Description

This command configures the listening port for the gRPC server.

The **no** form of this command reverts to the default.

Default

listening-port 57400

Parameters

port

Specifies the port number.

Values 1024 to 49151, 57400

Default 57400

Platforms

All

listening-port

Syntax

listening-port *port*

no listening-port

Context

[Tree] (config>system>security>ssh listening-port)

Full Context

configure system security ssh listening-port

Description

This command configures the default SSH port for SSH connections arriving in VPRN or base routing.

The **no** form of this command configures the default SSH port to 22.

Default

no listening-port

© 2026 Nokia.

26.46 live-output

live-output

Syntax

live-output {*ip-address* | *fqdn*} [**port** *port*] [**router** {*router-instance* | **service-name** *service-name*}]

no live-output

Context

[Tree] (config>call-trace>trace-profile live-output)

Full Context

configure call-trace trace-profile live-output

Description

This command specifies a live output destination for this trace. When configured, captures will not be stored locally but sent (over UDP) to the server in the specified routing context. The destination can be specified as either an IP address or a DNS FQDN. The **live-output** and **debug-output** commands are mutually exclusive.

The **no** form of this command disables live output streaming.

Parameters

ip-address

Specifies the IPv4 or IPv6 address of the server to stream to.

fqdn

Specifies the FQDN that represents the server in DNS, up to 255 characters.

port

Specifies the UDP port on which the server is listening.

Values 1 to 65535

Default 29770

router-instance

Specifies the router instance in which the live output is forwarded.

service-name

Specifies the name of the Layer 3 service in which the live output is forwarded.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Platforms

All

26.49 llf

llf

Syntax

[**no**] **llf**

Context

[Tree] (config>service>epipe>sap>ethernet llf)

Full Context

configure service epipe sap ethernet llf

Description

This command enables Link Loss Forwarding (LLF) on an Ethernet port. This feature provides an end-to-end OAM fault notification for Ethernet VLL service. It brings down the Ethernet port (Ethernet LLF) or sends a SONET/SDH Path AIS (ATM LLF) toward the attached CE when there is a local fault on the Pseudowire or service, or a remote fault on the SAP or pseudowire, signaled with label withdrawal or T-LDP status bits. It ceases when the fault disappears.

The Ethernet port must be configured for null encapsulation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This feature is also supported in Epipes with BGP-EVPN enabled. In this case, upon removal of the EVPN destination, the port is brought oper-down with flag LinkLossFwd, however the AD per-EVI route for the SAP is still advertised (the SAP is kept oper-up).

The **no** form of this command disables LLF on an Ethernet port.

Default

no llf

Platforms

All

26.50 lmm

lmm

Syntax

lmm [**test-id** *test-id*] [**create**]

no lmm

Context

[Tree] (config>oam-pm>session>ethernet lmm)

Full Context

configure oam-pm session ethernet lmm

Description

This command configures the LMM test ID to be assigned to the Tx and Rx counter-based loss test and creates the individual test. LMM does not carry this test ID in the PDU; the value is of local significance.

The **no** form of this command removes the LMM test function from the PM Session.

Parameters

test-id

Specifies the value to be placed in the 4-byte test ID field of an ETH-DMM PDU.

Values 0 to 2147483647 | **auto**

auto - automatically assigns a *test-id*

create

Creates the test.

Full Context

configure isa lns-group

Description

This command configures an LNS group.

The **no** form of the command removes the LNS group ID from the configuration.

Parameters

lns-group-id

Specifies the LNS group identifier.

Values 1 to 4

create

Mandatory keyword used when creating tunnel group in the ISA context. The create keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.52 load

load

Syntax

load *file-url* [**overwrite** | **insert** | **append**]

Context

[Tree] (candidate load)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

candidate load

Description

This command loads a previously saved candidate configuration into the current candidate. The edit point will be set to the end of the loaded configuration lines. The candidate configuration cannot be modified while a load is in progress.

Default

If the candidate is empty then a load without any of the optional parameters (such as overwrite, and so on) will load the file-url into the candidate. If the candidate is not empty then one of the options, such as overwrite, insert, and so on, must be specified.

Parameters

file-url

Specifies the directory and filename to load.

overwrite

Discards the contents of the current candidate and replace it with the contents of the file.

insert

Inserts the contents of the file at the current edit point.

append

Inserts the contents of the file at the end of the current candidate.

Platforms

Full Context

admin isa application-assurance-group isa load-balance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the load balance behaviour for assigning subscribers to an ISA or ESA-VM in an AA group.

Default

load-balance normal

Parameters

normal

Keyword to load balance subscribers to the ISA or ESA-VM.

avoid-subs

Keyword to prevent load balancing of new subscribers. This keyword can be configured in conjunction with the **tools perform application-assurance group load-balance** command to move existing subscribers away from the ISA or ESA-VM.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>router>radius-proxy>server load-balance-key)

Full Context

configure service vprn radius-proxy server load-balance-key

configure router radius-proxy server load-balance-key

Description

This command specifies the key used in calculating a hash to select an external RADIUS server from the pool of configured servers.

The key can be the source IP and source UDP port tuple, or the specified RADIUS attribute in RADIUS packets.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the parameters from the configuration.

Parameters

vendor-id

Specifies the vendor-id of vendor-specific attribute.

Values 0 to 16777215

attribute-type

Specifies that the key is constructed with the attributes in the RADIUS message.

Values 1 to 255

source-ip-udp

Specifies that the key consists of the source IP address and source UDP port of the RADIUS message.

Platforms

configure router l2tp group load-balance-method

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is applicable only to LNS. By default traffic load balancing between the BB-ISAs is based on sessions. Each session is individually assigned to an BB-ISA during session establishment phase.

By introducing MLPPPoX, all sessions of a bundle must be terminated on the same LNS BB-ISA. This is necessary for two reasons:

- QoS in the carrier IOM has a uniform view of the subscriber
- a single BB-ISA is responsible for MLPPPoX encapsulation/fragmentation for a given bundle.

Therefore, if fragmentation is enabled, load-balancing per tunnel must be configured. In the per tunnel load-balancing mode, all sessions within the same tunnel are terminated on the same LNS BB-ISA.

In the case that we have MLPPPoX sessions with a single member link, both load-balancing methods are valid.

The **no** form of this command reverts to the default.

Default

load-balance-method per-session

Parameters

per-session

Specifies that the traffic load balancing between the LNS BB-ISAs is based on individual PPPoE sessions.

per-tunnel

Specifies that the traffic load balancing between the LNS BB-ISAs is based on tunnels.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>port>tdm>e3 load-balancing-algorithm)

Full Context

configure port sonet-sdh path load-balancing-algorithm

configure port ethernet load-balancing-algorithm

configure port tdm ds3 load-balancing-algorithm

configure port tdm e3 load-balancing-algorithm

Description

This command specifies the load balancing algorithm to be used on this port.

In the default mode, **no load-balancing-algorithm**, the port inherits the global settings. The value is not applicable for ports that do not pass any traffic.

The configuration of load-balancing-algorithm at logical port level has three possible values:

- **include-l4** — Enables inherits system-wide settings including Layer 4 source and destination port value in hashing algorithm.
- **exclude-l4** — Layer 4 source and destination port value will not be included in hashing.
- **no load-balancing-algorithm** — Inherits system-wide settings.

The hashing algorithm addresses finer spraying granularity where many hosts are connected to the network. To address more efficient traffic distribution between network links (forming a LAG group), a hashing algorithm extension takes into account Layer 4 information (src/dst L4-protocol port). The hashing index can be calculated according to the following algorithm:

If [(TCP or UDP traffic) & enabled]

hash (<TCP/UDP ports>, <IP addresses>)

else if (IP traffic)

hash (<IP addresses>)

else

hash (<MAC addresses>)

endif

This algorithm will be used in all cases where IP information in per-packet hashing is included (refer to "Traffic Load Balancing Options” in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide*). However the Layer 4 information (TCP/UDP ports) will not be used in the following cases:

- fragmented packets

Default

no load-balancing-algorithm

Parameters

option

Specifies the load balancing algorithm to be used on this port.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values **include-l4** — Specifies that the source and destination ports are used in the hashing algorithm.**exclude-l4** — Specifies that the source and destination ports are not used in the hashing algorithm.

load-balancing-weight

Syntax

load-balancing-weight *value*

no load-balancing-weight [*value*]

Context

[Tree] (config>service>vprn>static-route-entry>next-hop load-balancing-weight)

Full Context

configure service vprn static-route-entry next-hop load-balancing-weight

Description

This command configures a weighted ECMP load-balancing weight for a static route next-hop.

If all of the ECMP next-hops of a static route have a configured load-balancing-weight then packets matching the route are sprayed according to the relative weights. In other words, the next-hop interface with the largest load-balancing weight should receive the most forwarded traffic if weighted ECMP is applicable.

The **no** form of this command disables weighted ECMP for the interface and effectively disables weighted ECMP for the entire static route.

Parameters

value

Specifies the cost metric value.

configure service vprn ospf3 area interface load-balancing-weight

configure service vprn ospf area interface load-balancing-weight

Description

This command configures the weighted ECMP load-balancing weight for an IS-IS, OSPF, and OSPF3 interface. If the interface becomes an ECMP next hop for an IPv4 or IPv6 route, and all the other ECMP next hops are interfaces with configured (non-zero) load-balancing weights, then the traffic distribution over the ECMP interfaces is proportional to the weights. This means that the interface with the largest load-balancing weight receives the most forwarded traffic if weighted ECMP is applicable.

The **no** form of this command disables weighted ECMP for the interface which effectively disables weighted ECMP for any IP prefix that has this interface as a next hop.

Default

no load-balancing-weight

Parameters

weight

Specifies the load balancing weight.

Values 1 to 4294967295

Full Context

configure router ldp interface-parameters interface load-balancing-weight

Description

This command configures the load balancing weight for the LDP interface. The load balancing weight, normalized to 64, is used for weighted ECMP of LDP labeled packets over direct network IP interfaces.

If the interface becomes an ECMP next hop for an LDP FEC, and all the other ECMP next hops are interfaces with configured (non-zero) load-balancing weights, then the traffic distribution over the ECMP interfaces is proportional to the normalized weight with a granularity of 64.

If one or more of the LDP interfaces in the ECMP set does not have a configured load-balancing weight, then the system falls back to ECMP.

The **no** form of this command removes the load balancing weight for the LDP interface.

Parameters

local

Syntax

local [**inherit** | **all** | **vc-only** | **none**]

Context

[Tree] (config>service>vprn>ttl-propagate local)

Full Context

configure service vprn ttl-propagate local

Description

This command overrides the global configuration of the TTL propagation for locally generated packets which are forwarded over a MPLS LSPs in a given VPRN service context.

The global configuration is performed under config>router>ttl-propagate>vprn-local.

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value

Default

local inherit

Parameters

inherit

Specifies the TTL propagation behavior is inherited from the global configuration under **config**>**router**>**ttl-propagate**>**vprn-local**.

none

Specifies the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack.

vc-only

Specifies the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

all

Specifies the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

configure router l2tp local-address

configure router l2tp group local-address

configure service vprn l2tp group tunnel local-address

Description

This command configures the local address.

The **no** form of this command removes the local IP address from the configuration.

Default

no local-address

Parameters

ip-address

Specifies the IP address used during L2TP authentication.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-address

Syntax

local-address *ip-address*

no local-address

Context

[Tree] (config>subscr-mgmt>bgp-prng-plcy local-address)

Full Context

configure subscriber-mgmt bgp-peering-policy local-address

Description

This command configures the local IP address used by the group or neighbor when communicating with BGP peers.

Outgoing connections use the **local-address** as the source of the TCP connection when initiating connections with a peer.

When a local address is not specified, the 7750 SR OS uses the system IP address when communicating with IBGP peers and uses the interface address for directly connected EBGP peers. This command is used at the neighbor level to revert to the value defined under the group level.

The **no** form of this command removes the configured local-address for BGP.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-address

Specifies the IPv4 or IPv6 address of the local address.

For IPv4, the local address is expressed in dotted decimal notation. Allowed values are a valid routable IP address on the router, either an interface or system IP address.

For IPv6, the local address is expressed in semi-colon hexadecimal notation. Allowed values is an interface or a system IP address.

Values

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

[Tree] (config>service>vpls>gsmp>group>neighbor local-address)

Full Context

configure service vprn gsmp group neighbor local-address

configure service vpls gsmp group neighbor local-address

Description

This command configures the source ip-address used in the connection towards the neighbor. The local address is optional. If specified the node will accept connections only for that address in the service running ANCP. The address may be created after the reference but connections will not be accepted until it is created. If the local address is not used, the system accepts connections on any interface within the routing context.

The **no** form of this command reverts to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-address

Specifies the source IP address to be used in the connection toward the neighbor.

Values *ip-address*: a.b.c.d. (unicast address only)

configure service vprn msdp peer local-address

configure service vprn msdp local-address

configure service vprn msdp group local-address

Description

This command configures the local end of a Multicast Source Discovery Protocol (MSDP) session. For MSDP to function, at least one peer must be configured. When configuring a peer, you must include this **local-address** command to configure the local end of the MSDP session. This address must be present on the node and is used to validate incoming connections to the peer and to establish connections to the remote peer.

If the user enters this command, then the address provided is validated and will be used as the local address for MSDP peers from that point. If a subsequent **local-address** command is entered, it will replace the existing configuration and existing sessions will be terminated.

Similarly, when the **no** form of this command is entered, the existing local address will be removed from the configuration and the existing sessions will be terminated.

Whenever a session is terminated, all information pertaining to and learned from that peer will be removed.

Whenever a new peering session is created or a peering session is lost, an event message should be generated.

The **no** form of this command removes the local address from the configuration.

Default

no local-address

Parameters

ip-address

Specifies an existing address on the node.

Full Context

configure router pcep pce local-address

configure router pcep pcc local-address

Description

This command configures the local IPv4 address of the PCEP speaker.

The PCEP protocol operates over TCP using destination TCP port 4189. The PCE client (PCC) always initiates the connection. After the user configures the PCEP local IPv4 address and the peer IPv4 address on the PCC, the latter initiates a TCP connection to the PCE. If both a local IPv4 and a local IPv6 address are configured, the connection uses the local address that is the same family as the peer address. When the connection is established, the PCC and PCE exchange OPEN messages, which initializes the PCEP session and exchanges the session parameters to be negotiated.

By default, the PCC attempts to reach the remote PCE address out of band using the management port. If it cannot, it attempts to reach the remote PCE address in band. The user can change the configuration of the peer to attempt connecting in band only or out of band only. When the session comes up out of band, the management IP address is used as the local address. The local IPv4 address configured by the user is only used for in-band sessions and is otherwise ignored.

The **no** form of the command removes the configured local address of the PCEP speaker.

Parameters

ip-address

Specifies the IP address of the PCEP speaker to be used for in-band sessions.

Full Context

configure router bgp group neighbor local-address

configure router bgp group local-address

Description

This command configures the local IP address used by the group or neighbor when communicating with BGP peers.

Outgoing connections use the **local-address** as the source of the TCP connection when initiating connections with a peer.

When a local address is not specified, the router uses the system IP address when communicating with IBGP peers and uses the interface address for directly connected EBGP peers. This command is used at the neighbor level to revert to the value defined under the group level.

When set to a router interface, the **local-address** inherits the primary IPv4 or IPv6 address of the router interface depending on whether BGP is configured for IPv4 or IPv6. If the corresponding IPv4 or IPv6 address is not configured on the router interface, the BGP sessions that have this interface set as the **local-address** are kept down until an interface address is configured on the router interface.

The **no** form of this command removes the configured local-address for BGP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command used at the group level returns the configuration to the value defined at the global level.

The **no** form of this command used at the neighbor level returns the configuration to the value defined at the group level.

Default

no local-address

Parameters

ip-address

Specifies the local address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address

Specifies the local address expressed in dotted decimal notation. Allowed value is a valid routable IPv6 address on the router, either an interface or system IPv6 address.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

ip-int-name

Specifies the IP interface name whose address the local address will inherit. The interface can be any network interface configured on the system.

Platforms

Full Context

configure service template vpls-template local-age

configure service vpls local-age

Description

Specifies the aging time for locally learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance. In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or with a service destination point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Like in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time). In each VPLS service instance, there are independent aging timers for local learned MAC and remote learned MAC entries in the FDB. The **local-age** timer specifies the aging time for local learned MAC addresses.

The **no** form of this command returns the local aging timer to the default value.

Default

local age 300 — Local MACs aged after 300 seconds.

Parameters

aging-timer

Specifies the aging time for local MACs expressed in seconds

Values 60 to 86400

configure subscriber-mgmt bgp-peering-policy local-as

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a BGP virtual autonomous system (AS) number.

In addition to the AS number configured for BGP in the config>router>autonomous-system context, a virtual (local) AS number is configured. The virtual AS number is added to the as-path message before the router's AS number makes the virtual AS the second AS in the as-path.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). Thus, by specifying this at each neighbor level, it is possible to have a separate as-number per EBGP session.

When a command is entered multiple times for the same AS, the last command entered is used in the configuration. The **private** attribute can be added or removed dynamically by reissuing the command.

Changing the local AS at the global level in an active BGP instance causes the BGP instance to restart with the new local AS number. Changing the local AS at the global level in an active BGP instance causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number. Changing the local AS at the neighbor level in an active BGP instance causes BGP to re-establish the peer relationship with the new local AS number.

This is an optional command and can be used in the following circumstance:

Provider router P is moved from AS1 to AS2. The customer router that is connected to P, however, is configured to belong to AS1. To avoid reconfiguring the customer router, the **local-as** value on router P can be set to AS1. Thus, router P adds AS1 to the as-path message for routes it advertises to the customer router.

The **no** form of this command used at the global level will remove any virtual AS number configured.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Parameters

as-number

Specifies the virtual autonomous system number, expressed as a decimal integer.

Values 1 to 4294967295

private

Specifies that the local-as number is hidden in paths learned from the peering.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service vprn bgp local-as

configure service vprn bgp group neighbor local-as

configure service vprn bgp group local-as

Description

This command configures a BGP virtual autonomous system (AS) number.

In addition to the global AS number configured for BGP in the config>router>autonomous-system context, a virtual (local) AS number can be configured to support various AS number migration scenarios. The local AS number is added to the to the beginning the as-path attribute ahead of the router's AS number.

This configuration parameter can be set at three levels: global level (applies to all EBGP peers), group level (applies to all EBGP peers in peer-group) or neighbor level (only applies to EBGP specified peer). Thus, by specifying this at each neighbor level, it is possible to have a separate local-as per EBGP session. The local-as command is not supported for IBGP sessions. When the optional **private** keyword is specified in the command the local-as number is not added to inbound routes from the EBGP peer that has **local-as** in effect.

When a command is entered multiple times for the same AS, the last command entered is used in the configuration. The **private** attribute can be added or removed dynamically by reissuing the command.

Changing the local AS at the global level in an active BGP instance causes the BGP instance to restart with the new local AS number. Changing the local AS at the global level in an active BGP instance causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number. Changing the local AS at the neighbor level in an active BGP instance causes BGP to re-establish the peer relationship with the new local AS number.

This is an optional command and can be used in the following circumstance:

Provider router P is moved from AS1 to AS2. The customer router that is connected to P, however, is configured to belong to AS1. To avoid reconfiguring the customer router, the **local-as** value on router P can be set to AS1. Thus, router P adds AS1 to the as-path message for routes it advertises to the customer router.

The **no** form of this command used at the global level removes any virtual AS number configured.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

no local-as

Parameters

as-number

The virtual autonomous system number, expressed as a decimal integer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 65535

private

Specifies the local-as is hidden in paths learned from the peering.

no-prepend-global-as

Specifies that the global-as is hidden in paths announced to the EBGP peer.

Platforms

All

local-as

Syntax

local-as *as-number* [**private**] [no-prepend-global-as]

no local-as

Context

[Tree] (config>router>bgp local-as)

[Tree] (config>router>bgp>group>neighbor local-as)

[Tree] (config>router>bgp>group local-as)

Full Context

configure router bgp local-as

configure router bgp group neighbor local-as

configure router bgp group local-as

Description

This command configures a BGP local autonomous system (AS) number. In addition to the global AS number configured for BGP using the autonomous-system command, a local AS number can be configured to support various AS number migration scenarios.

When the **local-as** command is applied to a BGP neighbor and the local-as is different from the peer-as, the session comes up as EBGP and by default the global-AS number and then (in that order) the local-as number are prepended to the AS_PATH attribute in outbound routes sent to the peer. In received routes from the EBGP peer, the local AS is prepended to the AS path by default, but this can be disabled with the **private** option.

When the **local-as** command is applied to a BGP neighbor and the local-as is the same as the peer-as, the session comes up as IBGP, and by default, the global-AS number is prepended to the AS_PATH attribute in outbound routes sent to the peer.

This configuration parameter can be set at three levels: global level (applies to all BGP peers), group level (applies to all BGP peers in group) or neighbor level (only applies to one specific BGP neighbor). By specifying this at the neighbor level, it is possible to have a separate **local-as** for each BGP session.

When the optional **no-prepend-global-as** command is configured, the global-as number is not added in outbound routes sent to an IBGP or EBGP peer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a command is entered multiple times for the same AS, the last command entered is used in the configuration. The private option can be added or removed dynamically by reissuing the command. Changing the local AS at the global level in an active BGP instance causes the BGP instance to restart with the new local AS number. Changing the local AS at the global level in an active BGP instance causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number. Changing the local AS at the neighbor level in an active BGP instance causes BGP to re-establish the peer relationship with the new local AS number.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

no local-as

Parameters

as-number

Specifies the virtual autonomous system number expressed as a decimal integer.

Values 1 to 4294967295

private

Specifies the local-as is hidden in paths learned from the peering.

no-prepend-global-as

Specifies that the global-as is hidden in paths announced to the BGP peer.

26.68 local-end

local-end

Syntax

local-end {*ip-address* | *ipv6-address*}

no local-end

Context

[Tree] (config>service>sdp local-end)

Full Context

configure service sdp local-end

Description

This command configures the local-end address of the following SDP encapsulation types:

- IPv6 address of the termination point of a SDP of encapsulation **l2tpv3** (L2TP v3 tunnel).
- IPv4/IPv6 source address of a SDP of encapsulation **eth-gre-bridged** (L2oGRE SDP).
- IPv4/IPv6 source address of a SDP of encapsulation **gre** (GRE SDP).

A change to the value of the **local-end** parameter requires that the SDP be shut down.

When used as the source address of a SDP of encapsulation **gre** (GRE SDP), the primary IPv4 address of any local network IP interface, loopback or otherwise, may be used.

The address of the following interfaces are not supported:

- unnumbered network IP interface

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- IES interface
- VPRN interface
- CSC VPRN interface

The **local-end** parameter value adheres to the following rules:

- A maximum of 15 distinct address values can be configured for all GRE SDPs under the **configure service sdp local-end**context, and all L2oGRE SDPs under the **configure service system gre-eth-bridged tunnel-termination** context.
- The same source address cannot be used in both contexts since an address configured for a L2oGRE SDP matches an internally created interface that is not available to other applications.
- The **local-end** address of a GRE SDP, when different from system, need not match the primary address of an interface that has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

The **no** form of this command removes the address from the local-end configuration.

Parameters

ip-address* | *ipv6-address

Specifies a IPv4 or IPv6 address for local-end of an SDP in dotted decimal notation.

Values

ip-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

configure ipsec ipsec-transport-mode-profile dynamic-keying local-id

configure service vprn interface sap ipsec-tunnel dynamic-keying local-id

configure service ies interface sap ipsec-gw local-id

Description

This command specifies the local ID used for IDi or IDr for IKEv2 negotiation.

The default behavior depends on the local-auth-method as follows:

- Psk: local tunnel IP address
- Cert-auth: subject of the local certificate

The **no** form of this command removes the parameters from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no local-id

Parameters

type

Specifies the type of local ID payload, which could be IPv4 or IPv6 address or FQDN domain name or distinguish the name of the subject in the X.509 certificate.

Values ipv4 — Specifies to use IPv4 as the local ID type; the default value is the local tunnel end-point address.

ipv6 — Specifies to use IPv6 as the local ID type; the default value is the local tunnel end-point address.

fq1dn — Specifies to use FQDN as the local ID type. The value must be configured.

value

Specifies the data type as an enumerated integer that describes the local identifier type used for IDi or IDr for IKEv2, up to 255 characters.

Platforms

VSR

- configure router interface ipsec ipsec-tunnel dynamic-keying local-id
- configure service vprn interface ipsec ipsec-tunnel dynamic-keying local-id

Full Context

configure router ipsec security-policy entry local-ip

configure service vprn ipsec security-policy entry local-ip

Description

This command configures the local (from the VPN) IP prefix/mask for the policy parameter entry.

Only one entry is necessary to describe a potential flow. The **local-ip** and **remote-ip** commands can be defined only once. The system evaluates:

- the local IP as the source IP when traffic is examined in the direction of the flows from private to public and as the destination IP when traffic flows from public to private
- the remote IP as the source IP when traffic flows public to private and as the destination IP when traffic flows from private to public

Parameters

ip-prefix

The destination address of the aggregate route in dotted decimal notation

Values a.b.c.d (host bits must be 0)

prefix-length 1 to 32

netmask

The subnet mask in dotted decimal notation

any

keyword to specify that it can be any address

Platforms

VSR

- configure router ipsec security-policy entry local-ip

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure isa nat-group inter-chassis-redundancy local-ip-range-start

Description

This command configures the first IP address that is assigned to a first member ISA in the **nat-group**. The remaining member ISAs in the **nat-group** are automatically assigned the consecutive IP addresses, starting from the first IP address. These IP addresses are used to communicate between the ISAs on redundant nodes for the purpose of flow synchronization. Traffic from the first local IP address (member ISA), is sent to the first IP address from the remote IP range.

Note: These IP addresses are added to the routing table under the protocol "NAT" within the routing context where they are configured. The user can then export the IP addresses into the network using routing policies to ensure reachability. These IP addresses effectively become routes with no relation to any local interface on the router.

The **no** form of this command reverts to the default.

Default

no local-ip-range-start

Parameters

ip-address

Specifies the first IP address from the range assigned to the first member ISA in the form of a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure router ldp interface-parameters interface ipv6 local-lsr-id

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure router ldp interface-parameters interface ipv4 local-lsr-id

Description

This command enables the use of the address of the local LDP interface, or any other network interface configured on the system, as the LSR-ID to establish link LDP Hello adjacency and LDP session with directly connected LDP peers. The network interface can be a loopback or not.

Link LDP sessions to all peers discovered over a given LDP interface share the same local LSR-ID. However, LDP sessions on different LDP interfaces can use different network interface addresses as their local LSR-ID.

By default, the LDP session to a peer uses the system interface address as the LSR-ID unless explicitly configured using this command. The system interface must always be configured on the router, or the LDP protocol will not come up on the node. There is no requirement to include the system interface in any routing protocol.

At initial configuration, the LDP session to a peer will remain down while the network interface used as LSR-ID is down. LDP will not try to bring it up using the system interface.

If the network IP interface used as LSR-ID goes down, the LDP sessions to all discovered peers using this LSR-ID go down.

When an interface other than the system is used as the LSR-ID, the transport connection (TCP) for the link LDP session will also use the address of that interface as the transport address. If the system or interface value is configured in the **config**>**router**>**ldp**>**if-params**>**if**>**ipv4** or **config**>**router**>**ldp**>**if-params**>**if**>**ipv6**> **transport-address** context, it will be overridden with the address of the LSR-ID interface.

When the **local-lsr-id** command is enabled with the **32bit-format** option, an SR OS LSR will be able to establish an LDP IPv6 Hello adjacency and an LDP IPv6 session with an RFC 7552 compliant peer LSR. The LSR uses a 32-bit LSR-ID set to the value of the IPv4 address of the specified local LSR-ID interface and a 128-bit transport address set to the value of the IPv6 address of the specified local LSR-ID interface.

Note:
The system interface cannot be used as a local LSR-ID with the **32bit-format** option enabled because the system interface is the default LSR-ID and transport address for all LDP sessions to peers on this LSR. This configuration is blocked in the CLI.

If the user enables the **32bit-format** option in the IPv6 context of a running LDP interface, the already established LDP IPv6 Hello adjacency and LDP IPv6 session will be brought down and re-established with the new 32-bit LSR-ID value.

If the user changes the LSR-ID value between **system**, **interface**, and *interface-name*, or enables the **32bit-format** option while the LDP session is up, LDP will immediately tear down all sessions using this LSR-ID and will attempt to re-establish them using the new LSR-ID.

The **no** form of this command returns to the default behavior, in which case the system interface address is used as the LSR-ID.

Default

no local-lsr-id

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

system

Specifies the use of the address of the system interface as the value of the LSR-ID of this LDP LSR.

interface

Specifies the use of the address of the local LDP interface as the value of the LSR-ID of this LDP LSR.

interface-name interface-name

Specifies the name, up to 32 character, of the network IP interface (which address is used as the LSR-ID of this LDP LSP). An interface name cannot be in the form of an IP address. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

32bit-format

Specifies the use of the IPv4 address of the local LSR-ID interface as the LSR-ID of this LDP LSR.

Platforms

[Tree] (config>router>ldp>targ-session>peer local-lsr-id)

Full Context

configure router ldp targeted-session peer-template local-lsr-id

configure router ldp targeted-session peer local-lsr-id

Description

This command enables the use of the address of any network interface configured on the system, as the LSR-ID to establish a targeted LDP Hello adjacency and a targeted LDP session with an LDP peer. The network interface can be a loopback or not.

By default, the targeted LDP session to a peer uses the system interface address as the LSR-ID and as the transport address, unless explicitly configured using this command. The system interface must always be configured on the router, or the LDP protocol will not come up on the node. There is no requirement to include the system interface in any routing protocol.

When the **local-lsr-id** command is enabled with the **32bit-format** option, an SR OS LSR will be able to establish a targeted LDP IPv6 Hello adjacency and a targeted LDP IPv6 session with an RFC 7552

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

compliant peer LSR. The LSR uses a 32-bit LSR-ID set to the value of the IPv4 address of the specified local LSR-ID interface and a 128-bit transport address set to the value of the IPv6 address of the specified local LSR-ID interface.

Note:
The system interface cannot be used as a local LSR-ID with the 3**2bit-format** option enabled because the system interface is the default LSR-ID and transport address for all targeted LDP sessions to peers on this LSR. This configuration is blocked in the CLI.

If the user enables the **32bit-format** option in the IPv6 context of a running targeted LDP peer, the already established targeted LDP IPv6 Hello adjacency and targeted LDP IPv6 session will be brought down and re-established with the new 32-bit LSR-ID value.

If the user changes the local LSR-ID value or enables/disables the **32bit-format** option, while the targeted LDP session is up, LDP will immediately tear down the targeted session using this LSR-ID and will attempt to re-establish it using the new LSR-ID.

The **no** form of this command returns to the default behavior, in which case the system interface address is used as the LSR-ID.

Default

no local-lsr-id

Parameters

interface-name

Specifies the name, up to 32 characters, of the network IP interface (which address is used as the LSR-ID of this LDP LSP). An interface name cannot be in the form of an IP address. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

32bit-format

Specifies the use of the IPv4 address of the local LSR-ID interface as the LSR-ID of this LDP LSR.

local-monitoring-policer

Syntax

[**no**] **local-monitoring-policer** *policer-name* [**create**]

Context

[Tree] (config>sys>security>dist-cpu-protection>policy local-monitoring-policer)

Full Context

configure system security dist-cpu-protection policy local-monitoring-policer

Description

This command configures a monitoring policer that is used to monitor the aggregate rate of several protocols arriving on an object (for example, SAP). When the **local-monitoring-policer** is determined to be in a nonconforming state (at the end of a minimum monitoring time of 60 seconds) then the system will attempt to allocate dynamic policers for the particular object for any protocols associated with the local monitor (for example, using the **protocol** *name* **enforcement dynamic** *policer-name* CLI command).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the system cannot allocate all the dynamic policers within 150 seconds, it will stop attempting to allocate dynamic policers, raise a LocMonExcdAllDynAlloc log event, and go back to using the local monitor. The local monitor may then detect exceeded packets again and make another attempt at allocating dynamic policers.

Once this *policer-name* is referenced by a protocol then this policer will be instantiated for each "object" that is created and references this DDoS policy. If there is no policer free then the object will be blocked from being created.

Parameters

policy-name

Specifies name of the policy, up to 32 characters.

Full Context

configure port ethernet efm-oam link-monitoring local-sf-action local-port-action

Description

This command configures the parameters that define if and how the local port will be affected when the local signal failure threshold (**sf-threshold**) has been reached within the configured window.

Interactions: The signal failure threshold will trigger these actions.

Default

local-port-action out-of-service

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

log-only

Keyword that prevents the port from being affected when the configured signal failure threshold is reach within the window. The event will be logged but the port will remain operational.

out-of-service

Keyword that causes the port to enter a non-operation down state with a port state of link up. The error will be logged when the configured signal failure threshold (**sf-threshold**) is reached within the window. The port will not be available to service data but will continue to carry Link OAM traffic to ensure the link is monitored.

configure service vprn bgp group local-preference

Description

This command enables setting the BGP local-preference attribute in incoming routes if not specified and configures the default value for the attribute. This value is used if the BGP route arrives from a BGP peer without the **local-preference** integer set.

The specified value can be overridden by any value set via a route policy. This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of this command at the global level specifies that incoming routes with local-preference set are not overridden and routes arriving without local-preference set are interpreted as if the route had local-preference value of 100.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

no local-preference - Does not override the local-preference value set in arriving routes and analyze routes without local preference with value of 100.

Parameters

local-preference

The local preference value to be used as the override value, expressed as a decimal integer.

configure router policy-options policy-statement entry from local-preference

Description

This command matches BGP routes based on local preference (the value in the LOCAL_PREF attribute).

If no comparison qualifiers are present (**equal**, **or-higher**, **or-lower**), then **equal** is the implied default.

A non-BGP route does not match a policy entry if it contains the **local-preference** command.

Default

no local-preference

Parameters

preference

Specifies the local preference value.

Values 0 to 4294967295, or a parameter name delimited by starting and ending at-sign (@) characters

equal

Specifies that matched routes should have the same local preference as the value specified.

or-higher

Specifies that matched routes should have the same or a greater local preference as the value specified.

or-lower

Specifies that matched routes should have the same or a lower local preference as the value specified.

configure router policy-options policy-statement default-action local-preference

configure router policy-options policy-statement entry local-preference

Description

This command assigns a BGP local preference to routes matching a route policy statement entry.

If no local preference is specified, the BGP configured local preference is used.

The **no** form of this command disables assigning a local preference in the route policy entry.

Default

no local-preference

Parameters

preference

Specifies the local preference expressed as a decimal integer.

Values 0 to 4294967295 name — Specifies the local preference parameter variable name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

Syntax

local-prefix *local-prefix* [**create**]

no local-prefix *local-prefix*

Context

[Tree] (config>service>pw-routing local-prefix)

Full Context

configure service pw-routing local-prefix

Description

This command configures one or more node prefix values to be used for MS-PW routing. At least one prefix must be configured on each node that is an S-PE or a T-PE.

The **no** form of this command removes a previously configured prefix, and will cause the corresponding route to be withdrawn if it has been advertised in BGP.

Default

no local-prefix

Parameters

local-prefix

Specifies a 32 bit prefix for the AII. One or more prefix values, up to a maximum of 16, may be assigned to the 7450 ESS, 7750 SR, or 7950 XRS node. The global ID can contain the 2-octet or 4-octet value of the provider's Autonomous System Number (ASN). The presence of a global ID based on the provider's ASN ensures that the AII for spoke-SDPs configured on the node will be globally unique.

Values <global-id>:<ip-addr>| <raw-prefix>

ip-addr	a.b.c.d
raw-prefix	1 to 4294967295
global-id	1 to 4294967295

no local-routes-domain-id

Context

[Tree] (config>service>vprn local-routes-domain-id)

Full Context

configure service vprn local-routes-domain-id

Description

This command specifies the domain ID that is used in the D-PATH attribute for local routes before those routes are exported to a BGP neighbor using BGP-IPVPN, EVPN-IFF, EVPN-IFL or PE-CE BGP. A local route is a non-BGP route installed in the VPRN route table and learned using static route or an IGP.

The domain IDs are used in the D-PATH attribute, in accordance with *draft-ietf-bess-evpn-ipvpn-interworking*. The D-PATH attribute is modified by gateway routers, where a gateway is defined as a PE where a VPRN is instantiated, and that VPRN advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN).

The D-PATH attribute is used on gateways to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best path selection decisions based on the D-PATH length (shorter D-PATH is preferred).

The **no** form of this command removes the domain ID for local routes.

configure mcast-management multicast-info-policy bundle channel source-override video local-rt-server

configure mcast-management multicast-info-policy bundle video local-rt-server

configure mcast-management multicast-info-policy bundle channel video local-rt-server

Description

This command enables the local retransmission server capability on the ISA video group.

RET server parameters can be configured in a multicast information policy or a service, but the parameters will have no effect if the RET server is disabled or if the video group is administratively disabled (shutdown).

The **no** form of the command returns the parameter to the default value where the RET server is disabled on the video group.

configure router mpls lsp-template local-sr-protection

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the SR LFA protection needed for the adjacencies used in the path computation of an SR-TE LSP by the local CSPF.

The default value of the command is **preferred**. The local CSPF will prefer a protected adjacency over an unprotected adjacency whenever both exist for a TE link. However, the entire computed path can combine both types of adjacencies.

When the user enables the **mandatory** value, CSPF uses it as an additional path constraint and selects protected adjacencies exclusively in computing the path of the SR-TE LSP. CSPF will return no path if all candidate paths that otherwise satisfy all other LSP path constraints do not have an unprotected SID for each of their TE links.

Similarly, if the user enables the value **none**, CSPF uses it as an additional path constraint and selects unprotected adjacencies exclusively in computing the path of the SR-TE LSP. CSPF will return no path if all candidate paths that otherwise satisfy all other LSP path constraints do not have a protected SID for each of their TE links.

The **no** form of this command returns the command to its default value.

Default

no local-sr-protection

Parameters

local-sr-protection

Specifies the local-sr-protection for LSPs.

Values none — Selects unprotected adjacencies only in the SR-TE LSP path computation.

preferred — Prefers protected adjacencies in the SR-TE LSP path computation.

mandatory — Selects protected adjacencies only in the SR-TE LSP path computation.

Full Context

configure system persistence subscriber-mgmt location

configure system persistence nat-port-forwarding location

configure system persistence dhcp-server location

configure system persistence ancp location

configure system persistence python-policy-cache location

Description

This command instructs the system where to write the persistency files for the corresponding application. Each application creates two files on the flash card, one with suffix .i<version>, referencing an index file, and the other with suffix .0<version>, where <version> is a 2-digit number reflecting the file version. These versions are not related to the SR OS release running on the node. The <version> can remain the same over two major releases, for example, when no format change is made to the persistency file. On boot, the system scans the file systems looking for the corresponding persistency files, and the load begins.

For example, in the subscriber management context, the location specifies the flash device on a CPM card where the data for handling subscriber management persistency is stored.

The **no** form of this command returns the system to the default. If there is a change in file location while persistence is running, a new file will be written on the new flash, and then the old file will be removed.

Default

no location

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

cflash-id

Specifies the compact flash device name.

Values cf1:, cf2:, cf3:

location

Syntax

location *remote-url*

no location

Context

[Tree] (config>service>nat>deterministic-script location)

Full Context

configure service nat deterministic-script location

Description

This command configures the remote location where the Python script will be exported. The Python script is then used off-line to perform reverse query. If this command is configured, the Python script generation is triggered by any modification of the deterministic NAT configuration. The new script reflects the change in mappings caused by configuration change. However, the script must be manually exported to the outside location with the **admin nat save-deterministic-nat** command. The script cannot be stored locally on the system.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The script allows two forms of queries:

- Forward – input is NAT inside parameters, output is NAT outside parameters.
- Backward – input is NAT outside parameters, output is NAT inside parameters.

Forward Query:

```
user@external-server:/home/ftp/pub/det-nat-script$ ./det-nat.py -f -s 10 -a 10.0.5.10
```

output:

```
subscriber has public ip address 198.51.100.1 from service 0 and is using ports [1324 - 1353]
```

Reverse Query:

```
user@external-server:/home/ftp/pub/det-nat-script$./det-nat.py -b -s 0 -a 198.51.100.1 -p 3020
```

output:

```
subscriber has private ip address 10.0.5.66 from service 10
```

Default

no location

Parameters

remote-url

A remote location where the script is stored:

[{ftp:// | tftp://}<login>:<pswd>@ <remote-locn>/][<file-path>]

Maximum length is 180 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Platforms

All

location

Syntax

location *cflash-id* [*backup-cflash-id*]

no location

Context

[Tree] (config>log>file-id location)

Full Context

configure log file-id location

Description

This command specifies the primary and optional backup location where the log or billing file will be created.

The **location** command is optional. If the location command not explicitly configured, log files will be created on cf1: and accounting files will be created on cf2: without overflow onto other devices. Generally, cf3: is reserved for system files (configurations, images, and so on).

When multiple location commands are entered in a single file ID context, the last command overwrites the previous command.

When the location of a file ID that is associated with an active log ID is changed, the log events are not immediately written to the new location. The new location does not take effect until the log is rolled over either because the rollover period has expired or a **clear log log-id** command is entered to manually rollover the log file.

When creating files, the primary location is used as long as there is available space. If no space is available, an attempt is made to delete unnecessary files that are past their retention date.

If sufficient space is not available an attempt is made to remove the oldest to newest closed log or accounting files. After each file is deleted, the system attempts to create the new file.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A medium severity trap is issued to indicate that a compact flash is either not available or that no space is available on the specified flash and that the backup location is being used.

A high priority alarm condition is raised if none of the configured compact flash devices for this file ID are present or if there is insufficient space available. If space does become available, then the alarm condition will be cleared.

Log files are created on cf1: and accounting files are created on cf2.

Use the **no** form of this command to revert to default settings.

Default

no location

Parameters

cflash-id

Specify the primary location.

Values cflash-id: cf1:, cf2:, cf3:

backup-cflash-id

Specify the secondary location.

Full Context

configure router p2mp-sr-tree replication-segment segment-routing-v6 incoming-sid locator

Description

This command configures the incoming replication SID locator for the P2MP SR tree replication segment entry. The incoming locator must already exist in the **router>segment-routing>segment-routing-v6** context.

The **no** form of this command removes the locator.

Default

no locator

Parameters

name

Specifies the locator name, up to 64 characters.

end-replicate

Specifies that the router uses the incoming replication SID to find the replication state. The replication SID is popped, and based on the replication state either a new replication segment starts and a new replication SID is pushed on the packet, or the payload is sent to the host based on the multicast routing table.

function-value

Specifies the function value of the incoming replication SID.

lock-override

Syntax

[**no**] **lock-override**

Context

[Tree] (config>system>script-control>script-policy lock-override)

Full Context

configure system script-control script-policy lock-override

Description

This command allows a triggered EHS/CRON script to execute while there is a datastore lock, started by an MD interface, in place.

A triggered EHS/CRON script queues until an **ongoing commit** (or **confirmed-commit**) is done. When an EHS/CRON script is triggered while the **lock-override** CLI knob is on, SR OS behaves as follows.

When an exclusive session is in place:

- Keep if it is an MD-CLI session. Disconnect if it is a NETCONF session
- Lose the exclusive lock
- Lose any uncommitted configuration changes

When a global session is in place:

- Keep the MD-CLI or NETCONF session
- Keep the uncommitted configuration changes
- An update may be required after committing the EHS/CRON script configuration changes

The **no** form of this command does not allow the script to execute while there is a datastore lock in place.

Description

This command enables the lockout mechanism for the IPsec tunnel. The system will lock out an IPsec client for the configured time interval if the number of failed authentications exceeds the configured value within the specified duration. This command only applies when the system acts as a tunnel responder.

A client is defined as the tunnel IP address plus the port.

Optionally, the **max-port-per-ip** parameter can be configured as the maximum number of ports allowed behind the same IP address. If this threshold is exceeded, then all ports behind the IP address are blocked.

The **no** form of this command disables the lockout mechanism.

Default

no lockout

Parameters

count

Specifies the maximum number of failed authentications allowed during the *duration-minutes* interval.

Values 1 to 64

Default 3

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

duration-minutes

Specifies the interval of time, in minutes, during which the configured failed authentication count must be exceeded in order to trigger a lockout.

Values 1 to 60

Default 5

block-minutes

Specifies the number of minutes that the client is blocked if the configured failed authentication count is exceeded.

Values 1 to 1440, infinite

Default 10

number-of-ports

Specifies the maximum number of ports allowed behind the same IP address.

Values 1 to 32000

Default 16

Platforms

26.104 log

log

Syntax

log

Context

[Tree] (config log)

Full Context

configure log

Description

Commands in this context are used to configure both event logs and accounting logs. Event logs control the generation, dissemination and recording of system events for monitoring status and troubleshooting faults within the system. Event logging configuration includes syslog, snmp notifications (traps), NETCONF notifications and other types of event log outputs. Accounting logs collect comprehensive accounting statistics and write them to XML files on the compact flash in order to support a variety of billing models.

Use subject to Terms available at: www.nokia.com/terms.

Description

This command associates a filter log to the current filter policy entry and therefore enables logging for that filter entry.

The filter log must exist before a filter entry can be enabled to use the filter log.

The **no** form of the command disables logging for the filter entry.

Default

no log

Parameters

log-id

Specifies the filter log ID expressed as a decimal integer.

Values 101 to 199

Platforms

All

log

Syntax

log *log-id* [**create**]

no log *log-id*

Context

[Tree] (config>filter log)

Full Context

configure filter log

Description

This command, creates a configuration context for the specified filter log if it does not exist, and enables the context to configure the specified filter log.

The **no** form of the command deletes the filter log. The log cannot be deleted if there are filter entries configured to write to the log. All filter entry logging associations need to be removed before the log can be deleted.

Default

log 101

Parameters

log-id

Specifies the filter log ID expressed as a decimal integer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 101 to 199

create

This keyword is required to create the configuration context. After it is created, the context can be enabled with or without the **create** keyword.

26.105 log-anno-interval

log-anno-interval

Syntax

log-anno-interval *log-interval*

no log-anno-interval

Context

[Tree] (config>system>ptp log-anno-interval)

Full Context

configure system ptp log-anno-interval

Description

This command configures the announce message interval used for both unicast and multicast messages.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For unicast messages, it defines the announce message interval that is requested during unicast negotiation to any peer. This controls the announce message rate sent from remote peers to the local node. It does not affect the announce message rate that may be sent from the local node to remote peers. Remote peers may request an announce message rate anywhere within the acceptable grant range.

For multicast messages, used on PTP Ethernet ports, this configures the message interval used for Announce messages transmitted by the local node.

This value also defines the interval between executions of the BTCA within the node.

The announce-interval cannot be changed unless the PTP is shut down.

Note:
In order to minimize BTCA driven reconfigurations, the IEEE recommends that the announce-interval should be consistent across the entire 1588 network.

The **no** form of this command reverts the configuration to the default value. The default value varies depending on the configuration of the **profile** command.

Default

log-anno-interval 1 (1 packet every 2 seconds) for **ieee1588-2008**

log-anno-interval 1 (1 packet every 2 seconds) for **g8265dot1-2010**

log-anno-interval -3 (8 packets per second) for **g8275dot1-2014**

log-anno-interval 1 (1 packet every 2 seconds) for **g8275dot2-2016**

Parameters

log-interval

Specifies the announce packet interval, in log form.

Values -3 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

log-anno-interval

Syntax

log-anno-interval *log-interval*

no log-anno-interval

Context

[Tree] (config>system>ptp>alternate-profile log-anno-interval)

Full Context

configure system ptp alternate-profile log-anno-interval

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the announce message interval used for multicast messages within the alternate profile.

For multicast messages used on PTP Ethernet ports, this command configures the message interval used for announce messages transmitted by the local node

This value has no impact on the interval used for the BTCA, which is controlled by the value defined for the primary profile.

This value can only be changed when the alternate profile is shut down.

The **no** form of this command reverts to the default value.

Default

log-anno-interval -3 (eight packets per second)

Parameters

log-interval

Specifies the announce packet interval, in log form.

Values -3 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

26.106 log-delay-interval

log-delay-interval

Syntax

log-delay-interval *log-interval*

no log-delay-interval

Context

[Tree] (config>system>ptp>port log-delay-interval)

Full Context

configure system ptp port log-delay-interval

Description

This command configures the minimum interval used for multicast Delay_Req messages. This parameter is applied on a per-port basis. For ports in a timeReceiver state, it shall be the interval used, unless the parent port indicates a longer interval. For a port in timeTransmitter state, it shall be the interval advertised

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

to external timeReceiver ports as the minimum acceptable interval for Delay_Req messages from those timeReceiver ports.

It is a requirement of the 1588 standard that a port in timeReceiver state shall check the logMessageInterval field of received multicast Delay_Resp messages. If the value of the logMessageInterval field of those messages is greater than the value programmed locally for the generation of Delay_Req messages, then the timeReceiver must change to use the greater value (i.e. longer interval) for the generation of Delay_Req messages. This requirement is supported in the router.

The parameter is only applicable to ports and not to peers.

The **no** form of this command reverts the configuration to the default value. The default value varies depending on the configuration of the **profile** command.

Default

log-delay-interval -6 (64 packets per second) for **ieee1588-2008**

log-delay-interval -6 (64 packets per second) for **g8265dot1-2010**

log-delay-interval -4 (16 packets per second) for **g8275dot1-2014**

log-delay-interval -6 (64 packets per second) for **g8275dot2-2016**

Parameters

log-interval

Specifies the Delay_Req message interval, in log form.

Values -6 to 0

Default -6

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

log-files-total-size

Syntax

log-files-total-size *megabytes*

no log-files-total-size

Context

[Tree] (config>log>storage log-files-total-size)

Full Context

configure log file-storage-control log-files-total-size

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the limit for the total space that all log files can occupy on each storage device on the active CPM.

When this threshold is reached, log events are no longer written to the files in the `\log` directory until SR OS removes older log files and the occupancy is below the limit.

When unconfigured, there is no specific limit for the total size of all log files.

Only log files in the `\log` directory with system generated names (including no file extension) are applicable toward the total size limit.

If a user manually adds or deletes log files from the `\log` directory, the size of the files is not taken into account for up to 1 hour.

The configured total size limit is not validated against the actual size of the installed storage devices. If the configured limit is larger than the installed CF device, the limit is never reached.

Default

no log-files-total-size

Parameters

megabytes

Specifies the total size limit for log files, in MB.

Values 50 to 4,194,304 MB (4 TBytes, 2^{22} MB)

Default 0

Platforms

All

26.109 log-filter

log-filter

Syntax

log-filter *filter-id*

no log-filter

Context

[Tree] (config>log>event-trigger>event>trigger-entry log-filter)

Full Context

configure log event-trigger event trigger-entry log-filter

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the log filter to be used for this trigger entry. The log filter defines the matching criteria that must be met in order for the log event to trigger the handler execution. The log filter is applied to the log event and, if the filtering decision results in a forward action, then the handler is triggered.

It is typically unnecessary to configure match criteria for the application or number in the log filter used for EHS since the particular filter is only applied for a specific log event application and number, as configured under the **config**>**log**>**event-trigger** context.

The **no** form of this command removes the log filter configuration.

Parameters

filter-id

Specifies the identifier of the filter.

Values 1 to 1500

Platforms

All

26.110 log-id

log-id

log-id *log-id* [**name** *log-name*]

no log-id *log-id*

Context

[Tree] (config>service>vprn>log log-id)

Full Context

configure service vprn log log-id

Description

This command creates a context to configure destinations for event streams.

The **log-id** context is used to direct events, alarms or traps, and debug information to respective destinations.

A maximum of 30 logs can be configured.

Before an event can be associated with this log-id, the **from** command identifying the source of the event must be configured.

Only one destination can be specified for a *log-id*. The destination of an event stream can be an in-memory buffer, console, session, snmp-trap-group, Syslog, or file.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Use the **event-control** command to suppress the generation of events, alarms, and traps for all log destinations.

An event filter policy can be applied in the log-id context to limit which events, alarms, and traps are sent to the specified log-id.

By default, the log events in a VPRN log are a subset of the complete set of possible log events in SR OS. See the **config**>**log**>**services-all-events** command for more details.

The **no** form of this command deletes the log destination ID from the configuration.

Default

No log destinations are defined.

Parameters

log-id

Specifies the log ID number, expressed as a decimal integer.

Values 1 to 100

name log-name

Configures an optional log name, up to 64 characters, that can be used to refer to the log destination after it is created.

Platforms

All

Syntax

log-id *log-id* [**name** *log-name*]

no log-id *log-id*

Context

[Tree] (config>log log-id)

Full Context

configure log log-id

Description

This command creates a context to configure destinations for event streams.

The **log-id** context is used to direct events, alarms or traps, and debug information for specific destinations.

A maximum of 30 logs can be configured.

Before an event can be associated with this log ID, the **from** command identifying the source of the event must be configured.

Only one destination can be specified for a *log-id*. The destination of an event stream can be an in-memory buffer, console, session, snmp-trap-group, syslog, or file.

Use the **event-control** command to suppress the generation of events, alarms, and traps for all log destinations.

An event filter policy can be applied in the log-id context to limit which events, alarms, and traps are sent to the specified log-id.

Log-IDs 99 and 100 are created by the agent. Log-ID 99 captures all log messages. Log-ID 100 captures log messages with a severity level of major and above.

Note:
Log-ID 99 provides valuable information for the admin-tech file. Removing or changing the log configuration may hinder debugging capabilities. It is strongly recommended not to alter the configuration for Log-ID 99.

The **no** form of this command deletes the log destination ID from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

log-id

Specifies the log ID, expressed as a decimal integer.

Values 1 to 101

name log-name

Configures an optional log name, up to 64 characters, that can be used to refer to the log destination after it is created.

26.111 log-prefix

log-prefix

Syntax

log-prefix *log-prefix-string*

no log-prefix

Context

[Tree] (config>service>vprn>log>syslog log-prefix)

Full Context

configure service vprn log syslog log-prefix

Description

This command adds the string prepended to every syslog message sent to the syslog host.

RFC 3164, *The BSD syslog Protocol,* allows an alphanumeric string (tag) to be prepended to the content of every log message sent to the syslog host. This alphanumeric string can, for example, be used to identify the node that generates the log entry. The software appends a colon (:) and a space to the string and it is inserted in the syslog message after the date stamp and before the syslog message content.

Only one string can be entered. If multiple strings are entered, the last string overwrites the previous string. The alphanumeric string can contain lowercase (a-z), uppercase (A-Z) and numeric (0-9) characters.

The **no** form of this command removes the log prefix string.

Default

log-prefix "TMNX".

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

log-prefix-string

Specifies the alphanumeric string of up to 32 characters. Spaces and colons (:) cannot be used in the string.

27 I Commands – Part III

27.1 log-sync-interval

log-sync-interval

Syntax

log-sync-interval *log-interval*

no log-sync-interval

Context

[Tree] (config>service>vprn>ptp>peer log-sync-interval)

Full Context

configure service vprn ptp peer log-sync-interval

Description

This command configures the message interval used for unicast event messages. It defines the message interval for both Sync and Delay_Resp messages that are requested during unicast negotiation to the specific peer. This controls the Sync and Delay_Resp message rate sent from remote peers to the local node. It does not affect the Sync or Delay_Resp packet rate that may be sent from the local node to remote peers. Remote peers may request a Sync or Delay_Resp packet rate anywhere within the acceptable grant range.

The **log-sync-interval** cannot be changed unless the peer is shutdown.

This command only applies to the 7450 ESS and 7750 SR.

The **no** form of this command reverts the value to the profile default.

Default

log-sync-interval -6 (64 packets per second) for **ieee1588-2008**

log-sync-interval -6 (64 packets per second) for **g8265dot1-2010**

log-sync-interval -4 (16 packets per second) for **g8275dot1-2014**

log-sync-interval -6 (64 packets per second) for **g8275dot2-2016**

Parameters

log-interval

Specifies the sync message interval, in log form.

Values -6 to 0

Syntax

log-sync-interval *log-interval*

no log-sync-interval

Context

[Tree] (config>system>ptp>peer log-sync-interval)

Full Context

configure system ptp peer log-sync-interval

Description

This command configures the message interval used for unicast event messages. It defines the message interval for both Sync and Delay_Resp messages that are requested during unicast negotiation to the specific peer. This controls the Sync and Delay_Resp message rate sent from remote peers to the local node. It does not affect the Sync or Delay_Resp packet rate that may be sent from the local node to remote peers. Remote peers may request a Sync or Delay_Resp packet rate anywhere within the acceptable grant range.

The **log-sync-interval** cannot be changed unless the peer is shutdown.

The **no** form of this command reverts the value to the profile default.

Default

log-sync-interval -6 (64 packets per second) for **ieee1588-2008**

log-sync-interval -6 (64 packets per second) for **g8265dot1-2010**

log-sync-interval -4 (16 packets per second) for **g8275dot1-2014**

log-sync-interval -6 (64 packets per second) for **g8275dot2-2016**

Parameters

log-interval

Specifies the sync message interval, in log form.

Values -6 to 0

log-sync-interval

Syntax

log-sync-interval *log-interval*

no log-sync-interval

Context

[Tree] (config>system>ptp>port log-sync-interval)

Full Context

configure system ptp port log-sync-interval

Description

This command configures the message interval used for transmission of multicast Sync messages.

For multicast messages used on PTP Ethernet ports, this configures the message interval used for Sync messages transmitted by the local node when the port is in Master state.

The **no** form of this command reverts the value to the profile default.

Default

log-sync-interval -6 (64 packets per second) for **ieee1588-2008**

log-sync-interval -6 (64 packets per second) for **g8265dot1-2010**

log-sync-interval -4 (16 packets per second) for **g8275dot1-2014**

log-sync-interval -6 (64 packets per second) for **g8275dot2-2016**

Parameters

log-interval

Specifies the message interval, in log form.

Values -6 to 0 (This corresponds to a maximum rate of 64 packets per second, and a minimum rate of 1 packet per second.)

