ingress and sap-egress policer stat-mode, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide*. For use in Enhanced Subscriber Management (ESM) context only, an additional stat-mode enables separate counters for IPv4 and IPv6 packets.

When a policer's stat-mode is changed while the sla profile is in use, any previous counter values are lost and any new counters are set to zero.

For queues, this command sets the stat-mode. Queue stat-mode is only available for use in Enhanced Subscriber Management (ESM) context to enable separate IPv4/IPv6 counters.

A queue's stat-mode cannot be changed while the SLA profile is in use.

The **no** form of this command reverts to the default.

Default

For policers, the default is no stat-mode override. The sap-ingress or sap-egress stat-mode is used instead.

For queues, the default is to count in-/out-of-profile octets and packets.

Parameters

stat-mode

Specifies the stat mode for the policer.

For ingress and egress qos queue stat-mode overrides.

For ingress and egress qos policer stat-mode overrides, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for details on the **sap-ingress** and **sap-egress policer stat-mode** parameters.

For use in Enhanced Subscriber Management (ESM) context only:

Values no-stats, minimal, offered-profile-no-cir, offered-priority-no-cir, offered-profile-cir, offered-priority-cir, offered-total-cir, offered-limited-profile-cir, offered-profile-capped-cir, offered-limited-capped-cir, v4-v6 (count IPv4 and IPv6 forwarded/dropped octets and packets separately)

Context

[Tree] (config>card>fp>ingress>network>qgrp>policer-over>plcr stat-mode)

[Tree] (config>card>fp>ingress>access>qgrp>policer-over>plcr stat-mode)

Full Context

configure card fp ingress network queue-group policer-override policer stat-mode

configure card fp ingress access queue-group policer-override policer stat-mode

Description

This command configures the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, high priority or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported which prevents any packet accounting, the use of the policer's **parent** command requires at the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. Once a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

configure service ipipe sap egress policer-override policer stat-mode

configure service ipipe sap ingress policer-override policer stat-mode

configure service cpipe sap egress policer-override policer stat-mode

Description

The SAP QoS policy's **policer stat-mode** command is used to configure the forwarding plane counters that allow offered, output, and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potentially large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and indicates how the offered packet types and output conditions should be mapped to the counters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's parent command requires that the policer's **stat-mode** to be set at least to the minimal setting so that offered statistics are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free statistics can be viewed by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The current active stat mode setting will continue to be used by the policer.

The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

The **no** form of this command attempts to return the policer's stat-mode setting to **minimal**.

Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for detailed information about the supported parameters for the **policer stat-mode** command.

configure service vpls sap egress policer-override policer stat-mode

Description

The SAP-egress QoS policy's policer stat-mode command is used to configure the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The stat-mode command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a no-stats mode is supported which prevents any packet accounting, the use of the policer's parent command requires that the policer's stat-mode to be set at least to the minimal setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat-mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The default stat-mode when a policer is created within the policy is minimal.

The stat-mode setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The previous stat-mode setting active for the policer will continue to be used by the policer.

The **no** form of the command returns the policer's stat-mode setting to minimal.

Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for detailed information about the **policer stat-mode** command parameters.

configure qos sap-ingress policer stat-mode

configure qos sap-ingress dynamic-policer stat-mode

Description

This command configures the forwarding plane counters that allow offered, forwarded, and dropped accounting for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority, or low-priority), and each of these offered types is interacting with the policer's metering and profiling functions, resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate, and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available to calculate the policer's FIR. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost, and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change fails, and the previous mode continues unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 125: Ingress Policer Stat Mode Summary .

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 125: Ingress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for use when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for use when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for use when the policer can change the profile of packets to in-profile and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for use when packet priority entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for use when the policer can change the profile of packet to in-profile and out-of-profile. The information is limited compared to offered-profile-capped-cir with the

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for use when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for use when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.
ecn-codepoints		Per ECN codepoint entering policer	—	Intended for use with an L4S policer.
ecn-marked		Single counter entering policer	Congestion Experienced (CE) marked, and ECN unmarked exiting policer	Intended for use with an L4S policer.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command fails if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped, and forwarded statistics. A policer using **no-stats** cannot be a child to a parent policer, and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types, and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 126: Ingress Accounting Statistics Collected in minimal stat-mode .

	aof	AllOctetsForwarded

offered-profile-no-cir

Counter resource allocation: 2

This **stat-mode** provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) traffic nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer, as it could cause the traffic profile to be modified by the policer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 127: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets, and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile, nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises hard in/out and uncolored traffic. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic not explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic, as well as untrusted packets, all subject to a defined CIR profiling rate. This mode differs from the **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This mode is intended to be used without **profile-capped** configured within the policer, as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 129: Ingress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

not expect trusted in-profile and out-of-profile packets, but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer, as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depend on the **record** configured in the applied accounting policy) are described in Table 130: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

out-of-profile packets, and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer, as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 131: Ingress Accounting Statistics Collected in offered-total-cir stat-mode .

offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses fewer stat resources.

offered-profile-cir

Counter resource allocation: 4

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic not explicitly profiled at ingress (Uncolor).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile**, which may be output as out-of-profile when **profile-capped** mode is enabled on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 133: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

ecn-codepoints

This stat-mode provides offered packet and octet counters for each ECN codepoint value as received by the policer: Not-ECT, ECT(0), ECT(1), and CE.

This mode is supported on a policer configured with **mode l4s**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ecn-marked

This stat-mode provides packet and octet counters for the traffic that exits the policer with the CE codepoint set, including packets that arrived at the policer already marked CE, and for the traffic that exits the policer as ECN unmarked (all other ECN codepoints).

This mode is supported on a policer configured with **mode l4s**.

Full Context

configure qos sap-egress dynamic-policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer’s metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer’s **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer’s Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in Table 135: Egress Policer Stat-mode Summary.

Table 135: Egress Policer Stat-mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In or out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-profile-cir	4	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In or out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile,	In/out exiting policer	Intended for when the policer has

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
		or soft in- or out-of-profile) entering policer		**profile-capped** configured

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 136: Egress Accounting Statistics Collected in minimal stat-mode .

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 137: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 138: Egress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 139: Egress Accounting Statistics Collected in offered-total-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 140: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

configure qos sap-egress policer stat-mode

Description

This command configures the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides), and each of these offered types is interacting with the policer's metering and profiling functions, resulting in colored output packets (green, yellow, and red). Due to the potentially large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate, and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in Table 142: Egress Policer Stat-mode Summary.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for use when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is reclassified at egress to exceed-profile
offered-four-profile-no-cir	4	Inplus, in, out, or exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic is reclassified at egress to inplus and/or exceed-profile
offered-total-cir-four-profile	4	Single counter entering policer	Inplus, in, out, or exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is reclassified at egress to profile inplus
ecn-codepoints		Per ECN codepoint entering policer	—	Intended for use with an L4S policer.
ecn-marked		Single counter entering policer	CE marked and ECN unmarked exiting policer	Intended for use with an L4S policer.

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Use subject to Terms available at: www.nokia.com/terms.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 143: Egress Accounting Statistics Collected in minimal stat-mode .

Table 143: Egress Accounting Statistics Collected in minimal stat-mode

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 144: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile), and traffic which has not been

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 145: Egress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 146: Egress Accounting Statistics Collected in offered-total-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter, and exceed-profile traffic is counted with the out-of-profile counter.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 147: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter, and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using o**ffered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer, but without **enable-exceed-pir** configured, as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 148: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

offered-total-cir-exceed

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic-manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress-reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer, as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 149: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode .

offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus, in, out and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped, and forwarded counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus and/or exceed-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the

offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both **profile inplus** and **profile exceed**.

This mode is intended to be used when traffic is reclassified at egress to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer, as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the **show** command output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 151: Egress Accounting Statistics Collected in offered-total-cir-four-profile stat-mode .

ecn-codepoints

This **stat-mode** provides offered packet and octet counters for each ECN codepoint value as received by the policer: Not-ECT, ECT(0), ECT(1), and CE.

This mode is supported on a policer configured with **mode l4s**.

ecn-marked

This **stat-mode** provides packet and octet counters for the traffic that exits the policer with the CE codepoint set, including packets that arrived at the policer already marked CE, and for the traffic that exits the policer as ECN unmarked (all other ECN codepoints) .

This mode is supported on a policer configured with **mode l4s**.

configure qos queue-group-templates ingress queue-group policer stat-mode

Description

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority or low-priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

(green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The stat-modes are described in Table 152: Stat Mode Descriptions.

Table 152: Stat Mode Descriptions

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in- and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in- and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 153: Ingress Accounting Statistics Collected in minimal stat-mode .

offered-profile-no-cir

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 154: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 155: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 156: Ingress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 157: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 158: Ingress Accounting Statistics collected in offered-total-cir stat-mode .

offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 159: Ingress Accounting Statistics Collected in offered-limited-profile-cir stat-mode .

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as 'out-of-profile' due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 160: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the 'offered undefined' statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

This mode is intended to be used with **profile-capped** configured within the policer.

The impact of using **offered-limited-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 161: Ingress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

configure qos queue-group-templates egress queue-group policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 162: Egress Policer Stat Mode Summary.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 162: Egress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in- and out-of-profile.
offered-profile-cir	4	In/out/uncolored (that corresponds to in- or out-of-profile from the ingress processing) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In/out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored (that corresponds to in- or out-of-profile from the ingress processing) entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured.
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with **enable-exceed-pir**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed.
offered-four-profile-no-cir	4	Inplus/in/out/exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic is egress reclassified to profile inplus and/ or exceed.
offered-total-cir-four-profile	4	Single counter entering policer	Inplus/in/out/exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is egress reclassified to profile inplus.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates one forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the **show** output and those collected when **collect-stats** is enabled are described in Table 163: Egress Accounting Statistics Collected in minimal stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

Table 163: Egress Accounting Statistics Collected in minimal stat-mode

Dro. All	apd	AllPacketsDropped
	aod	AllOctetsDropped
For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-of profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped and forwarded statistics are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 164: Egress Accounting Statistics Collected in offered-

© 2026 Nokia.

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover traffic reclassified to in-profile (that includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or

out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 166: Egress Accounting Statistics Collected in offered-total-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover in-profile traffic (that includes traffic reclassified to inplus-profile) and out-of-profile traffic (that includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft-in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 167: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is comprised of hard inplus, hard in, hard out, and hard exceed, as well as soft in and soft out. The offered counters cover traffic reclassified to in-profile (that includes traffic

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in**, and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 168: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-exceed

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 169: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus-profile, in-profile, out-of-profile, and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped and forwarded counters for both profile inplus and profile exceed.

This mode is intended to be used when traffic is egress reclassified to profile inplus and/or exceed. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 170: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out, and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could

configure router policy-options policy-statement entry from state

Description

This command identifies in resilient gateways which routes are associated with an active context and which routes are associated with a standby context.

Default

no state

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

state

Specifies the state.

Values srrp-master — This is used in non-CUPS BNG resiliency to identify routes associated with an active SRRP instance.

srrp-non-master — This is used in non-CUPS BNG resiliency to identify routes associated with a standby SRRP instance.

ipsec-master-with-peer — This is used in stateful multi-chassis IPsec (MC-IPsec) redundancy to identify routes associated with an active MC-IPsec node with a reachable peer.

ipsec-non-master — This is used in stateful MC-IPsec redundancy to identify routes associated with a standby MC-IPsec node.

ipsec-master-without-peer — This is used in stateful MC-IPsec redundancy to identify routes associated with an active MC-IPsec node without a reachable peer.

fsg-active — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on the active BNG-UP. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

fsg-active-path-restoration — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on an active BNG-UP that is in a headless state. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

fsg-standby — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on the standby BNG-UP. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

Full Context

configure service vpls proxy-nd static

Description

This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either dynamic or CStatic (Conditional Static MAC) in order to become active. Along with the IPv6 and MAC, the entry must also be configured as either host or router. This will determine if the received NS for the entry will be replied with the R flag set to 1 (router) or 0 (host).

