no tag

Context

[Tree] (config>router>policy-options>policy-statement>entry>from tag)

Full Context

configure router policy-options policy-statement entry from tag

Description

This command matches the tag value in static or IGP routes. A decimal or hexadecimal value of 4 octets can be entered. For IS-IS, OSPF, and static routes, all four octets can be used. For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag field match criterion.

Default

no tag

Parameters

tag

Matches the configured tag value.

Values Accepts decimal or hexadecimal formats:

- IS-IS, OSPF and static routes: 0x0 – 0xFFFFFFFF or 1 – 4294967295
- RIP and RIPng: 0x0 – 0xFFFF or 1 – 65535

no-tag

Specifies that no tag value is set.

Platforms

All

tag

Syntax

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router policy-options policy-statement entry action tag

configure router policy-options policy-statement default-action tag

Description

This command assigns a tag to routes matching the entry, which is then applied to IGP routes. A decimal or hexadecimal value of 4 octets can be entered.

For IS-IS and OSPF, all four octets can be used.

For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag.

Default

no tag

Parameters

tag

Assigns an IS-IS, OSPF, RIP or RIPng tag to routes matching the entry.

Values Accepts decimal or hexadecimal formats:

IS-IS and OSPF: 0x0–0xFFFFFFFF or 1–4294967295

RIP and RIPng: 0x0–0xFFFF or 1–65535

name — The tag parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

configure qos sap-ingress ipv6-criteria entry tag

Description

This command associates a tag with the criteria entry.

Tag identifiers are not supported in SAP ingress QoS policies, MAC criteria statements, or in SAP egress QoS policies.

The **no** form of this command removes the tag.

Parameters

tag-id

Specifies the tag ID.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>service>cpipe>spoke-sdp>pw-path-id taii-type2)

Full Context

configure service vpls spoke-sdp pw-path-id taii-type2

configure service epipe spoke-sdp pw-path-id taii-type2

configure service cpipe spoke-sdp pw-path-id taii-type2

Description

This command configures the Target Individual Attachment Identifier (TAII) for an MPLS-TP spoke SDP. If this is configured on a spoke SDP for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the saii-type2 of the mate spoke SDP.

Parameters

global-id

Specifies the global ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values 0 to 4294967295

node-id

Specifies the node ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values a.b.c.d or 0 to 4294967295

ac-id

Specifies the attachment circuit ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

taii-type2

Syntax

taii-type2 *global-id:prefix:ac-id*

no taii-type2

Context

[Tree] (config>service>epipe>spoke-sdp-fec taii-type2)

Full Context

configure service epipe spoke-sdp-fec taii-type2

Description

taii-type2 configures the target attachment individual identifier for the SDP SDP. This is only applicable to FEC129 AII type 2.

This command is blocked in CLI if this end of the spoke SDP is configured for single-sided auto configuration (using the **auto-config** command).

Parameters

global-id

Specifies a global ID of this router T-PE. This value must correspond to one of the global_id values configured for a local-prefix under **config>service>pw-routing>local-prefix** context.

Values 1 to 4294967295

prefix

Speecifies prefix on this router T-PE that the spoke SDP SDP is associated with. This value must correspond to one of the prefixes configured under **config>service>pw-routing>local-prefix** context.

Values an IPv4-formatted address a.b.c.d or 1 to 4294967295

ac-id

Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

Platforms

All

© 2026 Nokia.

configure system grpc-tunnel tunnel handler target-type

Description

This command assigns a server as a handler for all tunnel sessions.

The **no** form of this command disables the tunnel handler server.

Default

no target-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

grpc-server

Keyword that assigns the gRPC server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "GNMI_GNOI”.

ssh-server

Keyword that assigns the SSH server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "SSH”.

custom-type

Keyword that assigns an arbitrary string as the target type.

type

Specifies a string, up to 255 characters, defining the client to serve as a handler for all tunnel sessions. Values used by gRPC tunnel protocol, such as "GNMI_GNOI” or "SSH” can also be used.

Platforms

All

46.16 targeted-session

targeted-session

Syntax

targeted-session

Context

[Tree] (config>router>ldp targeted-session)

Full Context

configure router ldp targeted-session

Description

This command configures targeted LDP sessions. Targeted sessions are LDP sessions between non-directly connected peers. Hello messages are sent directly to the peer platform instead of to all the routers on this subnet multicast address. The user can configure different default parameters for IPv4 and IPv6 LDP targeted hello adjacencies.

The discovery messages for an indirect LDP session are addressed to the specified peer and not to the multicast address.

Keyword used to specify detailed information about PCE or connection task events.

Platforms

VSR-NRC

46.18 task-scheduling-int

task-scheduling-int

Syntax

task-scheduling-int *percent-of-default*

no task-scheduling-int

Context

[Tree] (config>card>virt-sched-adj task-scheduling-int)

Full Context

configure card virtual-scheduler-adjustment task-scheduling-int

Description

This command overrides the system default time between scheduling the hierarchical virtual scheduling task. By default, the system "wakes” the virtual scheduler task every 50ms; this is equivalent to five 10ms timer ticks. The task-scheduling-int command uses a percent value parameter to modify the number of timer ticks.

While the system accepts a wide range of percent values, the result is rounded to the nearest 10ms tick value. The fastest wake interval is 10ms (1 timer tick).

The **no** form of this command restores the default task scheduling interval of the card’s hierarchical virtual scheduler task.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

percent-of-default:

Specifies that the percent-of-default parameter is required and is used to modify the default task scheduling interval for the hierarchical virtual scheduling task on the card. Defining 100.00 percent is equivalent to removing the override.

Values 0.01% to 1000.00%

Default 100.00%

[Tree] (cfg>sys>sec>cpm>ip-filter>entry>match tcp-ack)

Full Context

configure system security cpm-filter ipv6-filter entry match tcp-ack

configure system security cpm-filter ip-filter entry match tcp-ack

Description

This command configures matching on the ACK bit being set or reset in the control bits of the TCP header of an IP or IPv6 packet as an IP filter match criterion.

Note:
An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the criterion from the match entry.

Default

no tcp-ack

Parameters

true

Specifies matching on IP or IPv6 packets that have the ACK bit set in the control bits of the TCP header of an IP or IPv6 packet.

false

Specifies matching on IP or IPv6 packets that do not have the ACK bit set in the control bits of the TCP header of the IP or IPv6 packet.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

46.23 tcp-cwr

tcp-cwr

Syntax

tcp-cwr {**true** | **false**}

no tcp-cwr

Context

[Tree] (config>filter>ip-filter>entry>match tcp-cwr)

[Tree] (config>filter>ipv6-filter>entry>match tcp-cwr)

Full Context

configure filter ip-filter entry match tcp-cwr

configure filter ipv6-filter entry match tcp-cwr

Description

This command configures an IP filter match criterion based on the Congestion Window Reduced (CWR) TCP Flag bit, defined in RFC 3168, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-cwr

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

© 2026 Nokia.

tcp-ece

Syntax

tcp-ece {**true** | **false**}

no tcp-ece

Context

[Tree] (config>filter>ipv6-filter>entry>match tcp-ece)

[Tree] (config>filter>ip-filter>entry>match tcp-ece)

Full Context

configure filter ipv6-filter entry match tcp-ece

configure filter ip-filter entry match tcp-ece

Description

This command configures an IP filter match criterion based on the ECN-Echo (ECE) TCP Flag bit, defined in RFC 3168, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-ece

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

Description

This command configures an IP filter match criterion based on the FIN TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-fin

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

46.27 tcp-keepalive

tcp-keepalive

Syntax

tcp-keepalive

Context

[Tree] (config>system>grpc tcp-keepalive)

Full Context

configure system grpc tcp-keepalive

Description

Commands in this context configure the sending of TCP keepalives by the router towards all gRPC clients.

Enabling TCP keepalive speeds up the detection of certain failures. The TCP keepalives sent by the router are controlled by three commands: **idle-time**, **interval**, and **retries**. The router starts sending TCP keepalives when the connection has been idle (no TCP segments sent or received) for more than **idle-time** seconds. At that point, the router sends a probe (TCP ACK with a sequence number = current sequence number - 1) and expects a TCP ACK. It repeats this probe every **interval** seconds for the configured number of **retries**. If no response is received to any of the probes, the connection is immediately closed, which starts the purge timer if the TCP connection is currently supporting the RibApi service.

configure service ies interface ipv6 tcp-mss

configure service ies interface tcp-mss

Description

This command statically sets the TCP maximum segment size (MSS) for TCP connections originated from the associated IP interface to the specified value.

The **no** form of this command removes the static value and allows the TCP MSS value to be calculated based on the IP MTU value by subtracting the base IP and TCP header lengths from the IP MTU value (tcp_mss = ip_mtu – 40).

Default

no tcp-mss

Parameters

mss-value

The TCP MSS value that should be used in the TCP SYN packet during the three-way handshake negotiation of a TCP connection.

Note: 9158 = max-IP_MTU (9198)-40

Values 536 to 9746 (IPv4) 1220 to 9726 (IPv6)

Context

[Tree] (config>router>bgp tcp-mss)

[Tree] (config>service>vprn>bgp tcp-mss)

Full Context

configure router bgp tcp-mss

configure service vprn bgp tcp-mss

Description

This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

Default

no tcp-mss

Parameters

mss-value

Specifies the The router uses the TCP SYN to advertise the TCP MSS option value towards its peer. MSS value, in bytes, to use with the peers that fall within the scope of the command.

Values 384 to 9746

Platforms

All

tcp-mss

configure service vprn bgp group tcp-mss

Description

This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

Default

no tcp-mss

Parameters

mss-value

Specifies the TCP MSS value, in bytes, to use with the peers that fall within the scope of the command.

Values 384 to 9746

ip-stack

This keyword requests that TCP MSS be derived from mechanisms and configurations outside of BGP, including the configuration of **tcp-mss** at the IP interface level. It provides a method to override inheritance within the BGP configuration.

Full Context

configure service ies subscriber-interface group-interface wlan-gw tcp-mss-adjust

configure service vprn subscriber-interface group-interface wlan-gw tcp-mss-adjust

Description

This command configures the TCP Maximum Segment Size (MSS) adjustment for the wlan-gw gateway.

The **no** form of this command disables adjusting tcp-mss values.

For DSM, this only applies to packets sent in the downstream direction (TCP SYN towards UE). For the upstream direction, it is also required to configure MSS adjust under the applicable NAT-policy.

Parameters

segment-size

Specifies the value to put into the TCP Maximum Segment Size (MSS) option if not already present, or if the present value is higher.

Values 160 to 10240

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-mss-adjust

Syntax

tcp-mss-adjust *segment-size*

no tcp-mss-adjust

Context

[Tree] (config>service>nat>map-domain tcp-mss-adjust)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service nat map-domain tcp-mss-adjust

Description

This command enables the TCP maximum segment size (MSS) adjustments in a MAP domain. The TCP SYN and SYN-ACK packets are intercepted in both directions, and if their MSS value is larger than the one configured using this command, the MSS value in the packet is re-written (lowered) to the configured value. The end hosts use the lowest setting of the two hosts. The MSS value does not account for the IP or TCP header length.

If the MSS value in the SYN or SYN-ACK is not found, a new value is added and set to the configured value.

Default

no tcp-mss-adjust

Parameters

segment-size

Specifies the maximum size of the segment.

Values 160 to 8626

Platforms

7750 SR-1, 7750 SR-s, VSR

Full Context

configure filter ipv6-filter entry match tcp-ns

configure filter ip-filter entry match tcp-ns

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures an IP filter match criterion based on the Nonce Sum (NS) TCP Flag bit, defined in RFC 3540, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-ns

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

46.31 tcp-optimizer

tcp-optimizer

Syntax

tcp-optimizer *tcp-optimizer-name [***create***]*

no tcp-optimizer *tcp-optimizer-name*

Context

[Tree] (config>app-assure>group tcp-optimizer)

Full Context

configure application-assurance group tcp-optimizer

Description

This command configures the TCP optimizer policy. When a TCP optimizer policy is removed or deleted, the existing flows using this policy are abandoned, and optimization is stopped. If, however, the TCP optimizer action is removed from a session-filter entry (in the **config>app-assure>group>sess-fltr>entry action** context), the existing flows are not affected.

The **no** form of this command removes the specified TCP optimizer policy.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

tcp-optimizer-name

Specifies the name of the TCP optimizer policy, up to 32characters.

create

This keyword is mandatory when creating a TCP optimizer policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>filter>ip-filter>entry>match tcp-syn)

Full Context

configure filter ipv6-filter entry match tcp-syn

configure filter ip-filter entry match tcp-syn

Description

This command configures an IP filter match criterion based on the Synchronize (SYN) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-syn

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

tcp-syn

Syntax

tcp-syn {**true** | **false**}

no tcp-syn

Context

[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match tcp-syn)

[Tree] (cfg>sys>sec>cpm>ip-filter>entry>match tcp-syn)

Full Context

configure system security cpm-filter ipv6-filter entry match tcp-syn

configure system security cpm-filter ip-filter entry match tcp-syn

Description

This command configures matching on the SYN bit being set or reset in the control bits of the TCP header of an IP or IPv6 packet as an IP filter match criterion.

Note:
An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The SYN bit is normally set when the source of the packet wants to initiate a TCP session with the specified destination IP or IPv6 address.

The **no** form of this command removes the criterion from the match entry.

Default

no tcp-syn

Parameters

true

Specifies matching on IP or IPv6 packets that have the SYN bit set in the control bits of the TCP header.

false

Specifies matching on IP or IPv6 packets that do not have the SYN bit set in the control bits of the TCP header.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

no tcp-validate

Context

[Tree] (config>app-assure>group>policy>aqp>entry>action tcp-validate)

Full Context

configure application-assurance group policy app-qos-policy entry action tcp-validate

Description

This command assigns an existing TCP validation policy as an action on flows matching this AQP entry.

tcp-validate can only be called from AQP entries that:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- have no matching conditions that relate to information extracted from the incoming IP packets; for example, no application or IP address.
- allow the following match conditions:
  - none
  - aa-sub
  - characteristic
  - traffic-direction (both only)

    traffic-direction cannot be unidirectional (from or to sub). It can either be set to both or left unspecified.

The **no** form of this command removes the TCP validation policy action from flows matching this AQP entry.

Default

no tcp-validate

Parameters

tcp-validate-name

Specifies the name of the TCP validation policy for this application assurance profile. The TCP validation policy is configured using the **config**>**app-assure**>**group**>**tcp-validate** *tcp-validate-name* command.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

46.45 tdm

tdm

Syntax

tdm

Context

[Tree] (config>port tdm)

Full Context

configure port tdm

Description

Commands in this context configure DS-1/E-1 and DS-3/E-3 parameters for a port on a channelized MDA T1/E1. This context cannot be accessed on non-channelized MDAs.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

TDM is a mechanism to divide the bandwidth of a stream into separate channels or time slots by assigning each stream a different time slot in a set. TDM repeatedly transmits a fixed sequence of time slots over a single transmission channel. Each individual data stream is reassembled at the receiving end based on the timing.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

Context

[Tree] (config>router>rsvp>diffserv-te te-class)

Full Context

configure router rsvp diffserv-te te-class

Description

This command configures a TE class. A TE class is defined as:

TE Class = {Class Type (CT), LSP priority}

Eight TE classes are supported. There is no default TE class once Diff-Serv is enabled. The user has to explicitly define each TE class.

When Diff-Serv is disabled, there will be an internal use of the default CT (CT0) and eight pre-emption priorities as shown in Table 177: Default Class Type.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 177: Default Class Type

Class Type (CT internal)	LSP Priority
0	7
0	6
0	5
0	4
0	3
0	2
0	1
0	0

The **no** form of this command deletes the TE class.

Parameters

te-class *te-class-number*

Specifies the TE class number.

Values 0 to 7

class-type *ct-number*

Specifies the Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

Values 0 to 7

priority *priority*

Specifies the LSP priority.

Values 0 to 7

Full Context

configure router rsvp te-down-threshold

configure router rsvp interface te-down-threshold

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the specific threshold levels per node and per interface. Threshold levels are for reserved bandwidth per interface. The **te-threshold-update** command is used to enable or disable threshold-based IGP TE updates. Any reserved bandwidth change per interface is compared with all the threshold levels and trigger an IGP TE update if a defined threshold level is crossed in either direction (LSP setup or teardown). Threshold-based updates must be supported with both ISIS and OSPF. A minimum of one and a maximum of 16 threshold levels is supported.

Threshold levels configured per node is inherited by all configured RSVP interfaces. Threshold levels defined under the RSVP interface is used to trigger IGP updates if non-default threshold levels are configured.

The **no** form of this command resets te-down-threshold to its default value.

Default

no te-down-threshold (equals following values 100 99 98 97 96 95 90 85 80 75 60 45 30 15 0)

Parameters

threshold-level

Specifies the threshold level.

Values 0 to 100

Platforms

All

46.50 te-metric

te-metric

Syntax

te-metric *value*

no te-metric

Context

[Tree] (config>router>mpls>interface te-metric)

Full Context

configure router mpls interface te-metric

Description

This command configures the TE metric used on the interface. This metric is in addition to the interface metric used by IGP for the shortest path computation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This metric is flooded as part of the TE parameters for the interface using an opaque LSA or an LSP. The IS-IS TE metric is encoded as sub-TLV 18 as part of the extended IS reachability TLV. The metric value is encoded as a 24-bit unsigned integer. The OSPF TE metric is encoded as a sub-TLV Type 5 in the Link TLV. The metric value is encoded as a 32-bit unsigned integer.

When the use of the TE metric is enabled for an LSP, CSPF will first prune all links in the network topology which do not meet the constraints specified for the LSP path. Such constraints include bandwidth, admin-groups, and hop limit. Then, CSPF will run an SPF on the remaining links. The shortest path among the all SPF paths will be selected based on the TE metric instead of the IGP metric which is used by default.

The TE metric in CSPF LSP path computation can be configured by entering the command **config>router>mpls>lsp>metric-type te**.

Note that the TE metric is only used in CSPF computations for MPLS paths and not in the regular SPF computation for IP reachability.

The **no** form of this command reverts to the default value.

Default

no te-metric

The value of the IGP metric is advertised in the TE metric sub-TLV by IS-IS and OSPF.

Parameters

value

Specifies the metric value.

Values 1 to 16777215

admin satellite eth-sat tech-support

admin tech-support

Description

This command generates technical support information and saves it to a file for analysis by Nokia technical support. If the *file-url* parameter is omitted and a directory is configured with the **configure system security tech-support ts-location** command, the technical support filename is generated in the ts-NAME.YYYYMMDD.HHMMUTC.suffix format.

- NAME: the system name with special characters encoded using URL encoding (for example, a "." is encoded as "%2e")
- YYYYMMDD: the date, with leading zeros in each field
- HHMM: the time in hours and minutes in the UTC time zone in 24-hour format, with leading zeros in each field
- .suffix: ".txt.gz" for state and diagnostic files, or ".dat" for extensive files

Several levels of technical support information can be saved in cleartext or encrypted format.

Parameters

file-url

Specifies the file URL location used to save the technical support file.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn*/][*file-path*]
	199 chars max
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

output-level

Specifies the type of information saved in the generated technical support file.

Values diagnostic – saves cleartext state and encrypted diagnostic information
extensive – saves encrypted state and diagnostic information
state – saves cleartext state information

Default extensive

telnet {*ip-address* | *dns-name*} [*port*] **service-name** *service-name* [**source** *ip-address*]

telnet {*ip-address* | *dns-name*} [*port*] [**router** *router-instance*] [**source** *ip-address*]

Context

[Tree] (telnet)

Full Context

telnet

Description

This command opens a Telnet session to a remote host. In 7450 ESS, 7750 SR, 7950 XRS, and VSR networks, the Telnet servers limit Telnet clients to three login attempts; if unsuccessful, the Telnet client session is disconnected. The number is not user configurable.

If a source address is specified, it is used for the source IP address in the originated IP packets for the Telnet session.

Parameters

ip-address

Specifies the IP address or the DNS name (if DNS name resolution is configured).

Values

ipv4-address	*a.b.c.d*	
ipv6-address	*x:x:x:x:x:x:x:x*[-interface]	*x*: [0 to FFFF]H
	x:x:x:x:x:x:d.d.d.d[-interface]	*d*: [0 to 255]D *ipv6-address*
		interface: up to 32 characters, mandatory for link local addresses
dns-name	up to 128 characters	

Note:
IPv6 applies to the 7750 SR and 7950 XRS.

dns-name

Specifies the DNS name (if DNS name resolution is configured), up to 128 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port

Specifies the TCP port number to use Telnet to the remote host, expressed as a decimal integer.

Values 1 to 65535

Default 23

router-instance

Specifies the router name or service ID used to identify the router instance.

Values

router-instance: *router-name* or *vprn-svc-id*

router-name	"Base", "management", vpls-management"
vprn-svc-id	1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

source ip-address

Specifies the source IP address to use as the source of the Telnet packets.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]

configure service ies interface ipv6 vrrp telnet-reply

Description

This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Proper login and CLI command authentication is still enforced.

When telnet-reply is not enabled, TCP port 23 Telnet packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the telnet-reply configuration.

The **telnet-reply** command is only available in non-owner VRRP nodal context. If the telnet-reply command is not executed, Telnet packets to the virtual router instance IP addresses will be silently discarded.

The **no** form of this command restores the default operation of discarding all Telnet packets destined to the non-owner virtual router instance IP addresses.

configure router interface ipv6 vrrp telnet-reply

configure router interface vrrp telnet-reply

Description

This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances' IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

This limitation can be disregarded for certain applications. Ping, SSH and Telnet can each be individually enabled or disabled on a per-virtual-router-instance basis.

The **telnet-reply** command enables the non-owner master to reply to Telnet requests directed at the virtual router instances' IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Correct login and CLI command authentication is still enforced.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When **telnet-reply** is not enabled, Telnet requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the **telnet-reply** setting.

The **telnet-reply** command is only available in non-owner **vrrp** nodal context.

By default, Telnet requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of the command configures discarding all Telnet request messages destined to the non-owner virtual router instance IP addresses.

Default

no telnet-reply — Telnet requests to the virtual router instance IP addresses are discarded.

configure service vpls temp-flooding

configure service template vpls-template temp-flooding

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

The temporary flooding is designed to minimize failover times by eliminating the time it takes to flush the MAC tables and if MVRP is enabled the time it takes for MVRP registration. Temporary flooding is initiated only upon xSTP TCN reception. During this procedure while the MAC flush takes place the frames received on one of the VPLS SAPs/pseudowires are flooded in a VPLS context which for MVRP case includes also the unregistered MVRP trunk ports. The MAC Flush action is initiated by the STP TCN reception or if MVRP is enabled for the data VPLS, by the reception of a MVRP New message for the SVLAN ID associated with the data VPLS. As soon as the MAC Flush is done, regardless of whether the temp-flooding timer expired or not, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. This command provides a flood-time value that configures a fixed amount of time, in seconds, during which all traffic is flooded (BUM or known unicast) as a safety mechanism. Once the flood-time expires, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. The temporary flooding timer should be configured in such a way to allow auxiliary processes like MAC Flush, MMRP and/or MVRP to complete/converge. The temporary flooding behavior applies to regular VPLS, VPLS instantiated with VPLS-template, IVPLS and BVPLS when MMRP is disabled.

The **no** form of this command disables the temporary flooding behavior.

Default

no temp-flooding

Parameters

flood-time

Specifies the flood time, in seconds

configure application-assurance group http-error-redirect template

Description

This command refers to the template of parameters passed from the AA-ISA to the redirect server via JavaScript in the redirect packet. The template is specific to the redirect server being used in the network.

Currently, two partners are used and tested with AA-ISA redirect solution, Barefruit and Xerocole.

The **no** form of this command reverts to the default.

Parameters

template-id

Specifies an HTTP error redirect template.

1 = Barefruit specific template

2 = xerocole specific template.

Values 0 to 4294967295

Platforms

configure router route-next-hop-policy template

Description

This command creates a template to configure the attributes of a Loop-Free Alternate (LFA) Shortest Path First (SPF) policy. An LFA SPF policy allows the user to apply specific criteria, such as admin group and

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

SRLG constraints, to the selection of an LFA backup next-hop for a subset of prefixes that resolve to a specific primary next-hop.

The user first creates a route next-hop policy template under the global router context and then applies it to a specific OSPF or IS-IS interface in the global routing instance or in a VPRN instance.

A policy template can be used in both IS-IS and OSPF to apply the specific criteria to prefixes protected by LFA. Each instance of IS-IS or OSPF can apply the same policy template to one or more interface.

The commands within the route next-hop policy template use the **begin-commit-abort** model. The following are the steps to create and modify the template:

To create a template, the user enters the name of the new template directly under the route-next-hop-policy context.

1. To delete a template that is not in use, the user enters the **no** form for the template name under the route-next-hop-policy context.
2. The user enters the editing mode by executing the begin command under the route-next-hop-policy context. The user can then edit and change any number of route next-hop policy templates. However, the parameter value will still be stored temporarily in the template module until the commit is executed under the route-next-hop-policy context. Any temporary parameter changes will be lost if the user enters the abort command before the commit command.
3. The user is allowed to create or delete a template instantly once in the editing mode without the need to enter the commit command. Furthermore, the abort command, if entered, will have no effect on the prior deletion or creation of a template.

Once the commit command is issued, IS-IS or OSPF will re-evaluate the templates and if there are any net changes, it will schedule a new LFA SPF to re-compute the LFA next-hop for the prefixes associated with these templates.

no template-format

Context

[Tree] (config>service>ipfix>ipfix-export-policy template-format)

Full Context

configure service ipfix ipfix-export-policy template-format

Description

This command selects one of two template formats that contains a set of element IDs and their interpretation in IPFIX NAT flow logging. The difference between the two formats is related to the fields conveying information about the translated source IP addresses and ports (outside IP addresses and ports). Further, format 1 conveys information about the translated source port (post NAT) in the sourceTransportPort information element while format 2 conveys this information in the postNAPTsourceTrasportPort element.

Further, format1 conveys information about the translated source port (post NAT) in the information element sourceTransportPort while a new information element postNAPTsourceTrasportPort is introduced in format2 to carry this information.

For more information about template formats, refer to "Template Formats” in the *7450 ESS, 7750 SR, and VSR Multiservice Integrated Service Adapter and Extended Services Appliance Guide*, where the table lists supported information elements and their description for each format.

The **no** form of the command reverts to the default value.

Default

template-format format1

Parameters

format1

Specifies that template format 1 is used by the IPFIX collectors associated with this IPFIX Export policy.

format2

Specifies that template format 2 is used by the IPFIX collectors associated with this IPFIX Export policy.

configure cflowd collector template-set

Description

This command specifies the set of templates sent to the collector when using cflowd Version 9 or Version 10.

Default

template-set basic

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

basic

Specifies that basic flow data is sent.

mpls-ip

Specifies that extended flow data is sent that includes IP and MPLS flow information.

If the sampled traffic is part of a locally configured service or IPv4 or IPv6 traffic is being forwarded with an MPLS shortcut, then the MPLS labels associated with that service encapsulation are included in the extended flow data for both network ingress and egress sampling.

l2-ip

Specifies that extended flow data is sent that includes Layer 2 (Ethernet) and IP flow information. This template is only applicable for V10 (IPFIX) collectors.

mpls-transport

Specifies that cflowd can collect flow statistics for MPLS traffic using only the outer transport label, EXP bit value, and ingress interface as the flow identifier. This template enables the collection of flow statistics on a core router to develop LSP usage statistics.

tertiary-dns

Syntax

tertiary-dns *ip-address*

no tertiary-dns

Context

[Tree] (config>service>vprn>dns tertiary-dns)

Full Context

configure service vprn dns tertiary-dns

Description

This command configures the tertiary DNS server for DNS name resolution. The tertiary DNS server is used only if the primary DNS server and the secondary DNS server do not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the tertiary DNS server from the configuration.

Default

no tertiary-dns — No tertiary DNS server is configured.

Parameters

ip-address

The IP or IPv6 address of the tertiary DNS server.

Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x[-interface]

x:x:x:x:x:x:d.d.d.d[-interface]

Platforms

All

tertiary-dns

Syntax

tertiary-dns *ip-address*

no tertiary-dns [*ip-address*]

Context

[Tree] (bof tertiary-dns)

Full Context

bof tertiary-dns

Description

This command configures the tertiary DNS server for DNS name resolution. The tertiary DNS server is used only if the primary DNS server and the secondary DNS server do not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the tertiary DNS server from the configuration.

Default

no tertiary-dns

Parameters

ip-address

Specifies the IP or IPv6 address of the tertiary DNS server.

Values

ipv4-address	a.b.c.d
ipv6-address	*x:x:x:x:x:x:x:x*[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H

		d: [0 to 255]D
	interface	32 chars max, for link local addresses

Note:
IPv6 is applicable to the 7750 SR and 7950 XRS only.

Platforms

All

46.77 tertiary-image

tertiary-image

Syntax

tertiary-image *file-url*

no tertiary-image

Context

[Tree] (bof tertiary-image)

Full Context

bof tertiary-image

Description

This command specifies the tertiary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (*.tim files) must be located in the same directory.

The **no** form of this command removes the **tertiary-image** configuration.

Parameters

file-url

Specifies the file URL; can be either local (this CPM) or a remote FTP server.

Values

file-url	{*local-url* | *remote-url*} (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]
remote-url	[{ftp://| tftp://} *login:pswd@remote-locn*/][*file-path*]

no tertiary-ip-address

Context

[Tree] (config>router>bgp>orr>location tertiary-ip-address)

Full Context

configure router bgp optimal-route-reflection location tertiary-ip-address

Description

This command specifies the tertiary IP address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable to find a node in its topology database that matches the primary address, then the TE DB tries to find a node with the matching secondary address. If this attempt also fails, the TE DB then tries to find a node with the matching tertiary address.

The IP addresses specified for a location should be topologically "close" to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IP address information.

Default

no tertiary-ip-address

Parameters

ipv4-address

Specifies the tertiary IPv4 address of a location, expressed in dotted decimal notation.

Values a.b.c.d

no tertiary-ipv6-address

Context

[Tree] (config>router>bgp>orr>location tertiary-ipv6-address)

Full Context

configure router bgp optimal-route-reflection location tertiary-ipv6-address

Description

This command specifies the tertiary IPv6 address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable find a node in its topology database that matches a primary address of the location, then it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address.

The IP addresses specified for a location should be topologically "close" to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IPv6 address information.

Default

no tertiary-ipv6-address

Parameters

ipv6-address

Specifies the tertiary IPv6 address of a location.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H

configure service vprn bgp third-party-nexthop

configure service vprn bgp group neighbor third-party-nexthop

configure service vprn bgp group third-party-nexthop

Description

Use this command to enable the router to send third-party next-hop to EBGP peers in the same subnet as the source peer, as described in RFC 4271. If enabled when an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next-hop is left unchanged. Third-party next-hop is not done if the address family of the transport does not match the address family of the route.

The **no** form of this command prevents BGP from performing any third party next-hop processing toward any single-hop EBGP peers within the scope of the command. No third-party next-hop means the next-hop will always carry the IP address of the interface used to establish the TCP connection to the peer.

[Tree] (config>router>bgp>group>neighbor third-party-nexthop)

Full Context

configure router bgp third-party-nexthop

configure router bgp group neighbor third-party-nexthop

Description

Use this command to enable the router to send third-party next-hop to EBGP peers in the same subnet as the source peer, as described in RFC 4271. If enabled when an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next-hop is left unchanged. Third-party next-hop is not done if the address family of the transport does not match the address family of the route.

The **no** form of this command prevents BGP from performing any third party next-hop processing toward any single-hop EBGP peers within the scope of the command. No third-party next-hop means the next-hop will always carry the IP address of the interface used to establish the TCP connection to the peer.

46.100 throttle-rate

throttle-rate

Syntax

throttle-rate *events* [**interval** *seconds*]

no throttle-rate

Context

[Tree] (config>log throttle-rate)

Full Context

configure log throttle-rate

Description

This command configures the number of events and interval length to be applied to all event types that have throttling enabled by the **event-control** command and do not have a **specific-throttle-rate** configured.

The **no** form of this command reverts to the default values.

Default

throttle-rate 2000 interval 1

Parameters

events

Specifies the number of log events that can be logged within the specified interval for a specific event. Once the limit has been reached, any additional events of that type will be dropped, for example, the event drop count will be incremented. At the end of the throttle interval if any events have been dropped a trap notification will be sent.

Values 1 to 20000

Default 2000

seconds

Specifies the number of seconds that an event throttling interval lasts.

Values 1 to 1200

Default 1

no ti-lfa

Context

[Tree] (config>router>isis>lfa ti-lfa)

Full Context

configure router isis loopfree-alternates ti-lfa

Description

This command enables the use of the Topology-Independent LFA (TI-LFA) algorithm in the LFA SPF calculation for this IS-IS instance.

The **no** form of this command disables the use of the TI-LFA algorithm in the LFA SPF calculation for this IS-IS instance.

Note: When users reenter the **configure router isis loopfree-alternates ti-lfa** context, they must configure the optional parameters to the values they want or the system reverts to the parameter defaults.

Default

no ti-lfa

Parameters

value

Specifies the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

Values 0 to 3

Default 2

sids-value

Specifies the maximum number of SRv6 SIDs allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

Values 0 to 3

Default 1

46.103 tier

tier

Syntax

tier {**1** | **2**}

Context

[Tree] (config>qos>policer-control-policy tier)

Full Context

configure qos policer-control-policy tier

Description

This command is used to create, configure, and delete tiered arbiters. Two tiers are supported that always exist, specified as tier 1 and tier 2. Tiered arbiters enable the creation of a bandwidth control hierarchy for managing child policers in an arbitrary fashion. Each arbiter enables parenting of child policers within eight strict levels of priority and a maximum aggregate rate may be defined for the children that the arbiter will enforce. Arbiters created on tier 1 are automatically parented to the root arbiter that is always present. Arbiters created on tier 2 default to the root arbiter as parent but can also be explicitly parented to a tier 2 arbiter. Child policers associated with an instance of the **policer-control-policy** can be parented to any tiered arbiter or to the root arbiter.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

tier

Syntax

[**no**] **tier** *tier*

Context

[Tree] (config>qos>scheduler-policy tier)

Full Context

configure qos scheduler-policy tier

Description

This command identifies the level of hierarchy that a group of schedulers are associated with. Within a tier level, a scheduler can be created or edited. Schedulers created within a tier can only be a child (take bandwidth from a scheduler in a higher tier). Tier levels increase sequentially with 1 being the highest tier.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

All tier 1 schedulers are considered to be root and cannot be a child of another scheduler. Schedulers defined in tiers other than 1 can also be root (parentless).

3 tiers (levels 1, 2, and 3) are supported.

The **save config** and **show config** commands only display information on scheduler tiers that contain defined schedulers. When all schedulers have been removed from a level, that level ceases to be included in output from these commands.

Parameters

tier

This parameter is required to indicate the group of schedulers to create or be edited. Tier levels cannot be created or deleted. If a value for level is given that is out-of-range, an error will occur and the current context of the CLI session will not change.

Values 1 to 3

time 86400

Parameters

time

Specifies the time relative to valid certificate period.

Values 3600 to 157680000

Platforms

All

46.105 time-average-factor

time-average-factor

Syntax

time-average-factor *taf-value* [**dec-only**]

no time-average-factor

Context

[Tree] (config>qos>adv-config-policy>child-control>offered-measurement time-average-factor)

Full Context

configure qos adv-config-policy child-control offered-measurement time-average-factor

Description

This command is used to weight the new offered rate with a portion of the previous offered rate. It would be expected that this command would mainly be used with the dec-only option enabled.

The adjustment to the offered rate is performed using the following formula when taf-value is not set to '0':

Adjusted_Rate = ((Prev_Offered_Rate x (taf-value – 1)) + New_Offered_Rate) / taf-value

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the dec-only option is specified, the adjustment is only applied when New_Offered_Rate is less than the Prev_Offered_Rate. When taf-value is set to '0', the adjustment is never applied.

The **no** form of this command is used to remove the time average factor adjustments to new offered rate measurements.

Parameters

taf-value

The taf-value is specified as a whole number between 0 and 64. The value '0' has special meaning in that it disables the time average factor adjustment and has the same effect as no time-average-factor.

Default 0

Values 0 to 64

dec-only

This keyword is an optional parameter. When enabled, the time average factor adjustment is only applied if the new offered rate is decreasing compared to the previous offered rate. If the new offered rate is greater than the previous offered rate, the adjustment is not applied.

Platforms

All

time-average-factor

Syntax

time-average-factor *value*

no time-average-factor

Context

[Tree] (config>qos>slope-policy time-average-factor)

Full Context

configure qos slope-policy time-average-factor

Description

This command sets a weighting factor to calculate the new shared buffer average utilization after assigning buffers for a packet entering a queue. To derive the new shared buffer average utilization, the buffer pool takes a portion of the previous shared buffer average and adds it to the inverse portion of the instantaneous shared buffer utilization.

The **time-average-factor** command sets the weighting factor between the old shared buffer average utilization and the current shared buffer instantaneous utilization when calculating the new shared buffer average utilization

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The TAF value applies to all high- and low-priority RED slopes for ingress and egress access buffer pools controlled by the slope policy.

The **no** form of this command restores the default setting.

Default

time-average-factor 7

Parameters

value

Represents the Time Average Factor (TAF), expressed as a decimal integer. The value specified for TAF affects the speed at which the shared buffer average utilization tracks the instantaneous shared buffer utilization. A low value weights the new shared buffer average utilization calculation more to the shared buffer instantaneous utilization; zero using it exclusively. A high value weights the new shared buffer average utilization calculation more to the previous shared buffer average utilization value.

Values 0 to 15

Platforms

All

46.106 time-display

time-display

Syntax

time-display {**local** | **utc**}

Context

[Tree] (environment time-display)

Full Context

environment time-display

Description

This command displays time stamps in the CLI session based on local time or Coordinated Universal Time (UTC).