Default -6

logger-event-bundling

Syntax

[**no**] **logger-event-bundling**

Context

[Tree] (config>router>mpls logger-event-bundling)

Full Context

configure router mpls logger-event-bundling

Description

This feature merges two of the most commonly generated MPLS traps, vRtrMplsXCCreate and vRtrMplsXCDelete, which can be generated at both LER and LSR into a new specific trap vRtrMplsSessionsModified. In addition, this feature perform bundling of traps of multiple RSVP sessions, that is LSPs, into this new specific trap.

The intent is to provide a tool for the user to minimize trap generation in an MPLS network. Note that the MPLS trap throttling will not be applied to this new trap.

The **no** version of this command disables the merging and bundling of the above MPLS traps.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

loop-detect ignore-loop

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

drop-peer

Sends a notification to the remote peer and drops the session.

discard-route

Discards routes received from a peer with the same AS number as the router itself. This option prevents routes looped back to the router from being added to the routing information base and consuming memory. When this option is changed, the change will not be active for an established peer until the connection is re-established for the peer.

ignore-loop

Ignores routes with loops in the AS path but maintains peering.

off

Disables loop detection.

Full Context

configure service vprn bgp loop-detect-threshold

configure service vprn bgp group loop-detect-threshold

configure service vprn bgp group neighbor loop-detect-threshold

Description

This command provides additional control over the behavior enabled by the **loop-detect** command. If this command specifies a threshold value of *n,* then a route received by the local BGP speaker with an AS path that contains up to *n* occurrences of the local speaker's AS number is considered valid and not treated as an AS path loop. An AS loop is considered to occur only when the received AS path has more than *n* occurrences of the local speaker's AS number.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the configuration and sets the value to 0. One or more occurrence of the local speaker's AS number in the received AS path triggers the **loop-detect** behavior.

Default

no loop-detect-threshold

Parameters

loop-detect-threshold

The maximum number of occurrences of the local speaker's AS number in the received AS path before the AS path is considered to be a loop.

Values 0 to 15

Default 0

Context

[Tree] (oam>eth-cfm loopback)

Full Context

oam eth-cfm loopback

Description

This command initiates a loopback test.

Parameters

mac-address

Specifies a unicast MAC address or multicast MAC address. The last nibble of the multicast address must match the level of the local MEP, or the command fails and the test is not instantiated.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx or multicast

remote-mepid *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the source MEP for the session. The Layer 2 IEEE MAC address is resolved from previously learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

send-count

Specifies the number of messages to send, expressed as a decimal integer. Loopback messages are sent back-to-back, with no delay between the transmissions.

Values 1 to 1024

Default 1

data-size

Specifies the size of the variable data pattern only of the data TLV. This value does not include the 1 Byte Type, 2 Byte Length. The total size of the data TLV is the configured value plus the three additional bytes to accommodate the type and length fields. If 0 is specified, no data TLV is added to the packet. This parameter and **lbm-padding** are mutually exclusive.

Values 0 to 1500

Default 0

priority

Specifies a three-bit value to be used in the VLAN tag, if present, in the transmitted frame.

Values 0 to 7

Default The CCM and LTM priority of the MEP

padding-size

Specifies the complete size of the data TLV, which includes the 1 Byte Type, 2 Byte Length, and the variable data pad. If 0 is specified, no data TLV is added to the packet. MSDU is not processed when **lbm-padding** is in use. This parameter and **size** are mutually exclusive.

Values 0, 3 to 9778

Default 0

timeout-time

Specifies the time, in seconds, used to override the default *timeout-time* value and is the amount of time that the router waits for a message reply after sending the message request. After the expiration of message time out, the requesting router assumes that the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

message response is not received. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

interval-time

Specifies the time, in deciseconds (100 ms), to configure the spacing between probes within the test run. A value of 0 means probes are sent with no enforced delay. This value is only applicable to tests where the **send-count** is 5 or less.

Values 0 to 600

Default 0 or 10 depending on the **send-count**

configure router isis level loopfree-alternate-exclude

configure router isis interface loopfree-alternate-exclude

configure service vprn isis level loopfree-alternate-exclude

Description

This command instructs IGP to not include a specific interface or all interfaces participating in a specific IS-IS level or OSPF area in the SPF LFA computation. This provides a way of reducing the LFA SPF calculation where it is not needed.

When an interface is excluded from the LFA SPF in IS-IS, it is excluded in both level 1 and level 2. When it is excluded from the LFA SPF in OSPF, it is excluded in all areas. However, the above OSPF command can only be executed under the area in which the specified interface is primary and once enabled, the interface is excluded in that area and in all other areas where the interface is secondary. If the user attempts to apply it to an area where the interface is secondary, the command will fail.

The **no** form of this command re-instates the default value for this command.

[Tree] (config>router>ospf loopfree-alternate-exclude)

Full Context

configure router ospf3 loopfree-alternate-exclude

configure router ospf loopfree-alternate-exclude

Description

This command excludes from the LFA SPF calculation those prefixes that match a prefix entry or a tag entry in a prefix policy. If a prefix is excluded from LFA, it is not included in LFA calculations regardless of its priority. The prefix tag will, however, be used in the main SPF.

The implementation also allows the user to exclude a specific interface in IS-IS or OSPF, a or all interfaces in an OSPF area or IS-IS level from the LFA SPF.

Note:
Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The default action of the **loopfree-alternate-exclude** command, when not explicitly specified by the user in the prefix policy, is "reject". Therefore, regardless of whether the user explicitly added the statement "default-action reject" to the prefix policy, a prefix that does not match any entry in the policy will be accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

Default

no loopfree-alternate-exclude

Parameters

prefix-policy

Specifies up to five policy prefix names. The specified policy name must already be defined. Prefix policies are created with the command **config>router>policy-options>prefix-list**; for information on prefix lists, refer to "Route Policies" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Unicast Routing Protocols Guide*.

Description

This command enables the advertisement of flexible-algorithm aware loop free alternates (LFAs).

The flexible algorithm LFA configuration (for example, LFA, remote-LFA or TI-LFA) inherits the LFA configuration for base SPF algorithm 0.

LFAs are administratively disabled for flexible algorithms in which IS-IS is participating. LFAs must be explicitly enabled using the **loopfree-alternates** command.

The **no** form of this command disables LFAs for the specific flexible algorithm in which the router is participating.

Full Context

configure router isis loopfree-alternates

Description

This command enables Loop-Free Alternate (LFA) computation by SPF for the IS-IS routing protocol.

When this command is enabled, it instructs the IGP SPF to attempt to pre-compute both a primary nexthop and an LFA next-hop for every learned prefix. When found, the LFA next-hop is populated into the routing table along with the primary next-hop for the prefix.

The user enables the remote LFA next-hop calculation by the IGP LFA SPF by appending the remote-lfa option. When this option is enabled in an IGP instance, SPF performs the remote LFA additional computation following the regular LFA next-hop calculation when the latter resulted in no protection for one or more prefixes which are resolved to a given interface.

Remote LFA extends the protection coverage of LFA-FRR to any topology by automatically computing and establishing/tearing-down shortcut tunnels, also referred to as repair tunnels, to a remote LFA node which puts the packets back into the shortest without looping them back to the node which forwarded them over the repair tunnel. The remote LFA node is referred to as PQ node. A repair tunnel can in theory be an RSVP LSP, a LDP-in-LDP tunnel, or a SR tunnel. In this feature, it is restricted to use SR repair tunnel to the remote LFA node.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The remote LFA algorithm is a per-link LFA SPF calculation and not a per-prefix like the regular LFA one. So, it provides protection for all destination prefixes which share the protected link by using the neighbor on the other side of the protected link as a proxy for all these destinations.

The Topology-Independent LFA (TI-LFA) further improves the protection coverage of a network topology by computing and automatically instantiating a repair tunnel to a Q node which is not in shortest path from the computing node. The repair tunnel uses shortest path to the P node and a source routed path from the P node to the Q node.

In addition, the TI-LFA algorithm selects the backup path which matches the post-convergence path. This helps the capacity planning in the network since traffic will always flow on the same path when transitioning to the FRR next-hop and then onto the new primary next-hop.

At a high level, the TI-LFA protection algorithm is searching for a candidate P-Q set separated with a number of hops such that the label stack size does not exceed the value of **ti-lfa max-sr-frr-labels**, on each of the post-convergence paths to each destination node or prefix D.

When the **ti-lfa** option is enabled in IS-IS, it provides TI-LFA node-protect or link-protect backup path in IS-IS MT=0 for an SR-ISIS IPV4/IPv6 tunnel (node SID and adjacency SID), for an IPv4 SR-TE LSP, and for LDP IPv4 FEC when the LDP **fast-reroute backup-sr-tunnel** option is enabled.

The **max-sr-frr-labels** parameter is used to limit the search for the TI-LFA backup next-hop:

1. 0 — The IGP LFA SPF restricts the search to TI-LFA backup next-hop which does not require a repair tunnel, meaning that P node and Q node are the same and match a neighbor. This is also the case when both P and Q node match the advertising router for a prefix.
2. 1 to 3 — The IGP LFA SPF will widen the search to include a repair tunnel to a P node which itself is connected to the Q nodes with a 0-to-2 hops for a total of maximum of three labels: one node SID to P node and two adjacency SIDs from P node to the Q node. If the P node is a neighbor of the computing node, its node SID is compressed and meaning that up to three adjacency SIDs can separate the P and Q nodes.
3. 2 (default) — Corresponds to a repair tunnel to a non-adjacent P which is adjacent to the Q node. If the P node is a neighbor of the computing node, then the node SID of the P node is compressed and the default value of two labels corresponds to two adjacency SIDs between the P and Q nodes.

When the **node-protect** command is enabled, the router will prefer a node-protect over a link-protect repair tunnel for a given prefix if both are found in the Remote LFA or TI-LFA SPF computations. The SPF computations may only find a link-protect repair tunnel for prefixes owned by the protected node. This node-protect backup protects against the failure of a downstream node in the path of the prefix of a node SID except for the node owner of the node SID.

The parameter **max-pq-nodes** in Remote LFA controls the maximum number of PQ nodes found in the LFA SPFs for which the node protection check is performed. The node-protect condition means the router must run the original Remote LFA algorithm plus one extra forward SPF on behalf of each PQ node found, potentially after applying the **max-pq-cost** parameter, to check if the path from the PQ node to the destination does not traverse the protected node. Setting this parameter to a lower value means the LFA SPFs will use less computation time and resources but may result in not finding a node-protect repair tunnel.

The **no** form of this command disables the LFA computation by IGP SPF.

configure router ospf3 loopfree-alternates

Description

This command enables Loop-Free Alternate (LFA) computation by SPF under the OSPF or OSPFv3 routing protocol instance.

When this command is enabled, it instructs the IGP SPF to attempt to precalculate both a primary next hop and an LFA next hop for every learned prefix. When found, the LFA next hop is populated into the routing table along with the primary next hop for the prefix.

The user enables the remote LFA next hop calculation by the IGP LFA SPF by appending the **remote-lfa** option. When this option is enabled in an IGP instance, SPF performs the remote LFA additional computation following the regular LFA next hop calculation when the latter resulted in no protection for one or more prefixes which are resolved to a particular interface.

Remote LFA extends the protection coverage of LFA-FRR to any topology by automatically computing and establishing or tearing down shortcut tunnels, also referred to as repair tunnels, to a remote LFA node that puts the packets back into the shortest path without looping them back to the node that forwarded them over the repair tunnel. The remote LFA node is referred to as a PQ node. A repair tunnel can, in theory, be an RSVP-TE LSP, an LDP-in-LDP tunnel, or a segment routing (SR) tunnel. In this command, **remote-lfa** is restricted to using an SR repair tunnel to the remote LFA node.

The remote LFA algorithm is a per-link LFA SPF calculation and not a per-prefix calculation like the regular LFA algorithm. The remote LFA algorithm provides protection for all destination prefixes that share the protected link by using the neighbor on the other side of the protected link as a proxy for all the destinations.

The Topology-Independent LFA (TI-LFA) further improves the protection coverage of a network topology by computing and automatically instantiating a repair tunnel to a Q node which is not in shortest path from the computing node. The repair tunnel uses shortest path to the P node and a source routed path from the P node to the Q node.

In addition, the TI-LFA algorithm selects the backup path which matches the post-convergence path. This helps the capacity planning in the network since traffic will always flow on the same path when transitioning to the FRR next hop and then onto the new primary next hop.

At a high level, the TI-LFA protection algorithm is searching for a candidate P-Q set separated with a number of hops such that the label stack size does not exceed the value of **ti-lfa max-sr-frr-labels**, on each of the post-convergence paths to each destination node or prefix D.

When the **ti-lfa** option is enabled in OSPF, it provides TI-LFA node-protect or link-protect backup path for a SR-OSPF IPV4 tunnel (node SID and adjacency SID), and for a IPv4 SR-TE LSP.

The **max-sr-frr-labels** parameter is used to limit the search for the TI-LFA backup next hop:

1. 0 — The IGP LFA SPF restricts the search to TI-LFA backup next hop which does not require a repair tunnel, meaning that P node and Q node are the same and match a neighbor. This is also the case when both P and Q node match the advertising router for a prefix.
2. 1 to 3 — The IGP LFA SPF will widen the search to include a repair tunnel to a P node which itself is connected to the Q nodes with a 0-to-2 hops for a total of maximum of three labels: one node SID to P node and two adjacency SIDs from P node to the Q node. If the P node is a neighbor of the computing node, its node SID is compressed and meaning that up to three adjacency SIDs can separate the P and Q nodes.
3. 2 (default) — Corresponds to a repair tunnel to a non-adjacent P which is adjacent to the Q node. If the P node is a neighbor of the computing node, then the node SID of the P node is compressed and the default value of two labels corresponds to two adjacency SIDs between the P and Q nodes.

The TI-LFA repair tunnel can have a maximum of three labels pushed in addition to the label of the destination node or prefix. The user can set a lower maximum value for the additional FRR labels by configuring the CLI option **max-sr-frr-labels** *labels*. The default value is 2.

When the **node-protect** command is enabled, the router will prefer a node-protect over a link-protect repair tunnel for a given prefix if both are found in the Remote LFA or TI-LFA SPF computations. The SPF computations may only find a link-protect repair tunnel for prefixes owned by the protected node. This node-protect backup protects against the failure of a downstream node in the path of the prefix of a node SID except for the node owner of the node SID.

The parameter **max-pq-nodes** in Remote LFA controls the maximum number of PQ nodes found in the LFA SPFs for which the node protection check is performed. The node-protect condition means the router must run the original Remote LFA algorithm plus one extra forward SPF on behalf of each PQ node found, potentially after applying the **max-pq-cost** parameter, to check if the path from the PQ node to the destination does not traverse the protected node. Setting this parameter to a lower value means the LFA SPFs will use less computation time and resources but may result in not finding a node-protect repair tunnel.

The **no** form of this command disables the LFA computation by the IGP SPF.

configure saa test loss-event

Description

Specifies that at the termination of an SAA test run, the calculated loss event value is evaluated against the configured rising and falling loss event thresholds. SAA threshold events are generated as required.

The configuration of loss event thresholds is optional.

The **no** form of this command disables the loss-event test run.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

rising-threshold *threshold*

Specifies a rising threshold loss event value, in packets. When the test run is completed, the calculated loss event value is compared to the configured loss event rising threshold. If the test run loss event value is greater than the configured rising threshold value then an SAA threshold event is generated. The SAA threshold event is tmnxOamSaaThreshold, logger application OAM, event #2101.

Values 0 to 2147483647

Default 0

falling-threshold *threshold*

Specifies a falling threshold loss event value, in packets. When the test run is completed, the calculated loss event value is compared to the configured loss event falling threshold. If the test run loss event value is greater than the configured falling threshold value then an SAA threshold event is generated. The SAA threshold event is tmnxOamSaaThreshold, logger application OAM, event #2101.

Values 0 to 2147483647

Default 0

direction

Specifies the direction for OAM ping responses received for an OAM ping test run.

Values **inbound** — Monitor the value of jitter calculated for the inbound, one-way, OAM ping responses received for an OAM ping test run.

outbound — Monitor the value of jitter calculated for the outbound, one-way, OAM ping requests sent for an OAM ping test run.

roundtrip — Monitor the value of jitter calculated for the round trip, two-way, OAM ping requests and replies for an OAM ping test run.

loss-threshold *percent*

no loss-threshold

Context

[Tree] (config>test-oam>sath>accept-crit-tmpl loss-threshold)

Full Context

configure test-oam service-activation-testhead acceptance-criteria-template loss-threshold

Description

This command configures a frame loss ratio (FLR) value that is compared to the measured FLR at the end of the test to determine the test result. If the measured value is greater than the configured value, the test fails; otherwise, it passes. Thresholds must be explicitly configured to use them for the comparison.

The FLR is computed as a ratio of the difference of the number of received frames to the number of injected or sent frames divided by the number of sent frames.

The **no** form of this command disables the comparison of the parameter with the measured value so that the threshold value is ignored for declaring the test result.

Default

no loss-threshold

Parameters

percent

Specifies the loss percentage threshold value for comparison with the measured value.

Values 0.0000 to 100.0000

Platforms

27.22 low-burst-max-class

low-burst-max-class

Syntax

low-burst-max-class *class*

no low-burst-max-class

Context

[Tree] (config>port>ethernet>egress>hs-sec-shaper>agg low-burst-max-class)

Full Context

configure port ethernet egress hs-secondary-shaper aggregate low-burst-max-class

Description

This command specifies which scheduling classes map to the low burst-limit threshold of an egress HS secondary shaper. Egress SAPs can be configured to use an HS secondary shaper that manages their maximum burst limit over a specified aggregate shaping rate. Each HS secondary shaper supports two thresholds, a low burst limit threshold and a high burst limit threshold.

By default, all scheduling classes are mapped to the low burst limit threshold. It is important to note that when mapping scheduling classes to the high burst limit threshold an adequate value for the **card>fp>egress>hs-fixed-high-thresh-delta** must be specified. This is due to the fact that the queues associated with the lower classes may burst over the lower threshold in normal operation due to the scheduler forwarding whole packets. The **hs-fixed-high-thresh-delta** value should be set to at least two times the maximum frame size to prevent lower threshold class forwarding from also affecting the higher threshold classes when forwarding larger packet sizes. An insufficient high threshold delta defeats the intended purpose of mapping classes to the higher threshold.

The system utilizes the lowest value attainable for each low threshold aggregate burst limit without causing shaper underrun conditions. The high burst limit threshold is determined by adding the **hs-fixed-high-thresh-delta** value configured in the **config>card>fp>egress** context to the aggregate's low burst limit threshold value.

The low-burst-max-class value can be changed at any time for an HS secondary shaper.

The **no** form of this command restores the HS secondary shaper's aggregate low burst limit threshold maximum scheduling class mapping to the default value. This causes all sets of queues associated with the hs-secondary-shaper secondary-shaper-name to have all scheduling classes mapped to the low burst limit threshold.

Default

low-burst-max-class 6

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

class

Specifies the low burst maximum class. This parameter is required when executing the **low-burst-max-class** command. The parameter reflects the highest scheduling class that will be associated with the low burst limit threshold associated with the HS secondary aggregate shaper. Scheduling classes higher than scheduling class ID will be associated with the high burst limit threshold.

Values 1 to 6

Platforms

7750 SR-7/12/12e

low-burst-max-class

Syntax

low-burst-max-class *class*

no low-burst-max-class

Context

[Tree] (config>qos>hs-attachment-policy low-burst-max-class)

Full Context

configure qos hs-attachment-policy low-burst-max-class

Description

This command specifies which scheduling classes map to the low burst-limit threshold of the queue-level aggregate shaper. Each egress SAP or subscriber SLA profile instance (SPI), per port set of network interface queues and egress queue group template instance has an aggregate shaper that manages the maximum burst limit over a specified shaping rate. Each aggregate shaper supports two thresholds. As the scheduling rate for the set of queues increases, eventually the aggregate rate exceeds the rate limit and the aggregate burst limit starts to be consumed. If this continues, the low burst limit threshold is exceeded and the queues mapped to the scheduling classes associated with low threshold are removed from the scheduler. If the remaining aggregate rate (from the higher scheduling classes) continues to exceed the shaping rate, then the burst limit continues to be consumed and eventually the high burst limit threshold is exceeded. This causes the queues for all scheduling classes to be removed from the scheduler.

The second (high) threshold exists to allow the higher priority classes to continue to forward, thereby mitigating the effects of low priority bursts beyond the aggregate shaping rate. Typically, the higher scheduling class queues are either individually rate-limited so their aggregate allowed throughput is less than the aggregate rate or the expected aggregate unshaped traffic from the individual higher scheduling classes does not exceed the aggregate shaping rate. Determining the value of **low-burst-max-class** class involves anticipating the proper dividing line between the low and high scheduling classes by evaluating the forwarding behavior and SLA enforcement of each class.

By default, all scheduling classes are mapped to the low burst limit threshold. When mapping scheduling classes to the high burst limit threshold, an adequate value for the **card>fp>egress>hs-fixed-high-**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

thresh-delta must be specified. This is due to the fact that the queues associated with the lower classes may burst over the lower threshold in normal operation due to the scheduler forwarding whole packets. Set the **hs-fixed-highthresh- delta** value to at least two times the maximum frame size to prevent lower threshold class forwarding from also affecting the higher threshold classes when forwarding larger packet sizes. An insufficient high threshold delta defeats the intended purpose of mapping classes to the higher threshold.

The system utilizes the lowest value attainable for each low threshold aggregate burst limit without causing shaper underrun conditions. The high burst limit threshold is determined by adding the **hs-fixed-high-thresh-delta** value configured in the **config>card>fp>egress** CLI context to the aggregate's low burst limit threshold value.

The **low-burst-max-class** value can be changed at any time in the HS attachment policy. Modifying the setting causes all queue aggregate shapers to reconfigure the scheduling class mappings to the low and high burst limit thresholds to reflect the new value for scheduling class ID.

Scheduling Classes — As described in the **queue** and **wrr-group** attachment commands, each queue is either directly or indirectly (through a WRR group) mapped to a scheduling class. Each scheduling class has an inherent priority at the port scheduler. The inherent descending priority is as follows:

- Scheduling Class 6 (Highest)
- Scheduling Class 5
- Scheduling Class 4
- Scheduling Class 3
- Scheduling Class 2
- Scheduling Class 1 (lowest)

Placing scheduling classes into the port level WRR group causes those classes to compete for scheduling opportunities based on their associated weights instead of inherent priority. If higher weights are given to higher scheduling class IDs, then the relative proportional scheduling priority may continue to exhibit the priority level indicated by the class ID.

Setting Low and High Burst Limit Threshold Association — Table 61: Low and High Burst Limit Threshold Association demonstrates the effect of the **low-burst-max-class** command parameters on scheduling class mappings to the low and high burst limit thresholds.

Table 61: Low and High Burst Limit Threshold Association

low-burst-max-class *sched-class*	**Scheduling Classes on Low Threshold**	**Scheduling Classes on High Threshold**
1	1	2, 3, 4, 5, and 6
2	1 and 2	3, 4, 5, and 6
3	1, 2, and 3	4, 5, and 6
4	1, 2, 3, and 4	5 and 6
5	1, 2, 3, 4, and 5	6
6	1, 2, 3, 4, 5, and 6	—

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of the command restores the queue aggregate low burst limit threshold maximum scheduling class mapping to the default value. This causes all sets of queues associated with the specified **hs-attachment-policy** *policy-name* to have all scheduling classes mapped to the low burst limit threshold.

Default

low-burst-max-class 6

Parameters

class

Specifies the low burst maximum class. This parameter is required when executing the **low-burst max-class** command. The parameter reflects the highest scheduling class that is associated with the low burst limit threshold associated with the queue aggregate shaper. Scheduling classes higher than the scheduling class ID are associated with the high burst limit threshold.

configure service vprn subscriber-interface group-interface sap eth-cfm low-priority-defect

configure service vprn interface sap eth-cfm mep low-priority-defect

Description

This command specifies the lowest priority defect that is allowed to generate a fault alarm.

Default

low-priority-defect macRemErrXcon

Parameters

parameters

Specifies the lowest priority defect.

Values		
	allDef	DefRDICCM, DefMACstatus, DefRemoteCCM, DefErrorCCM, and DefXconCCM
	macRemErrXcon	Only DefMACstatus, DefRemoteCCM, Def ErrorCCM, and DefXconCCM
	remErrXcon	Only DefRemoteCCM, DefErrorCCM, and Def XconCCM
	errXcon	Only DefErrorCCM and DefXconCCM
	xcon	Only DefXconCCM; or
	noXcon	No defects DefXcon or lower are to be reported

configure router interface eth-cfm mep low-priority-defect

Description

This command specifies the lowest priority defect that generates a fault alarm. This setting is also used to determine the fault state of the MEP which, when enabled to do so, causes a network reaction.

Default

low-priority-defect macRemErrXcon

Parameters

low-priority-defect

Specifies the lowest priority defect.

Values allDef, macRemErrXcon, remErrXcon, errXcon, xcon, noXcon

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

27.29 low-slope

low-slope

Syntax

[**no**] **low-slope**

Context

[Tree] (config>qos>slope-policy low-slope)

Full Context

configure qos slope-policy low-slope

Description

The **low-slope** context contains the commands and parameters for defining the low Random Early Detection (RED) slope graph. Each buffer pool supports a low RED slope for managing access to the shared portion of the buffer pool for low out-of-profile packets.

The **low-slope** parameters can be changed at any time and the affected buffer pool low RED slopes must be adjusted appropriately.

The **no** form of this command restores the low slope configuration commands to the default values. If the leaf commands within **low-slope** are set to the default parameters, the **low-slope** node will not appear in save config and show config output unless the detail parameter is present.

lower-bound

Syntax

lower-bound *microseconds*

no lower-bound

Context

[Tree] (config>oam-pm>bin-group>bin-type>bin lower-bound)

Full Context

configure oam-pm bin-group bin-type bin lower-bound

Description

This command allows the operator to specify the individual floors thresholds for the bins. The operator does not have to specific a lower threshold for every bin that was previously defined by the bin-count for the specific type. By default, each bin is the bin-number times 5000 microseconds. Lower thresholds in the previous adjacent bin must be lower than the threshold of the next higher bin threshold. A separate line per bin is required to configure an operator-specific threshold. An error prevents the bin from entering the active state if this is not maintained, at the time the **no shutdown** is issued. Bin 0 is the result of the difference between 0 and the configured lower-threshold of bin 1. The highest bin in the bin-count captures every result above the threshold. Any negative delay metric result is treated as zero and placed in bin 0.

The **no** form of this command removes the user configured threshold value and applies the default for the bin.

Parameters

microseconds

Specifies the threshold that defines the floor of the bin. The bin range is the difference between its configured threshold and the threshold of the next higher bin in microsecond threshold value.

Values 1 to 4294967295

Default bin-number * 5000

[Tree] (config>router>ospf>timers lsa-accumulate)

Full Context

configure router ospf3 timers lsa-accumulate

configure router ospf timers lsa-accumulate

Description

This command sets the internal OSPF delay to allow for the accumulation of multiple LSA so OSPF messages can be sent as efficiently as possible. The **lsa-accumulate** timer applies to all LSAs except Type 1 and Type 2 LSAs, which are sent immediately. LSAs are accumulated and then sent when:

- its size reaches the MTU size of the interface
- a new LSA is received on the interface
- the **lsa-accumulate** timer expires

Shorting this delay can speed up the advertisement of LSAs to OSPF neighbors but may increase the number of OSPF messages sent.

The **no** form of this command reverts to the default value.

Note:
The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is greater than or equal to 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default

lsa-accumulate 1000

Parameters

lsa-accumulate

Specifies the LSA accumulation delay in milliseconds.

Values 0 to 1000

configure service vprn ospf3 area interface lsa-filter-out

configure router ospf3 area interface lsa-filter-out

configure router ospf area interface lsa-filter-out

configure service vprn ospf area interface lsa-filter-out

Description

This command enables filtering of outgoing OSPF LSAs on the selected OSPFv2 or OSPFv3 interface. Three filtering options are provided:

- Do not flood any LSAs out the interface. This option is suitable if the neighbor is simply-connected and has a statically configured default route with the address of this interface as next-hop.
- Flood the router's own router-LSA out the interface and suppress all other flooded LSAs. This option is suitable if the neighbor is simply-connected and has a statically configured default route with a loopback or system interface address (contained in the router-LSA) as next-hop.
- Flood the router's own router-LSA and all self-generated type-3, type-5 and type-7 LSAs advertising a default route (0/0) out the interface; suppress all other flooded LSAs. This option is suitable if the neighbor is simply-connected and does not have a statically configured default route.

The **no** form of this command disables OSPF LSA filtering (normal operation).

27.35 lsa-generate

lsa-generate

Syntax

lsa-generate *max-lsa-wait* [lsa-initial-wait *lsa-initial-wait* [*lsa-second-wait lsa-second-wait*]]

no lsa-generate-interval

Context

[Tree] (config>service>vprn>ospf>timers lsa-generate)

[Tree] (config>service>vprn>ospf3>timers lsa-generate)

Full Context

configure service vprn ospf timers lsa-generate

configure service vprn ospf3 timers lsa-generate

Description

This parameter customizes the throttling of OSPF LSA-generation. Timers that determine when to generate the first, second, and subsequent LSAs can be controlled with this command. Subsequent LSAs are generated at increasing intervals of the *lsa-second-wait* timer until a maximum value is reached.

Configuring the **lsa-arrival** interval to equal or less than the *lsa-second-wait* interval configured in the **lsa-generate** command is recommended.

The **no** form of this command reverts to the default.

Note:
The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is ≥ 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Parameters

max-lsa-wait

Specifies the maximum interval, in milliseconds, between two consecutive occurrences of an LSA being generated.

Values 10 to 600000

Default 5000

lsa-initial-wait

Specifies the first waiting period between link-state advertisements (LSA) originate(s), in milliseconds. When the LSA exceeds the **lsa-initial-wait** timer value and the topology changes, there is no wait period and the LSA is immediately generated.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When an LSA is generated, the initial wait period commences. If, within the specified **lsa-initial-wait** period and another topology change occurs, then the **lsa-initial-wait** timer applies.

Values 10 to 600000

Default 5000

lsa-second-wait

Specifies the hold time in milliseconds between the first and second LSA generation. The next topology change is subject to this second wait period. With each subsequent topology change, the wait time doubles (this is 2x the previous wait time). This assumes that each failure occurs within the relevant wait period.

Values 10 to 600000

Default 5000

debug router ospf3 lsdb

debug router ospf lsdb

Description

This command enables debugging for an OSPF link-state database (LSDB).

Parameters

type

Specifies the OSPF link-state database (LSDB) type.

Values in the **ospf** context — router, network, summary, asbr, extern, nssa, area-opaque, as-opaque, link-opaque

in the **ospf3** context — router, network, inter-area-pfx, inter-area-rtr, external, nssa, intra-area-pfx, rtr-info-link, rtr-info-area, rtr-info-as

ls-id

Specifies an LSA type specific field containing either a router ID or an IP address. It identifies the piece of the routing domain being described by the advertisement.

adv-rtr-id

Specifies the router identifier of the router advertising the LSA.

area area-id

Specifies a 32-bit integer uniquely identifying an area.

Values ip-address — a.b.c.d

area — 0 to 4294967295

Context

[Tree] (config>service>nat>fwd lsn)

Full Context

configure service nat port-forwarding lsn

Description

This command creates NAT static port forwards for LSN44, Ds-Lite and NAT64. Static port forwards (SPF) are static mappings created so that certain applications on the inside (private side) can be reached from host that are on the outside of the NAT. SPF statically map the subscriber (inside IP address in LSN44, CPE IPv6 address/prefix in DS-Lite and IPv6 prefix in NAT64), inside port and protocol to an outside IPv4 address, port and the same protocol.

If only the inside router, the inside IPv4/v6 address/prefix and the protocol are configured as parameters in the SPF request, the remaining fields in the mapping (outside port and outside IPv4 address) will be selected automatically by the node and reported in CLI once the command execution is completed.

Specifying the outside IPv4 address in the SPF request, mandates that all other, otherwise optional, parameters be also specified in the request (inside port and outside port). This creates a fully specified SPF request. Fully specified SPF request can be used in multi-chassis NAT redundancy deployments where the SPF is manually replicated between the SR OS nodes. In single chassis NAT deployments, fully specified SPF request is guaranteed to work only in the system with a single MS-ISA in it. Otherwise (multiple MS-ISAs in the system) a conflict may arise where two distinct inside IP addresses that may reside on separate MS-ISAs are requested to be mapped to the same outside IPv4 address. This will not be possible since the outside IPv4 address cannot be split across the MS-ISAs (each IP address, inside or outside, is tied to a single MS-ISA).

In non-fully specified SPF requests (missing the inside port and/or outside port and the outside IPv4 address within the SPF request), the outside IPv4 address selection will depend on the configuration of the outside port in the SPF request:

- If the outside port is not specified or is specified from the configured **port-forwarding-range** [1024..port-forwarding-range], then the outside IPv4 address will be the same as the outside IPv4

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

address in an existing dynamic mapping for the same subscriber. If the subscriber does not exist (no dynamic mappings exist at the time of SPF creation request), then the subscriber will be automatically created and an outside IPv4 address will be assigned. In case that the outside ports are not available from the outside IPv4 address of the corresponding dynamic mapping, then the SPF request will fail. In other words, the dynamic and static mappings (created in this manner) for the same subscriber must use the same outside IPv4 address.

- If the outside port from the well-known port range [0 to 1023] is requested, then the outside IPv4 address does not have to match the outside IPv4 address of an existing dynamic mapping for the same subscriber, but can instead be any outside IPv4 address.

If multiple NAT policies per inside routing context are used, then the NAT policy must be specified in the SPF creation request. This is needed so the SPF be created in the correct pool.

SPFs are disabled by default and they must be explicitly enabled by the **port-limits forwarding** command within the NAT policy.

Configured SPFs, unlike SPFs created with the **tools** commands, are preserved across reboots without having to configure persistency (**config>system>persistence>nat-port-forwarding**) since they are part of the configuration. When the pool is shutdown the SPFs are deactivated. When the pool is enabled (no shutdown), the SPFs (as created by the **tools** command or by configuration) are activated.

To avoid possible persistency related conflicts, SPFs can only be created using one method on a given node: either as configuration (the CLI **configure** branch) or using the **tools** command. For example: if a first SPF entry is created via CLI **tools** commands, the node prevents SPF creation via configuration (the CLI **configure** branch) and vice versa.

The **no** form of the command deletes NAT static port forwards for LSN44, Ds-Lite and NAT64.

Parameters

router *router-instance*

This mandatory parameter specifies the inside routing instance; router name or service-id.

Values router-name, service-id

b4 *ipv6-address*

This optional parameter specifies the IPv6 address of the B4 element in DS-Lite.

Values <ipv6-address> : ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0..FFFF]H
d - [0..255]D

aftr *ipv6-address*

This optional parameter specifies IPv6 address of the AFTR element in DS-Lite.

Values <ip-address> : ipv4-address - a.b.c.d
ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0..FFFF]H
d - [0..255]D

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

protocol {tcp | udp}

This mandatory parameter specifies the protocol to use, either TCP or UDP.

port *port*

This optional parameter specifies a source port.

Values 1 to 65535

outside-ip *ipv4-address*

This mandatory parameter specifies the outside IPv4 address. If the outside IPv4 address is specified, then all other optional parameters become mandatory.

outside-port *port*

This optional parameter specifies the outside port.

nat-policy *policy-name*

If multiple NAT policies are used inside the routing context, then the NAT policy should be specified in the SPF request so the SPF is created in the correct NAT pool. Otherwise, the default NAT policy from the inside routing context will be used.

force

Force allocation of static port forwards.

This command is only applicable to a LSN44 pool with flexible port allocations. Such pools allow interleaving of static port forwards with other dynamically allocated ports triggered by traffic flow.

If the requested outside port in the static port forward command is already occupied by a dynamically allocated port, using the force keyword preempts the dynamically allocated port and reassigns it as a port forwarding port.

During preemption, all the flows associated with the dynamically allocated port are terminated.

When the requested port forward is occupied by another static port and not a dynamic port, the command fails even if the force keyword is configured.

When a static port forwarding command requests an arbitrary outside port that is not specified in the command, the force keyword has an effect if the entire port space is already occupied. In this case, one of the dynamic ports is preempted.

Values Keyword

27.38 lsp

lsp

Syntax

[**no**] **lsp** *lsp-name*

Context

[Tree] (config>router>ldp>targ-session>peer>tunneling lsp)

Full Context

configure router ldp targeted-session peer tunneling lsp

Description

This command configures a specific LSP destined to this peer and to be used for tunneling of LDP FEC over RSVP. A maximum of 4 RSVP LSPs can be explicitly used for tunneling LDP FECs to the T-LDP peer.

It is not necessary to specify any RSVP LSP in this context unless there is a need to restrict the tunneling to selected LSPs. All RSVP LSPs with a to address matching that of the T-LDP peer are eligible by default. The user can also exclude specific LSP names by using the ldp-over-rsvp exclude command in the **config>router>mpls>lsp** context.

configure router ldp targeted-session peer mcast-tunneling lsp

Description

This command configures a specific LSP destined to this peer and to be used for tunneling of multicast LDP FEC over RSVP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

lsp-name

Specifies the LSP name, up to 64 characters in length.

Platforms

All

lsp

Syntax

[**no**] **lsp** *lsp-name* **sender** *sender-address*

Context

[Tree] (config>router>mpls>ingress-statistics lsp)

Full Context

configure router mpls ingress-statistics lsp

Description

This command configures statistics in the ingress data path of a terminating RSVP LSP at an egress LER. The LSP name must correspond to the name configured by the operator at the ingress LER. It must not contain the special character ":" which is used as a field separator by the ingress LER for encoding the LSP and path names into the RSVP session name field in the session_attribute object. The operator must execute the **no shutdown** for this command to effectively enable statistics.

The same set of counters is updated for packets received over any path of this LSP and over the lifetime of the LSP. In steady-state, the counters are updated for packets received over the active path of the LSP. The active path can be the primary path, one of the secondary paths, the FRR detour path, or the FRR bypass path when the tail-end node is also the MP.

When a hierarchy of LSPs is in use, statistics collection on the outermost label corresponding to the tunneling LSP and on the inner labels, corresponding to the tunneled LSPs are mutually exclusive. A consequence of this is that when the operator enables statistics collection on an RSVP LSP which is also used for tunneling LDP FECs with the LDP over RSVP feature, then statistics will be collected on the RSVP LSP only. There will be no statistics collected for an LDP FEC tunneled over this RSVP LSP and also egressing on the same node regardless if the operator enabled statistics collection on this FEC. When, the operator disables statistics collection on the RSVP LSP, then statistics collection, if enabled, will be performed on a tunneled LDP FEC.

The operator can enable statistics collection on a manual bypass terminating on the egress LER. However all LSPs which primary path is protected by the manual bypass will not collect statistics when they activate forwarding over the manual bypass. When, the operator disables statistics collection on the manual bypass LSP, then statistics collection on the protected LSP, if enabled, will continue when the bypass LSP is activated.

The **no** form of this command disables statistics for this RSVP LSP in the ingress data path and removes the accounting policy association from the LSP.

Parameters

sender-address *ip-address*

Specifies a string of 15 characters representing the IP address of the ingress LER for the LSP.

lsp-name

Specifies the LSP name, up to 64 characters in length, as configured at the ingress LER.

Platforms

All

lsp

Syntax

[**no**] **lsp** *lsp-name* [**bypass-only** | **p2mp-lsp** | **mpls-tp** *src-tunnel-num* | **sr-te**]

Context

[Tree] (config>router>mpls lsp)

Full Context

configure router mpls lsp

Description

This command creates an LSP that is either signaled dynamically by the router, or a statically provisioned MPLS-TP LSP.

When the LSP is created, the egress router must be specified using the **to** command and at least one **primary** or **secondary** path must be specified for signaled LSPs, or at least one working path for MPLS-TP LSPs. All other statements under the LSP hierarchy are optional.

LSPs are created in the administratively down (**shutdown**) state.

The **no** form of this command deletes the LSP. All configuration information associated with this LSP is lost. The LSP must be administratively shutdown before it can be deleted. The LSP must also be unbound from all SDPs before it can be deleted.

Parameters

lsp-name

Specifies the name that identifies the LSP. The LSP name can be up to 64 characters long and must be unique.

bypass-only

Defines an LSP as a manual bypass LSP exclusively. When a path message for a new LSP requests bypass protection, the PLR first checks if a manual bypass tunnel satisfying the path constraints exists. If one if found, the router selects it. If no manual bypass tunnel is found, the router dynamically signals a bypass LSP in the default behavior. The CLI for this feature includes a knob that provides the user with the option to disable dynamic bypass creation on a per node basis.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

p2mp-lsp

Defines an LSP as a point-to-multipoint LSP. The following parameters can be used with a P2MP LSP: adaptive, adspec, cspf, exclude, fast-reroute, from, hop-limit, include, metric, retry-limit, retry-timer, resignal-timer. The following parameters cannot be used with a P2MP LSP: primary, secondary, to, dest-global-id, dest-tunnel-number, working-tp-path, protect-tp-path.

This option is not supported on the 7450 ESS.

mpls-tp *src-tunnel-num*

Defines an LSP as an MPLS-TP LSP. The *src-tunnel-num* is a mandatory create time parameter for mpls-tp LSPs, and has to be assigned by the user based on the configured range of tunnel IDs. The following parameters can only be used with an MPLS-TP LSP: to, dest-global-id, dest-tunnel-number, working-tp-path, protect-tp-path. Other parameters defined for the above LSP types cannot be used.

sr-te

Defines an LSP of type Segment Routing Traffic Engineering (SR-TE) LSP. The user can associate an empty path or a path with strict or loose explicit hops with the primary path of the SR-TE LSP. A hop which corresponds to an adjacency SID must be identified with its far-end host IP address (next-hop) on the subnet. If the local end host IP address is provided, this hop is ignored since this router can have multiple adjacencies (next-hops) on the same subnet. A hop which corresponds to a node SID is identified by the prefix address. The user is only allowed to configure a primary path for the SR-TE LSP.

Syntax

[**no**] **lsp** *lsp-name*

Context

[Tree] (config>service>sdp lsp)

Full Context

configure service sdp lsp

Description

This command creates associations between one or more label switched paths (LSPs) and an Multi-Protocol Label Switching (MPLS) service destination point (SDP). This command is implemented *only* on MPLS-type encapsulated SDPs.

In MPLS SDP configurations *either* one or more LSP names can be specified *or* LDP can be enabled. The SDP **ldp** and **lsp** commands are mutually exclusive except if the mixed-lsp-mode option is also enabled. If an LSP is specified on an MPLS SDP, then LDP cannot be enabled on the SDP. To enable LDP on the SDP when an LSP is already specified, the LSP must be removed from the configuration using the **no lsp lsp-name** command.

Alternatively, if LDP is already enabled on an MPLS SDP, then an LSP cannot be specified on the SDP. To specify an LSP on the SDP, the LDP must be disabled or the mixed-lsp-mode option is also enabled. The LSP must have already been created in the **config>router>mpls** context. with a valid far-end IP address. RSVP must be enabled.

If no LSP is associated with an MPLS SDP, the SDP cannot enter the operationally up state. The SDP can be administratively enabled (**no shutdown)** with no LSP associations. The *lsp-name* may be shutdown, causing the association with the SDP to be operationally down (the LSP will not be used by the SDP).

Up to 16 LSP names can be entered on a single command line.

The **no** form of this command deletes one or more LSP associations from an SDP. If the *lsp-name* does not exist as an association or as a configured LSP, no error is returned. An *lsp-name* must be removed from all SDP associations before the *lsp-name* can be deleted from the system. The SDP must be administratively disabled (**shutdown)** before the last *lsp-name* association with the SDP is deleted.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

lsp-name

Specifies the name of the LSP to associate with the SDP. An LSP name is case sensitive and is limited to 32 ASCII 7-bit printable characters with no spaces. If an exact match of *lsp-name* does not already exist as a defined LSP, an error message is generated. If the *lsp-name* does exist and the LSP **to** IP address matches the SDP **far-end** IP address, the association is created.

configure router ldp lsp-bfd

Description

Commands in this context configure LSP BFD for a set of LDP LSPs with FECs matching those defined in the specified prefix list.

Up to 16 LSP BFD instances can be configured for LDP.

If a prefix corresponding to an LDP FEC appears in more than one prefix list, then the system will apply the LSP BFD configuration to the LSP only once. A prefix list may contain a longest match corresponding to one or more LDP FECs, in which case the BFD configuration is applied to all of those LDP LSPs.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of the command removes LSP BFD. Specifying a prefix list name will remove LSP BFD for all LDP FECs that match the specified prefix list, except those LDP FECs that also match another LSP BFD prefix list.

Default

no lsp-bfd

Parameters

prefix-list-name

Specifies the name of the prefix list configured using the **configure router policy-options prefix-list** *name* command, up to 32 characters maximum. The prefix list name can be specified by the **lsp-bfd** command prior to the prefix list being defined in the **config**>**router**>**policy-options** context.

lsp-exp

Syntax

lsp-exp *lsp-exp-value* [**fc** *fc-name*] [**priority** {**low** | **high**}]

no lsp-exp *lsp-exp-value*

Context

[Tree] (config>qos>sap-ingress lsp-exp)

Full Context

configure qos sap-ingress lsp-exp

Description

This command explicitly sets the forwarding class or subclass enqueuing priority when a packet is marked with a MPLS EXP bits specified. Adding a lsp-exp rule on the policy forces packets that match the MPLS LSP EXP specified to override the forwarding class and enqueuing priority based on the parameters included in the lsp-exp rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueuing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

The *lsp-exp-value* is derived from the MPLS LSP EXP bits of the top label.

Multiple commands can be entered to define the association of some or all eight LSP EX bit values to the forwarding class.

The **no** form of this command removes the explicit lsp-exp classification rule from the SAP ingress policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

This command applies to Ethernet Layer 2 SAPs only.

Parameters

lsp-exp-value

This value is a required parameter that specifies the unique MPLS LSP EXP value that will match the lsp-exp rule. If the command is executed multiple times with the same *lsp-exp-value*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of eight lsp-exp rules are allowed on a single policy.

Values 0 to 7

fc *fc-name*

The value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rule, the forwarding class is only overridden when the *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a pre-existing subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (dot). If *subclass-name* does not exist in the context of *fc -name*, an error will occur.

Values *class*[.*subclass*]

class: be, l2, af, l1, h2, ef, h1, nc

subclass: 29 characters max

priority

The **priority** parameter is used to override the default enqueuing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueuing priority is only overridden when the **priority** parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueuing priority is inherited based on previous rule matches.

high

The **high** parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low

The **low** parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

configure qos network ingress lsp-exp

Description

This command creates a mapping between the LSP EXP bits of the network ingress traffic and the forwarding class.

Ingress traffic that matches the specified LSP EXP bits will be assigned to the corresponding forwarding class. Multiple commands can be entered to define the association of some or all eight LSP EXP bit values to the forwarding class. For undefined values, packets are assigned to the forwarding class specified under the **default-action** command.

The **no** form of this command removes the association of the LSP EXP bit value to the forwarding class. The **default-action** then applies to that LSP EXP bit pattern.

Default

no lsp-exp

Parameters

lsp-exp-value

Specify the LSP EXP values to be associated with the forwarding class.

Values 0 to 8 (Decimal representation of three EXP bit field)

fc *fc-name*

Enter this required parameter to specify the fc-name that the EXP bit pattern will be associated with.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out}

Enter this required parameter to indicate whether the LSP EXP value is the in-profile or out-of-profile value.

Values in, out

Context

[Tree] (config>router>mpls lsp-init-retry-timeout)

Full Context

configure router mpls lsp-init-retry-timeout

Description

This command configures the initial LSP path retry-timer.

The new LSP path initial retry-timer is used instead of the retry-timer to abort the retry cycle when no RESV is received. The retry-timer exclusively governs the time between two retry cycles and to handle retrying of an LSP path in a failure case with PATH errors or RESVTear.

The intent is that the user can now control how many refreshes of the pending PATH state can be performed before starting a new retry-cycle with a new LSP ID. This is all done without affecting the ability to react faster to failures of the LSP path, which will continue to be governed by the retry-timer.

The **no** form of this command returns the timer to the default value.

Default

lsp-init-retry-timeout 30

Parameters

seconds

Specifies the value (in s), used as the fast retry timer for a secondary path.

Values 10 to 600

Default 30

configure service vprn isis lsp-mtu-size

configure service vprn isis level lsp-mtu-size

Description

This command configures the LSP MTU size. If the *size* value is changed from the default using CLI or SNMP, then ISIS must be restarted for the change to take effect. This can be done by performing a **shutdown** command and then a **no shutdown** command in the **config>router>isis** context.

Note:
Using the **exec** command to execute a configuration file to change the LSP MTU size from its default value will automatically restart IS-IS for the change to take effect.

The **no** form of this command reverts to the default value.

Default

lsp-mtu-size 1492

Full Context

configure service vpls spoke-sdp spb lsp-pacing-interval

configure service vpls sap spb lsp-pacing-interval

Description

This command configures the interval during which LSPs are sent from the interface.

To avoid overwhelming neighbors that have less CPU processing power with LSPs, the pacing interval can be configured to limit how many LSPs are sent during an interval. LSPs may be sent in bursts during the interval up to the configured limit. If a value of 0 is configured, no LSPs are sent from the interface.

If configured to the default LSP pacing interval of 100, LSPs are sent in 100 millisecond intervals.

The **no** form of this command reverts to the default value.

Note:
The IS-IS timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default

lsp-pacing-interval 100

Parameters

milli-seconds

The interval in milliseconds during which IS-IS LSPs are sent from the interface, expressed as a decimal integer.

0 to 65535

Platforms

All

configure service vprn isis interface lsp-pacing-interval

Description

This command configures the interval at which LSPs are sent from the interface.

To avoid overwhelming neighbors that have less CPU processing power with LSPs, the pacing interval can be configured to limit how many LSPs are sent at the interval. LSPs are sent in bursts at the interval up to the configured limit. If a value of 0 is configured, no LSPs are sent from the interface.

If configured to the default LSP pacing interval of 100, LSPs are sent in 100 millisecond intervals.

The **no** form of this command reverts to the default value.

Note:
The IS-IS LSP pacing interval is 100 milliseconds for values < 100 milliseconds, and 1 second for values ≥ 100 milliseconds. For example, a pacing interval of 2 milliseconds means that a maximum of 50 LSPs are sent in a burst at 100 millisecond intervals. The default pacing interval of 100 milliseconds means that a maximum of 10 LSPs are sent in a burst at 1 second intervals.

Default

lsp-pacing-interval 100

Parameters

milliseconds

Specifies the pacing interval in milliseconds at which IS-IS LSPs are sent from the interface at each interval expressed as a decimal integer.

Values 0 to 65535

Platforms

All

configure router isis interface lsp-pacing-interval

Description

This command configures the interval at which LSPs are sent from the interface.

To avoid overwhelming neighbors that have less CPU processing power with LSPs, the pacing interval can be configured to limit how many LSPs are sent at the interval. LSPs are sent in bursts at the interval up to the configured limit. If a value of 0 is configured, no LSPs are sent from the interface. The interval applies to all LSPs: LSPs generated by the router, and LSPs received from other routers.

If configured to the default LSP pacing interval of 100, LSPs are sent in 100 millisecond intervals.

The **no** form of this command reverts to the default value.

Note:
The IS-IS LSP pacing interval is 100 milliseconds for values < 100 milliseconds, and 1 second for values ≥ 100 milliseconds. For example, a pacing interval of 2 milliseconds means that a maximum of 50 LSPs are sent in a burst at 100 millisecond intervals. The default pacing interval of 100 milliseconds means that a maximum of 10 LSPs are sent in a burst at 1 second intervals.

Default

lsp-pacing-interval 100

oam lsp-ping

Description

This command performs in-band LSP connectivity tests.

This command performs an LSP ping using the protocol and data structures defined in the RFC 8029, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*.

The LSP ping operation is modeled after the IP ping utility which uses ICMP echo request and reply packets to determine IP connectivity.

In an LSP ping, the originating device creates an MPLS echo request packet for the LSP and path to be tested. The MPLS echo request packet is sent through the data plane and awaits an MPLS echo reply packet from the device terminating the LSP. The status of the LSP is displayed when the MPLS echo reply packet is received.

This command, when used with the **static** option, performs in-band on-demand LSP connectivity verification tests for static MPLS-TP LSPs. For other LSP types, the **static** option should be excluded and these are described elsewhere in this user guide.

The **lsp-ping static** command performs an LSP ping using the protocol and data structures defined in the RFC 8029, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*, as extended by RFC 6426, *MPLS On-Demand Connectivity Verification and Route Tracing*.

In MPLS-TP, the echo request and echo reply messages are always sent in-band over the LSP, either in a G-ACh channel or encapsulated as an IP packet below the LSP label.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Default

The active LSP path

Values: Any path name associated with the LSP

Parameters

lsp-name

Specifies the name of the target RSVP-TE LSP, up to 64 characters.

rsvp-te lsp-name

Specifies the name of the target RSVP-TE LSP, up to 64 characters.

Note:
The **rsvp-te** explicit target FEC type is not supported under the SAA context.

path-name

Specifies the LSP path name, up to 32 characters, to which to send the LSP ping request.

Values Any path name associated with the LSP.

Default The active LSP path.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

bgp-label prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target BGP IPv4 /32 label route or the target BGP IPv6 /128 label route.

Values <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix a.b.c.d

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

path-destination *ip-address*

Specifies the IP address of the path destination from the range 127/8. When the LDP FEC prefix is IPv6, the user must enter a 127/8 IPv4 mapped IPv6 address, that is, in the range ::ffff:127/104.

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

flex-algo *flex-algo-num*

Specifies the Segment Routing Flexible Algorithm for the test.

Values 128 to 255

interface if-name

Specifies the name of an IP interface, up to 32 characters, to send the MPLS echo request message to. The name must already exist in the **config>router>interface** context.

next-hop *ip-address*

Specifies the next-hop address to send the MPLS echo request message to.

Values

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target LDP FEC.

Values <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix a.b.c.d

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

ldp prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target LDP FEC.

Values <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix a.b.c.d

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

sr-isis prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target node SID of the SR-IS-IS tunnel.

Values <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix a.b.c.d

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

igp-instance

Specifies the IGP instance of the node SID prefix.

Values isis-inst: 0 to 127

ospf3-inst: 0 to 31, 64 to 95

ospf-inst: 0 to 31

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sr-ospf prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF tunnel.

Values <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix - a.b.c.d

ipv6-prefix - x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

sr-ospf3 prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF3 tunnel. Note that only IPv6 prefixes in OSPFv3 instance ID 0-31 are supported.

Values

ipv6-prefix - x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

sr-policy color *color-id* endpoint *ip-address* segment-list *segment-list-id*

Specifies the name of the target IPv4 or IPv6 SR policy.

Note:
The **sr-policy** target FEC type is supported under the OAM context and under **type-multi-line node** in the SAA context.

color *color-id* — Specifies the color ID.

Values 0 to 4294967295

endpoint *ip-address* — Specifies the endpoint address.

Values

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

segment-list *segment-list-id* — Specifies the segment list ID.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 32

detail

Displays detailed information.

sr-te *lsp-name*

Specifies the name of the target SR-TE LSP, up to 64 characters.

static

Specifies the target FEC stack sub-type "Static LSP”.

assoc-channel {ipv4 | non-ip | none}

Specifies the launched echo request’s usage of the Associated Channel (ACH) mechanism, when testing an MPLS-TP LSP.

Values **ipv4** — Use an Associated Channel with IP encapsulation, as described in RFC 6426, Section 3.2.

non-ip — Do not use an Associated Channel, as described in RFC 6426, Section 3.1.

none — Use the Associated Channel mechanism described in RFC 6426, Section 3.3.

Default non-ip

global-id

Specifies the MPLS-TP global ID for the far end node of the LSP under test. If this is not entered, then the dest-global-id is taken from the LSP context.

Values 0 to 4294967295

Default 0

node-id

Specifies the MPLS-TP global ID for the far end node of the LSP under test. If this is not entered, then the dest-global-id is taken from the LSP context.

Values a.b.c.d, 1 to 4294967295

Default 0

force

Allows LSP ping to test a path that is operationally down, including cases where MPLS-TP BFD CC/V is enabled and has taken a path down. This parameter is only allowed in the OAM context; it is not allowed for a test configured as a part of an SAA.

Default disabled

path-type {active | working | protect}

The LSP path to test.

Values **active** — The currently active path. If MPLS-TP linear protection is configured on the LSP, then this is the path that is selected by the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

MPLS-TP PSC protocol for sending user plane traffic. If MPLS-TP linear protection is not configured, then this is the working path.

working — The working path of the MPLS-TP LSP.

protect — The protect path of the MPLS-TP LSP.

Default active

fc-name

Specifies the FC and profile parameters that are used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified fc and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. Table 62: lsp-ping Request Packet and Behavior summarizes this behavior.

Table 62: lsp-ping Request Packet and Behavior

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	• packet{tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router**.**

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the MPLS echo request packet.

Default out

flex-algo *flex-algo-num*

Specifies the Segment Routing Flexible Algorithm for the test. This option is only supported for **oam lsp-ping sr-isis** and **oam lsp-ping sr-ospf**. This option is not supported for SAA. If this option is not set, then the system looks up the prefix without flex-algo awareness.

Values 128 to 255

Default **none**

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

Values 1 to 10

Default 1

send-count

Specifies the number of messages to send, expressed as a decimal integer. The **send-count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

is sent. The message **interval** value must be expired before the next message request is sent.

Values 1 to 100

Default 1

octets

Specifies the MPLS echo request packet size in octets, expressed as a decimal integer. The request payload is padded with zeros to the specified size.

Values 1 to 9786

Default 1

src-ip-address *ip-address*

Specifies the source IP address. This option is used when an OAM packet must be generated from a different address than the node's system interface address. An example is when the OAM packet is sent over an LDP LSP and the LDP LSR-ID of the corresponding LDP session to the next-hop is set to an address other than the system interface address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

timeout

Specifies number, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of those request probes.

Values 1 to 10

Default 5

label-ttl

Specifies the TTL value for the MPLS label, expressed as a decimal integer.

Values 1 to 255

Default 255

lsp-ping-interval

Syntax

lsp-ping-interval *seconds*

no lsp-ping-interval

Context

[Tree] (config>router>ldp>lsp-bfd lsp-ping-interval)

Full Context

configure router ldp lsp-bfd lsp-ping-interval

Description

This command configures the interval between periodic LSP ping messages for LSPs on which **bfd-enable** is configured. The LSP ping messages are used to bootstrap and maintain the LSP BFD session.