Parameters

ipv6-address

Specifies the IPv6 address for the static entry.

ieee-address

Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

static-aa-sub *transit-aasub-name*

static-aa-sub *transit-aasub-name* **app-profile** *app-profile-name* [**create**]

no static-aa-sub *transit-aasub-name*

Context

[Tree] (config>app-assure>group>transit-ip-policy static-aa-sub)

Full Context

configure application-assurance group transit-ip-policy static-aa-sub

Description

This command configures static transit aa-subs with a name and an app-profile. A new transit sub with both a name and an app-profile is configured with the create command. Static transit aa-sub must have an explicitly assigned app-profile. An existing transit sub can optionally be assigned a different app-profile, or this command can be used to enter the static-aa-sub context.

The **no** form of this command deletes the named static transit aa-sub from the configuration.

Parameters

transit-aasub-name

Specifies the name of a transit subscriber up to 32 characters in length.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

app-profile-name

Specifies the name of an existing application profile up to 32 characters in length.

create

Keyword used to create a new app-profile entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service vprn interface static-arp

configure service ies interface static-arp

Description

This command configures a static address resolution protocol (ARP) entry associating a subscriber IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address will be replaced with the new MAC address.

The **no** form of this command removes a static ARP entry.

Parameters

ip-address

Specifies the IP address for the static ARP in IP address dotted decimal notation.

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Platforms

[Tree] (config>router>if static-arp)

Full Context

configure router interface static-arp

Description

This command configures a static Address Resolution Protocol (ARP) entry associating an IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a specific IP address already exists and a new MAC address is configured for the IP address, the existing MAC address is replaced by the new MAC address.

The number of static-arp entries that can be configured on a single node is limited to 1000.

Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address. Use proxy ARP so the router responds to ARP requests on behalf of another device.

The **no** form of this command removes a static ARP entry.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa-bb-cc-dd -ee-ff*, where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

44.72 static-blackhole-first

static-blackhole-first

Syntax

[**no**] **static-blackhole-first**

Context

[Tree] (config>service>vprn>bgp-ipvpn>mpls>auto-bind-tunnel static-blackhole-first)

Full Context

configure service vprn bgp-ipvpn mpls auto-bind-tunnel static-blackhole-first

Description

This command configures the router to use a modified next-hop resolution sequence for each imported VPN-IP route. The router first checks for a static route in the Base routing table that matches the BGP next-hop address. If at least one such static route exists, and the route that is the longest match of the BGP next-hop address is a blackhole static route, the router resolves the VPN-IP route and programs it into the VPRN IP FIB table with a next-hop action that discards all matching packets. If there is no matching static route, or the longest matching static route is not a blackhole, the router resolves the VPN-IP route in the Base routing table as normal, that is, according to the configured VPRN auto-bind filter options.

The **no** form of this command configures the router to resolve VPN-IP routes in the Base routing table according to the configured VPRN auto-bind filter options.

Default

no static-blackhole-first

configure router origin-validation static-entry

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a static VRP entry indicating that a specific origin AS is either valid or invalid for a specific IP prefix range. Static VRP entries are stored along with dynamic VRP entries (learned from local cache servers using the RPKI-Router protocol) in the origin validation database of the router. This database is used for determining the **origin-validation** state of IPv4 and/or IPv6 BGP routes received over sessions with the **enable-origin-validatio**n command configured.

Static entries can only be configured under the **config**>**router**>**origin-validation** context of the Base router.

Parameters

ip-prefix/ip-prefix-length

Specifies an IPv4 or IPv6 address with a minimum prefix length value.

Values 60 to 3600

prefix-length2

Specifies the maximum prefix length.

Values 1 to 128

as-number

Specifies as-number.

Values 0 to 4294967295

valid

Specifies a keyword meaning the static entry expresses a valid combination of origin AS and prefix range.

invalid

Specifies a keyword meaning the static entry expresses an invalid combination of origin AS and prefix range.

Full Context

configure service ies subscriber-interface group-interface sap static-host

configure service vprn subscriber-interface group-interface sap static-host

Description

This command creates a static subscriber host for the SAP. Static subscriber hosts may be used by the system for various purposes. Applications within the system that make use of static host entries include anti-spoof, ARP reply agent and source MAC population into the VPLS forwarding database.

Multiple static hosts may be defined on the SAP. Each host is identified by either a source IP address, a source MAC address or both a source IP and source MAC address. Every static host definition must have at least one address defined, IP or MAC.

Static hosts can exist on the SAP even with anti-spoof and ARP reply agent features disabled. When enabled, each feature has different requirements for static hosts.

The **no** form of this command removes a static entry from the system. The specified *ip-address* and *mac-address* must match the host's exact IP and MAC addresses as defined when it was created. When a static host is removed from the SAP, the corresponding anti-spoof filter entry and/or FDB entry is also removed.

Parameters

ip-prefix[/prefix-length

Specifies information for the specified IP address and mask.

mac-address

Specifies a MAC address. The MAC address must be specified for **anti-spoof mac**, and **anti-spoof ip-mac** and arp-reply-agent (**arp-reply-agent** is supported by the 7450 ESS only). Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

Every static host definition must have at least one address defined, IP or MAC.

force

Specifies the forced removal of the static host addresses.

create

Keyword used to create the static host instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

static-label-range

Syntax

static-label-range *static-range*

no static-label-range

Context

[Tree] (config>router>mpls-labels static-label-range)

Full Context

configure router mpls-labels static-label-range

Description

This command configures the range of MPLS static label values shared among static LSP, MPLS-TP LSP, and static service VC label. This command also sets the lower bound of the dynamic label range which is contiguous to the static label range. Once this range is configured, it is reserved and cannot be used by other protocols such as RSVP, LDP, BGP, or Segment Routing to assign a label dynamically.

Default

static-label-range 18400

Parameters

static-range

Specifies the size of the static label range in number of labels. The minimum label value in the range is 32. The maximum label value is therefore computed as {32+ static-range-1}.

Values 0 to 262112

Default 18400

no static-lsp-fast-retry

Context

[Tree] (config>router>mpls static-lsp-fast-retry)

Full Context

configure router mpls static-lsp-fast-retry

Description

This command specifies the value used as the fast retry timer for a static LSP.

When a static LSP is trying to come up, the MPLS request for the ARP entry of the LSP next-hop may fail when it is made while the next-hop is still down or unavailable. In that case, MPLS starts a retry timer before making the next request. This enhancement allows the user to configure the retry timer, so that the LSP comes up as soon as the next-hop is up.

The **no** form of this command reverts to the default.

Default

no static-lsp-fast-retry

Parameters

seconds

Specifies the value (in s), used as the fast retry timer for a static LSP.

Values 1 to 30

Full Context

configure service vpls sap static-mac

configure service vpls mesh-sdp static-mac

configure service vpls spoke-sdp static-mac

Description

This command creates a remote static MAC entry in the Virtual Private LAN Service (VPLS) forwarding database (FDB) associated with the service destination point (SDP).

In a VPLS service, MAC addresses are associated with a SAP or with an SDP. MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Local and remote static MAC entries create a permanent MAC address to SDP association in the forwarding database for the VPLS instance so that MAC address is not learned on the edge device.

Note:
Static MAC definitions on one edge device are not propagated to other edge devices participating in the VPLS instance, that is, each edge device has an independent forwarding database for the VPLS.

Only one static MAC entry (local or remote) can be defined per MAC address per VPLS instance.

By default, no static MAC address entries are defined for the SDP.

The **no** form of this command deletes the static MAC entry with the specified MAC address associated with the SDP from the VPLS forwarding database.

Parameters

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa-bb-cc-dd -ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Full Context

configure service vpls static-mac

Description

A set of conditional static MAC addresses can be created within a VPLS supporting BGP-EVPN. Conditional Static Macs are also supported in B-VPLS with SPBs. Unless they are configured as **black-hole**, conditional Static Macs are dependent on the SAP/SDP state.

This command allows the assignment of a set of conditional Static MAC addresses to a SAP/ spoke-SDP or **black-hole**. In the FDB, the static MAC is then associated with the active SAP or spoke-SDP.

When configured in conjunction with SPBM services, Static MACs are used for PBB Epipe and I-VPLS services that may terminate external to SPBM. If this is configured under a Control B-VPLS the interface referenced will not use IS-IS for this neighbor. This may also be configured under a User B-VPLS where the corresponding interface is not supported under the Control B-VPLS.

Static MACs configured in a BGP-EVPN service are advertised as protected (EVPN will signal the MAC as protected).

Platforms

All

44.86 static-route

static-route

Syntax

[**no**] **static-route** *route-name*

Context

[Tree] (config>service>pw-routing static-route)

Full Context

configure service pw-routing static-route

Description

This command configures a static route to a next hop S-PE or T-PE. Static routes may be configured on either S-PEs or T-PEs.

A default static route is entered as follows:

static-route 0:0:next_hop_ip_addresss

or

static-route 0:0.0.0.0:next_hop_ip_address

The **no** form of this command removes a previously configured static route.

Parameters

route-name

Specifies the static pseudowire route.

Values

route-name	<global-id>:<prefix>:<next-hop-ip_addr>
global-id	0 to 4294967295
prefix	a.b.c.d | 0 to 4294967295
next-hop-ip_addr	a.b.c.d

static-route

Syntax

[**no**] **static-route** *ip-prefix/ip-prefix-length* **next-hop** *ip-address*

Context

[Tree] (bof static-route)

Full Context

bof static-route

Description

This command creates a **static route** entry for the CPM management Ethernet port in the running configuration and the Boot Option File (BOF).

This command allows manual configuration of static routing table entries. These static routes are only used by traffic generated by the CPM Ethernet port. To reduce configuration, manual address aggregation should be applied where possible.

A maximum of 10 static routes can be configured on the CPM port.

The **no** form of this command deletes the static route.

Default

no static-route

Parameters

ip-prefix/ip-prefix-length

Specifies the destination address of the static route in dotted decimal notation.

Values

ip-prefix/ip-prefix-length	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-le	0 to 32
	ipv6-prefix	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0to 255]D
	ipv6-prefix-le	0 to128
ip-address	ipv4-address	a.b.c.d
	ipv6-address	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

x: [0 to FFFF]H

d: [0 to 255]D

Note:
IPv6 is applicable to the 7750 SR and 7950 XRS only.

mask

Specifies the subnet mask, expressed as an integer or in dotted decimal notation.

Values 1 to 32 (mask length), 128.0.0.0 to255.255.255.255 (dotted decimal)

ip-address

Specifies the next hop IP address used to reach the destination.

45 s Commands – Part V

45.1 static-route-entry

static-route-entry

Syntax

static-route-entry *ip-prefixIprefix-length* [**mcast**]

no static-route-entry *ip-prefixIprefix-length* [**mcast**]

Context

[Tree] (config>service>vprn static-route-entry)

Full Context

configure service vprn static-route-entry

Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

Once the static route context for the specified prefix and netmask has been created, additional parameters associated with the static route(s) may be specified through the inclusion of additional static-route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

IPv6 static routes are not supported on the 7450 ESS except in mixed mode.

Default

No static routes are defined.

Parameters

ip-prefix/prefix-length

The destination address of the static route.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D
ipv6-prefix-length	0 to 128

Values The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

mcast

Specifies that the associated static route should be populated in the associated VPRN multicast route table.

Platforms

All

static-route-entry

Syntax

[**no**] **static-route-entry** *ip-prefix*/*prefix-length* [**mcast**]

Context

[Tree] (config>router static-route-entry)

Full Context

configure router static-route-entry

Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

After the static route context for the specified prefix and netmask has been created, additional parameters associated with the static routes may be specified through the inclusion of additional static route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

Default

No static routes are defined.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-prefix/prefix-length

Specifies the destination address of the static route.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-prefix	a.b.c.d (host bits must be 0)	
ipv4-prefix-length	0 to 32	
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x	[0 to FFFF]H
	d	[0 to 255]D
ipv6-prefix-length	0 to 128	

Values The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

ip-address

Specifies the IP address of the IP interface. The *ip-addr* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses

Values The following value applies to the 7450 ESS:

ipv4-address	a.b.c.d (host bits must be 0)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mcast

Indicates that static route being configured is used for multicast table only.