The system keeps time internally in UTC and is capable of displaying the time in either UTC or local time based on the time zone configured.

This environment command only applies to times displayed in the current CLI session. This includes displays of event logs and all other places where a time stamp is displayed.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

In event logs, the selected time is used to control the timestamps in the CLI output of **show log log-id** and in YANG state in the /state/log/log-id branch (for logs such as session, cli, memory, SNMP and NETCONF).

Also see the **configure log log-id time-format** command.

Default

time-display local

Parameters

local

Indicates that local time should be used.

utc

Indicates that UTC time should be used.

Syntax

time-range daily start *start-time* **end** *end-time* [**on** *day* [*day*]]

time-range weekly start *start-time* **end** *end-time*

no time-range

Context

[Tree] (config>app-assure>group>tod-override time-range)

Full Context

configure application-assurance group policer tod-override time-range

Description

This command configures up to seven time-ranges applicable to a particular override-id. The time-range can be configured as daily or weekly policies.

When using a daily override the operator can select which days during the week from Sunday to Saturday it is applicable along with the start/end hour/min time range repeated over these days.

When using a weekly override the operator can select between which days in the week the policy start up to the hours/min for both start day and end day.

Default

no time-range

Parameters

daily

Schedule the override as a daily occurrence.

weekly

Schedule the override as a weekly occurrence.

Values

start-time	daily	<hh>:<mm>
	weekly	<day>,<hh>:<mm>

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>router>mpls>lsp-self-ping timeout)

Full Context

configure router mpls lsp-self-ping timeout

Description

This command configures a timeout value for LSP Self Ping. The LSP Self Ping timer is started when the RESV message is received for an LSP. The system then periodically sends LSP Self Ping packets until the timer expiry or the receipt of the first LSP Self Ping reply, whichever comes first. If the timeout expires before an LSP Self Ping packet is received, then the configured **timeout-action** is performed.

The **no** form of this command reverts to the default value.

Default

timeout 300

Parameters

seconds

Specifies the value, in seconds, of the fast retry timer for a secondary path.

Values 3 to 3600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Syntax

timeout *timeout*

no timeout

Context

[Tree] (config>saa>test>type-multi-line>lsp-trace>sr-policy timeout)

Full Context

configure saa test type-multi-line lsp-trace sr-policy timeout

Description

This command configures the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

timeout

Specifies the timeout value in seconds.

Values 1 to 60

Description

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far-end host. If a reply is not received within this time the far-end host is considered unresponsive.

Default

timeout 1

Parameters

seconds

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far end host.

Values 1 to 60

Platforms

All

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>vrrp>policy>priority-event>host-unreachable timeout)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure vrrp policy priority-event host-unreachable timeout

Description

This command defines the time, in seconds, that must pass before considering the far-end IP host unresponsive to an outstanding ICMP echo request message.

The **timeout** value is not directly related to the configured **interval** parameter. The **timeout** value may be larger, equal, or smaller, relative to the **interval** value.

If the **timeout** value is larger than the **interval** value, multiple ICMP echo request messages may be outstanding. Every ICMP echo request message transmitted to the far end host is tracked individually according to the message identifier and sequence number.

With each consecutive attempt to send an ICMP echo request message, the timeout timer is loaded with the **timeout** value. The timer decrements until:

- an internal error occurs preventing message sending (request unsuccessful)
- an internal error occurs preventing message reply receiving (request unsuccessful)
- a required route table entry does not exist to reach the IP address (request unsuccessful)
- a required ARP entry does not exist and ARP request timed out (request unsuccessful)
- a valid reply is received (request successful)

It is possible for a required ARP request to succeed or timeout after the message timeout timer expires. In this case, the message request is unsuccessful.

If an ICMP echo reply message is not received prior to the **timeout** period for a given ICMP echo request, that request is considered to be dropped and increments the consecutive message drop counter for the priority event.

If an ICMP echo reply message with the same sequence number as an outstanding ICMP echo request message is received prior to that message timing out, the request is considered successful. The consecutive message drop counter is cleared and the request message no longer is outstanding.

If an ICMP Echo Reply message with a sequence number equal to an ICMP echo request sequence number that had previously timed out is received, that reply is silently discarded while incrementing the priority event reply discard counter.

The **no** form of the command reverts to the default value.

Default

timeout 1

Parameters

seconds

The number of seconds before an ICMP echo request message is timed out. Once a message is timed out, a reply with the same identifier and sequence number is discarded.

Values 1 to 60

Platforms

All

Full Context

configure system security ldap timeout

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

The **timeout** value is the number of seconds that the SR OS will wait for a response from the current server that it is trying to establish a connection with. If the server does not reply within the configured **timeout** value, the SR OS will increment the retry counter by 1. The SR OS attempts to establish the connection to the current server up to the configured **retry** value before it moves to the next configured server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

The length of time that the SR OS waits for a response from the server.

Values 1 to 90

Default 3

Platforms

All

timeout

configure service vprn l2tp tunnel-selection-blacklist timeout-action

configure router l2tp tunnel-selection-blacklist timeout-action

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command defines an action that is executed on the entity (peer/tunnel) in the denylist once the entity becomes eligible for selection again.

The **no** form of this command reverts to the default.

Default

timeout-action remove-from-blacklist

Parameters

action

Specifies the Action to be taken when a tunnel or peer has been in the denylist for the max-period of time.

Values **remove-from-blacklist** — The peer or tunnel in the denylist is removed completely from the denylist and made eligible for the selection process once the max-time expires. In this mode of operation, multiple new sessions can be mapped into the same, newly released tunnel from the denylist. The first such session will try to setup the tunnel, while the other is buffered until the tunnel establishment process is completed. In case that the tunnel remains unavailable, it is placed in the denylist again. Consequently, all new sessions are re-negotiated over an alternate tunnel.

try-one-session — Once the max-time expired, the peer or tunnel in the denylist is made available for selection only to a single new session request. Only upon successful tunnel establishment will the incoming new sessions be eligible to be mapped into this tunnel. This behavior will avoid session establishment delays in case that the tunnel just removed from the denylist is still unavailable.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

timeout-action

Syntax

timeout-action {**retry** | **switch**}

no timeout-action

Context

Full Context

configure router mpls lsp-self-ping timeout-action

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures an action that the router takes when the timeout LSP self ping timeout timer expires. The lsp-self-ping timer is started when the RESV is received for an LSP. If the retry is configured and the timeout expires before an LSP self ping packet is received, then the system tears down the candidate path and goes back to CSPF for a new path. If the switch is configured and the timeout expires before an LSP self ping packet is received, then the system switches to the candidate path.

The **no** form of this command reverts to the default value.

Default

timeout-action retry

Parameters

retry

Specifies to retry the candidate path when the timeout expires.

switch

Specifies to switch to the candidate path when the timeout expires.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vprn rip group timers

configure service vprn ripng timers

configure service vprn ripng group timers

configure service vprn ripng group neighbor timers

configure service vprn rip group neighbor timers

Description

This command configures the values for the update, timeout, and flush timers:

- **update timer**

  Determines how often RIP updates are sent.

- **timeout timer**

  If a router is not updated by the time the timer expires, the route is declared invalid, but maintained in the RIP database.

- **flush timer**

  Determines how long a route is maintained in the RIP database, after it has been declared invalid. Once this timer expires it is flushed from the RIP database completely.

The **no** form of this command resets all timers to their default values of 30, 180, and 120 seconds respectively.

Default

no timers

Parameters

update

The RIP update timer value in seconds.

Values 1 to 600

Default 30

timeout

The RIP timeout timer value in seconds.

Values 1 to 1200

Default 180

flush

The RIP flush timer value in seconds.

Values 1 to 1200

Default 120

Full Context

debug router bgp timers

Description

This command logs all BGP timer events to the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

timers

Syntax

[**no**] **timers**

Context

[Tree] (config>router>isis timers)

Full Context

configure router isis timers

Description

This command configures the IS-IS timer values.

Platforms

All

timers

Syntax

timers

Context

[Tree] (config>router>ospf timers)

[Tree] (config>router>ospf3 timers)

Full Context

configure router ospf timers

configure router ospf3 timers

Description

Commands in this context configure OSPF timers. Timers control the delay between receipt of a link state advertisement (LSA) requiring a Dijkstra (Shortest Path First (SPF)) calculation and the minimum time between successive SPF calculations.

Changing the timers affects CPU utilization and network re-convergence times. Lower values reduce convergence time but increase CPU utilization. Higher values reduce CPU utilization but increase re-convergence time.

[Tree] (config>router>ripng timers)

Full Context

configure router ripng group timers

configure router rip group timers

configure router rip group neighbor timers

configure router ripng group neighbor timers

configure router rip timers

configure router ripng timers

Description

This command configures values for the update, timeout and flush RIP timers.

The RIP update timer determines how often RIP updates are sent.

If the route is not updated by the time the RIP timeout timer expires, the route is declared invalid but is maintained in the RIP database.

The RIP flush timer determines how long a route is maintained in the RIP database after it has been declared invalid. After the flush timer expires, the route is removed from the RIP database.

The **no** form of the command reverts to the default values.

Default

timers 30 180 120

Parameters

update

Specifies the RIP update timer value in seconds expressed as a decimal integer.

Values 1 to 600

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

timeout

Specifies the RIP timeout timer value in seconds expressed as a decimal integer.

Values 1 to 1200

flush

Specifies the RIP flush timer value in seconds expressed as a decimal integer.

Values 1 to 1200

47.9 timing

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ethernet>lmm>availability timing)

Full Context

configure oam-pm session ethernet lmm availability timing

Description

This command defines various availability parameters for LMM availability testing. This command does not define the probe interval. Validation occurs when the LMM test is activated using the **no shutdown** command. The maximum size of the availability window cannot exceed 100 seconds (100 000 milliseconds). LMM test activation fails if the availability window exceeds the maximum value.

The **no** form of this command restores the default values for all timing parameters, and uses those values to compute availability and set the loss frequency.

Parameters

frames

Specifies the number of SLM frames that define the size of the small measurement window. Each delta-t is marked as a high-loss interval or non-high-loss interval based on the **flr-threshold**. The size of the delta-t measurement is the product of the number of frames and the interval.

Values 1 to 50

Default 10

deltas

Specifies the number of consecutive delta-t measurement intervals that make up the sliding window over which availability and unavailability determined. Transitions from one state to another occurs when the **consec-delta-t** are in a new state. The sliding window cannot exceed 100 seconds.

Values 2 to 10

Default 10

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

threshold

Specifies the number of consecutive unavailable delta-t intervals that, when reached or exceeded, increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold of consecutive unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is incremented during times of availability.

Values 1 to 9

Default 5

Platforms

All

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **interval** *milliseconds* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ethernet>slm timing)

Full Context

configure oam-pm session ethernet slm timing

Description

This command configures availability parameters and the probe spacing (interval) for the SLM frames. The maximum size of the availability window cannot exceed 10 s (10 000 ms).

The **no** form of this command installs the default values for all timing parameters and use those values to compute availability and set the SLM frequency. If an SLM test is in the **no shutdown** state, it always has timing parameters, default or user configured.

Parameters

frames

Specifies the of SLM frames that define the size of the Delta-T (small measurement window). Each Delta-T is marked as available or unavailable based on the **flr-threshold**. The size of the Delta-T measurement is the product of the number of frames and the interval.

Values 1 to 50

Default 10

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

deltas

Specifies the number of consecutive Delta-T small measurement intervals that make up the sliding window over which availability and unavailability is determined. Transitions from one state to another occurs when the **consec-delta-t** is in a new state.

Values 2 to 10

Default 10

milliseconds

Specifies the number of milliseconds between the transmission of the SLM frames.

Values 50, 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000

Default 100

threshold

Specifies the number of consecutive high loss intervals (unavailable Delta-T) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable Delta-T intervals. A CHLI can only be incremented once during a sliding window and, by default, it is only incremented during times of availability.

Values 1 to 9

Default 5

Platforms

All

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss timing)

Full Context

configure oam-pm session ip twamp-light loss timing

Description

This command defines various availability parameters but not the probe interval. A single TWAMP-Light frame is used to collect both delay and loss metrics; the interval is common to both and as such not unique per metric type. Any TWAMP light test that is attempting to become active validates the configuration of the timing parameter regardless of which statistics are being recorded.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command restores the default values for all timing parameters and use those values to compute availability and set the loss frequency.

Default

timing frames-per-delta-t 1 consec-delta-t 10 chli-threshold 5

Parameters

frames

Defines the size of the small measurement window. Each delta-t is marked as available of unavailable based on the flr-threshold. The size of the delta-t measurement is the product of the number of frames and the interval. This value defaults to a different value thank single probe per metric approaches.

Values 1 to 50

Default 1

deltas

Specifies the number of consecutive delta-t small measurement intervals that make up the sliding window over which availability and unavailability are determined. Transitions from one state to another occurs when the consec-delta-t are now in a new state. The sliding window cannot exceed 100 seconds.

Values 2 to 10

Default 10

threshold

Specifies the number of consecutive high loss intervals (unavailable delta-t) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is only incremented during times of availability.

Values 1 to 9

Default 5

[Tree] (config>log>syslog tls-client-profile)

Full Context

configure service vprn log syslog tls-client-profile

configure log syslog tls-client-profile

Description

This command specifies the Transport Layer Security (TLS) client profile used to encrypt syslog communications for event logs. When configured, log event syslog messages are sent using TLS.

This command is ignored for filter logs.

Any change to this command results in a brief interruption of the event log, which may cause the loss of a few syslog messages.

The **no** form of this command removes TLS encryption of syslog communications and sends syslog messages over UDP.

Parameters

tls-client-profile

Specifies the name of a TLS profile configured in the **config**>**system**>**security**>**tls** context, up to 32 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

Full Context

configure router mpls lsp to

Description

This command specifies the IP address or MPLS-TP node-id of the egress router for the LSP. This command is mandatory to create an LSP.

An IP address for which a route does not exist is allowed in the configuration. If the LSP signaling fails because the destination is not reachable, an error is logged and the LSP operational status is set to down.

For a non MPLS-TP LSP, the **to** *ip-address* can be an IP address of a network IP interface, the system interface, or a loopback interface of the egress router. When used in a SDP, if the LSP **to** address does not match the SDP address, the LSP is not included in the SDP definition.

For an MPLS-TP LSP, the **to node-id** may be either in 4-octet IPv4 address format, or a 32-bit unsigned integer. This command is mandatory to create an MPLS-TP LSP. A value of zero is invalid. This **to** address is used in the MPLS-TP LSP ID, and the MPLS-TP MEP ID for the LSP.

Default

no default

Parameters

ip-address

Specifies the IP address of the egress router. When the LSP type is **sr-te**, then an IPv6 address can be used.

Values ipv4-address — a.b.c.d

ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x — 0 to FFFF (hexadecimal)

d — 0 to 255 (decimal)

node-id ***a.b.c.d.*** **|** ***1...4294967295***

4-octet IPv4 formatted or unsigned 32-bit integer MPLS-TP node-id of the egress router.

configure router mpls lsp-container to

Description

This command configures the IP address of the egress router for member LSPs in the LSP container.

The **no** form of this command reverts to the default value.

Default

no to

Parameters

ip-address

Specifies the IP address for member LSPs in this LSP container.

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

to

Syntax

to *ip-address*

Context

[Tree] (config>router>mpls>static-lsp to)

Full Context

configure router mpls static-lsp to

Description

This command specifies the IP address of the egress router for the static LSP. When creating an LSP this command is required. The **to** IP address may be the address of a local interface, the system IP interface, or of a loopback interface of the egress router. When used in a SDP and the **to** address does not match the far-end SDP address, the LSP is not included in the SDP definition.

Parameters

ip-address

Specifies the system IP address of the egress router.

to

Syntax

to memory [*size*]

to netconf [*size*]

to session

to snmp [*size*] [**send-using-vprn** *service-id*]

Context

[Tree] (config>li>log>log-id to)

Full Context

configure li log log-id to

Description

Commands in this context configure the destination type for the event log.

The source of the data stream must be specified in the **from** command prior to configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of a memory log, NETCONF log, or SNMP log must be modified, the log ID must be removed and then re-created.

Parameters

memory

Specifies that log events are directed to a memory file. A memory file is a circular buffer; when the file is full, each new entry replaces the oldest entry in the log. If the optional size parameter is not configured, the default value is used.

Default 100

netconf

Specifies that log events are directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream** *stream-name* for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.

session

Specifies that log events are directed to the current console or telnet session. This command is only valid for the duration of the session. When the session is terminated, the **to session** configuration is removed. A log ID with a **session** destination is saved in the configuration file but the **to session** part is not stored.

snmp

Specifies that log events are directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

size

The size parameter indicates the number of events that can be stored into memory.

Default 100

Values 50 to 1024

send-using-vprn *service-id*

Configures the lawful intercept (LI) SNMP notifications to transmit in a VPRN. The parameter is the service ID of the VPRN. This configuration is useful when doing management of LI using a VPRN.

The specified VPRN service must exist. After an LI log is configured using the **send-using-vprn** command, the VPRN service cannot be deleted without removing the LI log ID first.

When this command is configured, an LI log ID uses the snmp-trap-group configured for the VPRN.

When unconfigured, the outgoing routing instance of LI SNMP notifications is determined by the **configure log route-preference** command, and the LI log ID uses the **snmp-trap-group** configured in the main system log configuration.

no to

Context

[Tree] (config>oam-pm>session>mpls>lsp>rsvp-auto to)

Full Context

configure oam-pm session mpls lsp rsvp-auto to

Description

This command specifies an IPv4 address used (with the LSP template) to identify the LSP to be tested.

One of three mandatory configuration statements that are required to identify automatically created RSVP LSPs, using **config>router>mpls>lsp-template**. The **config>router>mpls>auto-lsp>lsp-template** links three distinct functions, the **config>router>policy-options>prefix-list**, **config>router>policy-options>policy-statement>entry>from** and the **config>router>mpls> lsp-template**. The **to** address is the same address configured as the **from** address for the **config>router>policy-options>policy-statement>entry>from**. The required identifiers are **from**, **lsp-template** and **to**, all under this node.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ipv4-address

Specifies the IPv4 address.

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

to

Syntax

to file *file-id*

Context

[Tree] (config>log>accounting-policy to)

Full Context

configure log accounting-policy to

Description

This command specifies the destination for the accounting records selected for the accounting policy.

Parameters

file-id

Specifies the destination for the accounting records selected for this destination. The characteristics of the file ID must have already been defined in the **config>log>file** context. A file ID can only be used once.

The file is generated when the file policy is referenced. This command identifies the type of accounting file to be created. The file definition defines its characteristics.

If the **to** command is executed while the accounting policy is in operation, then it becomes active during the next collection interval.

Values 1 to 99

Context

[Tree] (config>router>policy-options>policy-statement>entry to)

Full Context

configure router policy-options policy-statement entry to

Description

This command creates the context to configure export policy match criteria based on a route's destination or the protocol into which the route is being advertised.

If no condition is specified, all route destinations are considered to match.

The **to** command context only applies to export policies. If it is used for an import policy, match criteria is ignored.

The **no** form of this command deletes export match criteria for the route policy statement entry.

Platforms

to openconfig-messages

Context

[Tree] (config>log>log-id to)

Full Context

configure log log-id to

Description

This command specifies a destination for the log event data.

The source of the data stream must be specified in the **from** command before configuring the destination with the **to** command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **to** command cannot be modified or reentered. If the destination or maximum size of an SNMP or memory log needs to be modified, the log ID must be removed and then recreated.

Parameters

cli

Specifies that log events are directed to any subscribed CLI session. Subscribe to a CLI log from within a CLI session using the **tools perform log subscribe-to log-id** *log-id* command. Events are sent to the CLI session for the duration of that CLI session, or until an **unsubscribe-from** command is issued. A local circular memory log is maintained for CLI logs.

console

Specifies that log events are directed to the console port. If the console is not connected, all entries are dropped.

file ***log-file-id***

Specifies that log events are directed to a file with the specified *log-file-id*. The characteristics of the *log-file-id* referenced in this parameter must have already been defined in the **config log file** *file-id* context. When the *file-id* location parameter is modified, log files are not written to the new location until a rollover occurs or the log is manually cleared. A rollover can be forced by using the **clear log** command. Subsequent log entries are then written to the new location. If a rollover does not occur or the log is not cleared, the old location remains in use.

Values 1 to 99, *name* (up to 64 characters max)

memory

Specifies that log events are directed to a memory file. A memory file is a circular buffer; when the file is full, each new entry replaces the oldest entry in the log. If the optional size parameter is not configured, the default value is used.

Default 100

netconf

Specifies that log events are directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream** *stream-name* for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.

session

Specifies that log events are directed to the current console or telnet session. This command is only valid for the duration of the session. When the session is terminated, the **to session** configuration is removed. A log ID with a **session** destination is saved in the configuration file, but the **to session** part is not stored.

size

Specifies the maximum size of the log data destination, in bytes.

Values 50 to 3000

snmp

Specifies that log events are directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

syslog *syslog-id*

Specifies that log events are directed to the specified syslog collector. To remain consistent with the standards governing syslog, messages to syslog are truncated to 1024 bytes. The characteristics of the *syslog-id* referenced in this parameter must have already been defined in the **config log syslog** *syslog-id* context.

Values 1 to 10

openconfig-messages

Keyword to direct log events to the OpenConfig /system/messages container. The **openconfig-messages** destination applies only to **log-id** 102, the default non-deletable log ID used for the OpenConfig messages model.

Platforms

All

Full Context

configure service ies interface tos-marking-state

configure service ies subscriber-interface group-interface tos-marking-state

configure service vprn subscriber-interface group-interface tos-marking-state

configure service vprn interface tos-marking-state

Description

This command is used to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field are not remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interface as untrusted.

When the ingress interface is set to untrusted, all egress network IP interfaces remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions.

Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.

The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** form of this command restores the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

Default

tos-marking-state trusted

Parameters

trusted

The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set.

untrusted

Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

Context

[Tree] (config>isa>video-group>watermark>bandwidth total)

[Tree] (config>isa>video-group>watermark>session total)

Full Context

configure isa video-group watermark bandwidth total

configure isa video-group watermark session total

Description

This command sets the watermark to trigger the SNMP trap if the combined FCC and RET bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the bandwidth available is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

Default

total 90

Parameters

percent

Specifies the percentage of the system resources per ISA.

Description

This command configures the threshold for the total pool in use.

A tmnxTotalPoolUseThreshExcd trap is generated when the total pool usage exceeds this threshold percentage. When the usage returns below the threshold percentage, the tmnxTotalPoolUseThreshNotExcd trap is generated

The **no** form of this command removes the threshold on which to alarm.

Default

no total-pool-in-use

Parameters

percentage

Specifies the total pool in-use alarm threshold.

Values 0.01 to 100.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

47.36 tp-tunnel-id-range

tp-tunnel-id-range

Syntax

tp-tunnel-id-range *start-id end-id*

no tp-tunnel-id-range

Context

[Tree] (config>router>mpls>mpls-tp tp-tunnel-id-range)

Full Context

configure router mpls mpls-tp tp-tunnel-id-range

Description

This command configures the range of MPLS tunnel IDs reserved for MPLS-TP LSPs. The maximum difference between the start-id and end-id is 4K.

The tunnel ID referred to here is the RSVP-TE tunnel ID. This maps to the MPLS-TP Tunnel Number. There are some cases where the dynamic LSPs may have caused fragmentation to the number space such that contiguous range [*end-id* – *start-id*] is not available. In these cases, the command will fail.

There are no default values for the *start-id* and *end-id* of the tunnel id range, and they must be configured to enable MPLS-TP.

Default

no tp-tunnel-id-range

Parameters

start-id

Specifies the start ID.

Values 1 to 61440

end-id

Specifies the end ID.

Values 1 to 61440

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

no trace name *trace-name*

Context

[Tree] (debug>call-trace>ipoe trace)

Full Context

debug call-trace ipoe trace

Description

This command enables tracing for IPoE sessions specified by the configured parameters. This command can trace a single session or multiple sessions, and can use wildcard characters.

This command can be executed multiple times to start multiple traces. When rules overlap, such as for a wildcard SAP and a specific SAP, the rule that a specific trace is associated with cannot be guaranteed.

The **no** form of this command prevents new traces from being configured and terminates all trace jobs that were previously started using the **trace** command.

Parameters

circuit-id

Specifies a circuit ID that is used to filter sessions to trace. The *circuit-id* and *remote-id* parameters are mutually exclusive.

ieee-address

Specifies a MAC address that is used to identify a session to trace, in the format "ab:cd:ef:01:23:45”. A wildcard character can be used to match all remaining octets; for example, the format "ab:cd:ef:*” can be used to filter by OUI.

num

Specifies the maximum number of jobs that may be started with this rule.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 50

Default 1

remote-id

Specifies a remote ID that is used to filter sessions to trace. The *remote-id* and *circuit-id* parameters are mutually exclusive.

sap-id

Specifies a SAP to trace. The following formats are accepted:

- *port*/*lag*/*pw-port*:*svlan*.*cvlan*
- *port*/*lag*/*pw-port*:*vlan*
- *port*/*lag*/*pw-port*
- *port*/*lag*/*pw-port*:*vlan*.*
- *port*/*lag*/*pw-port*:* (also matches *.*)

trace-existing-sessions

Specifies that existing IPoE sessions is traced. If this parameter is not included, only new IPoE sessions is traced.

trace-name

Specifies the name by which the trace is referenced, up to 16 characters.

trace-profile-name

Specifies the name of the trace profile to be applied. The default parameters is used if a trace profile is not specified.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

47.38 trace-profile

trace-profile

Context

[Tree] (config>call-trace trace-profile)

Full Context

configure call-trace trace-profile

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a profile that can be applied to a specific trace job.

Parameters

profile-name

Specifies the unique name of the call trace profile.

create

Keyword used to create the trace profile instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

47.39 traceroute

traceroute

Syntax

Context

[Tree] (traceroute)

Full Context

traceroute

Description

This command determines the route to a destination address. DNS lookups for the responding hosts are enabled by default.

Parameters

candidate-path

Specifies a candidate path of the SRv6 policy to traceroute. The candidate path does not need to be the currently active candidate path.

dest-port-udp-fixed

Specifies that the destination UDP port number should not increment with each packet transmitted. By default, the UDP traceroute starts with destination UDP port 33434 and each subsequent packet sent to this destination UDP port increases by 1. The next packet uses UDP seat port 33435, the next 33436, and so on.

For a UDP test, this parameter prevents the per-transmitted packet increment of the destination UDP port number. The TCP protocol does not increment the destination TCP port, using a single destination TCP port for all traceroute packets for the test.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

decode

Perform additional original datagram parsing functions. This parameter must be used with the **detail** parameter.

detail

Specifies to display additional information about the resulting packet.

distinguisher

Specifies the distinguisher of the SRv6 policy candidate path to send the traceroute probe on. This parameter must be configured if **protocol-owner** is configured to **bgp**.

Values 1 to 4294967295

dns-name

Specifies the DNS name, up to 63 characters, of the far-end device on which to send the traceroute request message.

endpoint *ipv6-address*

Specifies an SRv6 policy for a specific endpoint as the target of the traceroute.

Values

ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

ip-address

Specifies the far-end IP address on which to send the traceroute request message in dotted decimal notation.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

max-ttl

Specifies the maximum Time-To-Live (TTL) value to include in the traceroute request, expressed as a decimal integer.

Values 1 to 255

Default 30

milliseconds

Specifies the time in milliseconds to wait for a response to a probe, expressed as a decimal integer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 60000

Default 5000

min-ttl

Specifies the IP TTL in the initial traceroute packet to target a specific node or starting node along the path.

Values 1 to 255

Default 1

no-dns

Specifies that, when the **no-dns** keyword is specified, DNS lookups of the responding hosts are not performed, and only the IP addresses are printed.

original-datagram

Parse the returned original datagram including any IPv6 and SRH header information.

pad-size

Specifies the number of bytes added to the UDP or TCP payload.

Values 0 to 9786

Default 0

port-number

Specifies the transport protocol destination port number.

Values 1 to 65535

Default 33434

preference

Specifies the preference of the SRv6 policy candidate path to send the traceroute probe on.

Values 0 to 4294967295

Default 100

probes-per-hop

Specifies the number of probes per hop.

Values 1 to 10

Default 3

protocol-owner

Specifies the protocol owner of the SRv6 policy candidate path to traceroute.

Values bgp — Specifies a BGP SRv6 policy.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

static — Specifies a locally configured static SRv6 policy.

protocol udp | tcp

Sets the transport protocol for the traceroute packet. The TCP protocol is silently discarded on a targeted VRPN service. VPRN services only respond to UDP traceroutes.

Default udp

router-or-service

Specifies the routing instance or service, by number. The *router-instance* parameter is the preferred parameter to specify the router or service.

Values router-name: Base, management, vpls-management

vprn-svc-id: 1 to 2147483647

Default Base

router-instance

Specifies the preferred method for entering a service name. Stored as the service name, this is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

Values router-name: Base, management, vpls-management

vprn-svc-name: up to 64 characters

service-name

Specifies the alias function that allows the service name to be used, converted, and stored as service ID.

source *ip-address*

Specifies the source IP address to use as the source of the probe packets, in dotted decimal notation. If the IP address is not one of the device's interfaces, an error is returned.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

type-of-service

Specifies the Type-of-Service (ToS) bits in the IP header of the probe packets, expressed as a decimal integer.

Values 0 to 255

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 0

srv6-policy

Keyword to specify that the traceroute probe is applied to an SRv6 policy matching a specific color and endpoint. The traceroute probe may optionally be targeted at a specific segment list of the SRv6 policy. When the segment list is not specified, the traceroute probe is sent on the lowest available segment list.

color-id

Specifies the SRv6 policy color ID.

Values 0 to 4294967295

segment-list

Specifies the SRv6 policy segment list to trace.

Values 1 to 32

Platforms

All

Output

Table 178: ICMPv4 Type 3 symbols in CLI, Table 179: ICMPv6 Type 1 symbols in CLI, and Table 180: ICMPv6 Type 2 symbols in CLI describe the ICMPv4 Type 3, and the ICMPv6 Type 1 and 2 symbols in the CLI outputs. For references without a symbol in the form !<code>, see www.iana.org/assignments/icmp-parameters/icmp-parameters.xhtml.

The following output is an example of traceroute for an IPv4 prefix.

Output Example

```
A:node-2# traceroute 192.168.xx.xx4
traceroute to 192.168.xx.xx4, 30 hops max, 40 byte packets
 1  192.168.xx.xx4 0.000 ms  0.000 ms  0.000 ms
```

The following output is an example of traceroute for an IPv4 prefix resolved to an IPv4 SR policy with ICMP tunneling enabled.