Configuring an interval of 0 seconds disables periodic LSP ping. An LSP ping message containing a bootstrap TLV will only be sent when the BFD session is first initialized.

In scaled environments, LSP BFD sessions should use longer intervals to reduce congestion and common resource loading. Unless required, the interval should not be set lower than 300 s.

The **no** form of this command restores the default interval.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

lsp-ping-interval 60

Parameters

seconds

Specifies the interval between periodic LSP ping messages, in seconds.

Values 0, 60 to 300

configure router mpls lsp-template bfd lsp-ping-interval

configure router mpls lsp secondary bfd lsp-ping-interval

configure router mpls lsp bfd lsp-ping-interval

Description

This command configures the interval for the periodic LSP ping for RSVP LSPs on which **bfd-enable** has been configured. This interval is used to bootstrap and maintain the LSP BFD session. A value of 0 disables periodic LSP Ping, such that an LSP Ping containing a bootstrap TLV is only sent when the BFD session is first initialized.

In scaled environments, LSP BFD sessions should use longer timers to reduce the chance of congestion and loading of common resources. Unless required, the **lsp-ping-interva**l should not be set lower than 300 seconds.

The **no** form of this command reverts to the default value.

Default

no lsp-ping-interval

© 2026 Nokia.

27.55 lsp-refresh-interval

lsp-refresh-interval

Syntax

lsp-refresh-interval [*seconds*] [**half-lifetime** [**enable** | **disable**]

no lsp-refresh-interval

Context

[Tree] (config>service>vpls>spb lsp-refresh-interval)

Full Context

configure service vpls spb lsp-refresh-interval

Description

This command configures the LSP refresh timer interval. When configuring the LSP refresh interval, the value that is specified for **lsp-lifetime** must also be considered. The LSP refresh interval cannot be greater than 90% of the LSP lifetime.

The no form of this command reverts to the default (600 seconds), unless this value is greater than 90% of the LSP lifetime. For example, if the LSP lifetime is 400, then the **no lsp-refresh-interval** command will be rejected.

Default

lsp-refresh-interval 600 half-lifetime enable

Parameters

seconds

Specifies the refresh interval.

Values 150 to 65535

half-lifetime

Sets the refresh interval to always be half the **lsp-lifetime** value. When this parameter is set to **enable**, the configured refresh interval is ignored.

Values enable, disable

Platforms

All

27.56 lsp-self-ping

lsp-self-ping

Syntax

[**no**] **lsp-self-ping**

Context

[Tree] (config>router>mpls lsp-self-ping)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router mpls lsp-self-ping

Description

Commands in this context configure LSP self-ping parameters.

LSP Self-ping checks that the datapath of an RSVP LSP has been programmed by all LSRs along its path before switching the traffic to it. If enabled, LSP Self-ping packets are sent periodically at a configurable interval following the receipt of the RESV message for an RSVP LSP path following an MBB or other event where the active path changes while the previous active path stayed up. The router will not switch traffic to the new path until an LSP Self-ping reply is received from the far-end LER.

When configured under the MPLS context, LSP Self-ping is enabled for all RSVP LSPs, unless it is explicitly disabled for a given LSP.

The **no** form of this command disables the system check for LSP Self-ping.

Default

no lsp-self-ping

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>router>mpls>lsp-template lsp-self-ping)

Full Context

configure router mpls lsp lsp-self-ping

configure router mpls lsp-template lsp-self-ping

Description

This command enables LSP Self-ping on a given RSVP-TE LSP or LSP template. If set to **disable**, then LSP Self-ping is disabled irrespective of the setting of **lsp-self-ping**>**rsvp-te** under the **mpls** context. By default, each LSP and LSP template inherits this value.

The **no** form of this command reverts to the default.

Default

lsp-self-ping inherit

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

enable

Enables LSP Self-ping on this RSVP LSP or RSVP LSPs (one-hop-p2p or mesh-p2p) using this LSP template.

disable

Disables LSP Self-ping on this RSVP LSP or RSVP LSPs using this LSP template.

inherit

Inherits the value configured under **config**>**router**>**mpls**>**lsp-self-ping**>**rsvp-te**.

27.58 lsp-template

lsp-template

Syntax

lsp-template *p2mp-lsp-template-name*

no lsp-template

Context

[Tree] (config>service>vpls>provider-tunnel>inclusive>rsvp lsp-template)

Full Context

configure service vpls provider-tunnel inclusive rsvp lsp-template

Description

This command specifies the template name of the RSVP P2MP LSP instance to be used by the leaf node or the root-and-leaf node that participates in BGP-AD VPLS. The P2MP LSP is referred to as the Inclusive Provider Multicast Service Interface (I-PMSI).

After the user performs a **no shutdown** under the context of the inclusive node and the delay timer expires, BUM packets will be forwarded over an automatically signaled instance of the RSVP P2MP LSP specified in the LSP template.

The **no** version of this command removes the P2MP LSP template from the I-PMSI configuration.

Parameters

p2mp-lsp-template-name

Specifies the name of the P2MP LSP template up to 32 characters in length.

Platforms

All

lsp-template

Syntax

[Tree] (config>router>mpls lsp-template)

Full Context

configure router mpls lsp-template

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates an LSP template that a client application references where dynamic LSP creation is required. The LSP template type is mandatory.

The **no** form of this command deletes the LSP template. An LSP template cannot be deleted if a client application is using it.

Parameters

template-name

Specifies the name of the LSP template, up to 32 characters. An LSP template name and LSP name must not be the same.

member-p2p

Keyword to configure the LSP type the template signals to member P2P.

mesh-p2p

Keyword to configure the LSP type the template signals to mesh P2P.

mesh-p2p-srte

Keyword to configure the LSP type the template signals to mesh P2P SR-TE.

one-hop-p2p

Keyword to configure the LSP type the template signals to one-hop P2P.

one-hop-p2p-srte

Keyword to configure the LSP type the template signals to one-hop P2P SR-TE.

p2mp

Keyword to configure the LSP type the template signals to P2MP.

The **p2mp** option is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

pce-init-p2p-srte

Keyword to configure the LSP type the template signals to PCE-initiated P2P SR-TE.

on-demand-p2p-srte

Keyword to configure the LSP type the template signals to on-demand P2P SR-TE.

default

Keyword to set the template to be the default LSP template for the PCE-initiated SR-TE LSPs.

template-id

Specifies the value that is signaled in the PCE to identify the LSP template.

configure oam-pm session mpls lsp rsvp-auto lsp-template

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the LSP template used to identify the LSP for testing.

One of three mandatory configuration statements that are required to identify automatically created RSVP LSPs, created using **config>router>mpls>lsp-template**. The **config>router>mpls>auto-lsp>lsp-template** links three distinct functions.

The **lsp-template** *template-name* must match the name of **config>router>mpls>lsp-template** used to dynamically create the RSVP LSP. This is a lose reference and does not impede the manipulation of the **config>router>mpls>lsp-template**. The required identifiers are **from**, **lsp-template** and **to**, all under this node.

The **no** form of this command deletes the *template-name* reference from the configuration.

Parameters

template-name

Specifies the name of the LSP template, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lsp-template

Syntax

lsp-template *template-name*

no lsp-template

Context

[Tree] (config>oam-pm>session>ip>tunnel>mpls>rsvp-te-auto lsp-template)

Full Context

configure oam-pm session ip tunnel mpls rsvp-te-auto lsp-template

Description

This command configures the name of the LSP template used to identify the unique LSP. Configure the following three commands to identify an RSVP-TE Auto LSP: **from**, **to**, and **lsp-template**. When all three of these values are configured, the specific RSVP LSP can be identified and the test packets can be carried across the tunnel

The **no** form of this command removes the LSP template name from the configuration.

Parameters

template-name

Specifies the LSP template name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

oam lsp-trace

configure saa test type lsp-trace

Description

This command performs an LSP traceroute using the protocol and data structures defined in IETF RFC 8029.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The LSP trace operation is modeled after the IP traceroute utility, which uses ICMP echo request and reply packets with increasing TTL values to determine the hop-by-hop route to a destination IP.

In an LSP trace, the originating device creates an MPLS echo request packet for the LSP to be tested with increasing values of the TTL in the outermost label. The MPLS echo request packet is sent through the data plane and awaits a TTL exceeded response or the MPLS echo reply packet from the device terminating the LSP. The devices that reply to the MPLS echo request packets with the TTL exceeded and the MPLS echo reply are displayed.

The downstream mapping TLV is used in **lsp-trace** to provide a mechanism for the sender and responder nodes to exchange and validate interface and label stack information for each downstream hop in the path of the LDP FEC an RSVP LSP, or a BGP IPv4 label route.

Two downstream mapping TLVs are supported. The original Downstream Mapping (DSMAP) TLV defined in RFC 4379 (obsoleted by RFC 8029) and the new Downstream Detailed Mapping (DDMAP) TLV defined in RFC 6424 AND RFC 8029. More details are provided in the DDMAP TLV sub-section below.

In addition, when the responder node has multiple equal cost next hops for an LDP FEC, a BGP label IPv4 prefix, an SR-ISIS node SID, an SR-OSPF node SID, or an SR-TE LSP, it replies in the Downstream Mapping TLV with the downstream information for each outgoing interface which is part of the ECMP next-hop set for the prefix. The downstream mapping TLV can further be used to exercise a specific path of the ECMP set using the **path-destination** option.

This command, when used with the **static** option, performs in-band on-demand LSP traceroute tests for static MPLS-TP LSPs. For other LSP types, the **static** option should be excluded and these are described elsewhere in this user guide.

The **lsp-trace static** command performs an LSP trace using the protocol and data structures defined in the RFC 8029, Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures, as extended by RFC 6426, MPLS On-Demand Connectivity Verification and Route Tracing.

In MPLS-TP, the echo request and echo reply messages are always sent in-band over the LSP, either in a G-ACh channel or encapsulated as an IP packet below the LSP label.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **configure test-oam mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Parameters

lsp-name

Specifies the name of the target RSVP-TE LSP, up to 64 characters.

rsvp-te lsp-name

Specifies the name of the target RSVP-TE LSP, up to 64 characters.

Note:
The **rsvp-te** explicit target FEC type is not supported under the SAA context.

path-name

Specifies the LSP path name along which to send the LSP trace request.

Values Any path name associated with the LSP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default The active LSP path.

bgp-label prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target BGP IPv4 /32 label route or the target IPv6 /128 label route.

Values <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix a.b.c.d

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

path-destination *ip-address*

Specifies the IP address of the path destination from the range 127/8. When the LDP FEC prefix is IPv6, the user must enter a 127/8 IPv4 mapped IPv6 address, that is, in the range ::ffff:127/104.

if-name

Specifies the name of an IP interface, up 32 characters, to send the MPLS echo request to. The name must already exist in the **config>router>interface** context.

next-hop *ip-address*

Specifies the next hop to send the MPLS echo request message to.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target LDP FEC.

Values <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix - a.b.c.d

ipv6-prefix - x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

d - [0 to 255]D

ldp prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target LDP FEC.

Values <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix a.b.c.d

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

sr-isis prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target node SID of the SR-ISIS tunnel.

Values <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix a.b.c.d

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

igp-instance

Specifies the IGP instance of the node SID prefix.

Values isis-inst: 0 to 127

ospf3-inst: 0 to 31, 64 to 95

ospf-inst: 0 to 31

sr-ospf prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF tunnel.

Values <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix - a.b.c.d

ipv6-prefix - x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

d - [0 to 255]D

sr-ospf3 prefix *ip-prefix/prefix-length*

Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF3 tunnel. Only IPv6 prefixes in OSPFv3 instance ID 0-31 are supported.

Values

ipv6-prefix - x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

sr-policy color *color-id* endpoint *ip-address* segment-list *segment-list-id*

Specifies the name of the target IPv4 or IPv6 SR policy.

Note:
The **sr-policy** target FEC type is supported under the OAM context and under **type-multi-line node** in the SAA context.

color *color-id* — Specifies the color ID.

Values 0 to 4294967295

endpoint *ip-address* — Specifies the endpoint address.

Values

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

segment-list *segment-list-id* — Specifies the segment list ID.

Values 1 to 32

detail

Displays detailed information and allows the user to display hop 0 (that is, ingress) information. When this parameter is applied to static LSPs, the next hop 0 information is not displayed. This information is also not displayed if the **min-ttl** *min-label-ttl* value is greater than 1.

sr-te *lsp-name*

Specifies the name of the target SR-TE LSP, up to 64 characters.

static

Specifies the selection of the target FEC Stack sub-type "Static LSP”.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

assoc-channel {ipv4 | non-ip | none}

Specifies the launched echo request's usage of the Associated Channel (ACH) mechanism, when testing an MPLS-TP LSP.

Values **ipv4** — Use the Associated Channel mechanism with IP encapsulation, as described in RFC 6426, Section 3.2.

non-ip — Do not use an Associated Channel, as described in RFC 6426, Section 3.1.

none — Use the Associated Channel mechanism described in RFC 6426, Section 3.3.

path-type {active | working | protect}

Specifies the LSP path to test.

Values **active** — Specifies the currently active path. If MPLS-TP linear protection is configured on the LSP, then this is the path that is selected by the MPLS-TP PSC protocol for sending user plane traffic. If MPLS-TP linear protection is not configured, then this is the working path.

working — Specifies the working path of the MPLS-TP LSP.

protect — Specifies the protect path of the MPLS-TP LSP.

Default active

downstream-map-tlv

Specifies which format of the downstream mapping TLV to use in the LSP trace packet. The DSMAP TLV is the original format in RFC 4379 (obsoleted by RFC 8029). The DDMAP is the new enhanced format specified in RFC 6424 and RFC 8029. The user can also choose not to include the downstream mapping TLV by entering the value none. When lsp-trace is used on a MPLS-TP LSP (static option), it can only be executed if the control-channel is set to none. In addition, the DSMAP/DDMAP TLV is only included in the echo request message if the egress interface is either a numbered IP interface, or an unnumbered IP interface. The TLV is not included if the egress interface is of type **unnumbered-mpls-tp**.

Values ddmap: Sends a detailed downstream mapping TLV.

dsmap: Sends a downstream mapping TLV.

none: No mapping TLV is sent.

Default Inherited from global configuration of downstream mapping TLV in option **mpls-echo-request-downstream-map {dsmap | ddmap}**.

fc-name

Specifies the FC and profile parameters are used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet EXP is dictated by the LSP-EXP mappings on the outgoing interface.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the fc and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. Table 63: lsp-trace Request Packet and Behavior summarizes this behavior.

Table 63: lsp-trace Request Packet and Behavior

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • pkt queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • pkt queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the MPLS echo request packet.

Default out

interval

Specifies the number of seconds to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default **1**

no-response-count

Specifies the maximum number of consecutive MPLS echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL.

Values 1 to 255

Default 5

max-label-ttl

Specifies the maximum TTL value in the MPLS label for the LDP treetrace test, expressed as a decimal integer.

Values 1 to 255

Default 30

min-label-ttl

Specifies the minimum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

Values 1 to 255

Default 1

probes-per-hop

Specifies the probes per hop.

Values 1 to 10

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 1

octets

Specifies the size in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request payload is padded with zeros to the specified size. Note that an OAM command is not failed if the user entered a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

src-ip-address *ip-address*

Specifies the source IP address. This option is used when an OAM packet must be generated from a different address than the node's system interface address. An example is when the OAM packet is sent over an LDP LSP and the LDP LSR-ID of the corresponding LDP session to the next-hop is set to an address other than the system interface address.

Values

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 3

lsp-trace

Syntax

lsp-trace

Context

[Tree] (config>saa>test>type-multi-line lsp-trace)

Full Context

configure saa test type-multi-line lsp-trace

Description

This command creates the context to perform an LSP traceroute using the protocol and data structures defined in IETF RFC 4379 (obsoleted by RFC 8029).

Platforms

All

27.60 lsp-wait

lsp-wait

Syntax

lsp-wait *lsp-wait* [**lsp-initial-wait** *lsp-initial-wait*] [**lsp-second-wait** *lsp-second-wait*]

no lsp-wait

Context

[Tree] (config>service>vpls>spb>timers lsp-wait)

Full Context

configure service vpls spb timers lsp-wait

Description

This command is used to customize LSP generation throttling. Timers that determine when to generate the first, second and subsequent LSPs can be controlled with this command. Subsequent LSPs are generated at increasing intervals of the second **lsp-wait** timer until a maximum value is reached.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note:
The IS-IS timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Parameters

lsp-wait

Specifies the maximum interval in milliseconds between two consecutive occurrences of an LSP being generated.

Values 10 to 120000

Default 5000

lsp-initial-wait

Specifies the initial LSP generation delay, in milliseconds. Values less than 100 ms are internally rounded down to 0, so that there is no added initial LSP generation delay.

Values 10 to 100000

Default 10

lsp-second-wait

Specifies the hold time, in milliseconds, between the first and second LSP generation.

Values 10 to 100000

Default 1000

Platforms

All

lsp-wait

Syntax

lsp-wait *lsp-wait* **lsp-initial-wait** [*initial-wait*] [**lsp-second-wait** *second-wait*]

Context

[Tree] (config>service>vprn>isis>timers lsp-wait)

Full Context

configure service vprn isis timers lsp-wait

Description

This command configures the throttling of IS-IS LSP-generation. Timers that determine when to generate the first, second, and subsequent LSPs are controlled with this command. Subsequent LSPs are generated at increasing intervals of the second **lsp-wait** timer until a maximum value is reached.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note: The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is greater than or equal to 500 ms. Timer values are rounded down to the nearest granularity; for example, a configured value of 550 ms is internally rounded down to 500 ms.

The **no** form of this command reverts to the default value.

Default

lsp-wait 5000 lsp-initial-wait 10 lsp-second-wait 1000

Parameters

lsp-wait

Specifies the maximum interval, in milliseconds, between two consecutive occurrences of an LSP being generated.

Values 10 to 120000

initial-wait

Specifies the initial LSP generation delay, in milliseconds. Values less than 100 ms are internally rounded down to 0, so that there is no added initial LSP generation delay.

Values 10 to 100000

second-wait

Specifies the hold time, in milliseconds, between the first and second LSP generation.

Values 10 to 100000

Platforms

All

lsp-wait

Syntax

lsp-wait *lsp-wait* [**lsp-initial-wait** *initial-wait*] [**lsp-second-wait** *second-wait*]

Context

[Tree] (config>router>isis>timers lsp-wait)

Full Context

configure router isis timers lsp-wait

Description

This command configures the throttling of IS-IS LSP-generation. Timers that determine when to generate the first, second, and subsequent LSPs are controlled with this command. Subsequent LSPs are generated at increasing intervals of the second **lsp-wait** timer until a maximum value is reached.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note: The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is greater than or equal to 500 ms. Timer values are rounded down to the nearest granularity; for example, a configured value of 550 ms is internally rounded down to 500 ms.

The **no** form of this command reverts to the default value.

Default

lsp-wait 5000 lsp-initial-wait 10 lsp-second-wait 1000

Parameters

lsp-wait

Specifies the maximum interval, in milliseconds, between two consecutive occurrences of an LSP being generated.

Values 10 to 120000

initial-wait

Specifies the initial LSP generation delay, in milliseconds. Values less than 100 ms are internally rounded down to 0, so that there is no added initial LSP generation delay.

Values 10 to 100000

second-wait

Specifies the hold time, in milliseconds, between the first and second LSP generation.

Values 10 to 100000

Platforms

27.61 lsr-label-route

lsr-label-route

Syntax

lsr-label-route [{**none** | **all**}]

Context

[Tree] (config>router>ttl-propagate lsr-label-route)

Full Context

configure router ttl-propagate lsr-label-route

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the TTL propagation for transit packets at a router acting as an LSR for a BGP label route.

When an LSR swaps the BGP label for a ipv4 prefix packet, therefore acting as a ABR, ASBR, or data-path Route-Reflector (RR) in the base routing instance, or swaps the BGP label for a vpn-ipv4 or vpn-ipv6 prefix packet, therefore acting as an inter-AS Option B VPRN ASBR or VPRN data path Route-Reflector (RR), the **all** value of this command enables TTL propagation of the decremented TTL of the swapped BGP label into all outgoing LDP or RSVP transport labels.

When an LSR swaps a label or stitches a label, it always writes the decremented TTL value into the outgoing swapped or stitched label. What this feature controls is whether this decremented TTL value is also propagated to the transport label stack pushed on top of the swapped or stitched label.

The none value reverts to the default mode which disables TTL propagation. This changes the existing default behavior which propagates the TTL to the transport label stack. When a customer upgrades, the new default becomes in effect. This command does not have a no version.

This feature also controls the TTL propagation at an LDP-BGP stitching LSR in the LDP to BGP stitching direction. It also controls the TTL propagation in Carrier Supporting Carrier (CsC) VPRN at both the CsC CE and CsC PE.

SR OS does not support ASBR or data path RR functionality for labeled IPv6 routes in the global routing instance (6PE). As such the CLI command of this feature has no impact on prefix packets forwarded in this context.

Default

lsr-label-route none

Parameters

none

Specifies that the TTL of the swapped label is not propagated into the transport label stack.

all

Specifies that the TTL of the swapped label is propagated into all labels of the transport label stack.

Platforms

All

configure service vprn network-interface load-balancing lsr-load-balancing

Description

This command specifies whether the IP header is used in the LAG and ECMP LSR hashing algorithm. This is the per interface setting.

Default

no lsr-load-balancing

Parameters

lbl-only

Only the label is used in the hashing algorithm.

lbl-ip

The IP header is included in the hashing algorithm.

ip-only

The IP header is used exclusively in the hashing algorithm.

eth-encap-ip

The hash algorithm parses down the label stack and once it hits the bottom, the stack assumes Ethernet II non-tagged/dot1q or qinq header follows. At the expected Ethertype offset location, algorithm checks whether the value present is IPv4/v6 (0x0800 or 0x86DD). If the check passes, the hash algorithm checks the first nibble at the expected IP header location for IPv4/IPv6 (0x0100/0x0110). If the secondary check passes, the hash is performed using IP SA/DA fields in the expected IP header; otherwise (if any of the checks failed) label-stack hash is performed.

Platforms

Description

This command specifies whether the IP header is used in the LAG and ECMP LSR hashing algorithm. This is the per interface setting.

Default

no lsr-load-balancing

Parameters

lbl-only

Specifies that only the label is used in the hashing algorithm

lbl-ip

Specifies that only the IP header is included in the hashing algorithm.

ip-only

Specifies that only the IP header is used exclusively in the hashing algorithm

eth-encap-ip

Specifies that the hash algorithm parses down the label stack and once it hits the bottom, the stack assumes Ethernet II non-tagged/dot1q or qinq header follows. At the expected Ethertype offset location, algorithm checks whether the value present is IPv4/v6 (0x0800 or0x86DD). If the check passes, the hash algorithm checks the first nibble at the expected IP header location for IPv4/IPv6 (0x0100/0x0110). If the secondary check passes, the hash is performed using IP SA/DA fields in the expected IP header; otherwise (any of the check failed) label-stack hash is performed.

lbl-ip-l4-teid

Specifies that this hashing algorithm hashes based on label, IP header, Layer 4 header and GTP header (TEID) in order. The algorithm uses all the supported headers that are found in the header fragment of incoming traffic.

Platforms

All

lsr-load-balancing

Syntax

lsr-load-balancing *hashing-algorithm*

no lsr-load-balancing

Context

[Tree] (config>system>load-balancing lsr-load-balancing)

Full Context

configure system load-balancing lsr-load-balancing

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures system-wide LSR load balancing. Hashing can be enabled on the label stack, IP header, or both. The hashing can be at an LSR for spraying labeled IP packets over multiple equal-cost paths, or over multiple links of a LAG group.

For IPv4 packets, the LSR hash routine operates on the label stack and the IP header. An LSR considers a packet to be IPv4 if the first nibble following the bottom of the label stack is 4. You can enable or disable hashing on the label stack and IPv4 and IPv6 headers at the system level or incoming network IP interface level.

Default

no lsr-load-balancing

Parameters

lbl-only

Specifies that only the label is used in the hashing algorithm.

lbl-ip

Specifies that the IP header is included in the hashing algorithm.

ip-only

Specifies that the IP header is used exclusively in the hashing algorithm.

eth-encap-ip

Specifies that the hash algorithm parses down the label stack and after it reaches the bottom, the stack assumes the Ethernet II non-tagged, dot1q, or QinQ header follows. At the expected Ethertype offset location, the algorithm checks whether the value present is IPv4/IPv6 (0x0800/0x86DD). If the check passes, the hash algorithm checks the first nibble at the expected IP header location for IPv4/IPv6 (0x0100/0x0110). If the secondary check passes, the algorithm performs the hash using the IP SA/DA fields in the expected IP header. If any of the checks fail, the label-stack hash is performed.

lbl-ip-l4-teid

Specifies that the hashing applies as follows for Layer 2 and Layer 3 encapsulated traffic:

- If an IPv4 or IPv6 header is found immediately after the MPLS label stack, the hashing includes label stack, source and destination IP addresses, TCP/UDP port numbers, and, if present, TEID values.
- If an IPv4 or IPv6 header is not found immediately after the MPLS label stack, the data plane searches for a valid Ethertype value for the IPv4 and IPv6 payload. If a valid Ethertype value is found and an IP header follows the Ethernet header, hashing includes the source and destination IP addresses, TCP/UDP port numbers, and, if present, TEID values.

27.63 lub-init-min-pir

lub-init-min-pir

Syntax

[**no**] **lub-init-min-pir**

Context

[Tree] (config>qos>adv-config-policy>child-control>bandwidth-distribution lub-init-min-pir)

Full Context

configure qos adv-config-policy child-control bandwidth-distribution lub-init-min-pir

Description

This command enables new queues associated with a LUB context to use a minimum PIR similar to the effect of the **limit-pir-zero-drain** command. When a queue is initially created in a LUB context, it defaults to a zero value PIR until H-QoS has an opportunity to configure an offered rate based operational PIR. Enabling this command forces a minimum rate operational PIR to be applied to the queue for use by enqueued packets prior to an H-QoS iteration.

The **no** form of this command reverts to default behavior.

Default

no lub-init-min-pir

28 m Commands – Part I

28.1 m-factor

m-factor

Syntax

m-factor *kbps*

no m-factor

Context

[Tree] (config>test-oam>sath>accept-crit-tmpl m-factor)

Full Context

configure test-oam service-activation-testhead acceptance-criteria-template m-factor

Description

This command configures the margin by which the observed throughput is off from the configured throughput to determine whether a service test passes or fails.

The M-factor is used with **cir-threshold** and **pir-threshold** values for different test types to determine whether a test passes or fails.

- type **cir**

  If the measured throughput is less than the difference of the configured CIR threshold and the M-factor, the test fails.

- type **cir-pir**

  If the measured throughput is less than the difference of the configured PIR threshold and the M-factor, the test fails.

- type **policing**
  - If the measured throughput is less than the difference of the configured PIR threshold and the M-factor, the test fails.
  - If the measured throughput is greater than the sum of the configured PIR threshold and the M-factor, the test fails.

- type **performance**

  If the measured throughput is less than the difference of the configured PIR threshold and the M-factor, the test fails.

The **no** form of this command removes the M-factor.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no m-factor

Parameters

kbps

Specifies the value, in kb/s, to use for the M-factor.

Values 1 to 400,000,000

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

28.2 ma-index-range

ma-index-range

Syntax

ma-index-range start *ma-index* **end** *ma-index*

no ma-index-range

Context

[Tree] (config>eth-cfm>md-auto-id ma-index-range)

Full Context

configure eth-cfm md-auto-id ma-index-range

Description

This command specifies the range of indexes used by SR OS to automatically assign an index to ETH-CFM associations that are created in model-driven interfaces without an index explicitly specified by the user or client.

An association created with an explicitly-specified index cannot use an index in this range. In classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **md-auto-id** command for further details.

Parameters

start *ma-index*

Specifies the lower value of the index range. The value must be less than or equal to the **end** value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 4294967295

end *ma-index*

Specifies the upper value of the index range. The value must be greater than or equal to the **start** value.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service ies interface mac

configure service ies subscriber-interface group-interface mac

Description

This command assigns a specific MAC address to an IES IP interface.

For Routed Central Office (CO), a group interface has no IP address explicitly configured but inherits an address from the parent subscriber interface when needed. For example, a MAC will respond to an ARP request when an ARP is requested for one of the IPs associated with the subscriber interface through the group interface.

The **no** form of this command returns the MAC address of the IP interface to the default value.

Default

The physical MAC address associated with the Ethernet interface that the SAP is configured on (the default MAC address assigned to the interface, assigned by the system).

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

[Tree] (config>port>tdm>ds3 mac)

Full Context

configure port tdm e3 mac

configure eth-tunnel mac

configure port ethernet mac

configure lag mac

configure port tdm ds3 mac

Description

This command assigns a specific MAC address to an Ethernet port, Link Aggregation Group (LAG), Ethernet tunnel, or BCP-enabled port or sub-port.

Only one MAC address can be assigned to a port. When multiple **mac** commands are entered, the last command overwrites the previous command. When the command is issued while the port is operational, IP will issue an ARP, if appropriate, and BPDUs are sent with the new MAC address.

The **no** form of this command returns the MAC address to the default value.

By default, a MAC address is assigned by the system from the chassis MAC address pool. The use of an all-zeroes MAC address indicates that an operational MAC address should be assigned from the chassis MAC address pool.

Default

mac 00:00:00:00:00:00

Parameters

ieee-address

Specifies the 48-bit MAC address in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Context

[Tree] (config>service>vpls>static-mac mac)

Full Context

configure service vpls static-mac mac

Description

This command assigns a conditional static MAC address entry to an SPBM B-VPLS SAP/spoke-SDP allowing external MACs for single and multi-homed operation.

For the 7450 ESS or 7750 SR, this command also assigns a conditional static MAC address entry to an EVPN VPLS SAP/spoke-SDP.

Static MACs are used for PBB Epipe and I-VPLS services that may terminate external to SPBM. If this is configured under a Control B-VPLS the interface referenced will not use IS-IS for this neighbor. This may also be configured under a User B-VPLS where the corresponding interface is not supported under the Control B-VPLS.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ieee-address

Specifies the static MAC address to an SPBM/sdp-binding interface.

Values 6-byte mac-address (xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx) Cannot be all zeros.

sap-id

Specifies the SAP identifier.

sdp-id

Specifies the SDP identifier.

Values 1 to 17407

vc-id

Specifies the virtual circuit identifier.

Values 1 to 4294967295

create

Mandatory keyword used to create a static MAC.

fwd-status

Specifies that this static mac is based on the forwarding status of the SAP or spoke-SDP for multi-homed operation.

black-hole

Specifies for TLS FDB entries defined on a local SAP the value 'sap', remote entries defined on an SDP have the value 'sdp'.

Description

This command assigns a specific MAC address to an IES IP interface.

The **no** form of this command returns the MAC address of the IP interface to the default value.

Default

The physical MAC address associated with the Ethernet interface that the SAP is configured on (the default MAC address assigned to the interface, assigned by the system).

Parameters

mac-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Full Context

configure router interface ipv6 vrrp mac

configure router interface vrrp mac

Description

This command sets an explicit MAC address used by the virtual router instance overriding the VRRP default derived from the VRID.

Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts using the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address.

The **mac** command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *mac-address* as the destination MAC is also enabled. The **mac** setting must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts will result. All VRRP advertisement messages are transmitted with *mac-address* as the source MAC.

The command can be configured in both non-owner and owner **vrrp** nodal contexts.

The **mac** command can be executed at any time and takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as backup, the gratuitous ARP and VRRP advertisement message is not sent.

The **no** form of the command restores the default VRRP MAC address to the virtual router instance.

Default

no mac

Parameters

mac-address

The 48-bit MAC address for the virtual router instance in the form *aa*:*bb*:*cc*:*dd*:*ee*:*ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC, and non-IEEE reserved MAC addresses.

[Tree] (config>card>mda>xconnect mac)

Full Context

configure card xiom mda xconnect mac

configure card mda xconnect mac

Description

This command creates a loopback in the MAC chip. It does not require the allocation of a faceplate. After the loopback is instantiated, a PXC can be configured on top of it.

For a list of MAC chip IDs per forwarding complex (datapath), use the **show datapath datapath-id** *datapath-id* command.

When considering loopback creation, the operation should consider the MAC chip's bandwidth capacity and the bandwidth utilization of all the faceplate ports connected to it. The selection of MAC chips for loopback creation should be taken into consideration.

The **no** form of this command removes the MAC ID from the configuration.

Parameters

mac-id

Specifies the MAC ID.

Values 1 to 12

create

Keyword used to create the MAC ID instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

28.9 mac-filter

mac-filter

Syntax

mac-filter *mac-filter-id* **entry** *entry-id* [*entry-id*]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no mac-filter *mac-filter-id* [**entry** *entry-id*]

Context

[Tree] (config>mirror>mirror-source mac-filter)

Full Context

configure mirror mirror-source mac-filter

Description

This command enables mirroring of packets that match specific entries in an existing MAC filter.

The **mac-filter** command directs packets which match the defined list of entry IDs to be mirrored to the mirror destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The MAC filter must already exist in order for the command to execute. Filters are configured in the **config**>**filter** context. If the MAC filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IP interface, an error is not be generated but mirroring will not be enabled (there are no packets to mirror). Once the filter is defined to a SAP or MAC interface, mirroring is enabled.

If the MAC filter is defined as ingress, only ingress packets are mirrored. Ingress mirrored packets are mirrored to the mirror destination prior to any ingress packet modifications.

If the MAC filter is defined as egress, only egress packets are mirrored. Egress mirrored packets are mirrored to the mirror destination after all egress packet modifications.

An *entry-id* within a MAC filter can only be mirrored to a single mirror destination. If the same *entry-id* is defined multiple times, an error occurs and only the first **mirror-source** definition is in effect.

By default, no packets matching any MAC filters are mirrored. Mirroring of MAC filter entries must be explicitly defined.

The **no** form of this command, without the **entry** keyword, removes mirroring on all *entry-id*'s within the *mac-filter-id*.

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, mirroring of that list of *entry-id*'s is terminated within the *mac-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being mirrored, no error will occur for that *entry-id* and the command will execute normally.

Parameters

mac-filter-id

Specifies the MAC filter ID whose entries are mirrored. If the *mac-filter-id* does not exist, an error will occur and the command will not execute. Mirroring of packets will commence once the *mac-filter-id* is defined on a SAP.

entry-id

Specifies the MAC filter entries to use as match criteria for packet mirroring. The **entry** keyword begins a list of *entry-id*'s for mirroring. Multiple *entry-id* entries may be specified with a single command. Each *entry-id* must be separated by a space. Up to 8 entry IDs may be specified in a single command.

Each *entry-id* must exist within the *mac-filter-id*. If the *entry-id* is renumbered within the MAC filter definition, the old *entry-id* is removed from the list and the new *entry-id* will need to be manually added to the list if mirroring is still desired.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If no *entry-id* entries are specified in the command, mirroring will not occur for that MAC filter ID. The command will have no effect.

Platforms

Full Context

configure li li-filter-associations li-mac-filter mac-filter

Description

Specifies the MAC filter(s) into which the entries from the specified **li-mac-filter** are to be inserted. The **li-mac-filter** and **mac-filter** must already exist before the association is made. If the normal MAC filter is deleted then the association is also removed (and not re-created if the MAC filter comes into existence in the future).

The **no** form of this command removes the MAC filter ID from the configuration.

Parameters

mac-filter-id

Specifies a filter identification to identify the MAC filter.

Values 1 to 65536, *name*: up to 64 characters

Platforms

All

mac-filter

Syntax

mac-filter *mac-filter-id* **entry** *entry-id* [*entry-id*] [**intercept-id** *intercept-id* [*intercept-id*]] [**session-id** [*session-id*] [[*session-id*]]]

no mac-filter *mac-filter-id*

Context

[Tree] (config>li>li-source mac-filter)

Full Context

configure li li-source mac-filter

Description

This command enables lawful interception (LI) of packets that match specific entries in an existing MAC filter. Multiple entries can be created using unique *entry-id* numbers within the filter. The router implementation exits the filter on the first match found and executes the actions in accordance with the accompanying action command. For this reason, entries must be sequenced correctly from most to least explicit.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword **action** for it to be considered complete. Entries without the **action** keyword will be considered incomplete and hence will be rendered inactive.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

An *entry-id* within an MAC filter can only be intercepted to a single destination. If the same *entry-id* is defined multiple times, an error occurs and only the first definition is in effect.

The **no** form of this command removes the specified entry from the IP or MAC filter. Entries removed from the IP or MAC filter are immediately removed from all services or network ports where that filter is applied.

Parameters

mac-filter-id

Specifies the MAC filter ID. If the *mac-filter-id* does not exist, an error will occur and the command will not execute.

entry-id

The MAC filter entries to use as match criteria.

intercept-id

Specifies the intercept-id that is inserted into the packet header for all mirrored packets of the associated li-source entry. This *intercept-id* can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** routable encap, no *intercept-id* is inserted and none should be specified against the **li-source** entries.

Values 1 to 4294967295 (32b) — For nat li-source entries that are using a mirror service that is not configured with routable encapsulation

Values 1 to 1,073,741,824 (30b) — For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and no direction-bit.

Values 1 to 536,870,912 (29b) — For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and with the direction-bit enabled.

session-id

Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encap (**config>mirror>mirror-dest>encap>ip-udp-shim**). For all types of **li-source** entries (filter, nat, sap, or subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, a *session-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** routable encap, no *session-id* is inserted and none should be specified against the **li-source** entries.

no mac-filter *mac-filter-id* [**entry** *entry-id*]

Context

[Tree] (debug>mirror-source mac-filter)

Full Context

debug mirror-source mac-filter

Description

This command enables mirroring of packets that match specific entries in an existing MAC filter.

The **mac-filter** command directs packets which match the defined list of entry IDs to be mirrored to the mirror destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The MAC filter must already exist in order for the command to execute. Filters are configured in the config>filter context. If the MAC filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IP interface, an error is not be generated but mirroring will not be enabled (there are no packets to mirror). Once the filter is defined to a SAP or MAC interface, mirroring is enabled.

If the MAC filter is defined as ingress, only ingress packets are mirrored. Ingress mirrored packets are mirrored to the mirror destination prior to any ingress packet modifications.

If the MAC filter is defined as egress, only egress packets are mirrored. Egress mirrored packets are mirrored to the mirror destination after all egress packet modifications.

An *entry-id* within a MAC filter can only be mirrored to a single mirror destination. If the same *entry-id* is defined multiple times, an error occurs and only the first **mirror-source** definition is in effect.

By default, no packets matching any MAC filters are mirrored. Mirroring of MAC filter entries must be explicitly defined.

The **no** form of this command, without the **entry** keyword, removes mirroring on all *entry-id*'s within the *mac-filter-id*.

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, mirroring of that list of *entry-id*'s is terminated within the *mac-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being mirrored, no error will occur for that *entry-id* and the command will execute normally.

Parameters

mac-filter-id

Specifies the MAC filter ID whose entries are mirrored. If the *mac-filter-id* does not exist, an error will occur and the command will not execute. Mirroring of packets will commence once the *mac-filter-id* is defined on a SAP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

entry-id

Specifies the MAC filter entries to use as match criteria for packet mirroring. The **entry** keyword begins a list of *entry-id*'s for mirroring. Multiple *entry-id* entries may be specified with a single command. Each *entry-id* must be separated by a space. Up to 8 entry IDs may be specified in a single command.

Each *entry-id* must exist within the *mac-filter-id*. If the *entry-id* is renumbered within the MAC filter definition, the old *entry-id* is removed from the list and the new *entry-id* will need to be manually added to the list if mirroring is still desired.

If no *entry-id* entries are specified in the command, mirroring will not occur for that MAC filter ID. The command will have no effect.

Full Context

configure filter mac-filter

Description

This command creates a configuration context for the specified MAC filter policy.

The **no** form of the command deletes the MAC filter policy. A filter policy cannot be deleted until it is removed from all objects where it is applied.

Parameters

filter-id

Specifies the MAC filter policy ID expressed as a decimal integer.

Values 1 to 65535

create

Keyword required to create the configuration context. After it is created, the context can be enabled with or without the **create** keyword.

name

Sets an optional filter name, up to 64 characters in length, to a given filter. This filter name can then be used in configuration references, display, and show commands throughout the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

system. A defined filter name can help the service provider or administrator to identify and manage filters within the SR OS platforms.

To create a filter, you must assign a filter ID, however, after it is created, either the filter ID or filter name can be used to identify and reference a filter.

If a name is not specified at creation time, then SR OS assigns a string version of the *filter-id* as the name.

Filter names may not begin with an integer (0 to 9).

Values *name*: 64 characters maximum

filter-name

Specifies a string of up to 64 characters uniquely identifying this MAC filter policy.

Context

[Tree] (config>filter>copy mac-filter)

Full Context

configure filter copy mac-filter

Description

This command copies an existing filter entry for a specific filter ID to another filter ID. The **copy** command is a configuration level maintenance tool used to create new entries using an existing filter policy. If **overwrite** is not specified, an error will occur if the destination filter entry exists.

Parameters

src-filter-id

Specifies the source filter policy from which the copy command will attempt to copy. The filter policy must exist within the context of the preceding keyword (**mac-filter**).

dst-filter-id

Specifies the destination filter policy to which the copy command will attempt to copy. If the **overwrite** keyword is not specified, the filter entry ID cannot already exist in the destination filter policy. If the **overwrite** keyword is present, the destination entry ID may or may not exist.

overwrite

Specifies that the destination filter entry may exist. If it does, everything in the existing destination filter entry will be completely overwritten with the contents of the source filter entry. If the destination filter entry exists, either **overwrite** must be specified or an error message will be returned. If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make” manner and therefore should be handled with care.

Description

This command configures a MAC list name. The MAC list is composed of a list of MAC addresses and masks, which along with Auto-Learn Mac Protect (ALMP) can be used to exclude certain MACs from being protected in a given object. This is typically used on SAPs and spoke SDPs configured with ALMP where certain MACs must be able to move to other objects (for example, VRRP virtual MACs).

The **no** form of this command removes the MAC list name.

Parameters

name

Specifies the MAC list name, up to 32 characters.

create

Keyword used to create the MAC list.

28.15 mac-move

mac-move

Syntax

[**no**] **mac-move**

Context

[Tree] (config>service>vpls mac-move)

[Tree] (config>service>template>vpls-template mac-move)

Full Context

configure service vpls mac-move

configure service template vpls-template mac-move

Description

Commands in this context configure MAC move attributes. A sustained high re-learn rate can be a sign of a loop somewhere in the VPLS topology. Typically, STP detects loops in the topology, but for those networks that do not run STP, the mac-move feature is an alternative way to protect your network against loops.

When enabled in a VPLS, **mac-move** monitors the re-learn rate of each MAC. If the rate exceeds the configured maximum allowed limit, it disables the SAP where the source MAC was last seen. The SAP can be disabled permanently (until a **shutdown**/**no shutdown** command is executed) or for a length of time that grows linearly with the number of times the specified SAP was disabled. You have the option of marking a SAP as non-blockable in the **config>service>vpls>sap>limit-mac-move** or **config>service>vpls>spoke-sdp>limit-mac-move** contexts. This means that when the re-learn rate has exceeded the limit, another (blockable) SAP will be disabled instead.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **mac-move** command enables the feature at the service level for SAPs and spoke-SDPs, as only those objects can be blocked by this feature. Mesh SDPs are never blocked, but their re-learn rates (sap-to-mesh/spoke-to-mesh or vice versa) are still measured.

The operation of this feature is the same on the SAP and spoke-SDP. For example, if a MAC address moves from SAP to SAP, from SAP to spoke-SDP, or between spoke-SDPs, one will be blocked to prevent thrashing. If the MAC address moves between a SAP and mesh SDP or spoke-SDP and mesh SDP combinations, the respective SAP or spoke-SDP will be blocked.

mac-move will disable a VPLS port when the number of relearns detected has reached the number of relearns needed to reach the move-frequency in the 5-second interval. For example, when the move-frequency is configured to 1 (relearn per second) mac-move will disable one of the VPLS ports when 5 relearns were detected during the 5-second interval because then the average move-frequency of 1 relearn per second has been reached. This can already occur in the first second if the real relearn rate is 5 relearns per second or higher.

The **no** form of this command disables MAC move.

Platforms

Context

[Tree] (oam mac-ping)

[Tree] (config>saa>test>type mac-ping)

Full Context

oam mac-ping

configure saa test type mac-ping

Description

This command determines the existence of an egress SAP binding of a given MAC within a VPLS service.

A **mac-ping** packet is sent via the data plane.

A **mac-ping** is forwarded along the flooding domain if no MAC address bindings exist. If MAC address bindings exist, then the packet is forwarded along those paths, provided they are active. A response is generated only when there is an egress SAP binding for that MAC address or if the MAC address is a "local" OAM MAC address associated with the device's control plan.

A **mac-ping** reply can be sent using the data plane or the control plane. The **return-control** option specifies the reply be sent using the control plane. If **return-control** is not specified, the request is sent using the data plane.

A **mac-ping** with data plane reply can only be initiated on nodes that can have an egress MAC address binding. A node without a FDB and without any SAPs cannot have an egress MAC address binding, so it is not a node where replies in the data plane are trapped and sent up to the control plane.

A control plane request is responded to via a control plane reply only.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

By default, MAC OAM requests are sent with the system or chassis MAC address as the source MAC. The **source** option allows overriding of the default source MAC for the request with a specific MAC address.

When a **source** *ieee-address* value is specified and the source MAC address is locally registered within a split horizon group (SHG), then this SHG membership is used as if the packet originated from this SHG. In all other cases, SHG 0 (zero) is used. If the **mac-trace** is originated from a non-zero SHG, such packets do not go out to the same SHG.

Parameters

service-id

Specifies the service ID of the service to diagnose or manage.

Values 1 to 2147483647

service-name: up to 64 characters

dst-ieee-address

Specifies the destination MAC address for the OAM MAC request.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

All zeros and multicast is not allowed.

src-ieee-address

Specifies the source MAC address from which the OAM MAC request originates. By default, the system MAC address for the chassis is used.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

All zeros and multicast is not allowed.

Default The system MAC address.

fc-name

Specifies that the **fc** parameter be used to test the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

Default out

octets

Specifies the MAC OAM request packet size in octets, expressed as a decimal integer. The request payload is padded to the specified size with a 6 byte PAD header and a byte payload of 0xAA as necessary. If the octet size specified is less than the minimum packet, the minimum sized packet necessary to send the request is used.

Values 1 to 9198

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vc-label-ttl

Specifies the TTL value in the VC label for the OAM MAC request, expressed as a decimal integer.

Values 1 to 255

Default 255

send-count

Specifies the number of messages to send, expressed as a decimal integer. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message *interval* value must be expired before the next message request is sent.

Values 1 to 100

Default 1

return-control

Specifies the MAC OAM reply to a data plane MAC OAM request be sent using the control plane instead of the data plane.

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

configure service vpls mesh-sdp mac-pinning

configure service vpls endpoint mac-pinning

Description

This command disables re-learning of MAC addresses on other SAPs within the VPLS. The MAC address will remain attached to a given SAP for duration of its age-timer.

The age of the MAC address entry in the FDB is set by the age timer. If **mac-aging** is disabled on a given VPLS service, any MAC address learned on a SAP or SDP with **mac-pinning** enabled will remain in the FDB on this SAP or SDP forever.

Every event that would otherwise result in re-learning is logged (MAC address; original-SAP; new-SAP).

When a SAP or spoke SDP is part of a Residential Split Horizon Group (RSHG), MAC pinning is activated at creation of the SAP. Otherwise MAC pinning is not enabled by default.

The **no** form of the command enables re-learning of MAC addresses.

Note:
MAC addresses learned during DHCP address assignment (DHCP snooping enabled) are not impacted by this command. MAC-pinning for such addresses is implicit.

Default

no mac-pinning

Full Context

oam mac-populate

Description

This command populates the FDB with an OAM-type MAC entry indicating the node is the egress node for the MAC address and optionally floods the OAM MAC association throughout the service. The **mac-populate** command installs an OAM MAC into the service FDB indicating the device is the egress node for a MAC address. The MAC address can be bound to a SAP (the **target-sap**) or can be associated with the control plane in that any data destined to the MAC address is forwarded to the control plane (CPM). As a

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

result, if the service on the node has neither a FDB nor an egress SAP, then it is not allowed to initiate a **mac-populate**.

The MAC address that is populated in the FDBs in the provider network is given a type OAM, so that it can be treated distinctly from regular dynamically learned or statically configured MACs. Note that OAM MAC addresses are operational MAC addresses and are not saved in the device configuration. An exec file can be used to define OAM MACs after system initialization.

The **force** option in **mac-populate** forces the MAC in the table to be type OAM in the case it already exists as a dynamic, static or an OAM induced learned MAC with some other type binding.

An OAM-type MAC cannot be overwritten by dynamic learning and allows customer packets with the MAC to either ingress or egress the network while still using the OAM MAC entry.

The **flood** option causes each upstream node to learn the MAC (that is, populate the local FDB with an OAM MAC entry) and to flood the request along the data plane using the flooding domain. The flooded **mac-populate** request is sent via the data plane.

An **age** can be provided to age an OAM MAC using a specific interval. By default, OAM MAC addresses are not aged and can be removed with a **mac-purge** or with an FDB clear operation.

When split horizon group (SHG) is configured, the flooding domain depends on which SHG the packet originates from. The **target-sap** *sap-id* value dictates the originating SHG information.

Parameters

service-id

Specifies the service ID of the service to diagnose or manage.

Values 1 to 2147483647

service-name

Specifies the name of the service to diagnose or manage. 64 characters maximum.

ieee-address

Specifies the MAC address to be populated.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

All zeros and multicast is not allowed.

flood

Sends the OAM MAC populate to all upstream nodes.

seconds

Specifies the age for the OAM MAC, in seconds, expressed as a decimal integer.

Values 1 to 65535

Default 3600

force

Converts the MAC to an OAM MAC.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sap-id

Specifies the local target SAP bound to a service on which to associate the OAM MAC. By default, the OAM MAC is associated with the control place, that is, it is associated with the CPU on the router.

When the **target-sap** *sap-id* value is not specified the MAC is bound to the CPM or CFM. The originating SHG is 0 (zero). When the **target-sap** *sap-id* value is specified, the originating SHG is the SHG of the target-sap.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (oam mac-purge)

Full Context

oam mac-purge

Description

This command removes an OAM-type MAC entry from the FDB and optionally floods the OAM MAC removal throughout the service. A **mac-purge** can be sent via the forwarding path or via the control plane.

When sending the MAC purge using the data plane, the TTL in the VC label is set to 1.

A MAC address is purged only if it is marked as OAM. A mac-purge request is an HVPLS OAM packet, with the following fields. The Reply Flags is set to 0 (since no reply is expected), the Reply Mode and Reserved fields are set to 0. The Ethernet header has source set to the (system) MAC address, the destination set to the broadcast MAC address. There is a VPN TLV in the FEC Stack TLV to identify the service domain.

If the **register** option is provided, the R bit in the Address Delete flags is turned on.

The **flood** option causes each upstream node to be sent the OAM MAC delete request and to flood the request along the data plane using the flooding domain. The flooded **mac-purge** request is sent via the data plane.

The **register** option reserves the MAC for OAM testing where it is no longer an active MAC in the FDB for forwarding, but it is retained in the FDB as a registered OAM MAC. Registering an OAM MAC prevents relearns for the MAC based on customer packets. Relearning a registered MAC can only be done through a **mac-populate** request. The originating SHG is always 0 (zero).

Parameters

service-id

Specifies the service ID of the service to diagnose or manage.

Values 1 to 2147483647

service-name

Specifies the name, up to 64 characters, of the service to diagnose or manage.

ieee-address

Specifies the MAC address to be purged.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

All zeros and multicast is not allowed.

flood

Sends the OAM MAC purge to all upstream nodes.

force

Purges the entry regardless of the entry’s originating node.

register

Reserves the MAC for OAM testing.

28.27 mac-subnet-length

mac-subnet-length

Syntax

mac-subnet-length *subnet-length*

no mac-subnet-length

Context

[Tree] (config>service>vpls mac-subnet-length)

Full Context

configure service vpls mac-subnet-length

Description

This command specifies the number of bits to be considered when performing MAC learning (MAC source) and MAC switching (MAC destination). Specifically, this value identifies how many bits, starting from the beginning of the MAC address are used. For example, if the mask-value of 28 is used, MAC learning only performs a lookup for the first 28 bits of the source MAC address when comparing with existing FDB entries. Then, it installs the first 28 bits in the FDB while zeroing out the last 20 bits of the MAC address. When performing switching in the reverse direction, only the first 28 bits of the destination MAC address are used to perform a FDB lookup to determine the next hop.

The **no** form of this command switches back to full MAC lookup.

Default

mac-subnet-length 48

Parameters

subnet-length

Specifies the number of bits to be considered when performing MAC learning or MAC switching.

Values 24 to 48

28.28 mac-trace

mac-trace

Syntax

mac-trace service *service-id* **destination** *ieee-address* [**source** *ieee-address*] [**fc** *fc-name* [**profile** {**in** | **out**}]] [**size** *octets*] [**min-ttl** *vc-label-ttl*] [**max-ttl** *vc-label-ttl*] [**probe-count** *send-count*] [**return-control**] [**interval** *interval*] [**timeout** *timeout*]

Context

[Tree] (config>saa>test>type mac-trace)

[Tree] (oam mac-trace)

Full Context

configure saa test type mac-trace

oam mac-trace

Description

This command displays the hop-by-hop path for a destination MAC address within a VPLS.

The MAC traceroute operation is modeled after the IP traceroute utility which uses ICMP echo request and reply packets with increasing TTL values to determine the hop-by-hop route to a destination IP. The MAC traceroute command uses Nokia OAM packets with increasing TTL values to determine the hop-by-hop route to a destination MAC.

In a MAC traceroute, the originating device creates a MAC ping echo request packet for the MAC to be tested with increasing values of the TTL. The echo request packet is sent via the data plane and awaits a TTL exceeded response or the echo reply packet from the device with the destination MAC. The devices that reply to the echo request packets with the TTL exceeded and the echo reply are displayed.

When a **source** *ieee-address* value is specified and the source MAC address is locally registered within a split horizon group (SHG), then this SHG membership is used as if the packet originated from this SHG. In all other cases, SHG 0 (zero) is used. Note that if the **mac-ping** is originated from a non-zero SHG, such packets do not go out to the same SHG.

Parameters

service-id

Specifies the service ID of the service to diagnose or manage.

This variant of the command is only supported in the classic configuration-mode (**configure system management-interface configuration-mode classic**).

Values {*id* | *svc-name*}

service-id: 1 to 2147483647

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

svc-name: up to 64 characters

destination *ieee-address*

Specifies the destination MAC address to be traced.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

All zeros and multicast is not allowed.

source *ieee-address*

The source MAC address from which the OAM MAC request originates. By default, the system MAC address for the chassis is used.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

All zeros and multicast is not allowed.

Default The system MAC address

fc-name

Specifies the forwarding class to test the forwarding class of the ICMP echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the ICMP echo request encapsulation.

Default out

octets

Specifies the MAC OAM request packet size in octets, expressed as a decimal integer. The request payload is padded to the specified size with a 6 byte PAD header and a byte payload of 0xAA as necessary. If the octet size specified is less than the minimum packet, the minimum sized packet necessary to send the request is used.

Values 1 to 9198

min-ttl *vc-label-ttl*

Specifies the minimum TTL value in the VC label for the MAC trace test, expressed as a decimal integer.

Values 1 to 255

Default 1

max-ttl *vc-label-ttl*

Specifies the maximum TTL value in the VC label for the MAC trace test, expressed as a decimal integer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 255

Default 4

send-count

Specifies the number of MAC OAM requests sent for a TTL value, expressed as a decimal integer.

Values 1 to 100

Default 1

return-control

Specifies the MAC OAM reply to a data plane MAC OAM request be sent using the control plane instead of the data plane.

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the *interval* is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 5

configure router mpls lsp main-ct-retry-limit

Description

This command configures the maximum number of retries the LSP primary path should be retried with the LSP Diff-Serv main Class Type (CT).

When an unmapped LSP primary path goes into retry, it uses the main CT until the number of retries reaches the value of the new main-ct-retry-limit parameter. If the path did not come up, it must start using the backup CT at that point in time. By default, this parameter is set to infinite value. The new main-ct-retry-limit parameter has no effect on an LSP primary path which retries due to a failure event.

An unmapped LSP primary path is a path which has never received a Resv in response to the first Path message sent. This can occur when performing a "shut/no-shut" on the LSP or LSP primary path or when the node reboots. An unmapped LSP primary path goes into retry if the retry timer expired or the head-end node received a PathErr message before the retry timer expired.

If the user entered a value of the main-ct-retry-limit parameter that is greater than the value of the LSP retry-limit, the number of retries will still stop when the LSP primary path reaches the value of the LSP retry-limit. In other words, the meaning of the LSP retry-limit parameter is not changed and always represents the upper bound on the number of retries. The unmapped LSP primary path behavior applies to both CSPF and non-CSPF LSPs.

The **no** form of this command sets the parameter to the default value of zero (0) which means the LSP primary path will retry forever.

Default

no main-ct-retry-limit

Parameters

number

Specifies the number of times MPLS will attempt to re-establish the LSP primary path using the Diff-Serv main CT. Allowed values are integers in the range of zero (0) to 10,000, where zero indicates to retry infinitely.

Values 0 to 1000, integer

configure service vpls sap managed-vlan-list

Description

Commands in this context configure VLAN ranges to be managed by a management VPLS. The list indicates, for each SAP, the ranges of associated VLANs that will be affected when the SAP changes state. This managed-vlan-list is not used when STP mode is MSTP in which case the vlan-range is taken from the **config>service>vpls>stp>msti** configuration.

This command is only valid when the VPLS in which it is entered was created as a management VPLS.

Full Context

configure system security management-access-filter

Description

This command creates the context to edit management access filters and to reset match criteria.

Management access filters control all traffic in and out of the CPM. They can be used to restrict management of the router by other nodes outside either specific (sub)networks or through designated ports.

Management filters, as opposed to other traffic filters, are enforced by system software.