Platforms

All

45.2 static-route-hold-down

static-route-hold-down

Syntax

static-route-hold-down initial *initial* **multiplier** *multiplier* **max-value** *max-value*

no static-route-hold-down

Context

[Tree] (config>router static-route-hold-down)

Full Context

configure router static-route-hold-down

Description

This command enables the hold down time feature globally for static routes in the system.

The static route hold-down time is a mechanism to protect from rapid, fluctuating state changes of static routes resulting from issues with reachability because of link flap.

This command applies to all static routes in the VPRN and the Base router instance in which this hold-down time is configured.

The **no** form of this command disables the hold down time feature globally for static routes in the system.

Default

no static-route-hold-down

Parameters

initial

Specifies the initial value of the hold down time, in seconds, globally for static routes in the system.

Values 1 to 65535

multiplier

Specifies the multiplier value of the hold down time feature globally for static routes in the system.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 10

max-value

Specifies the maximum value of the hold down time, in seconds, globally for static routes in the system.

Values 1 to 65535

Context

[Tree] (config>service>vprn>bgp-ipvpn>mpls static-service-label)

[Tree] (config>service>vprn>bgp-evpn>mpls static-service-label)

Full Context

configure service vprn bgp-ipvpn mpls static-service-label

configure service vprn bgp-evpn mpls static-service-label

Description

This command configures the static per-VRF MPLS service label for the VPRN instance. When configured, all routes advertised from this instance use the specified label instead of a dynamically allocated per-VRF label. Traffic received with the configured label is associated with this VPRN service context. The static service label allows two or more PEs to advertise the same label, and to be reached using a shared anycast address or SID.

Note:

- If a user configures the static label, the same label is used for that service regardless of any resignaling or reboots.
- The specified label value must come from the static label range.
- The VPRN service must be administratively disabled before a user configures or changes the static service label.

The **no** form of this command reverts to the default value, which allows the service to dynamically allocate a service label.

Default

no static-service-level

Parameters

service-label

Specifies the static service label.

Values 32 to 1048575

A value of 0 equals a dynamic configuration.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

45.5 static-string

static-string

Syntax

static-string *static-string*

no static-string

Context

[Tree] (config>app-assure>group>http-enrich>field static-string)

Full Context

configure application-assurance group http-enrich field static-string

Description

This command configures an HTTP header enrichment template field static string.

The **no** form of this command removes the template field static string.

Default

no static-string

Parameters

static-string

Specifies a static string.

Platforms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[Tree] (config>service>vprn>if static-tunnel-redundant-next-hop)

Full Context

configure service ies interface static-tunnel-redundant-next-hop

configure service vprn interface static-tunnel-redundant-next-hop

Description

This command configures a redundant next-hop address on a public or private IPsec interface (with a public or private tunnel SAP) for a static IPsec tunnel in 1:1 MC-IPsec. A standby node uses the specified next-hop address to shunt traffic to the master in case it receives traffic destined to a tunnel endpoint address. The standby tunnel group needs to be operationally up for the feature to work.

The next-hop address will be resolved in routing table of corresponding service.

The **no** form of this command removes the address from the interface configuration.

Parameters

ip-address

Specifies the static ISA tunnel redundant next-hop address.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

45.7 station

station

Syntax

station *station-name* [**create**]

no station *station-name*

Context

[Tree] (config>bmp station)

Full Context

configure bmp station

Description

The command configures the BMP monitoring station name.

The **no** form of this command removes the station name from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

station-name

Specifies the station name of the BMP monitoring station up to 32 characters.

create

Keyword used to create the station name. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

All

station

Syntax

station all

Full Context

configure service vprn bgp group monitor station

configure router bgp group neighbor monitor station

configure service vprn bgp group neighbor monitor station

configure router bgp group monitor station

configure router bgp monitor station

Description

This command configures the set of BMP monitoring stations for which BMP messages are to be sent, at the global BGP instance level, per group or for a particular neighbor.

Whatever value is configured for the station parameter at the most specific BGP hierarchy level is used.

- If a station list or the **no station** command is configured at a neighbor context, then that value is used.
- If **no station** command is configured at the neighbor context, the group value is used.
- If a station list or the **no station** command is configured at a group context, then that value is used.
- If **no station** command is configured at the group context, the global value is used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If a station list or the **no station** command is configured at the global context, then that value is used.
- If **no station** command is configured at the global context, then a **no station** is assumed.

The **no** form of this command disables sending BMP messages to BMP monitoring stations.

Parameters

name

Specifies up to eight station names up to 32 characters. Allowed values are any string up to 32 characters long composed of printable,7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

all

Specifies all configured stations.

Platforms

All

45.8 station-address

station-address

Syntax

station-address *ip-address* | *ipv6-address* **port** *port*

no station-address

Context

[Tree] (config>bmp>station>connection station-address)

Full Context

configure bmp station connection station-address

Description

This command configures the IP address and TCP port number of the remote BMP monitoring station. This is a mandatory parameter and must be configured before the associated station can transitioned out of the shut down state.

The **no** form of this command removes the configured station IP address and port number for the BMP session. The **no station-address** command cannot be accepted unless the BMP or station instance is shut down.

Parameters

ip-address

Specifies the station address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address

Specifies the station address expressed in dotted decimal notation. Allowed value is a valid routable IPv6 address on the router, either an interface or system IPv6 address.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

port

Specifies the TCP (destination) port number to be used when establishing the connection to the associated BMP station.

Values 1 to 65535

status-verify

Syntax

status-verify default-result {revoked | good}

no status-verify

Context

[Tree] (config>system>security>tls>client-tls-profile status-verify)

[Tree] (config>system>security>tls>server-tls-profile status-verify)

Full Context

configure system security tls client-tls-profile status-verify

configure system security tls server-tls-profile status-verify

Description

This command configures the certificate revocation status verification parameters for end-entity (EE) certificates in the TLS client or server. This configuration overrides the existing revocation check policy.

By default the router checks the certification revocation status, but if this command is set to **good**, the end-entity certificate revocation status is overwritten and a good revocation status is returned for the EE certificate.

If this command is set to **revoked**, the router returns the actual revocation status of the end-entity certificate.

The **no** form of this command returns the actual revocation status to that of the end entity certificate.

Default

status-verify default-result revoked

Parameters

good

Specifies that the certificate is considered acceptable.

revoked

Specifies that the certificate is considered revoked.

configure subscriber-mgmt steering-profile

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a steering profile mapping. A steering profile can be applied to each L2TP LAC subscriber host that requires traffic steering.

The **no** form of this command removes the specified steering profile.

Parameters

steering-profile-name

Specifies the name of the steering profile, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

steering-profile

Syntax

[**no**] **steering-profile**

Context

Full Context

configure service vprn nat inside redundancy steering-route

Description

This command configures specifies the IP address and prefix length of the steering route. The steering route is used in the realm of this virtual router instance as an indirect next-hop for all the traffic that must be routed to the large scale NAT function.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

steering-route

Syntax

steering-route *ip-prefix/length*

no steering-route

Context

[Tree] (config>router>nat>inside>redundancy steering-route)

Full Context

configure router nat inside redundancy steering-route

Description

This command is optionally used in LSN44 multi-chassis redundancy when filters are used on the inside to send traffic destined for the LSN44 function to MS-ISA, where NAT is performed.

If configured, the steering-route is advertised only from the active LSN44 node: the purpose is to bring the LSN44 node activity awareness to downstream routers. In this fashion, downstream routers can make a more intelligent decision when forwarding traffic in the upstream direction. Based on the steering-route, traffic can be sent directly towards the active LSN44 node. This route avoids an extra forwarding hop which would ensue in the case without LSN44 activity awareness, where the upstream traffic can be forwarded to the standby LSN44 node and then to the active LSN44 node.

LSN44 node activity (active/standby) is evaluated per isa-group based on monitoring routes advertised on the outside.

The **no** form of the command removes the ip-prefix/length from the configuration.

Parameters

ip-prefix/length

Specifies the IP address and length of the steering route.

Values

ip-prefix:	a.b.c.d
ip-prefix-length:	0 to 32

Full Context

configure filter mac-filter entry sticky-dest

configure filter redirect-policy sticky-dest

configure filter ip-filter entry sticky-dest

configure filter ipv6-filter entry sticky-dest

Description

This command configures sticky destination behavior for redundant PBR/PBF actions. Configuring sticky destination has an effect on PBR/PBF actions whether a secondary action is configured.

The *hold-time-up* parameter allows the operator to delay programming of a PBR/PBF action for a specified amount of time. The timer is only started when transitioning from all configured targets being down (that is, the primary target if no secondary target is configured, or both the primary and secondary targets when both are configured) to at least one target being up.

When the timer expires, the primary PBR/PBF action is programmed if its target is up. If the primary PBR/PBF target is down and a secondary PBR/PBF action has been configured and its target is up, then this secondary PBR/PBF action is programmed. In all other cases, no specific programming occurs when the timer expires.

When sticky destination is configured and the secondary PBR/PBF target is up and its associated action is programmed, it is not automatically replaced by the primary PBR/PBF action when its target transitions from down to up. In this situation, programming the primary PBR/PBF action can be forced using the **activate-primary-action** tools command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Changing the value of the timer while the timer is running takes effect immediately (that is, the timer is restarted immediately using the new value).

The **no** form of the command disables sticky destination behavior.

Default

no sticky-dest

Parameters

hold-time-up

Specifies the initial delay in seconds. Zero is equivalent to **no-hold-time-up** (no delay).

Values 0 to 65535 seconds

[Tree] (config>router>policy-options>policy-statement>entry>action sticky-ecmp)

Full Context

configure router policy-options policy-statement default-action sticky-ecmp

configure router policy-options policy-statement entry action sticky-ecmp

Description

This command specifies that BGP routes matching an entry or default-action of a route policy should be tagged internally as requiring sticky ECMP behavior. When a BGP route with multiple equal-cost BGP next-hops is programmed for sticky ECMP the failure of one or more of its BGP next-hops causes only the affected traffic flows to be re-distributed to the remaining next-hops; by default (without sticky-ECMP) all flows are potentially affected, even those using a next-hop that did not fail.

Default

no sticky-ecmp

Platforms

All

45.22 sticky-msaps

sticky-msaps

Syntax

sticky-msaps [**idle-timeout** *seconds*]

no sticky-msaps

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>subscr-mgmt>msap-policy sticky-msaps)

Full Context

configure subscriber-mgmt msap-policy sticky-msaps

Description

This command prevents MSAPs associated with the specified MSAP policy from being deleted unless a manual **clear** command is issued. If this command is not enabled, an MSAP is deleted when a host creation fails or when a subscriber is no longer associated with the MSAP, for example, when a subscriber ends the session. This feature is useful for an operator who wants to keep historical statistics on MSAPs. It can also speed up host creation on an MSAP since the MSAP is already created. The **idle-timeout** parameter allows the removal of MSAPs that are idle for longer than the specified time.

The **no** form of this command allows an MSAP to be deleted when a host creation fails or when a subscriber is no longer associated with the MSAP.

Default

no sticky-msaps

Parameters

seconds

Specifies the idle timeout, in seconds.

Values 5 to 604800

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure mcast-management multicast-info-policy bundle channel source-override video stream-selection-buffer

configure mcast-management multicast-info-policy bundle channel video stream-selection-buffer

configure mcast-management multicast-info-policy bundle video stream-selection-buffer

Description

This command configures the buffer time for the stream selection. The buffer time is the maximum time before a video packet is aged out of the active cache. Nokia recommends to set the buffer time based on the maximum jitter for the stream. The video group must be administratively disabled and then enabled again (**configure isa video-group shutdown**) for the changed buffer time to take effect.

The **no** form of this command reverts to the default.

Default

stream-selection-buffer 1400

Parameters

stream-selection-buffer-time

Specifies the time, in milliseconds, to buffer the stream selection.

Values 100 | 200 | 300 | 400 | 500 | 600 | 700 | 800 | 900 | 1000 | 1100 | 1200 | 1300 | 1400 | 1500 |1600 | 1700 | 1800 | 1900 | 2000 | 2100 | 2200 | 2300 | 2400 | 2500 | 2600 | 2700 | 2800 | 2900 | 3000

45.29 strict

strict

Syntax

[**no**] **strict**

Context

[Tree] (config>app-assure>group>tcp-validate strict)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure application-assurance group tcp-validate strict

Description

This command specifies whether enforcement of TCP sequence and acknowledgment numbers is applied. If a packet does not meet the expected sequence or acknowledgment number, it is dropped.