Output Example

```
A:node-2# traceroute 11.21.1.6 detail no-dns

traceroute-reply

Syntax

[**no**] **traceroute-reply**

Context

[Tree] (config>service>ies>if>ipv6>vrrp traceroute-reply)

Full Context

configure service ies interface ipv6 vrrp traceroute-reply

Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **traceroute-reply** status.

Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **trace-route-reply** status.

Default

no traceroute-reply

Platforms

All

traceroute-reply

Syntax

[**no**] **traceroute-reply**

Context

[Tree] (config>router>if>ipv6>vrrp traceroute-reply)

[Tree] (config>router>if>vrrp traceroute-reply)

Full Context

configure router interface ipv6 vrrp traceroute-reply

configure router interface vrrp traceroute-reply

Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **trace-route-reply** status.

Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).

Default

no traceroute-reply

47.41 track-accounting

track-accounting

Syntax

track-accounting [**start**] [**stop**][**interim-update**][**accounting-on**] [**accounting-off**]

no track-accounting

Context

[Tree] (config>service>vprn>radius-proxy>server>cache track-accounting)

[Tree] (config>router>radius-proxy>server>cache track-accounting)

Full Context

configure service vprn radius-proxy server cache track-accounting

configure router radius-proxy server cache track-accounting

Description

This command specifies the type of RADIUS accounting packets from RADIUS client (a WIFI AP) that the router should track.

The **no** form of this command removes the parameters from the configuration.

Parameters

start

Specifies that the router will update the associated ESM-host with the RADIUS client (for example, a WIFI AP) that generated the accounting-start. This is required in cases where a UE roams to a new AP that does not re-authenticate due to key caching.

stop

Specifies that the router will remove the corresponding ESM host and forward the accounting-stop packet to the external RADIUS server.

accounting-on | accounting-off

Specifies that the router will remove all ESM hosts associated with the RADIUS client (a WIFI AP), and forward the accounting-on packet to the external RADIUS server.

interim-update

Specifies that the router will update the associated ESM-host with the RADIUS client (a WIFI AP) that generated the interim-update. The interim-updates with the updated information are sent to the RADIUS server as scheduled.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

47.42 track-authentication

track-authentication

Syntax

track-authentication [**accept**]

no track-authentication

Context

[Tree] (config>service>vprn>radius-proxy>server>cache track-authentication)

[Tree] (config>router>radius-proxy>server>cache track-authentication)

Full Context

configure service vprn radius-proxy server cache track-authentication

configure router radius-proxy server cache track-authentication

Description

This command specifies if RADIUS authentication (from the AP) should be tracked in order to update the ESM host with the RADIUS client (for example, WIFI AP) on UE mobility. It also specifies the authentication packet from RADIUS client (for example, a WIFI AP) that the router should track for mobility.

The **no** form of this command stops tracking authentication for UE mobility.

Default

track-authentication accept

Parameters

accept

Indicates access-accept is tracked for mobility.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

47.43 track-delete-hold-time

track-delete-hold-time

Syntax

track-delete-hold-time *seconds*

no track-delete-hold-time

Context

[Tree] (config>router>radius-proxy>server>cache track-delete-hold-time)

Full Context

configure router radius-proxy server cache track-delete-hold-time

Description

This command specifies the delete hold-time in case the DHCP host gets a trigger to delete from the matched RADIUS Proxy server.

The **no** form of this command reverts to the default.

Default

track-delete-hold-time 0

Parameters

seconds

Specifies the delete hold time, in seconds.

Values 0 to 600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

47.44 track-mobility

track-mobility

Syntax

track-mobility

Context

Description

Commands in this context configure RADIUS-proxy cache information required for subscribers that are created via data-triggered authentication. The RADIUS proxy cache enables efficient handling of UE mobility.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

47.45 track-password-change

track-password-change

Syntax

[**no**] **track-password-change**

Context

[Tree] (config>service>vprn>l2tp>group>l2tpv3 track-password-change)

Full Context

configure service vprn l2tp group l2tpv3 track-password-change

Description

This command enables tracking of password changes, allowing password tunnel passwords to be changed without bringing down active tunnels or sessions. This is only supported with L2TPv3.

The **no** form of this command disables password change tracking.

Default

no track-password-change

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

47.46 track-srrp

track-srrp

Syntax

track-srrp *srrp-instance* **peer** *ip-address* **sync-tag** *sync-tag*

no track-srrp *srrp-instance*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vprn>l2tp>failover track-srrp)

[Tree] (config>router>l2tp>failover track-srrp)

Full Context

configure service vprn l2tp failover track-srrp

configure router l2tp failover track-srrp

Description

This command sets the sync-tag to be used to synchronize the tunnels with track-srrp *srrp-id* to MCS *peer IP-@*. The same sync-tag should be configured on the MCS peer.

The **no** form of this command reverts to the default.

Default

Removes the sync-tag for the indicated track-srrp.

Parameters

srrp-instance

Specifies the Simple Router Redundancy Protocol (SRRP) instance used for Multi-Chassis redundancy failover that is associated with this Layer Two Tunneling Protocol Tunnel.

sync-tag

Specifies a synchronization tag to be used while synchronizing with the peer.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-srrp

Syntax

[**no**] **track-srrp** [*srrp-instance*]

Context

[Tree] (config>redundancy>multi-chassis>peer>sync>track-srrp-instances track-srrp)

Full Context

configure redundancy multi-chassis peer sync track-srrp-instances track-srrp

Description

This command configures a tracked SRRP instance.

The **no** form of this command removes the SRRP instance identifier from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

srrp-instance

Indicates the unique identifier of the tracked SRRP instance.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-srrp

Syntax

track-srrp *srrp-id*

no track-srrp

Context

[Tree] (config>service>vpls>sap track-srrp)

Full Context

configure service vpls sap track-srrp

Description

This command configures the SRRP instance this capture SAP will track. This is a capture SAP level command. This command is important in PPPoE deployments with MSAPs. PPPoE operation requires that the MAC address learned by the client at the very beginning of the session negotiation phase remains unchanged for the lifetime of the session (RFC 2516). This command ensures that the virtual MAC address used during the PPPoE session negotiation phase on the capture SAP is the same virtual MAC address that is used by the SRRP on the group interface on which the session is established. Therefore, it is mandated that the SRRP instance (and implicitly the group-interface) where the session belongs to is known in advance. If the group interface name for the session is returned by the RADIUS, it must be ensured that this group interface is the one on which the tracked SRRP instance is configured. PPPoE sessions on the same capture SAP cannot be shared across multiple group interfaces, but instead they all must belong to a single group interface that is known in advance.

The same restrictions apply to IPoE clients in MC Redundancy scenario if they are to be supported concurrently on the same capture SAP as PPPoE.

The supported capture SAP syntax is this:

sap <port-id>:X.* capture-sap

The capture SAP syntax that is not supported is this:

sap <port-id>:*.* capture-sap

The **no** form of this command removes the SRRP ID from this configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

srrp-id

Specifies the SRRP instance number.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>app-assure>group>policy>aqp>entry>match traffic-direction)

Full Context

configure application-assurance group policy app-qos-policy entry match traffic-direction

Description

This command specifies the direction of traffic where the AQP match entry will be applied.

To use a policer action with the AQP entry the match criteria must specify a traffic-direction of either subscriber-to-network or network-to-subscriber.

Default

traffic-direction both

Parameters

subscriber-to-network

Traffic from a local subscriber will match this AQP entry.

network-to-subscriber

Traffic to a local subscriber will match this AQP entry.

both

Combines subscriber-to-network and network-to-subscriber.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

47.52 traffic-engineering

traffic-engineering

Syntax

[**no**] **traffic-engineering**

Context

47.59 transit

transit

Syntax

transit [**inherit** | **all** | **vc-only** | **none**]

Context

[Tree] (config>service>vprn>ttl-propagate transit)

Full Context

configure service vprn ttl-propagate transit

Description

This command overrides the global configuration of the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in a given VPRN service context.

The global configuration is performed under config>router>ttl-propagate>vprn-transit.

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

Default

transit inherit

Parameters

inherit

specifies the TTL propagation behavior is inherited from the global configuration under config>router>ttl-propagate>vprn-transit.

none

specifies the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vc-only

specifies the TTL of the IP packet is propagated into the VC label and not into the labels. in the transport label stack

all

specifies the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

Description

This command associates a transit AA subscriber IP or prefix policy to the service. The transit policy must be defined prior to associating the policy with a SAP in the **config**>**app-assure**>**group**>**transit-ip-policy** or **transit-prefix-policy** context.

The **no** form of this command removes the association of the policy to the service.

Default

no transit-policy

Parameters

ip-aasub-policy-id

Specifies a transit IP policy ID.

Values 1 to 65535

prefix-aasub-policy-id

Specifies a transit prefix policy ID.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

transit-policy

Syntax

transit-policy prefix *prefix-aasub-policy-id*

no transit-policy

Context

[Tree] (config>service>ipipe>spoke-sdp transit-policy)

[Tree] (config>service>ipipe>sap transit-policy)

Full Context

configure service ipipe spoke-sdp transit-policy

configure service ipipe sap transit-policy

Description

This command associates an AA transit policy to the service. The transit IP policy must be defined prior to associating the policy with a SAP in the **config>application assurance>group>policy>transit-ip-policy** context.

Transit AA subscribers are managed by the system through this service policy, which determines how transit subs are created and removed for that service.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The no form of this command removes the association of the policy to the service.

Default

no transit-policy

Parameters

prefix-aasub-policy-id

Specifies an integer identifying a prefix transit profile entry.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

47.65 transit-prefix-ipv4-entries

transit-prefix-ipv4-entries

Syntax

transit-prefix-ipv4-entries *entries* [**create**]

no transit-prefix-ipv4-entries

Context

47.66 transit-prefix-ipv6-entries

transit-prefix-ipv6-entries

Syntax

transit-prefix-ipv6-entries *entries* [**create**]

no transit-prefix-ipv6-entries

Context

[Tree] (config>isa>aa-grp transit-prefix-ipv6-entries)

Full Context

configure isa application-assurance-group transit-prefix-ipv6-entries

Description

This command configures the ISA-AA-group transit prefix IPv6 entry limit for each ISA in the group. This entry space is allocated on the IOM within a common area with the second MDA / ISA position of the IOM and also used for ipv6-filter entries for system SDPs. The per-ISA size allocated for transit-prefix-ipv6 entries should be set to allow sufficient space on the IOM for SDP ipv6-filters.

The **no** form of this command removes the assignment of entries space from the configuration. All entries must be removed in order to delete the configuration.

Default

no transit-prefix-ipv6-entries

Parameters

entries

Specifies the ISA-AA-Group transit prefix IPv6 entry limit.

Values 0 to 8191

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure router ldp interface-parameters interface ipv6 transport-address

configure router ldp interface-parameters ipv4 transport-address

configure router ldp interface-parameters ipv6 transport-address

Description

This command configures the transport address to be used when setting up the LDP TCP sessions. The transport address can be configured as **interface** or **system**. The transport address can be configured globally (applies to all LDP interfaces) or per interface. The most specific value is used.

The **config**>**router**>**ldp**>**if-params**>**ipv6**> **transport-address** command is not supported on the 7450 ESS.

With the transport-address command, you can set up the LDP interface to the connection which can be set to the interface address or the system address. However, there can be an issue of which address to use when there are parallel adjacencies. This situation can not only happen with parallel links, it could be a link and a targeted adjacency since targeted adjacencies request the session to be set up only to the system IP address.

The **transport-address** value should not be **interface** if multiple interfaces exist between two LDP neighbors. Depending on the first adjacency to be formed, the TCP endpoint is chosen. In other words, if one LDP interface is set up as **transport-address interface** and another for **transport-address system**, then, depending on which adjacency was set up first, the TCP endpoint addresses are determined. After that, because the hello contains the LSR ID, the LDP session can be checked to verify that it is set up and then match the adjacency to the session.

For any iLDP interface, as the **local-lsr-id** parameters is changed to **interface**, the **transport-address** configuration loses effectiveness. Since it will be ignored and the iLDP session will always use the relevant interface IP address as transport-address even though system is chosen.

The **no** form of this command, at the global level, sets the transport address to the default value.

The **no** form of this command, at the interface level, sets the transport address to the value defined under the global level.

Default

system

Parameters

interface

Specifies the IP interface address is used to set up the LDP session between neighbors. The transport address interface cannot be used if multiple interfaces exist between two neighbors, since only one LDP session is set up between two neighbors.

system

Specifies the system IP address is used to set up the LDP session between neighbors.

47.74 transport-tunnel

transport-tunnel

Syntax

transport-tunnel

Context

[Tree] (config>router>bgp>next-hop-res>labeled-routes transport-tunnel)

Full Context

configure router bgp next-hop-resolution labeled-routes transport-tunnel

Description

Commands in this context configure options for the next-hop resolution of BGP labeled routes (VPN-IP and labeled-unicast) using tunnels in TTM. The context allows the selection of different tunnel resolution options for different types of BGP labeled routes: label-unicast IPv4, label-unicast IPv6, and VPN-IP routes (both VPN-IPv4 and VPN-IPv6).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

By default (if this context and the resolution options are not configured), these routes resolve only to LDP tunnels.

If the **resolution** option is explicitly set to **disabled**, the default binding to LDP tunnel resumes. If **resolution** is set to **any**, then any supported tunnel type is allowed and the selection is based on the lowest numerical TTM preference value.

Platforms

All

trap-target

Syntax

trap-target name address *ip-address* [**port port**] [**snmpv1** | **snmpv2c** | **snmpv3**] **notify-community** *communityName* | *snmpv3SecurityName* [**security-level** {**no-auth-no-privacy** | **auth-no-privacy** | **privacy**}] [**replay**]

no trap-target *name*

Context

[Tree] (config>service>vprn>log>snmp-trap-group trap-target)

Full Context

configure service vprn log snmp-trap-group trap-target

Description

This command adds/modifies a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group**, and at least one **snmp-trap-group** must be configured.

The **snmp-trap-group** command is used to add or remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Default

No SNMP trap targets are defined.

Parameters

name

specifies the name of the trap target up to 28 characters in length

address ***ip-address***

The IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group.

Values		
	ipv4-address	a.b.c.d (host bits must be 0)
	ipv6-address	x:x:x:x:x:x:x:x[-interface]
		x:x:x:x:x:x:d.d.d.d[-interface]
		x: [0 to FFFF]H
		d: [0 to 255]D
		interface: 32 characters maximum, mandatory for link local addresses

The ipv6-address applies to the 7750 SR.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port

Specifies the destination UDP port used to send traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Values 1 to 65535

Default 162

snmpv1* | *snmpv2c* | *snmpv3

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

Pre-existing conditions are checked before the snmpv3SecurityName is accepted. These are:

- The username must be configured.
- The v3 access group must be configured.
- The v3 notification view must be configured.

Values snmpv1, snmpv2c, snmpv3

Default snmpv3

notify-community community* | *security-name

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If no **notify-community** is configured, then no alarms nor traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community

The community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

security-name

The *security-name* as defined in the config>system>security>user context for SNMP v3. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy}

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Values no-auth-no-privacy, auth-no-privacy, privacy

Default no-auth-no-privacy. This parameter can only be configured if SNMPv3 is also configured.

replay

Enable replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table. Because of route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-start-wait and route-recovery-wait timers under config>log>app-route-notifications can help reduce the probability of lost events.

Context

[Tree] (config>log>snmp-trap-group trap-target)

Full Context

configure log snmp-trap-group trap-target

Description

This command configures a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group** and at least one **trap-target** must be configured.

The **trap-target** command is used to add/remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

Note:
If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Parameters

name

Specifies the name of the trap target, up to 28 characters.

ip-address

Specifies the IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group. ipv6 applies to the 7750 SR only.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

x:x:x:x:x:x:d.d.d.d[-interface]

x: [0..FFFF]H

d: [0..255]D

interface: 32 characters maximum, mandatory for link local addresses

port

Specifies the destination UDP port used for sending traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Default 162

Values 1 **to** 65535

snmpv1* | *snmpv2c* | *snmpv3

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. The security name is the name of a locally configured user. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

The following conditions must all be met before traps will be issued using an SNMPv3 trap-target:

The user name must be configured, and must be configured with an snmp group that exists.

The v3 access group must be configured, or be one of the built-in SR OS views.

The v3 notification view must be configured, or be one of the built-in SR OS views.

Default snmpv3

Values snmpv1, snmpv2c, snmpv3

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

community* | *security-name

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If the **notify-community** is not configured, then no alarms or traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community-name

Specifies the community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

security-name

For SNMPv3 trap targets, specifies the *security-name* as defined in the **config>system>security>user** context. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy}

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Default **no-auth-no-privacy**. This parameter can only be configured if SNMPv3 is also configured.

Values no-auth-no-privacy, auth-no-privacy, privacy

replay

Enables the replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table.

Note:
Due to route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-

48 t Commands – Part III

48.1 tree

tree

Syntax

tree [**detail**] [**flat**]

Context

[Tree] (tree)

Full Context

tree

Description

This command displays the command hierarchy structure of the current working context.

Parameters

detail

Displays parameter information for each command shown in the tree output.

flat

Displays the full context on each line.

Platforms

All

48.2 tree-id

tree-id

Syntax

tree-id *tree-id*

no tree-id

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>p2mp-sr-tree>p2mp-policy tree-id)

Full Context

configure router p2mp-sr-tree p2mp-policy tree-id

Description

This command configures the P2MP SR tree ID on the root node of the P2MP policy. The root tree ID and the root address uniquely identify the P2MP policy on the root node.

The **no** form of this command removes the root tree ID entry.

Default

no tree-id

Parameters

tree-id

Specifies the ID of the tree.

Values 8193 to 16286

Platforms

All

tree-id

Syntax

tree-id *tree-id*

no tree-id

Context

[Tree] (config>router>p2mp-sr-tree>replication-segment tree-id)

Full Context

configure router p2mp-sr-tree replication-segment tree-id

Description

This command configures the tree ID for the replication segment of the P2MP SR tree.

The **no** form of this command removes the tree ID from the replication segment.

Default

no tree-id

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

tree-id

Specifies the tree ID.

Values 8193 to 16286

Platforms

All

48.3 trigger

trigger

Syntax

trigger *trigger-type*

Context

[Tree] (config>subscr-mgmt>shcv-policy trigger)

Full Context

configure subscriber-mgmt shcv-policy trigger

Description

This command enables to context to configure SHCV triggers.

Parameters

trigger-type

Specifies the trigger SHCV properties for the subscriber management group-interface.

Values **ip-conflict** — Upon detecting an IP conflict for the new host, a trigger SHCV is sent using a unicast ARP/NS. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

host-limit-exceeded — Upon exceeding the limit for (**sla-profile host-limits** or **session-limits**, **sub-profile host-limits** or **session-limits**, **ipoe-session sap-session-limit**, **ipoe-session session-limit**, and **arp-host host-limit**), a trigger SHCV is sent. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

inactivity — A trigger SHCV is sent to the idle host to verify the host's connectivity to the BNG. An unresponsive host is removed from the system.

mobility — Detects an IP or MAC conflict between different SAPs. Upon detecting a MAC or an IP conflict, a trigger SHCV is sent. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

mac-learning — Specifies the trigger SHCV properties to learn the MAC address of static hosts. Upon a **no shutdown**, a trigger SHCV is sent to the host to learn the host's MAC address.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

trigger

Syntax

trigger [**data**] [**iapp**] [**control**]

no trigger

Context

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>mobility trigger)

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>mobility trigger)

Full Context

configure service vprn subscriber-interface group-interface wlan-gw mobility trigger

configure service ies subscriber-interface group-interface wlan-gw mobility trigger

Description

This command specifies the type of packet used as a mobility trigger.

The **no** form of this command removes the parameters from the configuration and disables data-plane mobility.

Parameters

data

Specifies that data traffic be used as a trigger.

iapp

Specifies that Inter Access Point Protocol (IAPP) messages be used as a trigger.

control

Specifies that control traffic can be used as a trigger.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

trigger

Syntax

[**no**] **trigger** [**neighbor** *ip-int-name* | *ip-address*]

Context

[Tree] (debug>router>rip trigger)

Full Context

debug router rip trigger

Description

This command enables debugging for RIP trigger updates.

Parameters

ip-int-name* | *ip-address

Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms

All

trigger

Syntax

[**no**] **trigger** [**neighbor** *ip-int-name* | *ipv6-address*]

Context

[Tree] (debug>router>ripng trigger)

Full Context

debug router ripng trigger

Description

This command enables debugging for RIP trigger updates.

Parameters

ip-int-name*| *ipv6-address

Debugs the RIP updates sent on the neighbor IP address or interface.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

All

48.4 trigger-alarm-msg

trigger-alarm-msg

Syntax

trigger-alarm-msg *message-string*

no trigger-alarm-msg

Context

[Tree] (config>system>alarm-contact-input trigger-alarm-msg)

Full Context

configure system alarm-contact-input trigger-alarm-msg

Description

This command configures a message string to send with SNMP trap and log event messages that are generated when the system generates an alarm. The system generates the default message "Alarm Input Triggered" if no message is configured. The **trigger-alarm-msg** string is included in the log event when the pin changes from the normal state.

The **no** form of this command reverts to the default message "Alarm Input Triggered".

Default

no-trigger-alarm-msg

Parameters

message-string

Specifies a printable character string, up to 160 characters.

Platforms

7750 SR-a

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

48.5 trigger-entry

trigger-entry

Syntax

[**no**] **trigger-entry** *entry-id*

Context

[Tree] (config>log>event-trigger>event trigger-entry)

Full Context

configure log event-trigger event trigger-entry

Description

This command configures an instance of a trigger for an EHS handler. A trigger entry binds a set of matching criteria for a log event to a particular handler. If the log event occurs in the system and matches the criteria configured in the associated log filter then the handler will be executed.

The **no** form of this command removes the specified trigger entry.

Parameters

entry-id

Specifies the identifier of the EHS event trigger entry.

Values 1 to 1500

Platforms

All

48.6 trigger-fault

trigger-fault

Syntax

trigger-fault {**dying-gasp** | **critical-event**}

no trigger-fault

Context

[Tree] (config>lag>efm-member-template trigger-fault)

[Tree] (config>port>ethernet>efm-oam trigger-fault)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure lag efm-member-template trigger-fault

configure port ethernet efm-oam trigger-fault

Description

This command configures the appropriate flag field in the Information OAM PDU, bursting three consecutive packets during the off cycle. If the local port state is operational, this command changes the local port state to "Link Up". If the local port state is not operational, this configuration is installed as an EFM reason to prevent the port from returning to an Up operational state. This command can be used as a precursor to a port shutdown. This terminates the peering relationship without having to wait for protocol timeouts, assuming the peer supports the necessary action when receiving the dying gasp or critical event flag setting.

The **no** form of this command disables this functionality.

Default

no trigger-fault

Parameters

dying-gasp

Keyword to set the dying gasp flag.

critical-event

Keyword to set the critical event flag.

Platforms

7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

- configure lag efm-member-template trigger-fault

All

- configure port ethernet efm-oam trigger-fault

48.7 trigger-packet

trigger-packet

Syntax

trigger-packet [**dhcp**] [**pppoe**] [**arp**] [**dhcp6**] [**rtr-solicit**] [**data**]

no trigger-packet

Context

[Tree] (config>service>vpls>sap trigger-packet)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vpls sap trigger-packet

Description

This command enables triggering packet to initiate RADIUS authentication that provides a service context. The authentication, together with the service context for this request, creates a managed SAP. The VLAN is the same as the triggering packet. This SAP behaves as a regular SAP but the configuration is not user-editable and not maintained in the configuration file. The managed SAP remains active as long as the session is active.

The **no** form of this command reverts to the default.

Parameters

dhcp

Specifies whether the receipt of DHCP trigger packets on this VPLS SAP when the keyword **capture-sap** is specified in the **sap** command creation string, will result in a RADIUS authentication that will provide a service context and the creation of a SAP with a value of managed.

pppoe

Specifies whether the receipt of PPPoE trigger packets on this VPLS SAP when the keyword **capture-sap** is specified in the **sap** command creation string, will result in a RADIUS authentication that will provide a service context and the creation of a SAP with a value of managed.

arp

Indicates that ARP is the type of trigger packets for this entry.

dhcp6

Indicates that DHCP6 is the type of trigger packets for this entry.

rtr-solicit

Indicates that router solicit is the type of trigger packets for this entry.

data

Indicates that data is the type of trigger packets for this entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

trigger-packet

Syntax

[**no**] **trigger-packet**

Context

[Tree] (config>subscr-mgmt>git trigger-packet)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure subscriber-mgmt group-interface-template trigger-packet

Description

This command configures the router to process the specified types of trigger packets on dynamic SAPs.

The **no** form of this command disables the processing of trigger packets.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

48.8 triggered-policy

triggered-policy

Syntax

[**no**] **triggered-policy**

Context

[Tree] (config>router triggered-policy)

Full Context

configure router triggered-policy

Description

This command triggers route policy re-evaluation.

By default, when a change is made to a policy in the **config router policy options** context and then committed, the change is effective immediately. There may be circumstances when the changes should or must be delayed; for example, if a policy change is implemented that would affect every BGP peer on a router, the consequences could be dramatic. It is more effective to control changes on a peer by peer basis.

If the **triggered-policy** command is enabled, and a given peer is established, and you want the peer to remain up, then, in order for a change to a route policy to take effect, a **clear** command with the *soft* or *soft-inbound* option must be used. In other words, when a **triggered-policy** is enabled, any routine policy change or policy assignment change within the protocol will not take effect until the protocol is reset or a clear command is issued to re-evaluate route policies; for example, **clear router bgp neighbor x.x.x.x soft**. This keeps the peer up and the change made to a route policy is applied only to that peer, or group of peers.

Default

no triggered-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

All

48.9 triggered-updates

triggered-updates

Syntax

triggered-updates

Context

[Tree] (config>subscr-mgmt>acct-plcy triggered-updates)

Full Context

configure subscriber-mgmt radius-accounting-policy triggered-updates

Description

Commands in this context configure non-periodic accounting updates that are triggered by specific events.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

48.10 trust-anchor

trust-anchor

Syntax

[**no**] **trust-anchor** *ca-profile-name*

Context

[Tree] (config>ipsec>trust-anchor-profile trust-anchor)

Full Context

configure ipsec trust-anchor-profile trust-anchor

Description

This command specifies a CA profile as a trust anchor CA. Up to 8 multiple trust anchors can be specified in a single trust anchor profile.

The **no** form of this command removes the name from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ca-profile-name

Specifies the name of the trust anchor profile, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

trust-anchor

Syntax

[**no**] **trust-anchor** *ca-profile-name*

Context

[Tree] (config>system>security>tls>trust-anchor-profile trust-anchor)

Full Context

configure system security tls trust-anchor-profile trust-anchor

Description

This command configures a trust anchor with a CA profile used by the TLS profile. Up to eight CA profiles can be configured under the trust anchor. TLS will read the CA profiles one by one to try to authenticate the server certificate.

Parameters

ca-profile-name

Specifies the name of the TLS trust anchor, up to 32 characters.

Platforms

[Tree] (config>service>ies>sub-if>grp-if>dhcp trusted)

[Tree] (config>router>if>dhcp trusted)

Full Context

configure service ies interface dhcp trusted

configure service vprn interface dhcp trusted

configure service ies subscriber-interface group-interface dhcp trusted

configure router interface dhcp trusted

Description

This command enables relaying untrusted packets. According to RFC 3046, *DHCP Relay Agent Information Option*, a DHCP request where the giaddr is 0.0.0.0 and which contains an Option 82 field in the packet, should be discarded, unless it arrives on a "trusted" circuit. If the **trusted** mode is enabled on an IP interface, the Relay Agent (the router) modifies the requested giaddr to be equal to the ingress interface and forward the request.

The **no** form of this command reverts to the default.

Default

no trusted

Platforms

All

- configure router interface dhcp trusted
- configure service ies interface dhcp trusted
- configure service vprn interface dhcp trusted

48.13 trusted-mac-time

trusted-mac-time

Syntax

trusted-mac-time *range*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vpls>bgp-evpn>mac-duplication trusted-mac-time)

Full Context

configure service vpls bgp-evpn mac-duplication trusted-mac-time

Description

This command determines how long a MAC address needs to stay in the FDB as type learned without being flushed or changed in its type so that the MAC is declared as trusted for the mac-duplication procedures. If the MAC changes from SAP to SAP within the same VPLS service and node, the MAC does not reset its trusted MAC timer.

Default

trusted-mac-time 5

Parameters

range

Specifies the time, in minutes, before the MAC address can be flushed from the FDB.

Values 1 to 15

Platforms

All

48.14 trusted-server

trusted-server

Syntax

trusted-server *address* [**create**]

[**no**] **trusted-server** *address*

Context

[Tree] (config>app-assure>group>ip-id-asst>pdns trusted-server)

Full Context

configure application-assurance group ip-identification-assist passive-dns trusted-server

Description

Commands in this context configure a DNS server that the IP identification assist feature is allowed to passively monitor.

The **no** form of this command deletes the DNS server.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

address

Specifies the IPv4 or IPv6 address for the DNS server.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

48.15 ts-list

ts-list

Syntax

ts-list *list-name* [**create**]

no ts-list *list-name*

Context

[Tree] (config>ipsec ts-list)

Full Context

configure ipsec ts-list

Description

This command creates a new traffic selector (TS).

The **no** form of this command removes the list name from the configuration.

Parameters

list-name

Specifies the name of the TS-list.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

48.16 ts-location

ts-location

Syntax

ts-location *file-url*

no ts-location

Context

[Tree] (config>system>security>tech-support ts-location)

Full Context

configure system security tech-support ts-location

Description

The **ts-location** command configures the directory where technical support files are saved when no *file-url* parameter is specified with the **admin tech-support** command. If **no ts-location** is configured, the user must specify a *file-url* with the **admin tech-support** command.

The directory specified by the **ts-location** must be manually created by the administrator.

See the **admin tech-support** command for more details about the filename generated by the system.

Default

no ts-location

Parameters

file-url

Specifies the directory used for technical support files. The root directory (for example, cf3:\) is not allowed for local destinations; a subdirectory (for example, cf3:\tech-support) must be created.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[ftp://*login:pswd@remote-locn*/][*file-path*]
	247 chars max
	directory length 99 chars max each
remote-locn	[*hostname* | *ipv4-address* | "["*ipv6-address*"]"]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*]
	x:x:x:x:x:x:d.d.d.d[*-interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

configure router bgp group neighbor ttl-security

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures TTL security parameters for incoming packets. When the feature is enabled, LDP will accept incoming IP packets from a peer only if the TTL value in the packet is greater than or equal to the minimum TTL value configured for that peer. Per-peer-queueing must be enabled in order for TTL protection to operate.

The **no** form of this command disables TTL security.

Parameters

min-ttl-value

Specifies the minimum TTL value for an incoming BGP packet.

Values 1 to 255

Platforms

48.28 tunnel-down-damp-time

tunnel-down-damp-time

Syntax

tunnel-down-damp-time *seconds*

no tunnel-down-damp-time

Context

[Tree] (config>router>ldp tunnel-down-damp-time)

Full Context

configure router ldp tunnel-down-damp-time

Description

This command specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager (TTM).

When LDP can no longer resolve a FEC and de-activates it, it de-programs the NHLFE in the data path. It will however delay deleting the LDP tunnel entry in the TTM until the tunnel-down-damp-time timer expires. This means users of the LDP tunnel, such as SDPs (all services) and BGP (L3 VPN), will not be notified immediately. Traffic is still blackholed because the forwarding engine NHLFE has been de-programmed.

If the FEC gets resolved before the tunnel-down-damp-time timer expires, then LDP programs the forwarding engine with the new NHLFE and performs a tunnel modify event in TTM updating the dampened entry in TTM with the new NHLFE information. If the FEC does not get resolved and the tunnel-down-damp-time timer expires, LDP posts a tunnel down event to TTM which deletes the LDP tunnel.

When there is an upper layer (user of LDP) which depends of LDP control plane for failover detection then label withdrawal delay and tunnel-down-damp-time options must be set to 0.

An example is pseudowire redundancy where the primary PW does not have its own fast failover detection mechanism and the node depends on LDP tunnel down event to activate the standby PW.

The **no** form of this command resumes the default value of this command.

Default

no tunnel-down-damp-time (which equals a value of 3 seconds)

Parameters

seconds

Specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager.

Platforms

All

Context

[Tree] (config>service>vpls tunnel-elmi)

Full Context

configure service vpls tunnel-elmi

Description

This command enables the tunneling of E-LMI packets in a VPLS service. The following must also be the case for this command to function:

- the **configure port ethernet elmi mode uni-n** command is not configured
- the **configure service vpls tunnel-elmi true** command is enabled
- the E-LMI packets map to that VPLS service

This command configures E-LMI packets in a VPLS service to be tunneled when the **configure port ethernet elmi mode uni-n** is not configured and the **configure service vpls tunnel-elmi** is enabled and the E-LMI packets map to that VPLS service.

The **no** form of this command disables tunneling of the E-LMI packets for a VPLS service.

Default

no tunnel-elmi

Context

[Tree] (config>service>sdp tunnel-far-end)

Full Context

configure service sdp tunnel-far-end

Description

This command enables the user to specify an SDP tunnel destination address that is different from the configuration in the SDP far-end option. The SDP must be shutdown first to add or change the configuration of the **tunnel-far-end** option.

When this option is enabled, service packets are encapsulated using an LDP LSP with a FEC prefix matching the value entered in ip-address. By default, service packets are encapsulated using an LDP LSP with a FEC prefix matching the address entered in the SDP far-end option.

The T-LDP session to the remote PE is still targeted to the address configured under the **far-end option**. This means that targeted hello messages are sent to the far-end address, which is also the LSR-ID of the remote node. TCP based LDP messages, such as initialization and label mapping messages, are sent to the address specified in the transport-address field of the "hello" message received from the remote PE. This address can be the same as the remote PE LSR-ID, or a different address. This feature works, however, if the signaling option in the SDP is set to off instead of tldp, in which case, the service labels are statically configured.

This feature operates on an SDP of type LDP only. It can be used with VLL, VPLS, and VPRN services when an explicit binding to an SDP with the **tunnel-far-end** is specified. It also operates with a spoke interface on an IES or VPRN service. Finally, this feature operates with a BGP AD based VPLS service when the **use-provisioned-sdp** option is enabled in the pseudowire template.

This feature is not supported in an SDP of type MPLS when an RSVP LSP name is configured under the SDP. It also does not work with a mixed-lsp SDP.

The **no** form of this command disables the use of the **tunnel-far-end** option and returns to using the address specified in the far-end.

Default

no tunnel-far-end

Parameters

ip-address* | *ipv6-address

Specifies the system address of the far-end router for the SDP in dotted decimal notation.

Description

Allows the individual service SAPs to react to changes in the tunnel MEP state. When tunnel-fault accept is configured at the service level, the SAP will react according to the service type, Epipe will set the operational flag and VPLS, IES and VPRN SAP operational state will become down on failure or up on clear. This command triggers the OAM mapping functions to mate SAPs and bindings in an Epipe service as well as setting the operational flag. If AIS generation is the requirement for the Epipe services this command is not required. See the **ais-enable** command under the **config>service>epipe>sap>eth-cfm>ais-enable** context for more details. This works in conjunction with the tunnel-fault accept on the individual SAPs. Both must be set to accept to react to the tunnel MEP state. By default the service level command is "ignore” and the SAP level command is "accept”. This means simply changing the service level command to "accept” will enable the feature for all SAPs. This is not required for Epipe services that only wish to generate AIS on failure.

Default

tunnel-fault ignore (Service Level)

tunnel-fault accept (SAP Level for Epipe and VPLS)

Parameters

accept

Shares fate with the facility tunnel MEP.

ignore

Does not share fate with the facility tunnel MEP.

no tunnel-group *tunnel-group-id*

Context

[Tree] (config>isa tunnel-group)

Full Context

configure isa tunnel-group

Description

This command allows a tunnel group to be created or edited. A tunnel group is a set of one or more MS-ISAs that support the origination and termination of IPsec and IP/GRE tunnels. All of the MS-ISAs in a tunnel group must have **isa-tunnel** as their configured mda-type.

The **no** form of this command deletes the specified tunnel group from the configuration

Parameters

tunnel-group-id

Identifies the tunnel group.

Values 1 to 16

isa-scale-mode

Defines the maximum number of tunnels (all types combined) which can be established on each ISA of the tunnel group and for the whole tunnel-group. When it is not explicitly specified, **isa-scale-mode** has a default value, but that value is different on different platforms.

Values tunnel-limit-2k, tunnel-limit-32k, tunnel-limit-64k, tunnel-limit-8, tunnel-limit-32

create

Mandatory keyword used when creating tunnel group in the ISA context. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

Context

[Tree] (config>router tunnel-interface)

[Tree] (config>router>igmp tunnel-interface)

Full Context

configure router tunnel-interface

configure router igmp tunnel-interface

Description

This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces and associate each to a different RSVP P2MP LSP.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain "::" (two :s) nor contain a ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

Parameters

rsvp-p2mp *lsp-name*

Specifies the LSP. The LSP name can be up to 32 characters long and must be unique.

ldp-p2mp *p2mp-id*

Identifier used for signaling MLDP P2MP LSP.

Values 1 to 4294967296 (on leaf node)

1 to 8192 (on root node)

sender *sender-address*

Specifies the sender IP address: a.b.c.d.

Platforms

tunnel-mtu

Syntax

tunnel-mtu *bytes*

no tunnel-mtu

Context

[Tree] (config>router>isis>segment-routing tunnel-mtu)

Full Context

configure router isis segment-routing tunnel-mtu

Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into TTM is determined like in the case of an IGP tunnel; for example, LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU is determined by IGP as explained below.

The MTU of the SR tunnel in bytes is then determined as follows:

*SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr-overhead)*4}*

Where:

Cfg_SR_MTU is the MTU configured by the user for all SR tunnels within a given IGP instance using the above CLI. If no value was configured by the user, the SR tunnel MTU will be determined by the IGP interface calculation explained next.

IGP_Tunnel_MTU is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.

frr-overhead is set to 1 if **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated anytime any of the above parameters used in its calculation changes. This includes when the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default

no tunnel-mtu

Parameters

bytes

Specifies the size of the Maximum Transmission Unit (MTU) in bytes.

Values 512 to 9786

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[Tree] (config>router>ospf>segm-rtng tunnel-mtu)

Full Context

configure router ospf3 segment-routing tunnel-mtu

configure router ospf segment-routing tunnel-mtu

Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into the TTM is determined as the same as an IGP tunnel; for example, for an LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU will be determined by IGP as follows:

The MTU of the SR tunnel in bytes is then determined as follows:

SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr—overhead)X4}

Where:

- *Cfg_SR_MTU* is the MTU configured by the user for all SR tunnels within an IGP instance using the tunnel-mtu command. If no value is configured by the user, the SR tunnel MTU is determined by the IGP interface calculation explained in the next bullet point.
- *IGP_Tunnel_MTU* is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.
- *frr-overhead* is set to 1 if the **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated whenever any of the above parameters used in its calculation changes. This includes if the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default

no tunnel-mtu

tunnel-next-hop

Context

[Tree] (config>router>isis>igp-shortcut tunnel-next-hop)

Full Context

configure router isis igp-shortcut tunnel-next-hop

Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next-hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note:
An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable (disable) IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note:
An SR tunnel cannot resolve to SR-TE IGP shortcuts.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable or disable IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

48.58 tunnel-table-pref

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>ldp tunnel-table-pref)

Full Context

configure router ldp tunnel-table-pref

Description

This command configures the tunnel table preference for LDP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default

tunnel-table-pref 9

Parameters

preference

Specifies the preference value.

Values 1 to 255

Default 9

Platforms

All

Context

[Tree] (config>router>isis>segment-routing tunnel-table-pref)

Full Context

configure router isis segment-routing tunnel-table-pref

Description

This command configures the TTM preference of SR tunnels created by the IGP instance. This is used in the case of BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the new tunnel binding commands are configured to the **any** value which parses the TTM for tunnels in the protocol preference order. The user can choose to either go with the global TTM preference or list explicitly the tunnel types they want to use. When they list the tunnel types explicitly, the TTM preference will still be used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected one fails. Also, a reversion to a more preferred tunnel type is performed as soon as one is available.

The SR module adds to TTM a SR tunnel entry for each resolved remote node SID prefix and programs the data path with the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the setting of the default preference of the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as **SR-ISIS** and **SR-OSPF**).

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value for each tunnel type.

Default

tunnel-table-pref 11

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

preference

Specifies the integer value to represent the preference of IS-IS or OSPF SR tunnels in TTM.

Values 1 to 255

[Tree] (config>router>ospf>segm-rtng tunnel-table-pref)

Full Context

configure router ospf3 segment-routing tunnel-table-pref

configure router ospf segment-routing tunnel-table-pref

Description

This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel types explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The SR module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note:
The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value for each tunnel type.

Default

tunnel-table-pref 10

Parameters

preference

Specifies the integer value to represent the preference of IS-IS, OSPF, or OSPF3 SR tunnels in the TTM.

Values 1 to 255

Platforms

All

48.60 tunnel-termination

tunnel-termination

Syntax

tunnel-termination {*ip-address* | *ipv6-address*} **fpe** *fpe-id* [**create**]

no tunnel-termination {*ip-address* | *ipv6-address*}

Context

[Tree] (config>service>vprn>vxlan tunnel-termination)

Full Context

configure service vprn vxlan tunnel-termination

Description

This command instructs the system to redirect traffic to the corresponding PXC interface associated with the configured FPE when the destination IP address matches the configured tunnel termination IP address. Because the IP address is registered, the system can respond to ICMP packets directed to it.

The **no** form of this command removes the non-system IP address as the tunnel termination IP address.

Parameters

ip-address* | *ipv6-address

Specifies the non-system IPv4 or IPv6 address that terminates the VXLAN.

Values ip-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

where:

x: [0 to FFFF]H

d: [0 to 255]D

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fpe-id

Specifies the FPE identifier associated with the PXC port or LAG that processes and terminates the VXLAN.

Values 1 to 64

create

Mandatory keyword to create the FPE.

Platforms

All

tunnel-termination

Syntax

tunnel-termination *ip-address* **fpe** *fpe-id* [**create]**

no tunnel-termination *ip-address*

Context

tunnel-termination [*ip-address* | *ipv6-address*] **fpe** *fpe-id* [**create**]

no tunnel-termination [*ip-address* | *ipv6-address*]

Context

[Tree] (config>service>system>gre-eth-bridged tunnel-termination)

Full Context

configure service system gre-eth-bridged tunnel-termination

Description

This command configures an end-point IP address for a GRE tunnel carrying Ethernet payload that is to be terminated on a PW SAP. It also associates this IP address with the FPE object that is providing cross-connect logic between the tunnel and the PW port. This IP address fully supports ICMP protocols such as PING, traceroute, and others.

Parameters

ip-address

The tunnel end-point IP address in the SR OS node.

ipv6-address

The tunnel end-point IPv6 address in the SR OS node.

fpe id

The FPE ID that is providing cross-connect service between the GRE tunnel and the PW port.

Values 1 to 64

Full Context

configure subscriber-mgmt wlan-gw ue-query tunnel-type

Description

This command enables matching on UEs that are active on a tunnel of the specified type. The **not-specified** value disables matching on the tunnel type.

The **no** form of this command reverts to the default.

Default

tunnel-type not-specified

Parameters

gre

Specifies that the tunnel is of type GRE.

l2tp

Specifies that the tunnel is of type L2TPv3.

l2

Specifies that the UE is connected over a Layer 2 access point.

vxlan

Specifies that the tunnel is of type VXLAN.

not-specified

Specifies that no tunnel type matches on UEs.

Context

[Tree] (oam>eth-cfm two-way-delay-test)

Full Context

oam eth-cfm two-way-delay-test

Description

This command issues an ETH-CFM two-way delay test.

Parameters

mac-address

Specifies a unicast destination MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

remote-mepid ***mep-id***

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep ***mep-id***

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

priority

Specifies the priority.

Values 0 to 7

Default 7

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

48.66 two-way-slm-test

two-way-slm-test

Syntax

two-way-slm-test {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**priority** *priority*] [**send-count** *send-count*] [**size** *data-size*] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (oam>eth-cfm two-way-slm-test)

Full Context

oam eth-cfm two-way-slm-test

Description

This command configures an Ethernet CFM two-way SLM test in SAA.

Parameters

mac-address

Specifies a unicast destination MAC address in the format xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

remote-mepid *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the source MEP for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

priority

Specifies the priority.

Values 0 to 7

Default 7

send-count

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. The message interval value must be expired before the next message request is sent.

Values 1 to 1000

Default 1

data-size

Specifies the size of the data portion of the data TLV. If 0 is specified, no data TLV is added to the packet.

Values 0 to 1500

Default 0

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. After the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded. The *timeout* value must be less than the interval.

Values 1 to 10

Default 5

interval

Specifies the **interval** parameter in seconds, expressed as a decimal integer. This parameter is used to configure the spacing between probes within a test run.

Values 0.1 to 0.9, 1 to 10

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure port otu pm-tti tx

Description

This command enables the user to configure the transmit (tx) trail trace identifier (TTI) for path monitoring (PM) in the ODU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes.

The **no** form of this command reverts to the default TTI value.

Default

Auto-generated in the format of *nodename:iomnum/mdanum/portnum/dwdmchan*

The auto-generated value has five sections:

- Nodename — The first section is the name of the node.
- iomnum — The second section contains the IOM slot number.
- mdanum — The third section contains the MDA slot number.
- portnum — The fourth section contains the port number.
- dwdmchan — The fifth section contains the DWDM channel number (see the table "DWDM Channel Numbers" in the **channel** command [**config>port>dwdm channel** and **config>port>dwdm>coherent channel**]).

Parameters

auto-generated

Specifies to use the system generated (default) TTI.

identifier

Sets the PM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0.

byte-string

Sets the PM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings. Up to 64 byte strings can be specified in a single statement.

Values 0 to FF, in hexadecimal byte notation

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure port otu psi-payload tx

Description

This command allows the user to configure the transmit payload type value in byte 0 of the payload structure identifier (PSI) of the OPU overhead.

Default

3 for 10GE-LAN/WAN or OC192 with OTU encapsulation; 5 for GFP framed 10GE-LAN with OTU encapsulation.

Parameters

auto

Transmits the standard value in the payload type field.

byte

Specifies the transmit payload type value in bytes.

Values [00 to FF] Hexadecimal notation

Default 00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Description

This command allows the user to configure the transmit (tx) trail trace identifier (TTI) for section monitoring (SM) in the OTU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes.

The **no** form of this command reverts to the default TTI value.

Default

Auto-generated in the format of *nodename:iomnum/mdanum/portnum/dwdmchan*

The auto-generated value has five sections:

- Nodename — The first section is the name of the node.
- iomnum — The second section contains the IOM slot number.
- mdanum — The third section contains the MDA slot number.
- portnum — The fourth section contains the port number.
- dwdmchan — The fifth section contains the DWDM channel number (see the table "DWDM Channel Numbers" in the **channel** command [**config>port>dwdm channel** and **config>port>dwdm>coherent channel**]).

Parameters

auto-generated

Specifies to use the system generated (default) TTI.

identifier

Sets the SM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0. Up to 64 byte strings can be specified in a single statement.

byte-string

Sets the SM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings.

Values 0 to FF, in hexadecimal byte notation

Full Context

configure port ethernet lldp dest-mac tx-tlvs

Description

This command specifies which LLDP TLVs to transmit. The TX TLVs, defined as a bitmap, includes the basic set of LLDP TLVs whose transmission is allowed on the local LLDP agent by the network management. Each bit in the bitmap corresponds to a TLV type associated with a specific optional TLV. Organizationally-specific TLVs are excluded from this bitmap.

There is no bit reserved for the management address TLV type since transmission of management address TLVs are controlled by another object.

The **no** form of this command resets the value to the default.

Default

no tx-tlvs

Parameters

port-desc

Indicates that the LLDP agent should transmit port description TLVs.

sys-name

Indicates that the LLDP agent should transmit system name TLVs.

sys-desc

Indicates that the LLDP agent should transmit system description TLVs.

sys-cap

Indicates that the LLDP agent should transmit system capabilities TLVs.

configure system ptp tx-while-sync-uncertain

Description

This command configures the local PTP clock to transmit Announce messages to downstream clocks, indicating it has not yet stabilized on the recovered synchronization source (upstream clocks or GM clock). While the PTP clock is unsynchronized, the SyncUncertain state is true.

The **no** form of this command prevents the local PTP clock from sending Announce messages to downstream clocks to indicate it is not synchronized to a valid timing source. If the **no** form of this command is used while the clock's SyncUncertain state is true, unicast negotiation grant requests are not granted and current grants are canceled.

Default

tx-while-sync-uncertain

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure router segment-routing sr-policies static-policy type

Description

This command configures the static policy type. Only commands relevant to the type of the static policy (SRv6 or SR-MPLS) can be executed. The static policy type can only be changed to a new type if no configuration is present for the old type, or if a user deletes all configuration for the old type.

Default

type sr-mpls

Parameters

sr-mpls

Keyword that specifies the type as segment routing MPLS.

srv6

Keyword that specifies the type as segment routing IPv6.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

type

Syntax

type *reflector-type*

Context

[Tree] (config>router>twamp-light>reflector type)

[Tree] (config>service>vprn>twamp-light>refl type)

Full Context

configure router twamp-light reflector type

configure service vprn twamp-light reflector type

Description

This command configures the processing behavior of the TWAMP Light reflector. When the value is **twamp-light**, the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is **stamp**, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet.

In mixed environments where different types of Session-Senders may be targeting a common TWAMP Light reflector, the value should be set to stamp. When the reflector is operating in stamp mode, the primary parsing is based on STAMP, checking and processing known TLVs, and also determining when TLVs are not present and the arriving PDU is a TWAMP Light PDU. A Session-Sender launching a TWAMP Light-based packet must use all zeros and a padding pattern zero when the pad size is non zero.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

type twamp-light

Parameters

reflector-type

Specifies the type of processing behavior for the reflector.

Values stamp, twamp-light

configure service vprn type

Description

This command designates the type of VPRN instance being configured for hub and spoke topologies. Use the **no** form to reset to the default of a fully meshed VPRN.

Default

no type

Parameters

hub

Specifies a hub VPRN which allows all traffic from the hub SAPs to be routed to the destination directly, while all traffic from spoke VPRNs or network interfaces can only be routed to a hub SAP.

spoke

Specifies a spoke VPRN which allows traffic from associated SAPs or spoke terminations to only be forwarded through routes learned from separate VPRN, which should be configured as a type Hub VPRN.

subscriber-split-horizon

Controls the flow of traffic for wholesale subscriber applications.

[Tree] (config>qos>sap-ingress>ip-criteria type)

[Tree] (config>qos>sap-ingress>ipv6-criteria type)

Full Context

configure qos sap-ingress ip-criteria type

configure qos sap-ingress ipv6-criteria type

Description

This command sets the **ip-criteria** and **ipv6-criteria** type to control the type of match entries configurable in this context.

Default

type normal

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

filter-type

Specifies which type of entries that the **ip-criteria** and **ipv6-criteria** statements can contain.

Values **normal** — Regular match criteria are allowed; VXLAN VNI matching is not allowed.

tagged-entries — Specifies that entries within that criteria statement are tagged. Tagged entries are not populated by default, they are only populated when their tag value is activated using the criteria override under an Ethernet SAP.

The **type** can only be changed from **normal** to **tagged-entries** if there are no **ip-criteria** or **ipv6-criteria** entries configured and the SAP ingress QoS policy is not applied to any object.

A SAP ingress QoS policy configured with a criteria statement with **type tagged-entries** is not supported within an SLA profile, sub profile or MSAP policy, or under an IES/VPRN group interface SAP.

The configuration of **type tagged-entries** is mutually exclusive with the configuration of the **match dst-port** in the same criteria statement.

vxlan-vni — Matching is allowed on a VXLAN VNI for VXLAN and VXLAN GPE frames.

The type cannot be changed when **ip-criteria** or **ipv6-criteria** entries are configured. If there are no **ip-criteria** or **ipv6-criteria** entries configured, the type can be changed from **vxlan-vni** to **normal**. The type can only be changed from **normal** to **vxlan-vni** if there are no **ip-criteria** or **ipv6-criteria** entries configured but it is necessary that the SAP ingress QoS policy is also not applied to any object in order to change from **normal** to **vxlan-vni**.

A SAP ingress QoS policy configured with **type vxlan-vni** can be applied to any Ethernet SAPs, except for a PW-SAP, B-VPLS SAP, or CCAG SAP, in any applicable service.

Full Context

configure router policy-options policy-statement default-action type

configure router policy-options policy-statement entry action type

Description

This command sets the subtype for the Type 5 LSA (external LSA).

The **no** form of this command disables assigning a type in the route policy entry.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

type 2

Parameters

type

Specifies the type metric.

Values Subtype 1 — The external metric in the external LSA is comparable with the internal metric, and thus one can sum up all the metrics along the path (both internal and external) to get the total cost to the destination.

Subtype 2 — The metric in the external LSA is much more important than the internal metric, so the internal metrics should only be considered when comparing two external routes that have the same external metric.

param-name

The type parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

49 u Commands

49.1 ua

ua

Syntax

[**no**] **ua** *function-value*

Context

[Tree] (config>router>segment-routing>srv6>inst>ms-loc>func ua)

Full Context

configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function ua

Description

Commands in this context configure the attributes of the uA micro-SID function associated with a P2P interface. The uA micro-SID function encodes the behavior of an adjacency SID.

The range of allowed configurable values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1] to form a uA micro-SID.

Static micro-SID values range in [1024*global-sid-entries, 1024*global-sid-entries + max-entries – 1].

A static function value can be configured for each combination of SRH mode and protection type.

For a specified interface, the static function value associated with the same combination of protection type and SRH mode overrides any corresponding automatically allocated function value (**ua-auto-allocate** command configuration).

If more than one value is configured for an interface and combination of SRH mode and protection type, they are all advertised in IS-IS.

When used in remote TI-LFA repair tunnel programming, IS-IS uses rules to select one uA value from the multiple values received in IS-IS link advertisements.

The values assigned to loopback and system interfaces are not advertised in IS-IS.

The uA micro-SID functions for adjacencies over broadcast interfaces are always automatically allocated based on the configuration of the following command:

```
configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator
 function ua-auto-allocate
```

The **no** form of this command removes the function value from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

function-value

Specifies the SRv6 uA function.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

49.2 ua-auto-allocate

ua-auto-allocate

Syntax

[**no**] **ua-auto-allocate srh-mode** *srh-mode* **protection** *protection*

Context

[Tree] (config>router>segment-routing>srv6>inst>ms-loc>func ua-auto-allocate)

Full Context

configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function ua-auto-allocate

Description

This command configures a list entry for the automatic allocation of the uA micro-SID function for all adjacencies over all network interfaces on the router (P2P and broadcast interfaces).

Auto-allocated uA function value (N) is drawn by the system from the following range [max-entries + 1, 2^sid-length – 1024*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro SID range [1024*global-sid-entries, 2^sid-length – 1]. Dynamic micro-SID values range in [1024*global-sid-entries + max-entries, 2^sid-length – 1].

A list entry is a combination of the protection type and the SRH mode. Any combinations in addition to the maximum number of entries supported by this command must be allocated statically for each P2P interface. The maximum number of entries in this list is two.

When no list entries are configured, no uA function values are automatically allocated by default for a micro-segment locator.

Note:
Any change to this list causes a re-allocation of new function values to all interfaces on the router that results in flooding them to the network and triggers a new SPF in all routers.

The **no** form of this command removes the function value from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

srh-mode

Specifies the SRH mode for the SID.

Values psp — Penultimate Segment Pop (PSP) of the SRH

usp — Ultimate Segment Pop (USP) of the SRH

psp-usd — Supports both PSP of the SRH and Ultimate Segment Decapsulation (USD) on the same SID

usp-usd — Supports both USP of the SRH and USD on the same SID

psp-usp-usd — Supports PSP and USP of the SRH with USD on the same SID

protection

Specifies whether the adjacency SID is protected.

Values protected, unprotected

Full Context

configure test-oam build-packet header udp

debug oam build-packet packet field-override header udp

Description

This command creates a UDP header and enables the context to define the associated parameters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

udp

Syntax

[**no**] **udp**

Context

[Tree] (config>router>bgp>next-hop-resolution>labeled-routes>transport-tunnel>family>resolution-filter udp)

Full Context

configure router bgp next-hop-resolution labeled-routes transport-tunnel family resolution-filter udp

Description

This command selects UDP tunnel in TTM for next-hop resolution.

Platforms

All

udp

Syntax

udp

Context

[Tree] (config>service>vprn>auto-bind-tunnel>res-filter udp)

Full Context

configure service vprn auto-bind-tunnel resolution-filter udp

Description

Note: This command is no longer supported and will be removed in a future release.

Platforms

All

udp

Syntax

udp src *port* **dest** *udp-port*

no udp

Context

[Tree] (config>li>li-dest>encap>layer-3-encap>gateway udp)

Full Context

configure li li-dest encap layer-3-encap gateway udp

Description

This command configures the source and destination UDP ports to use in the UDP header part of the routable LI encapsulation.

The **no** form of this command reverts to the default value.

Default

no udp

Parameters

src *port*

Specifies the source UDP port.

Values 1 to 65535

dest *udp-port*

Specifies the destination UDP port.

Values 1 to 65535

Platforms

All

Full Context

configure service nat up-nat-policy timeouts udp-dns

configure service nat firewall-policy timeouts udp-dns

configure service nat nat-policy timeouts udp-dns

Description

This command configures the timeout applied to a UDP session with destination port 53.

Default

udp-dns sec 15

Parameters

hours

Specifies the timeout hours field.

Values 1 to 24

minutes

Specifies the timeout minutes field.

Values 1 to 59

seconds

Specifies the timeout seconds field.

Values 1 to 59

Platforms

49.9 udp-port

udp-port

Syntax

udp-port *udp-port-number*

Context

[Tree] (config>router>mtrace2 udp-port)

[Tree] (config>service>vprn>mtrace2 udp-port)

Full Context

configure router mtrace2 udp-port

configure service vprn mtrace2 udp-port

Description

This command specifies the destination and listening port for the **mtrace2** command. When it is configured, this command generates Mtrace2 packets with the configured UDP port, and also listens on the same port for any incoming Mtrace2 packets.

Port 33435 is the IANA-assigned port for Mtrace2. On several operating systems (for example, Linux OS, SR OS), this port is also used by traceroute. On SR OS, if port 33435 is configured as the Mtrace2 port, SR OS does not respond to traceroute on this port.

Default

5000

Parameters

udp-port-number

Specifies the UDP port for the test.

Values 1024 to 49151

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

udp-protocols

Syntax

udp-protocols *protocol-set*

Context

[Tree] (config>app-assure>group>tether-detect>ttl-mon udp-protocols)

Full Context

configure application-assurance group tethering-detection ttl-monitoring udp-protocols

Description

This command configures whether AA analyzes all UDP traffic or only traffic from standard applications that generate consistent TTL values. Configuring AA to analyze only standard UDP traffic is recommended.

Default

udp-protocols standard

Parameters

protocol-set

Specifies the scope of analysis for UDP traffic.

Values standard, all

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

49.11 udp-return-object

udp-return-object

Syntax

udp-return-object *ip-address*

no udp-return-object

Context

[Tree] (config>oam-pm>session>mpls>lsp>rsvp-auto udp-return-object)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[Tree] (config>oam-pm>session>mpls>lsp>rsvp udp-return-object)

Full Context

configure oam-pm session mpls lsp rsvp-auto udp-return-object

configure oam-pm session mpls lsp rsvp udp-return-object

Description

This command configures the destination IP address used by the far end of the test to send a test response. The UDP port in the UDP-Return Object is set to 64353 for MPLS DM PDUs.

RSVP tunnels are unidirectional and must include a configured local address for the responder can route the response back by the IP control plane. If the configuration is absent, the DN test fails to activate. If the configured IP address is not a local address, the command fails.

The **no** form of this command removes the udp-return-object IP address.

Parameters

ip-address

Specifies the destination IP.

Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure li mirror-dest-template layer-3-encap udp-src

Description

This command configures the source UDP port to be used in the UDP header of the routable LI encapsulation.

Parameters

udp-port

Specifies the source UDP port.

Values 1 to 65535

Platforms

All

49.13 udt2m

udt2m

Syntax

udt2m [*function-value*]

no udt2m

Context

[Tree] (config>service>vpls>srv6>ms-locator>function udt2m)

Full Context

configure service vpls segment-routing-v6 micro-segment-locator function udt2m

Description

This command configures the SRv6 uDT2M behavior and function value that is associated with the SRv6 instance in the service. This means that decapsulation and table lookup for IPv6 prefixes occurs in the VPLS service.

The range of allowed configurables values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1] to form a uDT2M micro-SID. Static micro-SID values range in [1024*global-sid-entries, 1024*global-sid-entries + max-entries – 1].

If no value is configured, the system draws a function value (N) from the following range [max-entries + 1, 2^sid-length – 1024*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1]. Dynamic micro-SID values range in [1024*global-sid-entries + max-entries, 2^sid-length – 1].

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the function behavior and value from the configuration.

Parameters

function-value

Specifies the SRv6 micro-segment uDT2M function value.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

49.14 udt2u

udt2u

Syntax

udt2u [*function-value*]

no udt2u

Context

[Tree] (config>service>vpls>srv6>ms-locator>function udt2u)

Full Context

configure service vpls segment-routing-v6 micro-segment-locator function udt2u

Description

This command configures the SRv6 uDT2U behavior and function value that is associated with the SRv6 instance in the service. This means that decapsulation and table lookup for IPv6 prefixes occurs in the VPLS service.

The range of allowed configurables values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1] to form a uDT2U micro-SID. Static micro-SID values range in [1024*global-sid-entries, 1024*global-sid-entries + max-entries – 1].

If no value is configured, the system draws a function value (N) from the following range [max-entries + 1, 2^sid-length – 1024*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1]. Dynamic micro-SID values range in [1024*global-sid-entries + max-entries, 2^sid-length – 1].

The **no** form of this command removes the function behavior and value from the configuration.

Parameters

function-value

Specifies the SRv6 micro-segment uDT2U function value.

ue-state

Syntax

[**no**] **ue-state**

Context

[Tree] (config>subscr-mgmt>wlan-gw>tunnel-query ue-state)

Full Context

configure subscriber-mgmt wlan-gw tunnel-query ue-state

Description

This command enables matching on a specific UE state. Multiple states can be provisioned. If no UE state specifier is configured, UE state matching is disabled (all UEs match).

This match criteria can be combined with minimum and maximum match criteria, which will then apply only to UEs of the specified state.

49.28 umh-selection

umh-selection

Syntax

umh-selection {**highest-ip** | **hash-based** | **tunnel-status** | **unicast-rt-pref**}

no umh-selection

Context

[Tree] (config>service>vprn>mvpn umh-selection)

Full Context

configure service vprn mvpn umh-selection

Description

This command specifies which UMH selection mechanism to use, highest IP address, hash based or provider tunnel status.

The **no** form of this command resets it back to default.

Default

umh-selection highest-ip

Parameters

highest-ip

Specifies that the highest next-hop IP address is selected as UMH. The RTM may have just one next-hop to the source, but **highest-ip** uses all of the next-hops available to BGP that appear in the BGP database.

hash-based

Specifies that the UMH selection is based on hash-based procedures set out in RFC 6513, section 5.1.3. The RTM may have just one next-hop to the source, but **hash-based** uses all of the next-hops available to BGP that appear in the BGP database.

tunnel-status

Specifies that UMH selection is based on the state of the tunnel as well as the available unicast routes through the tunnel. Not supported for IPv6.

unicast-rt-pref

When selected, best unicast route will decide which UMH is chosen. All PE routers shall prefer the same route to the UMH for the UMH selection criterion (for example BGP path selection criteria must not influence one PE to choose different UMH from another PE).

configure oam-pm session ip twamp-light loss-events unavailability-event

Description

This command sets the threshold to be applied to the overall count of the unavailability indicators, not transitions, per configured direction. This value is compared to the 32-bit unavailability counter specific to the direction which tracks the number of individual Delta-Ts that have been recorded as unavailable.

The **no** form of this command removes the event threshold for the frame loss ratio. The direction must be included with the **no** command.

Default

no unavailability-event forward

no unavailability-event backward

no unavailability-event aggregate

Parameters

forward

Keyword to apply the threshold to the forward direction count.

backward

Keyword to apply the threshold to the backward direction count.

aggregate

Keyword to apply the threshold to the aggregate count (sum of forward and backward). The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics.

raise-threshold

Specifies a numerical value compared to the unavailability counter that is the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior to configure a percentage of loss value lower than the rising percentage to indicate when to generate the clear event.

If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within the measurement interval.

If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to the following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

Values 0 to 863999

A value of zero means that the unavailability counter must be 0.

configure subscriber-mgmt sub-mcac-policy unconstrained-bw

Description

This command configures the bandwidth for the interface or subscriber's multicast CAC policy traffic. When disabled (**no unconstrained-bw**), there is no checking of bandwidth constraints on the interface or subscriber level. When enabled and a policy is defined, enforcement is performed. The allocated bandwidth for optional channels should not exceed the **unconstrained-bw** minus the **mandatory-bw** and the mandatory channels have to stay below the specified value for the **mandatory-bw**. After this interface and subscriber check, the bundle checks are performed.

The **no** form of this command reverts to the default.

Parameters

bandwidth

Specifies bandwidth assigned for interface's MCAC policy traffic, in kilobits per second (kb/s).

Values 0 to 2147483647

mandatory-bw

Specifies the bandwidth pre-reserved for all the mandatory channels on a given interface in kilobits per second (kb/s).

If the *bandwidth* value is 0, no mandatory channels are allowed. If the value of *bandwidth* is '-1', then all mandatory and optional channels are allowed.

If the value of *mandatory-bw* is equal to the value of *bandwidth*, then all the unconstrained bandwidth on a given interface is allocated to mandatory channels configured through multicast CAC policy on that interface and no optional groups (channels) are allowed.

The value of *mandatory-bw* should always be less than or equal to that of *bandwidth*, An attempt to set the value of *mandatory-bw* greater than that of *bandwidth*, will result in inconsistent value error.

Values 0 to 2147483647

Description

This command enables MCAC (or HMCAC) function on the corresponding level (subscriber, group-interface or redirected interface). When MCAC (or HMCAC) is enabled and a channel definition policy is referenced, admission control is performed. The allocated bandwidth for optional channels should not exceed the unconstrained-bw minus the mandatory-bw. The mandatory channels have to stay below the specified value for the mandatory-bw.

In HMCAC, the subscriber is checked first against its bandwidth limits followed by the check on the redirected interface or the group-interface against the bandwidth limits defined there.

In case that redirection is enabled and HMCAC enabled, the channel definition policy must be referenced under the redirected interface level. If it is referenced under the group-interface level, it will be ignored.

Subscriber MCAC (only subscriber is checked for available resources) is supported only with direct subscriber replication (no redirection). In this case the channel definition policy must be referenced under the group-interface.

If the redirection is enabled but the policy is referenced only under the group-interface, no admission control is executed (HMCAC or MCAC).

The **no** form of this command removes the values from the configuration.

Default

no unconstrained-bw

Parameters

bandwidth

Specifies the unconstrained bandwidth in kb/s for the MCAC policy.

Values 0 to 2147483647

mandatory-bw

Specifies the mandatory bandwidth in kb/s for the MCAC policy.

Values 0 to 2147483647

Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance unconsumed-higher-tier-rate

Description

This command configures the percentage of the unconsumed higher tier rate that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. Higher tier refers to the Vport aggregate rate and port scheduler level, group, and maximum rates.

This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **unconsumed-higher-tier-rate percent** to its default value.

Default

unconsumed-higher-tier-rate 100.00

Parameters

percent-of-unconsumed-higher-tier-rate

Specifies the percentage of the unconsumed higher tier rate that can be given to a queue.

Values 0.00 to 100.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

49.37 underflow-limit

underflow-limit

Syntax

underflow-limit *number* **threshold** *percent* [**bw** *rate-in-mbps*]

no underflow-limit

Context

[Tree] (config>router>mpls>lsp>auto-bandwidth underflow-limit)

[Tree] (config>router>mpls>lsp-template>auto-bandwidth underflow-limit)

Full Context

configure router mpls lsp auto-bandwidth underflow-limit

configure router mpls lsp-template auto-bandwidth underflow-limit

Description

This command configures underflow-triggered auto-bandwidth adjustment. An underflow auto-bandwidth adjustment can occur any time during the adjust interval; it is triggered when the number of consecutive underflow samples reaches the threshold *number* configured for this command. The new bandwidth of the LSP after a successful underflow adjustment is the maximum data rate observed in the last *number* of consecutive underflow samples.

A sample interval is counted as an underflow if the average data rate during the sample interval is lower than the currently reserved bandwidth by at least the thresholds configured for this command.

The **no** form of this command disables underflow-triggered auto-bandwidth adjustment.

Default

no underflow-limit

Parameters

number

Specifies the number of consecutive underflow samples to trigger an underflow auto-bandwidth adjustment attempt.

Values 1 to 10

percent

Specifies the minimum difference between the current bandwidth reservation of the LSP and the sampled data rate, expressed as a percentage of the current bandwidth reservation, for counting an underflow sample.

Values 0 to100

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rate-in-mbps

Specifies the minimum difference between the current bandwidth reservation of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s), for counting an underflow sample.

Values 0 to 6400000

Platforms

49.38 undet-availability-event

undet-availability-event

Syntax

undet-availability-event {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]

no undet-availability-event {**forward** | **backward** | **aggregate**}

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss-events undet-availability-event)

[Tree] (config>oam-pm>session>ethernet>slm>loss-events undet-availability-event)

[Tree] (config>oam-pm>session>ethernet>lmm>loss-events undet-availability-event)

Full Context

configure oam-pm session ip twamp-light loss-events undet-availability-event

configure oam-pm session ethernet slm loss-events undet-availability-event

configure oam-pm session ethernet lmm loss-events undet-availability-event

Description

This command configures the threshold to apply to the overall count of the undetermined availability indicators, not transitions, per configured direction. This value is compared to the 32-bit unavailability counter specific to the direction which tracks the number of individual Delta-Ts that have been recorded as undetermined available.

The **no** form of this command removes the event threshold for the frame loss ratio. The direction must be included with the **no** command.

Default

no undet-availability-event forward

no undet-availability-event backward

no undet-availability-event aggregate

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

forward

Keyword to apply the threshold to the forward direction count.

backward

Keyword to apply the threshold to the backward direction count.

aggregate

Keyword to apply the threshold to the aggregate count (sum of forward and backward). The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics.

raise-threshold

Specifies the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within the measurement interval.

If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

Values 0 to 863999

A value of zero means that the undetermined availability counter must be 0.

Default clear threshold disabled

Full Context

configure subscriber-mgmt ppp-policy unique-sid-per-sap

Description

This command assigns a unique session ID to each PPPoE session active on a single SAP.

On a capture SAP, a unique session ID is assigned per capture SAP: multiple sessions that are active on the same or different MSAP have a unique session ID per capture SAP.

With the optional parameter **per-msap**, a unique session ID is assigned per MSAP:

- multiple sessions that are active on the same MSAP have a unique session ID per MSAP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- multiple sessions that are active on different MSAPs are not guaranteed to have a unique session ID

The session ID range is 1 to 8191.

By default, all PPPoE sessions with a different client MAC address and active on a given SAP or MSAP have a session ID of 1 (**sid-allocation sequential**) or a random value in the range 1 to 8191 (**sid-allocation random**).

The **no** form of this command reverts to the default.

Parameters

per-msap

Assigns a unique session ID for PPPoE sessions that are active on the same MSAP. This parameter has no effect on regular SAPs.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

49.48 unknown-mac-route

unknown-mac-route

Syntax

[**no**] **unknown-mac-route**

Context

[Tree] (config>service>vpls>bgp-evpn unknown-mac-route)

Full Context

configure service vpls bgp-evpn unknown-mac-route

Description

This command enables the advertisement of the unknown-mac-route in BGP. This will be coded in an EVPN MAC route where the MAC address is zero and the MAC address length 48. By using this unknown-mac-route advertisement, the user may decide to optionally turn off the advertisement of MAC addresses learned from SAPs and SDP-bindings, hence reducing the control plane overhead and the size of the FDB tables in the data center. All the receiving NVEs supporting this concept will send any unknown-unicast packet to the owner of the unknown-mac-route, as opposed to flooding the unknown-unicast traffic to all other nodes part of the same VPLS. Although the 7750 SR, 7450 ESS, or 7950 XRS can be configured to generate and advertise the unknown-mac-route, the router will never honor the unknown-mac-route and will flood to the vpls flood list when an unknown-unicast packet arrives to an ingress SAP/SDP-binding.

Use of the unknown-mac-route is only supported for BGP-EVPN VXLAN.

Default

no unknown-mac-route

49.51 unknown-policer

unknown-policer

Syntax

unknown-policer *policer-id* [**fp-redirect-group**]

no unknown-policer

Context

[Tree] (config>qos>sap-ingress>fc unknown-policer)

Full Context

configure qos sap-ingress fc unknown-policer

Description

Within a **sap-ingress** QoS policy forwarding class context, the **unknown-policer** command is used to map packets that match the forwarding class and are considered unknown in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination based on the ingress service type and the service instance forwarding records. If the service type is VPLS and the destination MAC address is unicast, but the MAC has not been learned and populated within the VPLS services FDB, the packet is classified into the unknown forwarding type.

Unknown forwarding type packets are mapped to either an ingress multipoint queue (using the **unknown** *queue-id* or **unknown** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**unknown-policer** *policer-id*). The **unknown** and **unknown-policer** commands within the forwarding class context are mutually exclusive. By default, the unknown forwarding type is mapped to the SAP ingress default multipoint queue. If the **unknown-policer** *policer-id* command is executed, any previous policer mapping

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

or queue mapping for the unknown forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site, or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

The **unknown-policer** command is ignored for instances of the policer applied to SAPs or subscribers' multiservice site where unknown packets are not supported.

When the unknown forwarding type within a forwarding class is mapped to a policer, the unknown packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unknown forwarding type within the forwarding class to the default multipoint queue. If all forwarding class forwarding types had been removed from the default multipoint queue, the queue will not exist on the SAPs or subscriber or multiservice site associated with the QoS policy and the **no broadcast-policer** command will cause the system to attempt to create the default multipoint queue on each object. If the system cannot create the queue on each instance, the **no unknown-policer** command will fail and the unknown forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no unknown-policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters

policer-id

When the forwarding class **unknown-policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

fp-redirect-group

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

configure qos sap-ingress fc unknown-queue

Description

This command overrides the default unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters

queue-id

Specifies an existing multipoint queue defined in the **config>qos>sap-ingress** context.

Values Any valid multipoint *queue-id* in the policy including 2 through 32.

Default 11

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

group *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified queue-id within the queue-group-name. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts.

Platforms

All

unknown-queue

Syntax

no unknown-queue

Context

[Tree] (config>qos>shared-queue>fc unknown-queue)

Full Context

configure qos shared-queue fc unknown-queue

Description

This command configures the unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters

queue-id

The *queue-id* must be an existing, multipoint queue defined in the **config>qos>sap-ingress** context policer-output-queues profile. For the 7950 XRS, this is not configurable in the policer-output-queues profile.

Values 25 to 32

49.55 unlock

unlock

Syntax

unlock [**card** *cpm-slot*]

Context

[Tree] (admin>sys>sec>os-sec>anti-theft unlock)

Full Context

admin system security os-security anti-theft unlock

Description

This command disables anti-theft locking to allow router configuration. When prompted, the user must enter their OS security password, which is configured using the **admin system security os-security set-password** command. For each incorrect password attempt, the initial unsuccessful authentication wait period is doubled. This wait period applies to all users. Entering the correct password resets the wait period to the initial value for all users.

Parameters

cpm-slot

Specifies the CPM slot on which to disable the anti-theft locking.

Platforms

7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

Full Context

configure service ies subscriber-interface unnumbered

configure service vprn subscriber-interface unnumbered

Description

This command can be configured only for subscriber interfaces that do not have an IPv4 address explicitly configured and is therefore operationally in a DOWN state. By configuring this command, the subscriber interface borrows the IPv4 address from the referenced interface (directly or indirectly via IP address) that must be operationally UP and located in the same routing instance as the subscriber interface. This allows the subscriber interface to be operationally UP and consequently allow forwarding of the subscriber traffic.

Such interface is referred as unnumbered interface, since it does not have explicitly configured a unique IP address. Subscriber hosts under the unnumbered subscriber interface are installed in the fib as /32 hosts.

Without this command the subscriber interface is operationally DOWN and subscriber-host instantiation is not possible.

This command is mutually exclusive with the allow-unmatched-subnets command under the same CLI hierarchy.

The operation of IPv6 host is not affected by this command.

The **no** form of this command reverts to the default.

Parameters

ip-int-name

Specifies the interface name from which an IPv4 address is borrowed.

ip-address

Specifies the IP address from an optionally up interface that is used for subscriber interface.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure router interface unnumbered

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command sets an IP interface as an unnumbered interface and specifies the IP address to be used for the interface.

To conserve IP addresses, unnumbered interfaces can be configured. The address used when generating packets on this interface is the *ip-addr* parameter configured.

An error message will be generated if an **unnumbered** interface is configured, and an IP address already exists on this interface.

The **no** form of this command removes the IP address from the interface, effectively removing the unnumbered property. The interface must be **shutdown** before **no unnumbered** is issued to delete the IP address from the interface, or an error message will be generated.

Default

no unnumbered

Parameters

ip-int-name* | *ip-address

Optional. Specifies the IP address or IP interface name to associate with the unnumbered IP interface in dotted decimal notation. The configured IP address must exist on this node. It is recommended to use the system IP address as it is not associated with a specific interface and is therefore always reachable. The system IP address is the default if no *ip-addr* or *ip-int-name* is configured.

Description

This command configures the rate for ICMP host and network destination unreachable messages issued on the router interface.

The **unreachables** command enables the generation of ICMP destination unreachables on the router interface. The rate at which ICMP unreachables is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of destination unreachable messages which can be issued on the interface for a given time interval.

By default, generation of ICMP destination unreachables messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP destination unreachable messages on the router interface and reverts to the default values.

Default

unreachables 100 10

Parameters

number

Specifies the maximum number of ICMP unreachable messages to send. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds

Specifies the time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued.

Values 1 to 60

untrusted

Syntax

untrusted [**default-forwarding** *default-forwarding*]

no untrusted

Context

[Tree] (config>router>if untrusted)

Full Context

configure router interface untrusted

Description

This command configures the state of untrusted for a network IP interface.

The untrusted state identifies the participating interfaces in the label security feature for prefixes of a VPN family at an inter-AS boundary. The router supports a maximum of 15 network interfaces that can participate in this feature.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The user normally applies this command to an inter-AS interface. PIP keeps track of the untrusted status of each interface. In the data path, such an interface causes the default forwarding to be set to the *default-forwarding* value.

For backward compatibility reasons, the interface **default-forwarding** is set to the **forward** value; this means that labeled packets are checked in the normal way against the table of programmed ILMs to decide if they should be dropped or forwarded in a GRT, a VRF, or a L2 service context.

If the user sets the *default-forwarding* value to **drop**, all labeled packets received on that interface are automatically dropped.

This command sets the default behavior for an untrusted interface in the data path and for all ILMs. When enabling the label security for VPN IPv4 or VPN IPv6 prefixes, BGP programs the data path to provide an exception to the normal way of forwarding handling away from the default for those VPRN ILMs.

The **no** form of this command returns the interface into the default state of trusted.

Default

no untrusted

Parameters

default-forwarding

Specifies the default forwarding behavior of labeled packets received on this interface.

Values forward, drop

Default forward

file unzip

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command expands the contents of a ZIP file to the local file system. Any file that is zipped using the store, deflate, or zip64 compression methods can be unzipped. The source ZIP file location can be a locally installed solid-state storage device or a remote FTP or TFTP server. Files can only be unzipped to the active CPM.

Parameters

source-file-url, dest-file-url

Specifies the source or destination file URL.

Values

local-url	[*cflash-id*/]*file-path*
	200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	{ftp | tftp | sftp}://[*login*:*pswd*@]

ipv6-address:	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H
	d: [0 to 255]D
	interface - 32 characters max, for link local addresses
port	[0 to 65535]
cflash-id	cf1: | cf1-A: | cf2: | cf2-A: | cf3: | cf3-A:

create-destination

Specifies that a non-existent directory structure that is explicitly entered as the destination file URL is created as part of the unzip operation. This parameter is required to create new directories.

list

Keyword that lists the content of the ZIP file without performing the unzip operation.

force

Keyword that overwrites, without prompting, any file or directory contained within the ZIP file that already exists in the destination URL. This keyword does not automatically create new directories explicitly specified by *dest-file-url*. To create these directories, use the **create-destination** flag.

configure service nat up-nat-policy

Description

This command creates a NAT policy template for BNG CUPS UPF. This template is instantiated for a set of subscribers sharing in a NAT pool. The policy includes parameters that define the BNG CUPS UPF NAT behavior, such as, but not limited to, the following:

- ALGs
- filtering mode
- watermarks
- ports and NAT flow limits
- priority NAT flows
- protocol timers

When the BNG CPF does not receive the NAT policy template, a default template takes effect if it is configured on the BNG UPF. The name of the default NAT policy template on the BNG UPF must equal default.

Parameters

create

Keyword required to create a new NAT policy for BNG CUPS UPF.

name

Specifies the UP NAT policy name, up to 32 characters. The name default has a special meaning representing the default NAT policy template. The system uses the default template when the BNG CPF does not receive a more specific name when the subscriber is instantiated.

Full Context

configure router rsvp dbw-accounting up-threshold

Description

This command sets the minimum change (in percent of the latest advertised value) above which an increase in MRLB (IS-IS TE sub-TLV 10) or MRB (OSPF TE sub-TLV 7) triggers an IGP-TE update. This configuration only applies to a change in MRLB or MRB caused by dark bandwidth. Other events affecting MRLB or MRB (such as the change of the subscription factor or the loss of link in a LAG over which the RSVP interface is defined) trigger an immediate TE update, regardless of the importance of the impact.

Optionally, the threshold can also be expressed as an absolute value. In this case, the evaluation of the change is made using the percent change and the absolute change. An IGP-TE update is sent if both of these thresholds are crossed. Changing this parameter in the course of dark bandwidth accounting does not affect the accounting cycle.

Default

up-threshold 0

Parameters

percent-change

Specifies the minimum increase in MRLB/MRB, expressed in percent.

Values 0 to 100

absolute-change

Specifies the minimum increase in MRLB/MRB, expressed in Mb/s.

Values 0 to 1000000

no update

Context

[Tree] (debug>router>bgp update)

Full Context

debug router bgp update

Description

This command decodes and logs all sent and received update messages in the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms

All

Output

The following output is an example of debug router BGP update information.

Output Example

```
debug router bgp update
```

```

Context

[Tree] (config>test-oam>link-meas>template>twl>ipv6-dest-disc update-interval)

Full Context

configure test-oam link-measurement measurement-template twamp-light ipv6-destination-discovery update-interval

Description

This command configures the transmission frequency used to maintain the peer address. IPv6 discovery packets are generated to ensure that the peer address has not changed. After the **discovery-timer** expires or a peer is discovered during the **discovery-timer** phase the value of **update-interval** is used to continue to monitor the address of the peer. When set to zero, maintaining the peer address is disabled after the initial discovery phase. If the peer has not been discovered during that phase, disabling and enabling the IPv6 protocol can be used to restart the discovery process.