The **no** form of this command removes management access filters from the configuration.

28.43 map-domain

map-domain

Syntax

map-domain *domain-name* [**create**]

no map-domain

Context

[Tree] (config>service>nat map-domain)

Full Context

configure service nat map-domain

Description

This command creates a MAP domain template, which is used to define MAP rules and parameters specific to the MAP domain. A MAP domain represents a set of CEs that share the same default gateway (BR's IPv6 prefix - DMR rule) and a set of basic MAP rules (BMRs). As a bordering node between the IPv6 and IPv4 realm, the BR performs stateless IPv4 and IPv6 translation based on MAP rules.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A MAP domain can be instantiated within a routing context by referencing an existing MAP domain template in the context.

Parameters

domain-name

Specifies the name of the MAP domain, up to 32 characters. The MAP domain name has local significance.

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

map-domain

Syntax

map-domain *domain-name*

no map-domain *domain-name*

Context

[Tree] (config>router>nat>map map-domain)

[Tree] (config>service>vprn>nat>map map-domain)

Full Context

configure router nat map map-domain

configure service vprn nat map map-domain

Description

This command instantiates a MAP-T domain within a routing context, assuming that the MAP-T domain template is administratively enabled (**no shutdown**). When the MAP-T is instantiated, the forwarding for the MAP-T domain is enabled and its routes can be exported in routing protocols.

Multiple MAP-T domains can be instantiated within a routing context.

Interactions:

The referenced MAP domain is defined under the **config**>**service**>**nat** context.

Parameters

domain-name

Specifies the name of the MAP domain template, up to 32 characters.

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

Context

[Tree] (config>service>nat>map-domain mapping-rule)

Full Context

configure service nat map-domain mapping-rule

Description

This command provides a CLI context for configuring MAP rules.

Parameters

map-rule-name

Specifies the name of the MAP rule; the name has a local significance.

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

28.48 mapping-server

mapping-server

Syntax

[**no**] **mapping-server**

Context

[Tree] (config>router>isis>segment-routing mapping-server)

Full Context

configure router isis segment-routing mapping-server

Description

Commands in this context configures the Segment Routing mapping server feature in an IS-IS instance.

SR mapping server enables the configuration and advertisement, via IS-IS, of the node SID index for IS-IS prefixes of routers which are in the LDP domain. This is performed in the router acting as a mapping server, which uses a prefix-SID sub-TLV within the SID/Label binding TLV in IS-IS.

The **no** form of this command deletes all node SID entries in the IS-IS instance.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mapping-server

Syntax

[**no**] **mapping-server**

Context

[Tree] (config>router>ospf>segm-rtng mapping-server)

Full Context

configure router ospf segment-routing mapping-server

Description

Commands in this context configure the Segment Routing mapping server feature in an OSPF instance.

The mapping server feature allows the configuration and advertisement in OSPF of the node SID index for OSPF prefixes of routers which are in the LDP domain. This is performed in the router acting as a mapping server and using a prefix-SID sub-TLV within the Extended Prefix Range TLV in OSPF.

The **no** form of this command deletes all node SID entries in the OSPF instance.

Platforms

All

28.49 maps-to

maps-to

Syntax

maps-to fc *fc-name* **profile** *profile*

Context

[Tree] (config>qos>post-policer-mapping>fc maps-to)

Full Context

configure qos post-policer-mapping fc maps-to

Description

This command remaps the forwarding class and profile state of an egress policed packet that is to be mapped to another forwarding class and profile, where the profile state is that of the resulting profile after the packet has been processed by the egress policer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The new forwarding class is used to select the egress queue on which the post-policer traffic is placed. The new profile is used to determine the congestion control handling in that queue, specifically the drop tail or slope that is applied to the traffic.

The **maps-to** command parameters can be overwritten by reissuing the command with a different FC or profile.

The traffic remarking is based on the marking configured for the forwarding class and profile of the traffic after being policed but before it is remapped.

Parameters

fc-name

Specifies one of the eight forwarding classes supported by the system.

Values be, l2, af, l1, h2, ef, h1, nc

profile

Specifies one of the egress packet profile states.

Values exceed, in, inplus, out

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

28.50 mark

mark

Syntax

mark *entity* **high** *percentage-high* **low** *percentage-low*

no mark *entity*

Context

[Tree] (config>isa>wlan-gw-group>watermarks mark)

Full Context

configure isa wlan-gw-group watermarks mark

Description

This command enables a watermark notification. If the watermark is set, it generates a notification when the corresponding resource consumption goes above the high percentage. No additional notifications are sent until resource consumption goes under the low watermark, upon which, a notification is sent indicating the high watermark is no longer hit.

The **no** form of this command disables the watermark notification.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

entity

Specifies which watermark to set.

Values user-equipment | bridge-domain | radius-proxy-client

percentage-high

Specifies the high watermark in percentage of total resources available.

Values 1 to 100

percentage-low

Specifies the low watermark in percentage of total resources available.

Values 0 to 99

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

28.51 mask

mask

Syntax

mask type *ppp-match-type* {[**prefix-string** *prefix-string* | **prefix-length** *prefix-length*] [**suffix-string** *suffix-string* | **suffix-length** *suffix-length*]}

no mask type *ppp-match-type*

mask type *ipoe-match-type* {[**prefix-string** *prefix-string* | **prefix-length** *prefix-length*] [**suffix-string** *suffix-string* | **suffix-length** *suffix-length*]}

no mask type *ipoe-match-type*

Context

[Tree] (config>subscr-mgmt>loc-user-db>ppp mask)

[Tree] (config>subscr-mgmt>loc-user-db>ipoe mask)

Full Context

configure subscriber-mgmt local-user-db ppp mask

configure subscriber-mgmt local-user-db ipoe mask

Description

This command configures a mask for the specified match type. The masking is applied on the parameter when performing an LUDB lookup to identify a host.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the mask from the configuration.

Parameters

ppp-match-type

Specifies the parameter on which the mask should be applied for an LUDB lookup to identify a PPP host.

Values circuit-id, mac, remote-id, sap-id, service-name, username

ipoe-match-type

Specifies the parameter on which the mask should be applied for an LUDB lookup to identify an IPoE host.

The *prefix-string* and *suffix-string* command options are not supported when the *ipoe-match-type* value is set to **duid-en** or **duid-ll-llt**.

Values circuit-id, duid-en, duid-ll-llt, option60, remote-id, sap-id, string, system-id

prefix-string

Specifies a substring that is stripped of the start of the incoming parameter value before it is matched against the value configured in the LUDB host identification.

This string can only contain printable ASCII characters. The "*” character is a wildcard that matches any substring. If a "\" character is masked, use the escape key so it becomes "\\".

This command option is unsupported when the *ppp-match-type* equals mac.

Values up to 127 characters, **"***”

prefix-length

Specifies the number of characters to remove from the start of the incoming parameter value before it is matched against the value configured in the LUDB host identification.

When used with the **mac** or **duid-ll-llt** parameter, it specifies the number of bits to remove from the start of the MAC address. For example, if the MAC address is 0a:0b:0c:0d:0e:0f, to obtain the last bit for matching purposes (match an odd or even MAC address), the prefix length is 47. The result in this example would be a binary number of 1 (0xf = 1111).

Values 1 to 127

suffix-string

Specifies a substring that is stripped of the end of the incoming parameter value before it is matched against the value configured in the LUDB host identification.

This string can only contain printable ASCII characters. The "*” character is a wildcard that matches any substring. If a "\" character is masked, use the escape key so it becomes "\\".

This command option is unsupported when the *ppp-match-type* equals **mac**.

Values up to 127 characters

suffix-length

Specifies the number of characters to remove from the end of the incoming parameter value before it is matched against the value configured in the LUDB host identification.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When used with the **mac** or **duid-ll-llt** command option, the number of bits to remove from the end of the MAC address is specified.

Values 1 to 127

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mask

Syntax

mask *mask-value* [**type** {**included** | **excluded**}]

no mask

Context

[Tree] (config>system>security>snmp>view mask)

Full Context

configure system security snmp view mask

Description

The mask value and the mask type, along with the *oid-value* configured in the **view** command, determines the access of each sub-identifier of an object identifier (MIB subtree) in the view.

Each bit in the mask corresponds to a sub-identifier position. For example, the most significant bit for the first sub-identifier, the next most significant bit for the second sub-identifier, and so on. If the bit position on the sub-identifier is available, it can be included or excluded.

For example, the MIB subtree that represents MIB-II is 1.3.6.1.2.1. The mask that catches all MIB-II would be 0xfc or 0b11111100.

Only a single mask may be configured per view and OID value combination. If more than one entry is configured, each subsequent entry overwrites the previous entry.

The **no** form of this command removes the mask from the configuration.

Parameters

mask-value

The mask value associated with the OID value determines whether the sub-identifiers are included or excluded from the view. (Default: all 1s)

The mask can be entered either:

- In hex. For example, 0xfc.
- In binary. For example, 0b11111100.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note:
If the number of bits in the bit mask is less than the number of sub-identifiers in the MIB subtree, then the mask is extended with ones until the mask length matches the number of sub-identifiers in the MIB subtree.

type

Specifies to include or exclude MIB subtree objects.

Values **included** - All MIB subtree objects that are identified with a 1 in the mask are available in the view.

excluded - All MIB subtree objects that are identified with a 1 in the mask are denied access in the view.

Default **included**

[Tree] (config>router>if>vrrp master-int-inherit)

Full Context

configure router interface ipv6 vrrp master-int-inherit

configure router interface vrrp master-int-inherit

Description

This command enables the virtual router instance to inherit the master VRRP router's advertisement interval timer which is used by backup routers to calculate the master down timer.

The **master-int-inherit** command is only available in the non-owner nodal context and is used to allow the current virtual router instance master to dictate the master down timer for all backup virtual routers. The **master-int-inherit** command has no effect when the virtual router instance is operating as master.

If **master-int-inherit** is not enabled, the locally configured **message-interval** must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

The **no** form of the command restores the default operating condition which requires the locally configured **message-interval** to match the received VRRP advertisement message advertisement interval field value. The virtual router instance does not inherit the master VRRP router's advertisement interval timer and uses the locally configured message interval.

master-only {**true** | **false**}

Context

[Tree] (config>system>ptp>port master-only)

Full Context

configure system ptp port master-only

Description

This command is used to restrict the local port to never enter the timeReceiver state. Use the command to ensure that the 7750 SR never draws synchronization from the attached external device.

This parameter is only effective when the **profile** is set to **g8275dot1-2014** or **g8275dot2-2016**.

Note:
The ITU-T G.8275.1 (07/2014) recommendation used the term notSlave for this functionality; however, the IEEE has added this capability into the next edition of the 1588 standard using the term masterOnly. These are equivalent.

Default

master-only true

Parameters

true

Enables the **master-only** parameter of the PTP port.

false

Disables the **master-only** parameter of the PTP port.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

28.55 master-selection-mode

master-selection-mode

Syntax

master-selection-mode *mode*

Context

[Tree] (config>app-assure>aarp master-selection-mode)

Full Context

configure application-assurance aarp master-selection-mode

Description

This command configures the AARP mode of operation with the peer instance. The modes affect the AARP state machine behavior according to the desired behavior. Minimize-switchover will change AARP state based on Master ISA failure, and be non-revertive in that when the priority ISA returns a switch does not occur, which is optimal for AA flow identification. Inter-chassis efficiency mode considers both priority (revertive) and the endpoint status of the AARP instance and will switch activity in case of EP failure in order to avoid sending all the traffic over the ICL. The priority-based-balance mode will be revertive after a priority master returns to service, but excludes EP status. The master-selection-mode configuration must match on both peer AARP instances, or the AARP operational status will stay down.

Default

master-selection-mode minimize-switchovers

Parameters

mode

Specifies the AARP master selection mode.

Values **minimize-switchovers** — Optimal AA flow detection continuity by minimizing AARP switchovers.

inter-chassis-efficiency — Minimizes inter-chassis traffic.

priority-based-balance — AA load balance between AARP peers based on configured priority.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure subscriber-mgmt local-user-db ipoe host match-radius-proxy-cache match

Description

This command specifies in what DHCPv6 option to retrieve the value to be used as lookup key in the RADIUS proxy cache.

The **no** form of this command reverts to the default.

Default

match mac

Parameters

circuit-id

Specifies to use the circuit Id to match against.

mac

Specifies the MAC address to match against.

remote-id

Specifies the remote ID to match against.

option *number*

Specifies the option number that the DHCP server uses to send the identification strings to the client.

Values 1 to 254

option6 *number*

Specifies the DHCPv6 option to retrieve the value to be used as lookup key in the RADIUS proxy cache.

configure subscriber-mgmt isa-filter ipv6 entry match

Description

This command creates a match context for this entry. The **protocol** value specifies which Layer-4 protocol the packet should match.

The **no** form of this command removes the match context of this entry.

Default

match protocol any

Parameters

protocol

Specifies that the only supported match context is **protocol**.

any

Specifies to match any protocol.

icmp

Specifies to match ICMP packets in a v4 filter.

tcp

Specifies to match TCP packets.

udp

Specifies to match UDP packets.

gre

Specifies to match GRE over IP packets.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Description

Commands in this context enter match criteria for an LI IPv6 filter and optionally allows specification IPv6 next-header value to match on.

If more than one match criterion are configured, then all criteria must be satisfied for a match to occur (logical "AND"). Multiple criteria must be configured within a single match context for a given entry.

The **no** form removes the match criteria for the entry.

Parameters

next-header

protocol-number, *protocol-name*

Specifies the IPv6 next header to match. This parameter is analogous to the protocol parameter used in IP filter match criteria.

protocol-number

Specifies the protocol number value to be configured as a match criterion.

Values [0 to 255]D

[0x0 to 0xFF]H

[0b0 to 0b11111111]B

protocol-name

Specifies the protocol name to be configured as a match criterion.

Values none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

configure qos sap-ingress ip-criteria entry match

Description

This command creates a context to configure match criteria for SAP QoS policy match criteria. When the match criteria have been satisfied, the action associated with the match criteria is executed.

If more than one match criteria (within one match statement) are configured, all criteria must be satisfied (AND function) before the action associated with the match is executed.

A **match** context can consist of multiple match criteria, but multiple **match** statements cannot be entered per entry.

It is possible that a SAP policy includes the **dscp** map command, the **dot1p** map command, and an IP match criteria. When multiple matches occur for the traffic, the order of precedence is used to arrive at the final action. The order of precedence is as follows:

1. 802.1p bits
2. DSCP
3. IP quintuple or MAC headers

The **no** form of this command removes the match criteria for the *entry-id*.

Parameters

protocol *protocol-id*

Specifies an IP protocol to be used as a SAP QoS policy match criterion.

The protocol type such as TCP / UDP / OSPF is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6), UDP(17)

Table 66: IP Protocol Names lists the IP protocols and their respective IDs and descriptions.

Values The following values apply to the 7750 SR and 7950 XRS:

protocol-id: 0 to 255 protocol numbers accepted in decimal, hexadecimal, or binary

Keywords: none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

* — udp/tcp wildcard

Values The following values apply to the 7450 ESS:

Keywords: none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

[Tree] (config>qos>sap-egress>ipv6-criteria>entry match)

Full Context

configure qos sap-ingress ipv6-criteria entry match

configure qos sap-egress ipv6-criteria entry match

Description

This command creates a context to configure match criteria for ingress SAP QoS policy match IPv6 criteria. When the match criteria have been satisfied, the action associated with the match criteria is executed.

If more than one match criteria (within one match statement) are configured, all criteria must be satisfied (logical AND) before the action associated with the match is executed.

A **match** context can consist of multiple match criteria, but multiple **match** statements cannot be created per entry.

A SAP ingress policy may include the **dscp** map command, the **dot1p** map command, and an IPv6 match criteria. When multiple matches occur for the traffic, the following order of precedence is used to arrive at the final action.

1. 802.1p bits

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

2. DSCP
3. IP quintuple or MAC headers

The **no** form of this command removes the match criteria for the *entry-id*.

Parameters

next-header

protocol-number, *protocol-name*

Specifies the IPv6 next header to match.

On the 7750 SR and 7950 XRS, the protocol type such as TCP, UDP, or OSPF is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6) and UDP(17).

protocol-number

Specifies the protocol number value to be configured as a match criterion.

Values [0 to 255]D

[0x0 to 0xFF]H

[0b0 to 0b11111111]B

protocol-name

Specifies the protocol name to be configured as a match criterion.

Values none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

Full Context

configure qos sap-ingress mac-criteria entry match

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a context for entering/editing match MAC criteria for ingress SAP QoS policy match criteria. When the match criteria have been satisfied, the action associated with the match criteria is executed.

If more than one match criteria (within one match statement) are configured, all criteria must be satisfied (AND function) before the action associated with the match will be executed.

A **match** context can consist of multiple match criteria, but multiple **match** statements cannot be entered per entry.

The **no** form of this command removes the match criteria for the *entry-id*.

Parameters

frame-type

The **frame-type** keyword configures an Ethernet frame type or an ATM frame type to be used for the MAC filter match criteria.

Values 802dot3, 802dot2-llc, 802dot2-snap, ethernet_II, atm

Default 802dot3

802dot3

Specifies the frame type is Ethernet IEEE 802.3.

802dot2-llc

Specifies the frame type is Ethernet IEEE 802.2 LLC.

802dot2-snap

Specifies the frame type is Ethernet IEEE 802.2 SNAP.

ethernet-II

Specifies the frame type is Ethernet Type II.

atm

Specifies the frame type as ATM cell. The user is not allowed to configure entries with frame type of atm and a frame type of other supported values in the same QoS policy. This parameter applies only to the 7750 SR and 7950 XRS.

[Tree] (config>qos>network>ingress>ip-criteria>entry match)

Full Context

configure qos network egress ip-criteria entry match

configure qos network ingress ip-criteria entry match

Description

This command creates a context to configure match criteria for a network QoS policy. When the match criteria have been satisfied, the action associated with it is executed.

If more than one match criteria (within one match statement) are configured, then all criteria must be satisfied before the associated action with the match is executed.

A match context can consist of multiple match criteria, but multiple match statements cannot be entered per entry.

A network QoS policy can include the DSCP map command, the dot1p map command (ingress only), the prec map command (egress only), and an IP match criteria. When multiple matches occur for the traffic, the order of precedence is used to arrive at the final action. The order of precedence is as follows:

- 802.1p bits (ingress only)
- DSCP
- prec (egress only)
- IP quintuple

The **no** form of this command removes the match criteria for the entry identifier.

Parameters

protocol *protocol-id*

Specifies an IP protocol to be used as an ingress or egress network QoS policy match criterion.

The protocol type is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6), and UDP(17).

Values *protocol-id*: 0 to 255 protocol numbers accepted in decimal, hexadecimal, or binary

keywords: none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

* — udp/tcp wildcard

no match

Context

[Tree] (config>qos>network>ingress>ipv6-criteria>entry match)

[Tree] (config>qos>network>egress>ipv6-criteria>entry match)

Full Context

configure qos network ingress ipv6-criteria entry match

configure qos network egress ipv6-criteria entry match

Description

This command creates a context to configure match criteria for a network QoS policy match IPv6 criteria. When the match criteria have been satisfied, the action associated with the match criteria is executed.

If more than one match criteria (within one match statement) are configured, all criteria must be satisfied (logical AND) before the action associated with the match is executed.

A match context can consist of multiple match criteria, but multiple match statements cannot be created per entry.

A network policy can include the DSCP map command, the dot1p map command (ingress only), the prec map command (egress only), and an IPv6 match criteria. When multiple matches occur for the traffic, the following order of precedence is used to arrive at the final action.

- 802.1p bits (ingress only)
- DSCP
- prec (egress only)
- IP quintuple

The **no** form of this command removes the match criteria for the entry identifier.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

next-header

protocol-number, *protocol-name*

Specifies the next header to match.

The protocol type is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6), and UDP(17).

protocol-number

Specifies the protocol number value to be configured as a match criterion.

Values [0 to 255]D

[0x0 to 0xFF]H

[0b0 to 0b11111111]B

protocol-name

Specifies the protocol name to be configured as a match criterion.

Values none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

* - udp/tcp wildcard

Platforms

All

match

Syntax

match *field-value* **instance** *instance-id*

no match *field-value*

Context

[Tree] (config>qos>queue-group-redirect-list match)

Full Context

configure qos queue-group-redirect-list match

Description

This command configures the value of the field in the ingress or egress packet which, when matched, will cause the packet to be redirected to the specified queue group instance. The *field-value* is dependent on the setting of the **type** and therefore must be a valid VXLAN VNI.

A maximum of 16 match statements are supported in a queue group redirect list.

The **no** form of this command removes the match statement from the redirect list.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

field-value

Specifies the value of the field in the ingress or egress packet which, when matched, will cause the packet to be redirected to the specified queue group instance. Because the only permitted **type** is **vxlan-vni**, the field must be a valid VXLAN VNI. The VNI can be specified in any of the available formats but is always shown in decimal.

Values 1 to 16777215 (Decimal)

0x1 to 0xFFFFFF (Hexadecimal)

0b1 to 0b111111111111111111111111 (Binary)

instance-id

Specifies the instance of the queue group template to which the VXLAN traffic is redirected. The traffic can be redirected to the default instance, which is the instance specified with the QoS policy under the SAP ingress or egress.

Values 1 to 65535

Platforms

All

match

Syntax

match [**protocol** *protocol-id*]

match protocol none

no match

Context

[Tree] (config>filter>ip-exception>entry match)

Full Context

configure filter ip-exception entry match

Description

Commands in this context enter match criteria for the filter entry. When the match criteria have been satisfied the action associated with the match criteria is executed.

A **match** context may consist of multiple match criteria, but multiple **match** statements cannot be entered per entry. More precisely, the command can be entered multiple times but this only results in modifying the *protocol-id*. and does not affect the underlying match criteria configuration.

The **no** form of the command removes all the match criteria from the filter entry and sets the *protocol-id* of the match command to **none** (keyword). As per above, **match protocol none** is however not equivalent to **no match**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

match protocol none

Parameters

protocol-id

Sets an IP protocol to be used as an IP filter match criterion. The protocol type, such as TCP or UDP, is identified by its respective protocol number.

Values protocol-number: [0..255]D

[0x0..0xFF]H

[0b0..0b11111111]B

protocol-name:0 to 255 in decimal format. Values can also be specified in hexadecimal format, in binary format, or using the following keywords:

IPv4 filter keywords: none (default), icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

IP exception filter keywords: none, icmp, igmp, ospf-igp, pim, rsvp, tcp, udp, vrrp

match protocol none

no match

Context

[Tree] (config>filter>ip-filter>entry match)

Full Context

configure filter ip-filter entry match

Description

Commands in this context enter match criteria for the filter entry. When the match criteria have been satisfied, the action associated with the match criteria is executed.

A match context may consist of multiple match criteria, but multiple match statements cannot be created per entry. More precisely, the **protocol** command can be entered multiple times but this only results in modifying the *protocol-id*. Matching on more than one protocol can be achieved using the protocol-list match criteria in an IP filter policy.

The **no** form of the command removes all the match criteria from the filter entry and sets the *protocol-id* of the match command to **none**. However, **match protocol none** is not equivalent to **no match**.

Default

match protocol none

Parameters

protocol-id

protocol-number | *protocol-name*

protocol-number

Specifies the protocol number value to be configured as a match criterion. The value can be expressed as a decimal integer, or in hexadecimal or binary format.

Values [0..255]D, [0x0..0xFF]H, [0b0..0b11111111]B

protocol-name

Specifies the protocol name to be configured as a match criterion.

Values IPv4 filter keywords: none (default), icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

configure filter ipv6-filter entry match

Description

Commands in this context enter match criteria for the filter entry. When the match criteria have been satisfied, the action associated with the match criteria is executed.

A match context may consist of multiple match criteria, but multiple match statements cannot be created per entry. More precisely, the **next-header** command can be entered multiple times, but this only results in modifying the *protocol-id*. Matching on more than one protocol can be achieved using the **next-header-list** match criteria.

The **no** form of the command removes all the match criteria from the filter entry and sets the *protocol-id* of the match command to **none**. However, **match next-header none** is not equivalent to **no match**.

Default

match next-header none

Parameters

next-header

protocol-number, *protocol-name*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Specifies the IPv6 next header to match. This parameter is analogous to the protocol parameter used in IPv4 filter match command.

protocol-number

Specifies the protocol number value to be configured as a match criterion.

Values [0 to 255]D

[0x0 to 0xFF]H

[0b0 to 0b11111111]B

protocol-name

Specifies the protocol name to be configured as a match criterion.

Values none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

* - udp/tcp wildcard

Context

[Tree] (config>filter>mac-filter>entry match)

Full Context

configure filter mac-filter entry match

Description

This command creates the context for entering/editing match criteria for the filter entry and specifies an Ethernet frame type for the entry.

A **match** context may consist of multiple match criteria, but multiple **match** statements cannot be entered per entry.

The **no** form of the command removes the match criteria for the *entry-id*.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

frame-type

Keyword used to configure an Ethernet frame type to be used for the MAC filter match criteria.

Default **802dot3**

Values 802dot3, 802dot2-llc, 802dot2-snap, ethernet_II

802dot3

Specifies the frame type is Ethernet IEEE 802.3.

802dot2-llc

Specifies the frame type is Ethernet IEEE 802.2 LLC.

802dot2-snap

Specifies the frame type is Ethernet IEEE 802.2 SNAP.

ethernet_II

Specifies the frame type is Ethernet Type II.

Platforms

All

match

Syntax

[**no**] **match**

Context

[Tree] (config>log>filter>entry match)

Full Context

configure log filter entry match

Description

This command creates the context to enter and edit match criteria for a filter entry. When the match criteria is satisfied, the action associated with the entry is executed.

If more than one match parameter (within one match statement) is specified, then all the criteria must be satisfied (AND functional) before the action associated with the match is executed.

Use the **application** command to display a list of the valid applications.

Match context can consist of multiple match parameters (application, event-number, severity, subject), but multiple **match** statements cannot be entered per entry.

The **no** form of this command removes the match criteria for the *entry-id*.

Full Context

configure service ies subscriber-interface group-interface dhcp match-circuit-id

configure service vprn subscriber-interface dhcp match-circuit-id

configure service vprn subscriber-interface group-interface dhcp match-circuit-id

Description

This command enables Option 82 circuit ID on relayed DHCP packet matching. For routed CO, the group interface DHCP relay process is stateful. When packets are relayed to the server the virtual router ID, transaction ID, SAP ID, and client hardware MAC address of the relayed packet are tracked.

When a response is received from the server the virtual router ID, transaction ID, and client hardware MAC address must be matched to determine the SAP on which to send the packet out. In some cases, the virtual router ID, transaction ID, and client hardware MAC address are not guaranteed to be unique.

When the **match-circuit-id** command is enabled this as part of the key is used to guarantee correctness in our lookup. This is only needed when dealing with an IP aware DSLAM that proxies the client hardware MAC address.

The **no** form of this command disables Option 82 circuit ID on relayed DHCP packet matching.

no match-list

Context

[Tree] (config>subscr-mgmt>loc-user-db>ppp match-list)

Full Context

configure subscriber-mgmt local-user-db ppp match-list

Description

This command specifies the type of matching done to identify a host. There are different match-types for PPPoE hosts of which a maximum of three can be specified.

The **no** form of this command reverts to the default.

Parameters

match-type-x

Specifies up to three matching types to identify a host.

Values For PPP: circuit-id, derived-id, mac, remote-id, sap-id, encap-tag-range, encap-tag-separate-range, service-name, username

Note:
The format of *remote-id* in IPv6 is different that the format of *remote-id* in IPv4; IPv6 *remote-id* contains *enterprise-id* filed that is also honored in matching.

circuit-id — Specifies to use the circuit ID to match against.

derived-id — Specifies the value extracted by Python script during processing of DHCP Discover/Solicit/Request/Renew/Rebind Messages (client to server bound messages). The value is stored in the DHCP Transaction Cache (DTC) in a variable named alc.dtc.derivedId. This value has a lifespan of a DHCP transaction (a single pair of messages exchanged between the client and the server, for example DHCP Discover and DHCP Offer).

encap-tag-separate-range — Specifies the match encapsulation inner and outer tag in two separate ranges.

encap-tag-range — Specifies to match tag ranges for inner and outer tags.

mac — Specifies to use the MAC address to match against.

remote-id — Specifies to use the remote ID to match against.

sap-id — Specifies the SAP ID on which DHCPv4 packet are received. The SAP ID is inserted as ALU VSO (82,9,4) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay. Since the **dhcp-relay** configuration is enabled under the group-interface CLI hierarchy, the group interface and the service ID must be known before the SAP ID can be used for LUDB match.

service-id — Specifies the service ID of the ingress SAP for DHCPv4 packets. The service ID is inserted as ALU VSO (82,9,3) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

system-id — Specifies the system ID of the node name configured under the **system>name** CLI hierarchy. The system ID is inserted as ALU VSO (82,9,1) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay. Since the **dhcp-relay** configuration is enabled under the group interface CLI hierarchy, the group interface and the service-id must be known before the system ID can be used for LUDB match.

username — Specifies the user name.

match-list

Syntax

match-list *ipoe-match-type-1* [*ipoe-match-type-2*]

no match-list

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe match-list)

Full Context

configure subscriber-mgmt local-user-db ipoe match-list

Description

This command specifies the type of matching done to identify a host. There are different match-types for IPoE hosts of which a maximum of four can be specified.

The **no** form of this command removes all match criteria.

Parameters

match-type-x

Specifies up to four matching types to identify a host.

Values For IPoE: circuit-id, derived-id, dual-stack-remote-id, duid-en, duid-ll-llt, encap-tag-range, encap-tag-separate-range, ip, mac, option60, remote-id, sap-id, service-id, string, system-id

Note:
The format of **remote-id** in IPv6 is different than the format of **remote-id** in IPv4; IPv6 **remote-id** contains *enterprise-id* field that is also honored in matching.

circuit-id — Specifies to use the circuit ID to match against.

derived-id — Specifies the value extracted by Python script during processing of DHCP Discover/Solicit/Request/Renew/Rebind Messages (client to server bound messages). The value is stored in the DHCP Transaction Cache (DTC) in a variable

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

named alc.dtc.derivedId. This value has a lifespan of a DHCP transaction (a single pair of messages exchanged between the client and the server, for example DHCP Discover and DHCP Offer).

dual-stack-remote-id — Specifies the enterprise-id in IPv6 remote-id is stripped off before LUDB matching is performed. Processing of IPv4 remote ID remains unchanged. This will allow a single host entry in LUDB for dual-stack host where host identification is performed based on the remote ID field.

duid-en — Specifies to match against the concatenation of the enterprise number and identifier fields of DHCPv6 option CLIENTID (1) with DUID type = 2 (assigned by vendor based on the enterprise number) in the DHCPv6 client message.

duid-ll-llt — Specifies to match against the link-layer address field of DHCPv6 option CLIENTID (1) with DUID type = 3 (based on link-layer address) or DUID type = 1 (based on link-layer address plus time) and hardware type = 1 (Ethernet) in the DHCPv6 client message. For DUID type = 1, the time field is ignored.

encap-tag-separate-range — Specifies the match encapsulation inner and outer tag in two separate ranges.

encap-tag-range — Specifies to match tag ranges for inner and outer tags.

ip — Specifies the source IPv4/IPv6 address of a data-trigger packet.

mac — Specifies to use the MAC address to match against.

option-60 — Specifies to use Option60 to match against.

remote-id — Specifies to use the remote ID to match against.

sap-id — Specifies the SAP ID on which DHCPv4 packet are received. The SAP ID is inserted as ALU VSO (82,9,4) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay. Since the **dhcp-relay** configuration is enabled under the group interface CLI hierarchy, the group interface and the service ID must be known before the SAP ID can be used for LUDB match.

service-id — Specifies the service ID of the ingress SAP for DHCPv4 packets. The service ID is inserted as ALU VSO (82,9,3) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay.

string — Specifies the custom string configured under the vendor-specific-option CLI hierarchy of the DHCPv4 relay. The string is inserted as ALU VSO (82,9,5) by the DHCPv4 relay in router. Since the **dhcp-relay** configuration is enabled under the group-interface CLI hierarchy, the group-interface and the service ID must be known before the string can be used for LUDB match.

system-id — Specifies the system ID of the node name configured under the **system>name** CLI hierarchy. The system ID is inserted as ALU VSO (82,9,1) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay. Since the **dhcp-relay** configuration is enabled under the group interface CLI hierarchy, the group interface and the service ID must be known before the system ID can be used for LUDB match.

configure service ies subscriber-interface group-interface sap ingress match-qinq-dot1p

Description

This command specifies which dot1Q tag position dot1P bits in a QinQ encapsulated packet should be used to evaluate dot1P QoS classification.

The **match-qinq-dot1p** command allows the top or bottom PBits to be used when evaluating the applied sap-ingress QoS policy's dot1P entries. The **top** and **bottom** keywords specify which position should be evaluated for QinQ encapsulated packets.

By default, the bottom-most service delineating dot1Q tag's dot1P bits are used. Table 71: Default QinQ and TopQ SAP Dot1P Evaluation defines the default behavior for dot1P evaluation when the **match-qinq-dot1p** command is not executed.

Table 71: Default QinQ and TopQ SAP Dot1P Evaluation

Port/SAP Type	Existing Packet Tags	PBits Used for Match
Null	None	None
Null	Dot1P (VLAN-ID 0)	Dot1P PBits
Null	Dot1Q	Dot1Q PBits
Null	TopQ BottomQ	TopQ PBits
Null	TopQ (No BottomQ)	TopQ PBits

Description

This command specifies which Dot1Q tag position Dot1P bits in a QinQ encapsulated packet should be used to evaluate Dot1P QoS classification.

The **match-qinq-dot1p** command allows the top or bottom PBits to be used when evaluating the applied sap-ingress QoS policy's Dot1P entries. The **top** and **bottom** keywords specify which position should be evaluated for QinQ encapsulated packets.

The setting also applies to classification based on the DE indicator bit.

The **no** form of this command reverts the dot1p and de bits matching to the default tag.

By default, the bottom most service delineating Dot1Q tags Dot1P bits are used. Table 74: Default QinQ and TopQ SAP Dot1P Evaluation defines the default behavior for Dot1P evaluation. Top or bottom must be specified to override the default QinQ dot1p behavior.

Table 74: Default QinQ and TopQ SAP Dot1P Evaluation

Port/SAP Type	Existing Packet Tags	PBits Used for Match
Null	None	None
Null	Dot1P (VLAN ID 0)	Dot1P PBits
Null	Dot1Q	Dot1Q PBits
Null	TopQ BottomQ	TopQ PBits
Null	TopQ (No BottomQ)	TopQ PBits
Dot1Q	None (Default SAP)	None
Dot1Q	Dot1P (Default SAP VLAN ID 0)	Dot1P PBits
Dot1Q	Dot1Q	Dot1Q PBits
QinQ / TopQ	TopQ	TopQ PBits
QinQ / TopQ	TopQ BottomQ	TopQ PBits
QinQ / QinQ	TopQ BottomQ	BottomQ PBits

Default

no match-qinq-dot1p (no filtering based on p-bits)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

top

The top parameter is mutually exclusive to the bottom parameter. When the top parameter is specified, the top most PBits are used (if existing) to match any dot1p dot1p-value entries. Table 75: Top Position QinQ dpt1p Evaluation Behavior defines the dot1p evaluation behavior when the top parameter is specified.

Table 75: Top Position QinQ dpt1p Evaluation Behavior

Port/SAP Type	Existing Packet Tags	PBits Used for Match
Null	None	None
Null	Dot1P (VLAN ID 0)	Dot1P PBits
Null	Dot1Q	Dot1Q PBits
Null	TopQ BottomQ	TopQ PBits
Null	TopQ (No BottomQ)	TopQ PBits
Dot1Q	None (Default SAP)	None
Dot1Q	Dot1P (Default SAP VLAN ID 0)	Dot1P PBits
Dot1Q	Dot1Q	Dot1Q PBits
QinQ / TopQ	TopQ	TopQ PBits
QinQ / TopQ	TopQ BottomQ	TopQ PBits
QinQ / QinQ	TopQ BottomQ	TopQ PBits

bottom

The bottom parameter and the top parameter are mutually exclusive. When the bottom parameter is specified, the bottom most PBits are used (if existing) to match any dot1p dot1p-value entries. Table 76: Bottom Position QinQ and TopQ SAP Dot1P Evaluation defines the dot1p evaluation behavior when the bottom parameter is specified.

Table 76: Bottom Position QinQ and TopQ SAP Dot1P Evaluation

Port/SAP Type	Existing Packet Tags	PBits Used for Match
Null	None	None
Null	Dot1P (VLAN ID 0)	Dot1P PBits
Null	Dot1Q	Dot1Q PBits
Null	TopQ BottomQ	TopQ PBits
Null	TopQ (No BottomQ)	TopQ PBits

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Port/SAP Type	Existing Packet Tags	PBits Used for Match
Dot1Q	None (Default SAP)	None
Dot1Q	Dot1P (Default SAP VLAN ID 0)	Dot1P PBits
Dot1Q	Dot1Q	Dot1Q PBits
QinQ / TopQ	TopQ	TopQ PBits
QinQ / TopQ	TopQ BottomQ	BottomQ PBits
QinQ / QinQ	TopQ BottomQ	BottomQ PBits

Table 77: Egress SAP Types

Egress SAP Type	Ingress Packet Preserved Dot1P State	Marked (or Remarked) PBits
Null	No preserved Dot1P bits	None
Null	Preserved Dot1P bits	Preserved tag PBits remarked using dot1p-value
Dot1Q	No preserved Dot1P bits	New PBits marked using dot1p-value
Dot1Q	Preserved Dot1P bits	Preserved tag PBits remarked using dot1p-value
TopQ	No preserved Dot1P bits	TopQ PBits marked using dot1p-value
TopQ	Preserved Dot1P bits (used as TopQ and BottomQ PBits)	TopQ PBits marked using dot1p-value, BottomQ PBits preserved
QinQ	No preserved Dot1P bits	TopQ PBits and BottomQ PBits marked using dot1p-value
QinQ	Preserved Dot1P bits (used as TopQ and BottomQ PBits)	TopQ PBits and BottomQ PBits marked using dot1p-value

The QinQ and TopQ SAP PBit/DEI bit marking follows the default behavior defined in the preceding table when **qinq-mark-top-only** is not specified.

The dot1p *dot1p-value* command must be configured without the qinq-mark-top-only parameter to remove the TopQ PBits only marking restriction.

A QinQ-encapsulated Ethernet port can have two different sap types:

For a TopQ SAP type, only the outer (top) tag is explicitly specified. For example, **sap 1/1/1:10.***

For QinQ SAP type, both inner (bottom) and outer (top) tags are explicitly specified. For example, **sap 1/1/1:10.100**.

configure lag bfd family max-admin-down-time

Description

This command specifies the maximum amount of time the router will continue to forward traffic over a link after the micro-BFD sessions has transitioned to a Down state because it received an ADMIN-DOWN state from the far-end. This timer provide the administrator the configured amount of time to disable or de-provision the micro-BFD session on the local node before forwarding is halted over the associated link(s).

The **no** form of this command removes the time interval from the configuration.

Default

max-admin-down-time 0

Parameters

down-interval

Specifies the amount of time, in seconds.

Values -1 to 3600

infinite

Specifies no end time to forward traffic.

[Tree] (config>service>vpls>stp max-age)

Full Context

configure service template vpls-template stp max-age

configure service vpls stp max-age

Description

This command indicates how many hops a BPDU can traverse the network starting from the root bridge. The message age field in a BPDU transmitted by the root bridge is initialized to 0. Each other bridge will take the message_age value from BPDUs received on their root port and increment this value by 1. The

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

message_age therefore reflects the distance from the root bridge. BPDUs with a message age exceeding max-age are ignored.

STP uses the max-age value configured in the root bridge. This value is propagated to the other bridges via the BPDUs.

The **no** form of this command returns the max age to the default value.

Default

max-age 20

Parameters

max-age

The max info age for the STP instance in seconds. Allowed values are integers in the range 6 to 40.

Full Context

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit max-attempts

Description

This command configures the maximum number of attempts made to establish a new Diameter Gy session with the Online Charging Server (OCS) when Extended Failure Handling (EFH) is active.

A new attempt is made when the volume or time interim credit of a rating group is consumed or when the validity time expires for a rating group.

When the maximum number of attempts is reached, the user session associated with the Diameter session is terminated (the corresponding subscriber hosts are deleted from the system).

The **no** form of this command resets the value to the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

max-attempts 10

Parameters

count

Specifies the maximum number attempts that is made to establish a Diameter Gy session with the OCS when EFH is active.

Values 1 to 4294967295

infinite

Specifies that an unlimited number of attempts is made to establish a Diameter Gy session with the OCS when EFH is active.

Full Context

configure qos slope-policy highplus-slope max-avg

configure qos slope-policy low-slope max-avg

configure qos slope-policy exceed-slope max-avg

configure qos slope-policy high-slope max-avg

Description

Sets the exceed, low, high, or highplus Random Early Detection (RED) slope position for the shared buffer average utilization value where the packet discard probability rises directly to one. The percent parameter is expressed as a percentage of the shared buffer size.

The **no** form of this command restores the max-avg value to the default setting. If the current **start-avg** setting is larger than the default, an error will occur and the max-avg setting will not be changed to the default.

Default

max-avg 100 - Highplus slope default is 100% buffer utilization before discard probability is 1.

max-avg 90 — High slope default is 90% buffer utilization before discard probability is 1.

max-avg 75 — Low slope default is 75% buffer utilization before discard probability is 1.

max-avg 55 — Exceed slope default is 55% buffer utilization before discard probability is 1.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

percent

The percentage of the shared buffer space for the buffer pool at which point the drop probability becomes one. The value entered must be greater or equal to the current setting of **start-avg**. If the entered value is smaller than the current value of **start-avg**, an error will occur and no change will take place.

28.75 max-bypass-associations

max-bypass-associations

Syntax

max-bypass-associations *integer*

no max-bypass-associations

Context

[Tree] (config>router>mpls max-bypass-associations)

Full Context

configure router mpls max-bypass-associations

Description

This command allows the user to set a maximum number of LSP primary path associations with each manual or dynamic bypass LSP that is created in the system.

By default, a Point of Local Repair (PLR) node will associate a maximum of 1000 primary LSP paths with a given bypass before using the next available manual bypass or signaling a new dynamic bypass.

Note that a new bypass LSP may need to be signaled if the constraint of a given primary LSP path is not met by an existing bypass LSP even if the max-bypass-associations for this bypass LSP has not been reached.

The **no** form of this command reinstates the default value of this parameter.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

max-bypass-associations 1000

Parameters

integer

Configures the number of LSP primary path associations

Values 100 to 131072

Platforms

All

28.76 max-bypass-plr-associations

max-bypass-plr-associations

Syntax

max-bypass-plr-associations *plr-value*

no max-bypass-plr-associations

Context

[Tree] (config>router>mpls max-bypass-plr-associations)

Full Context

configure router mpls max-bypass-plr-associations

Description

This command enables the configuration of the maximum number of Points of Local Repair (PLRs) per RSVP-TE bypass LSP.

A PLR summarizes the constraints applied to the computation of the path of the bypass LSP. It consists of the avoid link/node constraint, and potentially other TE constraints such as exclude SRLG, that are needed to protect against the failure of the primary path of the RSVP-TE LSP that is associated with this bypass LSP.

Additional PLRs with the same avoid link/node constraint are associated with the same bypass to minimize the number of bypass LSPs created. This command controls the maximum number of such PLRs.

Because MPLS saves only the PLR constraints of the first LSP that triggered the dynamic bypass creation, subsequent LSPs for the same avoid link/node and with the non-strict bypass SRLG disjointness enabled may be associated with the same bypass. This is even in cases where there exists a bypass LSP path that strictly satisfies the SRLG constraint.

When the maximum PLRs per bypass is configured with a value of 1, MPLS triggers the signaling of a new dynamic bypass LSP for each new PLR and saves each PLR constraint separately with its own bypass.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

As a result, when MPLS re-optimizes a bypass LSP it guarantees that SRLG disjointness of that PLR are checked and enforced.

The **no** form of this command returns the command to its default value.

Default

max-bypass-plr-associations 16

Parameters

plr-value

Configures the number of LSP primary path associations

Values 1 to 16

Default 16

28.84 max-decrement

max-decrement

Syntax

max-decrement {**percent** *percent-of-admin-pir* | **rate** *rate-in-kilobits-per-second*}

no max-decrement

Context

[Tree] (config>qos>adv-config-policy>child-control>offered-measurement max-decrement)

Full Context

configure qos adv-config-policy child-control offered-measurement max-decrement

Description

This command is used to limit how fast a child queue or policer can 'give up' bandwidth that it has been allotted from the virtual scheduler in a single iteration. If the child's new offered rate has decreased by more than the maximum decrement limit, the system ignores the new offered rate and instead uses the old offered rate less the maximum decrement limit.

A possible reason to define a maximum decrement limit is to allow a child queue or policer to hold on to a portion of bandwidth that has been distributed by the parent virtual scheduler in case the child's offered rate fluctuates in an erratic manor. The max-decrement limit has a dampening effect to changes in the offered rate.

A side effect of using a maximum decrement limit is that unused bandwidth allocated to the child queue or policer will not be given to another child as quickly. This may result in an underrun of the virtual scheduler's aggregate rate.

The max-decrement limit has no effect on any increase in a child's offered rate. If the rate increase is above the change sensitivity, the new offered rate is immediately used.

If the max-decrement command is used with a percent-based value, the decrement limit will be a function of the configured PIR value on the policer or queue. In this case, care should be taken that the child is either configured with an explicit PIR rate (other than max) or the child's administrative PIR is defined using the percent-rate command with the local parameter enabled if an explicit value is not desired. When a maximum PIR is in use on the child, the system attempts to interpret the maximum child forwarding rate. This rate could be very large if the child is associated with multiple ingress or egress ports.

Except for the overall cap on the offered input into the virtual scheduler, the child's administrative PIR has no effect on the calculated sensitivity if an explicit rate is specified.

If the child's administrative PIR is modified while a percent based max-decrement is in effect, the system automatically uses the new relative maximum decrement limit value the next time the child's offered rate is determined.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the max-decrement command is not specified or removed, the virtual scheduler does not limit a decreasing offered rate to a specific limit.

The **no** form of this command is used to remove any currently configured maximum decrement limit for all child policers and queues associated with the policy.

Parameters

percent-of-admin-pir

When the percent qualifier is used, this parameter specifies the percentage of the child's administrative PIR that should be used as the decrement limit to offered rate change. If a value of 100 or 100.00 is used, the system will interpret this equivalent to **no max-decrement**.

Values 1.00 to 100.00

rate-in-kilobits-per-second

When the rate qualifier is used, this parameter specifies an explicit rate, in kb/s, that should be used as the child's offered rate change sensitivity value. If a rate sensitivity of 0 is specified, the system interprets this equivalent to **no max-decrement**.

All

28.90 max-fail

max-fail

Syntax

max-fail *no-response-count*

no max-fail

Context

[Tree] (config>saa>test>type-multi-line>lsp-trace>sr-policy max-fail)

Full Context

configure saa test type-multi-line lsp-trace sr-policy max-fail

Description

This command configures the maximum number of consecutive MPLS echo requests that do not receive a reply before the trace operation fails for a TTL.

The **no** form of this command reverts to the default value.

Default

max-fail 5

Parameters

no-response-count

Specifies the maximum number of consecutive MPLS echo requests, expressed as a decimal integer, that do not receive a reply before the trace operation fails for a TTL.

Values 1 to 255

Default 5

Platforms

All

configure router l2tp group tunnel mlppp max-fragment-delay

configure router l2tp group mlppp max-fragment-delay

configure service vprn l2tp group tunnel mlppp max-fragment-delay

Description

This command is applicable only to LNS. It determines the maximum fragment delay caused by the transmission that will be imposed on a link.

Fragmentation can be used to interleave high priority packet in-between low priority fragments on a MLPPPoX session with a single link or on a MLPPPoX session with multiple links to better load balance traffic over multiple member links.

Default

no max-fragment-delay

Parameters

milliseconds

Specifies the interval, in milliseconds.

Values 5 to 1000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

28.93 max-groups

max-groups

Syntax

max-groups *max-groups*

no max-groups

Context

[Tree] (config>service>vprn>igmp>if max-groups)

[Tree] (config>service>vprn>igmp>grp-if max-groups)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn igmp interface max-groups

configure service vprn igmp group-interface max-groups

Description

This command configures the maximum number of groups for which IGMP can have local receiver information based on received IGMP reports on this interface. When this configuration is changed dynamically to a value lower than currently accepted number of groups, the groups that are already accepted are not deleted. Only new groups will not be allowed.

The **no** form of this command removes the value.

Parameters

max-groups

Specifies the maximum number of groups for this interface.

Values 1 to 16000

Platforms

All

- configure service vprn igmp interface max-groups

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn igmp group-interface max-groups

max-groups

Syntax

max-groups *value*

no max-groups

Context

[Tree] (config>service>vprn>mld>if max-groups)

Full Context

configure service vprn mld interface max-groups

Description

This command specifies the maximum number of groups for which MLD can have local receiver information based on received MLD reports on this interface. When this configuration is changed dynamically to a value lower than the currently accepted number of groups, the groups that are already accepted are not deleted. Only new groups will not be allowed.

Default

0 (no limit to the number of groups)

© 2026 Nokia.

28.98 max-igmp-latency

max-igmp-latency

Syntax

max-igmp-latency *milli-seconds*

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if max-igmp-latency)

Full Context

configure mcast-management multicast-info-policy video-policy video-interface max-igmp-latency

Description

After the subscriber requests a fast channel change using RTCP, the video ISA bursts the video content as unicast to the subscriber. When the unicasted content has caught up to the multicast, the video ISA sends a notification message using RTCP to the subscriber to switch over to multicast with an IGMP request. When the notification message from the video ISA is sent, the **max-igmp-latency** timer starts. The video ISA continues to send unicast video until the **max-igmp-latency** expires or until the subscriber, using RTCP, informs the video ISA of the exact sequence number to stop (whichever occurs first). The **max-igmp-latency** is the maximum delay that the multicast router takes to respond and deliver the multicast upon the subscriber IGMP request.

Parameters

milli-seconds

Specifies the maximum delay in milliseconds.

Values 10 to 1000

Default 100

Platforms

7450 ESS, 7750 SR, 7750 SR-s

Full Context

configure router l2tp group mlppp max-links

configure router l2tp group tunnel mlppp max-links

configure service vprn l2tp group mlppp max-links

configure service vprn l2tp group tunnel mlppp max-links

Description

This command is applicable only to LNS. It determines the maximum number of links that can be put in a bundle.

Any attempt of a session to join a bundle that is above the max-link limit will be rejected.

If interleaving is configured, it is recommended that max-links be set to 1 or a version of the command is used (no max-links). Both have the same effect.

The configuration under the tunnel hierarchy will override the configuration under the group hierarchy.

The **no** form of this command limits the number of links in the bundle to 1.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no max-links

Parameters

max-links

Specifies the maximum number of links in a bundle.

Values 1 to 8

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

Full Context

configure router l2tp tunnel-selection-blacklist max-list-length

configure service vprn l2tp tunnel-selection-blacklist max-list-length

Description

This command specifies the number of tunnels or peers that can be in the **tunnel-selection-blacklist**. If a tunnel or peer needs to be added to the denylist and the denylist is full, the system removes the item (tunnel or peer) from the denylist that was in this denylist for the longest time.

The **no** form of this command reverts to the default.

Default

max-list-length unlimited

Parameters

unlimited

Specifies there is no limit.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

count

Specifies how many items (tunnels or peers) can be in the denylist.

Values 1 to 65635

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

28.104 max-lockout-hosts

max-lockout-hosts

Syntax

max-lockout-hosts *hosts*

no max-lockout-hosts

Context

[Tree] (config>subscr-mgmt>host-lockout-plcy max-lockout-hosts)

Full Context

configure subscriber-mgmt host-lockout-policy max-lockout-hosts

Description

When a client enters lockout, authentication and ESM host creation is suppressed. A lightweight context maintains the lockout state and the timeouts for the client in lockout. This command allows the number of lockout contexts to be configured per SAP. If the number of existing contexts reaches the configured count, incoming hosts that fail authentication or creation are not subject to lockout, and are retried as normal.

The **no** form of this command reverts to the default value.

Default

max-lockout-hosts 100

Parameters

hosts

Specifies the maximum number of lockout host.

Values 1 to 32000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vpls vxlan max-nbr-mac-addr

configure service template vpls-sap-template max-nbr-mac-addr

configure service vpls sap max-nbr-mac-addr

configure service vpls spoke-sdp max-nbr-mac-addr

Description

This command specifies the maximum number of FDB entries for both learned and static MAC addresses for this instance.

When the configured limit is reached, no new addresses are learned from the SAP or spoke SDP until at least one FDB entry is aged out or cleared.

When the configured limit is reached and the **discard-unknown-source** command is enabled for this instance, packets with unknown source MAC addresses are discarded. If **discard-unknown-source** is disabled, the packets are forwarded if their destination MAC addresses are known, or flooded if their destination MAC addresses are unknown.

However, if the **configure service vpls discard-unknown** command is enabled, packets with unknown destination MAC addresses are discarded, even if the limit of FDB entries on the specific VPLS instance is not reached.

The **no** form of this command restores the global MAC learning limitations for this instance.

Default

no max-nbr-mac-addr

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

table-size

Specifies the maximum number of learned and static entries allowed in the FDB of this service.

Values 1 to 511999 for the 7750 SR

1 to 131071 for the 7450 ESS

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vpls mesh-sdp igmp-snooping max-num-sources

configure service vpls sap igmp-host-tracking max-num-sources

configure service vpls spoke-sdp igmp-snooping max-num-sources

configure service vpls sap igmp-snooping max-num-sources

Description

This command defines the maximum number of multicast sources that can be joined on this SAP or SDP. If the node receives an IGMP join message that would exceed the configured number of sources, the request is ignored.

The **no** form of this command removes the value from the configuration.

Parameters

max-num-sources

Specifies the maximum number of multicast sources allowed per group.

Values 1 to 1000

Platforms

All

- configure service vpls spoke-sdp igmp-snooping max-num-sources
- configure service vpls mesh-sdp igmp-snooping max-num-sources
- configure service vpls sap igmp-snooping max-num-sources

Full Context

configure qos slope-policy high-slope max-prob

configure qos slope-policy highplus-slope max-prob

configure qos slope-policy low-slope max-prob

configure qos slope-policy exceed-slope max-prob

Description

This command sets the exceed, low, high, or highplus Random Early Detection (RED) slope position for the maximum non-one packet discard probability value before the packet discard probability rises directly to one. The percent parameter is expressed as a percentage of packet discard probability where always discard is a probability of 1. A **max-prob** value of 80 represents 80% of 1, or a packet discard probability of 0.8.

The **no** form of this command restores the **max-prob** value to the default setting.

Default

max-prob 80

Parameters

percent

The maximum drop probability percentage corresponding to the **max-avg,** expressed as a decimal integer.

Values 0 to 100

Platforms

All

Full Context

configure subscriber-mgmt sub-profile ingress policer-control-policy max-rate

configure subscriber-mgmt sub-profile egress policer-control-policy max-rate

Description

This command defines the parent policer's PIR leaky bucket's decrement rate. A parent policer is created for each time the policer-control-policy is applied to either a SAP or subscriber instance. Packets that are not discarded by the child policers associated with the SAP or subscriber instance are evaluated against the parent policer's PIR leaky bucket.

For each packet, the bucket is first decremented by the correct amount based on the decrement rate to derive the current bucket depth. The current depth is then compared to one of two discard thresholds associated with the packet. The first discard threshold (discard-unfair) is applied if the FIR (Fair Information Rate) leaky bucket in the packet's child policer is in the confirming state. The second discard threshold (discard-all) is applied if the child policer's FIR leaky bucket is in the exceed state. Only one of the two thresholds is applied per packet. If the current depth of the parent policer PIR bucket is less than the threshold value, the parent PIR bucket is in the conform state for that particular packet. If the depth is equal to or greater than the applied threshold, the bucket is in the violate state for the packet.

If the result is "conform," the bucket depth is increased by the size of the packet (plus or minus the per-packet-offset setting in the child policer) and the packet is not discarded by the parent policer. If the result is "violate," the bucket depth is not increased and the packet is discarded by the parent policer. When the parent policer discards a packet, any bucket depth increases (PIR, CIR and FIR) in the parent policer caused by the packet are canceled. This prevents packets that are discarded by the parent policer from consuming the child policers PIR, CIR and FIR bandwidth.

The **policer-control-policy root max-rate** setting may be overridden on each SAP or sub-profile where the policy is applied.

The **no** form of this command reverts to the default.

Default

max-rate max

Parameters

rate

Specifies the max rate in kilobits per second. Defining the *rate* value is mutually exclusive with the **max** parameter. The *rate* (in kilobits per second) value must be defined as an integer that represents the number of kilobytes that the parent policer is decremented per second. The actual decrement is performed per packet based on the time that has elapsed since the last packet associated with the parent policer.

Values 0 to 2000000000

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max

Specifies the maximum frame-based bandwidth limit of this policer. The **max** parameter is mutually exclusive with defining a *rate* (in kilobits per second) value. When max is specified, the parent policer does not enforce a maximum rate on the aggregate throughput of the child policers. This is the default setting when the **policer-control-policy** is first created and is the value that the parent policer returns to when a **no max-rate** command is executed. In order for the parent policer to be effective, a *rate* (in kilobits per second) value should be specified.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Use subject to Terms available at: www.nokia.com/terms.

The **policer-control-policy root max-rate** setting may be overridden on each SAP or sub-profile where the policy is applied.

The **no** form of this command returns the policer-control-policy's parent policer maximum rate to **max**.

Default

max-rate max

Parameters

rate

Specifies that a kilobits-per-second value is mutually exclusive with the **max** keyword. The kilobits-per-second value must be defined as an integer that represents the number of kilobytes that the parent policer will be decremented per second. The actual decrement is performed per packet based on the time that has elapsed since the last packet associated with the parent policer.