This command should only be enabled if the expected bit error rate or packet loss is low. For example, if acknowledgments are lost before being detected by AA, the server timeouts are triggered and retransmissions occur. If **strict** is enabled, these retransmissions would resemble a reply attack and would be dropped by AA.

The **no** form of this command removes TCP sequence and acknowledgment number enforcement.

Default

no strict

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

strict-adjacency-check

Syntax

[**no**] **strict-adjacency-check**

Context

[Tree] (config>service>vprn>isis strict-adjacency-check)

Full Context

configure service vprn isis strict-adjacency-check

Description

This command enables strict checking of address families (IPv4 and IPv6) for IS-IS adjacencies. When enabled, adjacencies do not come up unless both routers have exactly the same address families configured. If there is an existing adjacency with unmatched address families, it is torn down.

This command is used to prevent black-holing traffic when IPv4 and IPv6 topologies are different. When disabled (**no strict-adjacency-check**) a BFD session failure for either IPv4 or IPv6 will cause the routes for the other address family to be removed as well.

When disabled (**no strict-adjacency-check**), both routers only need to have one common address family to establish the adjacency.

Full Context

configure router mpls strict-ero-nhop-direct-resolution

Description

This command enables the strict Explicit Route Object (ERO) next-hop direct resolution. The feature restricts the routes used to resolve the next hop of an ERO address to local and host routes. This command avoids using a next hop over a parallel link when a half link is up in the routing table.

When enabled, this command applies to an ERO when all of the following conditions are met:

- the ERO next hop is an IPv4 address
- the ERO object is a strict hop
- the IPv4 address matches the primary subnet of a local numbered interface

An ERO that meets the preceding conditions restricts resolution of the next hop to a LOCAL or a HOST route. If no such route exists, RSVP rejects the PATH message with ErrCode = Routing Error (24) and SubErrCode = Bad Strict Node (2).

The **no** form of this command disables the strict ERO next-hop direct resolution.

Default

no strict-ero-nhop-direct-resolution

strip-label

Syntax

[**no**] **strip-label**

Context

[Tree] (config>router>if strip-label)

Full Context

configure router interface strip-label

Description

This command forces packets to be stripped of all (max 5) MPLS labels before the packets are handed over for possible filter (PBR) processing.

If the packets do not have an IP header immediately following the MPLS label stack after the strip, they are discarded. Only MPLS encapsulated IP, IGP shortcuts and VPRN over MPLS packets will be processed. However, IPv4 and IPv6 packets that arrive without any labels are supported on an interface with **strip-label** enabled.

This command operates in promiscuous mode. This means that the router does not filter on the destination MAC address of the Ethernet frames. In some network designs, multiple ports may be tapped and combined into interface toward the router. Promiscuous mode allows all of these flows to be processed without requiring the destination MAC address to be updated to match the router address.

This command is supported on:

- Optical ports for the 7750 SR and 7450 ESS
- Null/Dot1q encaps
- Network ports
- IPv4
- IPv6

In order to associate an interface that is configured with the strip-label parameter with a port, the port must be configured as single-fiber for the command to be valid.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Packets that are subject to the strip-label action and are mirrored (using mirrors or lawful interception) will contain the original MPLS labels (and other L2 encapsulation) in the mirrored copy of the packet, as they appeared on the wire, when the mirror-dest type is the default type "ether". If the mirror-dest type is "ip-only", then the mirrored copy of the packet will not contain the original L2 encapsulation or the stripped MPLS labels.

The **no** form of this command removes the strip-label command.

Default

no strip-label

45.44 sub-ident-policy

sub-ident-policy

Syntax

[**no**] **sub-ident-policy** *sub-ident-policy-name*

Context

[Tree] (config>subscr-mgmt sub-ident-policy)

Full Context

configure subscriber-mgmt sub-ident-policy

Description

This command configures a subscriber identification policy. Each subscriber identification policy can have a default subscriber profile defined. The subscriber identification policy default subscriber profile overrides the system default and the subscriber SAP default subscriber profiles. Defining a subscriber identification policy default subscriber profile is optional.

The subscriber identification policy default subscriber profile cannot be defined with the subscriber profile name default.

Defining a subscriber profile as a subscriber identification policy default subscriber profile will cause all active subscribers currently associated with a subscriber SAP using the policy and associated with a subscriber policy through the system default or subscriber SAP default subscriber profiles to be reassigned to the subscriber policy defined as default on the subscriber identification policy.

Attempting to delete a subscriber profile that is currently defined as a default for a subscriber identification policy will fail.

When attempting to remove a subscriber identification policy default subscriber profile definition, the system will evaluate each active subscriber on all subscriber SAPs the subscriber identification policy is currently associated with that are using the default definition to determine whether the active subscriber can be either reassigned to a subscriber SAP default or the system default subscriber profile. If all active subscribers cannot be reassigned, the removal attempt will fail.

The **no** form of this command reverts to the default.

Parameters

sub-ident-policy-name

Specifies the name of the subscriber identification policy, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt sub-ident-policy

configure service ies subscriber-interface group-interface sap sub-sla-mgmt sub-ident-policy

configure subscriber-mgmt msap-policy sub-sla-mgmt sub-ident-policy

configure service vpls sap sub-sla-mgmt sub-ident-policy

Description

This command associates a subscriber identification policy to this SAP. The subscriber identification policy must be defined prior to associating the profile with a SAP in the **config>subscr-mgmt>sub-ident-policy** context.

Subscribers are managed by the system through the use of subscriber identification strings such as a subscriber identifier, an sla-profile string, a sub-profile string and an app-profile string.

The subscriber identification policy performs following functions for subscriber hosts and sessions associated with the SAP or MSAP:

- mapping of sla-profile, sub-profile and app-profile strings obtained from authentication (for example, LUDB, RADIUS, Diameter, or Python) into profile names that are configured on the router
- for IPoE DHCPv4 hosts, the subscriber identification strings can be derived from the DHCP ACK message sent to the subscriber host using a Python script referenced in the sub-ident-policy
- for PPPoE hosts that get an IPv4 address via the PPPoE DHCPv4 client and for IPoE DHCPv4 hosts, an SR OS DHCPv4 server in combination with an LUDB returns the identification strings in a DHCPv4 option. The **strings-from-option** command in the sub-ident-policy tells the system from which option to extract the identification strings.

The **no** form of this command removes the default subscriber identification policy from the SAP configuration.

sub-ident-policy

Syntax

sub-ident-policy *sub-ident-policy-name*

no sub-ident-policy

Context

[Tree] (config>app-assure>group>transit-ip-policy sub-ident-policy)

Full Context

configure application-assurance group transit-ip-policy sub-ident-policy

Description

This command associates a subscriber identification policy to this SAP. The subscriber identification policy must be defined prior to associating the profile with a SAP in the **config>subscribermgmt>sub-ident-policy** context.

Subscribers are managed by the system through the use of subscriber identification strings. A subscriber identification string uniquely identifies a subscriber. For static hosts, the subscriber identification string is explicitly defined with each static subscriber host.

For dynamic hosts, the subscriber identification string must be derived from the DHCP ACK message sent to the subscriber host. The default value for the string is the content of Option 82 CIRCUIT-ID and REMOTE-ID fields interpreted as an octet string. As an option, the DHCP ACK message may be processed by a subscriber identification policy which has the capability to parse the message into an alternative ASCII or octet string value.

When multiple hosts on the same port are associated with the same subscriber identification string they are considered to be host members of the same subscriber.

A sub-ident-policy can also be used for identifying dynamic transit subscriber names.

The **no** form of this command removes the default subscriber identification policy from the SAP configuration.

Default

no sub-ident-policy

Parameters

sub-ident-policy-name

Specifies the subscriber identification policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

45.50 sub-mcac-policy

sub-mcac-policy

Syntax

sub-mcac-policy *sub-mcac-policy-name* [**create**]

no sub-mcac-policy *b*

Context

[Tree] (config>subscr-mgmt sub-mcac-policy)

Full Context

configure subscriber-mgmt sub-mcac-policy

Description

This command creates a policy template with MCAC bandwidth limits that are applied to the subscriber.

Per interface mcac bandwidth limits are set directly under the interface (regular interface or group-interface) and no such policy templates are needed.

The need for a separate policy template for subscribers is due to the fact that groups of subscribers under the same group-interface can share certain settings that can be configured via this template.

To summarize, the MCAC bandwidth constraints for subscribers are defined in the sub-mcac-policy while the mcac bandwidth constraints for the interface are configured directly under the **igmp>interface>mcac** or **igmp>grp-if>mcac** context without the need for policy templates.

Note:
The sub-mcac-policy only deals with the mcac bandwidth limits and not the channel bandwidth definitions. Channels bandwidth is defined in a different policy (in the **config>router>mcac** context) and that policy is applied on the interface level as follows:

- For group-interface: under the **config>service>vprn>igmp>grp-if>mcac** context
- For regular interface: under the **config>service/router>igmp>interface>mcac** context.

In case of HQoS Adjustment, it is mandatory that the sub-mcac-policy be created and applied to the subscriber. The sub-mac-policy does not have to contain any bandwidth constrains, but it has to be in a no shutdown state in order for HQoS Adjustment to work.

The **no** form of this command reverts to the default.

Parameters

policy-name

Specifies the name of the policy up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

© 2026 Nokia.

sub-mcac-policy

Syntax

sub-mcac-policy *policy-name*

no sub-mcac-policy

Context

[Tree] (config>subscr-mgmt>sub-prof sub-mcac-policy)

Full Context

configure subscriber-mgmt sub-profile sub-mcac-policy

Description

This command references the policy template in which the mcac bandwidth limits are defined. Mcac for the subscriber is effectively enabled with this command when the sub-profile is applied to the subscriber. The bandwidth of the channels is defined in a different policy (under the **config>router>mcac** context) and this policy is applied on the interface level as follows:

- For group-interfaces under the **config>service>vprn>igmp>grp-if>mcac** context
- For regular interfaces under the **config>service/router>igmp>interface>mcac** context

In case of HQoS Adjustment, it is mandatory that the sub-mcac-policy be created and applied to the subscriber. The sub-mac-policy does not have to contain any bandwidth constrains, but it has to be in a no shutdown state in order for HQoS Adjustment to work.

The **no** form of this command removes the policy from the configuration.

Parameters

policy-name

Specifies the policy name configured in the config>subscr-mgmt>sub-mcac-policy context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

45.53 sub-port

sub-port

Syntax

sub-port *port-id* [**create**]

no sub-port *port-id*

Context

[Tree] (config>port>ethernet>dot1x>macsec sub-port)

Full Context

configure port ethernet dot1x macsec sub-port

Description

This command creates a MACsec instance on a physical port, targeting the specific subset of traffic defined by the **encap-match** command.

The **no** form of this command removes the MACsec instance.

Parameters

port-id

Specifies the sub-port id index.

Values 1 to 1023

create

Creates a new sub-port.

Platforms

All

45.54 sub-profile

sub-profile

Syntax

[**no**] **sub-profile**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>subscr-mgmt>acct-plcy>include-radius-attribute sub-profile)

Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute sub-profile

Description

This command specifies that subscriber profile attributes should be included into RADIUS accounting messages.

The **no** form of this command excludes subscriber profile attributes into RADIUS accounting messages.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-profile

Syntax

configure service ies subscriber-interface group-interface sap static-host sub-profile

configure service ies interface sap static-host sub-profile

configure service vpls sap static-host sub-profile

configure service vprn interface sap static-host sub-profile

Description

This command specifies an existing subscriber profile name to be associated with the static subscriber host.

The **no** form of this command reverts to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

sub-profile-name

Specifies the sub-profile name.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-profile

Syntax

[**no**] **sub-profile** *subscriber-profile-name*

Context

[Tree] (config>subscr-mgmt sub-profile)

Full Context

configure subscriber-mgmt sub-profile

Description

Commands in this context configure a subscriber profile. A subscriber profile is a template used to define the aggregate QoS for all hosts within a subscriber context. This is done through the definition of the egress and ingress scheduler policies that govern the aggregate SLA for subscribers using the subscriber profile. Subscriber profiles also allow for specific SLA profile definitions when the default definitions from the subscriber identification policy must be overridden.