Default

update-interval 600

Parameters

seconds

Specifies the frequency used for probe packets once **discovery-timer** expires.

Values 0 to 3600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the absolute maximum random delay introduced on the update interval between two RADIUS Accounting Interim Update messages. The effective maximum random delay value is the minimum of the configured absolute jitter value and 10% of the configured update-interval.

A value of zero sends the accounting interim update message without introducing an additional random delay.

The **no** form of this command sets the default to 10% of the configured update-interval.

Default

no update-interval-jitter (10% of the configured update-interval)

Parameters

seconds

Specifies the absolute maximum jitter value in seconds.

Values 0 to 3600

Platforms

Context

[Tree] (config>card>xiom upgrade)

[Tree] (config>card>mda upgrade)

[Tree] (config>card upgrade)

Full Context

configure card xiom upgrade

configure card mda upgrade

configure card upgrade

Description

This command assigns a license level upgrade to the card, XIOM, or XMA. There can be multiple upgrades applied to a card, XIOM, or XMA. The first upgrade must use index 1 and then next index 2 and so on. Also, when removing upgrades, the largest index must be removed first and then the next largest removed and so on.

The path indicates the starting level and the new level that will apply due to the upgrade. For example, "cr1200g-cr1600g" can be applied to an XMA that is currently at the cr1200g level and after application of the upgrade, the operational level of the XMA shall be cr1600g.

There must be an upgrade license available for the path specified. Available upgrades can be checked using the **show licensing entitlements** command.

Note:
Some upgrades require a hard reset of the card or MDA to take effect. In general, this is required when the Full Duplex bandwidth is being changed.

Parameters

index

Specifies the order of the upgrade.

Values 1 to 6

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

upgrade-name

Specifies the upgrade name to be applied, up to 32 characters.

Full Context

configure router gtp uplink

configure service vprn gtp uplink

Description

This command enables GTP configuration related to a GTP uplink using the Gn, S2a, or S2b interface.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

uplink

Syntax

uplink arbiter *arbiter-name*

uplink policer *policer-id*

uplink queue *queue-id*

uplink scheduler *scheduler-name*

no uplink

Context

[Tree] (config>subscr-mgmt>gtp>apn-policy>apn>ambr-qos-mapping uplink)

Full Context

configure subscriber-mgmt gtp apn-policy apn ambr-qos-mapping uplink

Description

When enabled, the uplink rate in the APN-AMBR IE in an incoming GTP message is interpreted as a rate override for the specified ingress QoS object. For queues and policers, the PIR is overridden.

This override uses standard SR OS QoS overrides. Therefore, a subsequent Gx/RADIUS-based override removes this override.

The **no** form of this command disables the override mechanism.

Default

no uplink

Parameters

arbiter-name

Specifies the name of the arbiter to be overridden, up to 32 characters.

policer-id

Specifies the ID of the policer to be overridden.

© 2026 Nokia.

Values 1 to 63

queue-id

Specifies the ID of the queue to be overridden.

Values 1 to 32

scheduler-name

Specifies the name of the scheduler to be overridden, up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

uplink

Syntax

uplink *port-id*

uplink system-default

uplink none

Context

[Tree] (config>system>satellite>port-template>port uplink)

Full Context

configure system satellite port-template port uplink

Description

This command configures the uplink association to be used for the associated satellite port.

Parameters

port-id

Specifies the satellite physical port ID. This must use the format *slot*/*mda*/*port*. All satellites have a single slot and a single MDA, so these values will always be 1. For example, port 10 would be specified as 1/1/10.

system-default

Specifies that the uplink association is returned to the system default.

none

Clears the uplink association.

Platforms

49.80 uplink-forwarding-while-standby

uplink-forwarding-while-standby

Syntax

[**no**] **uplink-forwarding-while-standby**

Context

[Tree] (config>subscr-mgmt>up-resiliency>fsg-template uplink-forwarding-while-standby)

Full Context

configure subscriber-mgmt up-resiliency fate-sharing-group-template uplink-forwarding-while-standby

Description

This command allows a standby BNG-UP to forward uplink traffic. To prevent the possibility of packet replication toward the network, only enable this command if the access network is provisioned not to replicate unicast packets to the BNG-UP.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

49.81 uplink-initial-wait

uplink-initial-wait

Syntax

uplink-initial-wait *seconds*

Context

[Tree] (config>subscr-mgmt>vrgw>brg>brg-profile uplink-initial-wait)

Full Context

configure subscriber-mgmt vrgw brg brg-profile uplink-initial-wait

Description

This command specifies how long to wait for the uplink to fully establish when using a non-routed uplink such as a PPPoE client. During this initial wait time, setup of devices in the home is blocked.

After the timer expires, if an uplink was successful on only one of two IP stacks, devices continue to be configured with the successful IP stack. Control plane message for the failed IP stack are dropped.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

uplink-initial-wait 30

Parameters

seconds

Specifies the timeout in seconds.

Values 10 to 300

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

49.82 uplink-mbr-gbr

uplink-mbr-gbr

Syntax

uplink-mbr-gbr arbiter *arbiter-name*

uplink-mbr-gbr policer *policer-id*

uplink-mbr-gbr queue *queue-id*

uplink-mbr-gbr scheduler *scheduler-name*

no uplink-mbr-gbr

Context

[Tree] (config>subscr-mgmt>sla-prof>pfcp>seq uplink-mbr-gbr)

Full Context

configure subscriber-mgmt sla-profile pfcp-mappings session-qer uplink-mbr-gbr

Description

This command configures the uplink MBR/GBR to QoS override mapping.

The **no** form of the command disables the uplink MBR/GBR mapping.

Default

no uplink-mbr-gbr

Parameters

arbiter-name

Specifies the arbiter target of the MBR/GBR override. The arbiter name can be up to 32 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policer-id

Specifies the policer ID target of the MBR/GBR override.

Values 1 to 63

queue-id

Specifies the queue ID target of the MBR/GBR override.

Values 1 to 8

scheduler-name

Specifies the scheduler name target of the MBR/GBR override. The scheduler name can be up to 32 characters.

upnp-mappings

Syntax

upnp-mappings [*upnp-mappings*]

no upnp-mappings

Context

[Tree] (config>isa>wlan-gw-group>nat>session-limits upnp-mappings)

Full Context

configure isa wlan-gw-group nat session-limits upnp-mappings

Description

This command limits the number of Universal Plug 'n Play mappings per member

The **no** form of this command reverts to the default value.

Default

upnp-mappings 524288

Parameters

upnp-mappings

specifies, for each MDA in this ISA group, the maximum number of Universal Plug 'n Play (UPnP) mappings.

Values 1 to 524288

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure isa nat-group session-limits upnp-mappings

Description

This command specifies the maximum number of UPnP mappings per ISA.

Default

524288

Parameters

limit

Specifies the maximum number of UPnP mappings.

Values 1 to 524288

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

49.85 upnp-policy

upnp-policy

Syntax

upnp-policy *policy-name* [**create**]

no upnp-policy *policy-name*

Context

[Tree] (config>service>upnp upnp-policy)

Full Context

configure service upnp upnp-policy

Description

This command creates a new upnp-policy or enters the configuration context of an existing upnp-policy.

The **no** form of the command removes the upnp-policy policy-name from the configuration.

Parameters

policy-name

Specifies the name of the UPnP policy up to 32 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

upnp-policy

Syntax

upnp-policy *policy-name*

no upnp-policy

Context

[Tree] (config>subscr-mgmt>sub-prof upnp-policy)

Full Context

configure subscriber-mgmt sub-profile upnp-policy

Description

This command enables UPnP IGD services for the subscriber. All ESM hosts of the subscriber could use the UPnP protocol to create port mapping. This feature only support L2-Aware NAT host.

UPnP parameters are defined in the referenced upnp-policy configured in the **configure service upnp** context.

Default

no upnp-policy

Parameters

policy-name

Specifies the UPnP policy associated with this subscriber profile up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

49.86 upstream-ip-filter

upstream-ip-filter

Syntax

upstream-ip-filter *filter-id*

no upstream-ip-filter

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vprn>nat>outside upstream-ip-filter)

[Tree] (config>router>nat>outside upstream-ip-filter)

Full Context

configure service vprn nat outside upstream-ip-filter

configure router nat outside upstream-ip-filter

Description

This command configures the ip-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance; it is useful for traffic that bypasses the ingress filters applied in the inside virtual router instance, such as DS-Lite traffic.

Default

no upstream-ip-filter

Parameters

filter-id

Specifies the identifier of an IP filter.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

49.87 upstream-ipv6-filter

upstream-ipv6-filter

Syntax

upstream-ipv6-filter *filter-id*

no upstream-ipv6-filter

Context

[Tree] (config>router>nat>outside upstream-ipv6-filter)

[Tree] (config>service>vprn>nat>outside upstream-ipv6-filter)

Full Context

configure router nat outside upstream-ipv6-filter

configure service vprn nat outside upstream-ipv6-filter

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the ipv6-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance. This is useful for shared v6 filters that apply to all v6 DSM hosts.

Default

no upstream-ipv6-filter

Parameters

filter-id

Specifies the identifier of an ipv6-filter.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

49.88 url

url

Syntax

url *rdr-url-sting*

no url

Context

[Tree] (config>subscr-mgmt>http-rdr-plcy url)

Full Context

configure subscriber-mgmt http-redirect-policy url

Description

This command configures the HTTP URL to re-direct the matching traffic to. It also can specify inclusion of original URL, MAC address and IP address of the subscriber in the redirect URL.

Parameters

rdr-url-sting

Specifies the URL to redirect to.

Values

rdr-url-string		Up to 255 characters
macro substitutions:		
	$URL	Request-URI in the HTTP GET Request received

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

$MAC	A string that represents the MAC address of the subscriber host
$IP	A string that represents the IP address of the subscriber host

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

url

Syntax

url *url*

no url

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update>crl-urls>url-entry url)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry url

Description

This command specifies the HTTP URL of the CRL file for the **url-entry**. The system supports both IPv4 and IPv6 HTTP connections.

Note:
The URL must point to a DER encoded CRL.

Default

no url

Parameters

url

Specifies the URL, which specifies the location, where an updated CRL can be downloaded from.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

url

Syntax

url *url-string* [**service-id** *service-id*]

url *url-string* [**service-name** *service-name*]

no url

Context

[Tree] (config>system>security>pki>ca-profile>cmpv2 url)

Full Context

configure system security pki ca-profile cmpv2 url

Description

This command specifies HTTP URL of the CMPv2 server. The URL must be unique across all configured ca-profiles.

The URL is resolved by the DNS server configured (if configured) in the corresponding router context.

If the *service-id* is 0 or omitted, then system tries to resolve the FQDN via DNS server configured in bof.cfg. After resolution, the system connects to the address in the management routing instance first, then the base routing instance.

Note:
If the service is VPRN, the system only allows HTTP ports 80 and 8080.

Parameters

url-string

Specifies the HTTP URL of the CMPv2 server, up to 180 characters.

service-id *service-id*

Specifies the service instance that used to reach CMPv2 server.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **url** *url-string* **service-name** *service-name* variant can be used in all configuration modes.

Values service-id: 1 to 2147483647 base-router: 0

service-name service-name

Identifies the service, up to 64 characters.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

49.89 url-entry

url-entry

Syntax

url-entry *entry-id* [**create**]

no url-entry *entry-id*

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update>crl-urls url-entry)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry

Description

This command creates a new **crl-url** entry with the **create** parameter, or enters an existing url-entry configuration context without **create** parameter.

The **no** form of this command removes the specified entry.

Parameters

entry-id

Specifies a URL configured on this system.

Values 1 to 8

create

Creates an auto URL entry.

Platforms

All

49.90 url-filter

url-filter

Syntax

url-filter *url-filter-name* [**characteristic** *characteristic-name*]

no url-filter

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>app-assure>group>policy>aqp>entry>action url-filter)

Full Context

configure application-assurance group policy app-qos-policy entry action url-filter

Description

This command configures a url-filter action for flows matching this entry. The **characteristic** parameter enables the system to use the value of the characteristic name specified in the app-qos-policy url-filter action for the configurable ICAP x-header name provisioned in the url-filter policy. The ICAP server can then use this value to decide which url-filter policy to apply instead of applying a filter policy based on the subscriber name.

Parameters

url-filter-name

Specifies the name of the url-filter policy, up to 32 characters.

characteristic-name

Specifies the name of the application service option characteristic used to determine the custom X-Header value.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

url-filter

Syntax

url-filter *url-filter-name* [**create**]

no url-filter *url-filter-name*

Context

[Tree] (config>app-assure>group url-filter)

Full Context

configure application-assurance group url-filter

Description

This command configures a URL filter action for flows of a specific type matching this entry.

If no URL filters are specified then no URL filters will be evaluated.

Parameters

url-filter-name

Specifies the Application-Assurance URL filter that will be evaluated.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

49.91 url-list

url-list

Syntax

url-list *url-list-name* [**create**]

no url-list *url-list-name*

Context

[Tree] (config>app-assure>group url-list)

Full Context

configure application-assurance group url-list

Description

This command configures a url-list object. The url-list points to a file containing a list of URLs located on the system Compact Flash. The url-list is then referenced in a url-filter object in order to filter and redirect subscribers when a URL from this file is accessed.

The **no** form of this command removes the url-list object.

Parameters

url-list-name

Specify the Application-Assurance url-list

create

Keyword used to create the URL list.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

49.100 use-def-mcast

use-def-mcast

Syntax

[**no**] **use-def-mcast**

Context

[Tree] (config>service>vpls>isid-policy>entry use-def-mcast)

Full Context

configure service vpls isid-policy entry use-def-mcast

Description

The **use-def-mcast** option prevents local installation of the ISIDs in the range in the MFIB and uses the default multicast tree instead for a B-VPLS. In a node that does not have I-VPLS or static-isids, this command prevents the building of an MFIB entry for this ISID when received in a SPBM TLV and allows the broadcast of ISID based traffic on the default multicast tree. If an **isid-policy** exists, the core nodes can have this policy to prevent connectivity problems when some nodes are advertising an ISID and others are not. In a I-VPLS service if the customer MAC (C-MAC) is unknown, a frame will have the Multicast DA for an ISID (PBB-OUI + ISID) flooded on the default multicast tree and not pruned.

Default

no use-def-mcast

configure system security tacplus use-default-template

configure service vprn aaa remote-servers tacplus use-default-template

Description

This command specifies whether the **user-template tacplus_default** is actively applied to the TACACS+ user. When enabled, some parameters of the **user-template tacplus_default** are actively applied to all users that authenticate via TACACS+. See the **user-template tacplus_default** command for more details.

When disabled, the parameters of the template are not applied to TACACS+ users, and TACACS+ users cannot connect to an SR OS router since the user access parameters are not available. In this case, TACACS+ can only be used for accounting.

configure service vpls pbb use-es-bmac

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is only supported in B-VPLS instances where BGP-EVPN is enabled and controls the source B-MAC used by the system for packets coming from the SAP or spoke-SDPs when they belong to an EVPN Ethernet-Segment.

If enabled, the system will use a source B-MAC derived from the source-bmac (high order four bytes) and the least significant two bytes configured in **config>service>system>bgp-evpn>eth-seg>source-bmac-lsb** for all the packets coming from the local ethernet-segment.

If **no use-es-bmac** is configured, the system will use the regular source-bmac (provided by the **config>service>vpls>pbb>source-bmac** command, or the chassis bmac if the source-bmac is not configured).

Default

no use-es-bmac

use-gi-address [**scope** *scope*]

Context

[Tree] (config>service>vprn>dhcp>server use-gi-address)

[Tree] (config>router>dhcp>server use-gi-address)

Full Context

configure service vprn dhcp local-dhcp-server use-gi-address

configure router dhcp local-dhcp-server use-gi-address

Description

This command enables the use of gi-address matching. If the gi-address flag is enabled, a pool can be used even if a subnets is not found. If the **local-user-db-name** is not used, the gi-address flag is used and addresses are handed out by GI only. If a user must be blocked from getting an address the server maps to a local user database and configures the user with no address.

A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface the pool may provide IP addresses from any of the subnets included when the GI is matched to any of its subnets. This allows a pool to be created that represents a sub-int.

The **no** form of the reverts to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

scope

Specifies if addresses are handed out for a certain subnet where the gi-address belongs to only or for all subnets part of the pool.

Values **subnet** — Addresses are only handed out for the subnet where the gi-address is part.

pool — All subnets part of the pool which contain subnet where the gi-address is part of can hand out addresses.

configure router dhcp6 local-dhcp-server use-link-address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the local pool selection for IPv6 address or prefix assignment for the configured link-address under relay configuration. The selected pool will contain a prefix covering the link-address. The scope option defines the scope for the match. With scope **subnet**, the prefix or address selection is limited to the prefix in the pool that covers the link-address. With scope **pool**, all the prefixes in the selected pool are eligible for assignment.

The **no** form of the reverts to the default.

Default

scope subnet

Parameters

scope

Specifies the scope of the IP address selection.

Values **subnet** — Specifies that the prefix or address selection is limited to the prefix in the pool that covers the link address.

pool — Specifies that all prefixes in the selected pool are eligible for assignment.

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

49.115 use-pqc-only

use-pqc-only

Syntax

[**no**] **pqc**

Context

[Tree] (config>system>security>tls use-pqc-only)

Full Context

configure system security tls use-pqc-only

Description

This command configures the system to use only PQC algorithms when enabled. Even if non-PQC algorithms are configured, the system only negotiates the PQC algorithms. The system does not accept non-PQC algorithms with this command enabled.

When a user enables the **use-pqc-only** command, the system requires that the signature, cipher, and group lists must each have at least one PQC algorithm configured. If this condition is not met, the system does not allow the list to be assigned to an administratively enabled server or client TLS profile. In addition, with **use-pqc-only** enabled, TLS 1.3 only advertises PQC algorithms within each list in the TLS handshake and ignores any non-PQC algorithms, if they are present in the list.

This is a system-wide token and, when enabled, it affects all TLS sessions. Consequently, it cannot be enabled if any server or client TLS profiles contain existing lists that do not support PQC algorithms. To enable the **use-pqc-only** command, the user must first add a PQC algorithm to all lists that are assigned to administratively enabled profiles.

The **no** form of this command reverts to the default, which allows both non-PQC and PQC algorithms to be negotiated.

Default

no use-pqc-only

no use-vrtr-if-index

Platforms

All

49.120 user

user

Syntax

[**no**] **user** *user-name*

Context

[Tree] (config>system>security user)

Full Context

configure system security user

Description

This command creates a local user and a context to edit the user configuration.

If a new *user-name* is entered, the user is created. When an existing *user-name* is specified, the user parameters can be edited.

When creating a new user and then entering the **info** command, the system displays a password in the output. This is expected behavior in the hash2 scenario. However, when using that user name, there will be no password required. The user can login to the system and then <ENTER> at the password prompt, the user will be logged in.

Unless an administrator explicitly changes the password, it will be null. The hashed value displayed uses the username and null password field, so when the username is changed, the displayed hashed value will change.

The **no** form of this command deletes the user and all configuration data. Users cannot delete themselves.

Parameters

user-name

Specifies the name of the user up to 32 characters.

Parameters

local-user-db-name

Specifies the name of a user database, up to 32 characters.

create

Keyword used to create the user database. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-db

Syntax

user-db *local-user-db-name*

no user-db

Context

[Tree] (config>service>ies>if>ipv6>dhcp6-relay user-db)

[Tree] (config>service>vprn>if>ipv6>dhcp6-relay user-db)

Full Context

configure service ies interface ipv6 dhcp6-relay user-db

configure service vprn interface ipv6 dhcp6-relay user-db

Description

This command enables access to the LUDB for DHCPv6 messages under a routed interface. The name of this LUDB must match the name of the LUDB configured by the **config>sub-gmt>local-user-db** command.

The **no** form of this command reverts to the default.

Parameters

local-user-db-name

Specifies the name of the local user database, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

user-db

Syntax

user-db *local-user-database-name*

no user-db

Context

[Tree] (config>subscr-mgmt>gtp>apn-policy>apn user-db)

Full Context

configure subscriber-mgmt gtp apn-policy apn user-db

Description

This command configures the LUDB with which the GTP connection is authenticated.

The **no** form of this command removes the user database for authentication with this APN. Only new session setups are affected.

Default

no user-db

Parameters

local-user-database-name

Specifies the name of the LUDB to be used, up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

user-db

Syntax

user-db *local-user-db-name*

no user-db

Context

[Tree] (config>service>vprn>sub-if>grp-if>wpp user-db)

Full Context

configure service ies subscriber-interface group-interface wpp user-db

configure service vprn subscriber-interface group-interface wpp user-db

Description

This command configures the user database.

Note:
If configured, the values configured under grp-if will only be used if there is no corresponding value returned from LUDB lookup.

This command specifies the LUDB system use to lookup while creating initial host before WPP authentication. LUDB could return WPP attributes such as portal name, **initial-sla-profile**, **initial-sub-profile**, and so on LUDB is configured in **config>subscr-mgmt>local-user-db** context.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command reverts to the default.

Parameters

local-user-db-name

Specifies the Local User Database name up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-db

Syntax

[**no**] **user-db**

Context

[Tree] (config>service>ies>sub-if>grp-if>ipv6>rtr-sol user-db)

Full Context

configure service ies subscriber-interface group-interface ipv6 router-solicit user-db

Description

This command enables the use of the local-user-database for authentication.

The **no** form of this command reverts to the default.

Parameters

local-user-db-name

Specifies the name of the local-user-database to authenticate the router-solicit. The local-user-database can also return a static prefix or a pool name for address assignment.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service vpls sap ipoe-session user-db

configure service ies subscriber-interface group-interface ipoe-session user-db

configure service vprn subscriber-interface group-interface ipoe-session user-db

Description

This command configures the local user database to use for IPoE session authentication.

When configured on a capture SAP, the group interface must have the same local user database configured.

On a wlan-gw group interface, the **no** form of this command indicates that the user database is picked from the following sources in the order shown:

1. dhcp
2. ipv6>dhcp6
3. ipv6>router-solicit

If no user database can be found in any of these locations, processing continues as if no user database was configured. This behavior is for backwards compatibility reasons only; when using a LUDB, it should be explicitly added to the IPoE session configuration.

The **no** form of this command reverts to the default.

Parameters

local-user-db-name

Specifies the local user database name up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service ies subscriber-interface group-interface ipv6 dhcp6 user-ident

configure service vprn subscriber-interface group-interface ipv6 dhcp6 user-ident

Description

This feature is only applicable when DHCPv6-snooping is enabled. The Ethernet header MAC address on DHCPv6 is used as the default key host identification. This command allows addition the keys for identifying the DHCPv6 host. The *interface-id* can be included in addition to the MAC key to further differentiate each DHCPv6 host.

The **no** form of this command reverts to the default.

Default

user-ident mac

Parameters

user-ident

Specifies the DHCP6 user-identification for this interface.

Values **mac** — Specifies to use only the Ethernet MAC of the DHCPv6 message to identify the host.

mac-interface-id — Specifies to additionally use the interface-id to identify the DHCPv6 host.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn dhcp local-dhcp-server user-ident

configure router dhcp local-dhcp-server user-ident

Description

This command configures the user identification method for the DHCPv4 server.

The **no** form of the reverts to the default.

Default

user-ident mac-circuit-id

Parameters

user-ident

Specifies the user identification method

Values **client-id** — Specifies to use the DHCPv4 client identifier as the user identification method.

circuit-id — Specifies to use the circuit identifier of the DHCPv4 client as the user identification method.

mac — Specifies to use the MAC address of the DHCPv4 client as the user identification method.

mac-circuit-id — Specifies to use the MAC address and circuit identifier of the DHCPv4 client as the user identification method.

remote-id — Specifies to use the MAC address of the remote end as the user identification method.

Platforms

[Tree] (config>router>dhcp6>server user-ident)

Full Context

configure service vprn dhcp6 local-dhcp-server user-ident

configure router dhcp6 local-dhcp-server user-ident

Description

This command configures the keys for identification of the DHCPv6 lease being held in the lease-database (for configured period after lease timeout). Subscriber requesting a lease via DHCPv6 that matches an existing lease based on this configured key is handed the matched prefix or address. This allows address and prefix "stickiness" for DHCPv6 assigned prefixes (IA_NA or PD).

The **no** form of the reverts to the default.

Default

user-ident duid

Parameters

user-ident

Specifies the user identification method.

Values **duid** — Specifies the IPv6 DHCP unique identifier from DHCPv6.

interface-id — Specifies the IPv6 interface-id option.

interface-id-link-local — Specifies the interface-id and link-local address.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

no user-name-format

Context

[Tree] (config>subscr-mgmt>auth-plcy user-name-format)

Full Context

configure subscriber-mgmt authentication-policy user-name-format

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command defines the format of the "user-name” field in the session authentication request sent to the RADIUS server. By default, the MAC source address of the DHCPv4 DISCOVER or DCHPv6 SOLICIT message is used in the user-name field.

The **no** form of this command reverts to the default.

Parameters

format

Specifies the user name format in RADIUS message.

Values ascii-converted-circuit-id, ascii-converted-tuple, circuit-id, dhcp-client-vendor-opts, mac, mac-giaddr, tuple

ascii-converted-circuit-id — Identical to circuit-id, but the user name is sent to the RADIUS server as a string of hex digits, for use if there is binary data in the circuit-id

ascii-converted-tuple — Identical to tuple, but the circuit-id part of the user name is sent to the RADIUS server as a string of hex digits, for use if there is binary data in the circuit-id

circuit-id — If the system serves as a DHCP relay server which inserts option 82 info, the user name is formatted as defined under DHCP information option. If the system is not a DHCP relay server, the circuit-id is taken from option 82 in the received DHCP message. If no circuit-id can be found, the DHCP-msg is rejected.

dhcp-client-vendor-opts — IPoEv4 host (IPoE session enabled or disabled on group-interface) — The RADIUS user-name is a concatenation of the DHCPv4 Client Identifier Option 61, an "@” delimiter, and the DHCPv4 Vendor Class Identifier Option 60. Non-printing characters in the DHCP option values are converted as described below.

IPoEv6 host (IPoE session enabled on group-interface) — The RADIUS user-name is a concatenation of the identifier field of a type 2 DUID in the DHCPv6 Client Identifier Option 1, the "@” delimiter, and the opaque data field of the first vendor class data in the DHCPv6 Vendor Class Option 16. Non-printing characters in the DHCP option values are converted as described below.

IPoEv6 host (IPoE session disabled on group-interface) — The MAC source address of the DHCPv6 SOLICIT message.

In the absence of a DHCPv4 Client Identifier Option 61 or a DHCPv6 Client Identifier Option 1 containing a DUID type 2, the DHCP client MAC address is used.

In the absence of a DHCPv4 Vendor Class Identifier Option 60 or a DHCPv6 Vendor Class Option 16, the "@” delimited is omitted and nothing is appended.

Non-printing characters, that is, characters outside the ASCII range hex 21 through hex 7E, are converted into an underscore (hex 5F) character.

mac — The MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message is used in the user-name field. The format of the MAC address string used as the user name in the RADIUS authentication requests uses lowercase hex digits, and ":” as the inter-digit separator, for example, 00:11:22:aa:bb:cc is valid but 00-11-22-AA-BB-CC will return an error. The RADIUS server must be configured accordingly, otherwise the authentication request will fail.

mac-giaddr — A concatenation of the MAC address and the Relay Agent IP address (giaddr)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tuple — Specifies that the concatenation of MAC source address and circuit-ID are used in the user-name field

mac-format

Specifies how a MAC address is represented when contacting a RADIUS server. This is only used while the value of is equal to the DHCP client vendor options and if the MAC address is used by default of the DHCP client vendor options.

Examples: ab: 00:0c:f1:99:85:b8 7xxx style

XY- 00-0C-F1-99-85-B8 IEEE canonical style

mmmm. 0002.03aa.abff Cisco style

append

Specifies the data type which is an enumerated integer that indicates what needs to be appended to the user-name sent to the RADIUS server.

Values 1 — nothing 2 — domain name

domain

Specifies to user the domain name. In some instances it is desired to add a domain only to usernames which have omitted the domain (@domain). In these instances a default-domain can be appended to usernames which lack a @domain.

append

Adds a "@" delimiter and the specified string after the PAP/CHAP username. No allowance is made for the presence of an existing domain or @ delimited.

replace

Replaces the character-string after the "@" delimiter with the string specified.

strip

Removes all characters after and including the "@" delimiter.

For example:

```
Command: append
String:     domainA-1.com
PAP/CHAP User:    someuser
Resulting User:    someuser@domainA-1.com

Command: append
String:     domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@existing-domain.net@domainA-1.com

Command: strip
String:
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser

Command: replace
String:     domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@domainA-1.com

Command: default-domain
```

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

```
String:    domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@existing-domain.net

Command: default-domain
String: domainA-1.com
PAP/CHAP User:    someuser
Resulting User:    someuser@domainA-1.com
```

no user-name-format

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>nasreq user-name-format)

Full Context

configure subscriber-mgmt diameter-application-policy nasreq user-name-format

Description

This command defines the format of the User-Name AVP value in Diameter NASREQ AA-Requests for IPoE hosts.

The **no** form of this command reverts to the default.

Parameters

format

Specifies the format of the User-Name AVP value.

Values **mac** — Specifies to use the MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message in the user-name field. The format of the MAC address string is defined with the **mac-forma**t CLI command.

circuit-id — Specifies to use the circuit ID to identify the user toward the server. If the system serves as a DHCP relay server which inserts option 82 info, the user name is formatted as defined under DHCP information option. If the system is not a DHCP relay server, the circuit-id is taken from option 82 in the received DHCP message. If no circuit-id can be found, the DHCP-msg is rejected.

tuple — Specifies to use a concatenation of MAC source address and circuit-ID.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ascii-converted-circuit-id — Identical to circuit-id, but the user name is a string of hex digits, for use if there is binary data in the circuit-id.

ascii-converted-tuple — Specifies a string of hex digits, for use if there is binary data in the circuit-id.

dhcp-client-vendor-opts — Specifies to use a concatenation of the DHCPv4 Client Identifier Option 61, the "@" delimiter, and the DHCPv4 Vendor Class Identifier Option 60. Non-printing characters in the DHCP option values are converted as described below.

In the absence of a DHCPv4 Client Identifier Option 61, the DHCP client MAC address is used.

In the absence of a DHCPv4 Vendor Class Identifier Option 60, the "@" delimiter is omitted and nothing is appended.

Non-printing characters, that is, characters outside the ASCII range hex 21 through hex 7E, are converted into an underscore (hex 5F) character.

mac-giaddr — Specifies to use a concatenation of MAC source address and DHCP GI address.

nas-port-id — Specifies to use a value of the nas-port-id with format defined in the include-avp section.

Description

This command enables domain name manipulation of the user name, such as append, strip, replace or add as default.

For IPoE, this command only applies when **user-name-format** is configured to **dhcp-client-vendor-opts**.

The **no** form of this command reverts to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

operation

Specifies the user name manipulations with respect to domain name values.

Values **append-domain** – appends an "@" delimiter with the specified domain-name at the end of the user-name, independent if a domain name was already present

strip-domain – removes all characters after and including the "@" delimiter

default-domain – adds an "@" delimiter and the specified domain name to user-names that have no domain name present

replace-domain – replaces the characters after the "@" delimiter with the specified domain-name

domain-name

Specifies the domain name string to be used in the specified operation, up to 128 characters.

49.128 user-srlg-db

user-srlg-db

Syntax

user-srlg-db [**enable** | **disable**]

Context

[Tree] (config>router>mpls user-srlg-db)

Full Context

configure router mpls user-srlg-db

Description

This command enables the use of CSPF by the user SRLG database. When the MPLS module makes a request to CSPF for the computation of an SRLG secondary path, CSPF will query the local SRLG and compute a path after pruning links that are members of the SRLG IDs of the associated primary path. When MPLS makes a request to CSPF for an FRR bypass or detour path to associate with the primary path, CSPF queries the user SRLG database and computes a path after pruning links that are members of the SRLG IDs of the PLR outgoing interface.

If an interface was not entered into the user SRLG database, it is assumed that it does not have any SRLG membership. CSPF will not query the TE database for IGP advertised interface SRLG information.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The disable keyword disables the use of the user SRLG database. CSPF will then resume queries into the TE database for SRLG membership information. The user SRLG database is maintained.

user-template

Syntax

user-template {**tacplus_default** | **radius_default** | **ldap-default**}

Context

[Tree] (config>system>security user-template)

Full Context

configure system security user-template

Description

This command configures default security user template parameters.

Parameters

tacplus_default

Specifies the default TACACS+ user template. All parameters of the tacplus_default template except the "profile" are actively applied to all TACACS+ users if tacplus **use-default-template** is enabled. The **profile** parameter is used for AAA command authorization if TACACS+ authorization is disabled, or if the TACACS+ server does not return a priv-lvl for a user when **use-priv-lvl** is enabled under **tacplus authorization**. See the **tacplus authorization** command for more details.

radius_default

Specifies the default RADIUS user template. The radius_default template is actively applied to a RADIUS user if radius authorization is enabled, radius **use-default-template** is enabled, and no VSAs are returned with the auth-accept from the RADIUS server.

ldap_default

Specifies the default LDAP user template.

username *user-name* **no-domain**

username *user-name* **domain-only**

no username

Context

[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>host-ident username)

Full Context

configure subscriber-mgmt local-user-db ppp host host-identification username

Description

This command specifies the PPPoE username to match for a host lookup. When **no-domain** or **domain-only** is specified, the username "user[@domain]" is converted to a user and a domain entity by splitting it on the first @-sign before matching on the specific entity.

Note:
This command is only used when **username** is configured as one of the **match-list** parameters.

The **no** form of this command removes the username from the configuration.

Parameters

username

Specifies the user name, up to 253 characters, of this host. For example, "jane@nokia.com”.

no-domain

Only the user user part of the username is specified and used for matching. For example "jane".

domain-only

Only the domain part of the username is specified and used for matching, for example, nokia.com.

49.131 usm-community

usm-community

Syntax

usm-community *community-string* [**hash** | **hash2** | **hash3** | **custom**] **group** *group-name* [**src-access-list** *list-name*]

no usm-community *community-string* [**hash** | **hash2** | **custom**]

Context

[Tree] (config>system>security>snmp usm-community)

Full Context

configure system security snmp usm-community

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is used to associate a community string with an SNMPv3 access group and its view. The access granted with a community string is restricted to the scope of the configured group.

Nokia's SR OS implementation of SNMP uses SNMPv3. In order to implement SNMPv1 and SNMPv2c configurations, several access groups are predefined. In order to implement SNMP with security features (Version 3), security models, security levels, and USM communities must be explicitly configured. Optionally, additional views which specify more specific OIDs (MIB objects in the subtree) can be configured.

The **no** form of this command removes a community string.

Parameters

community-string

Specifies the SNMPv1/SNMPv2c community string to determine the SNMPv3 access permissions to be used. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

group

Specifies the group that governs the access rights of this community string. This group must be configured first in the **config**>**system**>**security**>**snmp**> **access group** context. Nokia does not recommend associating a **usm-community** with an SNMP access group that is configured with the **li** (lawful intercept) context.

list-name

Specifies the usm-community to reference a specific src-access-list that will be used to validate the source IP address of all received SNMP requests that use this usm-community. Multiple **community**, **usm-community**, or **vprn snmp community** instances can reference the same **src-access-list**.

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server valid-lifetime

configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server valid-lifetime

Description

This command configured valid-lifetime for DHCPv6 lease (address/prefix).

The valid lifetime is the length of time an address/prefix remains in the valid state (for example, the time until invalidation). The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address/prefix becomes invalid and must not be used in communications. RFC 2461, sec 6.2.1 recommends default value of 30 days.

Each address/prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (DHCP server, RADIUS, ESM). To request an extension of the lifetimes

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

assigned to an address, the client sends a Renew message to the addressing authority. The addressing authority sends a Reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption.

The lifetimes are transmitted from the addressing authority to the client in the IA option on the top level (not the address or prefix level).

The **no** form of this command reverts to the default.

Default

valid-lifetime days 1

Parameters

infinite

Specifies that the valid lifetime is infinite.

Full Context

configure service vprn router-advertisement interface prefix valid-lifetime

Description

This command specifies the length of time in seconds that the prefix is valid for the purpose of on-link determination. A value of all one bits (0xffffffff) represents infinity.

The address generated from an invalidated prefix should not appear as the destination or source address of a packet.

Default

valid-lifetime 2592000

Parameters

seconds

Specifies the remaining length of time in seconds that this prefix will continue to be valid.

Values 0 to 429496729

infinite

Specifies that the prefix will always be valid. A value of 4,294,967,295 represents infinity.

Platforms

All

50.6 validate

validate

Syntax

validate [*file-url*]

Context

[Tree] (admin>system>license validate)

Full Context

admin system license validate

Description

This command performs a validation on the license file pointed to by the command line argument. A validation ensures that the license is compatible with the current state of the target system but it does not change the existing license. Aspects that can cause a failure in the validation include:

- The license file was created for a different target system. The UUID encoded into the file must match that defined by the specific hardware platform.
- The license file does not include license information for the release of software currently running on the system.
- The current date/time reported to system is outside the validity period encoded in the license.
- The system is currently using a hardware upgrade license that is not included in the new file being validated.