Values 0 to 2000000000

max

The **max** keyword is mutually exclusive with defining a kilobits-per-second value. When max is specified, the parent policer does not enforce a maximum rate on the aggregate throughput of the child policers. This is the default setting when the **policer-control-policy** is first created and is the value that the parent policer returns to when no max-rate is executed. In order for the parent policer to be effective, a kilobits-per-second value should be specified.

configure port sonet-sdh path egress-scheduler-override max-rate

configure port ethernet egress-scheduler-override max-rate

Description

This command overrides the **max-rate** parameter found in the port-scheduler-policy associated with the port. When a max-rate is defined at the port or channel level, the port scheduler policies max-rate parameter is ignored.

The egress-scheduler-override **max-rate** command supports a parameter that allows the override command to restore the default of not having a rate limit on the port scheduler. This is helpful when the port scheduler policy has an explicit maximum rate defined and it is desirable to remove this limit at the port instance.

The **no** form of this command removes the maximum rate override from the egress port or channels port scheduler context. Once removed, the max-rate parameter from the port scheduler policy associated with the port or channel will be used by the local scheduler context.

Parameters

pir-rate

Specifies the explicit maximum frame based bandwidth limit, in kilobits per second. This value overrides the QoS scheduler policy rate.

Values **For Ethernet:** 1 to 6400000000, **max**

For SONET-SDH and TDM: 1 to 3200000000, **max**

percent-rate

Specifies the percent rate.

Values 0.01 to 100.00

Description

The **max-rate** command defines the parent policer's PIR leaky bucket's decrement rate. A parent policer is created for each time the policer-control-policy is applied to either a SAP or subscriber instance for the 7450 ESS and 7750 SR, or multiservice site instance for the 7950 XRS. Packets that are not discarded by the child policers associated with the SAP or subscriber or multiservice site instances are evaluated against the parent policer's PIR leaky bucket.

For each packet, the bucket is first decremented by the correct amount based on the decrement rate to derive the current bucket depth. The current depth is then compared to one of two discard thresholds associated with the packet. The first discard threshold (discard-unfair) is applied if the FIR (Fair Information Rate) leaky bucket in the packet's child policer is in the confirming state. The second discard threshold (discard-all) is applied if the child policer's FIR leaky bucket is in the exceed state. Only one of the two thresholds is applied per packet. If the current depth of the parent policer PIR bucket is less than the threshold value, the parent PIR bucket is in the conform state for that particular packet. If the depth is equal to or greater than the applied threshold, the bucket is in the violate state for the packet.

If the result is "conform," the bucket depth is increased by the size of the packet (plus or minus the per-packet-offset setting in the child policer) and the packet is not discarded by the parent policer. If the result is "violate," the bucket depth is not increased and the packet is discarded by the parent policer. When the parent policer discards a packet, any bucket depth increases (PIR, CIR and FIR) in the parent policer caused by the packet are canceled. This prevents packets that are discarded by the parent policer from consuming the child policers PIR, CIR, and FIR bandwidth.

The **policer-control-policy root max-rate** setting may be overridden on each SAP or sub-profile where the policy is applied.

The **no** form of this command returns the policer-control-policy's parent policer maximum rate to **max**.

Parameters

rate

The kilobits-per-second value must be defined as an integer that represents the number of kilobytes that the parent policer will be decremented per second. The actual decrement is performed per packet, based on the time that has elapsed since the last packet associated with the parent policer.

Values 1 to 6400000000, **max**

max

When **max** is specified, the parent policer does not enforce a maximum rate on the aggregate throughput of the child policers. This is the default setting when the **policer-control-policy** is first created and is the value that the parent policer returns to when no max-rate is executed. In order for the parent policer to be effective, a kilobits-per-second value should be specified.

Description

This command defines an explicit maximum frame-based bandwidth limit for the HS scheduler policy scheduler context. If a maximum rate is defined that is smaller than the port rate, the port is rate-limited to the configured megabits per second value. This command can be executed at any time for any non-default existing HS scheduler policy.

The **no** form of the command removes an explicit rate value from the HS scheduler policy. After the explicit rate value is removed, all instances of the scheduler policy on HSQ egress ports are allowed to run at the available line rate unless the instance has a max rate override in place.

Parameters

rate

Specifies the explicit maximum frame-based bandwidth limit, in megabits per second. This parameter is required when executing this command.

Values 1 to 100000, max

Platforms

7750 SR-7/12/12e

max-rate

Syntax

max-rate *pir-rate*

max-rate percent *percent-rate*

no max-rate

Full Context

configure qos port-scheduler-policy max-rate

Description

This command defines an explicit maximum frame-based bandwidth limit for the port scheduler policies scheduler context. By default, when a scheduler policy is associated with a port or channel, the instance of the scheduler on the port automatically limits the bandwidth to the lesser of port or channel line rate and a possible egress-rate value (for Ethernet ports). If a max-rate is defined that is smaller than the port or channel rate, the expressed kilobits per second value is used instead. The max-rate command is another way to sub-rate the port or channel. This command can be used on channels only on the 7450 ESS and 7750 SR.

The **max-rate** command may be executed at any time for an existing port-scheduler-policy. When a new max-rate is given for a policy, the system evaluates all instances of the policy to see if the configured rate is smaller than the available port or channel bandwidth. If the rate is smaller and the maximum rate is not currently overridden on the scheduler instance, the scheduler instance is updated with the new maximum rate value.

The max-rate value defined in the policy may be overridden on each scheduler instance. If the maximum rate is explicitly defined as an override on a port or channel, the policies max-rate value has no effect.

The **no** form of this command removes an explicit rate value from the port scheduler policy. When removed, all instances of the scheduler policy on egress ports or channel are allowed to run at the available line rate unless the instance has a max-rate override in place.

Parameters

pir-rate

Specifies the PIR rate, in kilobits per second.

Values 1 to 6400000000, **max**

percent *percent-rate*

Specifies the percent rate.

Values 0.01 to 100.00

max-routes

Syntax

max-routes *routes*

no max-routes

Context

[Tree] (config>aaa>route-downloader max-routes)

Full Context

configure aaa route-downloader max-routes

Description

This command determines the upper limits for total number of routes to be received and accepted by the system. The total number is inclusive of both IPv4 and IPv6 addresses and no differentiation is needed across protocols. It includes the sum of both. Once this limit is reached, the download process stops sending new access-requests until the next download-interval expires.

The **no** form of this command reverts to the default value.

Default

max-routes 200000

Parameters

routes

Specifies the maximum number of the routes imported.

Values 1 to 200000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

29 m Commands – Part II

29.1 max-sess-prefix

max-sess-prefix

Syntax

max-sess-prefix *count*

no max-sess-prefix

Context

[Tree] (config>test-oam>twamp>server>prefix max-sess-prefix)

Full Context

configure test-oam twamp server prefix max-sess-prefix

Description

This command configures the maximum number of concurrent TWAMP-Test sessions by clients with an IP address in a specific prefix. A new test session (described by a Request-TW-Session message) is rejected if accepting it would cause either the limit defined by this command or the server limit (max-sess-server) to be exceeded.

The **no** form of this command returns the value to the default.

Default

max-sess-prefix 32

Parameters

count

Specifies the maximum number of concurrent test sessions.

Values 0 to 128

Default 32

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure service vprn bgp group dynamic-neighbor interface max-sessions

configure router bgp group dynamic-neighbor interface max-sessions

Description

This command configures the maximum number of dynamic sessions that are allowed to be set up on the interface as a result of accepting sessions from link-local addresses or initiating sessions by receiving IPv6 router advertisements.

Default

max-sessions 1

Parameters

number

Specifies the maximum number of sessions.

Values 1 to 255

Platforms

All

29.4 max-sessions-per-cid

max-sessions-per-cid

Syntax

max-sessions-per-cid *sessions* [**allow-sessions-without-cid**]

no max-sessions-per-cid

Context

[Tree] (config>subscr-mgmt>ppp-policy max-sessions-per-cid)

Full Context

configure subscriber-mgmt ppp-policy max-sessions-per-cid

Description

This command configures the maximum number of PPPoE sessions with the same Agent Circuit ID that can be active on the same SAP or MSAP. The limit is enforced in the discovery phase, prior to PAP or CHAP authentication and is based on the Agent Circuit ID sub-option that is present in the vendor-specific PPPoE access loop identification tag added in PADI and PADR messages by a PPPoE intermediate agent.

When the optional **allow-sessions-without-cid** keyword is specified, PPPoE sessions without an Agent Circuit ID can be established. The configured sessions limit does not apply to these sessions.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

By default, there is no limit for the number of PPPoE sessions with the same Agent Circuit ID that are active on the same SAP or MSAP. Sessions without Agent Circuit ID can be established.

The **no** form of this command reverts to the default value.

Default

no max-sessions-per-cid

Parameters

sessions

Specifies the maximum number of sessions with the same circuit ID that can be active on the same SAP or MSAP.

Values 1 to 8190

allow-sessions-without-cid

Specifies to enable support for PPPoE sessions without a circuit ID while a **max-sessions-per-cid** limit is configured on a SAP or MSAP.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

29.5 max-sessions-per-mac

max-sessions-per-mac

Syntax

max-sessions-per-mac *maximum*

no max-sessions-per-mac

Context

[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>plcy-parms max-sessions-per-mac)

Full Context

configure subscriber-mgmt local-user-db ppp host ppp-policy-parameters max-sessions-per-mac

Description

This command configures the maximum number of PPPoE sessions created per MAC address. This number overrides the value defined within the PPPoE policy.

The **no** form of this command reverts to the default value.

Default

no max-sessions-per-mac

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

maximum

Specifies the maximum PPP sessions that can be opened for the given MAC address.

Values 1 to 8191

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-sessions-per-mac

Syntax

max-sessions-per-mac *sessions* [**allow-same-circuit-id-for-dhcp**]

no max-sessions-per-mac

Context

[Tree] (config>subscr-mgmt>ppp-policy max-sessions-per-mac)

Full Context

configure subscriber-mgmt ppp-policy max-sessions-per-mac

Description

This command sets the maximum PPP sessions that can be opened for a given MAC address.

To enable IPv4 address allocation using the internal DHCPv4 client for multiple PPPoE sessions on a single SAP and having the same MAC address and circuit-ID, the optional CLI parameter **allow-same-circuit-id-for-dhcp** should be added. The SR OS local DHCP server detects the additional vendor-specific options inserted by the internal DHCPv4 client and use an extended unique key for lease allocation.

The **no** form of this command reverts to the default value.

Parameters

sessions

Specifies the maximum PPP sessions that can be opened for the given MAC address.

Values 1 to 8191

allow-same-circuit-id-for-dhcp

Sets the support for IPv4 address allocation using the internal DHCPv4 client for multiple PPPoE sessions on a single SAP that have the same MAC address and circuit ID.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

29.6 max-setup-time

max-setup-time

Syntax

max-setup-time [[*up-interval*] | **infinite**]

no max-setup-time

Context

[Tree] (config>lag>bfd>family max-setup-time)

Full Context

configure lag bfd family max-setup-time

Description

This command specifies the maximum amount of time the router will forward traffic over a link that has transitioned from Standby to Active, before the micro-BFD session must be fully established (Up state).

The **no** form of this command returns the timer value to the default (0) which indicates that forwarding will not start until the BFD session is established.

Default

max-setup-time infinite

Parameters

up-interval

Specifies the amount of time, in milliseconds.

Values -1 to 60000

infinite

Specifies no end time to forward traffic.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max-sources

Syntax

max-sources *max-sources*

no max-sources

Context

[Tree] (config>service>vprn>igmp>if max-sources)

[Tree] (config>service>vprn>igmp>grp-if max-sources)

[Tree] (config>service>vprn>mld>interface max-sources)

Full Context

configure service vprn igmp interface max-sources

configure service vprn igmp group-interface max-sources

configure service vprn mld interface max-sources

Description

This command specifies the maximum number of sources for which IGMP can have local receiver information based on received IGMP reports on this interface. When this configuration is changed dynamically to a value lower than currently accepted number of sources, the sources that are already accepted are not deleted. Only new sources will not be allowed.

Parameters

sources

Specifies the maximum number of sources for this interface.

Values 1 to 1000

Platforms

All

- configure service vprn mld interface max-sources
- configure service vprn igmp interface max-sources

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-sr-labels

Syntax

max-sr-labels *label-stack-size* [**additional-frr-labels** *labels*]

no max-sr-labels

Context

[Tree] (config>router>mpls>lsp max-sr-labels)

[Tree] (config>router>mpls>lsp-template max-sr-labels)

Full Context

configure router mpls lsp max-sr-labels

configure router mpls lsp-template max-sr-labels

Description

This command configures the maximum number of labels which the ingress LER can push for a given SR-TE LSP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command is used to allow room to insert additional transport, service, and other labels when packets are forwarded in a given context.

The **max-sr-labels** *label-stack-size* value should reflect the desired maximum label stack of the primary path of the SR-TE LSP.

The value in **additional-frr-labels** *labels* should reflect additional labels inserted by remote LFA for the backup next-hop of the SR-TE LSP.

The sum of both label values represents the worst case transport of SR label stack size for this SR-TE LSP and is populated by MPLS in the TTM such that services and shortcut applications can check it to decide if a service can be bound or a route can be resolved to this SR-TE LSP.

The maximum label stack supported by the router is always signaled by PCC in the PCEP Open object as part of the as SR-PCE-CAPABILITY TLV. It is referred to as the Maximum Stack Depth (MSD).

In addition, the per-LSP value for the max-sr-labels option, if configured, is signaled by PCC to PCE in the Segment-ID (SID) Depth value in a METRIC object for both a PCE computed LSP and a PCE controlled LSP. PCE will compute and provide the full explicit path with TE-links specified. If there is no path with the number of hops lower than the MSD value, or the Segment-ID (SID) Depth value if signaled, a reply with no path will be returned to PCC.

For a PCC controlled LSP, if the label stack returned by the TE-DB's hop-to-label translation exceeds the per LSP maximum SR label stack size, the LSP is brought down.

The **no** form of this command reverts to the default value.

Default

max-sr-labels 6 additional-frr-labels 1

Parameters

label-stack-size

Specifies the label stack size.

Values 1 to 11

additional-frr-labels ***labels***

Specifies the addition FRR labels.

Values 0 to 3

configure router mpls ingress-statistics p2mp-template-lsp max-stats

configure router mpls lsp-template egr-stats max-stats

Description

This command enables accounting and statistical data collection. When applying accounting policies the data, by default, is collected in the appropriate records and written to the designated billing file.

When the **no max-stats** command is issued the statistics are still accumulated by the forwarding engine. However, the CPU will not obtain the results and write them to the billing file. If a subsequent **max-stats** command is issued then the counters written to the billing file include all the traffic while the **no max-stats** command was in effect.

max-tx-delay

Syntax

max-tx-delay *deci-seconds*

no max-tx-delay

Context

[Tree] (config>mcast-mgmt>mcast-rprt-dest max-tx-delay)

Full Context

configure mcast-management mcast-reporting-dest max-tx-delay

Description

This command specifies the time interval before the packet starts transmitting towards the destination. When an IGMP event is encoded and ready to be transported, a buffer for the packet is allocated (if not already existent). The events are written into this buffer. Along with the initial buffer creation, a timer is started. The trigger for the transmission of the packet is either the TX buffer being filled up to 1400 B, or the timer expiry, whichever comes first.

The **no** form of this command reverts to the default.

Parameters

deci-seconds

Specifies the maximum delay after which any cached reports are flushed to the reporting destination.

Values 0 to 100

Platforms

All

max-tx-delay

Syntax

max-tx-delay *deciseconds*

no max-tx-delay

Context

[Tree] (config>service>nat>syslog>syslog-export-policy max-tx-delay)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service nat syslog syslog-export-policy max-tx-delay

Description

This command enables aggregation of flow log messages within a syslog frame. It introduces a delay during which logs are collected in each BB-ISA so they can be sent in a single syslog message to conserve system resources and network bandwidth.

When aggregation is enabled, generation of a syslog frame carrying multiple flow logs is triggered by one of the two events (whichever occurs first):

- Expiry of the max-tx-delay timer
- Exceeding MTU size

The **no** form of the command reverts to the default.

Default

max-tx-delay 3

Parameters

deciseconds

Specifies the maximum time a syslog message is delayed in the system's output buffer.

Values 1 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

29.20 max-ve-id

max-ve-id

Syntax

max-ve-id *value*

no max-ve-id

Context

[Tree] (config>service>vpls>bgp-vpls max-ve-id)

Full Context

configure service vpls bgp-vpls max-ve-id

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the allowed range for the VE-id value: locally configured and received in a NLRI. Configuration of a VE-id higher than the value specified in this command is not allowed.

Also upon reception of a higher VE-id in an NLRI imported in this VPLS instance (RT is the configured import RT) the following action must be taken:

- a trap must be generated informing the operator of the mismatch.
- NLRI must be dropped
- no service labels are to be installed for this VE-id
- no new NLRI must be generated if a new offset is required for VE-id.

The **no** form of this command sets the max-ve-id to un-configured. The BGP VPLS status should be administratively down for "no max-ve-id" to be used.

The max-ve-id value can be changed without shutting down bgp-vpls if the newly provisioned value does not conflict with the already configured local VE-ID. If the value of the local-VE-ID is higher than the new max-ve-id value the command is rejected. The operator needs to decrease first the VE-ID before running the command.

The actions taken for other max-ve-id values are as follows:

- max-ve-id value higher than all VE-IDs (local and received) is allowed and there are no effects.
- max-ve-id higher than the local VE-ID but smaller than the remote VE-IDs:
  - Provisioning is allowed
  - A warning message will be generated stating that "Higher VE-ID values were received in the BGP VPLS context. Related pseudowires will be removed."
  - The pseudowires associated with the higher VE-IDs will be removed locally.
  - This is a situation that should be corrected by the operator as the pseudowire may be down just at the local PE, consuming unnecessarily core bandwidth. The higher VE-IDs should be removed or lowered.

If the max-ve-id has increased a BGP route refresh is sent to the VPLS community to get the routes which might have been rejected earlier due to max-ve-id check. A max-ve-id value needs to be provisioned for BGP VPLS to be in "no shutdown" state.

Default

no max-ve-id

Parameters

value

Specifies the allowed range of [1-value] for the VE-id. The configured value must be bigger than the existing VE-ids

Values 1 to 65535

Platforms

All

29.21 max-wait-to-advertise

max-wait-to-advertise

Syntax

max-wait-to-advertise *seconds*

no max-wait-to-advertise

Context

[Tree] (config>service>vprn>bgp>convergence>family max-wait-to-advertise)

Full Context

configure service vprn bgp convergence family max-wait-to-advertise

Description

This command configures the maximum amount of time that BGP waits until it starts advertising IPv4-unicast or IPv6-unicast routes to its BGP peers. For IPv4-unicast routes, *seconds* is measured from the time when the first peer that supports the IPv4-unicast address family comes up. For IPv6-unicast routes *seconds* is measured from the time when the first peer that negotiates the IPv6-unicast address family comes up.

The time limit configured by this command should allow sufficient time for all important peers to re-establish their sessions with the restarting router and advertise their complete set of IPv4-unicast or IPv6-unicast routes (followed by the applicable End of RIB marker).

The **no** form of this command implements the default value, which is three times the value of the **min-wait-to-advertise** time limit.

Default

no max-wait-to-advertise

Parameters

seconds

Specifies the maximum amount of time, in seconds, that BGP waits until IPv4-unicast or IPv6-unicast routes are advertised to peers.

Values 0 to 3600

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure router dhcp local-dhcp-server failover maximum-client-lead-time

configure service vprn dhcp6 local-dhcp-server failover maximum-client-lead-time

Description

The command configures the maximum time that a DHCP server can extend client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environment, the initial lease time for all DHCP clients is by default restricted to MCLT. Consecutive DHCP renews can extend the lease time beyond the MCLT.

The maximum client lead time (MCLT) is a safeguard against IP address/prefix duplication in cases of a lease synchronization failure when local-remote failover model is deployed.

Once the intercommunication link failure between the redundant DHCP servers is detected, the DHCP IP address range configured as remote will not be allowed to start delegating new leases until the MCLT + partner-down-delay intervals expire. This is to ensure that the new lease that was delegated from the local IP address-range/prefix on one node but was never synchronized due to the intercommunication link failure, will expire before the same IP address/prefix is allocated from the remote IP address-range/prefix on the other node.

However, the already existing (and synchronized) lease times can be renewed from the remote IP address range at any time, regardless of the state of the intercommunication link (operational or failed).

Lease synchronization failure can be caused either by a node failure, or a failure of the link over which the DHCP leases are synchronized (intercommunication link). Synchronization failure detection can take up to 3 seconds.

During the failure, the DHCP lease time for the new clients is restricted to MCLT while for the existing clients the lease time will over time (by consecutive DHCP renews) be gradually reduced to the MCLT.

29.26 maximum-ipv6-routes

maximum-ipv6-routes

Syntax

maximum-ipv6-routes *number* [**log-only**] [**threshold** *percentage*]

no maximum-ipv6-routes

Context

[Tree] (config>service>vprn maximum-ipv6-routes)

Full Context

configure service vprn maximum-ipv6-routes

Description

This command specifies the maximum number of remote IPv6 routes that can be held within a VPN routing/ forwarding (VRF) context. The **local**, **host**, **static** and **aggregate** routes are not counted.

The VPRN service ID must be in a shutdown state in order to modify maximum-routes command parameters.

If the **log-only** parameter is not specified and the maximum-routes value is set below the existing number of routes in a VRF, then the offending RIP peer (if applicable) is brought down (but the VPRN instance remains up). BGP peering will remain up but the exceeding BGP routes will not be added to the VRF.

The maximum route threshold can dynamically change to increase the number of supported routes even when the maximum has already been reached. Protocols will resubmit their routes which were initially rejected.

The **no** form of this command disables any limit on the number of routes within a VRF context. The threshold will not be raised. Issue the **no** form of this command only when the VPRN instance is shutdown.

Default

0 or disabled

Parameters

number

Specifies an integer that specifies the maximum number of routes to be held in a VRF context.

Values 1 to 2147483647

log-only

Specifies that if the maximum limit is reached, only log the event. **log-only** does not disable the learning of new routes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

threshold percentage

Specifies the percentage at which a warning log message and SNMP trap should be set. There are two warnings, the first is a mid-level warning at the threshold value set and the second is a high-level warning at level between the maximum number of routes and the mid-level rate ([mid+max] / 2).

Default

maximum-p2mp-spmsi 10

Parameters

range

Specifies the maximum number of RSVP P2MP or LDP P2MP S-PMSI tunnels for the GTM.

Values 1 to 4000

Default 10

Platforms

All

29.30 maximum-paths

maximum-paths

Syntax

maximum-paths *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]

no maximum-paths

Context

[Tree] (config>service>vprn>bgp>multi-path maximum-paths)

Full Context

configure service vprn bgp multi-path maximum-paths

Description

This command sets ECMP multi-path parameters that apply to all address families for that BGP multi-path. For some address families it is possible to override these settings on a per address family basis.

When multi-path is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

To qualify as a multi-path, a non-best route must meet the following criteria (some criteria are controlled by this command):

- The multi-path route must be the same type of route as the best path (same AFI/SAFI and, in some cases, same next-hop resolution method).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- The multi-path route must be tied with the best path for all criteria of greater significance than next-hop cost, except for criteria that are configured to be ignored.
- If the best path selection reaches the next-hop cost comparison, the multi-path route must have the same next-hop cost as the best route unless the **unequal-cost** option is configured.
- The multi-path route must not have the same BGP next-hop as the best path or any other multi-path route.
- The multi-path route must not cause the ECMP limit of the routing instance to be exceeded (configured using the **ecmp** command with a value in the range 1 to 64).
- The multi-path route must not cause the applicable *max-paths* limit to be exceeded. If the best path is an EBGP learned route and the **ebgp** option is used, the *ebgp-max-paths* limit overrides the *max-paths* limit. If the best path is an IBGP-learned route and the **ibgp** option is used, the *ibgp-max-paths* limit overrides the *max-paths* limit. All path limits are configurable up to a maximum of 64. Multi-path is effectively disabled if a value is set to 1.
- The multi-path route must have the same neighbor AS in its AS path as the best path if the **restrict same-neighbor-as** option is configured. By default, any path with the same AS path length as the best path (regardless of neighbor AS) is eligible for multi-path.
- The route must have the same AS path as the best path if the **restrict exact-as-path** option is configured. By default, any path with the same AS path length as the best path (regardless of the actual AS numbers) is eligible for multi-path.

The **no** form of this command disables BGP multi-path.

Default

no maximum-paths

Parameters

max-paths

Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

egp-max-paths

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

restrict same-neighbor-as

Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

restrict exact-as-path-as

Specifies that the non-best path must have the same AS path as the best path.

unequal-cost

Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

Platforms

All

Parameters

interval

Specifies the length of time in seconds.

Values 15 to 1800

Platforms

All

29.32 maximum-routes

maximum-routes

Syntax

maximum-routes *number* [**log-only**] [**threshold** *percentage*]

no maximum-routes

Context

[Tree] (config>service>vprn maximum-routes)

Full Context

configure service vprn maximum-routes

Description

This command specifies the maximum number of remote routes that can be held within a VPN routing/forwarding (VRF) context. The **local**, **host**, **static** and **aggregate** routes are not counted.

The VPRN service ID must be in a shutdown state in order to modify maximum-routes command parameters.

If the **log-only** parameter is not specified and the maximum-routes value is set below the existing number of routes in a VRF, then the offending RIP peer (if applicable) is brought down (but the VPRN instance remains up). BGP peering will remain up but the exceeding BGP routes will not be added to the VRF.

The maximum route threshold can dynamically change to increase the number of supported routes even when the maximum has already been reached. Protocols will resubmit their routes which were initially rejected.

The **no** form of this command disables any limit on the number of routes within a VRF context. Issue the **no** form of this command only when the VPRN instance is shutdown.

Default

0 or disabled — The threshold will not be raised.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

number

An integer that specifies the maximum number of routes to be held in a VRF context.

Values 1 to 2147483647

log-only

Specifies that if the maximum limit is reached, only log the event. **log-only** does not disable the learning of new routes.

threshold percentage

The percentage at which a warning log message and SNMP trap should be set. There are two warnings, the first is a mid-level warning at the threshold value set and the second is a high-level warning at level between the maximum number of routes and the mid-level rate ([mid+max] / 2).

Syntax

[**no**] **mbb-prefer-current-hops**

Context

[Tree] (config>router>mpls mbb-prefer-current-hops)

Full Context

configure router mpls mbb-prefer-current-hops

Description

This command implements a new option in the CSPF path computation during a Make-Before-Break (MBB) procedure of an RSVP LSP.

When MPLS performs an MBB for the primary or secondary path of a P2P LSP, or the S2L path of a P2MP LSP, and the new **mbb-prefer-current-hops** option is enabled in MPLS context, CSPF will select a path, among equal-cost candidate paths, with the most overlapping links with the current path. Normally, CSPF selects the path randomly.

The procedures of the new MBB CSPF path selection apply to LSP without the least-fill option enabled. If the least-fill rule results in a different path, the LSP path will be moved though. Users can still favor stability over least-fill condition by applying a larger value to the parameter **least-fill-min-thd** under the MPLS context such that a path will only be moved when the difference of the least-available bandwidth becomes significant enough between the most used links in the equal cost paths. If that difference is not significant enough, CSPF will select the path with the most overlapping links instead of selecting a path randomly.

The procedures when the new **mbb-prefer-current-hops** option is enabled apply to all MBB types. Thus, it applies to the auto-bandwidth MBB, the configuration change MBB, the soft preemption MBB, the TE graceful shutdown MBB, the delayed retry MBB (for SRLG secondary LSP path), the path change MBB, the timer resignal MBB, and the manual resignal MBB.

During the FRR global revertive MBB, CSPF selects a random link among the ones available between the PLR node and the Merge Point node, including the failed link if it has restored in the meantime. These links cannot be checked for overlap with the current path.

The TE graceful shutdown MBB will still avoid the link or node that is in maintenance and the soft preemption MBB will still avoid the link that is overbooked.

For an inter-area LSP, this feature applies to the subset of the path from the ingress LER to the exit ABR.

The procedures of this feature are not applied to a zero bandwidth CSPP LSP, including an auto-bandwidth CSPF LSP while its operational bandwidth is zero, and to a non-CSPF LSP.

Full Context

configure mcast-management bandwidth-policy t2-paths primary-path queue-parameters mbs

configure mcast-management bandwidth-policy t2-paths secondary-path queue-parameters mbs

Description

This command configures the override for the default maximum buffer size (MBS) for each individual path's queue. The queue's MBS threshold defines the point at which all packets destined for the queue are discarded based on queue depth. The defined threshold also provides context for the queues drop-tail parameter.

The mbs *percent-of-pool* parameter is defined as a percentage of the total pool size. The system allows the sum of all MBS values to equal more than 100%, allowing for oversubscription of the pool.

For the primary-path and secondary-path queues, the **mbs** value is applied to a single queue for each path.

The **no** form of this command is used to restore the path queues default MBS value.

Parameters

percent-of-pool

Specifies the percent of buffers from the total buffer pool space for the number of buffers, expressed as a decimal integer. If 10 MB is the total buffers in the buffer pool, a value of 10 would limit the maximum queue size to 1 MB (10%) of buffer space for the forwarding class queue. If the total size is increased to 20 MB, the existing value of 10 automatically increases the maximum size of the queue to 2 MB.

Values 0 to 100

configure subscriber-mgmt sla-profile egress qos queue mbs

Description

This command configures the maximum size for the queue.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The sum of the MBS for all queues on an egress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer is available when needed or that the packet's RED slope will not force the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

The **no** form of this command returns the MBS size to the size as configured in the QoS policy.

Parameters

size

This required parameter specifies that the MBS is expressed as an integer representing the required size in either bytes or kilobytes. The default is **kilobytes**. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly to define the size. By specifying the keyword **default** sets the MBS to its default value.

Values 0 to 1073741824, **default**

bytes

Specifies that the value given for *size* is interpreted as the queue's MBS value in bytes.

kilobytes

Specifies that the value given for *size* is interpreted as the queue's MBS value in kilobytes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure subscriber-mgmt sla-profile ingress qos queue mbs

Description

The Maximum Burst Size (MBS) command configures the explicit definition of the maximum number of buffers allowed for a specific queue.

The MBS value is used by a queue to determine whether it has exhausted all of its buffers while enqueuing packets. Once the queue has exceeded the number of buffers allowed by MBS, all packets are discarded until packets have been drained from the queue.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The sap-ingress context for mbs provides a mechanism for overriding the default maximum size for the queue.

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer is available when needed or that the packet's RED slope does not force the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

The **no** form of this command returns the MBS size to the size as configured in the QoS policy.

Parameters

size

This required parameter specifies that the MBS is expressed as an integer representing the required size in either bytes or kilobytes. The default is **kilobytes**. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly to define the size. By specifying the keyword **default** sets the MBS to its default value.

Values 0 to 1073741824, **default**

bytes

Specifies that the value given for *size* is interpreted as the queue's MBS value is in bytes.

kilobytes

Specifies that the value given for *size* is interpreted as the queue's MBS value is in kilobytes.

Description

This command overrides specific attributes of the specified queue's MBS parameters. The MBS is a mechanism to override the default maximum size for the queue.

The sum of the MBS for all queues on an egress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer is available when needed or that the packets RED slope is not forced the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

If the CBS value is larger than the MBS value, an error will occur, preventing the MBS change.

The **no** form of this command returns the MBS size assigned to the queue.

Default

mbs default

Parameters

size

This required parameter specifies that the MBS is expressed as an integer representing the required size in either bytes or kilobytes. The default is **kilobytes**. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly to define the size. Specifying the keyword **default** sets the MBS to its default value.

Values 0 to 1073741824, default

bytes

Specifies that the value given for *size* is interpreted as the queue's MBS value in bytes.

kilobytes

Specifies that the value given for *size* is interpreted as the queue's MBS value in kb/s.

Full Context

configure service vpls sap ingress queue-override queue mbs

configure service vpls sap egress queue-override queue mbs

Description

This command overrides specific attributes of the specified queue's MBS parameters. The MBS value is used by a queue to determine whether it has exhausted all of its buffers while enqueuing packets. Once the queue has exceeded the amount of buffers allowed by MBS, all packets are discarded until packets have been drained from the queue.

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope a packet is associated with. A queue that has not exceeded its MBS is not guaranteed that a buffer will be available when needed or that the packets RED slope will not force the discard of the packet. Setting correct CBS parameters and controlling CBS over-subscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

The **no** form of this command returns the MBS assigned to the queue to the default value.

Default

mbs default

Parameters

size

The size parameter is required when specifying mbs and is expressed as an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **bytes** and **kilobytes** keywords are mutually exclusive and are used to explicitly define whether the size represents bytes or kilobytes.

Values 0 to 1073741824

default

bytes

When **byte** is defined, the value given for size is interpreted as the queue's MBS value given in bytes.

kilobytes

When **kilobytes** is defined, the value is interpreted as the queue's MBS value given in kilobytes.

Full Context

configure card fp ingress access queue-group policer-override policer mbs

configure card fp ingress network queue-group policer-override policer mbs

Description

This command configures the policer's PIR leaky bucket's violate threshold. The **high-prio-only** command is applied to the MBS value to derive the bucket's low priority violate threshold. For ingress, trusted in-profile packets and untrusted high priority packets use the policer's high priority violate threshold while trusted out-of-profile and untrusted low priority packets use the policer's low priority violate threshold.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The PIR bucket's violate threshold represent the maximum burst tolerance allowed by the policer. If the policer's offered rate is equal to or less than the policer's defined rate, the PIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the offered rate increases beyond the metering rate, the amount of data allowed above the rate is capped by the threshold. The low priority violate threshold provides a smaller burst size for the lower priority traffic associated with the policer. Since all lower priority traffic is discarded at the lower burst tolerance size, the remaining burst tolerance defined by **high-prio-only** is available for the higher priority traffic.

The policer's mbs size defined in the QoS policy may be overridden on an sla-profile or SAP where the policy is applied.

The **no** form of this command reverts the policer to its default MBS size. By default, the MBS is 16 Mbytes when PIR equals max or is greater than or equal to the FP capacity (this overrides an explicit configured MBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max PIR capped to 3968 kbytes, with a minimum of 256 bytes.

Parameters

size

The *size* parameter is required when specifying **mbs** and is expressed as an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **bytes** and **kilobytes** keywords are mutually exclusive and are used to explicitly define whether size represents bytes or kilobytes.

Values 0 to 2683435456, **default**

bytes

When **bytes** is defined, the value given for size is interpreted as the policer's MBS value given in bytes.

kilobytes

When **kilobytes** is defined, the value is interpreted as the policer's MBS value given in kilobytes.

default

Keyword that reverts the MBS to its default value.

[Tree] (config>port>ethernet>access>egr>qgrp>qover>q mbs)

Full Context

configure port ethernet access ingress queue-group queue-overrides queue mbs

configure port ethernet network egress queue-group queue-overrides queue mbs

configure port ethernet access egress queue-group queue-overrides queue mbs

Description

The Maximum Burst Size (MBS) command specifies the default maximum buffer size for the template queue. The value is given in kilobytes.

The MBS value is used by a queue to determine whether it has exhausted all of its buffers while enqueuing packets. Once the queue has exceeded the amount of buffers allowed by MBS, all packets are discarded until packets have been drained from the queue.

The **queue-group** or network egress QoS context for mbs provides a mechanism for overriding the default maximum size for the queue.

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer will be available when needed or that the packets RED slope will not force the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

This command applies to egress queue group queues as the queue-delay is only supported on egress queues. This command **the queue-delay** command are mutually exclusive.

The **no** form of this command returns the MBS size assigned to the queue to the value.

Default

mbs default

Parameters

size

The *size* parameter is required when specifying **mbs** and is expressed as an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly define whether size represents bytes or kilobytes.

Values 0 to 1073741824

bytes

When **byte** is defined, the value given for size is interpreted as the queue's MBS value given in bytes.

kilobytes

When **kilobytes** is defined, the value is interpreted as the queue's MBS value given in kilobytes.

configure service ipipe sap egress queue-override queue mbs

configure service ipipe sap ingress queue-override queue mbs

configure service epipe sap ingress queue-override queue mbs

configure service epipe sap egress queue-override queue mbs

Description

This command overrides specific attributes of the specified queue's MBS parameters. A queue uses its MBS value to determine whether it has exhausted all of its buffers while enqueuing packets. Once the queue has exceeded the number of buffers allowed by the MBS, all packets are discarded until packets have been drained from the queue.

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope associated with a packet. A queue that has not exceeded its MBS is not guaranteed to have buffer available when needed or that the packet's RED slope will not force the discard of the packet. Setting correct CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

The **no** form of this command returns the MBS assigned to the queue to the default value.

Default

mbs default

Parameters

size

The size parameter is an integer expression of the maximum number of kilobytes or bytes of buffering allowed for the queue. A value of 0 causes the queue to discard all packets.

Values 0 to 1073741824, default

bytes

Indicates that the *size* parameter value is expressed in bytes.

kilobytes

Indicates that the *size* parameter is expressed in kilobytes.

Description

This command is used to configure the policer's PIR leaky bucket's high-priority violate threshold. The **high-prio-only** command is applied to the MBS value to derive the bucket's low-priority violate threshold. For ingress, trusted in-profile packets and untrusted high-priority packets use the policer's high-priority violate threshold while trusted out-of-profile and untrusted low-priority packets use the policer's low-priority violate threshold. At egress, inplus-profile, and in-profile packets use the policer's high-priority violate threshold and out-of-profile packets use the policer's low-priority violate threshold. Exceed-profile packets are discarded unless **enable-exceed-pir** is configured, in which case they are forwarded.

The PIR bucket's violate threshold represents the maximum burst tolerance allowed by the policer. If the policer's offered rate is equal to or less than the policer's defined rate, the PIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the offered rate increases beyond the metering rate, the amount of data allowed above the rate is capped by the threshold. The low-priority violate threshold provides a smaller burst size for the lower priority traffic associated with the policer. Since all lower priority traffic is discarded at the lower burst tolerance size, the remaining burst tolerance defined by **high-prio-only** is available for the higher priority traffic.

The policer's MBS size defined in the QoS policy may be overridden on an SLA profile or SAP where the policy is applied.

The **no** form of this command returns the queue to its default MBS size. By default, the MBS is 16 Mbytes when PIR equals max or is greater than or equal to the FP capacity (this overrides an explicit configured MBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max PIR capped to 3968 kbytes, with a minimum of 256 bytes.

Parameters

size [bytes | kilobytes]

The *size* parameter is required when specifying **mbs** and is expressed as an integer representing the required size in either bytes or kilobytes. The default is kilobytes. Context

[Tree] (config>qos>network-queue>queue mbs)

Full Context

configure qos network-queue queue mbs

Description

This command specifies the relative amount of buffer pool space for the maximum buffers for a specific ingress network FP forwarding class queue or egress network port forwarding class queue. The value is entered as a percentage.

The MBS value is used by a queue to determine whether it has exhausted its total allowed buffers while enqueuing packets. When the queue has exceeded its maximum amount of buffers, all packets are discarded until the queue transmits a packet. A queue that has not exceeded its MBS is not guaranteed to have a buffer available when needed or that the packet's RED slope will not force the discard of the packet. In order to safeguard against queue starvation (when a queue does not receive its fair share of buffers), set proper CBS parameters and control CBS oversubscription. Another safeguard is to properly set the RED slope parameters for the needs of the network queues.

The MBS can sometimes be smaller than the CBS. This will result in a portion of the CBS for the queue to be unused and should be avoided.

The **no** form of this command returns the MBS for the queue to the default for the forwarding class.

Parameters

percent

The percent of buffers from the total buffer pool space for the maximum number of buffers, expressed as a decimal integer. If 10 Mbytes is the total buffer space in the buffer pool, a value of 10 would limit the maximum queue size to 1 Mbyte (10%) of buffer space for the forwarding class queue. If the total size is increased to 20 Mbytes, the existing value of 10 would automatically increase the maximum size of the queue to 2 Mbytes.

configure qos queue-group-templates egress queue-group policer mbs

configure qos queue-group-templates ingress queue-group policer mbs

Description

This command specifies the default maximum buffer size for the template queue in bytes or kilobytes.

The MBS value is used by a queue to determine whether it has exhausted all of its buffers while enqueuing packets. When the queue has exceeded the amount of buffers allowed by MBS, all packets are discarded until packets have been drained from the queue.

The **port>ethernet>access>ingress>queue-group** and **port>ethernet>access>egress>queue-group** contexts for **mbs** provides a mechanism for overriding the default maximum size for the queue.

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope that a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer will be available when needed or that the packet's RED slope will not force the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard against queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

When configured on an egress queue group queue, this command and the **queue-delay** command are mutually exclusive. In order to change between the **mbs** and **queue-delay** parameters, the current parameter must be removed before adding the new parameter; that is, changing from **mbs** to **queue-delay** requires a **no mbs** before the **queue-delay** is configured and changing from **queue-delay** to **mbs** requires a **no queue-delay** before the **mbs** is configured. If **queue-delay** is configured for an egress queue group queue, it is not possible to override the MBS for that queue.

For policers, this command is used to configure the policer's PIR leaky bucket's high-priority violate threshold. The **high-prio-only** command is applied to the MBS value to derive the bucket's low-priority violate threshold.

At ingress, trusted in-profile packets and untrusted high-priority packets use the policer's high-priority violate threshold while trusted out-of-profile and untrusted low-priority packets use the policer's low-priority violate threshold.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

At egress, inplus-profile and in-profile packets use the policer’s high-priority violate threshold and out-of-profile packets use the policer's low-priority violate threshold. Exceed-profile packets are discarded unless **enable-exceed-pir** is configured, in which case they are forwarded.

The PIR bucket’s violate threshold represents the maximum burst tolerance allowed by the policer. If the policer's offered rate is equal to or less than the policer's defined rate, the PIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the offered rate increases beyond the metering rate, the amount of data allowed above the rate is capped by the threshold. The low-priority violate threshold provides a smaller burst size for the lower priority traffic associated with the policer. Since all lower priority traffic is discarded at the lower burst tolerance size, the remaining burst tolerance defined by high-prio-only is available for the higher priority traffic.

The policer’s mbs size defined in the QoS policy may be overridden on an SLA profile or SAP where the policy is applied.

The **no** form of this command returns the MBS size to its default value. By default, the MBS is 16 Mbytes when PIR equals max or is greater than or equal to the FP capacity (this overrides an explicit configured MBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max PIR capped to 3968 kbytes, with a minimum of 256 bytes.

Default

default

Parameters

size

For queues, the size parameter is an integer expression of the maximum number of bytes or kilobytes of buffering allowed for the queue. For a value of 100 kbytes, enter the value 100. A value of 0 causes the queue to discard all packets. For policers, the size parameter is an integer expression of the maximum number of bytes for the policer's MBS. The queue MBS maximum value used is constrained by the pool size in which the queue exists and by the shared pool space in the corresponding megapool.

Values 0 to 2683435456

Default value: 16 Mbytes when PIR equals max or is greater than or equal to the FP capacity (this overrides an explicitly configured MBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max PIR capped to 3968 kbytes, with a minimum of 256 bytes.

[bytes | kilobytes]

Specifies bytes or kilobytes.

Default kilobytes

default

Sets the MBS to its default value.

[Tree] (config>qos>qgrps>egr>qgrp>queue mbs)

Full Context

configure qos queue-group-templates ingress queue-group queue mbs

configure qos queue-group-templates egress queue-group queue mbs

Description

This command specifies the default maximum buffer size for the template queue in bytes or kilobytes.

The MBS value is used by a queue to determine whether it has exhausted all of its buffers while enqueuing packets. When the queue has exceeded the amount of buffers allowed by MBS, all packets are discarded until packets have been drained from the queue.

The **port>ethernet>access>ingress>queue-group** and **port>ethernet>access>egress>queue-group** contexts for **mbs** provides a mechanism for overriding the default maximum size for the queue.

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope that a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer will be available when needed or that the packet's RED slope will not force the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard against queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

When configured on an egress queue group queue, this command and the **queue-delay** command are mutually exclusive. In order to change between the **mbs** and **queue-delay** parameters, the current parameter must be removed before adding the new parameter; that is, changing from **mbs** to **queue-delay** requires a **no mbs** before the **queue-delay** is configured and changing from **queue-delay** to **mbs** requires a **no queue-delay** before the **mbs** is configured. If **queue-delay** is configured for an egress queue group queue, it is not possible to override the MBS for that queue.

For policers, this command is used to configure the policer's PIR leaky bucket's high-priority violate threshold. The **high-prio-only** command is applied to the MBS value to derive the bucket's low-priority violate threshold.

At ingress, trusted in-profile packets and untrusted high-priority packets use the policer's high-priority violate threshold while trusted out-of-profile and untrusted low-priority packets use the policer's low-priority violate threshold.

At egress, inplus-profile and in-profile packets use the policer's high-priority violate threshold and out-of-profile packets use the policer's low-priority violate threshold. Exceed-profile packets are discarded unless **enable-exceed-pir** is configured, in which case they are forwarded.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The PIR bucket’s violate threshold represents the maximum burst tolerance allowed by the policer. If the policer's offered rate is equal to or less than the policer's defined rate, the PIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the offered rate increases beyond the metering rate, the amount of data allowed above the rate is capped by the threshold. The low-priority violate threshold provides a smaller burst size for the lower priority traffic associated with the policer. Since all lower priority traffic is discarded at the lower burst tolerance size, the remaining burst tolerance defined by high-prio-only is available for the higher priority traffic.

The policer’s mbs size defined in the QoS policy may be overridden on an SLA profile or SAP where the policy is applied.

The **no** form of this command returns the MBS size assigned by the queue.

Default

default

Parameters

size

For queues, the size parameter is an integer expression of the maximum number of bytes or kilobytes of buffering allowed for the queue. For a value of 100 kbytes, enter the value 100. A value of 0 causes the queue to discard all packets. For policers, the size parameter is an integer expression of the maximum number of bytes for the policer's MBS. The queue MBS maximum value used is constrained by the pool size in which the queue exists and by the shared pool space in the corresponding megapool.

Values 0 to 1048576 or **default**

Minimum configurable non-zero value: 6 kbytes on an FP2, 7680 bytes on an FP3, and 16 kbytes on an FP4

Minimum non-zero default value: maximum of 10 ms of CIR, or 6 kbytes on an FP2, 7680 bytes on an FP3, and 16 kbytes on an FP4

[bytes | kilobytes]

Specifies bytes or kilobytes.

Default kilobytes

default

Sets the MBS to its default value.

Context

[Tree] (config>qos>shared-queue>queue mbs)

Full Context

configure qos shared-queue queue mbs

Description

This command specifies the relative amount of the buffer pool space for the maximum buffers for a specific ingress shared queue.

The MBS value is used by a queue to determine whether it has exhausted its total allowed buffers while enqueuing packets. When the queue has exceeded its maximum amount of buffers, all packets are discarded until the queue transmits a packet. A queue that has not exceeded its MBS size is not guaranteed that a buffer will be available when needed. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard against queue starvation (when a queue does not receive its fair share of buffers).

The MBS size can sometimes be smaller than the CBS. This will result in a portion of the CBS for the queue to be unused and should be avoided.

Default

The queue MBS defaults are listed in Table 82: Queue MBS Default Values.

Table 82: Queue MBS Default Values

configure subscriber-mgmt sub-profile egress policer-control-policy priority-mbs-thresholds priority mbs-contribution

configure subscriber-mgmt sub-profile ingress policer-control-policy priority-mbs-thresholds priority mbs-contribution

Description

This command is used to configure the policy-based burst tolerance for a parent policer instance created when the policy is applied to a SAP or subscriber context. The system uses the parent policer's **min-thresh-separation** value, the priority level's **mbs-contribution** value and the number of child policers currently attached to the priority level to derive the priority level's shared-portion and fair-portion of burst tolerance within the local priority level. The shared-portion and fair-portions for each priority level are then used by the system to calculate each priority level's discard-unfair threshold and discard-all threshold.

The value for a priority level's **mbs-contribution** within the policer-control-policy may be overridden on the SAP or subscriber sub-profile where the policy is applied in order to allow fine tuning of the discard-unfair and discard-all thresholds relevant to the needs of the local child policers on the object.

Accumulative Nature of Burst Tolerance for a Parent Policer Priority Level

When defining **mbs-contribution**, the specified size may only be a portion of the burst tolerance associated with the priority level. The packets associated with the priority level share the burst tolerance of lower within the parent policer. As the parent policer PIR bucket depth increases during congestion, the lower priority packets eventually experience discard based on each priority's discard-unfair and discard-all thresholds. Assuming congestion continues once all the lower priority packets have been prevented from consuming bucket depth, the burst tolerance for the priority level is consumed by its own packets and any packets associated with higher priorities.

The Effect of Fair and Unfair Child Policer Traffic at a Parent Policer Priority Level

The system continually monitors the offered rate of each child policer on each parent policer priority level and detects when the policer is in a congested state (the aggregate offered load is greater than the decrement rate defined on the parent policer). As previously stated, the result of congestion is that the parent policer's bucket depth will increase until it eventually hovers around either a discard-unfair or discard-all threshold belonging to one of the priority levels. This threshold is the point where enough

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

packets are being discarded that the increment rate and decrement rate begin to even out. If only a single child policer is associated to the priority level, the discard-unfair threshold is not used since fairness is only applicable when multiple child policers are competing at the same priority level.

When multiple child policers are sharing the congested priority level, the system uses the offered rates and the parenting parameters of each child to determine the fair rate per child when the parent policer is unable to meet the bandwidth needs of each child. The fair rate represents the number of bandwidth that each child at the priority level should receive relative to the other children at the same level according to the policer control policy instance managing the child policers. This fair rate is applied as the decrement rate for each child's FIR bucket. Changing a child's FIR rate does not modify the number of packets forwarded by the parent policer for the child's priority level. It simply modifies the forwarded ratio between the children on that priority level. Since each child FIR bucket has some level of burst tolerance before marking its packets as unfair, the current parent policer bucket depth may at times rise above the discard-unfair threshold. The mbs-contribution value provides a means to define how much separation is provided between the priority level's discard-unfair and discard-all threshold to allow the parent policer to absorb some of the FIR burst before reaching the priority's discard-all threshold.

This level of fair aggregate burst tolerance is based on the decrement rate of the parent policer's PIR bucket while the individual fair bursts making up the aggregate are based on each child's FIR decrement rate. The aggregate fair rate of the priority level is managed by the system with consideration of the current rate of traffic in higher priority levels. In essence, the system ensures that for each iteration of the child FIR rate calculation, the sum of the child FIR decrement rates plus the sum of the higher priority traffic increment rates equals the parent policers decrement rate. This means that dynamic numbers of higher priority traffic can be ignored when sizing a lower priority's fair aggregate burst tolerance. Consider the following:

- The parent policer decrement rate is set to 20 Mb/s (max-rate 20,000).
- A priority level's fair burst size is set to 30 kbytes (mbs-contribution 30 kbytes).
- Higher priority traffic is currently taking 12 Mb/s.
- The priority level has three child policers attached.
- Each child's PIR MBS is set to 10 kbytes, which makes each child's FIR MBS 10 kbytes.
- The children want 10 Mb/s, but only 8 Mb/s is available,
- Based on weights, the children's FIR rates are set as follows.

Table 83: FIR Rates of the Children Based on Weights

	FIR Rate	FIR MBS
Child 1	4 Mb/s	10 kbytes
Child 2	3 Mb/s	10 kbytes
Child 3	1 Mb/s	10 kbytes

The 12 Mb/s of the higher priority traffic and the 8 Mb/s of fair traffic equal the 20 Mb/s decrement rate of the parent policer.

It is clear that the higher priority traffic is consuming 12 Mb/s of the parent policer's decrement rate, leaving 8 Mb/s of decrement rate for the lower priority's fair traffic.

- The burst tolerance of child 1 is based on 10 kbytes above 4 Mb/s,
- The burst tolerance of child 2 is based on 10 kbytes above 3 Mb/s,

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- The burst tolerance of child 3 is based on 10 kbytes above 1 Mb/s.

If all three children burst simultaneously (unlikely), they will consume 30 kbytes above 8 Mb/s. This is the same as the remaining decrement rate after the higher priority traffic.

Parent Policer Total Burst Tolerance and Downstream Buffering

The highest in-use priority level's discard-all threshold is the total burst tolerance of the parent policer. In some cases the parent policer represents downstream bandwidth capacity and the max-rate of the parent policer is set to prevent overrunning the downstream bandwidth. The burst tolerance of the parent policer defines how much more traffic may be sent beyond the downstream scheduling capacity. In the worst case scenario, when the downstream buffering is insufficient to handle the total possible burst from the parent policer, downstream discards based on lack of buffering may occur. However, in all likelihood, this is not the case.

In most cases, lower priority traffic in the policer is responsible for the greater part of congestion above the parent policer rate. Since this traffic is discarded with a lower threshold, this lowers the effective burst tolerance even while the highest priority traffic is present.

Configuring a Priority Level's MBS Contribution Value

In the most conservative case, a priority level's **mbs-contribution** value may be set to be greater than the sum of child policer's mbs and one max-size-frame per child policer. This ensures that even in the absolute worst case where all the lower priority levels are simultaneously bursting to the maximum capacity of each child, enough burst tolerance for the priority's children will exist if they also burst to their maximum capacity.

Since simply adding up all the child policer's PIR MBS values may result in large overall burst tolerances that are not ever likely to be needed, you should consider some level of burst oversubscription when configuring the **mbs-contribution** value for each priority level. The number of oversubscription should be determined based on the needs of each priority level.

Using the Fixed Keyword to Create Deterministic Parent Policer Discard Thresholds

In the default behavior, the system ignores the **mbs-contribution** values for a priority level on a subscriber or SAP parent policer when a child policer is not currently associated with the level. This prevents additional burst tolerance from being added to higher priority traffic within the parent policer.

This does cause fluctuations in the defined threshold values when child policers are added or removed from a parent policer instance. If this behavior is undesirable, the fixed keyword may be used which causes the **mbs-contribution** value to always be included in the calculation of parent policer's discard thresholds. The defined **mbs-contribution** value may be overridden on a subscriber sla-profile or on a SAP instance, but the fixed nature of the contribution cannot be overridden.

If the defined **mbs-contribution** value for the priority level is zero, the priority level will have no effect on the parent policer's defined discard thresholds. A packet associated with the priority level will use the next lower priority level's discard-unfair and discard-all thresholds.

The form of this command returns the policy's priority level's MBS contribution to the default value. When changed, the thresholds for the priority level and all higher priority levels for all instances of the parent policer is recalculated.

Parameters

***size* [bytes | kilobytes]**

The size parameter is required when executing the **mbs-contribution** command. It is expressed as an integer and specifies the priority's specific portion of accumulative MBS for the priority level in bytes or kilobytes which is selected by the trailing **bytes** or **kilobytes** keywords. If both **bytes** and **kilobytes** are missing, **kilobytes** is assumed. Setting this

configure card fp ingress access queue-group policer-control-override priority-mbs-thresholds priority mbs-contribution

Description

This command configures the policy-based burst tolerance for a parent policer instance created when the policy is applied to a SAP or subscriber context. The system uses the parent policer's **min-thresh-separation** value, the priority level's **mbs-contribution** value and the number of child policers currently attached to the priority level to derive the priority level's shared-portion and fair-portion of burst tolerance within the local priority level. The shared-portion and fair-portions for each priority level are then used by the system to calculate each priority level's discard-unfair threshold and discard-all threshold.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The value for a priority level's **mbs-contribution** within the policer-control-policy may be overridden on the SAP or subscriber sub-profile where the policy is applied in order to allow fine tuning of the discard-unfair and discard-all thresholds relevant to the needs of the local child policers on the object.

Accumulative Nature of Burst Tolerance for a Parent Policer Priority Level

When defining **mbs-contribution**, the specified size may only be a portion of the burst tolerance associated with the priority level. The packets associated with the priority level share the burst tolerance of lower within the parent policer. As the parent policer PIR bucket depth increases during congestion, the lower priority packets eventually experience discard based on each priority's discard-unfair and discard-all thresholds. Assuming congestion continues once all the lower priority packets have been prevented from consuming bucket depth, the burst tolerance for the priority level will be consumed by its own packets and any packets associated with higher priorities.

The Effect of Fair and Unfair Child Policer Traffic at a Parent Policer Priority Level

The system continually monitors the offered rate of each child policer on each parent policer priority level and detects when the policer is in a congested state (the aggregate offered load is greater than the decrement rate defined on the parent policer). As previously stated, the result of congestion is that the parent policer's bucket depth will increase until it eventually hovers around either a discard-unfair or discard-all threshold belonging to one of the priority levels. This threshold is the point where enough packets are being discarded that the increment rate and decrement rate begin to even out. If only a single child policer is associated to the priority level, the discard-unfair threshold is not used since fairness is only applicable when multiple child policers are competing at the same priority level.

When multiple child policers are sharing the congested priority level, the system uses the offered rates and the parenting parameters of each child to determine the fair rate per child when the parent policer is unable to meet the bandwidth needs of each child. The fair rate represents the amount of bandwidth that each child at the priority level should receive relative to the other children at the same level according to the policer control policy instance managing the child policers. This fair rate is applied as the decrement rate for each child's FIR bucket. Changing a child's FIR rate does not modify the amount of packets forwarded by the parent policer for the child's priority level. It simply modifies the forwarded ratio between the children on that priority level. Since each child FIR bucket has some level of burst tolerance before marking its packets as unfair, the current parent policer bucket depth may at times rise above the discard-unfair threshold. The mbs-contribution value provides a means to define how much separation is provided between the priority level's discard-unfair and discard-all threshold to allow the parent policer to absorb some amount of FIR burst before reaching the priority's discard-all threshold.

This level of fair aggregate burst tolerance is based on the decrement rate of the parent policer's PIR bucket while the individual fair bursts making up the aggregate are based on each child's FIR decrement rate. The aggregate fair rate of the priority level is managed by the system with consideration of the current rate of traffic in higher priority levels. In essence, the system ensures that for each iteration of the child FIR rate calculation, the sum of the child FIR decrement rates plus the sum of the higher priority traffic increment rates equals the parent policers decrement rate. This means that dynamic amounts of higher priority traffic can be ignored when sizing a lower priority's fair aggregate burst tolerance. Consider the following:

- The parent policer decrement rate is set to 20 Mb/s (max-rate 20,000).
- A priority level's fair burst size is set to 30 kbytes (mbs-contribution 30 kilobytes).
- Higher priority traffic is currently taking 12 Mb/s.
- The priority level has three child policers attached.
- Each child's PIR MBS is set to 10 kbytes, which makes each child's FIR MBS 10 kbytes.
- The children want 10 Mb/s, but only 8 Mb/s is available.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- The following table describes the FIR rates of the children based on weights.