Subscribers are either explicitly mapped to a subscriber profile template or are dynamically associated by one of various non-provisioned subscriber profile definitions.

A subscriber host can be associated with a subscriber profile in the following ways, listed from lowest to highest precedence:

1. The subscriber profile named default.
2. The subscriber profile defined as the subscriber SAP default.
3. The subscriber profile found by the subscriber identification policy sub-profile-map.
4. The subscriber profile found by the subscriber identification policy explicit map.

In the event that no defaults are defined and the subscriber identification string is not explicitly provisioned to map to a subscriber profile, either the static subscriber host creation will fail or the dynamic subscriber host DHCP ACK is discarded.

Default Subscriber profile:

When a subscriber profile is created with the *subscriber-profile-name* default, it is used when no other subscriber profile is associated with the subscriber host by the system. Creating a subscriber profile with the *subscriber-profile-name* default is optional. If a default subscriber profile is not created, all subscriber hosts subscriber identification strings must match either a non-provisioned default or be provisioned as an explicit match to a subscriber profile.

The default profile has no effect on existing active subscriber on the system as they exist due to higher precedence mappings.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Attempting to delete any subscriber profile (including the profile named default) while in use by existing active subscribers will fail.

The **no** form of this command reverts to the default.

Parameters

subscriber-profile-name

Specifies the name of the subscriber profile, up to 32 characters.

create

Keyword used to create the subscriber profile.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure subscriber-mgmt vrgw brg brg-profile sub-profile-string

Description

This string will be used as a default for subscriber-profile lookup. This string can be overridden during BRG or host authentication. The **no** form of the command removes the string from the configuration.

Default

no sub-profile-string

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

string

Specifies the string used to look up the subscriber profile.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

45.57 sub-ring

sub-ring

Syntax

[**no**] **sub-ring** {**virtual-link** | **non-virtual-link**}

Context

[Tree] (config>eth-ring sub-ring)

Full Context

configure eth-ring sub-ring

Description

This command specifies this ring-id to be sub-ring as defined in G.80312. By declaring this ring as a sub-ring object, this ring will only have one valid path and the sub-ring will be connected to a major ring or a VPLS instance.

The **virtual-link** keyword declares that a sub-ring is connected to another ring and control messages can be sent over the attached ring to the other side of the sub-ring.

The **non-virtual-link** channel parameter declares that a sub-ring may be connected to another ring or to a VPLS instance but no control messages from the sub-ring use the attached ring or VPLS instance. The non-virtual channel behavior is standard G.8032 capability.

The **no** form of this command deletes the sub-ring and its virtual channel associations.

Default

no sub-ring

Parameters

virtual-link

Specifies that the interconnection is to a ring and a virtual link will be used.

non-virtual-link

Specifies that the interconnection is to a ring or a VPLS instance and a virtual link will not be used.

configure service vprn interface external-reference openconfig subinterface

Description

This command configures the subinterface ID used to map a Nokia vendor-specific configuration and the OpenConfig state.

This command configures the ability to query the OpenConfig state through NETCONF, gRPC, and the MD-CLI from any configuration mode without having to add any OpenConfig model configuration. As part of the configuration, a user must also add a port to the Layer 3 interface.

The **no** form of this command reverts to the default.

Default

no subinterface

Parameters

subinterface

Specifies the subinterface ID.

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

45.60 subject

subject

Syntax

subject {**eq** | **neq**} *subject* [*regexp*]

no subject

Context

[Tree] (config>service>vprn>log>filter>entry>match subject)

Full Context

configure service vprn log filter entry match subject

Description

This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the subject match criterion.

Default

no subject

Parameters

eq | neq

This operator specifies the type of match. Valid operators are listed below.

Values

Table 172: Valid Operators

Operator	Notes
eq	equal to
neq	not equal to

subject

A string used as the subject match criterion.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered.

When **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

Platforms

All

subject

Syntax

subject {**eq** | **neq**} *subject* [*regexp*]

no subject

Context

[Tree] (config>log>filter>entry>match subject)

configure log filter entry match subject

Description

This command adds an event subject as a match criterion.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

The **no** form of this command removes the subject match criterion.

Parameters

eq | neq

Specifies the match type. Valid operators are listed in Table 173: Valid Operators.

Table 173: Valid Operators

Operator	Notes
eq	equal to
neg	not equal to

subject

Specifies a string up to 32 characters, used as the subject match criterion.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered. When the **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

45.61 subnet

subnet

Syntax

subnet {*ip-address*/*mask* | *ip-address netmask*} [**create**]

no subnet {*ip-address*/*mask* | *ip-address netmask*}

Context

[Tree] (config>service>vprn>dhcp>server>pool subnet)

[Tree] (config>router>dhcp>server>pool subnet)

Full Context

configure service vprn dhcp local-dhcp-server pool subnet

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure router dhcp local-dhcp-server pool subnet

Description

This command creates a subnet of IP addresses to be served from the pool. The subnet cannot include any addresses that were assigned to subscribers without those addresses specifically excluded. When the subnet is created, no IP addresses are made available until a range is defined.

The **no** form of the removes the subnet parameters from the configuration.

Parameters

ip-prefix/mask

Specifies the address prefix and mask. A mask of 255.255.255.255 is reserved for system IP addresses.

Values ip-prefix: a.b.c.d

mask: 8 to 32

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

Values a.b.c.d, any mask expressed as dotted quad

create

Keyword used to create the subnet. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

subrate

Syntax

subrate {**digital-link** | **larscom**} *rate-step*

no subrate

Context

[Tree] (config>port>tdm>ds3 subrate)

Full Context

configure port tdm ds3 subrate

Description

This command configures the channel service unit (CSU) compatibility mode to interoperate with existing DS-3 subrate standards.

This configuration applies only for non-channelized DS-3s on ASAP TDM MDAs.

The **no** form of this command remove the subrate functionality.

Default

no subrate

Parameters

digital-link

Enables the Digital-Link (Quick Eagle) CSU compatibility mode.

larscom

Enables the Larscom CSU compatibility mode.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rate-step

Specifies the subrate value for the associated DS-3.

Values 1 to 147 (digital-link) 1 to 14 (larscom)

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

configure service ies interface sap static-host subscriber

configure service vprn subscriber-interface group-interface sap static-host subscriber

configure service vprn interface sap static-host subscriber

Description

This command specifies an existing subscriber identification profile to be associated with the static subscriber host.

Parameters

sub-ident

Specifies the subscriber identification.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

subscriber

Syntax

subscriber *sub-ident-string* [**sap** *sap-id*] [**ip** *ip-address*] [{[**mac** *ieee-address*] | **sla-profile** *sla-profile-name*}] [**fc** {[**be**] [**l2**] [**af**] [**l1**] [**h2**] [**ef**] [**h1**] [**nc**]}] {[**ingress**] [**egress**]} [**host-type** *host-type*] [**family** *family*]

no subscriber *sub-ident-string*

Context

[Tree] (config>mirror>mirror-source subscriber)

Full Context

configure mirror mirror-source subscriber

Description

This command adds hosts of a subscriber to mirroring service.

Parameters

sub-ident-string

Specifies the name of the subscriber identification policy.

sap-id

Specifies the physical port identifier portion of the SAP definition.

ip-address

Specifies the service IP address (system IP address) of the remote device sending LI traffic. If 0.0.0.0 is specified, any remote router is allowed to send to this service.

Values 1.0.0.1 to 223.255.255.254

ieee-address

Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name

Each host of a subscriber can use a different sla-profile. This option allows interception of only the hosts using the specified sla-profile. In some deployments sla-profiles are assigned per type of traffic. There can be, for example, a specific sla-profile for voice traffic (which could be used for all SIP-hosts). The name can have up to 32 characters.

fc

Specifies the name of the forwarding class with which to associate traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error will be returned and the **fc** command will have no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* will override the default forwarding class.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values be, l2, af, l1, h2, ef, h1, nc

egress

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

ingress

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination prior to ingress packet modification.

host-type

Specifies the host type for mirroring. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipoe, ppp

family

Specifies the IP family for mirroring. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipv4, ipv6

Platforms

All

subscriber

Syntax

subscriber *sub-ident-string* [**sap** *sap-id* [**ip** *ip-address*] [**mac** *ieee-address*] | **sla-profile** *sla-profile-name*] [**fc** {[**be**] [**l2**] [**af**] [**l1**] [**h2**] [**ef**] [**h1**] [**nc**]}] [**intercept-id** *intercept-id*] [**session-id** *session-id*] {[**ingress**] [**egress**]} [**host-type** *host-type*] [**family** *ip-family*]

no subscriber *sub-ident-string*

Context

[Tree] (config>li>li-source subscriber)

Full Context

configure li li-source subscriber

Description

This command adds hosts of a subscriber to mirroring service.

Parameters

sub-ident-string

Specifies the name of the subscriber identification policy.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sap-id

Specifies the physical port identifier portion of the SAP definition.

ip-address

Specifies the service IP address (system IP address) of the remote device sending LI traffic. If 0.0.0.0 is specified, any remote router is allowed to send to this service.

Values 1.0.0.1 to 223.255.255.254

ieee-address

Specifies a MAC address when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name

Specifies an SLA profile name, up to 32 characters. Each host of a subscriber can use a different sla-profile. This option allows interception of only the hosts using the specified sla-profile. In some deployments sla-profiles are assigned per type of traffic. There can be, for example, a specific sla-profile for voice traffic (which could be used for all SIP-hosts).

fc

The name of the forwarding class with which to associate LI traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error will be returned and the **fc** command will have no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* will override the default forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

intercept-id

Specifies the intercept-id that is inserted into the packet header for all mirrored packets of the associated li-source entry. This *intercept-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs.

For all types of **li-source** entries (**filter**, **nat**, **sap**, or **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** or **ip-udp-shim-sampled** routable encap, no *intercept-id* is inserted and none can be specified against the **li-source** entries.

Values 1 to 4294967295 (32b) For **nat li-source** entries that are using a mirror service that is not configured with routable encap

Values 1 to 1,073,741,824 (30b) For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and no direction-bit.

Values 1 to 536,870,912 (29b) For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and with the direction-bit enabled.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

session-id

Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encapsulation (**config>mirror>mirror-dest>encap>ip-udp-shim**).

For all types of **li-source** entries (**filter**, **nat**, **sap**, or **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, a *session-id* field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** or **ip-udp-shim-sampled** routable encap, no *session-id* is inserted and none can be specified against the **li-source** entries.

Values 1 to 4,294,967,295 (32b)

ingress

Specifies the ingress policy for lawful intercept.

egress

Specifies the egress policy for lawful intercept.

host-type

Specifies the host type for lawful intercept. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipoe, ppp

ip-family

Specifies the IP family for lawful intercept. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipv4, ipv6

Description

This command adds hosts of a subscriber to mirroring service.

Parameters

sub-ident-string

Specifies the name of the subscriber identification policy.

sap-id

Specifies the physical port identifier portion of the SAP definition.

ip-address

The service IP address (system IP address) of the remote 7750 SR or 7450 ESS device sending LI traffic.

Values 1.0.0.1 to 223.255.255.254

ieee-address

Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name

Specifies the SLA profile name, up to 32 characters.

fc

Specifies name of the forwarding class with which to associate LI traffic.

Values be, l2, af, l1, h2, ef, h1, nc

ingress

Specifies information for the ingress policy.

egress

Specifies information for the egress policy.

Description

This command allows the operator to create special subscriber-based interfaces. It is used to contain multiple group interfaces. Multiple subnets associated with the subscriber interface can be applied to any of the contained group interfaces in any combination. The subscriber interface allows subnet sharing between group interfaces.

The **no** form of this command reverts to the default.

Parameters

ip-int-name

Specifies the interface name of a subscriber interface, up to 32 characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

create

Keyword used to create the subscriber interface.

fwd-service *service-id*

Specifies the wholesale service ID or service name.

Values *service-id*: 1 to 214748364

svc-name: A string up to 64 characters

ip-int-name

Specifies the wholesale subscriber interface.

wan-mode *mode*

Specifies the WAN mode as 64-bit or 128-bit. To change the WAN mode after creation, the interface must first be removed then recreated.