Note:
If the CLM tool is being used for license management, it shall perform the validation and activation and there is no need to enter these commands manually.

Parameters

file-url

Specifies the file URL location to read the license file.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values local-url, remote-url

Note:
IPv6 addresses apply only to 7750 SR and 7950 XRS.

50.7 validate-dest-prefix

validate-dest-prefix

Syntax

validate-dest-prefix

no validate-dest-prefix

Context

[Tree] (config>service>vprn>bgp>flowspec validate-dest-prefix)

Full Context

configure service vprn bgp flowspec validate-dest-prefix

Description

This command enables the validation of received IPv4 and IPv6 FlowSpec routes that contain a destination-prefix subcomponent.

A FlowSpec route with a destination-prefix subcomponent is considered invalid if both of the following are true:

- the route was originated outside the local AS of the receiving BGP router
- the neighbor AS of the FlowSpec route does not match the neighbor AS of the best match BGP (unicast) route for the destination prefix or the neighbor AS of any longer match BGP (unicast) route for the destination prefix

An invalid route is retained in the BGP RIB, but it is not used for filtering traffic or propagated to other BGP routers.

The **no** form of this command disables the validation procedure based on the destination prefix.

Default

no validate-dest-prefix

Platforms

50.10 validate-redirect-ip

validate-redirect-ip

Syntax

validate-redirect-ip

no validate-redirect-ip

Context

[Tree] (config>service>vprn>bgp>flowspec validate-redirect-ip)

Full Context

configure service vprn bgp flowspec validate-redirect-ip

Description

This command enables the validation of the redirect-to-IPv4 action attached to FlowSpec-IPv4 routes received by the BGP instance.

The SR OS FlowSpec implementation supports the redirect-to-IPv4 action encoded as an IPv4-address-specific BGP extended community.

When this command is configured, a FlowSpec-IPv4 route is considered invalid and is not installed as a filter rule if it is determined to have originated from a different AS than the IP route that resolves the redirection IPv4 address. The originating AS of a FlowSpec route is identified based on its AS path.

The **no** form of this command disables the validation procedure based on the redirect-to-IPv4 action.

Default

no validate-redirect-ip

Platforms

configure subscriber-mgmt isa-service-chaining vas-filter

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a Value Added Service filter.

The **no** form of this command removes the VAS filter name from the configuration.

Default

This command configures a value added service (VAS) filter that can be associated to an L2-aware NAT host, and is matched on the NAT ISA to select flows for a host that needs to be steered to remote value-added services.

Parameters

name

Specifies a VAS filter name, up to 32 characters.

create

Keyword used to create the VAS filter instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service ies interface vas-if-type

Description

This command configures the type of a Value Added Service (VAS) facing interface. To change the **vas-if-type**, the **shutdown** command is required. The **vas-if-type** and **loopback** commands are mutually exclusive.

The **no** form of this command removes the VAS interface type configuration.

Default

no vas-if-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

to-from-access

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from access interfaces (upstream) is redirected to a PBR target reachable over this interface for upstream VAS processing. Downstream traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

to-from-network

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from network interfaces (downstream) is redirected to a PBR target reachable over this interface for downstream VAS processing. Upstream traffic after VAS processing must arrive on this interface, so that regular routing can be applied.

to-from-both

Used when a single interface is used for VAS connectivity (no local-to-local traffic). For service chaining, both traffic arriving from access interfaces and from network interfaces is redirected to a PBR target reachable over this interface for upstream/downstream VAS processing. Traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

configure router interface vas-if-type

Description

This command configures the type of a Value Added Service (VAS) facing interface. To change the **vas-if-type**, the **shutdown** command is required. The **vas-if-type** and **loopback** commands are mutually exclusive.

The **no** form of this command removes the VAS interface type configuration.

Default

no vas-if-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

to-from-access

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from access interfaces (upstream) is redirected to a PBR target reachable over this interface for upstream VAS processing. Downstream traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

to-from-network

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from network interfaces (downstream) is redirected to a PBR target reachable over this interface for downstream VAS processing. Upstream traffic after VAS processing must arrive on this interface, so that regular routing can be applied.

to-from-both

Used when a single interface is used for VAS connectivity (no local-to-local traffic). For service chaining, both traffic arriving from access interfaces and from network interfaces is redirected to a PBR target reachable over this interface for upstream/downstream VAS processing. Traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor to egress subscriber PBR.

Full Context

configure service system bgp-evpn ethernet-segment vc-id-range

Description

This command determines the VC-IDs associated with the virtual Ethernet Segment on a specific SDP based on the following considerations:

- VC-IDs for manual spoke-SDP and BGP-AD are included in the range.
- Th mesh-sdp VC-IDs are not allowed on a SDP used by a virtual ES.
- A maximum of 8 ranges are allowed.
- A range can be comprised of a single VC-ID.
- A **vc-id-range** can be comprised of a single VC-ID.
- Shutting down the ES is not required prior to making changes.

The **no** form of the command removes the configured range. Only the first VC-ID value is required to remove the range.

Parameters

vc-id

Specifies the VC-ID. When configuring a range of VC-IDs (and not a single value), the value of the second VC-ID must be greater than the first VC-ID.

vc-type

Syntax

vc-type {**ether** | **vlan**}

no vc-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>sdp>binding>pw-port vc-type)

Full Context

configure service sdp binding pw-port vc-type

Description

This command sets the forwarding mode for the pseudowire port. The vc-type is signaled to the peer, and must be configured consistently on both ends of the pseudowire. vc-type VLAN is only configurable with dot1q encapsulation on the pseudowire port. The tag with vc-type vlan only has significance for transport, and is not used for service delineation or ESM. The top (provider tag) is stripped while forwarding out of the pseudowire, and a configured vlan-tag (for vc-type vlan) is inserted when forwarding into the pseudowire. With vc-type ether, the tags if present (max 2), are transparently preserved when forwarding in our out of the pseudowire.

The **no** form of the command reverts to the default value.

Default

vc-type ether

Parameters

ether

Specifies **ether** as the virtual circuit (VC) associated with the SDP binding.

vlan

Specifies **vlan** as the virtual circuit (VC) associated with the SDP binding.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vc-type

Syntax

vc-type {**ether** | **vlan**}

Context

[Tree] (config>service>pw-template vc-type)

Full Context

configure service pw-template vc-type

Description

This command overrides the default VC type signaled for the binding to the far end SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

- The VC type value for Ethernet is 0x0005.
- The VC type value for an Ethernet VLAN is 0x0004.

Parameters

ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding. (hex 5)

vlan

Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a vlan-tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

Note:
The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

Context

[Tree] (config>saa>test>type vccv-ping)

[Tree] (oam vccv-ping)

Full Context

configure saa test type vccv-ping

oam vccv-ping

Description

This command configures a Virtual Circuit Connectivity Verification (VCCV) ping test. A VCCV ping test checks the connectivity of a VLL inband. This test verifies that the destination (target) PE is the egress for the Layer 2 Forwarding Equivalence Class (FEC), and provides a cross-check between the dataplane and the control plane. This test is inband, which means that the **vccv-ping** message is sent using the same encapsulation and along the same path as user packets in the VLL. The VCCV ping test is the equivalent of the LSP ping test for a VLL service. This command reuses an LSP ping message format and can be used to test a VLL configured over both an MPLS and a GRE SDP.

Note: A VCCV ping can be initiated on T-PE or S-PE. If initiated on the S-PE, the **reply-mode** parameter must be used with the **ip-routed** value. The ping from the T-PE can either have values or be omitted, in which case the default value is used.

If a VCCV ping is initiated from T-PE to a neighboring S-PE (one segment only), it is sufficient to use only the **spoke-sdp-fec-id** parameter. However, if the ping is across two or more segments, at least the **spoke-sdp-fec-id**, **src-ip-address** *ip-addr*, **dst-ip-address** *ip-addr*, **ttl** *vc-label-ttl* parameters are used

where:

- The **src-ip-address** is the system IP address of the router preceding the destination router.
- The *vc-label-ttl* parameter must have a value equal to or higher than the number of PW segments.

Note: VCCV ping is a multi-segment PW. For a single-hop PW, only the peer VCCV CC bit of the control word is advertised when the control word is enabled on the PW.

VCCV ping on multi-segment PWs requires that the control word is enabled in all segments of the VLL. If the control word is not enabled on a spoke SDP, it is signaled peer VCCV CC bits to the far end, consequently the **vccv-ping** command cannot be successfully initiated on the specific spoke SDP.

If the **saii-type-2** and **taii-type-2** parameters are specified for a FEC 129 PW, these values are used by the VCCV ping echo request message instead of the source access individual identifiers (SAII) and target attachment individual identifier (TAII) of the spoke-SDP indexed by the **spoke-sdp-fec** parameter, or any SAII and TAII received in a switching point TLV for the PW. Furthermore, the user must enter the SAII and TAII in accordance with the direction of the PW as seen from the node on which the **vccv-ping** command

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

is executed. However, the values of the SAII and TAII sent in the echo request message are swapped with respect to the user-entered values to match the order in the installed FEC on the targeted node. The output of the command for a FEC 129 type 2 PW reflects the order of the SAII and TAII stored on the targeted node.

When used with the **static** option, this command configures a VCCV ping test for static MPLS-TP PWs used in a VLL service. The test verifies that the destination (target) PE is the egress for the static PW FEC, and provides a cross-check between the dataplane and the configuration. The **vccv-ping static** command reuses an **lsp-ping** message format and can be used to test an MPLS-TP PW VLL configured over an MPLS SDP. VCCV ping for MPLS-TP PWs always use the VCCV control word (associated channel header) with either an IPv4 channel type (0x0021) or on-demand CV message channel type (0x0025).

Note: vccv-ping static can only be initiated on a T-PE. Both the echo request and reply messages are sent using the same, in-band, encapsulation. If the **target-fec-type** option is not specified, the target FEC stack contains a static PW FEC TLV. The contents of this TLV are populated based on the source node ID, source global ID, destination global ID, and destination node ID in the **vccv-ping** command (or taken from the PW context, if omitted from the command).

The **target-fec-type** option allows the user to test a segment of a MS-PW that does not have the same FEC type as the local segment from the T-PE where the **vccv-ping** command is issued. This is applicable for performing VCCV ping on an MS-PW that consists of static PW FEC segments and dynamically signaled PW ID FEC segments.

The timestamp format that is sent, and is expected when received in a PDU, is configured using the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Parameters

fec-128

Keyword to specify that the VCCV ping test is of the type FEC 128.

sdp-id:vc-id

Specifies that if a FEC 128 PW is tested, its VC ID must be indicated with this parameter. The VC ID must exist on the local router and the far-end peer must indicate that it supports VCCV to allow the user to send a VCCV ping message.

Values sdp-id: 1 to 32767

vc-id: 1 to 4294967295

reply-mode {ip-routed | control-channel}

Indicates to the far end the method to send the reply message. The **ip-routed** option specifies an out-of-band reply mode using the VCCV control channel. The **control-channel** option specifies an in-band reply mode using the VCCV control channel.

Default control-channel

src-ip-address *ip-addr*

Specifies the source IP address.

Values a.b.c.d

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

dst-ip-address ***ip-addr***

Specifies the destination IP address.

Values a.b.c.d

pw-id

Specifies the PW ID for performing a VCCV ping operation. The PW ID is a non-zero 32-bit connection ID required by FEC 128, as defined in RFC 8029, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*.

Values 1 to 4294967295

target-fec-type

Specifies the FEC type for a remote PW segment targeted by a VCCV ping echo request. This parameter is used if VCCV ping is used with an MS-PW, where a static MPLS-TP PW segment using the static PW FEC is switched to a T-LDP signaled segment using the PW ID FEC (FEC 128), or vice versa, which requires the user to explicitly specify a target FEC that is different from the local segment FEC.

Values **pw-id-fec** — Specifies that the FEC element for the remote target PW 00000000000000000000000000000000000000000000000000000000000000000000000000000000 segment is of the type PW ID (FEC 128).

static-pw-fec — Specifies that the FEC element for the remote target PW segment is of the type static PW FEC.

attachment-group-identifier

Specifies the attachment group identifier for the target FEC. This parameter is valid only in combination with the **target-fec-type** *static-pw-fec* options.

Values 0 to 4294967295

pw-path-id-saii ***global-id:node-id:ac-id***

Specifies the SAII of the target FEC. This parameter is valid only in combination with the **target-fec-type** *static-pw-fec* options.

global-id — Specifies the global ID for the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

node-id — Specifies the node ID on far end T-PE that the PW being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the PW being tested at the far end T-PE.

Values 1 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

pw-path-id-taii *global-id:node-id:ac-id*

Specifies the TAII of the target FEC. This parameter is valid only in combination with the **target-fec-type** *static-pw-fec* options.

global-id — Specifies the global ID of the TAII of the targeted static PW FEC element.

Values 0 to 4294967295

node-id — Specifies the node ID on the far end T-PE that the PW being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique TAII for the PW being tested at the far end T-PE.

Values 1 to 4294967295

saii-type2 *global-id*:*prefix*:*ac-id*

Specifies that if a FEC 129 AII type 2 PW is tested, the SAII must be indicated. The **saii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

taii-type2 *global-id:prefix:ac-id*

Specifies that if a FEC 129 AII type 2 PW is tested, the TAII must be indicated. The **taii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

global-id — Specifies the global ID of the far end T-PE of the FEC129 PW.

Values 0 to 4294967295

Default 0

node-id — Specifies the node ID on the far end T-PE that the PW being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique TAII for the PW being tested at the far end T-PE.

Values 1 to 4294967295

spoke-sdp-fec-id

Specifies that if a FEC 129 PW is tested, the *spoke-sdp-fec-id* option must be indicated using this parameter. The *spoke-sdp-fec-id* must already exist on the local router and the far-end peer must indicate that it supports VCCV to allow the user to send a message using the **vccv-ping** command.

spoke-sdp-fec is mutually exclusive with the *sdp-id:vc-id* parameter.

Values 1 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

assoc-channel {ipv4 | non-ip}

Specifies the associated channel encapsulation format to use for the VCCV ping echo request and echo reply packet for a PW that uses the static PW FEC. An associated channel type of ipv4 must be used if a VCCV ping is performed to a remote segment of a different FEC type.

Values **ipv4**

IPv4 encapsulation in an IPv4 PW associated channel (channel type 0x0021)

non-ip

MPLS-TP encapsulation without UDP/IP headers, in a PW associated channel using the channel type 0x025.

Default non-ip

global-id

Specifies the MPLS-TP global ID for the far end node of the PW under test. If this is not entered, the *dest-global-id* is taken from the PW context.

Values 0 to 4294967295

Default 0

node-id

Specifies the MPLS-TP node ID of the far end node for the PW under test. If this is not entered, then the *dest-global-id* is taken from the PW context.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

Default 0

sender-src-address ip-addr

Specifies the 4-octet IPv4 address of the node originating the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

remote-dst-address ip-addr

Specifies the 4-octet IPv4 address of the far end node that is a target of the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

pw-type

Specifies the PW type value of the PW segment targeted on the far end node. This field must be included to populate the PW type field of the PW ID FEC in the FEC static TLV, when the far end FEC type is different form the local FEC type and the **target-fec-type** *pw-id-fec*.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values atm-cell (=3), atm-sdu (=2), atm-vcc (=9), atm-vpc (=10), cesopsn (=21), cesopsn-cas (=23), ether (=5), satop-e1 (=17), satop-t1 (=18), 1 to 65535

send-count

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message interval value must have expired before the next message request is sent.

Values 1 to 100

Default 1

fc-name

Specifies the **fc** parameter be used to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

The LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end 7750 SR that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message. The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating SR.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

The ToS byte is not modified. Table 181: vccv-ping Request Packet and Behavior summarizes this behavior.

Table 181: vccv-ping Request Packet and Behavior

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

Default out

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

octets

Specifies the size, in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request pay-load is padded with zeros to the specified size. Note that an OAM command is not failed if the user entered a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 1

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

vc-label-ttl

Specifies the time-to-live value for the vc-label of the echo request message. The outer label TTL is still set to the default of 255 regardless of this value.

Values 1 to 255

Default 1

Platforms

All

Output

The following output is an example of VCCV ping information.