Table 84: FIR Rates of the Children Based on Weights

	FIR Rate	FIR MBS
Child 1	4 Mb/s	10 kbytes
Child 2	3 Mb/s	10 kbytes
Child 3	1 Mb/s	10 kbytes

The 12 Mb/s of the higher priority traffic and the 8 Mb/s of fair traffic equal the 20 Mb/s decrement rate of the parent policer.

It is clear that the higher priority traffic is consuming 12 Mb/s of the parent policer's decrement rate, leaving 8 Mb/s of decrement rate for the lower priority's fair traffic.

- The burst tolerance of child 1 is based on 10 kbytes above 4 Mb/s,
- The burst tolerance of child 2 is based on 10 kbytes above 3 Mb/s,
- The burst tolerance of child 3 is based on 10 kbytes above 1 Mb/s.

If all three children burst simultaneously (unlikely), they will consume 30 kbytes above 8 Mb/s. This is the same as the remaining decrement rate after the higher priority traffic.

Parent Policer Total Burst Tolerance and Downstream Buffering

The highest in-use priority level's discard-all threshold is the total burst tolerance of the parent policer. In some cases the parent policer represents downstream bandwidth capacity and the max-rate of the parent policer is set to prevent overrunning the downstream bandwidth. The burst tolerance of the parent policer defines how much more traffic may be sent beyond the downstream scheduling capacity. In the worst case scenario, when the downstream buffering is insufficient to handle the total possible burst from the parent policer, downstream discards based on lack of buffering may occur. However, in all likelihood, this is not the case.

In most cases, lower priority traffic in the policer will be responsible for the greater part of congestion above the parent policer rate. Since this traffic is discarded with a lower threshold, this lowers the effective burst tolerance even while the highest priority traffic is present.

Configuring a Priority Level's MBS Contribution Value

In the most conservative case, a priority level's **mbs-contribution** value may be set to be greater than the sum of child policer's MBS and one max-size-frame per child policer. This ensures that even in the absolute worst case where all the lower priority levels are simultaneously bursting to the maximum capacity of each child, enough burst tolerance for the priority's children will exist if they also burst to their maximum capacity.

Since simply adding up all the child policer's PIR MBS values may result in large overall burst tolerances that are not ever likely to be needed, you should consider some level of burst oversubscription when configuring the **mbs-contribution** value for each priority level. The amount of oversubscription should be determined based on the needs of each priority level.

Using the Fixed Keyword to Create Deterministic Parent Policer Discard Thresholds

In the default behavior, the system ignores the **mbs-contribution** values for a priority level on a subscriber or SAP parent policer when a child policer is not currently associated with the level. This prevents additional burst tolerance from being added to higher priority traffic within the parent policer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This does cause fluctuations in the defined threshold values when child policers are added or removed from a parent policer instance. If this behavior is undesirable, the fixed keyword may be used which causes the **mbs-contribution** value to always be included in the calculation of parent policer's discard thresholds. The defined **mbs-contribution** value may be overridden on a subscriber SLA profile or on a SAP instance, but the fixed nature of the contribution cannot be overridden.

If the defined **mbs-contribution** value for the priority level is zero, the priority level will have no effect on the parent policer's defined discard thresholds. A packet associated with the priority level will use the next lower priority level's discard-unfair and discard-all thresholds.

The **no** form of this command reverts to the policy's priority level's MBS contribution to the default value. When changed, the thresholds for the priority level and all higher priority levels for all instances of the parent policer are recalculated.

Default

no mbs-contribution

Parameters

size

Specifies that the size parameter is required when executing the **mbs-contribution** command. It is expressed as an integer and specifies the priority's specific portion amount of accumulative MBS for the priority level in bytes or kilobytes which is selected by the trailing **bytes** or **kilobytes** keywords. If both **bytes** and **kilobytes** are missing, **kilobytes** is assumed. Setting this value has no effect on parent policer instances where the priority level's **mbs-contribution** value has been overridden. Clearing an override on parent policer instance causes this value to be enforced.

Values 0 to 16777216

bytes, kilobytes

Specifies that the **bytes** keyword is optional and is mutually exclusive with the **kilobytes** keyword. When specified, size is interpreted as specifying the size of **min-thresh-separation** in bytes.

The **kilobytes** keyword is optional and is mutually exclusive with the **bytes** keyword. When specified, size is interpreted as specifying the size of min-thresh-separation in kilobytes.

configure service ipipe sap ingress policer-control-override priority-mbs-thresholds priority mbs-contribution

configure service cpipe sap egress policer-control-override priority-mbs-thresholds priority mbs-contribution

Description

The mbs-contribution override command within the SAP ingress and egress contexts is used to override a parent policer's priority level's mbs-contribution parameter that is defined within the policer-control-policy applied to the SAP. This override allow the priority level's burst tolerance to be tuned based on the needs of the SAP's child policers attached to the priority level.

When the override is defined, modifications to the policer-control-policy priority level's mbs-contribution parameter have no effect on the SAP's parent policer priority level until the override is removed using the no mbs-contribution command within the SAP.

The **no** form of this command removes the override and allows the mbs-contribution setting from the policer-control-policy to control the parent policer's priority level's burst tolerance.

Default

no mbs-contribution

Parameters

size

Specifies the mbs-contribution override value.

Values 1 to 16777216 | default

bytes

Specifies that *size* is expressed in bytes. The bytes and kilobytes keywords are mutually exclusive and optional. The default is kilobytes.

kilobytes

Specifies that *size* is expressed in kilobytes. The bytes and kilobytes keywords are mutually exclusive and optional. The default is kilobytes.

Full Context

configure service vpls sap ingress policer-control-override priority-mbs-thresholds priority mbs-contribution

configure service vpls sap egress policer-control-override priority-mbs-thresholds priority mbs-contribution

Description

The mbs-contribution override command within the SAP ingress and egress contexts is used to override a parent policer's priority level's mbs-contribution parameter that is defined within the policer-control-policy applied to the SAP. This override allow the priority level's burst tolerance to be tuned based on the needs of the SAP's child policers attached to the priority level.

When the override is defined, modifications to the policer-control-policy priority level's mbs-contribution parameter have no effect on the SAP's parent policer priority level until the override is removed using the no mbs-contribution command within the SAP.

The **no** form of this command removes the override and allows the mbs-contribution setting from the policer-control-policy to control the parent policer's priority level's burst tolerance.

Default

no mbs-contribution

[Tree] (config>qos>plcr-ctrl-plcy>root>priority-mbs-thresholds>priority mbs-contribution)

Full Context

configure qos policer-control-policy root priority-mbs-thresholds priority mbs-contribution

Description

The **mbs-contribution** command is used to configure the policy-based burst tolerance for a parent policer instance created when the policy is applied to a SAP, or a subscriber context for the 7450 ESS and 7750 SR, or a 7950 XRS multiservice site. The system uses the parent policer's **min-thresh-separation** value, the priority level's **mbs-contribution** value, and the number of child policers currently attached to the priority level to derive the priority level's shared-portion and fair-portion of burst tolerance within the local priority level. The shared-portion and fair-portions for each priority level are then used by the system to calculate each priority level's discard-unfair threshold and discard-all threshold. The mbs-contribution is the minimum separation between two adjacent active discard-all thresholds.

The value for a priority level's **mbs-contribution** within the policer-control-policy may be overridden on the SAP, or subscriber sub-profile (applies to the 7450 ESS and 7750 SR) or multiservice site (for 7950 XRS) where the policy is applied in order to allow fine tuning of the discard-unfair and discard-all thresholds relevant to the needs of the local child policers on the object.

Accumulative Nature of Burst Tolerance for a Parent Policer Priority Level

When defining **mbs-contribution**, the specified size may only be a portion of the burst tolerance associated with the priority level. The packets associated with the priority level share the burst tolerance of lower within the parent policer. As the parent policer PIR bucket depth increases during congestion, the lower priority packets eventually experience discard based on each priority's discard-unfair and discard-all thresholds. Assuming congestion continues when all the lower priority packets have been prevented from

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

consuming bucket depth, the burst tolerance for the priority level will be consumed by its own packets and any packets associated with higher priorities.

The Effect of Fair and Unfair Child Policer Traffic at a Parent Policer Priority Level

The system continually monitors the offered rate of each child policer on each parent policer priority level and detects when the policer is in a congested state (the aggregate offered load is greater than the decrement rate defined on the parent policer). As previously stated, the result of congestion is that the parent policer's bucket depth will increase until it eventually hovers around either a discard-unfair or discard-all threshold belonging to one of the priority levels. This threshold is the point where enough packets are being discarded that the increment rate and decrement rate begin to even out. If only a single child policer is associated with the priority level, the discard-unfair threshold is not used since fairness is only applicable when multiple child policers are competing at the same priority level.

When multiple child policers are sharing the congested priority level, the system uses the offered rates and the parenting parameters of each child to determine the fair rate per child when the parent policer is unable to meet the bandwidth needs of each child. The fair rate represents the amount of bandwidth that each child at the priority level should receive relative to the other children at the same level according to the policer control policy instance managing the child policers. This fair rate is applied as the decrement rate for each child's FIR bucket. Changing a child’s FIR rate does not modify the number of packets forwarded by the parent policer for the child’s priority level. It just modifies the forwarded ratio between the children on that priority level. Since each child FIR bucket has some level of burst tolerance before marking its packets as unfair, the current parent policer bucket depth may at times rise above the discard-unfair threshold. The mbs-contribution value provides a means to define how much separation is provided between the priority level’s discard-unfair and discard-all threshold to allow the parent policer to absorb some amount of FIR burst before reaching the priority’s discard-all threshold.

This level of fair aggregate burst tolerance is based on the decrement rate of the parent policer’s PIR bucket while the individual fair bursts making up the aggregate are based on each child’s FIR decrement rate. The aggregate fair rate of the priority level is managed by the system with consideration of the current rate of traffic in higher priority levels. In essence, the system ensures that for each iteration of the child FIR rate calculation, the sum of the child FIR decrement rates plus the sum of the higher priority traffic increment rates equals the parent policers decrement rate. This means that dynamic amounts of higher priority traffic can be ignored when sizing a lower priority’s fair aggregate burst tolerance. Consider the following:

- The parent policer decrement rate is set to 20 Mb/s (max-rate 20,000).
- A priority level’s fair burst size is set to 30 kbytes (mbs-contribution 30 kbytes).
- Higher priority traffic is currently taking 12 Mb/s.
- The priority level has three child policers attached.
- Each child’s PIR MBS is set to 10 kbytes, which makes each child’s FIR MBS 10 kbytes.
- The children want 10 Mb/s, but only 8 Mb/s is available
- Based on weights, the children's FIR rates are set as follows.

Table 85: FIR Rates of the Children Based on Weights

	FIR Rate	FIR MBS
Child 1	4 Mb/s	10 kbytes
Child 2	3 Mb/s	10 kbytes

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	FIR Rate	FIR MBS
Child 3	1 Mb/s	10 kbytes

The 12 Mb/s of the higher priority traffic and the 8 Mb/s of fair traffic equal the 20 Mb/s decrement rate of the parent policer.

It is clear that the higher priority traffic is consuming 12 Mb/s of the parent policer's decrement rate, leaving 8 Mb/s of decrement rate for the lower priority's fair traffic.

- The burst tolerance of child 1 is based on 10 kbytes above 4 Mb/s.
- The burst tolerance of child 2 is based on 10 kbytes above 3 Mb/s.
- The burst tolerance of child 3 is based on 10 kbytes above 1 Mb/s.

If all three children burst simultaneously (unlikely), they will consume 30 kbytes above 8 Mb/s. This is the same as the remaining decrement rate after the higher priority traffic.

Parent Policer Total Burst Tolerance and Downstream Buffering

The highest in-use priority level's discard-all threshold is the total burst tolerance of the parent policer. In some cases, the parent policer represents downstream bandwidth capacity and the max-rate of the parent policer is set to prevent overrunning the downstream bandwidth. The burst tolerance of the parent policer defines how much more traffic may be sent beyond the downstream scheduling capacity. In the worst-case scenario, when the downstream buffering is insufficient to handle the total possible burst from the parent policer, downstream discards based on lack of buffering may occur. However, in all likelihood, this is not the case.

In most cases, lower priority traffic in the policer will be responsible for the greater part of congestion above the parent policer rate. Since this traffic is discarded with a lower threshold, this lowers the effective burst tolerance even while the highest priority traffic is present.

Configuring a Priority Level's MBS Contribution Value

In the most conservative case, a priority level's **mbs-contribution** value may be set to be greater than the sum of child policer's mbs and one max-size-frame per child policer. This ensures that even in the absolute worst case where all the lower priority levels are simultaneously bursting to the maximum capacity of each child, enough burst tolerance for the priority's children will exist if they also burst to their maximum capacity.

Since simply adding up all the child policer's PIR MBS values may result in large overall burst tolerances that are not ever likely to be needed, consider some level of burst oversubscription when configuring the **mbs-contribution** value for each priority level. The amount of oversubscription should be determined based on the needs of each priority level.

Using the Fixed Keyword to Create Deterministic Parent Policer Discard Thresholds

In the default behavior, the system ignores the **mbs-contribution** values for a priority level on a subscriber for 7450 ESS and 7750 SR, or a multiservice site for 7950 XRS, or SAP parent policer when a child policer is not currently associated with the level. This prevents additional burst tolerance from being added to higher priority traffic within the parent policer.

This does cause fluctuations in the defined threshold values when child policers are added or removed from a parent policer instance. If this behavior is undesirable, the fixed keyword may be used that causes the **mbs-contribution** value to always be included in the calculation of parent policer's discard thresholds. The defined **mbs-contribution** value may be overridden on a subscriber sla-profile for the 7450 ESS and 7750 SR, or on a multiservice site for the 7950 XRS, or on a SAP instance, but the fixed nature of the contribution cannot be overridden.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the defined **mbs-contribution** value for the priority level is zero, the priority level will have no effect on the parent policer's defined discard thresholds. A packet associated with the priority level will use the next lower priority level's discard-unfair and discard-all thresholds.

The **no** form of this command returns the policy's priority level's MBS contribution to the default value. When changed, the thresholds for the priority level and all higher priority levels for all instances of the parent policer will be recalculated.

Parameters

size

The size parameter is required when executing the **mbs-contribution** command. It is expressed as an integer and specifies the priority's specific portion amount of accumulative MBS for the priority level. Setting this value has no effect on parent policer instances where the priority level's **mbs-contribution** value has been overridden.

Values 0 to 4194304 or **default** (applies to the 7450 ESS)

0 to 16777216 or **default** (applies to the 7750 SR and 7950 XRS)

Default 8

bytes | kilobytes:

This parameter indicates whether the size is expressed in bytes or kilobytes.

Default **kilobytes**

fixed

The optional fixed keyword is used to force the inclusion of the defined **mbs-contribution** value in the parent policer's discard threshold calculations. If the **mbs-contribution** command is executed without the **fixed** keyword, the fixed calculation behavior for the priority level is removed.

29.42 mc-ecmp-hashing-enabled

mc-ecmp-hashing-enabled

Syntax

mc-ecmp-hashing-enabled [**rebalance**]

no mc-ecmp-hashing-enabled

Context

[Tree] (config>service>vprn>pim mc-ecmp-hashing-enabled)

Full Context

configure service vprn pim mc-ecmp-hashing-enabled

Description

This command enables hash-based multicast balancing of traffic over ECMP links and causes PIM joins to be distributed over the multiple ECMP paths based on a hash of S and G (and possibly next-hop IP address). When a link in the ECMP set is removed, the multicast flows that were using that link are redistributed over the remaining ECMP links using the same hash algorithm. When a link is added to the ECMP set new joins may be allocated to the new link based on the hash algorithm, but existing multicast flows using the other ECMP links stay on those links until they are pruned.

Hash-based multicast balancing is supported for both IPv4 and IPv6.

This command cannot be used together with the **mc-ecmp-balance** command. Using this command and the **lag-usage-optimization** command on mixed port speed LAGs is not recommended, because some groups may be forwarded incorrectly.

The **no** form of this command disables the hash-based multicast balancing of traffic over ECMP links.

The **no** form of this command means that the use of multiple ECMP paths if enabled at the **config>router** or **config>service>vprn** context is controlled by the existing implementation and CLI commands **mc-ecmp-balance**.

Default

no mc-ecmp-hashing-enabled

Parameters

rebalance

Specifies to rebalance flows to newly added links immediately, instead of waiting until they are pruned.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

29.50 mc-maximum-routes

mc-maximum-routes

Syntax

mc-maximum-routes *number* [**log-only**] [**threshold** *threshold*]

Context

[Tree] (config>service>vprn mc-maximum-routes)

Full Context

configure service vprn mc-maximum-routes

Description

This command specifies the maximum number of multicast routes that can be held in the form of this command in a VPN routing or forwarding (VRF) context. When this limit is reached, a log and SNMP trap are sent. If the **log-only** parameter is not specified and the maximum-routes value is set below the existing number of routes in a VRF, then no new joins are processed.

The **no** form of this command disables the limit of multicast routes within a VRF context. Issue the **no** form of this command only when the VPRN instance is shutdown.

Default

no mc-maximum-routes

Parameters

number

Specifies the maximum number of routes to be held in a VRF context.

Values 1 to 2147483647

log-only

Specifies that if the maximum limit is reached, only log the event. **log-only** does not disable the learning of new routes.

threshold

Specifies the percentage at which a warning log message and SNMP trap should be sent.

Values 0 to 100

Default 10

Platforms

All

29.53 mcast-capacity

mcast-capacity

Syntax

mcast-capacity *primary-percentage* **secondary** *secondary-percentage*

no mcast-capacity

Context

[Tree] (config>mcast-mgmt>chassis-level>plane-capacity mcast-capacity)

Full Context

configure mcast-management chassis-level per-mcast-plane-capacity mcast-capacity

Description

This command configures the primary and secondary multicast plane capacities used when the full complement of possible switch fabrics in the system is not up (at least one possible switch fabric is not provisioned or is down). The rates are defined as a percentage of the total multicast plane capacity which is configured using the **total-capacity** command.

The **no** form of this command reverts to the default values.

Default

mcast-capacity 87.50 secondary 87.50

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

primary-percentage

Specifies the percentage of the total multicast plane capacity to be used for primary multicast planes.

secondary-percentage

Specifies the percentage of the total multicast plane capacity to be used for secondary multicast planes.

Values 0.01 to 100

Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

Full Context

configure service vpls mcast-ipv6-snooping-scope

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the forwarding scope used for IPv6 multicast traffic when PIM snooping for IPv6 is enabled.

By default, the scope is **mac-based**; IPv6 snooped multicast traffic is forwarded is based on the low-order 32 bits of the destination IPv6 address.

When the scope is configured as **sg-based**, the IPv6 snooped multicast traffic is forwarded based on both its full source (if specified in the join) and destination IPv6 address. SG-based forwarding is only supported on FP3- (or higher) based line cards.

PIM snooping for IPv6 must be disabled to change the forwarding mode within a VPLS service between **mac-based** and **sg-based**.

The **no** form of this command configures the router to use the default value.

Default

mcast-ipv6-snooping-scope mac-based

Parameters

mac-based

Sets forwarding for PIM-snooped IPv6 multicast traffic based on the low-order 32 bits of its destination IPv6 address.

sg-based

Sets forwarding for PIM-snooped IPv6 multicast traffic based on its full source (if specified in the join) and destination IPv6 address.

Platforms

29.57 mcast-management

mcast-management

Syntax

mcast-management

Context

[Tree] (config mcast-management)

Full Context

configure mcast-management

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

Commands in this context configure multicast management parameters. The **mcast-management** CLI node contains the **bandwidth-policy** and **multicast-info-policy** definitions. The bandwidth-policy is used to manage the ingress multicast paths into the switch fabric. The multicast-info-policy defines how each multicast channel is handled by the system. The policy may be used by the ingress multicast bandwidth manager, the ECMP path manager and the egress multicast CAC manager.

The **mcast-management** node always exists and contains the default bandwidth-policy and the default multicast-info-policy. Enter the mcast-management node when editing, deleting or creating a bandwidth policy or multicast info policy. The default bandwidth policy and multicast-info-policy cannot be edited or deleted.

A chassis-level node within multicast-management is used to control the switch fabric multicast planes replication limits. The switch fabric multicast planes are the individual multicast spatial replication contexts available in the system.

29.59 mcast-pool

mcast-pool

Syntax

mcast-pool percent-of-total *percent-of-buffers* **resv-cbs** *percent-of-pool* **slope-policy** *policy-name*

no mcast-pool

Context

[Tree] (config>mcast-mgmt>bw-plcy mcast-pool)

Full Context

configure mcast-management bandwidth-policy mcast-pool

Description

This command configures the ingress multicast path management buffer pool. The pool is used by the primary and secondary path queues through which all ingress managed multicast traffic must flow. The parameters may be used to configure the size of the pool relative to the total ingress buffer space, the amount of reserved CBS buffers within the pool and the slope policy used to manage early congestion detection functions in the shared portion of the pool.

Care should be taken when managing the buffer pool space as changes to the systems buffer pool behavior can have negative effects on multicast and unicast forwarding.

Sizing the Pool

The percent-of-total command defines how much of the total ingress buffer pool space for the MDA is dedicated for multicast channels managed by the bandwidth policy. Since multicast typically has a higher scheduling priority through the switch fabric, the buffer pool does not need to be large. By default, the system reserves 10% of the buffers on the ingress side of the MDA once multicast path management is enabled.

Reserved CBS Portion of the Pool

The multicast pool is divided into two portions; reserved and shared. The reserved portion is used by the multicast path queues until they cross there individual CBS thresholds. Since the CBS thresholds are configured as percentages and the percentages can oversubscribe the reserved portion of the pool, it is possible for some of the queues CBS buffer allocation to be met by the shared portion of the pool. By default, 50% of the pool is defined as reserved. This may be changed using the resv-cbs percentage parameter.

Shared Portion WRED Slopes

The shared portion of the buffer pool is used by queues that have crossed over their CBS thresholds. Since the total MBS values for the multicast path queues may oversubscribe the pool size, a buffer congestion control mechanism is supported within the pool in the form of two WRED slopes. The **slope-policy** parameter defines how the slopes are configured and whether they are activated. Each packet entering a path queue is defined as high or low priority within the queue based on the channel's preference

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

value relative to the **cong-priority-threshold** command. When getting a shared buffer of a high priority packet, the high WRED slope is used. Low priority packets use the low WRED slope.

The **no** form of this command returns the managed multicast path pool to its default settings.

Parameters

percent-of-buffers

Specifies the percentage of ingress buffers that is allocated to the multicast pool.

Values 1 to 50

Default 10

percent-of-pool

Specifies the percentage of the pool that is reserved for multicast path queues within their CBS threshold.

Values 1 to 100

Default 50

slope-policy-name

Specifies the WRED slopes within the multicast pool. Once a slope policy is associated with a buffer pool, it cannot be deleted.

Default default

Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router ldp mcast-upstream-asbr-frr

Description

This command enables ASBR MoFRR.

When ASBR MoFRR is enabled, the local leaf will perform MoFRR for multiple ASBRs; for example, if there are two ASBRs, the local leaf will select one ASBR as the primary and another ASBR as the backup.

If the **mcast-upstream-frr** command is enabled, disabling ASBR MoFRR will only allow IGP MoFRR in the local AS; for example, a single ASBR will be selected and two separate, disjointed paths will be selected as the primary and backup LSPs from the local leaf to ASBR.

If the **mcast-upstream-frr** command is disabled, disabling ASBR MoFRR will disable MoFRR entirely.

The **no** form of the command disables ASBR MoFRR.

Default

no mcast-upstream-asbr-frr

Full Context

configure router bgp group add-paths mcast-vpn-ipv4

configure router bgp group neighbor add-paths mcast-vpn-ipv4

configure router bgp add-paths mcast-vpn-ipv4

Description

This command configures the add-paths capability for multicast IPv4 VPN routes. By default, add-paths is not enabled for multicast IPv4 VPN routes.

The maximum number of multicast paths per IPv4 VPN prefix to send is the configured *send-limit*, which is a mandatory parameter. The capability to receive multiple multicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command, receive capability is enabled by default. The **none** option disables the receive capability.

The **no** form of this command disables add-paths support for multicast IPv4 VPN routes, causing sessions established using add-paths for multicast IPv4 VPN to go down and come back up without the add-paths capability.

Default

no mcast-vpn-ipv4

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

send-limit

Specifies the maximum number of paths per multicast IPv4 VPN prefix that are allowed to be advertised to add-paths peers. The actual number of advertised routes may be less. If the value is **none**, the router does not negotiate the send capability with respect to multicast IPv4 VPN AFI/SAFI.

Values 1 to 16, none

receive

Specifies that the router negotiates to receive multiple multicast routes per IPv4 VPN prefix.

none

Specifies that the router does not negotiate to receive multiple multicast routes per IPv4 VPN prefix.

Full Context

configure router bgp add-paths mcast-vpn-ipv6

configure router bgp group add-paths mcast-vpn-ipv6

configure router bgp group neighbor add-paths mcast-vpn-ipv6

Description

This command configures the add-paths capability for multicast IPv6 VPN routes. By default, add-paths is not enabled for multicast IPv6 VPN routes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The maximum number of multicast paths per IPv6 VPN prefix to send is the configured *send-limit*, which is a mandatory parameter. The capability to receive multiple multicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command, receive capability is enabled by default. The **none** option disables the receive capability.

The **no** form of this command disables add-paths support for multicast IPv6 VPN routes, causing sessions established using add-paths for multicast IPv6 VPN to go down and come back up without the add-paths capability.

Default

no mcast-vpn-ipv6

Parameters

send-limit

Specifies the maximum number of paths per multicast IPv6 VPN prefix that are allowed to be advertised to add-paths peers. The actual number of advertised routes may be less. If the value is **none**, the router does not negotiate the send capability with respect to multicast IPv6 VPN AFI/SAFI.

Values 1 to 16, none

receive

Specifies that the router negotiates to receive multiple multicast routes per IPv6 VPN prefix.

none

Specifies that the router does not negotiate to receive multiple multicast routes per IPv6 VPN prefix.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a matching condition for the IMSI (MCC-MNC) prefix.

Parameters

imsi-prefix-string

Specifies a string of 1 to 6 decimal digits representing the IMSI prefix to be matched against the IMSI IE of the packet, or the special value **ANY_IMSI** to indicate that an IMSI IE must be present as a matching condition regardless of the IMSI IE value.

If no MCC-MNC prefix is specified, the entry will match GTP packets that have an IMSI IE containing any value.

Values 0 to 999999, **ANY_IMSI**

no md-index-range

Context

[Tree] (config>eth-cfm>md-auto-id md-index-range)

Full Context

configure eth-cfm md-auto-id md-index-range

Description

This command specifies the range of indexes used by SR OS to automatically assign an index to ETH-CFM domains that are created in model-driven interfaces without an index explicitly specified by the user or client.

A domain created with an explicitly-specified index cannot use an index in this range. In classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **md-auto-id** command for further details.

Parameters

start *md-index*

Specifies the lower value of the index range. The value must be less than or equal to the **end** value.

Values 1 to 4294967295

end *md-index*

Specifies the upper value of the index range. The value must be greater than or equal to the **start** value.

Values 1 to 4294967295

Platforms

md-interfaces

Syntax

[**no**] **md-interfaces**

Context

[Tree] (config>system>security>management-interface>output-authorization md-interfaces)

Full Context

configure system security management-interface output-authorization md-interfaces

Description

This command controls output authorization of commands or RPCs for model-driven interfaces that display configuration or state.

When enabled, output authorization is performed for the following commands:

- MD-CLI **info** and **compare** commands
- NETCONF <get> and <get-config> RPCs
- gNMI Get RPC

When disabled, output authorization is not performed, which may significantly decrease the system response time by reducing command authorization requests, especially when remote AAA servers are used. Input to edit configuration is always authorized based on the AAA configuration.

By default, authorization checks are performed for configuration and state output.

The **no** form of this command disables authorization checks, allowing the output to be displayed immediately.

configure card mda mda-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This mandatory command provisions a specific MDA type to the device configuration for the slot. The MDA can be preprovisioned but an MDA must be provisioned before ports can be configured. Ports can be configured once the MDA is properly provisioned.

A maximum of two MDAs can be provisioned on an IOM or XCM. To modify an MDA slot, shut down all port associations.

XMAs are provisioned using MDA commands. A medium severity alarm is generated if an MDA is inserted that does not match the MDA type configured for the slot. This alarm is cleared when the correct MDA is inserted or the configuration is modified. A high severity alarm is raised when an administratively enabled MDA is removed from the chassis. This alarm is cleared if the either the correct MDA type is inserted or the configuration is modified. A low severity trap is issued if an MDA is removed that is administratively disabled.

An MDA can only be provisioned in a slot if the MDA type is allowed in the MDA slot. An error message is generated when an MDA is provisioned in a slot where it is not allowed.

Some MDA hardware can support two different firmware loads. One load includes the base Ethernet functionality, including 10G WAN mode, but does not include 1588 port-based timestamping. The second load includes the base Ethernet functionality and 1588 port-based timestamping, but does not include 10G WAN mode. These are identified as two MDA types that are the same, except for a "-ptp" suffix to indicate the second loadset; for example, *x40-10gb-sfp* and *x40-10gb-sfp-ptp*. A hard reset of the MDA occurs when switching between the two provisioned types.

A medium severity alarm is generated if an MDA is inserted that does not match the MDA type configured for the slot. This alarm is cleared when the correct MDA is inserted or the configuration is modified.

A high severity alarm is raised when an administratively enabled MDA is removed from the chassis. This alarm is cleared if the either the correct MDA type is inserted or the configuration is modified. A low severity trap is issued if an MDA is removed that is administratively disabled.

An alarm is raised if partial or complete MDA failure is detected. The alarm is cleared when the error condition ceases.

All parameters in the MDA context remain and if non-default values are required then their configuration remains as it is on all existing MDAs.

New generations of XMAs include variants controlled through hardware and software licensing. For these XMAs, the license level must be provisioned in addition to the MDA type. An XMA cannot become operational unless the provisioned license level matches the license level of the XMA installed into the slot. The set of license levels varies by MDA type.

The provisioned level controls aspects related to connector provisioning and the consumption of hardware egress queues and egress policers. Changes to the provisioned license level may be blocked if configuration that would not be permitted with the new target license level exists.

If the license level is not specified, the level is set to the highest license level for that XMA.

The **no** form of this command deletes the MDA from the configuration. The MDA must be administratively shut down before it can be deleted from the configuration.

Parameters

mda-type

Specifies the type of MDA selected for the slot position. Values for this attribute vary by platform and release. The release notes include a listing of all supported mda-types and their CLI strings. In addition, the command can be queried to check which mda-types are

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

relevant for the active platform type. Some examples include me6-10gb-spf+ and x4-100g-cfp2.

mda-level

Specifies the MDA level. Possible values vary by MDA type.

Platforms

All

mda-type

Syntax

mda-type *mda-type*

no mda-type

Context

[Tree] (config>card>xiom>mda mda-type)

Full Context

configure card xiom mda mda-type

Description

This command adds an MDA-s to the device configuration for the slot. The MDA-s type can be preprovisioned, which means that the MDA-s does not have to be installed in the chassis.

An MDA-s must be provisioned before a connector or a port can be configured.

An MDA-s can only be provisioned in a slot that is vacant. No other MDA-s can be provisioned (configured) for that particular slot. To reconfigure a slot position, use the **no** form of this command to remove the current information.

An MDA-s can only be provisioned in a slot if the MDA-s type is allowed in the slot. An error message is generated if an attempt is made to provision an MDA-s type that is not allowed.

If an MDA-s is inserted that does not match the configured MDA-s type for the slot, then a log event and a facility alarm are raised. The alarm is cleared when the correct MDA-s type is installed or the configuration is modified.

A log event and a facility alarm are raised if an administratively enabled MDA-s is removed from the chassis. The alarm is cleared when the correct MDA-s type is installed or the configuration is modified. A log event is issued when a MDA-s is removed that is administratively disabled.

The **no** form of this command removes the MDA-s from the configuration.

Parameters

mda-type

Specifies the type of MDA-s to be configured and installed in the slot. Values for this attribute vary by platform and release. The release notes include a listing of all supported mda-types and their CLI strings. In addition, the command can be queried to check which mda-types are relevant for the active platform type.

Description

This command configures the maintenance data link (MDL) message for a DS-3/E-3.

This command is only applicable if the DS-3/E-3 is using C-bit framing (see the **config>port>tdm>ds3 framing** command).

The **no** form of this command removes the MDL string association and stops the transmission of any IDs.

Default

no mdl

Parameters

mdl-string

Specifies an MDL message up to 38 characters long on a DS-3.

eic

Specifies the equipment ID code up to 10 characters long.

lic

Specifies the equipment ID code up to 11 characters long.

fic

Specifies the ID code up to 10 characters long.

unit

Specifies the unit ID code up to 6 characters long.

pfi

Specifies the facility ID code up to 38 characters long.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port

Specifies the port ID code up to 38 characters long.

gen

Specifies the generator number to send in the MDL test signal message up to 38 characters long.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

no mdl-transmit [**path** | **idle-signal** | **test-signal**]

Context

[Tree] (config>port>tdm>ds3 mdl-transmit)

Full Context

configure port tdm ds3 mdl-transmit

Description

This command enables the transmission of an MDL message on a DS-3/E-3 over channelized interface.

The **no** form of this command disables transmission of the specified message or all messages.

Default

no mdl-transmit

Parameters

path

Specifies the MDL path message.

idle-signal

Specifies the MDL idle signal message.

test-signal

Specifies the MDL test signal message.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

Full Context

configure service vprn mvpn mdt-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command allows restricting MVPN instance per PE node to a specific role. By default, MVPN instance on a given PE node assumes the role of being a sender as well as receiver. This creates a mesh of MDT/PMSI across all PE nodes from this PE.

This command provides an option to configure either a sender-only or receiver-only mode per PE node. Restricting the role of a PE node prevents creating full mesh of MDT/PMSI across all PE nodes that are participating in MVPN instance.

auto-rp-discovery cannot be enabled together with **mdt-type sender-only** or **mdt-type receiver-only**, or **wildcard-spmsi** configurations.

The **no** version of this command restores the default (sender-receiver).

Default

mdt-type sender-receiver

Parameters

sender-receiver

Specifies MVPN has both sender and receivers connected to PE node.

sender-only

Specifies MVPN has only senders connected to PE node.

receiver-only

Specifies MVPN has only receivers connected to PE node.

29.85 measurement-template

measurement-template

Syntax

measurement-template *template-name* [**create**]

no measurement-template *template-name*

Context

[Tree] (config>test-oam>link-meas measurement-template)

Full Context

configure test-oam link-measurement measurement-template

Description

This command configures a measurement template identifier that can be assigned to the IP interface by name.

Configuration modifications can be made to the measurement template without disabling the template and while IP interfaces are actively referencing the **measurement-template**. See the *7450 ESS, 7750 SR, 7950 XRS, and VSR OAM and Diagnostics Guide* for more information about which modifications will cause the test on associated IP interfaces to "Terminate" and restart.

The **no** form of this command removes the template name. A measurement template can be removed if no interfaces are referencing the template.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

template-name

Specifies the measurement template name, up to 64 characters.

create

Keyword used to create the measurement template. The create keyword requirement can be enabled or disabled in the **environment create** context.

member

Syntax

member *port-id*

no member

Context

[Tree] (config>eth-tunnel>path member)

Full Context

configure eth-tunnel path member

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command associates a port with the path defined under the Ethernet tunnel. If the operator wants to replace an existing member port or control tag, the whole path needs to be shutdown first. The alternate path will be activated as a result keeping traffic interruption to a minimum. Then the whole path must be deleted, the alternate path precedence modified to primary before re-creating the new path.

The following port-level configuration needs to be the same across the two member ports of an Ethernet tunnel:

- port>ethernet>access>{ingress|egress}>queue-group
- port>ethernet>egress-scheduler-policy
- port>access>egress>pool
- port>ethernet>dot1q-etype
- port>ethernet>qinq-etype
- port>ethernet>pbb-etype
- port>ethernet>mtu

The Ethernet tunnel will inherit the configuration from the first member port for these parameters. Additional member port that is added must have the same configuration.

The operator is allowed to update these port parameters only if the port is the sole member of an Ethernet tunnel. This means that in the example below, the operator needs to remove port 1/1/4 and port 1/1/5 before being allowed to modify 1/1/1 for the above parameters.

```
eth-tunnel 1
  path 1
    member 1/1/1
  path 2
    member 1/1/4
eth-tunnel 2
  path 1
    member 1/1/1
  path 2
    member 1/1/5
```

The **no** form of this command is used just to indicate that a member is not configured. The procedure described above, based on the **no path** command must be used to un-configure/change the member port assigned to the path.

Default

no member

Parameters

port-id

Specifies the port-id associated with the path in the format x/y/z where x represents the IOM, y the MDA and z the port numbers.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context

[Tree] (config>service>vpls>sap>egress>encap-defined-qos>encap-group member)

Full Context

configure service vpls sap egress encap-defined-qos encap-group member

Description

This command adds or removes a member ISID or a range of contiguous ISID members to an encap-group. The user can add or remove members to the encap-group one at a time or as a range of contiguous values using the member command. However, when the **qos-per-member** option is enabled, members must be added or removed one at a time.

The **no** form of this command removes the single or range of ISID values from the encap-group.

Parameters

encap-id

Specifies the value of the single encap-id or the start encap-id of the range. ISID is the only encap-id supported.

to *encap-id*

Specifies the value of the end encap-id of the range. ISID is the only encap-id supported.

member

Syntax

member *user-profile-name* [*user-profile-name*]

no member *user-profile-name*

Context

[Tree] (config>system>security>user>console member)

Full Context

configure system security user console member

Description

This command is used to associate the user with a local command authorization profile.

A user can be associated with up to eight profiles.

When a user is a member of multiple profiles, profiles are evaluated in the order that they are configured. Evaluation stops if there is a match, or when the default action of the a profile is **deny-all**, **permit-all** or **read-only-all**. When the profile default action is **none** and if no match conditions are met in the profile, the next profile is evaluated. When the default action of the last profile is **none** and no explicit match is found, the command is denied.

The **no** form of this command removes the association between the user and the profile.

Default

member default

Parameters

user-profile-name

Specifies up to eight user profile names, up to 32 characters.

Platforms

Description

This command associates the tunnel group with a tunnel member pool. This tunnel group is used as the designated standby in an N:M IPsec redundancy configuration.

The **no** form of this command removes the tunnel member pool from the configuration.

Parameters

name

Specifies the name of the member pool, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

29.91 members

members

Syntax

[**no**] **members** *comm-id* [*comm-id*]

Context

[Tree] (config>router>policy-options>community members)

Full Context

configure router policy-options community members

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command adds members to a route policy community list to use in route policy entries.

Each member of a community list is a standard, extended, or large community value or a regular expression that potentially matches many community values. A regular expression incorporates terms and operators that use the terms. An individual numerical digit is an elementary term in the community regular expression. More complex terms can be built from elementary terms. The following are key operators supported by SR OS:

- .
- *
- ?
- {n}
- {m,n}
- {m, }

To reverse the match criteria when specifying a list of ranges or single values using square brackets, use the non-match operator (^) before the elements within the square brackets.

The **no** version of this command deletes route policy community members.

Parameters

comm-id

Specifies a BGP community value, up to 72 characters. A community ID can be specified in different forms.

Values [*as-num:comm-val* | *reg-ex* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *reg-ex* — A regular expression string. Allowed values are any string up to 72 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (such as "#", "$", or spaces), the entire string must be enclosed within double quotes.
- *ext-comm* — The extended community, defined as one of the following:
  - {*target* | *origin*}:*ip-address*:*comm-val*
  - {*target* | *origin*}:*reg-ex1*&*reg-ex2*
  - {*target* | *origin*}:*ip-address*:*reg-ex2*
  - {*target* | *origin*}:*asnum*:*ext-comm-val*
  - {*target* | *origin*}:*ext-asnum*:*comm-val*
  - **bandwidth**:*asnum*:*val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext**:*value1*:*value2*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- **flowspec-set**:*ext-asnum*:*group-id*
- **flowspec-set-trans**:*ext-asnum*:*group-id*
- **ipv6-redirect**: *ipv6-addr*
- **color**:*co-bits*:*color-value*

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- *reg-ex1*, *reg-ex2* — A regular expression string. Allowed values are any string up to 63 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- **ext** — extended
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFFFF
- **flowspec-set —** FlowSpec set
- **flowspec-set-trans —** FlowSpec set transitive
- *ipv6-addr* — x:x:x:x:x:x:x:x (eight 16-bit pieces)
- *group-id* — 0 to 16383
- *co-bits* — 00, 01, 10 or 11
- *color-value* — 0 to 4294967295

- *well-known-comm* — **null**, **no-export**, **no-export-subconfed**, **no-advertise**, **llgr-stale**, **no-llgr**, **blackhole**
- *large-comm* — large community, defined as one of the following:
  - *ext-asnum*:*ext-comm-val*:*ext-comm-val*
  - *reg-ex3*&*reg-ex3*&*reg-ex3*

  where:
  - *reg-ex3* — A regular expression string. Allowed values are any string up to 68 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

no memory-use-alarm

Context

[Tree] (config>system>thresholds memory-use-alarm)

Full Context

configure system thresholds memory-use-alarm

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

The memory thresholds are based on monitoring the TIMETRA-SYSTEM-MIB sgiMemoryUsed object. This object contains the amount of memory currently used by the system. The severity level is Alarm. The absolute sample type method is used.

The **no** form of this command removes the configured memory threshold warning.

Parameters

rising-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

The threshold value represents units in bytes.

Values -2147483648 to 2147483647

Default 0

falling-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal the rising-threshold value.

The threshold value represents units in bytes.

Values -2147483648 to 2147483647

Default 0

seconds

Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

The threshold value represents units in bytes.

Values 1 to 2147483647

rmon-event-type

Specifies the type of notification action to be taken when this event occurs.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values log — An entry is made in the RMON-MIB log table for each event occurrence. This does not create an OS logger entry. The RMON-MIB log table entries can be viewed using the CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

alarm-type

Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Configuration example

```
memory-use-alarm rising-threshold 50000000 falling-threshold 45999999
interval 500 rmon-event-type both start-alarm either
```

no memory-use-warn

Context

[Tree] (config>system>thresholds memory-use-warn)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure system thresholds memory-use-warn

Description

The memory thresholds are based on monitoring MemoryUsed object. This object contains the amount of memory currently used by the system. The severity level is Alarm.

The absolute sample type method is used.

The **no** form of this command removes the configured compact flash threshold warning.

Parameters

rising-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

The threshold value represents units in bytes.

Values -2147483648 to 2147483647

Default 0

falling-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal the rising-threshold value.

The threshold value represents units in bytes.

Values -2147483648 to 2147483647

Default 0

seconds

Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

Values 1 to 2147483647

rmon-event-type

Specifies the type of notification action to be taken when this event occurs.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values log — An entry is made in the RMON-MIB log table for each event occurrence.

This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

startup-alarm *alarm-type*

Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

Default either

Values rising, falling, either

Configuration example

```
memory-use-warn rising-threshold 500000 falling-threshold 400000 interval 800
 rmon-
event-type log start-alarm falling
```

Parameters

mep-id

Specifies the MEP identifier.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 8191

md-index

Specifies the MD index value.

Values 1 to 4294967295

ma-index

Specifies the MA index value.

Values 1 to 4294967295

direction {up | down}

Keyword used to configure the MEP's facing direction on a bridge port. The up direction is not supported for all Fpipe services. For example, Ipipe does not support the up direction for MEPs.

Values **up** – Sends ETH-CFM messages toward the MAC relay entity.
down – Sends ETH-CFM messages away from the MAC relay entity.

primary-vlan-enable

Provides a method for linking the MEP with the primary VLAN configured under the bridge-identifier for the MA. This must be configured as part of the creation step and can only be changed by deleting the MEP and re-creating it. Primary VLANs are only supported under Layer 2 Epipe and VPLS services.

configure service vpls mesh-sdp eth-cfm mep

Description

This command configures the ETH-CFM maintenance endpoint (MEP). A MEP created at the VPLS service level **vpls>eth-cfm** creates a virtual MEP.

The **no** version of the command will remove the MEP.

Parameters

mep-id

Specifies the MEP identifier.

Values 1 to 8191

md-index

Specifies the maintenance domain (MD) index value.

Values 1 to 4294967295

ma-index

Specifies the maintenance association (MA) index value.

Values 1 to 4294967295

direction up | down

Sets the direction in which the MEP faces on the bridge port. Direction is not supported when a MEP is created directly under the vpls>eth-cfm construct (vMEP).

down — Sends ETH-CFM messages away from the MAC relay entity.

up — Sends ETH-CFM messages toward the MAC relay entity.

primary-vlan-enable

Sets a method for linking the MEP with the primary VLAN configured under the bridge-identifier for the MA. MEPs cannot be changed from or to primary VLAN functions. This must be configured as part of the creation step and can only be changed by deleting the MEP and re-creating it. Primary VLANs are only supported under Layer 2 Epipe and VPLS services.

mesh-group

Syntax

mesh-group {**value** | **blocked**}

no mesh-group

Context

[Tree] (config>service>vprn>isis>if mesh-group)

Full Context

configure service vprn isis interface mesh-group

Description

This command assigns an interface to a mesh group. Mesh groups limit the amount of flooding that occurs when a new or changed LSP is advertised throughout an area.

All routers in a mesh group should be fully meshed. When LSPs need to be flooded, only a single copy is received rather than a copy per neighbor.

To create a mesh group, configure the same mesh group value for each interface that is part of the mesh group. All routers must have the same mesh group value configured for all interfaces that are part of the mesh group.

To prevent an interface from flooding LSPs, the optional **blocked** parameter can be specified. Configure mesh groups carefully. It is easy to create isolated islands that do not receive updates as (other) links fail.

The **no** form of this command removes the interface from the mesh group. The interface does not belong to a mesh group.

Default

no mesh-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

value

Specifies a unique decimal integer value distinguishes this mesh group from other mesh groups on this or any other router that is part of this mesh group.

Context

[Tree] (config>service>vpls mesh-sdp)

Full Context

configure service vpls mesh-sdp

Description

This command binds a VPLS service to an existing service destination point (SDP).

Mesh SDPs bound to a service are logically treated like a single bridge "port” for flooded traffic where flooded traffic received on any mesh SDP on the service is replicated to other "ports” (spoke SDPs and SAPs) and not transmitted on any mesh SDPs.

Note:
This command creates a binding between a service and an SDP. The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate the SDP with an Epipe or VPLS service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end router devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

No *sdp-id* is bound to a service.

Parameters

sdp-id

Specifies an SDP identifier.

Values 1 to 17407

vc-id

Specifies a virtual circuit identifier. This value is used to validate the VC ID portion of each mesh SDP binding defined in the service. The default value of this object is equal to the service ID. Any value may be used for the *vc-id* when there is no existing mesh SDP within the service; if a mesh SDP exists then all other mesh SDPs in the service must be configured with the same *vc-id*.

Values 1 to 4294967295

vc-type

Specifies to override the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

ether

Defines the VC type as Ethernet. The **vlan** keyword is mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding (hex 5).

vlan

Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a vlan-tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for mesh SDP bindings.

Note:
The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

root-leaf-tag

Specifies a tagging mesh SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this SDP binding is a tag SDP that uses a default VID 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

leaf-ac

Specifies an access (AC) mesh SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP type is a root AC if *leaf-ac* or *root-leaf-tag* is not specified at SDP binding creation. This option is only available when the VPLS is designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

create

Keyword used to create the mesh SDP. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Full Context

configure log filter entry match message

Description

This command adds system messages as a match criterion.

The **no** form of this command removes messages as a match criterion.

Parameters

eq

Determines if the matching criteria should be equal to the specified value.

neq

Determines if the matching criteria should not be equal to the specified value.

pattern

Specifies a message up to 400 characters in length to be used in the match criteria.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of **message** command parameters. When the **regexp** keyword is not specified, the default matching algorithm used is a basic substring match.

[Tree] (config>service>vprn>ospf>area>if message-digest-key)

Full Context

configure service vprn ospf area virtual-link message-digest-key

configure service vprn ospf area sham-link message-digest-key

configure service vprn ospf area interface message-digest-key

Description

This command configures a message digest key when MD5 authentication is enabled on the interface, virtual-link or sham-link. Multiple message digest keys can be configured.

This command is not valid in the OSPF3 context.

The **no** form of this command removes the message digest key identified by the *key-id*.

Default

No message digest keys are defined.

Parameters

keyid

Specifies the key ID. The *keyid* is expressed as a decimal integer.

Values 1 to 255

md5 *key*

Specifies the MD5 key. The *key* can be any alphanumeric string up to 16 characters in length.

md5 hash-key

Specifies the MD5 hash key. The key can be any combination of ASCII characters up to 32 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

Platforms

All

Full Context

configure service ies interface ipv6 vrrp message-interval

Description

This command sets the advertisement timer and indirectly sets the master down timer on the virtual router instance. The message-interval setting must be the same for all virtual routers participating as a virtual router. Any VRRP advertisement message received with an Advertisement Interval field different than the virtual router instance configured message-interval value will be silently discarded.

The message-interval command is available in both non-owner and owner **vrrp** *virtual-router-id* nodal contexts. If the message-interval command is not executed, the default message interval of 1 second will be used.

The **no** form of this command restores the default message interval value of 1 second to the virtual router instance.

Default

message-interval 1

Parameters

seconds

The number of seconds that will transpire before the advertisement timer expires.

Values 1 to 255

Default 1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

milliseconds ***milliseconds***

[Tree] (config>router>if>ipv6>vrrp message-interval)

[Tree] (config>router>if>vrrp message-interval)

Full Context

configure router interface ipv6 vrrp message-interval

configure router interface vrrp message-interval

Description

This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages and to derive the master down timer as backup.

For an owner virtual router instance, the administrative advertisement timer directly sets the operational advertisement timer and indirectly sets the master down timer for the virtual router instance.

Non-owner virtual router instances usage of the **message-interval** setting is dependent on the state of the virtual router (master or backup) and the state of the **master-int-inherit** parameter.

- When a non-owner is operating as master for the virtual router, the configured **message-interval** is used as the operational advertisement timer similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as master.
- When a non-owner is in the backup state with **master-int-inherit** disabled, the configured **message-interval** value is used to match the incoming VRRP advertisement message advertisement interval field. If the locally configured message interval does not match the advertisement interval field, the VRRP advertisement is discarded.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured **message-interval** is ignored. The master down timer is indirectly derived from the incoming VRRP advertisement message advertisement interval field value.

VRRP advertisements messages that are fragmented, or contain IP options (IPv4), or contain extension headers (IPv6) require a longer message interval to be configured.

The in-use value of the message interval is used to derive the master down timer to be used when the virtual router is operating in backup mode based on the following formula:

(3x (in-use message interval) + skew time)

The skew time portion is used to slow down virtual routers with relatively low priority values when competing in the master election process.

The command is available in both non-owner and owner **vrrp** nodal contexts.

By default, a **message-interval** of 1 second is used.

The **no** form of the command reverts to the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

message-interval 1 — Advertisement timer set to 1 second.

Parameters

seconds

The number of seconds that will transpire before the advertisement timer expires expressed as a decimal integer.

Values IPv4: 1 to 255 IPv6: 1 to 40

milliseconds

Specifies the time interval, in milliseconds, between sending advertisement messages.

Values 100 to 900 IPv6: 10 to 990

no message-path

Context

[Tree] (config>service>vprn>sub-if>grp-if>srrp message-path)

[Tree] (config>service>ies>sub-if>grp-if>srrp message-path)

Full Context

configure service vprn subscriber-interface group-interface srrp message-path

configure service ies subscriber-interface group-interface srrp message-path

Description

This command defines a specific SAP for SRRP in-band messaging. A message-path SAP must be defined prior to activating the SRRP instance. The defined SAP must exist on the SRRP instances group IP interface for the command to succeed and cannot currently be associated with any dynamic or static subscriber hosts. Once a group IP interface SAP has been defined as the transmission path for SRRP Advertisement messages, it cannot be administratively shutdown, will not support static or dynamic subscriber hosts and cannot be removed from the group IP interface.

The SRRP instance message-path command may be executed at any time on the SRRP instance. Changing the message SAP fails if a dynamic or static subscriber host is associated with the new SAP. Once successfully changed, the SRRP instance immediately disables anti-spoof on the SAP and starts sending SRRP Advertisement messages, if the SRRP instance is activated.

Changing the current SRRP message SAP on an active pair of routers should be done in the following manner:

1. Shutdown the backup SRRP instance.
2. Change the message SAP on the shutdown node.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

3. Change the message SAP on the active master node.
4. Re-activate the shutdown SRRP instance.

Shutting down the backup SRRP instance prevents the SRRP instances from becoming master due to temporarily using differing message path SAPs.

If an MCS peering is operational between the redundant nodes and the SRRP instance has been associated with the peering, the designated message path SAP is sent from each member.

The **no** form of this command can only be executed when the SRRP instance is shutdown. Executing no message-path allows the existing SAP to be used for subscriber management functions. A new message-path SAP must be defined prior to activating the SRRP instance.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

metric

Syntax

metric *metric*

no metric

Context

[Tree] (config>service>vprn>static-route-entry>follow metric)

Full Context

configure service vprn static-route-entry follow metric

Description

This command configures the cost metric for the static route, expressed as a decimal integer. If there are multiple static routes with the same preference but different metrics, the lower cost (metric) route is installed. When the metric is configured as 0, the metric configured in OSPF, which is the default import metric, applies. When modifying the metric of an existing static route, the preference does not change unless specified. This value is also used to determine which static route to install in the forwarding table.

configure router mpls lsp-template metric

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command allows the user to override the LSP operational metric with a constant administrative value that will not change regardless of the actual path the LSP is using over its lifetime.

The LSP operational metric will match the metric the active path of this LSP is using at any given time. For a CSPF LSP, this metric represents the cumulative IGP metric of all the links the active path is using. If CSPF for this LSP is configured to use the TE metric, the LSP operational metric is set to the maximum value. For a non-CSPF LSP, the operational metric is the shortest IGP cost to the destination of the LSP.

The LSP operational metric is used by some applications to select an LSP among a set of LSPs that are destined to the same egress router. The LSP with the lowest operational metric will be selected. If more than one LSP with the same lowest LSP metric exists, the LSP with the lowest tunnel index will be selected. The configuration of a constant metric by the user will make sure the LSP always maintains its preference in this selection regardless of the path it is using at any given time. Applications that use the LSP operational metric include LDP-over-RSVP, VPRN auto-bind, and IGP, BGP and static route shortcuts.

The **no** form of this command disables the administrative LSP metric and reverts to the default setting in which the metric value will represent the LSP metric returned by MPLS. The same behavior is obtained if the user entered a metric of value zero (0).

Default

no metric. The LSP operational metric defaults to the metric returned by MPLS.

Parameters

metric

Specifies the integer value which specifies the value of the LSP administrative metric. A value of zero command reverts to the default setting and disables the administrative LSP metric.

Values 0 to 16777215

configure router policy-options policy-statement entry from metric

Description

This command matches BGP routes based on local preference (the value in the MULTI_EXIT_DISC attribute).

If no comparison qualifiers are present (**equal**, **or-higher**, **or-lower**), then **equal** is the implied default.

A non-BGP route does not match a policy entry if it contains the **metric** command. In addition, a BGP route without a MED attribute also does not match a policy entry if it contains a **metric** command.

Default

no metric

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

metric

Specifies the MED value.

Values 0 to 4294967295, or a parameter name delimited by starting and ending at-sign (@) characters

equal

Specifies that matched routes should have the same MED as the value specified.

or-higher

Specifies that matched routes should have the same or a greater MED as the value specified.

or-lower

Specifies that matched routes should have the same or a lower MED as the value specified.

Full Context

configure router policy-options policy-statement entry action metric

configure router policy-options policy-statement default-action metric

Description

In a BGP import or export policy, this command assigns a MED value to routes matched by the policy statement entry. The MED value may be set to a fixed value (overriding the received value), set to the routing table cost of the route used to resolve the next hop of the BGP route, or modified by adding or subtracting a fixed value offset.

The **no** form of this command removes the MED attribute from the matched routes.

Default

no metric

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

add

Specifies that an integer is added to any existing metric. If the result of the addition results in a number greater than 4294967295, the value 4294967295 is used.

subtract

Specified *integer* is subtracted from any existing metric. If the result of the subtraction results in a number less than 0, the value of 0 is used.

set

Specifies that *integer* replaces any existing metric.

igp

Sets the MED value to the routing table cost of the route used to resolve the next hop of the BGP route.

metric

Specifies the metric modifier expressed as a decimal integer.

Values 0 to 4294967295

param-name —Specifies the metric parameter variable name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”

Full Context

configure service vpls mesh-sdp egress mfib-allowed-mda-destinations

configure service vpls spoke-sdp egress mfib-allowed-mda-destinations

Description

Commands in this context configure MFIB-allowed MDA destinations.

The allowed-mda-destinations node and the corresponding **mda** command are used on spoke and mesh SDP bindings to provide a list of MDA destinations in the chassis that are allowed as destinations for multicast streams represented by [*,g] and [s,g] multicast flooding records on the VPLS service. The MDA list only applies to IP multicast forwarding when IGMP snooping is enabled on the VPLS service. The MDA list has no effect on normal VPLS flooding such as broadcast, L2 multicast, unknown destinations or non-snooped IP multicast.

At the IGMP snooping level, a spoke or mesh SDP binding is included in the flooding domain for an IP multicast stream when it has either been defined as a multicast router port, received a IGMP query through the binding or has been associated with the multicast stream through an IGMP request by a host over the binding. Due to the dynamic nature of the way that a spoke or mesh SDP binding is associated with one or more egress network IP interfaces, the system treats the binding as appearing on all network ports. This causes all possible network destinations in the switch fabric to be included in the multicast streams flooding domain. The MDA destination list provides a simple mechanism that narrows the IP multicast switch fabric destinations for the spoke or mesh SDP binding.