Values *mode64*, *mode128*

Default *mode64*

45.72 subscriber-limit

subscriber-limit

Syntax

subscriber-limit *limit*

no subscriber-limit

Context

[Tree] (config>service>vprn>nat>outside>pool subscriber-limit)

Full Context

configure service vprn nat outside pool subscriber-limit

Description

This command configures the maximum number of subscribers per outside IP address.

If multiple port blocks per subscriber are used, the block size is typically small; all blocks assigned to a given subscriber belong to the same IP address; the subscriber limit guarantees that any subscriber can get a minimum number of ports.

The subscribers are counted per protocol (UDP, TCP and ICMP). For example, in LSN44 a source IPv4 address that uses ports on each of the three protocols (UDP, TCP and ICMP) on an outside IP address count as 3 subscribers on that outside IP address. The ‘no subscriber-limit’ removes the limit for the number of subscribers per outside IP address.

This command is not applicable to pools with:

- arbitrary address pooling enabled
- flexible port allocations (application configured under a pool)

Parameters

limit

Specifies the maximum number of subscribers per outside IP address.

Values 1 to 65535

© 2026 Nokia.

subscriber-mgmt

Syntax

subscriber-mgmt

Context

[Tree] (config subscriber-mgmt)

Full Context

configure subscriber-mgmt

Description

Commands in this context configure subscriber management entities. A subscriber is uniquely identified by a subscriber identification string. Each subscriber can have several DHCP sessions active at any time. Each session is referred to as a subscriber host and is identified by its IP address and MAC address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

All subscriber hosts belonging to the same subscriber are subject to the same hierarchical QoS (HQoS) processing. The HQoS processing is defined in the sub-profile (the subscriber profile). A sub-profile refers to an existing scheduler policy (configured in **the config>qos>scheduler-policy** context) and offers the possibility to overrule the rate of individual schedulers within this policy.

Because all subscriber hosts use the same scheduler policy instance, they must all reside on the same complex.

configure service vprn nat inside dual-stack-lite subscriber-prefix-length

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the IPv6 prefix length of the DS-Lite subscribers.

The **no** form of this command reverts the default.

Default

subscriber-prefix-length 128

Parameters

prefix-length *prefix-length*

Specifies the IPv6 prefix length of the DS-Lite subscriber.

Values 32 to 64, 128

Default 128

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscriber-prefix-length

Syntax

subscriber-prefix-length *prefix-length*

no subscriber-prefix-length

Context

[Tree] (config>router>nat>inside>dual-stack-lite subscriber-prefix-length)

Full Context

configure router nat inside dual-stack-lite subscriber-prefix-length

Description

This command sets the value for the number of high order bits of the source IPv6 address that will be considered as DS-Lite subscriber. The remaining bits of the source IPv6 address will be masked off, effectively aggregation all IPv6 source addresses under the configured prefix length into a single DS-Lite subscriber. Source IPv4 addresses/ports of the traffic carried within the DS-Lite subscriber will be translated into a single outside IPv4 address and the corresponding deterministic port-block (port-blocks can be extended).

The range of values for subscriber-prefix-length in non-deterministic DS-Lite is limited from 32 to 64 (a prefix will be considered as a DS-Lite subscriber) or it can be set to a value of 128 (the source IPv6 address is considered as a DS-Lite subscriber).

In cases where deterministic DS-Lite is enabled in a giver inside routing context, the range of values of the **subscriber-prefix-length** depends on the value of *dslite-max-subscriber-limit* parameter as follows:

subscriber-prefix-length – n = [32..64,128]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

where n = log2(dslite-max-subscriber-limit)

[or in an alternate form: dslite-max-subscriber-limit = 2^n.]

In other words the largest prefix length for the deterministic DS-Lite subscriber will be 32+n, where n = log2(dslite-max-subscriber-limit). The subscriber prefix length can extend up to 64 bits. Beyond 64 bits for the subscriber prefix length, there only one value is allowed: 128. In the case n must be 0, which means that the mapping between B4 elements (or IPv6 address) and the IPv4 outside addresses is in 1:1 ratio (no sharing of outside IPv4 addresses).

This parameter can be changed only when there are no deterministic prefixes configured in the same routing context.

The **no** form of the command reverts to the default.

Default

128

Parameters

prefix-length

In non-deterministic DS-Lite this value can be [32..64,128], assuming that the deterministic DS-Lite is not concurrently enabled in the same inside routing context. In case that deterministic DS-Lite is enabled, this value can be within the range [(32+n)..64,128] where n = log2(dslite-max-subscriber-limit). The value of 128 is allowed only when n=0 (each subscriber is mapped to a single outside IPv4 IP address).

Values 32 to 64

debug router isis summary

Description

This command enables debugging for ISIS summary addresses.

The **no** form of the command disables the debugging.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-address

When specified, only packets with the specified address are debugged.

Platforms

All

45.84 summary-address

summary-address

Syntax

summary-address {*ip-prefix/mask* | *ip-prefix* [*netmask*]} [*level*] [**tag** *tag*]

no summary-address {*ip-prefix/mask* | *ip-prefix* [*netmask*]}

Context

[Tree] (config>service>vprn>isis summary-address)

Full Context

configure service vprn isis summary-address

Description

This command creates summary-addresses for the specified router or VPRN instance.

Parameters

ip-prefix/mask

Specifies information for the specified IP prefix and mask length.

Values		
	ip-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-length	0 to 32
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	ipv6-prefix-length	0 to 128

netmask

The subnet mask in dotted decimal notation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level

Specifies IS-IS level area attributes. If no level parameter is specified, the default is level-1/2.

Values level-1, level-2, level-1/2

tag *tag*

Assigns a route tag to the summary address.

Values 1 to 4294967295

Platforms

All

summary-address

Syntax

summary-address {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*} [*level*] [**tag** *tag*] [**algorithm** *algo-id*]

summary-address {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*} [*level*] [**tag** *tag*] [**algorithm** *algo-id*] **advertise-unreachable** [**match-route-tag** *tag*] [**advertise-route-tag** *tag*]

no summary-address {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*}

Context

[Tree] (config>router>isis summary-address)

Full Context

configure router isis summary-address

Description

This command creates a summary IPv4, IPv6, or SRv6 locator address.

When an IS-IS domain exists out of multiple areas, the user must redistribute IP addresses and SRv6 locators between areas for inter-area SRv6-based transport services.

Scaling may be impacted if all existing IPv4, IPv6, and SRv6 locators are redistributed between all existing areas. SRv6 locators and IP addresses can be summarized when they are redistributed from one area into another area. Summarization reduces the number of entries redistributed, which reduces the size of the Link State Database (LSDB) and increases network stability.

The **no** form of this command reverts to the default.

Default

no summary-address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-prefix/ip-prefix-length

Specifies the IP prefix and prefix length of the summary address.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

netmask

Specifies the subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level

Specifies IS-IS level area attributes.

Values level-1, level-2, level-1/2

Default level-1/2

tag

Specifies the route tag to assign for the summary address.

Values 1 to 4294967295

algo-id

Specifies the algorithm topology applied for the summary address.

Values 0, 128 to 255

Default 0

match-route-tag *tag*

Specifies the route tag to match the Unreachable Prefix Announcements (UPAs). This selects a subset of summary member prefixes to monitor for reachability.

Values 1 to 4294967295

Default no match-route-tag

advertise-route-tag *tag*

Specifies the route tag to advertise in the UPA. The UPA tag can be used when there are multiple ASBR redistributing prefixes between two IGP areas.

© 2026 Nokia.

summary-crit

Syntax

summary-crit dst-addr

summary-crit src-addr

no summary-crit

Context

[Tree] (config>filter>log>summary summary-crit)

Full Context

configure filter log summary summary-crit

Description

This command defines the key of the index of the mini-table. If key information is changed while summary is administratively enabled (no shutdown), the filter summary mini-table is flushed and recreated with different key information. Log packets received during the reconfiguration time will be handled as if summary was not active.

The **no** form of the command reverts to the default parameter.

Default

summary-crit src-addr

Parameters

dst-addr

Specifies that received log packets are summarized based on the destination IPv4, IPv6, or MAC address.

src-addr

Specifies that received log packets are summarized based on the source IPv4, IPv6 or MAC address.

45.93 suppress-lsn-events

suppress-lsn-events

Syntax

[**no**] **suppress-lsn-events**

Context

[Tree] (configure>isa>wlan-gw-group>nat suppress-lsn-events)

Full Context

configure isa wlan-gw-group nat suppress-lsn-events

Description

This command suppresses the generation of Large Scale NAT (LSN) events when RADIUS accounting is enabled.

By default, only one logging facility for tracking subscribers in LSN44, DS-Lite, and NAT64 can be enabled at the time, either the SR OS event logging facility or the RADIUS logging facility. Note that SR OS event logs can be sent to multiple destinations, such as the console session, a telnet or SSH session, memory logs, file destinations, SNMP trap groups, and syslog destinations.

If RADIUS logging is enabled, the NAT logs are sent to the RADIUS destination and the NAT logs are suppressed in the SR OS event logging facility, for example, NAT logs are not sent to the syslog server.

If RADIUS logging is disabled, the NAT logs are sent to the SR OS event logging facility, for example, syslog, assuming that the events are enabled via the SR OS event-control (**configure log event-control nat** *event* **generate**).

The **no** form of this command, the NAT logs can be sent to both logging facilities simultaneously, the SR OS event logging facility and RADIUS logging facility.

45.94 suppress-lsn-sub-blks-free

suppress-lsn-sub-blks-free

Syntax

[**no**] **suppress-lsn-sub-blks-free**

Context

[Tree] (configure>isa>wlan-gw-group>nat suppress-lsn-sub-blks-free)

Full Context

configure isa wlan-gw-group nat suppress-lsn-sub-blks-free

Description

This command suppresses the tmnxNatLsnSubBlksFree summary notification and use the tmnxNatPlBlockAllocationLsn notifications. When the SR OS node is in a state of excessive logging, the queue associated with the transmission of logs on the MS-ISA can become congested. This event further delays the generation of logs, and with this, further allocations and deallocations of NAT resources (port-

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

blocks) is stalled until the queue is relieved of congestion. For example, an excessive logging state in the system can be caused by issuing a command to clear a large number of NAT subscribers where a large number of resources (port-blocks) are released at once.

The **suppress-lsn-sub-blks-free** command enables the generation of individual logs carried in event-id 2012 for every released port block regardless of the state of the transmission queue (whether congested or not). If NAT subscribers have a large number of allocated port blocks (this could be hundreds of port blocks per subscriber), generating individual logs per port-block release contributes to the congestion.

To alleviate transmission queue congestion, this behavior can be changed by disabling this command (**no suppress-lsn-sub-blks-free**). This causes the suppression of logs related to the release of individual port blocks of a NAT subscriber when the transmission queue is congested. As a result, only a summarized release log via event-id 2021 for the subscriber is generated. The purpose of this new log is to inform the operator in a single message that all ports blocks for the subscriber are released. For example, the log message for LSN is "LSN subscriber all blocks freed". The benefit of such summarization (or log aggregation) is to alleviate the congestion of the transmission queue and consequently accelerate resource releases. An effect is the decreased granularity of information.

If summarization is enabled (**no suppress-lsn-sub-blks-free**) while there is no logging congestion in the system, the port block releases continue to be logged individually via the event-id 2012 (assuming that this is enabled in the event control), except for the last port block of the subscriber. When the last port block is released, the log with event-id 2021 is generated indicating that all port blocks for the subscriber are now released without carrying the specific information about this last port block that is released.

Syntax

svc-ping *ip-address* [**service** *service-id*] [**local-sdp**] [**remote-sdp**]

Context

[Tree] (oam svc-ping)

Full Context

oam svc-ping

Description

This command tests a service ID for correct and consistent provisioning between two service end points.

The **svc-ping** command accepts a far-end IP address and a service ID for local and remote service testing. The following information can be determined from **svc-ping**:

Local and remote service existence

- Local and remote service state
- Local and remote service type correlation

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Local and remote customer association
- Local and remote service-to-SDP bindings and state
- Local and remote ingress and egress service label association

Unlike **sdp-ping**, only a single message is sent per command; no count nor interval parameter is supported and round trip time is not calculated. A time out value of 10 seconds is used before failing the request. The forwarding class is assumed to be Best-Effort Out-of-Profile.