Output Example

```
Ping TPE to SPE on a LDP/GRE tunnel
===================================

*A:Dut-B# oam vccv-ping 3:1
VCCV-PING 3:1 88 bytes MPLS payload
Seq=1, send from intf toSPE1-D-8 to NH 12.1.8.2
       reply from 4.4.4.4 via Control Channel

50.23 vccv-trace

vccv-trace

Syntax

vccv-trace *sdp-id:vc-id* [**reply-mode** { **ip-routed** | **control-channel**] [**target-fec-type static-pw-fec agi** *attachment-group-identifier* **pw-path-id-saii** *global-id:node-id:ac-id* **pw-path-id-taii** *global-id:node-id:ac-id*]

vccv-trace saii-type2 *global-id:prefix:ac-id* **taii-type2** *global-id:prefix:ac-id* [**reply-mode** {**ip-routed** | **control-channel**}]

vccv-trace spoke-sdp-fec *spoke-sdp-fec-id* [**reply-mode** {**ip-routed** | **control-channel**}] [**saii-type2** *global-id:prefix:ac-id* **taii-type2** *global-id:prefix:ac-id*]

vccv-trace static *sdp-id:vc-id* [**assoc-channel** {**ipv4** | **non-ip**}] [**src-ip-address** *ipv4-address*] [**target-fec-type pw-id-fec sender-src-address** *ipv4-address* **remote-dst-address** *ipv4-address* **pw-id** *pw-id* **pw-type** *pw-type*]

NOTE: Options common to all **vccv-trace** cases: [**fc** *fc-name* [**profile** {**in** | **out**]] [**interval** *interval-value*] [**max-fail** *no-response-count*] [**max-ttl** *max-vc-label-ttl*] [**min-ttl** *min-vc-label-ttl*] [**probe-count** *probe-count*] [**size** *octets*] [**timeout** *timeout-value*]

Context

[Tree] (oam vccv-trace)

[Tree] (config>saa>test>type vccv-trace)

Full Context

oam vccv-trace

configure saa test type vccv-trace

Description

This command configures a Virtual Circuit Connectivity Verification (VCCV) automated trace test. The automated VCCV-trace can trace the entire path of a PW with a single command issued at the T-PE or at an S-PE. This is equivalent to LSP-Trace and is an iterative process by which the source T-PE or S-PE node sends successive VCCV-Ping messages with incrementing the TTL value, starting from TTL=1. In each iteration, the T-PE builds the MPLS echo request message in a way like VCCV-Ping. The first message with TTL=1 has the next-hop S-PE T-LDP session source address in the Remote PE Address field in the PW FEC TLV. Each S-PE which terminates and processes the message includes in the MPLS echo reply message the FEC 128 TLV corresponding the PW segment to its downstream node. The source T-PE or S-PE node can then build the next echo reply message with TTL=2 to test the next-next hop for the MS-PW. It copies the FEC TLV it received in the echo reply message into the new echo request message. The process is terminated when the reply is from the egress T-PE or when a time out occurs.

The user can specify to display the result of the VCCV-trace for a fewer number of PW segments of the end-to-end MS-PW path. In this case, the **min-ttl** and **max-ttl** parameters are configured accordingly. However, the T-PE/S-PE node still probes all hops up to **min-ttl** to correctly build the FEC of the subset of segments.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note that if the **saii-type-2** and **taii-type-2** parameters are specified this command for a FEC129 pseudowire, then these values are used by the vccv-ping echo request message instead of the saii and taii of the spoke SDP indexed by the **spoke-sdp-fec** parameter, or any saii and taii received in a switching point TLV for the pseudowire. Furthermore, the use must enter the saii and taii in accordance with the direction of pseudowire as seen from the node on which the **vccv-trace** command is executed. However, the values of the saii and taii sent in the echo request message are swapped with respect to the user-entered values to match the order in the installed FEC on the targeted node. The output of the command for a FEC129 type 2 pseudowire reflects the order of the saii and taii stored on the targeted node.

This command, when used with the **static** option, configures a VCCV-automated trace test for static MPLS-TP pseudowires used in a VLL service. VCCV trace for MPLS-TP pseudowires always uses the VCCV control word (associated channel header) with either an IPv4 channel type (0x0021) or on-demand CV message channel type (0x0025).

Note that **vccv-trace static** can only be initiated on a T-PE. Both the echo request and reply messages are send using the same, in-band, encapsulation. The target FEC stack contains a static PW FEC TLV. The contents of this TLV are populated based on the source Node ID, source global ID, and destination global ID and destination node ID taken from the pseudowire context.

The **target-fec-type** option allows the user to perform a vccv-trace to a segment of a MS-PW that does not have the same FEC type as the local segment from the T-PE where the **vccv-trace** command is issued. This is applicable for performing VCCV ping on an MS-PW consists of static PW FEC segments and dynamically signaled PW ID FEC segments.

Parameters

sdp-id:vc-id

Specifies that if a FEC 128 PW is being tested, then its VC ID must be indicated with this parameter. The VC ID needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

Values sdp-id: 1 to 32767

vc-id: 1 to 4294967295

reply-mode {ip-routed | control-channel}

Indicates to the far end, the method to send the reply message. The option **ip-routed** indicates an out-of-band reply mode using the vccv control channel. The option **control-channel** indicates an in-band reply mode using the vccv control channel.

Default control-channel

target-fec-type

Specifies the FEC type for a remote PW segment targeted by a VCCV Ping echo request. This parameter is used if VCCV Ping is used along a MS-PW where a static MPLS-TP PW segment using the static PW FEC is switched to a T-LDP signaled segment using the PW ID FEC (FEC128), or vice versa, thus requiring the user to explicitly specify a target FEC that is different from the local segment FEC.

Values **pw-id-fec** — Indicates that FEC element for the remote target PW segment is of type PW ID (FEC128).

static-pw-fec — Indicates that FEC element for the remote target PW segment is of type Static PW FEC.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

attachment-group-identifier

Specifies the attachment group identifier for the target FEC. This parameter is only valid in combination with the **target-fec-type static-pw-fec**.

Values 0 to 4,294,967,295

pw-path-id-saii *global-id:node-id:ac-id*

Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

Default 0

node-id — Specifies the node ID on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

pw-path-id-taii *global-id:node-id:ac-id*

Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

Default 0

node-id — Specifies the node ID of the far-end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

saii-type2 *global-id:prefix:ac-id*

If a FEC129 AII Type 2 pseudowire is being tested, then the source attachment individual identifier (SAII) must be indicated.

The **saii-type2** parameter is mutually exclusive with the **sdp-id:vc-id** parameter.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

global-id — Specifies the global ID of this T-PE node.

Values 1 to 4294967295

prefix — Specifies the prefix on this T-PE node that the spoke SDP is associated with.

ac-id — Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

taii-type2 ***global-id:prefix:ac-id***

Specifies that if a FEC129 AII Type 2 pseudowire is being tested, then the target attachment individual identifier (TAII) must be indicated. The **taii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

global-id — Specifies the global ID of the far end T-PE of the FEC129 pseudowire.

Values 0 to 4294967295

node-id — Specifies the node ID on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique TAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

spoke-sdp-fec-id

Specifies that if a FEC 129 PW is being tested, then its *spoke-sdp-fec-id* must be indicated with this parameter. The **spoke-sdp-fec-id** needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

spoke-sdp-fec is mutually exclusive with the *sdp-id:vc-id* parameter.

Values 1 to 4294967295

assoc-channel {ipv4 | non-ip}

Specifies the associated channel encapsulation format to use for the VCCV trace echo request and echo reply packet for a PW that uses the static PW FEC. An associated channel type of ipv4 must be used if a vccv-ping is performed to a remote segment of a different FEC type.

Values ipv4 – IPv4 encapsulation in an IPv4 pseudowire associated channel (channel type 0x0021)

non-ip – MPLS-TP encapsulation without UDP/IP headers, in pseudowire associated channel using channel type 0x025.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default non-ip

src-ip-address ***ipv4-address***

Specifies the 4-octet IPv4 address of the source node.

Values a.b.c.d

sender-src-address ***ipv4-address***

Specifies the 4-octet IPv4 address of the node originating the VCCV trace.

Values a.b.c.d

remote-dst-address ***ipv4-address***

Specifies the 4-octet IPv4 address of the far end node that is a target of the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

pw-id

Specifies the pseudowire ID to be used for performing a VCCV ping operation. The pseudowire ID is a non-zero 32-bit connection ID required by the FEC 128, as defined in RFC 8029, Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures.

Values 1 to 4294967295

pw-type

Specifies the PW type of the PW segment targeted on the far end node. This field must be included to populate the PW type field of the PW ID FEC in the FEC static TLV, when the far end FEC type is different form the local FEC type and the **target-fec-type** is **pw-id-fec**.

Values atm-cell (=3), atm-sdu (=2), atm-vcc (=9), atm-vpc (=10), cesopsn (=21), cesopsn-cas (=23), ether (=5), satop-e1 (=17), satop-t1 (=18), 1 to 65535

fc-name

Specifies the FC and profile parameters are used to indicate the forwarding class of the VCCV trace echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

The LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end router that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message. The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

The ToS byte is not modified. Table 182: vccv trace Request Packet and Behavior summarizes this behavior.

Table 182: vccv trace Request Packet and Behavior

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet{tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2}

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	• exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

profile {in | out}

Specifies the profile state of the VCCV trace echo request packet.

Default out

interval-value

Specifies the interval parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 255

Default 1

no-response-count

Specifies the maximum number of consecutive VCCV trace echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL value.

Values 1 to 255

Default 5

max-vc-label-ttl

Specifies the TTL value for the VC label of the echo request message for the last hop of the MS-PW for which the results are to be displayed. This is expressed as a decimal integer. The outer label TTL is still set to the default regardless of the value of the VC label.

Values 1 to 255

Default 8

min-vc-label-ttl

Specifies the TTL value for the VC label of the echo request message for the first hop of the MS-PW for which the results are to be displayed. This is expressed as a decimal integer. Note that the outer label TTL is still set to the default regardless of the value of the VC label.

Values 1 to 255

Default 1

probe-count

Specifies the number of VCCV trace echo request messages to send per TTL value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 10

Default 1

octets

Specifies the size in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request pay-load is padded with zeros to the specified size. An OAM command is not failed if the user enters a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

timeout-value

Specifies the *timeout* parameter, in seconds, expressed as a decimal integer. This value is used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response are not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 3

[Tree] (config>service>epipe>bgp-vpws>ve-name ve-id)

Full Context

configure service epipe bgp-vpws remote-ve-name ve-id

configure service epipe bgp-vpws ve-name ve-id

Description

This command configures a ve-id for either the local VPWS instance when configured under the ve-name, or for the remote VPWS instance when configured under the remote-ve-name.

A single ve-id can be configured per ve-name or remote-ve-name. The ve-id can be changed without shutting down the VPWS instance. When the ve-name ve-id changes, BGP withdraws the previously advertised route and sends a route-refresh to all the peers which would result in reception of all the remote routes again. The old PWs are removed and new ones are instantiated for the new ve-id value.

When the remote-ve-name ve-id changes, BGP withdraws the previously advertised route and send a new update matching the new ve-id. The old pseudowires are removed and new ones are instantiated for the new ve-id value.

NLRIs received whose advertised ve-id does not match the list of ve-ids configured under the remote ve-id will not have a spoke SDP binding auto-created but will remain in the BGP routing table but not in the Layer 2 route table. A change in the locally configured ve-ids may result in auto-sdp-bindings either being deleted or created, based on the new matching results.

Each ve-id configured within a service must be unique.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPWS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default

no ve-id

Parameters

value

A two bytes identifier that represents the local or remote VPWS instance and is advertised through the BGP NLRI.

Values 1 to 65535

Platforms

All

ve-id

Syntax

Full Context

configure service vpls bgp-vpls ve-name ve-id

Description

This command configures a ve-id. Just one ve-id can be configured per BGP VPLS instance. The VE-ID can be changed without shutting down the VPLS Instance. When the VE-ID changes, BGP is withdrawing its own previously advertised routes and sending a route-refresh to all the peers which would result in reception of all the remote routes again. The old pseudowires are removed and new ones are instantiated for the new VE-ID value.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPLS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default

no ve-id

Parameters

value

Specifies a two-byte identifier that represents the local instance in a VPLS and is advertised through the BGP NLRI. Must be lower or equal with the max-ve-id.

Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping version

Description

This command specifies the version of IGMP which is running on an MSAP. This object can be used to configure a router capable of running either value. For IGMP to function correctly, all routers on a LAN must be configured to run the same version of IGMP on that LAN.

When the **send-query** command is configured, all type of queries generated are of the configured **version**. If a report of a version higher than the configured version is received, the report gets dropped and a new "wrong version" counter is incremented.

If the **send-query** command is not configured, the **version** command has no effect. The version used on that SAP or SDP is the version of the querier. This implies that, for example, when there is a v2 querier, a v3 group or group-source specific query when a host wants to leave a certain group will never be sent.

Default

version 3

Parameters

version

Specifies the IGMP version.

50.33 video-group

video-group

Syntax

video-group *video-group-id* [**create**]

no video-group *video-group-id*

Context

[Tree] (config>isa video-group)

Full Context

configure isa video-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures an ISA video group.

Parameters

video-group-id

Specifies a video group ID.

Values 1 to 4

create

Keyword required when first creating the configuration context. Once the context is created, one can navigate into the context without the **create** keyword.

Platforms

7450 ESS, 7750 SR, 7750 SR-s

video-group

Syntax

video-group *video-group-id*

video-group disable

no video-group

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video video-group)

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video video-group)

Full Context

configure mcast-management multicast-info-policy bundle channel source-override video video-group

configure mcast-management multicast-info-policy bundle channel video video-group

configure mcast-management multicast-info-policy bundle video video-group

Description

This command assigns a video group ID to the channel.

Parameters

video-group-id

specifies the identifier for this video group. The video group must have been configured in the **config>isa** context.

Values 1 to 4

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

disable

Explicitly disables the video group within the policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-s

50.34 video-interface

video-interface

Syntax

video-interface *ip-address* [**create**]

no video-interface *ip-address*

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy video-interface)

Full Context

configure mcast-management multicast-info-policy video-policy video-interface

Description

This command creates a video interface policy context that correlates to the IP address assigned for a video interface. This interface is created in a subscriber service to which the multicast information policy is assigned. If the specified IP address does not correlate to a video interface ip address, the parameters defined within this context have no effect.

The **no** form of the command deletes the video interface policy context.

Parameters

ip-address

The IP address of a video interface provisioned within the context of a service to which the Multicast Information Policy is assigned. If the IP address does not match the IP address assigned to a video interface, the parameters defined within this context have no effect.

create

Mandatory keyword needed when creating a new video interface within the video policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-s

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

video-interface

Syntax

video-interface *ip-int-name* [**create**]

no video-interface *ip-int-name*

Context

[Tree] (config>service>ies video-interface)

[Tree] (config>service>vprn video-interface)

Full Context

configure service ies video-interface

configure service vprn video-interface

Description

This command creates a video interface within the service. The video interface and associated IP addresses are the addresses to which clients within the service will send requests. The video interface must be associated with an ISA group using the video-sap command and have IP addresses for it to be functional.

The **no** form of the command deletes the video interface. The video interface must be administratively shut down before issuing the **no video-interface** command.

Parameters

ip-int-name

Specifies the name of the video interface, up to 32 characters. An interface name cannot be in the form of an IP address. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

create

This keyword is mandatory when creating a video interface.

Platforms

7450 ESS, 7750 SR, 7750 SR-s

video-interface

Syntax

Use subject to Terms available at: www.nokia.com/terms.

Full Context

candidate view

Description

This command displays the candidate configuration along with line numbers that can be used for editing the candidate configuration.

Parameters

line

Displays the candidate configuration starting at the point indicated by the following options (the display is not limited to the current CLI context/branch).

Values line, offset, **first**, **edit-point**, **last**

line	absolute line number
offset	relative line number to current edit point. Prefixed with '+' or '-'
first	keyword - first line
edit-point	keyword - current edit point
last	keyword - last line that is not 'exit'

admin view

Description

The context to configure administrative system viewing parameters. Only authorized users can execute the commands in the **admin** context.

Parameters

bootup-cfg

Specifies the bootup configuration.

active-cfg

Specifies current running configuration.

candidate-cfg

Specifies candidate configuration.

latest-rb

Specifies the latest configuration.

checkpoint-id

Specifies a specific checkpoint file configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 9

rescue

Specifies a rescue checkpoint configuration.

Platforms

All

view

Syntax

view *view-name* **subtree** *oid-value*

no view *view-name* [**subtree** *oid-value*]

Context

[Tree] (config>system>security>snmp view)

Full Context

configure system security snmp view

Description

This command configures a view. Views control the accessibility of a MIB object within the configured MIB view and subtree. Object identifiers (OIDs) uniquely identify MIB objects in the subtree. OIDs are organized hierarchically with specific values assigned by different organizations.

Once the subtree (OID) is identified, a mask can be created to select the portions of the subtree to be included or excluded for access using this particular view. See the **mask** command.

The view(s) configured with this command can subsequently be used in read, write, and notify commands which are used to assign specific access group permissions to created views and assigned to particular access groups.

Multiple subtrees can be added or removed from a view name to tailor a view to the requirements of the user access group.

A subtree statement matches (covers) any OID that is a descendant of the specified OID value. For example, the subtree 1.3.6.1 matches 1.3.6.1.x (for any value of x), 1.3.6.1.x.y (for any values of x & y), and so on.

Subtrees that are not covered by **view** statements are not accessible in the view.

Per RFC 2575, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP),* each MIB view is defined by two sets of view subtrees, the included view subtrees, and the excluded view subtrees (see the **included** and **excluded** parameters of the **mask** command). Every such view subtree, both the included and the excluded ones, are defined in this table. To determine if a particular object instance is in a particular MIB view, compare the object instance's OID with each of the MIB view's active entries in this table. If none match, then the object instance is not in the MIB view. If one or more match, then the object instance is included in, or excluded from, the MIB view according to the value of vacmViewTreeFamilyType in the entry whose value of vacmViewTreeFamilySubtree has the most sub-identifiers.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no view** *view-name* command removes a view and all subtrees.

The **no view** *view-name* **subtree** *oid-value* removes a sub-tree from the view name.

Parameters

view-name

Specifies a view name, up to 32 characters.

oid-value

Specifies the object identifier (OID) value for the *view-name*. This value, for example, 1.3.6.1.6.3.11.2.1, combined with the mask and include and exclude statements, configures the access available in the view.

It is possible to have a view with different subtrees with their own masks and include and exclude statements. This allows for customizing visibility and write capabilities to specific user requirements**.**

50.39 virtual-link

virtual-link

Syntax

[**no**] **virtual-link** *router-id* **transit-area** *area-id*

Context

[Tree] (config>service>vprn>ospf3>area virtual-link)

[Tree] (config>service>vprn>ospf>area virtual-link)

Full Context

configure service vprn ospf3 area virtual-link

configure service vprn ospf area virtual-link

Description

This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of this command deletes the virtual link.

Default

No virtual link is defined.

Parameters

router-id

The router ID of the virtual neighbor in IP address dotted decimal notation.

transit-area ***area-id***

The area-id specified identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

Platforms

All

virtual-link

Syntax

vlan

Syntax

vlan [*vlan-encap*]

Context

[Tree] (config>redundancy>mc>peer>mcr>l3ring>node>cv vlan)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify vlan

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the VLAN tag of the SAP used for ring-node connectivity verification of this ring node. It is only meaningful if the value of is not zero.

The **no** form of this command reverts to the default.

Parameters

vlan-encap

Specifies the node cc VLAN IP.

Platforms

All

vlan

Syntax

vlan *tag*

no vlan

Context

[Tree] (config>subscr-mgmt>wlan-gw>ue-query vlan)

Full Context

configure subscriber-mgmt wlan-gw ue-query vlan

Description

This command enables matching on UEs, based on the VLAN tag within the tunnel, which typically used to indicate an SSID.

The **no** form of this command disables matching on the VLAN.

Default

no vlan

Parameters

tag

Specifies the VLAN tag.

Values 0 to 4096

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (cfg>eth-cfm>domain>assoc>bridge vlan)

Full Context

configure eth-cfm domain association bridge-identifier vlan

Description

This command configures the bridge identifier primary VLAN ID. This is informational only, and no verification is done to ensure MEPs on this association are on the configured VLAN.

The **no** form of this command reverts to the default value.

Default

no vlan

Parameters

vlan-id

Specifies a VLAN ID monitored by MA.

Values 1 to 4094

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

50.44 vlan-aware-bundle

vlan-aware-bundle

Syntax

vlan-aware-bundle *name* [**eth-tag** *value*]

no vlan-aware-bundle

Context

[Tree] (config>service>vpls>bgp-evpn vlan-aware-bundle)

Full Context

configure service vpls bgp-evpn vlan-aware-bundle

Description

This command configures a name that is used to group a bundle of VPLS services (Broadcast Domains) that are part of the same VLAN-aware bundle instance. This name is optional and allows the user to execute **show** commands that are relevant to all the Broadcast Domains in a VLAN-aware bundle service group.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The optional Ethernet Tag ID can be encoded in the EVPN routes for control-plane interoperability mode with VLAN-aware bundle services. The configuration of a non-default value requires the previous configuration of a VLAN-aware bundle name on the service.

When the Ethernet Tag ID is set to a non-zero value, the EVPN routes advertised for the VPLS service are advertised with this value into the Ethernet Tag ID field of the routes.

On reception of EVPN routes with non-zero Ethernet Tag ID, BGP imports the routes based on the import route target as usual. However, the system checks the received Ethernet Tag ID field and processes only routes whose Ethernet Tag ID matches the local VLAN-aware bundle Ethernet Tag value.

The **no** form of this command removes the configuration.

Parameters

name

Specifies the VLAN-aware bundle name, up to 32 characters.

value

Specifies the Ethernet Tag ID.

Values 1 to 16777215

Platforms

All

50.45 vlan-id

vlan-id

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range authentication vlan-mismatch-timeout

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range authentication vlan-mismatch-timeout

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the timeout value for the RADIUS proxy cache if a packet is received with a non-matching VLAN tag. The new timeout value is the lesser of the **vlan-mismatch-timeout** value and the currently remaining proxy cache timeout value.

The **no** form of this command disables the timeout behavior. The cache timeout value will remain unchanged.

Parameters

seconds

Specifies the timeout value for the RADIUS proxy cache, in seconds.

Values 5 to 60

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

50.47 vlan-range

vlan-range

Syntax

[**no**] **vlan-range** [*vlan-range*]

Context

[Tree] (config>service>vpls>stp>mst-instance vlan-range)

Full Context

configure service vpls stp mst-instance vlan-range

Description

This command specifies a range of VLANs associated with a certain mst-instance. This range applies to all SAPs of the M-VPLS.

Every VLAN range that is not assigned within any of the created **config>service>vpls>stp mst-instance** is automatically assigned to mst-instance 0. This instance is automatically maintained by the software and cannot be modified. Changing the VLAN range value can be performed only when the specified mst-instance is shutdown.

The **no** form of this command removes the **vlan-range** from the specified **config>service>vpls>stp mst-instance**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

vlan-range

The first VLAN range specifies the left-bound (i.e., minimum value) of a range of VLANs that are associated with the M-VPLS SAP. This value must be smaller than (or equal to) the second VLAN range value. The second VLAN range specifies the right-bound (i.e., maximum value) of a range of VLANs that are associated with the M-VPLS SAP.

Values 1 to 4094 to 1 to 4094

Platforms

All

vlan-range

Syntax

vlan-range *from* [**to** *to*]

no vlan-range *from*

Context

[Tree] (config>connection-profile-vlan vlan-range)

Full Context

configure connection-profile-vlan vlan-range

Description

This command allows the user to configure different ranges in the connection-profile-vlan. The ranges have the following characteristics:

- Ranges can contain a single VID or start-and-end values. When the *to-vid* is not specified, the end vid value is the same as the start vid value.
- On the fly addition/removal of ranges is allowed.
- When removing an entry, the **no vlan-range** *vid* **to** *vid* must be configured by the user.
- Multiple ranges are allowed under the same connection-profile-vlan. No VLAN values should overlap within the same connection-profile-vlan.
- The index for connection-profile and connection-profile-vlan must be unique between the two. For example, if **connection-profile 100** is present, then **connection-profile-vlan 100** is disallowed.

Each connection-profile-vlan must be explicitly configured.

Parameters

from

Specifies the beginning of the **vlan-range** associated to the **connection-profile-vlan**.

Values 1 to 4094

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

to

Specifies the end of the **vlan-range** associated to the **connection-profile-vlan**. If not specified, the **vlan-range** is comprised of only the *from* VLAN ID.

Values 1 to 4094

Platforms

All

50.48 vlan-signaled-flexible-cross-connect

vlan-signaled-flexible-cross-connect

Syntax

[**no**] **vlan-signaled-flexible-cross-connect**

Context

[Tree] (config>service>epipe>bgp-evpn>local-attachment-circuit vlan-signaled-flexible-cross-connect)

Full Context

configure service epipe bgp-evpn local-attachment-circuit vlan-signaled-flexible-cross-connect

Description

This command configures the FXC Epipe in VLAN-signaled mode. In addition, a separate EVPN Auto Discovery per-EVI route is advertised per SAP, with Ethernet tag IDs autoderived from the normalized tags for the SAP.

The **no** form of this command advertises a single Auto Discovery per-EVI route for the service with the configured local Ethernet tag ID.

Platforms

7750 SR-1, 7750 SR-s

Full Context

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges

Description

Commands in this context configure VLAN-to-retail-map parameters to map dot1q tags to the retail service ID. The WIFI AP inserts a dot1Q tag in the Layer 2 frame within the GRE tunnel to indicate the retail service provider for the subscriber.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

50.50 vlan-translation

vlan-translation

Syntax

vlan-translation {*vlan-id* | **copy-outer**}

no vlan-translation

Context

[Tree] (config>service>epipe>sap>ingress vlan-translation)

[Tree] (config>service>vpls>sap>ingress vlan-translation)

Full Context

configure service epipe sap ingress vlan-translation

configure service vpls sap ingress vlan-translation

Description

This command configures ingress VLAN translation. If this command is enabled with an explicit VLAN value, the preserved VLAN ID is overwritten with this value. This setting is applicable to dot1q encapsulated ports. If enabled with the **copy-outer** keyword, the outer VLAN ID is copied to inner position on QinQ encapsulated ports. The feature is not supported on:

- dot1q SAPs
- QinQ saps with **qinq-vlan-translation** enabled
- connection profile VLAN SAPs if the **copy-outer** option is configured

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command disables VLAN translation.

Default

no vlan-translation

Parameters

vlan-id

Specifies the VLAN ID.

Values 0 to 4094

copy-outer

Keyword to specify to use the outer VLAN ID.

Platforms

All

[Tree] (config>service>vpls>spoke-sdp vlan-vc-tag)

Full Context

configure service vpls mesh-sdp vlan-vc-tag

configure service vpls spoke-sdp vlan-vc-tag

Description

This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

Default

no vlan-vc-tag

Parameters

vlan-id

Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

Values 0 to 4094

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt volume-quota-direction

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt volume-quota-direction

Description

This command specifies whether volume quota is applied in the egress (downstream), ingress (upstream), or both directions. Configuration changes apply only to new DSM UEs and not to existing UEs.

Parameters

both

Enforces the volume quota on the packets ingressing and egressing the WLAN-GW combined.

ingress

Enforces the volume quota on packets ingressing the WLAN-GW from the UE (upstream).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

egress

Enforces the volume quota on packets egressing the WLAN-GW to the UE (downstream).

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

volume-stats-type

Syntax

volume-stats-type {**ip** | **default**}

no volume-stats-type

Context

[Tree] (config>subscr-mgmt>sub-prof volume-stats-type)

Full Context

configure subscriber-mgmt sub-profile volume-stats-type

Description

This command enables the reporting of Layer 3 (IP) based subscriber host volume accounting data.

By default, subscriber host volume accounting data includes Layer 2 header octets and can be configured to include a fixed packet byte offset or last-mile encapsulation overhead.

The **no** form of this command reverts to the default.

Default

volume-stats-type default

Parameters

default

Specifies that the subscriber host volume accounting data is reported including the Layer 2 header octets and optional delta's introduced by configuration (for example: packet byte offset, last mile aware shaping, and so on).

ip

Specifies that the subscriber host volume accounting data reporting is based on Layer 3 (IP) packet sizes. This includes subscriber host ingress/egress queue and policer stats in snmp, CLI show commands, RADIUS and XML accounting, and Diameter Gx usage monitoring. RADIUS and Diameter (DCCA) based credit control volume quota are interpreted as Layer 3 (IP).

50.61 vpls

vpls

Syntax

vpls *service-id* [**customer** *customer-id*] [**create**] [**vpn** *vpn-id*] [**m-vpls**] [**b-vpls** | **i-vpls**] [**etree**] [**name** *name*]

no vpls *service-id*

Context

[Tree] (config>service vpls)

Full Context

configure service vpls

Description

This command creates or edits a VPLS instance. The **vpls** command is used to create or maintain a VPLS service. If the *service-id* does not already exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

A VPLS service connects multiple customer sites together acting like a zero-hop, Layer 2 switched domain. A VPLS is always a logical full mesh.

When a service is created, the **create** keyword must be specified if the **create** command is enabled in the **environment** context. To create a service, enter the **customer** keyword and specify a preexisting *customer-id* to associate the service with a customer. After a service is associated with a customer, the association cannot be edited. The service must be deleted and re-created with a new customer association.

To create a management VPLS on the 7450 ESS, the m-vpls keyword must be specified. See section **Hierarchical VPLS Redundancy** for an introduction to the concept of management VPLS.

After a service is created, using the **customer** *customer-id* to navigate to the service configuration context is optional. Attempting to edit a service using an incorrect *customer-id* results in an error.

More than one VPLS service may be created for a single customer ID.

By default, no VPLS instances exist until they are explicitly created.

The **no** form of this command deletes the VPLS service instance with the specified *service-id*. The service cannot be deleted until all SAPs and SDPs defined within the service ID have been shut down and deleted, and the service has been shut down.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

service-id

Specifies a unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: 64 characters maximum

customer-id

Specifies the customer ID number to be associated with the service. This parameter is required during service creation, and is optional for service editing or deleting.

Values 1 to 2147483647

vpn-id

Specifies the VPN ID number that allows you to identify VPNs by a VPN identification number

Values 1 to 2147483647

Default null (0)

create

Keyword used to create the service ID. The **create** keyword requirement can be enabled or disabled in the **environment create** context.

m-vpls

Keyword that specifies a management VPLS.

e-tree

Specifies a VPLS service as an E-Tree VPLS. E-Tree VPLS services have root and leaf attachment circuit (AC) and root leaf tag SAPs/SDP bindings for E-Tree interconnection. The access root AC SAP behaves as a SAP in non-E-tree VPLS services. The leaf AC SAP communicates only with root-connected services. Leaf and root AC SAPs behave externally the same as SAPs in non-E-Tree VPLS services.

The root AC SDP bind behaves as an SDP bind in non-E-tree VPLS services. The leaf AC SDP bind communicates only with root-connected services.

In the E-Tree VPLS, the root AC SAP/SDP bindings can communicate with other root and leaf AC SAP/SDP bind services locally and remotely. Root-originated traffic is marked internally with a root indication and the root is tagged externally on tag SAP/SDP binds. The leaf AC SAP/SDP bindings can communicate with other root SAP/SDP bindings locally and remotely. Leaf-originated traffic is marked internally with a leaf indication and tagged externally on leaf tag SAP/SDP bindings.

Any number of root or leaf AC SAPs can be used, up to the configured SAP limits in the E-Tree VPLS.

Network-side root leaf tag SAPs use additional SAP resources. These tag SAPs used two tags; one for root and one for leaf. Network-side tag SDPs use a hard coded tag of 1 for

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

root and 2 for leaf. AC SDP bindings are designated as root or leaf SDP bindings but carry no tags marking traffic on the egress frames.

The E-Tree SAP type must be specified when the SAP is created. To change the SAP type, the SAP must be removed and recreated.

b-vpls | i-vpls

Creates a backbone-vpls or ISID-vpls

name

Specifies an optional service name identifier, up to 64 characters, for a specific service. This service name can be used in configuration references, and **show** commands throughout the system. The service provider or administrator can use the defined service name to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Platforms

All

vpls

Syntax

vpls *service-name*

no vpls

Context

[Tree] (config>service>ies>if vpls)

Full Context

configure service ies interface vpls

Description

The **vpls** command, within the IP interface context, is used to bind the IP interface to the specified service name (VPLS or I-VPLS).

The system does not attempt to resolve the service name provided until the IP interface is placed into the administratively up state (**no shutdown**). Once the IP interface is administratively up, the system will scan the available VPLS services that have the **allow-ip-int-bind** flag set for a VPLS service associated with the name. If the service name is bound to the service name when the IP interface is already in the administratively up state, the system will immediately attempt to resolve the given name.

If a VPLS service is found associated with the name and with the **allow-ip-int-bind** flag set, the IP interface is attached to the VPLS service allowing routing to and from the service virtual ports once the IP interface is operational.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A VPLS service associated with the specified name that does not have the **allow-ip-int-bind** flag set or a non-VPLS service associated with the name is ignored and will not be attached to the IP interface.

If the service name is applied to a VPLS service after the service name is bound to an IP interface and the VPLS service **allow-ip-int-bind** flag is set at the time the name is applied, the VPLS service is automatically resolved to the IP interface if the interface is administratively up or when the interface is placed in the administratively up state.

If the service name is applied to a VPLS service without the **allow-ip-int-bind** flag set, the system will not attempt to resolve the applied service name to an existing IP interface bound to the name. To rectify this condition, the flag must first be set and then the IP interface must enter or reenter the administratively up state.

While the specified service name may be assigned to only one service context in the system, it is possible to bind the same service name to more than one IP interface. If two or more IP interfaces are bound to the same service name, the first IP interface to enter the administratively up state (if currently administratively down) or to reenter the administratively up state (if currently administratively up) when a VPLS service is configured with the name and has the **allow-ip-int-bind** flag set is attached to the VPLS service. Only one IP interface is allowed to attach to a VPLS service context. No error is generated for the remaining non-attached IP interfaces using the service name.

Once an IP interface is attached to a VPLS service, the name associated with the service cannot be removed or changed until the IP interface name binding is removed. Also, the **allow-ip-int-bind** flag cannot be removed until the attached IP interface is unbound from the service name.

Unbinding the service name from the IP interface causes the IP interface to detach from the VPLS service context. The IP interface may then be bound to another service name or a SAP or SDP binding may be created for the interface using the **sap** or **spoke-sdp** commands on the interface.

IP Interface MTU and Fragmentation

A VPLS service is affected by two MTU values; port MTUs and the VPLS service MTU. The MTU on each physical port defines the largest Layer 2 packet (including all DLC headers and CRC) that may be transmitted out a port. The VPLS itself has a service level MTU that defines the largest packet supported by the service. This MTU does not include the local encapsulation overhead for each port (QinQ, Dot1Q, TopQ or SDP service delineation fields and headers) but does include the remainder of the packet. As virtual ports are created in the system, the virtual port cannot become operational unless the configured port MTU minus the virtual port service delineation overhead is greater than or equal to the configured VPLS service MTU. Thus, an operational virtual port is ensured to support the largest packet traversing the VPLS service. The service delineation overhead on each Layer 2 packet is removed before forwarding into a VPLS service. VPLS services do not support fragmentation and must discard any Layer 2 packet larger than the service MTU after the service delineation overhead is removed.

IP interfaces have a configurable up MTU that defines the largest packet that may egress the IP interface without being fragmented. This MTU encompasses the IP portion of the packet and does not include any of the egress DLC header or CRC. This MTU does not affect the size of the largest ingress packet on the IP interface. If the egress IP portion of the packet is larger than the IP interface MTU and the IP header do not fragment flag is not set, the packet is fragmented into smaller packets that will not exceed the configured MTU size. If the do not fragment bit is set, the packet is silently discarded at egress when it exceeds the IP MTU.

When the IP interface is bound to a VPLS service, the IP MTU must be at least 18 bytes less than the VPLS service MTU. This allows for the addition of the minimal Ethernet encapsulation overhead; 6 bytes for the DA, 6 bytes for the SA, 2 bytes for the Etype and 4 bytes for the trailing CRC. Any remaining egress virtual port overhead (Dot1P, Dot1Q, QinQ, TopQ or SDP) required above the minimum is known to be less than the egress ports MTU since the virtual port would not be operational otherwise.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the IP interface IP MTU value is too large based on the VPLS service MTU, the IP interface will enter the operationally down state until either the IP MTU is adequately lowered or the VPLS service MTU is sufficiently increased.

The **no** form of this command on the IP interface is used to remove the service name binding from the IP interface. If the service name has been resolved to a VPLS service context and the IP interface has been attached to the VPLS service, the IP interface will also be detached from the VPLS service.

Parameters

service-name

The service-name parameter is required when using the IP interface vpls command and specifies the service name that the system will attempt to resolve to an **allow-ip-int-bind** enabled VPLS service associated with the name. The specified name is expressed as an ASCII string comprised of up to 32 characters. It does not need to already be associated with a service and the system does not check to ensure that multiple IP interfaces are not bound to the same name.

[Tree] (config>service>vpls>bgp-ad vpls-id)

Full Context

configure service vpls bgp-ad vpls-id

Description

This command configures the VPLS ID component that is signaled in one of the extended community attributes (*ext-comm*).

Values and format (6 bytes, other 2 bytes of type-subtype is automatically generated)

Parameters

vpls-id

Specifies a globally unique VPLS ID for BGP auto-discovery in this VPLS service

Values vpls-id: <ip-addr:comm-val>| <as-number:ext-comm-val>

ip-addr: a.b.c.d

comm-val: [0 to 65535]

as-number: [1 to 65535]

ext-comm-val: [0 to 4294967295]

50.65 vpls-sap-template

vpls-sap-template

Syntax

vpls-sap-template *name/id* **create**

[**no**] **vpls-sap-template** *name/id*

Context

[Tree] (config>service>template vpls-sap-template)

Full Context

configure service template vpls-sap-template

Description

This is the command used to create a SAP template to be used in a vpls-template. Only certain existing VPLS SAP attributes can be changed in the vpls-sap-template, not in the instantiated VPLS SAP

The following SAP attributes are set in the instantiated saps (no configuration allowed):

description: "Sap <sap-id> controlled by MVRP service <svc id>" – auto generated

shutdown: no shutdown

Parameters

name/id

Specifies the name in ASCII or the template ID

Values 1 to 2147483647

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

50.66 vpls-template

vpls-template

Syntax

vpls-template *name/id* **create**

[**no**] **vpls-template** *name/id*

Context

[Tree] (config>service>template vpls-template)

Full Context

configure service template vpls-template

Description

This command is used to create a vpls-template to be used to auto-instantiate a range of VPLS services. Only certain existing VPLS attributes specified in the command reference section can be changed in the vpls-template, not in the instantiated VPLS. The following attributes are automatically set in the instantiated VPLSs (no template configuration necessary) and the operator cannot change these values.

vpn-id: none

description: "Service <svc id> auto-generated by control VPLS <svc-id>”

service-name: "Service <svc id>” (Auto-generated)

shutdown: no shutdown

Following existing attributes can be set by the user in the instantiated VPLSs:

[no] sap

All the other VPLS attributes are not supported.

Parameters

name/id

Specifies the name in ASCII or the template ID

Values name: ASCII string

Values ID: [1 to 2147483647]

Platforms

All

Use subject to Terms available at: www.nokia.com/terms.

50.67 vpls-template-binding

vpls-template-binding

Syntax

vpls-template-binding *name/id*

no vpls-template-binding

Context

[Tree] (config>service>vpls>vpls-group vpls-template-binding)

Full Context

configure service vpls vpls-group vpls-template-binding

Description

This command configures the binding to a VPLS template to be used to instantiate pre-provisioned data VPLS using as input variables the service IDs generated by the vid-range command.

The **no** form of this command removes the binding and deletes the related VPLS instances. The command will fail if any of the affected VPLS instances have either a provisioned SAP or an active MVRP declaration/registration or if the related vpls-group id is in no shutdown state. Any changes to the vpls-template-binding require the vpls-group to be in shutdown state.

Default

no vpls-template-binding

Parameters

name/id

Specifies the name or the ID of the VPLS template

Values 1 to 1024

Platforms

All

50.71 vpn-family-policy

vpn-family-policy

Syntax

vpn-family-policy *policy-name*

no vpn-family-policy

Context

[Tree] (config>router>bgp>next-hop-resolution vpn-family-policy)

Full Context

configure router bgp next-hop-resolution vpn-family-policy

Description

This command specifies the VPN family policy that is applied when filtering routes for consideration for next-hop resolution process for EVPN and IP-VPN families.

This policy is supported by the following families:

- VPN-IPv4 and VPN-IPv6
- EVPN (all routes types 1-6, although AD per-ES and AD per-EVI routes are always shown as resolved)
- MCAST-VPN-IPv4 and MCAST-VPN-IPv6

In a VPN family policy:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- only prefix-lists are used to match the next hop of a resolving route. No other policy qualifiers are supported.
- the route resolving the next hop is accepted or rejected

  In other words, if an imported route's next hop is resolved by route N (N is the preferred entry in tunnel-table for MPLS or the longest prefix match in the route-table for VXLAN), and route N is rejected by vpn-family-policy, then the route next hop is unresolved. This is irrespective of the existence of a route M that could potentially resolve the next hop in the tunnel-table or route-table.

The **no** form of this command removes the VPN family policy.

Default

no vpn-family-policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

50.72 vpn-gre-source-ip

vpn-gre-source-ip

Syntax

vpn-gre-source-ip *ip-address*

no vpn-gre-source-ip

Context

[Tree] (config>service>system vpn-gre-source-ip)

Full Context

configure service system vpn-gre-source-ip

Description

This command configures a single system-wide alternate source IPv4 address of the GRE tunnels in all VPRN services using the **auto-bind-tunnel** or an explicit SDP binding (**config**>**service**>**vprn**>**spoke-sdp**) with a tunnel of encapsulation GRE.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A change to the value of the **vpn-gre-source-ip** parameter can be performed without disabling the service. Once the new value is configured, the system address is not used in services which bind to the GRE tunnel.

The primary IPv4 address of any local network IP interface, loopback or otherwise, may be used.

The address of the following interfaces are not supported, and the configuration is rejected:

- unnumbered network IP interface
- IES interface
- VPRN interface
- CSC VPRN interface

The **vpn-gre-source-ip** parameter value adheres to the following rules:

- This single source address counts towards the maximum of 15 distinct address values per system that are used by all GRE SDPs under the **config**>**service**>**sdp**>**local-end** context and all L2oGRE SDPs under the **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** context.
- The same source address can be used in both **vpn-gre-source-ip** and **config**>**service**>**sdp**>**local-end** contexts.
- The same source address cannot be used in both **vpn-gre-source-ip** and **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** contexts because an address configured for a L2oGRE SDP matches an internally created interface which is not available to other applications.
- The **vpn-gre-source-ip** address, when different from system, need not match the primary address of an interface which has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

The **no** form of the command reverts to the default value.

Default

vpn-gre-source-ip ip-address (System interface primary IPv4 address)

Parameters

ip-address

Specifies the IPv4 address (a.b.c.d).

Full Context

configure router bgp add-paths vpn-ipv4

configure router bgp group neighbor add-paths vpn-ipv4

configure router bgp group add-paths vpn-ipv4

Description

This command configures the add-paths capability for VPN-IPv4 routes. By default, add-paths is not enabled for VPN-IPv4 routes.

The maximum number of paths per VPN-IPv4 NLRI to send is the configured send-limit, which is a mandatory parameter. The capability to receive multiple paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for VPN-IPv4 routes, causing sessions established using add-paths for VPN-IPv4 to go down and come back up without the add-paths capability.

Default

no vpn-ipv4

Parameters

send-limit

Specifies the maximum number of paths per VPN-IPv4 NLRI that are allowed to be advertised to add-paths peers (the actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules). If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each VPN-IPv4 NLRI if the peer has signaled support for receiving multiple add paths. If the router has not installed any of the routes in its FIB then all BGP add-paths qualify for advertisement. If the value is **all**, all valid and next-hop diverse paths for a prefix are advertised to add-paths capable peers instead of a limited number.

Values 1 to 16, none, multipaths, all

receive

Specifies that the router negotiates the add-paths receive capability for VPN-IPv4 routes with its peers.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

none

Specifies that the router does not negotiate the add-paths receive capability for VPN-IPv4 routes with its peers.

no vpn-ipv4

Context

[Tree] (config>router>bgp>multi-path vpn-ipv4)

Full Context

configure router bgp multi-path vpn-ipv4

Description

This command configures ECMP multipath parameters that apply only to the VPN-IPv4 unicast address family in the context of an inter-AS model B ASBR or next-hop-self RR. These settings override the values set by the **maximum-paths** command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path.

The **no** form of this command removes VPN-IPv4-specific overrides.

Default

no vpn-ipv4

Parameters

max-paths

Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

ebgp-max-paths

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

restrict same-neighbor-as

Keyword that specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

restrict exact-as-path

Keyword that specifies that the non-best path must have the same AS path as the best path.

unequal-cost

Keyword that instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

Context

[Tree] (config>port>ethernet>access>egress vport)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure port ethernet access egress vport

Description

This command configures a scheduling node, referred to as virtual port, within the context of an egress Ethernet port. The Vport scheduler operates either like a port scheduler with the difference that multiple Vport objects can be configured on the egress context of an Ethernet port, or it can be an aggregate rate when an egress port-scheduler policy is applied to the port.

The Vport is always configured at the port level even when a port is a member of a LAG.

When a port scheduler policy is applied to a Vport the following command is used:

```
config>port>ethernet>access>egress>vport>port-scheduler-policy
port-scheduler-policy-name
```

The CLI will not allow the user to apply a port scheduler policy to a Vport if one has been applied to the port. Conversely, the CLI will not allow the user to apply a port scheduler policy to the egress of an Ethernet port if one has been applied to any Vport defined on the access egress context of this port. The **agg-rate**, along with an egress port-scheduler, can be used to ensure that a given Vport does not oversubscribe the port's rate.

SAP and subscriber host queues can be port-parented to a Vport scheduler in a similar way they port-parent to a port scheduler or can be port-parented directly to the egress port-scheduler if the **agg-rate** is used.

When the Vport uses an aggregate rate, the following command is used:

configure>port>ethernet>access>egress>vport>agg-rate-limit

The **no** form of this command removes the Vport name from the configuration.

Parameters

name

Specifies the name of the Vport scheduling node and can be up to 32 ASCII characters. This does not need to be unique within the system but is unique within the port or a LAG.

no vprn *service-id*

Context

[Tree] (config>service vprn)

Full Context

configure service vprn

Description

This command creates or edits a Virtual Private Routed Network (VPRN) service instance.

If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

VPRN services allow the creation of customer-facing IP interfaces in the same routing instance used for service network core routing connectivity. VPRN services require that the IP addressing scheme used by the subscriber must be unique between it and other addressing schemes used by the provider and potentially the entire Internet.

IP interfaces defined within the context of an VPRN service ID must have a SAP created as the access point to the subscriber network.

When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

When a service is created, the use of the **customer** *customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error.

Multiple VPRN services are created to separate customer-owned IP interfaces. More than one VPRN service can be created for a single customer ID. More than one IP interface can be created within a single VPRN service ID. All IP interfaces created within an VPRN service ID belongs to the same customer.

The **no** form of this command deletes the VPRN service instance with the specified *service-id*. The service cannot be deleted until all the IP interfaces and all routing protocol configurations defined within the service ID have been shut down and deleted.

Parameters

service-id

Specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

of any type. The *service-id* must be the same number used for every 7750 SR on which this service is defined.

Values
service-id: 1 to 2147483648
svc-name: 64 characters maximum

customer-id

Specifies an existing customer identification number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

name name

This parameter configures an optional VPRN name, up to 64 characters, which adds a name identifier to a given vprn to then use that vprn name in configuration references as well as display and use vprn names in show commands throughout the system. This helps the service provider/administrator to identify and manage vprn within the SR OS platforms.

All services are required to assign a service ID to initially create a service. However, either the service ID or the service name can be used to identify and reference a given service once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the service-id as the name.

Service names may not begin with an integer (0 to 9).

create

Keyword used to create a service ID. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

Full Context

configure cflowd collector export-filter interface-list service vprn

Description

This command configures the VPRN service interfaces flow data sent to this collector.

The **no** form of the command removes the values from the configuration.

Parameters

service-id

Specifies the unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every SR OS on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: 64 characters maximum

interface *ip-int-name*

Specifies the name of an IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters and must start with a letter. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

network-interface *ip-int-name*

Specifies the name of a network interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes and must start with a letter.

subscriber-interface *ip-int-name*

Specifies an interface name of a subscriber interface. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes and must start with a letter.

group-interface *ip-int-name*

Specifies an interface name of a group interface. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes and must start with a letter.

ingress

Keyword to specify that ingress flows are sent to the associated Cflowd Collector.

Default both

egress

Keyword to specify that egress flows are sent to the associated Cflowd Collector.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default both

both

Keyword to specify that both ingress and egress flows are sent to the associated Cflowd Collector.

Full Context

configure router mpls lsp vprn-auto-bind

configure router mpls lsp-template vprn-auto-bind

Description

This command determines whether the associated names LSP can be used or not as part of the auto-bind feature for VPRN services. By default, a names LSP is available for inclusion to be used for the auto-bind feature.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

By configuring the command vprn-auto-bind exclude, the associated LSP will not be used by the auto-bind feature within VPRN services.

The **no** form of this command resets the flag back to the default value.

Default

vprn-auto-bind include

Parameters

include

Allows an associated LSP to be used by auto-bin for vprn services

exclude

Disables the use of the associated LSP to be used with the auto-bind feature for VPRN services.

Platforms

All

50.81 vprn-local

vprn-local

Syntax

vprn-local [{**none** | **all** | **vc-only**}]

Context

[Tree] (config>router>ttl-propagate vprn-local)

Full Context

configure router ttl-propagate vprn-local

Description

This command configures the TTL propagation for locally generated packets which are forwarded over a MPLS LSPs in all VPRN service contexts.

For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP traceroute in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance.

Default

vprn-local vc-only

Parameters

none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

Context

[Tree] (config>system>security vprn-network-exceptions)

Full Context

configure system security vprn-network-exceptions

Description

This command configures the rate to limit the processing of packets with label TTL expiry received within an LSP shortcut, or within all VPRN instances in the system, and from all network IP interfaces. This includes labeled user and control plane packets, ping and traceroute packets within GRT and VPRN, and ICMP replies. Packets over the configured rate are dropped.

This feature does not rate limit MPLS and service OAM packets (vprn-ping, vprn-trace, lsp-ping, lsp-trace, vccv-ping, and vccv-trace).

The **no** form of this command disables the rate limiting of the reply to these packets.

Parameters

number

Specifies the number limit of MPLS exception messages.

Values 10 to 10,000

seconds

Specifies the rate limit of MPLS exception messages, in seconds.

Values 1 to 60

configure service system bgp-evpn ethernet-segment vprn-next-hop

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configuresthe IPv4 or IPv6 address associated with an Ethernet Segment (ES). A virtual ES using this VPRN next-hop association represents a Layer 3 ES as described in *draft-sajassi-bess-evpn-ip-aliasing*. This IP address must be installed in the route table of the VPRN service identified by the EVI so that the Auto-Discovery per-ES or EVI routes for the ES are advertised. Only one VPRN next hop is supported per ES.

The **no** form of this command removes the IPv4 or IPv6 address association.

Default

no vprn-next-hop

Parameters

ip-address

Specifies the IPv4 or IPv6 address associated with an Ethernet Segment.

Values ipv4-address - a.b.c.d

ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0..FFFF]H

Full Context

oam vprn-ping

configure saa test type vprn-ping

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command performs a VPRN ping and applies only to the 7750 SR and 7950 XRS.

Parameters

service-id

Specifies the VPRN service ID to diagnose or manage.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **configure saa test type vprn-ping service** *service-name* variant can be used in all configuration modes.

Values 1 to 2147483647

service-name

Specifies the VPRN service name to diagnose or manage, up to 64 characters.

source *ip-address*

Specifies an unused IP address in the same network that is associated with the VPRN.

Values	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

destination *ip-address*

Specifies the IP address to be used as the destination for performing a VPRN ping operation.

Values	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

fc-name

Specifies the forwarding class of the MPLS echo request encapsulation.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default out

size

Specifies the OAM request packet size in bytes, expressed as a decimal integer.

Values 1 to 9786

Default 72

vc-label-ttl

Specifies the TTL value in the VC label for the OAM request, expressed as a decimal integer.

Values 1 to 255

Default 255

send-count

Specifies the number of messages to send. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

Values 1 to 100

Default 1

return-control

Specifies the response to come on the control plane.

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response was not received. Any response received after the request times out is silently discarded.

Values 1 to 100

Default 5

interval

Specifies the interval time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

oam vprn-trace

configure saa test type vprn-trace

Description

This command is used to perform a VPRN trace.

Parameters

service-id

Specifies the VPRN service ID to diagnose or manage.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **configure saa test type vprn-trace service** *service-name* variant can be used in all configuration modes.

Values 1 to 2147483647

service-name

Specifies the VPRN service name to diagnose or manage, up to 64 characters.

source *ip-address*

Specifies the IP address for the source IP address in dotted decimal notation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

destination *ip-address*

Specifies the IP address to be used as the destination for performing an vprn-trace operation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

50.86 vprn-transit

vprn-transit

Syntax

vprn-transit [{**none** | **all** | **vc-only**}]

Context

[Tree] (config>router>ttl-propagate vprn-transit)

Full Context

configure router ttl-propagate vprn-transit

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in all VPRN service contexts. For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP trace-route in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN service instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance

Default

vprn-transit vc-only

Parameters

none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

configure service vprn bgp-evpn vxlan vrf-export

configure service vprn bgp-ipvpn segment-routing-v6 vrf-export

configure service vprn bgp-evpn mpls vrf-export

Description

This command configures route policies that control how routes are exported from the local VRF to other VRFs on the same or remote PE routers (using MP-BGP). Route policies are configured in the **configure router policy-options** context.

The **vrf-export** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route.

Only one of the 15 objects referenced by the **vrf-export** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-export** commands are issued, the last command entered overrides the previous command.

Aggregate routes are not advertised using MP-BGP protocols to the other MP-BGP peers.

The **no** form of this command removes all route policy names from the **vrf-export** list.

Default

no vrf-export

© 2026 Nokia.

configure service vprn mvpn vrf-export

Description

This command specifies the export policy to control MVPN routes exported from the local VRF to other VRFs on the same or remote PE routers.

Default

vrf-export unicast

Parameters

unicast

Specifies to use unicast VRF export policy for the MVPN.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string up to 255 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed between double quotes.

plcy-or-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed between double quotes. Up to 14 policies can be specified in a single statement.

configure service vprn bgp-evpn mpls vrf-import

configure service vprn bgp-ipvpn segment-routing-v6 vrf-import

configure service vprn bgp-evpn vxlan vrf-import

Description

This command configures route policies that control how VPN-IP and EVPN-IFL routes exported by other VRFs, on the same or remote PEs, are imported into the local VRF. Route policies are configured in the **configure router policy-options** context.

The **vrf-import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route

Only one of the 15 objects referenced by the **vrf-import** command is allowed to be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-import** commands are issued, the last command entered overrides the previous command.

The **no** form of this command removes all route policy names from the import list

Note:
Unless the preference value is changed by the policy, BGP-VPN and EVPN-IFL routes imported with a **vrf-import** policy have the preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs on the same router.

Default

no vrf-import

Parameters

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

configure service vprn bgp-evpn vxlan vrf-target

configure service vprn bgp-ipvpn segment-routing-v6 vrf-target

Description

This command provides a simplified method to configure the route target added to advertised routes or compared against received routes from other VRFs on the same or remote PE routers (using MP-BGP).

BGP-VPN and EVPN-IFL routes imported with a VRF target policy use the BGP preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs in the same router.

Specified VRF import or VRF export policies override the VRF target policy.

The **no** form of this command removes the VRF target policy.

Default

no vrf-target

Parameters

ext-comm

Specifies an extended BGP community in the *type:x:y* format. The value *x* can be an integer or IP address. The *type* can be the target or origin. *y* can be 16-bit integers.

Values

<ext-community>	: target:{<ip-addr:comm-val> | <2byte-asnumber:ext-comm-val> | <4byte-asnumber:comm-val>}	
	ip-addr:	a.b.c.d
	comm-val:	[0 to 65535]
	2byte-asnumber:	[0 to 65535]
	ext-comm-val:	[0 to 4294967295]
	4byte-asnumber:	[0 to 4294967295]

import *ext-community*

Specifies communities allowed to be received from remote PE neighbors.

export *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

The **no** form of this command removes the vrf-target.

Default

no vrf-target

Parameters

unicast

Specifies to use unicast vrf-target ext-community for the multicast VPN.

ext-comm

An extended BGP community in the **type**:**x**:**y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers.

Values target:{*ip-address*:*comm-val* | *2byte-asnumber:ext-comm-val* | 4byte-asnumber:comm-val}

ip-address:	a.b.c.d
comm-val:	0 to 65535
2byte-asnumber:	1 to 65535
4byte-asnumber	0 to 4294967295

import *ext-community*

Specifies communities allowed to be accepted from remote PE neighbors.

Context

[Tree] (config>service>ies>if vrrp)

[Tree] (config>service>ies>if>ipv6 vrrp)

Full Context

configure service ies interface vrrp

configure service ies interface ipv6 vrrp

Description

This command configures the router to create or edit a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. The **vrrp** *virtual-router-id* command is used to define the configuration parameters for the VRID.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shutdown to remove the virtual router instance.

Parameters

virtual-router-id

Specifies a virtual router ID or an ID that can be modified on the IP interface.

Values 1 to 255

owner

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Keyword used to identify this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

Context

[Tree] (config>router>if>ipv6 vrrp)

[Tree] (config>router>if vrrp)

Full Context

configure router interface ipv6 vrrp

configure router interface vrrp

Description

This command creates the context to configure a VRRP virtual router instance. A virtual router is defined by its virtual router identifier (VRID) and a set of IP addresses.

The optional **owner** keyword indicates that the **owner** controls the IP address of the virtual router and is responsible for forwarding packets sent to this IP address. The **owner** assumes the role of the master virtual router.

All other virtual router instances participating in this message domain must have the same *vrid* configured and cannot be configured as **owner**. Once created, the **owner** keyword is optional when entering the *vrid* for configuration purposes.

A *vrid* is internally associated with the IP interface. This allows the *vrid* to be used on multiple IP interfaces while representing different virtual router instances.

For IPv4, up to four VRRP VRID nodes can be configured on a router interface. Each virtual router instance can manage up to 16 backup IP addresses. For IPv6, only one VRID can be configured on a router interface.

The optional **passive** keyword indicates that a *vrid* can be configured as **passive**, in which case, the VRRP advertisement messages are suppressed on transmission and reception, and all routers configured with the same *vrid* become master. Passive *VRIDs* can exceed the limit of four VRRP VRID nodes on a router interface.

The **no** form of the command removes the specified *vrid* from the IP interface. This terminates VRRP participation and deletes all references to the *vrid* in conjunction with the IP interface. The *vrid* does not need to be shut down to remove the virtual router instance.

Default

no vrrp — No VRRP virtual router instance is associated with the IP interface.

Parameters

virtual-router-id

The virtual router ID for the IP interface expressed as a decimal integer.

Values 1 to 255

owner

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

passive

Keyword used to identify this virtual router instance as **passive**, therefore owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove the parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

Full Context

configure service epipe bgp-evpn vxlan

configure service vpls bgp-evpn vxlan

Description

Commands in this context configure the VXLAN parameters when BGP EVPN is used as the control plane. In VPLS services, instance BGP 1 or BGP 2 can be configured, as well as VXLAN instances 1 or 2. Up to two instances of this command can be configured in the same service, as long as the BGP instance and the VXLAN instance are different in both commands. In Epipe services, only BGP instance 1 and VXLAN instance 1 is supported. If the BGP or VXLAN instance are not specified, the instances are by default set to 1.

The **no** version of this command will remove the vxlan instance from the service.

Parameters

bgp

Indicates the BGP instance identifier.

configure service epipe vxlan

Description

This command enables the use of VXLAN in the Epipe service.

The **no** version of this command will remove the VXLAN instance from the service.

Parameters

vni-id

Specifies the VXLAN network identifier configured in the Epipe service. When EVPN is used in the control plane, the configured VNI is encoded in the MPLS field of the NLRI. The VPLS service is operationally up when the **vxlan vni** *vni-id* is successfully created.

Values 1 to 16777215

Default 1

instance-id

Specifies the VXLAN instance identifier.

Values 1, 2

create

Mandatory keyword that creates a VXLAN instance.

vxlan service-name *service-name*

no vxlan

Context

[Tree] (config>fwd-path-ext>fpe vxlan)

Full Context

configure fwd-path-ext fpe vxlan

Description

This command informs the system about the cross-connect type that is required for non-system IPv4 and IPv6 VXLAN termination. Internally, it triggers the automatic creation of two internal IP interfaces in the PXC ports and enables those internal interfaces to process and terminate VXLAN.

If no parameters are used, the VXLAN termination occurs in the Base router; however, when the FPE is used for static VXLAN termination (no BGP-EVPN services), non-system IPv4 and IPv6 VXLAN can be terminated in a VPRN service. In this case, the VPRN router instance or service name must be configured with the **vxlan-termination** command.

The **no** form of this command disables the cross-connect type from the configuration.

Default

no vxlan-termination

Parameters

router-name

Specifies the router instance for VXLAN termination.

Values *router-name*: *router-name* or *vprn-svc-id*

router-name	"Base"
vprn-svc-id	1 to 2147483647

Default Base

service-name

Specifies the service name that identifies the VPRN for VXLAN termination, up to 64 characters.

50.96 vxlan-ipv4-tep-ecmp

vxlan-ipv4-tep-ecmp

Syntax

[**no**] **vxlan-ipv4-tep-ecmp**

Context

[Tree] (config>service>vpls>allow-ip-int-bind vxlan-ipv4-tep-ecmp)

Full Context

configure service vpls allow-ip-int-bind vxlan-ipv4-tep-ecmp

Description

This command enables and disables ECMP on VXLAN IPv4 destinations for R-VPLS services. When this command is enabled, packets entering a VPRN connected to an R-VPLS that is terminating on a VXLAN IPv4 destination are looked up in the routing table. If the next hop is a VXLAN IPv4 TEP, the packets are distributed based on per-flow load-balancing.

This command can only be used in FP3- (or higher) routers. R-VPLS per-flow load-balancing for VXLAN IPv6 destinations works by default without this command.

The **no** version of this command reverts the process to the default behavior of per-remote VTEP load-balancing.

Default

no vxlan-ipv4-tep-ecmp

Context

[Tree] (oam vxlan-ping)

Full Context

oam vxlan-ping

Description

Operational command used to validate the VXLAN Tunnel Endpoint (VXLAN) connectivity between peers.

Parameters

test-id

Specifies a value to identify the originator handle of the specific request. Each active test requires a unique test identifier.

Values 1 to 2147483647

vpls-service-id

Specifies the VPLS service used to launch the request and by extension pick up the source VNI information.

Values

service-id: 1 to 2147483647

svc-name: up to 64 characters

vxlan-network-id

Specifies the target Vxlan network identifier on the terminating VTEP.

Values 1 to 16777215

outer-ip-destination *ipv4-address*

Specifies the IPv4 address of the terminating VTEP.

Values a.b.c.d

udp-port-number

Optional outer source UDP port number.

Values 1 to 65535

Default System-generated UDP port number

time-to-live

Specifies the optional outer time to live.

Values 1 to 255

Default 255

inner-l2 *ieee-address*

Specifies the destination MAC address used in the inner VXLAN header.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Default 00:00:00:00:00:00

inner-ip-source ***ipv4-address***

Specifies the inner source IPv4 address.

Values a.b.c.d

Default System IPv4 Address

inner-ip-destination ***ipv4-address***

Specifies the inner destination IPv4 address. Must be in the range 127/8.

Values 127.0.0.0 to 127.0.0.8

Default 127.0.0.1

i-flag-on

Sets the VNI Validation bit to 1, indicating that the OAMPDU contains a valid VNI.

Default i-flag set to "0” which prevents the OAMPDU form being forwarded beyond the terminating VTEP.

end-system ***ieee-address***

Optional command to include the sub TLV to validate an end system MAC address in the FDB. Only one MAC address may be included.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Default 00:00:00:00:00:00

packets

Specifies the number of VXLAN ping requests to transmit.

Values 1 to 1024

Default 1

interval-time

Specifies the probe interval, in seconds.

Values 0.1, 1 to 10

Default 1

timeout-time

Specifies the packet time out value, in seconds.

Values 1 to 10

Default 5

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tlv-size

Specifies whether to include the Pad TLV and specifies the number of octets that defines the entire size of the pad TLV, including the type (2B), the length field (2B), the padding (variable).

Values 0, 5 to 2000

Default 0

reflect-pad

Instructs the responder to include the pad-tlv in the echo response. This option is not supported when the reply mode is "UDP".

fc-name

Indicates the forwarding class that is exposed to the QoS policy as input into generating the outer CoS.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Defines the frame's disposition that is exposed to the QoS policy as input into generating the outer CoS.

Default in

reply-mode {overlay | udp}

Instructs the responder how to route the VXLAN response.

Values **udp**: responds using UDP over the IP network. The default must be changed if the VTEP uses anything other than an IPv4 System Address as the source.

overlay: responds using the VXLAN overlay for the service

Default udp

configure service system bgp-evpn ip-prefix-routes interface-less vxlan-router-mac

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the router MAC address of the VXLAN instance in the VPRN. This MAC address is encoded in the router MAC extended community that is advertised with the IP prefix routes with VXLAN encapsulation. The MAC address is configured at the system level and used by all the VPRN services configured with VXLAN instances.

When unconfigured, the chassis base MAC is used as the inner source MAC in the originated packets for all the EVPN IFL VXLAN instances, as well as in the MAC extended community of the router.

The **no** form of this command removes the router MAC address configuration.

Default

no vxlan-router-mac

Parameters

ieee-address

Specifies the router MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

7750 SR-1, 7750 SR-s

Full Context

configure qos sap-ingress ip-criteria entry match vxlan-vni

configure qos sap-ingress ipv6-criteria entry match vxlan-vni

Description

This command configures a VXLAN or VXLAN GPE VNI to be used as a SAP QoS policy match criterion. A range of VNIs to be matched can be specified by including the keyword **range** with a *start* and *end* VNI. This command requires the **type** to be set to **vxlan-vni** in the related **ip-criteria** or **ipv6-criteria** context.

See Virtual Network Identifier (VNI) Classification for the list of restrictions for this command.

Default

no vxlan-vni

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

eq *vxlan-vni-id*

Specifies the VXLAN or VXLAN GPE VNI to be matched in the SAP ingress QoS classification. The VNI can be specified in any of the available formats but is always shown in decimal.

Values 1 to 16777215 (Decimal)
0x1 to 0xFFFFFF (Hexadecimal)
[0b1 to 0b111111111111111111111111] (Binary)

range *startend*

Identifies a range of VNIs to be used as matching criteria. The *start* value must be lower than the *end* value. The VNI can be specified in any of the available formats but is always shown in decimal.

Values 1 to 16777215 (Decimal)
0x1 to 0xFFFFFF (Hexadecimal)
[0b1 to 0b111111111111111111111111] (Binary)

configure router mpls lsp-template bfd wait-for-up-timer

configure router mpls lsp primary bfd wait-for-up-timer

configure router mpls lsp secondary bfd wait-for-up-timer

Description

This command configures the time to wait for a BFD to come up in seconds. This timer is applicable to SR-TE LSPs, including auto-LSPs and PCE-initiated LSPs, as well as RSVP-TE LSPs. In case of SR-TE LSPs, this timer takes effect if BFD does not come up, or BFD goes from up to down. The timer is started when BFD is first enabled on a path or BFD transitions from up to down. When the timer expires if BFD is not yet come up, then the path is torn down by removing it from the TTM and the IOM and the retry timer is started.

In case of RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up on the original path
- the initial administrative enable of an LSP
- signaling retry of non-standby secondary paths

The **no** form of this command sets the timer to its default value.

Default

no wait-for-up-timer

Parameters

seconds

Specifies the BFD wait for up timer in seconds.

Values 0 to 60

Default 4

Platforms

All

- configure router mpls lsp bfd wait-for-up-timer

configure service vpls spoke-sdp bfd wait-for-up-timer

configure service epipe spoke-sdp bfd wait-for-up-timer

configure service vprn interface spoke-sdp bfd wait-for-up-timer

Description

This command configures the time interval, in seconds, that is used to wait for a BFD session to come up.

This command is triggered when a spoke-SDP is first administratively enabled and a VCCV BFD session transitions from up to down. The command is required to allow time for BFD sessions to come up, and for BFD to settle before selecting the active spoke-SDP to use in a redundant set. In the case where a VCCV BFD session is bouncing, the timer prevents excessive flapping of the operational state of a spoke-SDP.

The **no** form of this command disables the timer.

Default

no wait-for-up-timer

Parameters

seconds

Specifies the wait interval, in seconds, for the BFD up timer.

Values 1 to 60

Platforms

All

© 2026 Nokia.

configure system sync-if-timing wait-to-restore

Description

This command configures the time for the Wait to Restore timer. A previously failed input reference must be valid for the time specified before it is used for either the BITSout or the central clock input reference.

The **no** form of this command disables the timer.

Default

no wait-to-restore

Parameters

minutes

Specifies a value representing the number of minutes for the wait to restore timeout.

Values 1 to 12

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

51.7 warm-standby

warm-standby

Syntax

warm-standby

Context

[Tree] (config>redundancy>multi-chassis>peer warm-standby)

Full Context

configure redundancy multi-chassis peer warm-standby

Description

This command enables Oversubscribed Multi-Chassis Redundancy (OMCR) model where subscriber hosts are synchronized between the two chassis only in the control plane and are kept there (as part of the Multi-Chassis Synchronization (MCS) state) until the switchover occurs. Link or nodal failure will trigger the switchover at which point the subscriber hosts are being fully instantiated in the control and the forwarding plane. This approach allows oversubscription of the resources in the central standby (or protecting) node that is backing-up several active nodes. The total number of protected subscribers in the OMCR cluster exceeds the forwarding capacity of the protecting node. This is achievable by not fully occupying the resources for the subscriber hosts until the failure occurs.

The restoration times depend on the amount of the subscriber hosts that are affected by the switchover and it is related to the time needed for the full instantiation of the subscribers in the forwarding plane.

Although this command is configured on a peer level, the warm-standby property is a nodal characteristic. In other words, mixing of N:1 and 1:1 (hot standby) mode in the central standby node is not supported. Consequently all peers on the central standby node must be configured for warm-standby (N:1), or all peers must be configured for hot-standby (1:1) by omitting the warm-standby keyword from the configuration.

The peer of the central backup node is not aware of the redundancy model supported. In in other words, the peer of the central-backup node does not know whether it peers with a warm-standby peer or host-standby-peer.

51.9 watchdog-timer

watchdog-timer

Syntax

watchdog-timer *seconds*

no watchdog-timer

Context

[Tree] (config>aaa>diam>node>peer watchdog-timer)

Full Context

configure aaa diameter node peer watchdog-timer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

Watchdog messages are used to verify liveliness of a Diameter peer. A single watchdog message is sent to a peer in case that no traffic is received from it within a configured watchdog-timer. This watchdog request message solicits a watchdog answer message from the peer. If no traffic (watchdog answer or otherwise) is received from the peer in response to watchdog request while the watchdog timer is running, the peer ise put in suspicious state and a peer failover routine is triggered.

The peer closes after it has been in suspicious mode for the duration of one more watchdog-timer interval without receiving any traffic from it.

After the peer is recovered, it takes three successful exchanges of diameter watchdog messages (DWR/DWA) for the peer to become used again in Diameter forwarding. This behavior is described in RFC 3539, §3.4.1, *Authentication, Authorization and Accounting (AAA) Transport Profile*).

This command is not applicable to legacy implementations of Diameter base in the SR OS.

The **no** form of this command removes the watchdog timer value from the configuration.

Default

watchdog-timer 30

Parameters

seconds

Specifies the device watchdog timer, in seconds, used on all connections by this peer.

Values 1 to 1000

[Tree] (config>service>vprn>nat>outside>pool watermarks)

Full Context

configure router nat outside pool watermarks

configure service vprn nat outside pool watermarks

Description

This command configures the watermarks for ports or port-block utilization in a NAT pool.

For CGN and L2-aware NAT, the port and port-block watermarks are used to monitor ports or port-block utilization in a NAT pool. High and low thresholds are configured in percentages of total available port-blocks or ports per protocol in a pool.

For LSN44 pools with flexible port allocation, the watermarks represent the port utilization per outside IP address if paired address pooling is enabled. If an arbitrary address pooling is enabled, then the watermarks represent the port utilization per pool.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For port-block based pools where flexible port allocation is disabled, the watermarks represent port-block occupancy per pool. These watermarks cover combined initial and extended port-blocks in a NAT pool. If the extended port blocks are not enabled in L2-aware NAT, then the L2-aware pool contains only the initial port-blocks.

For the system to generate those events, the NAT event ID is configured as follows:

- 2001 is enabled for L2-aware pools which do not use l2-aware port-block-extensions
- 2003 is enabled for port-blocks based LSN pools
- 2044 is enabled for L2-aware pools which use l2aware port-block-extension
- 2046 is enabled for port based LSN pools for flexible-port-allocation

Event IDs are enabled via log event control configuration.

Default

no watermarks

Full Context

configure system cron schedule weekday

Description

This command specifies which days of the week that the schedule will fire on. Multiple days of the week can be specified. When multiple days are configured, each of them will cause the schedule to occur. If a weekday is configured without configuring the month, weekday, day-of-month, and minute, the event will not execute.

Using the **weekday** command as well as the **day-of month** command will cause the script to run twice. For example, consider that today is Monday January 1. If Tuesday January 5 is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified weekday from the configuration.

Default

no weekday

Parameters

weekday-number

Specifies a weekday number.

Values 1 to 7 (maximum 7 weekday-numbers)

day-name

Specifies a day by name.

Values sunday, monday, tuesday, wednesday, thursday, friday, saturday (maximum 7 weekday names)

all

Specifies all days of the week.

51.16 weight-down

weight-down

Syntax

[**no**] **weight-down** *lag-ports-down-weight*

Context

[Tree] (config>vrrp>policy>priority-event>lag-port-down weight-down)

Full Context

configure vrrp policy priority-event lag-port-down weight-down

Description

This command creates a context to configure an event set threshold within a lag-port-down priority control event. The weight-down command defines a sub-node within the lag-port-down event and is uniquely identified with the lag-ports-down-weight parameter. Each weight-down node within the same lag-port-down event node must have a unique lag-ports-down-weight value. Each weight-down node has its own priority command that takes effect whenever that node represents the current threshold. A single LAG can use either weight-based (**weight-down**) or port-based (**number-down**) thresholds. The weight-based thresholds are required for correct operation on mixed port-speed LAGs, but can be used for non mixed port-speed LAGs as well. The weights for the **weight-down** node are normalized from the **hash-weight** values of the LAG member ports to fit a 1 to 64 range for 64-link capable LAGs and a 1 to 32 range for other LAGs.

The total number of sub-nodes (uniquely identified by the lag-ports-down-weight parameter) allowed in the system is 2048.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A **weight-down** node is not required for each possible number of ports that could be down. The active threshold is always the closest lower threshold.

The **no** form of the command deletes the event set threshold. The threshold may be removed at any time. If the removed threshold is the current active threshold, the event set thresholds must be re-evaluated after removal.

Default

no weight-down

Parameters

lag-ports-down-weight

The total weight of LAG ports down to create a set event threshold. This is the active threshold when the weight of down ports in the LAG equals or exceeds *lag-ports-down-weight*, but does not equal or exceed the next highest configured *lag-ports-down-weight*.

Values 1 to 64 (for 64-link capable LAGs)

1 to 32 (for other LAGs)

configure service vprn bgp-evpn segment-routing-v6 evpn-link-bandwidth weighted-ecmp

configure service vprn bgp-evpn mpls evpn-link-bandwidth weighted-ecmp

Description

This command enables the processing of the EVPN link bandwidth extended community when installing an ECMP set for an EVPN IP prefix route in the VPRN route table.

Flows to an IP prefix received with a weight and a zero ESI value are sprayed according to the weight. If the EVPN IP prefix route received with the weight has a non-zero ESI, the weight is divided into the number of PEs attached to the Ethernet Segment (and rounded up if the result is not an integer).

This command also enables the weighted ECMP functionality for BGP CEs where the weight is configured with the **evpn-link-bandwidth add-to-received-bgp** command.

The **no** form of this command disables EVPN link bandwidth extended community.

weighted-ecmp

Syntax

weighted-ecmp [**strict**]

no weighted-ecmp

Context

[Tree] (config>router weighted-ecmp)

Full Context

configure router weighted-ecmp

Description

This command enables the weighted load-balancing, or weighted ECMP, over MPLS LSP.

When this command is enabled, packets of IGP, BGP, and static route prefixes resolved to a set of ECMP tunnel next-hops are sprayed proportionally to the weights configured for each MPLS LSP in the ECMP set.

Weighted load-balancing over MPLS LSP is supported in the following forwarding contexts:

- IGP prefix resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- BGP prefix with the BGP next-hop resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- Static route prefix resolved to an indirect next-hop, which itself is resolved to a set of equal-metric MPLS LSPs in TTM. The user can allow automatic selection or specify the names of the equal-metric MPLS LSPs in TTM to be used in the ECMP set.
- Static route prefix resolved to an indirect next-hop, which is resolved to IGP shortcuts in RTM.
- BGP prefix with a BGP next-hop resolved to a static route, which resolves to a set of tunnel next-hops toward an indirect next-hop in RTM or TTM.
- BGP prefix resolving to another BGP prefix, whose next-hop is resolved to a set of ECMP tunnel next-hops with a static route in RTM or TTM or to IGP shortcuts in RTM.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

IGP computes the normalized weight for each prefix tunnel next-hop. IGP updates the route in RTM with the set of tunnel next-hops and normalized weights. RTM downloads the information to IOM for inclusion in the FIB.

If one or more LSPs in the ECMP set of a prefix do not have a weight configured, the regular ECMP spraying for the prefix will be performed.

The weight assigned to an LSP impacts only the forwarding decision, not the routing decision. In other words, it does not change the selection of the set of ECMP tunnel next-hops of a prefix when more next-hops exist than the value of the router **ecmp** option. Once the set of tunnel next-hops is selected, the LSP weight is used to modulate the amount of packets forwarded over each next-hop. It also does not change the hash routine, but only the spraying of the flows over the tunnel next-hops is modified to reflect the normalized weight of each tunnel next-hop.

The **no** form of this command resumes regular ECMP spraying of packets of IGP, BGP, and static route prefixes over MPLS LSP.

Default

no weighted-ecmp

Parameters

strict

Enables strict enforcement for a load balancing weight to be configured on each interface within a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

[**no**] **wide-metrics-only**

Context

[Tree] (config>service>vprn>isis>level wide-metrics-only)

Full Context

configure service vprn isis level wide-metrics-only

Description

This command enables the exclusive use of wide metrics in the LSPs for the level number. Narrow metrics can have values between 1 and 63. IS-IS can generate two TLVs, one for the adjacency and one for the IP prefix. In order to support traffic engineering, wider metrics are required. When wide metrics are used, a second pair of TLVs are added, again, one for the adjacency and one for the IP prefix.

By default, both sets of TLVs are generated. When wide-metrics-only is configured, IS-IS only generates the pair of TLVs with wide metrics for that level.

The **no** form of this command reverts to the default value.

[Tree] (config>service>vpls>provider-tunnel>selective wildcard-spmsi)

Full Context

configure service vprn mvpn provider-tunnel inclusive wildcard-spmsi

configure service vpls provider-tunnel selective wildcard-spmsi

Description

This command enables RFC 6625 (C-*, C-*) S-PMSI functionality for NG-MVPN, EVPN VPLS, or R-VPLS services. When enabled, (C-*, C-*) S-PMSI is used instead of I-PMSI for this MVPN, EVPN VPLS, or R-VPLS service. When used in MVPN services, wildcard S-PMSI uses the I-PMSI LSP template.

The **configure service vprn pim rp auto-rp-discovery** command and the following commands are mutually exclusive:

```
configure service vprn mvpn md-type sender-only
configure service vprn mvpn md-type receiver-only
configure service vprn mvpn provider-tunnel inclusive wildcard-spmsi
configure service vpls provider-tunnel selective wildcard-spmsi
```

The **no** form of this command disables the (C-*, C-*) S-PMSI functionality.

Default

no wildcard-spmsi

[Tree] (config>port>ethernet>efm-oam>link-mon>errored-frame-period window)

Full Context

configure lag efm-member-template link-monitoring errored-frame-period window

configure port ethernet efm-oam link-monitoring errored-frame-period window

Description

This command defines the size of the window based on a packet receive rate. The minimum serviceable rate is the number of minimum size packets that can be received in one second. The window receive count value will be polled at a minimum one second intervals to see if the window size has been reached. Errors are accumulated until the end of the window. At the end of the window the actual errors are compared to the thresholds to determine if a threshold has been crossed. There is no mid-window threshold checking. The window represents a unique non-overlapping period of time.

Parameters

packets

Specifies the number of received packets in one second.

Values 1 to 4294967295

Default 1488095

Platforms

7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

51.25 window-integrity

window-integrity

Syntax

window-integrity *percentage*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no window-integrity

Context

[Tree] (config>oam-pm>streaming>delay-template window-integrity)

Full Context

configure oam-pm streaming delay-template window-integrity

Description

This command specifies the integrity of the sample window. A percentage value that suggests the measurement has enough samples (integrity) to be considered representative for that sample window. The configured percentage considers the interval of the test PDUs, and the length of the sample window to determine the number of packets required in the sample.

(((window-integrity %) x (sample-window length (s) x pps per test (interval)).

Ensure that the percentage and the combination of sample window and packet per second per test interval produces the desired results.

If the number of samples in the sample window are equal to or greater than the computed number of required samples, then the value has integrity and the suspect flag is set to false for that streamed result.

If the count is less than the computed number of required samples, then the suspect flag is set to true for that streamed result.

Regardless of the integrity, the average values are streamed. It is up to the higher level systems to interrogate the suspect flag and determine if the value that is set should be used, discarded, or reported separately.

The **no** form of this command reverts to the default.

Default

window-integrity 50

Parameters

percentage

Specifies the window integrity percentage.

Values 1 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

window-integrity

Syntax

window-integrity *percent*

no window-integrity

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>test-oam>link-meas>template>asw window-integrity)

Full Context

configure test-oam link-measurement measurement-template aggregate-sample-window window-integrity

Description

This command determines whether the aggregate sample window is integral based on the number of samples received from the sample window, comparing the number of samples to the percentage configured.

The configured percentage translates to a required sample window count that must be included in the aggregate sample window. The range is from 0 to 100. The number of samples is computed as follows:

(window-integrity (%)) x (((aggregate-sample-window length (s)) / (sample-window length (s)))

For an aggregate sample window that does not reach the integrity, the value is not considered as representative and is used for threshold comparison.

If the number of samples in the aggregate sample window are equal to or greater than the computed number of required samples, the sample window has integrity and the aggregate sample window result is compared to configured sample window thresholds.

If the count is less than the computed number of required samples, the aggregate sample window does not have integrity and the aggregate sample window results are compared to configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

The **no** form of this command disables integrity checking.

Default

window-integrity 0

Parameters

percent

Specifies the percentage of successful sent and received request-response pairs.

Zero indicates any amount of integrity is acceptable for report to the routing engine.

Values 0 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

window-integrity

Syntax

window-integrity *percent*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no window-integrity

Context

[Tree] (config>test-oam>link-meas>template>sw window-integrity)

Full Context

configure test-oam link-measurement measurement-template sample-window window-integrity

Description

This command specifies the integrity of the sample window. A percentage value indicates when the sample window has enough samples to be considered representative for that window (integrity). The configured percentage considers the interval of probes and the length of the sample window to determine the number of packets required in the sample:

(window-integrity (%)) x (((sample-window length (s)) / pps per test (interval)))

Ensure that the percentage and the combination of sample window and the packet-per- second per test interval produces the desired results.

If the number of samples in the sample window are equal to or greater than the computed number of required samples, the sample window has integrity and the sample window result is compared to the configured sample window thresholds.

If the count is less than the computed number of required samples, the sample window does not have integrity and the sample window results are not compared to configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

The **no** form of this command disables integrity checking.

Default

window-integrity 0

Parameters

percent

Specifies the percentage of successful sent and received request-response pairs.

A value of 0 indicates any amount of integrity acceptable for report to the routing engine.

Values 0 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure isa wlan-gw-group

Description

This command creates a WLAN GW group that contains a set of ISAs to be used in WLAN-GW functionality. A WLAN-GW group can also be used where a NAT group is expected. The WLAN-GW group ID shares the same number space with the NAT group.

At most, one WLAN-GW group may be configured.

The optional redundancy parameter determines the provisioning and redundancy mode.

- IOM mode

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A whole IOM is added to the group. The IOM must be fully provisioned with BB ISA modules. In IOM mode, when a single ISA fails, the entire IOM is considered to have failed and all subscribers are recovered on a backup IOM.

- ISA mode

  BB ISA modules are added separately with no restriction put on other MDAs in the IOM. When a single ISA fails, a backup ISA will try to recover as many subscribers as possible but may run out of resources (for example, queues, policers, host entries) during the recovery process. It is recommended to pair ISAs with MDAs and services that do not consume many IOM resources.

The **no** form of this command removes the group.

Parameters

group-id

Specifies WLAN Gateway Integrated Service Adaptor (ISA) Groups.

Values 1 to 4

unit

Specifies the provisioning and redundancy mode.

Values mda or iom

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>service>vpls>wlan-gw wlan-gw-group)

Full Context

configure service vpls wlan-gw wlan-gw-group

Description

This command configures a WLAN-GW group to be used as an endpoint within the VPLS. This feature is used in conjunction with the **configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dynamic-service** command for a VPRN service and the **configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dynamic-service** command for an IES service.

The **no** form of the command removes the WLAN-GW group as the endpoint.

See "Dynamic VPLS service" in the *7450 ESS, 7750 SR, and VSR Triple Play Service Delivery Architecture Guide* for more information about the dynamic VPLS service feature.

Parameters

nat-group-id

Specifies the NAT group ID of the WLAN-GW group to be used as an endpoint.

Values 1 to 4

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

51.34 wred-queue

wred-queue

Syntax

wred-queue [**policy** *slope-policy-name*] [**mode** *mode*] [**slope-usage** *slope-usage*]

no wred-queue

Context

[Tree] (config>qos>sap-egress>queue wred-queue)

Full Context

configure qos sap-egress queue wred-queue

Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

  This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out-of-profile and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus-profile and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

This is only supported on FP3 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The size of the buffer pool is dictated by the queue's MBS parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's CBS parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shutdown (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue is automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used. If the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for a SAP egress queue, the queue **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the WRED queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default

no wred-queue

Parameters

slope-policy-name

Specifies an existing slope policy that is used to override the default WRED slope policy.

mode

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** — uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue — each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This is supported on both FP2- and higher-based hardware and requires **slope-usage default**.

Default native

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

slope-usage

Specifies congestion control to be used.

Values **default** — maps the inplus, in, out, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low — maps the out and exceed-profile traffic to the low and exceed WRED slopes with the inplus and in-profile traffic using the MBS drop tail. This is only supported for **native** mode.

Default exceed-low

Platforms

All

no wred-queue

Context

[Tree] (config>qos>qgrps>egr>qgrp>queue wred-queue)

Full Context

configure qos queue-group-templates egress queue-group queue wred-queue

Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

  This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When **native** mode is enabled for a queue, the drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

Native hardware WRED is supported on FP3- and higher-based hardware and is ignored on FP2 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's **mbs** parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's **cbs** parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shut down (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue will be automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used, and if the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for an egress queue group queue, the queue pool and drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the wred-queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default

no wred-queue

Parameters

slope-policy-name

Specifies an existing slope policy that is used to override the default WRED slope policy.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mode {native | pool-per-queue}

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** - Each queue uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue - Each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This requires **slope-usage default**.

Default native

slope-usage {default | exceed-low}

Specifies the type of congestion control to be used.

Values **default** - Maps the inplus-profile, in-profile, out-of-profile, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low - Maps the out-of-profile and exceed-profile traffic to the low and exceed WRED slopes, with the inplus-profile and in-profile traffic using the MBS drop tail. This option is only supported for **native** mode.

51.38 wrr-group

wrr-group

Syntax

wrr-group *group-id* **sched-class** *class-id*

wrr-group *group-id* **unattached**

no wrr-group *group-id*

Context

[Tree] (config>qos>hs-attachment-policy wrr-group)

Full Context

configure qos hs-attachment-policy wrr-group

Description

This command defines how the specified group ID is attached to the scheduler. A WRR group may have one of two attachment states:

- directly attached to a scheduler class
- unattached

A WRR group provides a weighted scheduling context for its member queues, collapsing the queues into a single scheduling class.

The following WRR membership restrictions apply:

- Two groups are supported: WRR-group 1 and WRR-group 2.
- Up to six of the eight queues can become members of WRR groups (the sum of the membership of both groups cannot exceed six queues). All six queues can be placed in a single WRR group or they can be spread between the two groups.
- All queues within a group must have contiguous queue IDs.
- When both groups are configured to have queue members, the queue IDs in group 1 must be lower than the queue IDs in group 2.

The **queue** *queue-id* attachment command is used to define WRR group membership.

The **no** form of the command reverts to the default unattached attachment state for the group ID.

Default

wrr-group group-id unattached

Parameters

group-id

Specifies the WRR group identifier. The *group-id* parameter is required when executing the **wrr-group** attachment command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1, 2

sched-class

Specifies a direct attachment between the WRR group and one of the six scheduling classes. The **sched-class** and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **wrr-group** attachment command is executed.

class-id

Specifies the scheduling class associated with this WRR group. The **sched-class** keyword specifies the attachment between the group ID and one of the six scheduling classes. A value of 1 through 6 must accompany the **sched-class** keyword representing the WRR group's attached scheduling class. Only one queue or WRR group can be attached to a given scheduling class. If another queue or a WRR group is currently attached to the specified scheduling class, the **wrr-group** attachment command fails and the current attachment for the *group-id* is unchanged.

Values 1 to 6

unattached

Indicates that the group ID is not attached to any scheduling class or WRR group. Queues that are members of the unattached WRR group do not forward any packets. The **sched-class** and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **wrr-group** attachment command is executed.

configure card mda xconnect

configure card xiom mda xconnect

Description

This command creates a loopback (cross-connect) in the MAC chip and does not require a faceplate port.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

- configure card mda xconnect

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- configure card xiom mda xconnect

52.13 xgig

xgig

Syntax

xgig {**lan** | **wan**}

Context

[Tree] (config>port>ethernet xgig)

Full Context

configure port ethernet xgig

Description

This command configures a 10 Gb/s interface to be in Local or Wide Area Network (LAN or WAN) mode. When configuring the port to be in WAN mode certain SONET/SDH parameters can be changed to reflect the SONET/SDH requirements for this port.

When the port is configured for LAN mode, all SONET/SDH parameters are pre-determined and not configurable.

Default

xgig lan

Parameters

lan

Sets the port to operate in LAN mode.

wan

Sets the port to operate in WAN mode.

Platforms

All

Use subject to Terms available at: www.nokia.com/terms.

52.14 xiom

xiom

Syntax

[**no**] **xiom**

Context

[Tree] (config>card xiom)

Full Context

configure card xiom

Description

This command configures an XIOM in one of the slots of an XCM. An XIOM can be used instead of an XMA and operates as a carrier module to support MDA-s modules.

Parameters

xiom-slot

Specifies the XIOM identifier.

Values x1 or x2

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

52.15 xiom-type

xiom-type

Syntax

xiom-type *xiom-type* [**level** *xiom-level*]

no xiom-type

Context

[Tree] (config>card>xiom xiom-type)

Full Context

configure card xiom xiom-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command adds an XIOM to the device configuration for the slot. The XIOM type can be preprovisioned, which means that the XIOM does not have to be installed in the chassis.

An XIOM must be provisioned before an MDA-s, connector, or port can be configured.

An XIOM can only be provisioned in a slot that is vacant. No other XIOM or XMA can be provisioned (configured) for that particular slot. To reconfigure a slot position, use the **no** form of this command to remove the current information.

An XIOM can only be provisioned in a slot if the XIOM type is allowed in the slot. An error message is generated if an attempt is made to provision an XIOM type that is not allowed.

If an XIOM is inserted that does not match the configured XIOM type for the slot, then a log event and a facility alarm are raised. The alarm is cleared when the correct XIOM type is installed or the configuration is modified.

A log event and a facility alarm are raised if an administratively enabled XIOM is removed from the chassis. The alarm is cleared when the correct XIOM type is installed or the configuration is modified. A log event is issued when a XIOM is removed that is administratively disabled.

XIOMs are controlled by hardware and software licensing. For these cards, the license level must be provisioned in addition to the XIOM type. An XIOM cannot become operational unless the provisioned license level matches the license level of the card installed into the slot. The set of license levels varies by XIOM type.

The provisioned license level controls aspects related to connector provisioning and the consumption of hardware egress queues and egress policers. Changes to the provisioned license level may be blocked if a configuration exists that would not be permitted with the new target license level.

If the license level is not specified, the level is set to the highest license level for that XIOM.

The **no** form of this command removes the XIOM from the configuration.

Parameters

xiom-type

Specifies the type of XIOM to be configured and installed in the slot. Values for this attribute vary by platform and release. The release notes include a listing of all supported xiom-types and their CLI strings. In addition, the command can be queried to check which xiom-types are relevant for the active platform type.

xiom-level

Specifies the license level of the XIOM, up to 32 characters. Possible values vary by XIOM type.

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

54 z Commands

54.1 zone

zone

Syntax

zone {*std-zone-name* | *non-std-zone-name*} [*hh* [*:mm*]]

no zone

Context

[Tree] (config>system>time zone)

Full Context

configure system time zone

Description

This command sets the time zone and/or time zone offset for the device.

The 7450 ESS, 7750 SR, 7950 XRS, and VSR router OS supports system-defined and user-defined time zones. The system-defined time zones are listed in the Time Zones section.

For user-defined time zones, the zone and the UTC offset must be specified.

The **no** form of the command reverts to the default of Coordinated Universal Time (UTC). If the time zone in use was a user-defined time zone, the time zone will be deleted. If a **dst-zone** command has been configured that references the zone, the summer commands must be deleted before the zone can be reset to UTC.

Default

zone UTC 00

Parameters

std-zone-name

Specifies the standard time zone name. The standard name must be a system-defined zone in the Time Zones section. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining **start-date**, **end-date** and **offset** parameters do not need to be provided unless it is necessary to override the system defaults for the time zone.

For system-defined time zones, a different offset cannot be specified. If a new time zone is needed with a different offset, the user must create a new time zone. Note that some system-defined time zones have implicit summer time settings which causes the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

switchover to summer time to occur automatically; configuring the **config>system>time dst-zone** command is not required.

A user-defined time zone name is case-sensitive and can be up to 5 characters in length.

Values A user-defined value can be up to 5 characters or one of the following values: GMT, WET, CET, EET, EEST, MSK, MSD, AST, NST, EST, CST, MST, PST, HST, AKST, AWST, ACST, AEST, NZST, UTC

non-std-zone-name

Specifies the non-standard time zone name. The name can be up to 5 characters.

hh [:mm]

Specifies the hours and minutes offset from UTC time, expressed as integers. Some time zones do not have an offset that is an integral number of hours. In these instances, the *minutes-offset* must be specified. For example, the time zone in Pirlanngimpi, Australia UTC + 9.5 hours.

Values hours: -11 to 12 minutes: 0 to 59

Default hours: 0 minutes: 0

Platforms

54.2 zone-channel

zone-channel

Syntax

zone-channel *mcast-address* **source** *ip-address* **adi-channel-name** *channel-name*

no zone-channel *mcast-address* **source** *ip-address*

Context

[Tree] (config>service>ies>video-interface>channel zone-channel)

[Tree] (config>service>vprn>video-interface>channel zone-channel)

Full Context

configure service ies video-interface channel zone-channel

configure service vprn video-interface channel zone-channel

Description

This command configures zone-channel parameters or ad insertion. The channel configuration along with the zone-channel configuration associates a network channel to a zone-channel and builds the store and forward relationship.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

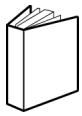
mcast-address

Specifies the IP multicast group address for which this entry contains information.

source *ip-address*

Specifies the type of address to be used for a source address.

adi-channel-name *channel-name*



Specifies the name for this zone channel.

Platforms

7450 ESS, 7750 SR, 7750 SR-s