If no MDAs are defined within the allowed-mda-destinations node, the system operates normally and will forward IP multicast flooded packets associated with the spoke or mesh SDP binding to all switch fabric taps containing network IP interfaces.

The MDA inclusion list should include all MDAs that the SDP binding may attempt to forward through. A simple way to ensure that an MDA that is not included in the list is not being used by the binding is to define the SDP the binding is associated with as MPLS and use an RSVP-TE LSP with a strict egress hop. The MDA associated with the IP interface defined as the strict egress hop should be present in the inclusion list. If the inclusion list does not currently contain the MDA that the binding is forwarding through, the multicast packets will not reach the destination represented by the binding.

By default, the MDA inclusion list is empty.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If an MDA is removed from the list, the MDA is automatically removed from the flooding domain of any snooped IP multicast streams associated with a destination on the MDA unless the MDA was the last MDA on the inclusion list. Once the inclusion list is empty, all MDAs are eligible for snooped IP multicast flooding for streams associated with the SDP binding.

mfib-allowed-mda-destinations

Context

[Tree] (config>service>pw-template>egress mfib-allowed-mda-destinations)

Full Context

configure service pw-template egress mfib-allowed-mda-destinations

Description

Commands in this context configure MFIB-allowed XMA or MDA destinations.

The allowed-mda-destinations node and the corresponding **mda** command are used on spoke and mesh SDP bindings to provide a list of XMA or MDA destinations in the chassis that are allowed as destinations for multicast streams represented by [*,g] and [s,g] multicast flooding records on the VPLS service. The XMA or MDA list only applies to IP multicast forwarding when IGMP snooping is enabled on the VPLS service. The XMA or MDA list has no effect on normal VPLS flooding such as broadcast, Layer 2 multicast, unknown destinations or non-snooped IP multicast.

At the IGMP snooping level, a spoke or mesh SDP binding is included in the flooding domain for an IP multicast stream when it has either been defined as a multicast router port, received a IGMP query through the binding or has been associated with the multicast stream through an IGMP request by a host over the binding. Due to the dynamic nature of the way that a spoke or mesh SDP binding is associated with one or more egress network IP interfaces, the system treats the binding as appearing on all network ports. This causes all possible network destinations in the switch fabric to be included in the multicast streams flooding domain. The XMA or MDA destination list provides a simple mechanism that narrows the IP multicast switch fabric destinations for the spoke or mesh SDP binding.

If no XMAs or MDAs are defined within the allowed-mda-destinations node, the system operates normally and will forward IP multicast flooded packets associated with the spoke or mesh SDP binding to all switch fabric taps containing network IP interfaces.

The XMA or MDA inclusion list should include all XMAs or MDAs that the SDP binding may attempt to forward through. A simple way to ensure that an XMA or MDA that is not included in the list is not being used by the binding is to define the SDP the binding is associated with as MPLS and use an RSVP-TE LSP with a strict egress hop. The XMA or MDA associated with the IP interface defined as the strict egress hop should be present in the inclusion list.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the inclusion list does not currently contain the XMA or MDA that the binding is forwarding through, the multicast packets will not reach the destination represented by the binding. By default, the XMA or MDA inclusion list is empty.

If an XMA or MDA is removed from the list, the XMA or MDA is automatically removed from the flooding domain of any snooped IP multicast streams associated with a destination on the XMA or MDA unless the XMA or MDA was the last XMA or MDA on the inclusion list. Once the inclusion list is empty, all XMAs or MDAs are eligible for snooped IP multicast flooding for streams associated with the SDP binding.

29.122 mfib-ping

mfib-ping

Syntax

mfib-ping service *service-id* **source** *src-ip* **destination** *mcast-address* [**size** *size*] [**ttl** *vc-label-ttl*] [**count** *send-count*] [**return-control**] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (oam mfib-ping)

Full Context

oam mfib-ping

Description

This command determines the list of SAPs which egress a certain IP multicast stream (identified by source unicast and destination multicast IP addresses) within a VPLS service. An MFIB ping packet is always sent via the data plane.

An MFIB ping is forwarded across the VPLS following the MFIB. If an entry for the specified source unicast and destination multicast IP addresses exist in the MFIB for that VPLS, then the packet is forwarded along those paths, provided they are active. A response is generated only when there is an egress SAP binding for the specified IP multicast stream.

An MFIB ping reply can be sent using the data plane or the control plane. The **return-control** option configures the reply to be sent using the control plane. If **return-control** is not specified, the reply is sent using the data plane.

Parameters

service-id

Specifies the service ID of the VPLS to diagnose or manage.

Values 1 to 2147483647, *service-name*, up to 64 characters

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

src-ip

Specifies the source IP address for the OAM request.

Values ipv4-address - a.b.c.dipv6-address - xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx

xx [0..FF]H

mcast-address

Specifies the destination multicast address for the OAM request.

Values ipv4-address - a.b.c.dipv6-address - xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx

xx [0..FF]H

size

Specifies the multicast OAM request packet size, in octets, expressed as a decimal integer. The request payload is padded to the specified size with a 6-byte PAD header and a byte payload of 0xAA as necessary.

If the octet size specified is less than the minimum packet, the minimum sized packet necessary to send the request is used.

Values 1 to 9786

Default No OAM packet padding

vc-label-ttl

Specifies the TTL value in the VC label for the OAM request, expressed as a decimal integer.

Values 1 to 255

Default 255

send-count

Specifies the number of messages to send, expressed as a decimal integer. The **count** parameter override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent.

The message interval value must be expired before the next message request is sent.

Values 1 to 100

Default 1

return-control

Specifies that the OAM reply must be sent using the control plane instead of the data plane.

timeout

Specifies the value used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the next message request.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 100

Default 5

interval

Specifies the value used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

29.128 mhf-creation

mhf-creation

Syntax

mhf-creation {**default** | **none** | **explicit** | **static**}

no mhf-creation

Context

[Tree] (cfg>eth-cfm>domain>assoc>bridge mhf-creation)

Full Context

configure eth-cfm domain association bridge-identifier mhf-creation

Description

This command defines the MIP method of creation. MIP creation mode and other factors are part of the MIP creation authority (**association** or **default-domain**) logic. The MIP creation algorithm may result in multiple potential MIPs. Only the lowest-level valid MIP is installed. The **static** creation mode is the exception to the single MIP installation rule.

Under the association context, the **level** *level* parameter is not supported as part of this command. The level is derived from the level configuration of the domain.

The **no** form of this command is only available under the **association** context, and reverts the current mode of creation to the default **none**. In order to transition to and from the **static** mode of operation, the active **mhf-creation** mode must be **none**.

Default

mhf-creation none

Parameters

default

Specifies MHFs (MIPs) can be created for this SAP or spoke SDP without the requirement for a MEP at some lower MA level. If a lower-level MEP exists, the creation method will behave as **explicit**.

none

Specifies that no MHFs (MIPs) can be created for this SAP or spoke SDP.

explicit

Specifies that MHFs (MIPs) can be created for this SAP or spoke SDP only if a MEP is created at some lower MD Level. There must be at least one lower MD Level MEP provisioned on the same SAP or spoke SDP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

static

Specifies the exact level of the MHF (MIP) that will be created for this SAP. Multiple MHFs (MIPs) are allowed as long as the MD Level hierarchy is properly configured for the particular Primary VLAN. Ingress MHFs (MIPs) with primary VLAN are not supported on SDP Bindings.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure eth-cfm default-domain bridge-identifier mhf-creation

Description

This command defines the MIP method of creation. MIP creation mode and other factors are part of the MIP creation authority (**association** or **default-domain**) logic. The MIP creation algorithm may result in multiple potential MIPs. Only the lowest-level valid MIP is installed. The **static** creation mode is the exception to the single MIP installation rule.

Under the association context, the **level** *level* parameter is not supported as part of this command. The level is derived from the level configuration of the domain.

The **no** form of this command is only available under the **association** context, and reverts the current mode of creation to the default **none**. In order to transition to and from the **static** mode of operation, the active **mhf-creation** mode must be **none**.

Default

mhf-creation defer (config>eth-cfm>default-domain>bridge-identifier)

Parameters

none

Specifies that no MHFs (MIPs) can be created for this SAP or spoke SDP.

default

Specifies MHFs (MIPs) can be created for this SAP or spoke SDP without the requirement for a MEP at some lower MA level. If a lower-level MEP exists, the creation method will behave as **explicit**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

explicit

Specifies that MHFs (MIPs) can be created for this SAP or spoke SDP only if a MEP is created at some lower MD Level. There must be at least one lower MD Level MEP provisioned on the same SAP or spoke SDP.

defer

Defers the MIP creation process to the system-wide read-only values. This parameter is only configurable under the **default-domain** context.

level

Specifies the requested level of the MIP. This is used by the MIP creation algorithm to determine its validity in comparison to other ETH-CFM MIPs in the same service. If *level* is configured as "defer", the level value will be inherited from the global read-only system values, and "-1" will be stored as a MIB value in the table.

Values 0 to 7, **defer**

Default defer

configure router isis segment-routing micro-loop-avoidance

Description

This command enables, in the IGP instance, the microloop avoidance feature to prevent microloops from using segment routing (SR) loop-free tunnels for packets that are forwarded over SR IS-IS node SIDs.

This command enables microloop avoidance for MT0. Microloop avoidance for MT2 is enabled when this command is enabled along with SR-MPLS MT2 using the **configure router isis segment-routing multi-topology mt2** command.

When enabled, the behavior of the feature is triggered by the receipt of a single event on a P2P link or broadcast link with two neighbors:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- link addition or restoration
- link removal or failure
- link metric change

IGP then performs the following procedures:

1. IGP runs the main SPF and LFA SPFs.
2. For a node or a prefix in which the SPF resulted in no change to its next hops and metrics, IGP takes no action.
3. For a node or a prefix in which SPF resulted in a change to its next hops or metrics, IGP marks the route as eligible for microloop avoidance.
   a. Activate, for each node SID that uses a microloop avoidance eligible route with ECMP next hops, the common set of next hops between the previous and new SPF.
   b. Compute and activate, for each node SID which uses a microloop avoidance eligible route, with a single next hop loop-free SR tunnel that is applicable to the specific link event.

      This tunnel acts the microloop avoidance primary path for the route and uses the same outgoing interface as the new computed primary next hop.
   c. Program the TI-LFA, base LFA, or remote LFA backup path that protects the new primary next hop for the node SID.
4. Start the **fib-delay** timer to delay programming of new main and LFA SPF results into the FIB.
5. After the expiry of the **fib-delay** timer, program the new primary next hops for node SIDs routes that were marked eligible for microloop avoidance procedures.

The **no** form of this command disables the microloop avoidance feature.

Default

no micro-loop-avoidance

Parameters

fib-delay

Specifies the delay, in 100s of milliseconds, before the system programs the new next hops for the SR tunnel.

Values 1 to 300

Default 15

Platforms

Context

[Tree] (config>router>ospf>flex-algos>flex-algo micro-loop-avoidance)

Full Context

configure router ospf flexible-algorithms flex-algo micro-loop-avoidance

Description

This command enables microloop avoidance for an SR-OSPF flexible algorithm, and consequently, inherits the FIB delay timer from the SR-OSPF **configure router ospf segment-routing** context.

When enabled, FIB updates are delayed before programming new primary next hops to avoid microloops.

When enabled, the feature applies to the following contexts:

- OSPFv2 SR-OSPF IPv4 tunnel (node SID)
- IPv4 and IPv6 SR-TE LSPs that use a node SID in their segment list
- IPv4 and IPv6 SR policies that use a node SID in their segment list

The **no** form of this command disables microloop avoidance. When microloop avoidance is disabled, the system forces any running FIB delay to expire immediately and programs the new next hops for all

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

impacted node SIDs. When disabled, microloop avoidance is disabled instantaneously and will be disabled for the next SPF runs. Microloop avoidance remains disabled until it is re-enabled.

micro-loop-avoidance [**fib-delay** *fib-delay*]

no micro-loop-avoidance

Context

[Tree] (config>router>ospf>segm-rtng micro-loop-avoidance)

Full Context

configure router ospf segment-routing micro-loop-avoidance

Description

This command enables microloop avoidance for SR-OSPF.

When enabled, the feature applies to the following contexts:

- SPFv2 SR-OSPF IPv4 tunnel (node SID)
- IPv4 and IPv6 SR-TE LSPs that use a node SID in their segment list
- IPv4 and IPv6 SR policies that use a node SID in their segment list

The **no** form of this command disables microloop avoidance. When microloop avoidance is disabled, the system forces any running FIB delay to expire immediately and programs the new next hops for all impacted node SIDs. When disabled, microloop avoidance is disabled instantaneously and will be disabled for the next SPF runs. Microloop avoidance remains disabled until it is re-enabled.

Default

no micro-loop-avoidance

Parameters

fib-delay

Specifies the FIB delay before programming new primary next hops. Configure the FIB delay timer to a value that corresponds to the worst-case IGP convergence in a network domain. The default FIB delay timer value corresponds to a network with a nominal convergence time.

Values 1 to 300

Description

This command assigns a micro-segment locator to each algorithm in an IS-IS instance. The same micro-segment locator of a specific algorithm number can be shared with other IGP instances and BGP instances in IP-VPN or EVPN.

This command refers to a micro-segment locator name defined under the following context.

```
configure router segment-routing segment-routing-v6
```

The **no** form of this command removes the micro-segment locator.

Default

no micro-segment-locator

Parameters

ms-locator-name

Specifies a micro-segment locator name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

micro-segment-locator

Syntax

micro-segment-locator *name* **function end-b6-encaps-red-next-csid** [**function-value** *function-value*]

no micro-segment-locator

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>srv6>binding-sid micro-segment-locator)

Full Context

configure router segment-routing sr-policies static-policy segment-routing-v6 binding-sid micro-segment-locator

Description

This command configures binding SID micro-segment-locator parameters for a local SRv6 policy.

The **no** form of the command removes the configuration.

Parameters

name

Specifies the name of the micro-segment-locator, up to 256 characters. A corresponding micro-segment-locator name must exist in the **config>router>segment-routing>srv6** context.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

end-b6-encaps-red-next-csid

Keyword to configure reduced encapsulation for the microbinding SID.

function-value

Specifies the optional function value of the local SRv6 microbinding SID. If a function value is configured, the router checks whether this function value is available for the named locator. If no function value is configured, the router dynamically allocates a value.

Values 1 to 65535

Default no function value

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

29.132 mid-pool

mid-pool

Syntax

[**no**] **mid-pool** *mid-pool-id*

Context

[Tree] (config>qos>hs-pool-policy>mid-tier mid-pool)

Full Context

configure qos hs-pool-policy mid-tier mid-pool

Description

Commands in this context configure mid-pool tier parameters for an HS pool policy. Parameters allow for allocating the percentage of the root pool size, defining a mid-tier pool's root-pool parent, specifying the port bandwidth oversubscription factor, or specifying a slope policy for the specific mid-tier pool.

The **no** form of the command reverts the parent root pool association to root-pool 1, reverts to the default allocation-percentage value, the default **port-bw-oversub-factor**, and default slope-policy to the specified mid-pool.

Parameters

mid-pool-id

Specifies the mid pool ID. This is a required parameter when this command is executed and specifies which mid-pool context is being entered.

Values 1 to 16

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms
7750 SR-7/12/12e

29.133 mid-tier

mid-tier

Syntax
mid-tier

Context
[Tree] (config>qos>hs-pool-policy mid-tier)

Full Context
configure qos hs-pool-policy mid-tier

Description
Commands in this context configure HS pool policy parameters. Within the **mid-tier** context, mid-pools can be associated with a root pool, sized as a percentage of the root pool, have an HS slope policy applied, or be configured with a port bandwidth oversubscription factor parameter used to influence the port-class pool sizes associated with the mid-tier pool.

Platforms
7750 SR-7/12/12e

29.134 migrant

migrant

Syntax
[**no**] **migrant**

Context

Full Context
configure subscriber-mgmt wlan-gw tunnel-query ue-state migrant

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables matching on tunnels with migrant UEs.

The **no** form of this command disables matching on migrant UEs, unless UE state matching is disabled altogether.

Default

no migrant

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

29.135 millisecond-event-timestamp

millisecond-event-timestamp

Syntax

[no] millisecond-event-timestamp

Context

[Tree] (config>aaa>isa-radius-plcy>acct-include-attributes millisecond-event-timestamp)

Full Context

configure aaa isa-radius-policy acct-include-attributes millisecond-event-timestamp

Description

This command enables the router to include the Alc-Millisecond-Event-Timestamp attribute in the accounting message. This attribute specifies the time the accounting event was logged, in milliseconds since Jan 1, 1970 00:00:00 UTC.

The **no** form of this command disables the router from including the Alc-Millisecond-Event-Timestamp attribute in the accounting message.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Syntax

min-auth-interval [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

no min-auth-interval

Context

[Tree] (config>service>ies>sub-if>grp-if>ipv6>rtr-sol min-auth-interval)

Full Context

configure service ies subscriber-interface group-interface ipv6 router-solicit min-auth-interval

Description

This command specify the minimum interval between two consecutive authentication attempts from the same host.

The **no** form of this command reverts to the default.

Parameters

days

Specifies the number of days that a user must wait for the next authentication attempt.

hours

Specifies the number of hours that a user must wait for the next authentication attempt.

minutes

Specifies the number of minutes that a user must wait for the next authentication attempt.

seconds

Specifies the number of seconds that a user must wait for the next authentication attempt.

Platforms

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn subscriber-interface group-interface ipoe-session min-auth-interval

configure service ies subscriber-interface group-interface ipoe-session min-auth-interval

Description

Re-authentication for IPoE sessions enable dynamic policy changes.

This command configures the maximum frequency of re-authentications by specifying a minimum interval between two non-forced authentications for the same IPoE session.

A forced authentication is by default triggered by a circuit-id, interface-id or remote-id change (see the **force-auth** [**config>service>ies>sub-if>grp-if>ipoe-session force-auth**, **config>service>vprn>sub-if>grp-if>ipoe-session force-auth**] command).

Re-authentications are, by default, disabled and can be enabled by configuring a **min-auth-interval**.

Setting the **min-auth-interval** to zero seconds always re-authenticates on each trigger packet.

The **no** form of this command reverts to the default behavior.

Default

min-auth-interval infinite

Parameters

days

Specifies the min number of days between two non-forced authentications for IPoE sessions.

Values 0 to 365

hours

Specifies the min number of hours between two non-forced authentications for IPoE sessions.

Values 0 to 23

minutes

Specifies the min number of minutes between two non-forced authentications for IPoE sessions.

Values 0 to 59

seconds

Specifies the min number of seconds between two non-forced authentications for IPoE sessions.

Values 0 to 59

infinite

Specifies that non-forced re-authentications for IPoE sessions is not performed.

Full Context

configure router nat inside dual-stack-lite address min-first-fragment-size-rx

configure service vprn nat inside dual-stack-lite address min-first-fragment-size-rx

Description

This command configures the minimum MTU size for the first fragment in the upstream direction. This command can be used to enable processing of first IPv6 fragments smaller than 1280 bytes. RFC 8200 recommends the minimum MTU in IPv6 be 1280 bytes which allows fragmentation only for packets that are larger than 1280 bytes. If a first fragment is smaller than 1280 bytes, DS-lite implementation in the SR OS, by default, drops the first fragment.

The **no** form of the command reverts to the default value.

Default

min-first-fragment-size-rx 1280

Parameters

mtu-bytes

Specifies the minimum MTU size for the first fragment in the upstream direction

Values 512 to 1280

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure router bgp group min-route-advertisement

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the minimum interval, in seconds, between successive updates of a prefix towards a peer.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group), or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of this command used at the global level reverts to default.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

The **rapid-update** command can be used to override the peer-level **min-route-advertisement** time and applies the minimum setting (0 seconds) to routes belonging to address families specified by the **rapid-update** command; routes of other address families continue to be advertised according to the session-level MRAI setting.

The **rapid-update** and **rapid-withdrawal** commands may result in the routes being sent before the peer-level MRAI timer expires.

Default

min-route-advertisement 30

Parameters

seconds

Specifies the minimum route advertising interval, in seconds, expressed as a decimal integer.

Values 1 to 255

Platforms

All

30 m Commands – Part III

30.1 min-thresh-separation

min-thresh-separation

Syntax

min-thresh-separation *size* [**bytes** | **kilobytes**]

no min-thresh-separation

Context

[Tree] (config>subscr-mgmt>sub-prof>ingress>policer-control-policy>priority-mbs-thresholds min-thresh-separation)

[Tree] (config>subscr-mgmt>sub-prof>egress>policer-control-policy>priority-mbs-thresholds min-thresh-separation)

Full Context

configure subscriber-mgmt sub-profile ingress policer-control-policy priority-mbs-thresholds min-thresh-separation

configure subscriber-mgmt sub-profile egress policer-control-policy priority-mbs-thresholds min-thresh-separation

Description

The **min-thresh-separation** command defines the minimum required separation between each in-use discard threshold maintained for each parent policer context associated with the policer-control-policy. The min-thresh-separation value may be overridden on each SAP or sub-profile to which the policy is applied.

The system uses the default or specified min-thresh-separation value in order to determine the minimum separation required between each of the of the parent policer discard thresholds. The system enforces the minimum separation based on the following behavior in two ways. The first is determining the size of the shared-portion for each priority level (when the **mbs-contribution** command's optional fixed keyword is not specified):

- When a parent policer instance's priority level has less than two child policers associated, the shared-portion for the level is zero.
- When a parent policer instance's priority level has two or more child policers associated, the shared-portion for the level is equal to the current value of **min-thresh-separation**.

The second function the system uses the **min-thresh-separation** value for is determining the value per priority level for the fair-portion:

- When a parent policer instance's priority level has no child policers associated, the fair-portion for the level is zero.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- When a parent policer instance's priority level has one child policer associated, the fair-portion is equal to the maximum of the min-thresh-separation value and the priority level's mbs-contribution value.
- When a parent policer instance's priority level has two or more child policers associated, the fair-portion is equal to the maximum of the following:
  - **min-thresh-separation** value
  - The priority level's **mbs-contribution** value less **min-thresh-separation** value

When the **mbs-contribution** command's optional fixed keyword is defined for a priority level within the policy, the system will treat the defined **mbs-contribution** value as an explicit definition of the priority level's MBS. While the system will continue to track child policer associations with the parent policer priority levels, the association counters will have no effect. Instead the following rules is used to determine a fixed priority level's shared-portion and fair-portion:

- If a fixed priority level's **mbs-contribution** value is set to zero, both the shared-portion and fair-portion is set to zero
- If the **mbs-contribution** value is not set to zero:
  - The shared-portion is set to the current **min-thresh-separation** value
  - The fair-portion is set to the maximum of the following:

min-thresh-separation value

mbs-contribution value less **min-thresh-separation value**

Each time the **min-thresh-separation** value is modified, the thresholds for all instances of the parent policer created through association with this **policer-control-policy** are reevaluated.

Determining the Correct Value for the Minimum Threshold Separation Value

The minimum value for **min-thresh-separation** should be set equal to the maximum size packet that is handled by the parent policer. This ensures that when a lower priority packet is incrementing the bucket, the size of the increment will not cause the bucket's depth to equal or exceed a higher priority threshold. It also ensures that an unfair packet within a priority level cannot cause the PIR bucket to increment to the discard-all threshold within the priority.

When evaluating maximum packet size, each child policer's per-packet-offset setting should be taken into consideration. If the maximum size packet is 1518 bytes and a per-packet-offset parameter is configured to add 20 bytes per packet, min-thresh-separation should be set to 1538 due to the fact that the parent policer will increment its PIR bucket using the extra 20 bytes.

In most circumstances, a value larger than the maximum packet size is not necessary. Management of priority level aggregate burst tolerance is intended to be implemented using the priority level **mbs-contribution** command. Setting a value larger than the maximum packet size will not adversely affect the policer performance, but it may increase the aggregate burst tolerance for each priority level.

Note:
A priority level's shared-portion of the parent policer's PIR bucket depth is only necessary to provide some separation between a lower priority's discard-all threshold and this priority's discard-unfair threshold. It is expected that the burst tolerance for the unfair packets is relatively minimal since the child policers feeding the parent policer priority level all have some amount of fair burst before entering into an FIR exceed or unfair state. The fair burst amount for a priority level is defined using the mbs-contribution command.

The **no** form of this command returns the policy's **min-thresh-separation** value to the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

size

The size parameter is required when executing the **min-thresh-separation** command. It is expressed as an integer and specifies the shared portion in bytes or kilobytes that is selected by the trailing bytes or kilobytes keywords. If both bytes and kilobytes are missing, kilobytes is the assumed value. Setting this value has no effect on parent policer instances where the **min-thresh-separation** value has been overridden.

Values 0 to 16777216

[bytes | kilobytes]

The **bytes** keyword is optional and is mutually exclusive with the **kilobytes** keyword. When specified, size is interpreted as specifying the size of **min-thresh-separation** in bytes.

The **kilobytes** keyword is optional and is mutually exclusive with the **bytes** keyword. When specified, size is interpreted as specifying the size of **min-thresh-separation** in kilobytes.

configure card fp ingress access queue-group policer-control-override priority-mbs-thresholds min-thresh-separation

Description

This command defines the minimum required separation between each in-use discard threshold maintained for each parent policer context associated with the policer-control-policy. The min-thresh-separation value may be overridden on each SAP or sub-profile to which the policy is applied.

The system uses the default or specified min-thresh-separation value in order to determine the minimum separation required between each of the of the parent policer discard thresholds. The system enforces the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

minimum separation based on the following behavior in two ways. The first is determining the size of the shared-portion for each priority level (when the **mbs-contribution** command's optional fixed keyword is not specified):

- When a parent policer instance's priority level has less than two child policers associated, the shared-portion for the level will be zero.
- When a parent policer instance's priority level has two or more child policers associated, the shared-portion for the level will be equal to the current value of **min-thresh-separation**.

The second function the system uses the **min-thresh-separation** value for is determining the value per priority level for the fair-portion:

- When a parent policer instance's priority level has no child policers associated, the fair-portion for the level will be zero.
- When a parent policer instance's priority level has one child policer associated, the fair-portion will be equal to the maximum of the min-thresh-separation value and the priority level's mbs-contribution value.
- When a parent policer instance's priority level has two or more child policers associated, the fair-portion will be equal to the maximum of the following:
  - **min-thresh-separation** value
  - The priority level's **mbs-contribution** value less **min-thresh-separation** value

When the **mbs-contribution** command's optional fixed keyword is defined for a priority level within the policy, the system will treat the defined **mbs-contribution** value as an explicit definition of the priority level's MBS. While the system will continue to track child policer associations with the parent policer priority levels, the association counters will have no effect. Instead the following rules will be used to determine a fixed priority level's shared-portion and fair-portion:

- If a fixed priority level's **mbs-contribution** value is set to zero, both the shared-portion and fair-portion will be set to zero
- If the **mbs-contribution** value is not set to zero:
  - The shared-portion will be set to the current **min-thresh-separation** value
  - The fair-portion will be set to the maximum of the following:
    - **min-thresh-separation** value
    - **mbs-contribution** value less **min-thresh-separation value**

Each time the **min-thresh-separation** value is modified, the thresholds for all instances of the parent policer created through association with this **policer-control-policy** are reevaluated except for parent policer instances that currently have a min-thresh-separation override.

Determining the Correct Value for the Minimum Threshold Separation Value

The minimum value for **min-thresh-separation** should be set equal to the maximum size packet that will be handled by the parent policer. This ensures that when a lower priority packet is incrementing the bucket, the size of the increment will not cause the bucket's depth to equal or exceed a higher priority threshold. It also ensures that an unfair packet within a priority level cannot cause the PIR bucket to increment to the discard-all threshold within the priority.

When evaluating maximum packet size, each child policer's per-packet-offset setting should be taken into consideration. If the maximum size packet is 1518 bytes and a per-packet-offset parameter is configured to add 20 bytes per packet, min-thresh-separation should be set to 1538 due to the fact that the parent policer will increment its PIR bucket using the extra 20 bytes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

In most circumstances, a value larger than the maximum packet size is not necessary. Management of priority level aggregate burst tolerance is intended to be implemented using the priority level **mbs-contribution** command. Setting a value larger than the maximum packet size will not adversely affect the policer performance, but it may increase the aggregate burst tolerance for each priority level.

One thing to note is that a priority level's shared-portion of the parent policer's PIR bucket depth is only necessary to provide some separation between a lower priority's discard-all threshold and this priority's discard-unfair threshold. It is expected that the burst tolerance for the unfair packets is relatively minimal since the child policers feeding the parent policer priority level all have some amount of fair burst before entering into an FIR exceed or unfair state. The fair burst amount for a priority level is defined using the mbs-contribution command.

The **no** form of this command returns the policy's **min-thresh-separation** value to the default value. This has no effect on instances of the parent policer where **min-thresh-separation** is overridden unless the override is removed.

Default

no min-thresh-separation

Parameters

size

Specifies that the size parameter is required when executing the **min-thresh-separation** command. It is expressed as an integer and specifies the shared portion in bytes or kilobytes that is selected by the trailing bytes or kilobytes keywords. If both bytes and kilobytes are missing, kilobytes is the assumed value. Setting this value has no effect on parent policer instances where the **min-thresh-separation** value has been overridden. Clearing an override on parent policer instance causes this value to be enforced.

Values 0 to 16777216

bytes | kilobytes

Specifies that the **bytes** keyword is optional and is mutually exclusive with the **kilobytes** keyword. When specified, size is interpreted as specifying the size of **min-thresh-separation** in bytes.

The **kilobytes** keyword is optional and is mutually exclusive with the **bytes** keyword. When specified, size is interpreted as specifying the size of **min-thresh-separation** in kilobytes.

configure qos policer-control-policy root priority-mbs-thresholds min-thresh-separation

Description

The **min-thresh-separation** command defines the minimum required separation between each in-use discard threshold maintained for each parent policer context associated with the policer-control-policy. The min-thresh-separation value may be overridden on each SAP or sub-profile to which the policy is applied.

The system uses the default or specified **min-thresh-separation** value in order to determine the minimum separation required between each of the of the parent policer discard thresholds. The system enforces the minimum separation based on the following behavior in two ways. The first is determining the size of the shared-portion for each priority level (when the **mbs-contribution** command's optional fixed keyword is not specified):

- When a parent policer instance's priority level has less than two child policers associated, the shared-portion for the level will be zero.
- When a parent policer instance's priority level has two or more child policers associated, the shared-portion for the level will be equal to the current value of **min-thresh-separation**.

The second function the system uses the **min-thresh-separation** value for is determining the value per priority level for the fair-portion:

- When a parent policer instance's priority level has no child policers associated, the fair-portion for the level will be zero.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- When a parent policer instance's priority level has one child policer associated, the fair-portion will be equal to the maximum of the min-thresh-separation value and the priority level's mbs-contribution value.
- When a parent policer instance's priority level has two or more child policers associated, the fair-portion will be equal to the maximum of the following:
  - **min-thresh-separation** value
  - **mbs-contribution** value less **min-thresh-separation** value

When the **mbs-contribution** command's optional fixed keyword is defined for a priority level within the policy, the system will treat the defined **mbs-contribution** value as an explicit definition of the priority level's MBS. While the system will continue to track child policer associations with the parent policer priority levels, the association counters will have no effect. Instead, the following rules will be used to determine a fixed priority level's shared-portion and fair-portion:

- If a fixed priority level's **mbs-contribution** value is set to zero, both the shared-portion and fair-portion will be set to zero
- If the **mbs-contribution** value is not set to zero:
  - The shared-portion will be set to the current **min-thresh-separation** value
  - The fair-portion will be set to the maximum of the following:

    min-thresh-separation value

    mbs-contribution value less **min-thresh-separation value**

Each time the **min-thresh-separation** value is modified, the thresholds for all instances of the parent policer created through association with this **policer-control-policy** are reevaluated.

Determining the Correct Value for the Minimum Threshold Separation Value

The minimum value for **min-thresh-separation** should be set equal to the maximum size packet that will be handled by the parent policer. This ensures that when a lower priority packet is incrementing the bucket, the size of the increment will not cause the bucket's depth to equal or exceed a higher priority threshold. It also ensures that an unfair packet within a priority level cannot cause the PIR bucket to increment to the discard-all threshold within the priority.

When evaluating maximum packet size, each child policer's per-packet-offset setting should be taken into consideration. If the maximum size packet is 1518 bytes and a per-packet-offset parameter is configured to add 20 bytes per packet, min-thresh-separation should be set to 1538 due to the fact that the parent policer will increment its PIR bucket using the extra 20 bytes.

In most circumstances, a value larger than the maximum packet size is not necessary. Management of priority level aggregate burst tolerance is intended to be implemented using the priority level **mbs-contribution** command. Setting a value larger than the maximum packet size will not adversely affect the policer performance, but it may increase the aggregate burst tolerance for each priority level.

Note:
A priority level's shared-portion of the parent policer's PIR bucket depth is only necessary to provide some separation between a lower priority's discard-all threshold and this priority's discard-unfair threshold. It is expected that the burst tolerance for the unfair packets is relatively minimal since the child policers feeding the parent policer priority level all have some amount of fair burst before entering into an FIR exceed or unfair state. The fair burst amount for a priority level is defined using the mbs-contribution command.

The **no** form of this command returns the policy's **min-thresh-separation** value to the default value.

configure router dhcp6 local-dhcp-server pool prefix thresholds minimum-free minimum

configure service vprn dhcp6 local-dhcp-server pool prefix thresholds minimum-free minimum

Description

This command configures a percentage-based or number-based threshold which represents the minimal available percentage or number of the prefix with a configured length in the provisioned prefix. The system sends out a warning if the actual percentage or number is lower than the configured threshold.

For example:

```
prefix 2001:0:0:ffe0::/50 pd wan-host create
   thresholds
       minimum-free prefix-length 64
           minimum number 3
```

With the above configuration, the system sends a warning when the number of available /64 in prefix 2001:0:0:ffe0::/50 is less than 3.

The **no** form of this command removes the command parameters from the configuration.

Parameters

percent

Specifies the percentage of used prefixes with the minimum free threshold length in the pool compared to the number of provisioned prefixes.

configure service vprn dhcp local-dhcp-server pool minimum-free

configure router dhcp local-dhcp-server pool minimum-free

Description

This command specifies the desired minimum number of free addresses in this pool.

The **no** form of this command reverts to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

minimum-free 1

Parameters

minimum-free

Specifies the minimum number of free addresses.

Values 0 to 255

percent

Specifies that the value indicates a percentage.

event-when-depleted

This parameter enables a system-generate event when all available addresses in the pool/subnet of local DHCP server are depleted.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

minimum-free

Syntax

minimum-free *minimum-free* [**percent**] [**event-when-depleted**]

no minimum-free

Context

[Tree] (config>service>vprn>dhcp>server>pool>subnet minimum-free)

Full Context

configure router dhcp local-dhcp-server pool subnet minimum-free

configure service vprn dhcp local-dhcp-server pool subnet minimum-free

Description

This command configures the minimum number of free addresses in this subnet. If the actual number of free addresses in this subnet falls below this configured minimum, a notification is generated.

The **no** form of the reverts to the default.

Default

minimum-free 1

Parameters

minimum-free

Specifies the minimum number of free addresses in this subnet.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0 to 255

percent

Specifies that the value indicates a percentage.

event-when-depleted

Enables a system-generate event when all available addresses in the pool or subnet of local DHCP server are depleted.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

minimum-free

Syntax

[**no**] **minimum-free prefix-length** [*prefix-length*]

Context

[Tree] (config>router>dhcp6>server>pool>thresholds minimum-free)

[Tree] (config>service>vprn>dhcp6>server>pool>thresholds minimum-free)

Full Context

configure router dhcp6 local-dhcp-server pool thresholds minimum-free

configure service vprn dhcp6 local-dhcp-server pool thresholds minimum-free

Description

This command creates a threshold for a given prefix length on the pool level. Up to 128 thresholds could be created. For example, with **minimum-free prefix-length 64**, then the usage of /64 prefix in the pool is counted.

There are two types of thresholds that could be defined at the pool level:

- Depleted — The system sends out a warning when the prefix with the configured length is no long available in the pool.
- Minimum free — A percentage-based threshold which represents the minimal available percentage of prefix with the configured length in the pool. The system will send out warning if the actual percentage is lower than the configured percentage.

Configuring this command also enables the system stats collection for **configure prefix length**, which could be displayed with the **show router** *router-id* **dhcp6 local-dhcp-server** *dhcp6-server-name* **pool-threshold-stats** command.

The **no** form of this command removes the prefix-length from the configuration.

Parameters

prefix-length

Specifies the IPv6 prefix length.

30.9 minimum-isa-generation

minimum-isa-generation

Syntax

minimum-isa-generation *min-isa-generation*

Context

[Tree] (config>isa>aa-grp minimum-isa-generation)

Full Context

configure isa application-assurance-group minimum-isa-generation

Description

This command configures the scale parameters for the ISA group. When *min-isa-generation* is configured as 1, the group and per-ISA limits are the MS-ISA scale.

If there is a mix of ISA 1s and 2s, the *min-isa-generation* must be left as 1.

When min-isa-gen is configured as 2, the per-isa resource limits shown in the **show isa application-assurance-group 1 load-balance** output will increase to show ISA2 limits.

Default

minimum-isa-generation 1

Parameters

min-isa-generation

Specifies the minimum ISA Generation allowed in this group.

Values 1 – ISA (ISA1)

2 – ISA2

configure service epipe sap eth-cfm mip

configure service vpls spoke-sdp eth-cfm mip

configure service vpls mesh-sdp eth-cfm mip

configure service vpls sap eth-cfm mip

configure service epipe spoke-sdp eth-cfm mip

Description

This command configures Maintenance Intermediate Points (MIPs). The creation rules of the MIP are dependent on the **mhf-creation** configuration for the MA.

The MIP can be created with a primary VLAN using the **primary-vlan-enable** *vlan-id* parameter matching the VLAN configured under the applicable association. Optional VLANs can be added the to the locally-generated CFM frames for egress processing using the **cfm-vlan-tag** option.

The **no** form of this command removes the MIP creation request.

Default

no mip

Parameters

qtag1

Specifies the outer VLAN ID.

Values 1 to 4094

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

qtag2

Specifies the inner VLAN ID and can only be specified if *qtag1* is configured.

Values 1 to 4094

mac

Provides a method for manually configuring the MIP MAC address.

mac-address

Specifies the MAC address of the MIP.

Values 6-byte mac-address in the form of xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx of the MIP. The MAC address must be unicast. Using the all-zeros address is equivalent to the **no** form of this command.

default-mac

Specifies to change the MAC address back to the default MAC without having to delete and reconfigure the MIP.

primary-vlan-enable

Provides a method for linking the MIP with the primary VLAN configured under the bridge-identifier for the MA. This is only allowed if the mhf-creation method is static. MIPs cannot be changed from or to primary VLAN functions without first being deleted. This must be configured as part of the creation step and can only be changed by deleting the MIP and re-creating it. Primary VLANs are only supported under Layer 2 Epipe and VPLS services.

vlan-id

Specifies the VLAN ID. This parameter must match the VLAN ID under the bridge-identifier for the MA that is appropriate for this service.

Values 0 to 4094

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Description

This command allows Maintenance Intermediate Points (MIPs). The creation rules of the MIP are dependent on the mhf-creation configuration for the MA. This MIP option is only available for default and static mhf-creation methods.

Parameters

primary-vlan-enable

Provides a method for linking the MIP with the primary VLAN configured under the bridge-identifier for the MA. This is only allowed if the mhf-creation method is static. MIPs cannot be changed from or to primary VLAN functions without first being deleted. This must be configured as part of the creation step and can only be changed by deleting the MEP and re-creating it. Primary VLANs are only supported under Ethernet SAPs.

vlan

A required parameter when including primary-vlan-enable. Provides a method for associating the VLAN under the bride-identifier under the MA with the MIP.

vlan-id

Must match the vlan-id under the bridge-identifier for the MA that is appropriate for this service.

Values 0 to 4094

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

30.16 mirror-dest

mirror-dest

Syntax

mirror-dest *service-id* [**create**] [**type** *mirror-type*] [**name** *name*]

no mirror-dest *service-id*

Context

[Tree] (config>mirror mirror-dest)

Full Context

configure mirror mirror-dest

Description

This command creates a context to set up a service that is intended for packet mirroring. It is configured as a service to allow mirrored packets to be directed locally (within the same router) or remotely, over the core of the network and have a far-end decode mirror encapsulation.

The mirror destination service is comprised of destination parameters that define where the mirrored packets are to be sent. It also specifies whether the defined *service-id* will receive mirrored packets from far-end router over the network core.

The mirror destination service IDs are persistent between boots of the router and are included in the configuration saves. The local sources of mirrored packets for the service ID are defined within the **debug mirror mirror-source** command that references the same *service-id*. Up to 255 mirror destination service IDs can be created within a single system.

The **mirror-dest** command creates or edits a service ID for mirroring purposes. If the *service-id* does not exist within the context of all defined services, the mirror destination service is created and the context of the CLI is changed to that service ID. If the *service-id* exists within the context of defined mirror destination services, the CLI context is changed for editing parameters on that service ID. If the *service-id* exists within the context of another service type, an error message is returned and CLI context is not changed from the current context.

LI source configuration is saved using the **li>save** command.

The **no** form of this command removes a mirror destination from the system. The mirror source or **li-source** associations with the mirror destination *service-id* do not need to be removed or shutdown first. The mirror destination *service-id* must be shutdown before the service ID can be removed. When the service ID is removed, all **mirror-source** or **li-source** commands that have the service ID defined will also be removed from the system.

Parameters

service-id

The service identification identifies the service in the service domain. This ID is unique to this service and cannot be used by any other service, regardless of service type. The same service ID must be configured on every router that this particular service is defined on.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If particular a service ID already exists for a service, then the same value cannot be used to create a mirror destination service ID with the same value. For example:

If an Epipe service ID **11** exists, then a mirror destination service ID **11** cannot be created. If a VPLS service ID **12** exists, then a mirror destination service ID **12** cannot be created.

If an IES service ID **13** exists, then a mirror destination service ID **13** cannot be created.

Values

service-id: 1 to 2147483647

svc-name: 64 characters maximum

create

Keyword used to create a mirror destination service.

mirror-type

The type describes the encapsulation supported by the mirror service.

Values The following values apply to the 7750 SR:

ether, ip-only

Values The following values apply to the 7950 XRS:

ether, ip-only

Values The following values apply to the 7450 ESS:

ether

name

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Service names may not begin with an integer (0 to 9).

Full Context

configure li mirror-dest-template

Description

This command creates a template used by RADIUS-triggered mirror destinations. RADIUS provides the IP destination (and other optional attributes) for the mirror destination and the mirror template provides the remaining mirror destination attributes for mirroring packets remotely over the core of an IP network.

The system supports up to eight mirror destination templates and allows a mirror destination to be swapped in real time. Only new LI sources will use the new attribute of the mirror destination template. Existing LI sources remain unchanged and continue to use the attribute of the previous mirror destination template.

The **no** form of this command removes a mirror destination template from the system.

Parameters

name

Specifies the template name, up to 32 characters.

mirror-type

Specifies the type of encapsulation supported by the mirror service.

Values ether, frame-relay, ppp, ip-only, atm-sdu, satop-e1, satop-t1, cesopsn, cesopsn-cas

30.19 mirror-source

mirror-source

Syntax

mirror-source [**all-inclusive**] *mirror-service-id*

no mirror-source

Context

[Tree] (config>app-assure>group>policy>aqp>entry>action mirror-source)

Full Context

configure application-assurance group policy app-qos-policy entry action mirror-source

Description

This command configures an application-based policy mirroring service that uses this AA ISA group's AQP entry as a mirror source. When configured, AQP entry becomes a mirror source for IP packets seen by the AA (the mirrored packet is an IP packet analyzed by AA and does not include encapsulations present on the incoming interfaces).

Default

no mirror-source

Parameters

all-inclusive

Specifies that all packets during identification phase that could match a given AQP rule are mirrored in addition to packets after an application identification completes that match the AQP rule. This ensures all packets of a given flow are mirrored at a cost of sending unidentified packets that once the application is identified will no longer match this AQP entry.

mirror-service-id

Specifies the mirror source service ID to use for flows that match this policy.

Values 1 to 2147483647

svc-name: 64 characters maximum

© 2026 Nokia.

mirror-source

Syntax

[**no**] **mirror-source** *service-id*

Context

[Tree] (config>mirror mirror-source)

Full Context

configure mirror mirror-source

Description

This command configures mirror source parameters for a mirrored service.

The **mirror-source** command is used to enable mirroring of packets specified by the association of the **mirror-source** to sources of packets defined within the context of the *mirror-dest-service-id*. The mirror destination service must already exist within the system.

A mirrored packet cannot be mirrored to multiple destinations. If a packet matches multiple mirror source entries (for example, a SAP on one **mirror-source** and a port on another **mirror-source**), then the packet is mirrored to a single *mirror-dest-service-id* based on the following precedence:

1. Filter entry
2. Subscriber (applies to the 7750 SR and 7450 ESS)
3. SAP
4. Physical port

The precedence is structured so the most specific match criteria has precedence over a less specific match. For example, if a **mirror-source** defines a port and a SAP on that port, then a packet arriving on the SAP will be mirrored using the SAP mirror (and not mirrored using the Port mirror) because the SAP is more specific than the port.

The **no** form of this command deletes all related source commands within the context of the **mirror-source** *service-id*. The command does not remove the service ID from the system.

Parameters

service-id

Specifies the service identification identifies the service in the service domain. This ID is unique to this service and cannot be used by any other service, regardless of service type. The same service ID must be configured on every router that this particular service is defined on.

Values *service-id*: 1 to 2147483647

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

svc-name: 64 characters maximum

Platforms

All

mirror-source

Syntax

[**no**] **mirror-source** *service-id*

Context

[Tree] (debug mirror-source)

Full Context

debug mirror-source

Description

This command configures mirror source parameters for a mirrored service.

The **mirror-source** command is used to enable mirroring of packets specified by the association of the **mirror-source** to sources of packets defined within the context of the *mirror-dest-service-id*. The mirror destination service must already exist within the system.

A mirrored packet cannot be mirrored to multiple destinations. If a packet matches multiple mirror source entries (for example, a SAP on one **mirror-source** and a port on another **mirror-source**), then the packet is mirrored to a single *mirror-dest-service-id* based on the following precedence:

1. Filter entry
2. Subscriber (applies to the 7750 SR and 7450 ESS)
3. SAP
4. Physical port

The precedence is structured so the most specific match criteria has precedence over a less specific match. For example, if a **mirror-source** defines a port and a SAP on that port, then a packet arriving on the SAP will be mirrored using the SAP mirror (and not mirrored using the Port mirror) because the SAP is more specific than the port.

The **mirror-source** configuration is not saved when a configuration is saved. A **mirror-source** manually configured within an ASCII configuration file will not be preserved if that file is overwritten by a **save** command. Define the **mirror-source** within a file associated with a **config exec** command to make a **mirror-source** persistent between system reboots.

By default, all mirror destination service IDs have a **mirror-source** associated with them. The **mirror-source** is not technically created with this command. Instead the service ID provides a contextual node for storing the current mirroring sources for the associated mirror destination service ID. The **mirror-source** is created for the mirror service when the operator enters the **debug>mirror-source** *svcId* for the first time. If the operator enters **li>li-source** *svcId* for the first time, an LI source is created for the mirror service. The

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mirror-source is also automatically removed when the mirror destination service ID is deleted from the system.

The **no** form of this command deletes all related source commands within the context of the **mirror-source** *service-id*. The command does not remove the service ID from the system.

Parameters

service-id

Specifies the mirror destination service ID for which match criteria will be defined. The *service-id* must already exist within the system.

Values *service-id*: 1 to 2147483647

svc-name: 64 characters maximum

30.23 mixed-lsp-mode

mixed-lsp-mode

Syntax

[**no**] **mixed-lsp-mode**

Context

[Tree] (config>service>sdp mixed-lsp-mode)

Full Context

configure service sdp mixed-lsp-mode

Description

This command enables the use by an SDP of the mixed-LSP mode of operation. This command indicates to the service manager that it must allow a primary LSP type and a backup LSP type in the same SDP configuration. For example, the **lsp** and **ldp** commands are allowed concurrently in the SDP configuration. The user can configure one or two types of LSPs under the same SDP. Without this command, these commands are mutually exclusive.

The user can configure an RSVP LSP as a primary LSP type with an LDP LSP as a backup type. The user can also configure an RFC 8277 BGP LSP as a backup LSP type.

If the user configures an LDP LSP as a primary LSP type, then the backup LSP type must be an RFC 8277 BGP labeled route.

At any given time, the service manager programs only one type of LSP in the linecard that will activate it to forward service packets according to the following priority order:

- RSVP LSP type. Up to 16 RSVP LSPs can be entered by the user and programmed by the service manager in ingress linecard to load balance service packets. This is the highest priority LSP type.
- LDP LSP type. One LDP FEC programmed by the service manager but the ingress card can use up to 16 LDP ECMP paths for the FEC to load balance service packets when ECMP is enabled on the node.
- BGP LSP type. One RFC 8277-labeled BGP prefix programmed by the service manager. The ingress card can use more than one next-hop for the prefix.

In the case of the RSVP/LDP SDP, the service manager will program the NHLFE(s) for the active LSP type preferring the RSVP LSP type over the LDP LSP type. If no RSVP LSP is configured or all configured RSVP LSPs go down, the service manager will re-program the card with the LDP LSP if available. If not, the SDP goes operationally down.

When a higher priority type LSP becomes available, the service manager reverts back to this LSP at the expiry of the sdp-revert-time timer or the failure of the currently active LSP, whichever comes first. The service manager then re-programs the card accordingly. If the infinite value is configured, then the SDP reverts to the highest priority type LSP only if the currently active LSP failed.

Note:
LDP uses a tunnel down damp timer which is set to three seconds by default. When the LDP LSP fails, the SDP will revert to the RSVP LSP type after the expiry of this timer. For an immediate

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

switchover, this timer must be set to zero. Use the **config>router>ldp>tunnel-down-damp-time** command.

If the user changes the value of the sdp-revert-time timer, it will take effect only at the next use of the timer. Any timer which is outstanding at the time of the change will be restarted with the new value.

If class based forwarding is enabled for this SDP, the forwarding of the packets over the RSVP LSPs will be based on the FC of the packet as in current implementation. When the SDP activates the LDP LSP type, then packets are forwarded over the LDP ECMP paths using the regular hash routine.

In the case of the LDP/BGP SDP, the service manager will prefer the LDP LSP type over the BGP LSP type. The service manager will re-program the card with the BGP LSP if available otherwise it brings down the SDP operationally.

Also note the following difference in behavior of the LDP/BGP SDP compared to that of an RSVP/LDP SDP. For a given /32 prefix, only a single route will exist in the routing table: the IGP route or the BGP route. Thus, either the LDP FEC or the BGP label route is active at any given time. The impact of this is that the tunnel table needs to be re-programmed each time a route is deactivated and the other is activated. Furthermore, the SDP revert-time cannot be used since there is no situation where both LSP types are active for the same /32 prefix.

The **no** form of this command disables the mixed-LSP mode of operation. The user first has to remove one of the LSP types from the SDP configuration or the command will fail.

Description

This command specifies the mode of unicast RPF check.

The **no** form of this command reverts to the default (strict) mode.

Default

mode strict

Parameters

strict

When specified, uRPF checks whether incoming packet has a source address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source address prefix.

loose

In **loose** mode, uRPF checks whether incoming packet has source address with a corresponding prefix in the routing table. However, the loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. This object is valid only when **urpf-check** is enabled.

strict-no-ecmp

When a packet is received on an interface in this mode and the SA matches an ECMP route the packet is dropped by uRPF.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure subscriber-mgmt group-interface-template ipv4 urpf-check mode

Description

This command configures the mode of Unicast RPF (uRPF) check.

The **no** form of this command reverts to the default.

Default

mode strict

Parameters

strict

Specifies that the uRPF checks whether the incoming packet has a source IP address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source IP address prefix.

loose

Specifies that the uRPF checks whether the incoming packet has a source IP address with a corresponding prefix in the routing table. However, the **loose** mode does not check whether the interface expects to receive a packet with a specific source IP address prefix. This object is valid only when the **urpf-check** command is enabled.

strict-no-ecmp

Specifies that when a packet is received on an interface in this mode and the SA matches an ECMP route, the packet is dropped by uRPF.

configure system power-management mode

Description

This command sets the power mode.

Default

mode basic

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

none

Specifies that there is no management of power to modules. In this mode, no gradual shutdown of active XCMs and XMAs is enforced. No spare capacity is reserved and any APEQ failure may result in brownouts or card failures.

basic

Specifies that the node will bring up as many provisioned modules (in order of priority) as possible using the N+1 algorithm. In **basic** mode the system shuts down IO cards when power capacity drops below the Power Safety Level.

advanced

Specifies that the operator can maintain a spare APEQ as long as possible to make it immune to the possibility of power brown-outs. In **advanced** mode, the system starts shutting down IO cards when the power capacity drops below the Power Safety Level + Max rated APEQ.

Description

This command configures an Ethernet portfor **access**, **network**, or **hybrid** mode operation.

An **access** port or channel is used for customer facing traffic on which services are configured. A Service Access Point (SAP) can only be configured on an access port or channel. When a port is configured for access mode, the appropriate **encap-type**must be specified to distinguish the services on the port. After an Ethernet port has been configured for access mode, multiple services can be configured on the Ethernet port.

A network port or channel participates in the service provider transport or infrastructure network when a network mode is selected. When the network option is configured, the encap-type cannot be configured for the port/channel.

A hybrid Ethernet port allows the combination of network and access modes of operation on a per-VLAN basis and must be configured as either dot1q or QinQ encapsulation.

When the hybrid port is configured to the dot1q encapsulation, the user configures a SAP inside a service simply by providing the SAP ID which must include the port-id value of the hybrid mode port and an unused VLAN tag value. The format is <*port-id*>:*qtag1*. A SAP of format <*port-id*>:* also supported.

The user configures a network IP interface under **config>router>if>port** by providing the port name which consists of the port-id of the hybrid mode port and an unused VLAN tag value. The format is <*port-id*>:*qtag1*. The user must explicitly enter a valid value for qtag1. The <*port-id*>:* value is not supported on a network IP interface. The 4096 VLAN tag space on the port is shared among VLAN SAPs and VLAN network IP interfaces.

When the hybrid port is configured to QinQ encapsulation, the user configures a SAP inside a service simply by providing the SAP ID which must include the port-id value of the hybrid mode port and the outer and inner VLAN tag values. The format is <port-id>:qtag1.qtag2. A SAP of format <*port-id*>: *qtag1*.* is also supported. The outer VLAN tag value must not have been used to create an IP network interface on this port. In addition, the qtag1.qtag2 value combination must not have been used by another SAP on this port.

The user configures a network IP interface under **config>router>if>port** by providing the port name which consists of the port-id of the hybrid mode port and a VLAN tag value. The format is <*port-id*>:*qtag1*.*. An outer VLAN tag qtag2 of * creates an IP network interface. In addition, the qtag1.qtag2 value combination must not have been used on another SAP or IP network interface on this port.

The **no** form of this command restores the default.

Default

mode network — For Ethernet ports

Parameters

network

Configures the Ethernet port, TDM channel or SONET path for transport network use.

hybrid

Configures the Ethernet port for hybrid use.

Platforms

All

- configure lag mode
- configure port ethernet mode

mode

Syntax

mode {**active** | **passive**}

Context

[Tree] (config>port>ethernet>efm-oam mode)

Full Context

configure port ethernet efm-oam mode

Description

This command configures the mode of OAM operation for this Ethernet port. These two modes differ in that active mode causes the port to continually send out efm-oam info PDUs while passive mode waits for the peer to initiate the negotiation process. A passive mode port cannot initiate monitoring activities (such as loopback) with the peer.

Default

mode active

Parameters

active

Provides capability to initiate negotiation and monitoring activities.

passive

Relies on peer to initiate negotiation and monitoring activities.

Platforms

All

Full Context

configure service system bgp-evpn ethernet-segment service-carving mode

Description

This command configures the service-carving mode. This determines how the DF is elected for a specified Ethernet-Segment and service.

Default

mode auto

Parameters

auto

This mode is the service-carving algorithm defined in RFC 7432. The DF for the service is calculated based on the modulo function of the service (identified by either the evi or the isid) and the number of PEs.

manual

In this mode the DF is elected based on the manual configuration added in the **service-carving>manual** context.

off

In this mode all the services elect the same DF PE (assuming the same PEs are active for all the configured services). The PE with the lowest IP is elected as DF for the Ethernet-Segment.

configure service vpls stp mode

Description

This command specifies the version of Spanning Tree Protocol the bridge is currently running.

See section Spanning Tree Operating Modes for more information about these modes.

The **no** form of this command returns the STP variant to the default.

Default

mode rstp

Parameters

rstp

Corresponds to the Rapid Spanning Tree Protocol specified in IEEE 802.1D/D4-2003

dot1w

Corresponds to the mode where the Rapid Spanning Tree is backward compatible with IEEE 802.1w

compdot1w

Corresponds to the Rapid Spanning Tree Protocol in conformance with IEEE 802.1w

mstp

Sets MSTP as the STP mode of operation. Corresponds to the Multiple Spanning Tree Protocol specified in 802.1Q REV/D5.0-09/200

configure service vprn msdp group mode

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures groups of peers in a full mesh topology to limit excessive flooding of source-active messages to neighboring peers.

Multicast Source Discovery Protocol (MSDP) peers can be configured grouped in a full-mesh topology that prevents excessive flooding of source-active messages to neighboring peers.

In a meshed configuration, all members of the group must have a peer connection with every other mesh group member. If this rule is not adhered to, then unpredictable results may occur.

Default

mode standard

Parameters

mesh-group

Specifies that source-active message received from a mesh group member are always accepted but are not flooded to other members of the same mesh group. These source-active messages are only flooded to non-mesh group peers or members of other mesh groups.

standard

Specifies a non-meshed mode.

Platforms

All

mode

Syntax

mode *mode*

Context

[Tree] (config>app-assure>group>gtp mode)

Full Context

configure application-assurance group gtp mode

Description

This command is used to either untunnel GTP-U traffic received on UDP port number 2152, or apply GTP filtering/firewall rules as specified under this GTP CLI context.

Default

mode filtering

Parameters

mode

Specifies the operational mode of the command.