If no request is sent or a reply is not received, all remote information is shown as N/A.

To terminate a **svc-ping** in progress, use the CLI break sequence <Ctrl-C>.

Upon request time out, message response, request termination, or request error the following local and remote information is displayed. See Table 174: Svc-ping. Local and remote information is dependent upon service existence and reception of reply.

Table 174: Svc-ping

Field	Description	Values
Request Result	The result of the **svc-ping** request message.	Sent - Request Timeout
		Sent - Request Terminated
		Sent - Reply Received
		Not Sent - Non-Existent Service-ID

Field	Description	Values
		—
Originating SDP-ID Binding Oper State	The local operational state of the originating *sdp-id*s binding to *service-id*. If an *sdp-id* is not bound to the service, N/A is displayed.	Oper-Up
		Oper-Down
		—
Responding SDP-ID	The *sdp-id* used by the far end to respond to the **svc-ping** request. If the request was received without the **sdp-path** parameter, the responding router does not use an *sdp-id* as the return path, but the appropriate responding *sdp-id* is displayed. If a valid *sdp-id* return path is not found to the originating router that is bound to the *service-id*, Non-Existent is displayed.	*resp-sdp-id*
		Non-Existent
Responding SDP-ID Path Used	Whether the responding router used the responding *sdp-id* to respond to the **svc-ping** request. If the request was received via the originating *sdp-id* and a valid return *sdp-id* is found, operational and has a valid egress service label, the far-end router should use the *sdp-id* as the return *sdp-id*. If the far end uses the responding *sdp-id* as the return path, Yes is displayed. If the far end does not use the responding *sdp-id* as the return path, No is displayed. If the responding *sdp-id* is non-existent, N/A is displayed.	Yes
		No
		—
Responding SDP-ID Administrative State	The administrative state of the far-end *sdp-id* associated with the return path for *service-id*. When a return path is administratively down, Admin-Down is displayed. If the return *sdp-id* is administratively up, Admin-Up is displayed. If the responding *sdp-id* is non-existent, N/A is displayed.	Admin-Up
		Admin-Up
		N/A
Responding SDP-ID Operational State	The operational state of the far-end *sdp-id* associated with the return path for *service-id*. When a return path is operationally down, Oper-Down is displayed. If the return *sdp-id* is operationally up, Oper-Up is displayed. If the responding *sdp-id* is non-existent, N/A is displayed.	Oper-Up
		Oper-Down
		—
Responding SDP-ID Binding Admin State	The local administrative state of the responder's *sdp-id* binding to *service-id*. If an *sdp-id* is not bound to the service, N/A is displayed.	Admin-Up
		Admin-Down
		—
Responding SDP-ID Binding Oper State		Oper-Up

Field	Description	Values
	The local operational state of the responder's *sdp-id* binding to *service-id*. If an *sdp-id* is not bound to the service, N/A is displayed.	Oper-Down
		—
Originating VC-ID	The originator's VC-ID associated with the *sdp-id* to the far-end address that is bound to *service-id*. If the *sdp-id* signaling is off, *originator-vc-id* is 0. If the *originator-vc-id* does not exist, N/A is displayed.	*originator-vc-id*
		—
Responding VC-ID	The responder's VC-ID associated with the *sdp-id* to *originator-id* that is bound to *service-id*. If the *sdp-id* signaling is off or the service binding to *sdp-id* does not exist, *responder-vc-id* is 0. If a response is not received, N/A is displayed.	*responder-vc-id*
		—
Originating Egress Service Label	The originating service label (VC-Label) associated with the *service-id* for the originating *sdp-id*. If *service-id* does not exist locally, N/A is displayed. If *service-id* exists, but the egress service label has not been assigned, Non-Existent is displayed.	*egress-vc-label*
		—
		Non-Existent
Originating Egress Service Label Source	The originating egress service label source. If the displayed egress service label is manually defined, Manual is displayed. If the egress service label is dynamically signaled, Signaled is displayed. If the *service-id* does not exist or the egress service label is non-existent, N/A is displayed.	Manual
		Signaled
		—
Originating Egress Service Label State	The originating egress service label state. If the originating router considers the displayed egress service label operational, Up is displayed. If the originating router considers the egress service label inoperative, Down is displayed. If the *service-id* does not exist or the egress service label is non-existent, N/A is displayed.	Up
		Down
		—
Responding Service Label	The actual responding service label in use by the far-end router for this *service-id* to the originating router. If *service-id* does not exist in the remote router, N/A is displayed. If *service-id* does exist remotely but the remote egress service label has not been assigned, Non-Existent is displayed.	*rec-vc-label*
		—
		Non-Existent
Responding Egress Service Label Source	The responder's egress service label source. If the responder's egress service label is manually defined, Manual is displayed. If the responder's egress service label is dynamically signaled, Signaled is displayed. If the *service-id* does not exist on the responder or the responder's egress service label is non-existent, N/A is displayed.	Manual
		Signaled
		—

Field	Description	Values
	ingress service label operational, Up is displayed. If the remote router considers its ingress service label inoperative, Down is displayed. If the *service-id* does not exist on the remote router or the ingress service label has not been assigned on the remote router, N/A is displayed.	Down
		—

Parameters

ip-address

Specifies the far-end IP address to which to send the **svc-ping** request message in dotted decimal notation.

Values a.b.c.d

service-id

Specifies the service ID of the service being tested must be indicated with this parameter. The service ID need not exist on the local router to receive a reply message.

Values 1 to 2147483647, service-name: up to 64 characters

local-sdp

Specifies the **svc-ping** request message should be sent using the same service tunnel encapsulation labeling as service traffic. If **local-sdp** is specified, the command attempts to use an egress *sdp-id* bound to the service with the specified **far-end** IP address with the VC-Label for the service. The far-end address of the specified *sdp-id* is the expected *responder-id* within the reply received. The *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reach the far end; this can be IP/GRE or MPLS. On originator egress, the service-ID must have an associated VC-Label to reach the far-end address of the *sdp-id* and the *sdp-id* must be operational for the message to be sent.

If **local-sdp** is not specified, the **svc-ping** request message is sent with GRE encapsulation with the OAM label.

Table 175: Message Encapsulation indicates whether a message is sent and how the message is encapsulated based on the state of the service ID.

Table 175: Message Encapsulation

Local Service State	local-sdp Not Specified		local-sdp Specified	
	Message Sent	Message Encapsulation	Message Sent	Message Encapsulation
Invalid Local Service	Yes	Generic IP/GRE OAM (PLP)	No	None
No Valid SDP-ID Bound	Yes	Generic IP/GRE OAM (PLP)	No	None

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Local Service State	local-sdp Not Specified		local-sdp Specified	
	Message Sent	Message Encapsulation	Message Sent	Message Encapsulation
SDP-ID Valid But Down	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid and Up, But No Service Label	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid, Up and Egress Service Label	Yes	Generic IP/GRE OAM (PLP)	Yes	SDP Encapsulation with Egress Service Label (SLP)

remote-sdp

Specifies **svc-ping** reply message from the **far-end** should be sent using the same service tunnel encapsulation labeling as service traffic.

If **remote-sdp** is specified, the **far-end** responder attempts to use an egress *sdp-id* bound to the service with the message originator as the destination IP address with the VC-Label for the service. The *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reply to the originator; this can be IP/GRE or MPLS. On responder egress, the service-ID must have an associated VC-Label to reach the originator address of the *sdp-id* and the *sdp-id* must be operational for the message to be sent.

If **remote-sdp** is not specified, the **svc-ping** request message is sent with GRE encapsulation with the OAM label.

Table 176: Message Response Encapsulation indicates how the message response is encapsulated based on the state of the remote service ID.

Table 176: Message Response Encapsulation

Remote Service State	Message Encapsulation	
	remote-sdp Not Specified	remote-sdp Specified
Invalid Ingress Service Label	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
Invalid Service-ID	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
No Valid SDP-ID Bound on Service-ID	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid But Down	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, but No Service Label	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, Egress Service Label, but VC-ID Mismatch	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)

45.100 svlan-statistics

svlan-statistics

Syntax

svlan-statistics

Context

[Tree] (config>subscr-mgmt svlan-statistics)

Full Context

configure subscriber-mgmt svlan-statistics

Description

Commands in this context enable subscriber VLAN statistics collection.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

45.101 swap

swap

Syntax

swap {*out-label* | **implicit-null-label**} **nexthop** *ip-address*

no swap

Context

[Tree] (config>router>mpls>if>label-map swap)

Full Context

configure router mpls interface label-map swap

Description

This command swaps the incoming label and specifies the outgoing label and next hop IP address on an LSR for a static LSP.

The **no** form of this command removes the swap action associated with the *in-label*.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

implicit-null-label

Specifies the use of the implicit label value for the outgoing label of the swap operation.

out-label

Specifies the label value to be swapped with the in-label. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment
- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services
- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services
- label values 131,072 through 1,048,575 are reserved for future use

Values 16 to 1048575

nexthop *ip-address*

Specifies the IP address to forward to. If an ARP entry for the next hop exists, then the static LSP will be marked operational. If ARP entry does not exist, software will set the operational status of the static LSP to down and continue to ARP for the configured nexthop. Software will continuously try to ARP for the configured nexthop at a fixed interval.

45.102 sweep

sweep

Syntax

sweep start *dispersion-start* **end** *dispersion-end*

Context

[Tree] (config>port>dwdm>coherent sweep)

Full Context

configure port dwdm coherent sweep

Description

This command allows users to configure the dispersion sweep 'start' and 'end' values for the automatic mode of coherent control. If the user knows the approximate or theoretical residual dispersion of the link,

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

this command can be used to limit the range of sweeping for the automatic control mode and thus achieve faster link up.

Parameters

dispersion-start

Specifies the lower range limit for the dispersion compensation.

Values -50000 to 50000

Default -25500

dispersion-end

Specifies the upper range limit for the dispersion compensation.

Values -50000 to 50000

Default 2000

45.104 switchover-exec

switchover-exec

Syntax

switchover-exec *file-url*

no switchover-exec

Context

[Tree] (config>system switchover-exec)

Full Context

configure system switchover-exec

Description

This command specifies the location and name of the CLI script file executed following a redundancy switchover from the previously active CPM card. A switchover can happen because of a fatal failure or by manual action.

The CLI script file can contain commands for environment settings, classic CLI debug configuration (excluding mirroring settings), and other commands not maintained by the configuration redundancy.

The following commands are not supported in the switchover-exec file: clear, configure, candidate, oam, tools, oam, ping, traceroute, mstat, mtrace and mrinfo.

Default

no switch-over-exec

Parameters

file-url

Specifies the location and name of the CLI script file.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn*/][*file-path*]
	243 chars max
	directory length 99 chars max each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses

sync

Syntax

[**no**] **sync**

Context

[Tree] (config>isa>nat-group>inter-chassis-redundancy sync)

Full Context

configure isa nat-group inter-chassis-redundancy sync

Description

This command configures synchronization of NAT flows between the nodes.

The **no** form of this command disables synchronization of NAT flows that were enabled between the ISAs or ESAs across the nodes. This allows NAT reconfiguration on both nodes. The synchronization of flows must be disabled on both nodes, active and standby, while NAT configuration changes are performed. The active NAT node continues to forward traffic while flow synchronization is disabled.

- configure card mda sync-e

sync-e

Syntax

[**no**] **sync-e**

Context

[Tree] (config>system>satellite>eth-sat sync-e)

Full Context

configure system satellite eth-sat sync-e

Description

This command enables the Ethernet satellite for synchronous Ethernet operation so that the transmit timing of the satellite access ports use the frequency of the host router's central clock.

To enable this functionality, both host ports on the router that connect to the U1 and U2 ports of the satellite must be synchronous Ethernet-capable ports.

When the Ethernet satellite is configured for synchronous Ethernet, ESMC frames are enabled on the host ports. The SSM code-type used between the host and the satellite should be manually configured on the host ports to match the code-type desired on the satellite client ports. The code-type setting on the host ports does not restrict the code-type used on the satellite client ports, as those may be configured on an individual port basis.

45.112 synchronize

synchronize

Syntax

synchronize {**boot-env** | **config**}

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>redundancy synchronize)

Full Context

configure redundancy synchronize

Description

This command enables automatic synchronization of system files on the active CPM to the standby CPM.

The **no** form of the command disables synchronization.

Default

synchronize config

Parameters

boot-env

Synchronizes all files required for the boot process.

config

Synchronizes the configuration files.

Platforms

All

synchronize

Syntax

synchronize {**boot-env** | **cert** | **config**}

Context

[Tree] (admin>redundancy synchronize)

Full Context

admin redundancy synchronize

Description

This command manually synchronizes system files on the active CPM to the standby CPM. Either the **boot-env**, **cert** or **config** parameter must be specified.

Parameters

boot-env

Synchronize all files required for the boot process.

cert

Synchronize the PKI certificate files.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

config

Synchronize the configuration files.

Platforms

All

45.113 synchronous-execution

synchronous-execution

Syntax

synchronous-execution *seconds*

synchronous-execution never

Context

[Tree] (config>system>management-interface>ops>global-timeouts synchronous-execution)

Full Context

configure system management-interface operations global-timeouts synchronous-execution

Description

This command configures the period of time that operations launched as "'synchronous" (the default method for all operations) are allowed to execute before they are automatically stopped, and their associated data is deleted.

If a specific execution timeout is not included in the request for a particular synchronous operation, this system-level timeout applies.

Note:
This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own **timeout** parameter).

Caution:
This timeout also applies to operations requested in the MD-CLI interface (for example, ping, file dir, and so on). If **synchronous-execution** is enabled with a specific time value, MD-CLI operations are subject to this timeout and are interrupted if they execute longer than the configured **synchronous-execution** time.

Default

synchronous-execution never

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

seconds

Specifies the period of time, in seconds, that synchronous operations are allowed to execute.

Values 1 to 604800

never

Keyword to specify that an execution timeout is not applied to synchronous operations.

Platforms

All

45.114 syslog

syslog

Syntax

syslog script *name*

no syslog

Context

[Tree] (config>python>py-policy syslog)

Full Context

configure python python-policy syslog

Description

This command enables Python script to process syslog related messages and events.

The **no** form of this command disables the Python script to process syslog related messages and events.

Parameters

name

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

syslog

Syntax

syslog *syslog-id* [**name** *syslog-name*]

no syslog *syslog-id*

Context

[Tree] (config>service>vprn>log syslog)

Full Context

configure service vprn log syslog

Description

This command creates the context to configure a Syslog target host that is capable of receiving selected Syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 30 Syslog IDs can be configured.

No log events are sent to a Syslog target address until the syslog-id has been configured as the log destination (**to**) in the log-id node.

The Syslog ID configured in the **configure**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config>log**.

Default

No syslog IDs are defined.

Parameters

syslog-id

Specifies the Syslog ID for the Syslog destination.

Values 1 to 30

name syslog-name

Specifies an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>log syslog)

Full Context

configure log syslog

Description

Commands in this context configure a Syslog target host capable of receiving selected syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 10 Syslog IDs can be configured.

Log events are not sent to a Syslog target address until the *syslog-id* is configured as the log destination (**to**) in the node specified by the Log ID.

The Syslog ID configured in the **config**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config**>**log**.

The **no** form of this command removes the Syslog configuration.

Parameters

syslog-id

Specifies the Syslog ID for the Syslog destination.

Values 1 to 10

name syslog-name

Configures an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

system-base-mac

Syntax

system-base-mac *mac-address*

no system-base-mac

Context

[Tree] (bof system-base-mac)

Full Context

bof system-base-mac

Description

This command is used to specify the base MAC address for a VSR-based system. The specified MAC address is used as the first MAC address by the system to assign MAC addresses to individual interfaces.

It is strongly recommended that a unique base MAC address is assigned to each VSR instance with a minimum gap of 1024 between base addresses to avoid a MAC address overlap.

The **no** form of this command removes the configured system base MAC address.

Default

no system-base-mac

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

mac-address

Specifies the MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS-20, 7950 XRS-20e, VSR

system-id *isis-system-id*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no system-id

Context

[Tree] (config>service>vprn>isis system-id)

Full Context

configure service vprn isis system-id

Description

This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference order:

1. **config>service>vprn>isis>system-id**
2. **config>service>vprn>isis>router-id**
3. **config>service>vprn>router-id**
4. **config>service>vprn>if>address**
5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, a **shutdown** and then **no shutdown** must be performed on the IS-IS instance. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

Default

no system-id

Parameters

isis-system-id

12 hexadecimal characters in dotted-quad notation.

Values aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

Platforms

45.121 system-ip-load-balancing

system-ip-load-balancing

Syntax

[**no**] **system-ip-load-balancing**

Context

[Tree] (config>system>load-balancing system-ip-load-balancing)

Full Context

configure system load-balancing system-ip-load-balancing

Description

This command enables the use of the system IP address in the ECMP hash algorithm to add a per system variable. This can help guard against cases where multiple routers, in series, will end up hashing traffic to the same ECMP/LAG path.

This command is set at a system wide basis, however if certain IOMs do not support the new load-balancing algorithm, they will continue to use the default algorithm. By default, the IPv4 system IP address is used in the hash algorithm. When no IPv4 system IP address is configured, the IPv6 system IP address, when configured, is used in the hash algorithm.

The **no** form of the command resets the system wide algorithm to default.

Default

no system-ip-load-balancing

Platforms

Syntax

system-priority *value*

no system-priority

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ep system-priority)

Full Context

configure redundancy multi-chassis peer mc-endpoint system-priority

Description

This command allows the operator to set the system priority. The peer configured with the lowest value is chosen to be the master. If system-priority are equal then the one with the highest system-id (chassis MAC address) is chosen as the master.

The **no** form of this command sets the system priority to default.

Default

no system-priority

Parameters

value

Specifies the priority assigned to the local MC-EP peer.

Values 1 to 255

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

45.126 system-profile

system-profile

Syntax

system-profile {**profile-a** | **profile-b**}

no system-profile

Context

[Tree] (bof system-profile)

Full Context

bof system-profile

Description

This command configures the system profile in the BOF.

System profile none represents the existing system capabilities and allows hardware based on FP3 and later generations (for example, FP4, FP5) to co-exist within a system. This profile is indicated by the omission of the **system-profile** parameter in the BOF.

System profile **profile-a** is primarily targeted at subscriber services and layer 2 and 3 VPN business services.

System profile **profile-b** is primarily targeted at infrastructure routing, core, peering, and DC-GW applications.

System profiles **profile-a** and **profile-b** support only line cards based on FP4 and later generations (for example, FP5).

On 7750 SR-1 and 7750 SR-s systems, the following conditions apply about the profile parameter:

- The parameter should be configured to either **profile-a** or **profile-b**.
- If the parameter is omitted, profile **profile-a** is used by the system.
- If the parameter is configured to an invalid value, it is ignored and profile **profile-a** is used by the system.

On 7750 SR-7-B/12-B/12e and 7950 XRS-20/20e systems, the following conditions apply about the profile parameter:

- The default system profile is **none** when the parameter is omitted.
- The parameter can be configured to either **profile-a** or **profile-b**, in which case only FP4-based line cards are supported.
- If the parameter is configured to an invalid value, it is ignored and profile **none** is used by the system.

On all other systems, the following conditions apply about the profile parameter:

- These systems must use profile **none** (the existing system capabilities). As a result, the parameter must not be configured.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the parameter is configured to **profile-a** or **profile-b**, the system boots, allowing access using the console and CPM management interface, but FP2-based and FP3-based line cards cannot be provisioned; if these card types are present in the boot configuration, the boot sequence aborts loading the configuration file when it encounters their configuration. This issue can be corrected by removing the parameter and rebooting the system.
- If the parameter is configured to an invalid value, it is ignored and profile **none** is used by the system.

See "System profiles" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Basic System Configuration Guide* for more information.

The **no** form of this command removes the **system-profile** parameter from the BOF.

Parameters

profile-a

Specifies that the system profile is for subscriber services and Layer 2 and 3 VPN business services.

profile-b

Specifies that the system profile is primarily targeted at infrastructure routing, core, peering, and DC-GW applications.

45.127 system-reserve

system-reserve

Syntax

system-reserve *percent-of-buffers*

no system-reserve

Context

[Tree] (config>qos>hs-pool-policy system-reserve)

Full Context

configure qos hs-pool-policy system-reserve

Description

This command defines the amount of HSQ IOM buffers that is set aside for internal system use. By default, 5% of the total buffer space is reserved for system internal queues. The command is provided for the case where the reserved buffer space is either insufficient or excessive. Exercise care when modifying this value.

When the system reserve value is changed, all the provisioned port-class, mid-tier, and root pool sizes are reevaluated and possibly changed.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Use the **show hs-pools** *card-slot-number* **fp** *forwarding-plane* **egress** command to display the current buffer allocation and buffer usage conditions on an HSQ IOM.

The **no** form of the command reverts to the default system reserve value.

Default

system-reserve 5.0

Parameters

percent-of-buffers

Specifies the percentage of HS buffers that are reserved for internal system use. This parameter is required when executing the **system-reserve** command. The parameter accepts a percent value with two decimal places (100th of a percent).

Values 1.00 to 30.00

Full Context

configure service vpls proxy-nd table-size

configure service vpls proxy-arp table-size

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command adds a table-size limit per service. By default, the table-size limit is 250; it can be set up to 16k entries per service. A non-configurable implicit high watermark of 95% and low watermark of 90% exists, per service and per system. When those watermarks are reached, a syslog/trap is triggered. When the system/service limit is reached, entries for a specified IP can be replaced (a different MAC can be learned and added) but no new IP entries will be added, regardless of the type (Static, evpn, dynamic). If the user attempts to change the **table-size** value to a value that cannot accommodate the number of existing entries, the attempt will fail.

Default

table-size 250

Parameters

table-size

Specifies the table-size as number of entries for the service.

Values 1 to 16384

Context

[Tree] (config>system>security tacplus)

Full Context

configure system security tacplus

Description

Commands in this context configure TACACS+ at the system level.

Configure multiple server addresses for each router for redundancy.

The **no** form of this command removes the TACACS+ configuration.

Platforms

All

46.7 tacplus-map-to-priv-lvl

tacplus-map-to-priv-lvl

Syntax

tacplus-map-to-priv-lvl [*admin-priv-lvl*]

no tacplus-map-to-priv-lvl

Context

[Tree] (config>system>security>password>enable-admin-control tacplus-map-to-priv-lvl)

Full Context

configure system security password enable-admin-control tacplus-map-to-priv-lvl

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

When **tacplus-map-to-priv-lvl** is enabled, and tacplus authorization is enabled with the *use-priv-lvl* option, typing **enable-admin** starts an interactive authentication exchange from the node to the TACACS+ server. The start message (service=enable) contains the user-id and the requested *admin-priv-lvl*. Successful authentication results in the use of a new profile (as configured under **config>system>security>tacplus>priv-lvl-map**).

Platforms

All

46.8 tag

tag

Syntax

tag *tag*

no tag [*tag*]

Context

[Tree] (config>service>vprn>static-route-entry tag)

Full Context

configure service vprn static-route-entry tag

Description

This command associates a 4-byte route-tag with the static route. The tag value can be used in route policies to control distribution of the static route into other protocols.

The tag specified at this level of the static route causes tag values configured under the next-hop, black-hole, and indirect contexts of the static route to be ignored.

The **no** form of this command removes the tag association.

Default

no tag

Parameters

tag

Specifies an integer value.

Values 1 to 4294967295

Platforms

All

[Tree] (config>service>vprn>static-route-entry>indirect tag)

[Tree] (config>service>vprn>static-route-entry>ipsec-tunnel tag)

Full Context

configure service vprn static-route-entry next-hop tag

configure service vprn static-route-entry indirect tag

configure service vprn static-route-entry ipsec-tunnel tag

Description

This command adds a 32-bit integer tag to the associated static route.

The tag value can be used in route policies to control distribution of the route into other protocols.

Default

no tag

Parameters

tag-value

Specifies an integer tag value.

Values 32 bit integer