Values **filtering** — AA applies GTP filtering rules to GTP-U traffic, without further analysis of IP traffic tunneled within GTP.

untunneling — AA untunnels GTP traffic and provides analytical reporting of the applications running within the GTP tunnels. The rest of the commands under GTP CLI context (such as GTP-filter and event-log) are not applicable in this mode.

For AA to untunnel GTP traffic, the operator must configure "gtp" under the partition by using the **config**>**app-assure**>**group**>**gtp** command.

The following caveats apply:

- Only GTP-U traffic with TID <> 0 is untunneled.
- Any UDP but non-GTP traffic that uses port 2152 will be identified as UDP traffic.
- Only GTP-U packets with message type: G-PDU (0xFF) is untunneled. Other GTP-U packets with different message types are reported as GTP Protocol.
- Only GTP-u packets with non-fragmented outer IP and no IPv4 options or IPv6 extension headers are untunneled. Otherwise, no inner GTP tunnel classification is performed and the traffic is identified and reported as GTP protocol.

Full Context

configure router interface ipv6 urpf-check mode

configure router interface urpf-check mode

Description

This command specifies the mode of unicast RPF check.

The **no** form of this command reverts to the default (strict) mode.

Default

mode strict

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

strict

When specified, uRPF checks whether incoming packet has a source address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source address prefix.

loose

In **loose** mode, uRPF checks whether incoming packet has source address with a corresponding prefix in the routing table. However, the loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. This object is valid only when **urpf-check** is enabled.

strict-no-ecmp

When a packet is received on an interface in this mode and the SA matches an ECMP route the packet is dropped by uRPF.

Platforms

All

mode

Syntax

mode {**ecmp-protected** | **linear**}

no mode

Context

[Tree] (config>router>segment-routing>maintenance-policy mode)

Full Context

configure router segment-routing maintenance-policy mode

Description

This command specifies the data path programming and protection mechanism for SR policy candidate paths to which the maintenance policy is applied.

In both the **linear** mode and **ecmp-protected** modes, if two or more candidate paths of the same {headend, color, endpoint} and also have the same mode, then the best preference path is treated as the primary while the next best preference path is the standby. If a third path is present in the linear mode, then this is treated as a tertiary and also programmed in the IOM.

If the currently active path goes unavailable due to S-BFD, the system failovers to the next best preference available candidate path. If S-BFD is down on all segment lists of all programmed candidate paths of an SR Policy, then the SR Policy is marked as down in TTM.

If the default mode is specified, the router only programs the segment lists of the best preference paths in the IOM.

The **no** form of this command removes the configured mode.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no mode

Parameters

ecmp-protected

Specifies only the top two routes (paths) are programmed in the IOM. Up to 32 segment lists can be programmed for each path.

linear

Specifies the top three routes are programmed in the IOM. Only one segment list is allowed per path.

Syntax

mode {**next-hop** | **per-prefix** }

Context

[Tree] (config>router>bgp>label-allocation>vpn-ipv4 mode)

Full Context

configure router bgp label-allocation vpn-ipv4 mode

Description

This command configures the label-allocation mode to use with VPN-IPv4 routes in the context of an inter-AS model B ASBR or next-hop-self route reflector.

When the mode is set to next hop, all VPN-IPv4 routes that share the same BGP next hop and outgoing label use the same incoming label.

When the mode is set to per prefix, each VPN-IPv4 route prefix is assigned a unique incoming label.

Default

mode next-hop

Parameters

next-hop

When specified, this keyword allocates labels based on the BGP next hop and received label of the best RIB-IN route. All VPN-IPv4 routes that share the same BGP next hop and outgoing label use the same incoming label. This is the default behavior and provides efficient label usage. BGP fast reroute and multipath for VPN-IPv4 routes are not supported with **mode next-hop**.

per-prefix

When specified, this keyword allocates a unique incoming label for each VPN-IPv4 route prefix. This provides per-prefix granularity and enables BGP FRR and multipath for VPN-IPv4 routes in the context of an inter-AS model B ASBR or next-hop-self route reflector.

[Tree] (config>port>ethernet>access>egress>vport mon-port-sch)

Full Context

configure port ethernet mon-port-sch

configure port ethernet access egress vport mon-port-sch

Description

This command enables congestion monitoring on an Egress Port Scheduler (EPS) that is applied to a physical port or to a Vport.

Congestion monitoring must be further configured under the port-scheduler CLI hierarchy. Once the congestion monitoring is in effect, the offered rate (incoming traffic) is compared to the configured port-scheduler congestion threshold. The results of these measurements are stored as the number of samples representing the number of times the offered rates exceeded the configured congestion threshold since the last clearing of the stats. Therefore, the results represent the number of times that the port-scheduler that is applied to a port/Vport was congested since the last reset of the stats (via a **clear** command).

The **no** form of this command disables congestion monitoring.

configure service ies subscriber-interface wlan-gw redundancy monitor

Description

This command specifies an IPv4 route (prefix/length) per subscriber-interface to be monitored in the FDB to determine liveness of the subscriber-interface (and consequently all associated group-interfaces of type **wlangw**) on a peer WLAN-GW. This route is the one that is advertised in routing by the peer WLAN-GW when the subscriber-interface and WLAN-GW group are operationally up.

Parameters

ip-prefix/length

Specifies the IP prefix and length.

Values ip-prefix: a.b.c.d

ip-prefix-length: 0 to 32

configure router nat outside pool redundancy monitor

configure service vprn nat outside pool redundancy monitor

Description

This command configures the monitoring route based on which the NAT multi-chassis switchover is triggered. Monitoring route of a NAT pool on the local node must match the export route of a corresponding NAT pool on the peering node. Presence of the monitoring route in the routing table is an indication that the peering NAT pool is active (since it is advertising its export route). The disappearance of the monitoring route from the routing table is an indication that the peering pool has failed and consequently the nodal

[Tree] (config>port monitor-agg-egress-queue-stats)

Full Context

configure port monitor-agg-egress-queue-stats

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the monitoring of aggregate egress queue statistics on the port. All queues on the port are monitored, including SAP egress, network egress, subscriber egress, and egress queue group queues, as well as system queues that can be used, for example, to send port-related protocol packets (LACP, EFM, and so on). The aggregate in-profile, out-of-profile, and total statistics are provided for both forwarded and dropped packets and octets.

Monitoring of aggregate statistics is supported on **PXC** sub-ports but not on a **PXC** physical port. It is also not supported on satellite ports.

The **no** form of this command disables aggregate egress queue statistics monitoring on the specified port.

configure service vprn subscriber-interface group-interface srrp monitor-oper-group

configure service ies subscriber-interface group-interface srrp monitor-oper-group

Description

This command will configure the association between the SRRP instance in a Fate Sharing Group and the operational-group that contains messaging SAPs. A state transition of a messaging SAP within an operational-group will trigger calculation of the priority for all SRRP instances that are associated with that operational-group.

The **no** form of this command reverts to the default.

Parameters

name

Specifies the name of the operational-group, up to 32 characters, that is tracking operational state of SRRP messaging SAPs

priority-step

Specifies the priority step for which the priority of an SRRP instance is changed. If a messaging SAP within an operational-group transition to a non-UP state, the priority is decreased by the step value. If the messaging SAP within the operational-group transition into the UP state, the priority of the SRRP instance is increased by the step value.

[Tree] (config>service>vprn>nat>outside>pool monitor-oper-group)

Full Context

configure router nat outside pool monitor-oper-group

configure service vprn nat outside pool monitor-oper-group

Description

This command configures an operational group monitored by a NAT pool. Although a NAT pool lacks its own operational state, it can track the status of another entity via the operational group associated with that entity.

When an operational group monitored by a NAT pool transitions to the down state, the route of the pool is withdrawn from the routing table. NAT steering is disabled when the destination prefix or filter entry points to a NAT policy linked to the affected pool. This applies whether the reference is direct or indirect (like through a default NAT policy). In such cases, related routes or filters are removed from the routing or forwarding table.

In effect, when the monitored operational group goes down, the NAT pool becomes unreachable.

Deterministic NAT is where NAT policy selection is defined in a deterministic prefix or address map. In this case, internal destination prefixes or filter entries not explicitly assigned a NAT policy are withdrawn from the routing and forwarding tables only if all NAT pools referenced by all NAT policies in the deterministic configuration become inactive. In other words, all monitored operational groups are down.

The **no** form of this command removes the association from the configuration.

Default

no monitor-oper-group

Parameters

name

Specifies a character string, up to 32 ASCII characters, identifying the group instance.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service vprn pim interface monitor-oper-group

Description

This command configures PIM to monitor the state of an operational group to provide a redundancy mechanism. PIM monitors the operational group and changes its DR priority to the specified value when the status of the operational group is up. This enables the router to become the PIM DR only when the operational group is up. If the operational group status changes to down, PIM changes its DR priority to the default or the value configured with **priority** under **config**>**service**>**vprn**>**pim**>**if**. The **oper-group** *group-name* must already be configured under the **config**>**service** context before its name is referenced in this command. Two operational groups are supported per PIM interface.

The **no** form of this command removes the operational group from the configuration.

Parameters

group-name

Specifies the operational group identifier up to 32 characters in length.

family

Specifies the address family.

ipv4

Specifies the IPv4 designated router priority.

ipv6

Specifies the IPv6 designated router priority.

add

Specifies that the value is to be added to the existing priority to become the designated router.

subtract

Specifies that the value is to be subtracted from the existing priority to become the designated router.

© 2026 Nokia.

no monitor-oper-group *name*

Context

[Tree] (config>isa>nat-group>inter-chassis-redundancy monitor-oper-group)

Full Context

configure isa nat-group inter-chassis-redundancy monitor-oper-group

Description

This command enables monitoring of the objects, such as SAPs, BFD sessions, or VRRP sessions for the purpose of adjusting the overall health of the node in a redundant inter- chassis NAT system. A state change of the objects in the oper-group influences the health of a NAT node in a redundant configuration.

The **no** form of this command reverts to the default.

Default

no monitor-oper-group

Parameters

name

Specifies the name of the operational group that is being monitored, up to 32 characters.

drop

A state change of an object in the oper-group influences the overall health of the system in the context of NAT inter-chassis redundancy. For example, a transition into a non-operational (down) state of an object within the monitored oper-group triggers a decrease of the overall health of the node for the amount specified by the health-drop value.

configure service epipe sap eth-cfm mep monitor-oper-group

configure service vprn interface sap eth-cfm mep monitor-oper-group

configure service vpls sap eth-cfm mep monitor-oper-group

Description

This command configures the operational group that operationally affects the state of the SAP based on the state of the operational group. When the monitoring function detects an operationally down state for the operational group, the SAP is set to operationally down and any CFM defects present on the MEP are cleared. The MEP enters a pseudo down state and does not try to transmit CFM packets, and it is not expecting to receive CFM packets. When the monitoring function detects an operationally up state for the operational group, the CFM reason code that brought the SAP operationally down is removed. Assuming no other conditions prevent this, the SAP transitions to operationally up and the MEP is initialized.

This command is applicable to MEPs with a direction of down (**configure service sap eth-cfm mep direction down**) and a **configure eth-cfm domain association ccm-interval** of 1 second or higher.

The **no** form of this command removes the operational group.

Default

no monitor-oper-group

Parameters

name

Specifies the operational group name, up to 32 characters.

Full Context

configure system ptp ptsf monitor-ptsf-unusable

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

Commands in this context configure the monitoring of neighbor clocks for the Packet Timing Signal Fail (PTSF) unusable state (condition) when the profile is set to g8275dot1-2014.

When enabled, the local clock monitors the noise level of PTP event messages exchanged between external neighbor PTP ports and the local clock. If there is too much noise and the expectation is these event message would not allow the clock to meet its output performance requirements, that neighbor port is considered unusable. This relates to declaring the PTSF-unusable state as defined in the profile.

Once a neighbor port is declared unusable, its Announce messages are excluded from the BTCA and the port cannot be selected as the parent clock.

The unusable condition can be cleared using the following command:

clear system ptp port *port-id* **neighbor** *mac-address* **ptsf-unusable**

When disabled, PTP clears the PTSF-unusable state from all neighbor PTP ports.

Deleting or disabling the local PTP port clears the PTSF-unusable state from all neighbor PTP ports that are accessed through the local PTP port.

Disabling the **monitor-ptsf-unusable** function of the PTP clock clears the PTSF-unusable state from all neighbor PTP ports.

In addition, if no PTP messages have been received from a neighbor for 15 minutes, the neighbor information is purged, which also clears the PTSF-unusable state.

configure service ies interface sap egress queue-override queue monitor-queue-depth

configure service vprn interface sap egress queue-override queue monitor-queue-depth

configure port ethernet access egress queue-group queue-overrides queue monitor-queue-depth

Description

This command configures queue depth monitoring for the specified queue.

The **no** form of this command disables queue depth monitoring for the specified queue.

Parameters

fast-polling

Keyword used to specify that fast queue polling is enabled. Fast queue polling is only supported on FP3- and FP4-based hardware.

percentage

Specifies a percentage, up to two decimal places, of the queue MBS. When the depth of the queue exceeds this percentage, a violation is registered.

Values 00.01 to 99.99

Platforms

All

- configure service epipe sap egress queue-override queue monitor-queue-depth

Context

[Tree] (config>system>ptp>port monitor-sender)

Full Context

configure system ptp port monitor-sender

Description

This command enables this PTP port as a monitorSender for PTP. When not in TimeTransmitter mode, the PTP port sends Announce, Sync, and Delay_Resp messages with the alternateMasterFlag set to TRUE for PTP monitoring at the remote clock. This object is supported only when the PTP profile is set to G.8275.1 or G.8275.2.

The **no** form of this command disables the PTP port as a monitorSender.

Default

no monitor-sender

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

30.58 monitor-threshold

monitor-threshold

Syntax

monitor-threshold *percent*

no monitor-threshold

Context

[Tree] (config>qos>port-scheduler-policy monitor-threshold)

[Tree] (config>qos>port-scheduler-policy>group monitor-threshold)

Full Context

configure qos port-scheduler-policy monitor-threshold

configure qos port-scheduler-policy group monitor-threshold

Description

This command defines the congestion monitoring threshold for the desired monitoring entity under the port-scheduler for per aggregate port-scheduler rate, per individual level, and per group that is aggregating multiple levels.

The congestion threshold is specified in percentages of the configured PIR rate for the entity for which congestion monitoring is desired. For example, if the configured PIR rate for level 1 is 100,000 kb/s,

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

and the monitoring threshold is set to 90%, then an event where the offered rate is >90,000 kb/s will be recorded. This event is shown as part of the cumulative count of congestion threshold exceeds since the last clearing of the counters.

The **no** form of this command removes the congestion monitoring threshold.

Default

no monitor-threshold

Parameters

percent

Specifies the percent of the configured rate. If the offered rate exceeds the configured threshold, a counter monitoring the threshold will be increased.

Values 0 to 100

Platforms

All

monitor-threshold

Syntax

monitor-threshold *percent*

no monitor-threshold

Context

[Tree] (config>qos>hw-agg-shap-sched-plcy monitor-threshold)

Full Context

configure qos hw-agg-shaper-scheduler-policy monitor-threshold

Description

This command configures the egress scheduler monitor threshold for the hardware aggregate shaper scheduler policy. The value is expressed as a percentage of the scheduler rate, which is considered as a limit for determining congestion.

The **no** form of this command removes the congestion monitoring threshold.

Default

no monitor-threshold

Parameters

percent

Specifies the percent of the configured rate.

month {*month-number* [*..month-number*] | *month-name* [*..month-name*] | **all**}

no month

Context

[Tree] (config>system>cron>sched month)

Full Context

configure system cron schedule month

Description

This command specifies the month when the event should be executed. Multiple months can be specified. When multiple months are configured, each of them will cause the schedule to trigger. If a month is configured without configuring the month, weekday, day-of-month, and minute, the event will not execute.

The **no** form of this command removes the specified month from the configuration.

Default

no month

Parameters

month-number

Specifies a month number.

Values 1 to 12 (maximum 12 month-numbers)

month-name

Specifies a month by name.

Values january, february, march, april, may, june, july, august, september, october, november, december (maximum 12 month names)

all

Specifies all months.

motd {**url** *url-prefix*: *source-url* | **text** *motd-text-string*}

no motd

Context

[Tree] (config>system>login-control motd)

Full Context

configure system login-control motd

Description

This command creates the message of the day displayed after a successful console login. Only one message can be configured.

The **no** form of this command removes the message.

Default

no motd

Parameters

url *url-prefix*: *source-url*

When the message of the day is present as a text file, provide both url-prefix and the source-url of the file containing the message of the day. The URL prefix can be local or remote.

text *motd-text-string*

Specifies the text of the message of the day. The *motd-text-string* must be enclosed in double quotes. Multiple text strings are not appended to one another.

Some special characters can be used to format the message text. The \n character can be used to create multi-line messages. A \n in the message moves to the beginning of the next line by sending ASCII/UTF-8 chars 0xA (LF) and 0xD (CR) to the client terminal. An \r in the message sends the ASCII/UTF-8 char 0xD (CR) to the client terminal.

cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

force

Forces an immediate move of the specified file(s).

The **file move force** command moves the specified file(s) without displaying a user prompt message. This command also automatically accepts HTTP redirects unless overridden by the **no-redirect** parameter.

profile

Specifies the TLS client profile configured under **config**>**system**>**security**>**tls**>**client-tls-profile** to use.

proxy-url

Specifies the URL of an HTTP proxy. For example, http://proxy.mydomain.com:8000. This URL must be an HTTP URL and not an HTTPS URL.

no-redirect

Keyword to automatically refuse any HTTP redirects without prompting the user.

[Tree] (config>service>template>vpls-template>mac-move move-frequency)

Full Context

configure service vpls mac-move move-frequency

configure service template vpls-template mac-move move-frequency

Description

This command indicates the maximum rate at which MACs can be relearned in the VPLS service before the SAP where the moving MAC was last seen is automatically disabled to protect the system against undetected loops or duplicate MACs. The rate (relearns per second) is measured in a 5-second window.

The **no** form of this command reverts to the default value.

Default

2 (relearns per second, when mac-move is enabled). For example, the value 2 requires 10 MAC relearns in a 5-second period for the MAC to be considered duplicate.

Parameters

frequency

Specifies the rate, in relearns per second.

configure service vpls bgp-evpn mpls

configure service epipe bgp-evpn mpls

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

Commands in this context configure the BGP EVPN MPLS parameters. In VPLS, either instance BGP 1 or BGP 2 can be configured, but not both simultaneously in the same service. Epipe and VPRN services only support instance 1. If the **bgp** *bgp* parameter is not specified, the instance is set to 1.

The **endpoint** option is only supported for Epipe services. When configured, the same endpoint name can be configured for the **bgp-evpn>mpls** context and an additional spoke SDP. An EVPN MPLS destination always has higher preference than a spoke SDP.

The **no** form of this command removes the MPLS instance from the service.

Parameters

bgp

Indicates the BGP instance identifier.

Values 1, 2

endpoint-name

Specifies the endpoint name for Epipe services, up to 32 characters.

Platforms

All

30.69 mpls-echo-request-downstream-map

mpls-echo-request-downstream-map

Syntax

mpls-echo-request-downstream-map {**dsmap** | **ddmap**}

Context

[Tree] (config>test-oam mpls-echo-request-downstream-map)

Full Context

configure test-oam mpls-echo-request-downstream-map

Description

This command specifies which format of the downstream mapping TLV to use in all LSP trace packets and LDP tree trace packets originated on this node. The Downstream Mapping (DSMAP) TLV is the original format in RFC 4379 (obsoleted by RFC 8029) and is the default value. The new Downstream Detailed Mapping (DDMAP) TLV is the new enhanced format specified in RFC 6424 and RFC 8029.

This command applies to LSP trace of an RSVP P2P LSP, a MPLS-TP LSP, or LDP unicast FEC, and to LDP tree trace of a unicast LDP FEC. It does not apply to LSP trace of an RSVP P2MP LSP which always uses the DDMAP TLV.

The global DSMAP/DDMAP setting impacts the behavior of both OAM LSP trace packets and SAA test packets of type **lsp-trace** and is used by the sender node when one of the following events occurs:

1. An SAA test of type **lsp-trace** is created (not modified) and no value is specified for the per-test **downstream-map-tlv** {**dsmap** | **ddmap** | **none**} option. In this case, the SAA test **downstream-map-tlv** value defaults to the global **mpls-echo-request-downstream-map** value.
2. An OAM test of type **lsp-trace** test is executed and no value is specified for the per-test **downstream-map-tlv** {**dsmap** | **ddmap** | **none**} option. In this case, the OAM test **downstream-map-tlv** value defaults to the global **mpls-echo-request-downstream-map** value.

A consequence of the rules above is that a change to the value of **mpls-echo-request-downstream-map** option does not affect the value inserted in the downstream mapping TLV of existing tests.

Following are the details of the processing of the new DDMAP TLV:

1. When either the DSMAP TLV or the DDMAP TLV is received in an echo request message, the responder node includes the same type of TLV in the echo reply message with the proper downstream interface information and label stack information.
2. If an echo request message without a Downstream Mapping TLV (DSMAP or DDMAP) expires at a node which is not the egress for the target FEC stack, the responder node always includes the DSMAP TLV in the echo reply message. This can occur in the following cases:
   a. The user issues a LSP trace from a sender node with a **min-ttl** value higher than 1 and a **max-ttl** value lower than the number of hops to reach the egress of the target FEC stack. This is the sender node behavior when the global configuration or the per-test setting of the DSMAP/DDMAP is set to DSMAP.

b. The user issues a LSP ping from a sender node with a **ttl** value lower than the number of hops to reach the egress of the target FEC stack. This is the sender node behavior when the global configuration of the DSMAP/DDMAP is set to DSMAP.

c. The behavior in (a) is changed when the global configuration or the per-test setting of the Downstream Mapping TLV is set to DDMAP. The sender node includes in this case the DDMAP TLV with the Downstream IP address field set to the all-routers multicast address as per Section 3.4 of RFC 8029. The responder node then bypasses the interface and label stack validation and replies with a DDMAP TLV with the correct downstream information for the target FEC stack.

3. A sender node never includes the DSMAP or DDMAP TLV in an lsp-ping message.

In addition to performing the same features as the DSMAP TLV, the new DDMAP TLV addresses the following scenarios:

1. Full validation of an LDP FEC stitched to a BGP IPv4 label route. In this case, the LSP trace message is inserted from the LDP LSP segment or from the stitching point.
2. Full validation of a BGP IPv4 label route stitched to an LDP FEC. This includes the case of explicit configuration of the LDP-BGP stitching in which the BGP label route is active in Route Table Manager (RTM) and the case of a BGP IPv4 label route resolved to the LDP FEC due to the IGP route of the same prefix active in RTM. In this case, the LSP trace message is inserted from the BGP LSP segment or from the stitching point.
3. Full validation of an LDP FEC which is stitched to a BGP LSP and stitched back into an LDP FEC. In this case, the LSP trace message is inserted from the LDP segments or the or from the stitching points.
4. Full validation of an LDP FEC tunneled over an RSVP LSP using LSP trace.

To properly check a target FEC which is stitched to another FEC (stitching FEC) of the same or a different type, or which is tunneled over another FEC (tunneling FEC), it is necessary for the responding nodes to provide details about the FEC manipulation back to the sender node. This is achieved via the use of the new FEC stack change sub-TLV in the Downstream Detailed Mapping TLV (DDMAP) defined in RFC 6424.

When the user configures the use of the DDMAP TLV on a trace for an LSP that does not undergo stitching or tunneling operation in the network, the procedures at the sender and responder nodes are the same as in the case of the DSMAP TLV.

This feature however introduces changes to the target FEC stack validation procedures at the sender and responder nodes in the case of LSP stitching and LSP hierarchy. These changes pertain to the processing of the new FEC stack change sub-TLV in the new DDMAP TLV and the new return code of value 15 `Label switched with FEC change`.

The **no** form of this command reverts to the default behavior of using the DSMAP TLV in a LSP trace packet and LDP tree trace packet.

Default

mpls-echo-request-downstream-map dsmap

Parameters

dsmap

Specifies that the DSMAP TLV should be used in all LSP trace packets and LDP tree trace packets originating on the node.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ddmap

Specifies that the DDMAP TLV should be used in all LSP trace packets and LDP tree trace packets originating on the node.

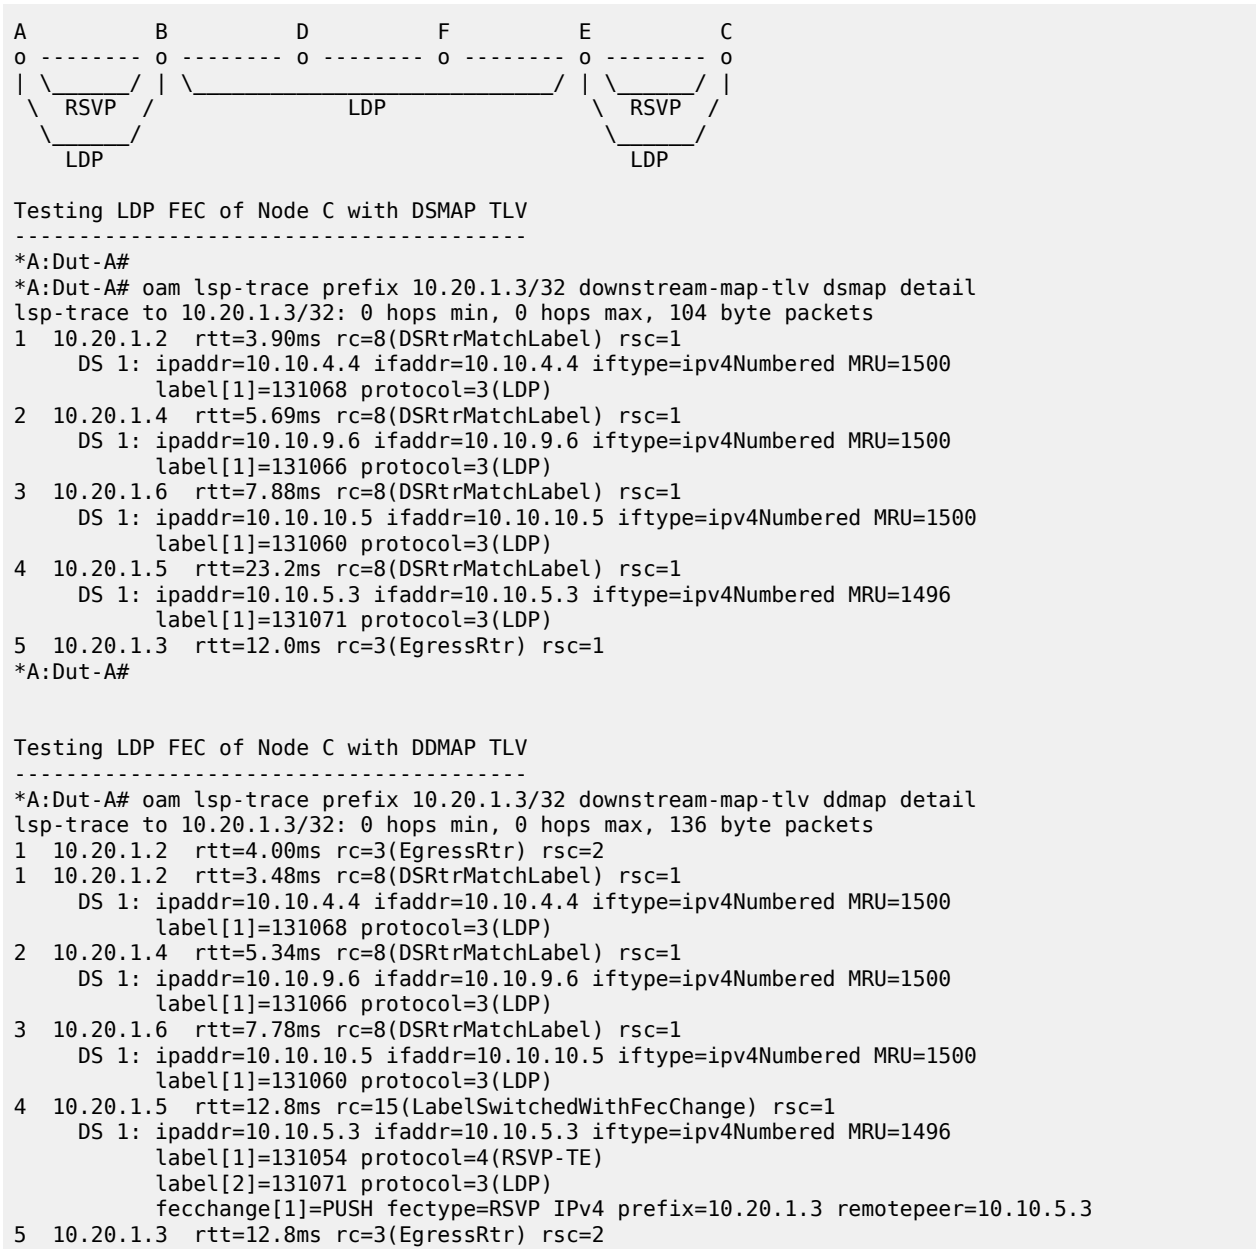
Platforms

All

Output

The following output is an example of mpls-echo-request-downstream-map information.

Output Example: LDP-over-RSVP



```
A          B          D          F          E          C

30.73 mpls-time-stamp-format

mpls-time-stamp-format

Syntax

mpls-time-stamp-format {**rfc4379** | **unix**}

Context

[Tree] (config>test-oam mpls-time-stamp-format)

Full Context

configure test-oam mpls-time-stamp-format

Description

This command configures the format of the timestamp used by for lsp-ping, lsp-trace, p2mp-lsp-ping and p2mp-lsp-trace, vccv-ping, vccv-trace, and lsp-trace.

If **rfc4379** is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Changing this system-wide setting does not affect tests that are currently in progress, but SAAs starts to use the new timestamp when they are restarted. When an SR OS receives an echo request, it replies with the locally configured timestamp format, and does not try to match the timestamp format of the incoming echo request message.

Default

mpls-time-stamp-format unix

Parameters

rfc4379

Specifies the RFC 4379 (obsoleted by RFC 8029) time stamp format. The timestamp's **seconds** field holds the integral number of seconds since 1-Jan-1900 00:00:00 UTC. The timestamp's **microseconds** field contains a microseconds value in the range 0 to 999999. This setting is used to inter-operate with network elements which are fully compliant with RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*, (such as an SR OS system with the same setting, or any other RFC 4379 compliant router).

unix

Specifies the Unix time stamp format. The time stamps **seconds** field holds a Unix time, the integral number of seconds since 1-Jan-1970 00:00:00 UTC. The time stamps **microseconds** field contains a microseconds value in the range 0 to 999999. This setting is used to inter-operate with network elements which send and expect a 1970-based timestamp in MPLS Echo Request/Reply PDUs (such as an SR OS system with the same setting, or an SR OS system running software earlier than R8.0 R4).

30.74 mpls-tp

mpls-tp

Syntax

[**no**] **mpls-tp**

Context

[Tree] (config>router>mpls mpls-tp)

Full Context

configure router mpls mpls-tp

Description

Generic MPLS-TP parameters and MPLS-TP transit paths are configured under this context. If a user configures **no mpls**, normally the entire mpls configuration is deleted. However, in the case of mpls-tp, a check is made that there is no other mpls-tp configuration (e.g., services or LSPs using mpls-tp on the node). The mpls-tp context cannot be deleted if MPLS-TP LSPs or SDPs exist on the system.

A **shutdown** of mpls-tp will bring down all MPLS-TP LSPs on the system.

Default

no mpls-tp

Platforms

Output

The following output is an example of mrinfo information. The output fields are described in the following table.

Output Example

```
A:dut-f# mrinfo 10.1.1.2

10.1.1.2  [version 3.0,prune,genid,mtrace]:
  10.1.1.2 -> 10.1.1.1 [1/0/pim]
  10.1.1.3 -> 0.0.0.0 [1/0/pim/down/disabled]
  10.1.1.4 -> 0.0.0.0 [1/0/pim/querier/leaf]
  239.200.200.3 -> 239.200.200.5 [1/0/tunnel/pim]...
```

Table 86: Mrinfo Output Fields

Label	Description
General flags	
version	Indicates software version on queried router
prune	Indicates that router understands pruning
genid	Indicates that router sends generation IDs
mtrace	Indicates that the router handles mtrace requests
Neighbors flags	

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Label	Description
1	Metric
0	Threshold (multicast time-to-live)
pim	PIM enabled on interface
down	Operational status of interface
disabled	Administrative status of interface
leaf	No downstream neighbors on interface
querier	Interface is IGMP querier
tunnel	Neighbor reached via tunnel

configure service vpls mesh-sdp igmp-snooping mrouter-port

configure service vpls allow-ip-int-bind mld-snooping mrouter-port

configure service vpls allow-ip-int-bind igmp-snooping mrouter-port

Description

This command specifies whether a multicast router is attached behind this SAP, SDP, or routed VPLS IP interface.

Configuring these objects as an mrouter-port will have a double effect. Firstly, all multicast traffic received on another SAP, SDP, or routed VPLS IP interface will be copied to this SAP, SDP, or routed VPLS IP interface. Secondly, IGMP/MLD reports generated by the system as a result of a router joining or leaving a multicast group, will be sent to this SAP, SDP, or routed VPLS IP interface.

If two multicast routers exist in the network, one of them will become the active querier. While the other multicast router (non-querier) stops sending IGMP queries, it should still receive reports to keep its multicast trees up-to-date. To support this, the mrouter-port should be enabled on all SAPs, SDPs, or routed VPLS IP interfaces connecting to a multicast router.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note:
The IGMP version to be used for the reports (v1, v2, or v3) can only be determined after an initial query has been received. Until such time, no reports are sent on the SAP, spoke-SDP, or routed VPLS IP interface, even if **mrouter-port** is enabled.

If the **send-queries** command is enabled on this SAP or spoke-SDP, the **mrouter-port** parameter cannot be set.

When PIM-snooping is enabled within a VPLS service, all IP multicast traffic and PIM messages will be sent to any SAP or SDP binding configured with an IGMP-snooping mrouter port. This occurs even without IGMP-snooping enabled, but is not supported in a BGP-VPLS or M-VPLS service.

The **no** form of this command reverts to the default.

Default

no mrouter-port

configure service vpls vxlan igmp-snooping mrouter-port

Description

This command enables all VXLAN binds to be mrouter ports, indicating that a multicast router is attached behind each VXLAN binding. Configuring these objects as an **mrouter-port** has two effects. Firstly, all multicast traffic received on another object is copied to each VXLAN binding. Secondly, IGMP reports generated by the system as a result of a router joining or leaving a multicast group is sent to all VXLAN bindings. When PIM snooping for IPv4 is enabled within a VPLS service, all IP multicast traffic and PIM for IPv4 messages are sent to all VXLAN bindings configured with an **igmp-snooping mrouter-port**. This occurs even without **igmp-snooping** enabled.

Description

This command specifies whether a multicast router is attached behind this SAP or spoke-SDP.

Configuring a SAP or spoke-SDP as an mrouter-port will have a double effect. Firstly, all multicast traffic received on another SAP or spoke-SDP will be copied to this SAP or spoke-SDP. Secondly, IGMP or MLD reports generated by the system as a result of someone joining or leaving a multicast group, will be sent to this SAP or SDP.

If two multicast routers exist in the local area network, one of them will become the active querier. The other multicast router (non-querier) stops sending IGMP or MLD queries, but it should still receive reports to keep its multicast trees up to date. To support this, the mrouter-port should be enabled on all SAPs or spoke-SDPs connecting to a multicast router.

The IGMP version to be used for the reports (v1, v2 or v3) or MLD version (v1 or v2) can only be determined after an initial query has been received. Until such time no reports are sent on the SAP, even if mrouter-port is enabled.

If the **send-queries** command is enabled on this SAP or spoke-SDP, the **mrouter-port** parameter cannot be set.

Default

no mrouter-port

30.82 mrp-policy

mrp-policy

Syntax

mrp-policy *policy-name* [**create**]

no mrp-policy *policy-name*

Context

[Tree] (config>service>mrp mrp-policy)

Full Context

configure service mrp mrp-policy

Description

Commands in this context configure an MRP policy. The mrp-policy specifies either a forward or a drop action for the Group B-MAC attributes associated with the ISIDs specified in the match criteria. The mrp-policy can be applied to multiple BVPLS services as long as the scope of the policy is template.

Any changes made to the existing policy, using any of the sub-commands, will be applied immediately to all services where this policy is applied. For this reason, when many changes are required on a mrp-policy, Nokia recommends that the policy be copied to a work area. That work-in-progress policy can be modified until complete and then written over the original mrp-policy. Use the **config mrp-policy copy** command to maintain policies in this manner.

The **no** form of this command deletes the mrp-policy. An MRP policy cannot be deleted until it is removed from all the SAPs or SDPs where it is applied.

Default

no mrp-policy

Parameters

policy-name

Specifies the redirect policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

create

This keyword is required when first creating the configuration context. When the context is created, it is possible to navigate into the context without the **create** keyword.

Full Context

configure service vpls spoke-sdp mrp mrp-policy

configure service vpls sap mrp mrp-policy

configure service vpls mesh-sdp mrp mrp-policy

Description

This command instructs MMRP to use the mrp-policy specified in the command to control which Group B-MAC attributes will be declared and registered on the egress SAP/Mesh-SDP/Spoke-SDP. The Group B-MACs will be derived from the ISIDs using the procedure used in the PBB solution. The Group MAC is standard OUI with the last 24 bits being the ISID value. If the policy-name refers to a non-existing mrp-policy the command should return error. Changes to a mrp-policy are allowed and applied to the SAP/SDPs under which the policy is referenced.

Default

no mrp-policy

Parameters

policy-name

Specifies the redirect policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

debug router pcep pce msg

debug router pcep pce connection msg

Description

This command enables debugging for PCE or connection messaging events.

The **no** form of this command disables debugging.

Parameters

detail

Keyword used to specify detailed information about PCE or connection messaging events.

Platforms

VSR-NRC

Use subject to Terms available at: www.nokia.com/terms.

30.91 msg-pacing

msg-pacing

Syntax

[**no**] **msg-pacing**

Context

[Tree] (config>router>rsvp msg-pacing)

Full Context

configure router rsvp msg-pacing

Description

This command enables RSVP message pacing in which the specified number of RSVP messages, specified in the **max-burst** command, are sent in a configured interval, specified in the **period** command. A count is kept of the messages that were dropped because the output queue for the interface used for message pacing was full.

Default

no msg-pacing

Platforms

All

30.92 msisdn

msisdn

Syntax

[**no**] **msisdn**

Context

[Tree] (config>subscr-mgmt>acct-plcy>include-radius-attribute msisdn)

configure subscriber-mgmt radius-accounting-policy include-radius-attribute msisdn

configure subscriber-mgmt authentication-policy include-radius-attribute msisdn

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the inclusion of the MSISDN in AAA protocols as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the attribute.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

30.93 mss-adjust-group

mss-adjust-group

Syntax

mss-adjust-group *bb-group-id* **segment-size** *segment-size*

no mss-adjust-group

Context

[Tree] (config>router mss-adjust-group)

[Tree] (config>service>vprn mss-adjust-group)

Full Context

configure router mss-adjust-group

configure service vprn mss-adjust-group

Description

This command associates the MSS adjust group consisting of multiple ISAs with the routing context in which the application requiring TCP MSS adjust resides.

Parameters

bb-group-id

Specifies the group used for TCP MSS adjust

segment-size

Specifies the value to put into the TCP Maximum Segment Size (MSS) option if it is not already present, or if the present value is higher

Values 160 to 10240

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

30.94 mst-instance

mst-instance

Syntax

mst-instance *mst-inst-number*

Context

[Tree] (config>service>vpls>sap>stp mst-instance)

Full Context

configure service vpls sap stp mst-instance

Description

Commands in this context configure MSTI related parameters at SAP level. This context can be open only for existing mst-instances defined at the service level (see **config**>**service**>**vpls**>**stp mst-instance**).

Parameters

mst-inst-number

Specifies an existing Multiple Spanning Tree Instance number.

Values 1 to 4094

Platforms

All

mst-instance

Syntax

mst-instance *mst-inst-number* [**create**]

no mst-instance [*mst-inst-number*]

Context

[Tree] (config>service>vpls>stp mst-instance)

Full Context

configure service vpls stp mst-instance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates the context to configure MST instance (MSTI) related parameters. Up to 16 instances will be supported by MSTP. The instance 0 is mandatory by protocol and therefore, it cannot be created by the CLI. The software will maintain this instance automatically.

Parameters

mst-inst-number

Specifies the Multiple Spanning Tree instance

Values 1 to 4094

Platforms

All

30.95 mst-max-hops

mst-max-hops

Syntax

mst-max-hops *hops-count*

no mst-max-hops

Context

[Tree] (config>service>vpls>stp mst-max-hops)

Full Context

configure service vpls stp mst-max-hops

Description

This command specifies the number of hops in the region before BPDU is discarded and the information held for the port is aged out. The root bridge of the instance sends a BPDU (or M-record) with remaining-hop-count set to configured <*max-hops*>. When a bridge receives the BPDU (or M-record), it decrements the received remaining-hop-count by 1 and propagates it in BPDU (or M-record) it generates.

The **no** form of this command sets the *hops-count* to its default value.

Default

mst-max-hops 20

Parameters

hops-count

Specifies the maximum number of hops.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 40

Platforms

All

30.96 mst-name

mst-name

Syntax

mst-name *region-name*

no mst-name

Context

[Tree] (config>service>vpls>stp mst-name)

Full Context

configure service vpls stp mst-name

Description

This command defines an MST region name. Two bridges are considered as a part of the same MST region as soon as their configuration of the MST region name, the MST-revision and VLAN-to-instance assignment is identical.

The **no** form of this command removes *region-name* from the configuration.

Default

no mst-name

Parameters

region-name

Specifies an MST-region name up to 32 characters in length.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

30.97 mst-path-cost

mst-path-cost

Syntax

mst-path-cost *inst-path-cost*

no mst-path-cost

Context

[Tree] (config>service>vpls>sap>stp>mst-instance mst-path-cost)

Full Context

configure service vpls sap stp mst-instance mst-path-cost

Description

This commands specifies path-cost within a specified instance, expressing probability that a specified port will be put into the forwarding state in case a loop occurs (the highest value expresses lowest priority).

The **no** form of this command sets port-priority to its default value.

Default

The path-cost is proportional to link speed.

Parameters

inst-path-cost

Specifies the contribution of this port to the MSTI path cost of paths toward the spanning tree regional root that include this port.

Values 1 to 200000000

Platforms

All

30.98 mst-port-priority

mst-port-priority

Syntax

mst-port-priority *stp-priority*

no mst-port-priority

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vpls>sap>stp>mst-instance mst-port-priority)

Full Context

configure service vpls sap stp mst-instance mst-port-priority

Description

This commands specifies the port priority within a specified instance, expressing probability that a specified port will be put into the forwarding state if a loop occurs.

The **no** form of this command sets port-priority to its default value.

Default

mst-port-priority 128

Parameters

stp-priority

Specifies the value of the port priority field.

Platforms

All

30.99 mst-priority

mst-priority

Syntax

mst-priority *bridge-priority*

no mst-priority

Context

[Tree] (config>service>vpls>stp>mst-instance mst-priority)

Full Context

configure service vpls stp mst-instance mst-priority

Description

This command specifies the bridge priority for this specific Multiple Spanning Tree Instance for this service. The *bridge-priority* value reflects likelihood that the switch will be chosen as the regional root switch (65535 represents the least likely). It is used as the highest 4 bits of the Bridge ID included in the MSTP BPDUs generated by this bridge.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The priority can only take on values that are multiples of 4096 (4k). If a value is specified that is not a multiple of 4K, then the value will be replaced by the closest multiple of 4K, which is lower than the value entered.

All instances created by the **configure service vpls stp mst-instance vlan-range** command and not having explicit definition of bridge-priority inherit the default value.

The **no** form of this command sets the bridge-priority to its default value.

Default

mst-priority 32768

Parameters

bridge-priority

Specifies the priority of this specific Multiple Spanning Tree Instance for this service.

Values 0 to 65535

Platforms

All

30.100 mst-revision

mst-revision

Syntax

mst-revision *revision-number*

no mst-revision

Context

[Tree] (config>service>vpls>stp mst-revision)

Full Context

configure service vpls stp mst-revision

Description

This command defines the MST configuration revision number. Two bridges are considered as a part of the same MST region as soon as their configuration of MST-region name, MST-revision and VLAN-to-instance assignment is identical.

The **no** form of this command returns MST configuration revision to its default value.

Default

mst-revision 0

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

revision-number

Specifies the MSTP region revision number to define the MSTP region.

Values 0 to 65535

Platforms

Full Context

mstat

Description

This command traces a multicast path from a source to a receiver and displays multicast packet rate and loss information.

Parameters

source ip-address

Specifies the ip-address of the multicast capable target router.

Values ipv4 address (a.b.c.d)

dns-name

Specifies the DNS name (if DNS name resolution is configured), up to 63 characters.

group *ip-address*

Specifies the multicast address or DNS name of the group that resolves to the multicast group address that will be used. If the group is not specified, address 224.2.0.1 (the MBone audio) is used. This will suffice if packet loss statistics for a particular multicast group are not needed.

destination *ip-address*

Specifies either the IP address or the DNS name of the unicast destination. If this parameter is omitted the IP address of the system where the command is entered will be

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

used. The receiver parameter can also be used to specify a local interface address as the destination address for sending the trace query. The response is also returned to the address specified as the receiver.

hop

Specifies the maximum number of hops that will be traced from the receiver back toward the source.

Values 1 to 255

Default 32 hops (infinity for the DVMRP routing protocol)

router-instance

Specifies the router name or service ID used to identify the router instance.

Values

router-name: Base

service-id: 1 to 2147483647

Default Base

service-name

Specifies the service name up to 64 characters in length.

Table 87: Mstat Output Fields

Label	Description
hop	The number of hops from the source to the listed router
router name	The number of the router for this hop or "?" when not reverse DNS translated
address	The address of the router for this hop
protocol	The protocol used
ttl	The forward TTL threshold. TTL that a packet is required to have before it is forwarded over the outgoing interface.
forwarding code	Forwarding information/error code for this hop

For each interface between two nodes a line is printed, following the same layout as other routers with an implementation derived from mrouted. Consider the following:

- The forwarding information/error code is only displayed when different from "No Error".
- "?" means there is no reverse DNS translation.
- There is no "Overall Mcast Pkt Rate" available in the PE for the VPRN case.

Full Context

mstat2

Description

This command traces a multicast path from a source to a receiver and displays multicast packet rate and loss information.

Parameters

source ip-address

Specifies the ip-address of the multicast capable target router.

Values ipv4-prefix:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

dns-name

Specifies the DNS name (if DNS name resolution is configured), up to 63 characters.

starg

Specifies a static (*,G) entry. This command can only be enabled if no existing source addresses for this source is specified.

group *ip-address*

Specifies the multicast address or DNS name of the group that resolves to the multicast group address that will be used. If the group is not specified, address 224.2.0.1 (the MBone audio) is used. This will suffice if packet loss statistics for a particular multicast group are not needed.

Values ipv4-prefix:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

destination *ip-address*

Specifies either the IP address or the DNS name of the unicast destination. If this parameter is omitted the IP address of the system where the command is entered will be used. The receiver parameter can also be used to specify a local interface address as the destination address for sending the trace query. The response is also returned to the address specified as the receiver.

configure service vprn mtrace2

Description

This command traces a multicast path from a source to a receiver.

Platforms

All

mtrace2

Syntax

mtrace2 source [*ip-address* | *dns-name* | *starg*] **group** {*ip-address* | *dns-name*} [**destination** *ip-address* | *dns-name*] [**hop** *hop-count*] [**router** *router-instance* | **service-name** *service-name*] [**wait-time** *wait-time*]

Context

[Tree] (mtrace2)

Full Context

mtrace2

Description

This command traces a multicast path from a source to a receiver.

Parameters

source ip-address

Specifies the IP address of the multicast capable target router.

Values ipv4-prefix:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

dns-name

Specifies the DNS name (if DNS name resolution is configured), up to 63 characters.

starg

Specifies a static (*,G) entry. This command can only be enabled if no existing source addresses for this source is specified.

group *ip-address*

Specifies the multicast address or DNS name of the group that resolves to the multicast group address that is used. If the group is not specified, address 224.2.0.1 (the MBone audio) is used. This suffices if packet loss statistics for a particular multicast group are not needed.

Values ipv4-prefix:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

destination *ip-address*

Specifies either the IP address or the DNS name of the unicast destination. If this parameter is omitted, the IP address of the system where the command is entered is used. The receiver parameter can also be used to specify a local interface address as the destination address for sending the trace query. The response is returned to the address specified as the receiver.

Values ipv4-prefix:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

hop-count

Specifies the maximum number of hops that are traced from the receiver back toward the source.

Values 1 to 255

Default 32 hops (infinity for the DVMRP routing protocol)

router-instance

Specifies the router name or service ID used the identify the router instance.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values

router-name: "Base"

service-id: 1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

wait-time

Specifies the number of seconds to wait for the response.

Values 1 to 60

configure service vprn router-advertisement interface mtu

configure service vprn subscriber-interface ipv6 router-advertisements mtu

configure service ies subscriber-interface group-interface ipv6 mtu

configure subscriber-mgmt router-advertisement-policy mtu

Description

This command specifies the value to be placed in link MTU options sent by the router on this interface.

The **no** form of this command reverts to the default.

Default

no mtu — The MTU option is not sent in the router advertisement messages.

Parameters

bytes

Specifies the advertised MTU value in bytes for this interface.

Values 1280 to 9800 (for **config**>**router**>**router-advert**>**if** and **config**>**service**>**vprn**>**router-advert**>**if** contexts only)

1280 to 9212 (for **subscriber management** context, **ies** and **vprn service subscriber-interface** contexts)

[Tree] (config>port>tdm>ds3 mtu)

[Tree] (config>port>ethernet mtu)

Full Context

configure port tdm e3 mtu

configure port tdm ds3 mtu

configure port ethernet mtu

Description

This command configures the maximum payload MTU size for an Ethernet port, PPP-enabled port or sub-port and Frame Relay-enabled port or subport. The Ethernet port level MTU parameter indirectly defines the largest physical packet the port can transmit or the far-end Ethernet port can receive. Packets that cannot be fragmented at egress and exceed the MTU are discarded.

The value specified for the MTU includes the destination MAC address, source MAC address, the Ethertype or Length field and the complete Ethernet payload. The MTU value does not include the preamble, start of frame delimiter or the trailing CRC.

PoS channels use the MTU to define the largest PPP payload a PoS frame may contain. A significant difference between SONET/SDH PoS channel and Ethernet physical MTU values the overhead considered part of the framing method and the overhead considered to be part of the application using the frame. In Ethernet, the preamble, start of frame delimiter and the CRC are considered part of the framing overhead and not part of the frame payload. For a PoS channel, the HDLC framing overhead is not included in the physical MTU; only the PPP and PPP payload are included. If the port mode or encapsulation type is changed, the MTU assumes the default values of the new mode or encapsulation type.

The **no** form of this command restores the default values.

Default

The default MTU value depends on the (sub-)port type, mode and encapsulation and are listed in Table 90: Default MTU Values:

Table 90: Default MTU Values

Type	Mode	Encap Type	Default (Bytes)
10/100, Gig, or 10GigE	Access	null	1514
10/100, Gig, or 10GigE	Access	dot1q	1518
10/100, Gig, or 10GigE	Access	q-in-q	1522
SONET/SDH or TDM	Access	mpls	1506
TDM	Access	bcp-null	1518
TDM	Access	bcp-dot1q	1522
TDM	Access	ipcp	1502
TDM	Access	frame-relay	1578

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Type	Mode	Encap Type	Default (Bytes)
TDM	Access	atm	1524
10/100 or 100FX Ethernet	Network	null	1514
10/100 or 100FX Ethernet	Network	dot1q	1518

Parameters

mtu-bytes

Sets the maximum allowable size of the MTU, expressed as an integer.

Values		
	512 to 9212	config>port>ethernet
	512 to 9800	config>port>ethernet (for FP4-based connector ports)
	512 to 9208	config>port>tdm>ds3
	512 to 9208	config>port>tdm>e3

configure service vprn ospf3 area interface mtu

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the OSPF packet size used on this interface. If this parameter is not configured, OSPF derives the MTU value from the MTU configured (default or explicitly) in the following contexts:

config>port>ethernet, **config>port>sonet-sdh>path**, **config>port>tdm>t3-e3**, **config>port>tdm>t1-e1>channel-group**

If this parameter is configured, the smaller value between the value configured here and the MTU configured (default or explicitly) in an above-mentioned contexts is used.

To determine the actual packet size, add 14 bytes for an Ethernet packet and 18 bytes for a tagged Ethernet packet to the size of the OSPF (IP) packet MTU configured in this command.

The **no** form of this command reverts to default value derived from the MTU configured in the **config>port** context.

Default

no mtu

Parameters

mtu-bytes

Specifies the MTU to be used by OSPF for this logical interface, in bytes.

Values 512 to 9786

Platforms

All

mtu

Syntax

mtu *value*

no mtu

Context

[Tree] (config>service>vprn>nat>outside mtu)

Full Context

configure service vprn nat outside mtu

Description

This command configures the Maximum Transmission Unit (MTU) for downstream traffic flowing through this router (as outside NAT router). The system fragments IP datagrams exceeding the MTU.

The **no** form of the command reverts to the default.

Default

no mtu

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

value

Specifies the MTU for downstream traffic.

Values 512 to 9000

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>service>ipfix>export-policy>collector mtu)

Full Context

configure service ipfix ipfix-export-policy collector mtu

Description

This command sets the MTU size of the UDP packet containing IPFIX records destined for the collector node. Multiple records will be stuffed into a single IP packet until stuffing an additional data record would exceed MTU or the internal timer of 250 ms expires.

Default

mtu 1500

Parameters

mtu

Specifies the Maximum Transmission Unit range.

Values 512 to 9212

Platforms

All

mtu

Syntax

mtu *mtu-size*

Context

[Tree] (config>service>nat>syslog>syslog-export-policy mtu)

Full Context

configure service nat syslog syslog-export-policy mtu

Description

The command defines the MTU, the maximum size of the IP frame that can be transmitted. The size of the frame includes the syslog message and the IP header. This is an IP-MTU value.

When aggregation is enabled (the **max-tx-delay** command), generation of a syslog frame carrying multiple flow logs is triggered by one of the two events (whichever occurs first):

- Expiry of the max-tx-delay timer
- Exceeding MTU size

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

mtu 1500

Parameters

mtu-size

Specifies the MTU size in bytes.

Values 512 to 9000

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mtu

Syntax

mtu *mtu-size*

no mtu

Context

[Tree] (config>service>nat>map-domain mtu)

Full Context

configure service nat map-domain mtu

Description

This command configures the IPv6 MTU in a MAP domain. The configured MTU applies to traffic in the downstream direction, towards the CE. The configured MTU value must be lower than the MTU of the outgoing port for the traffic, which includes L2 overhead.

Default

mtu 8686

Parameters

mtu-size

Specifies the IPMTU size of the translated IPv6 packet.

Values 160 to 8686

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

Context

[Tree] (config>router>ospf>area>interface mtu)

[Tree] (config>router>ospf3>area>interface mtu)

Full Context

configure router ospf area interface mtu

configure router ospf3 area interface mtu

Description

This command configures the OSPF packet size used on this interface. If this parameter is not configured OSPF derives the MTU value from the MTU configured (default or explicitly) in the following contexts:

- **config>port>ethernet**
- **config>port>sonet-sdh>path**
- **config>port>tdm>t3-e3**
- **config>port>tdm>t1-e1>channel-group**

If this parameter is configured, the smaller value between the value configured here and the MTU configured (default or explicitly) in an above-mentioned context is used.

To determine the actual packet size, add 14 bytes for an Ethernet packet and 18 bytes for a tagged Ethernet packet to the size of the OSPF (IP) packet MTU configured in this command.

The **no** form of this command reverts to the default derived from the MTU configured in the **config>port** context.

Default

no mtu

Parameters

bytes

Specifies the MTU to be used by OSPF for this logical interface in bytes.

Values 512 to 9786 in the **config**>**router**>**ospf**>**area**>**interface** context.

1280 to 9786 in the **config**>**router**>**ospf3**>**area**>**interface** context.

mtu

Syntax

mtu *mtu-size*

no mtu

Context

[Tree] (config>fwd-path-ext>fpe>srv6>interface-b mtu)

Full Context

configure fwd-path-ext fpe srv6 interface-b mtu

Description

This command configures the Maximum Transfer Unit (MTU) of interface-b of the SRv6 originating FPE.

The MTU is used to check if an IPv4 service packet should be fragmented and if an IPv6 service packet should be dropped when tunneled over SRv6.

The minimum value is the IPv6 minimum MTU value. The maximum value is set to the FP4 or FP5 maximum Ethernet port MTU of 9800 minus 14 bytes for Null Ethernet encapsulation.

The **no** form of this command reverts to the default value.

Default

mtu 9786

Parameters

mtu-size

Specifies the MTU size, in bytes.

Values 1280 to 9786

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Context

[Tree] (config>isa>tunnel-grp multi-active)

Full Context

configure isa tunnel-group multi-active

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables configuring multiple active MS-ISA in the tunnel-group. IPsec traffic will be load balanced to configured active MS-ISAs.

Operational notes:

- A shutdown of group and removal of all existing configured tunnels of the tunnel-group are needed before provisioning command "multi-active”.
- If the tunnel-group is admin-up with "multi-active” configured then the configuration of "primary” and "backup” are not allowed.
- The active-mda-number must be =< total number of ISA configured.
  - If active-mda-number is less than total number of ISA configured then the delta number of ISA will become backup ISA.

Default

no multi-active

Platforms

Full Context

configure service vprn subscriber-mgmt multi-chassis-shunt-id

configure service ies subscriber-mgmt multi-chassis-shunt-id

Description

This command configures the shunt ID that is used to shunt downstream traffic from a standby node to an active node. Because this ID identifies the traffic service on the standby node, the same ID must be configured per service on each node. This configuration is required for BNG CUPS inter-BNG-UP resiliency shunting, not for non- BNG-UP shunting. However, when configured, it is also used for shunting non- BNG-UPsessions in the same service.

The **no** form of the command removes the configuration.

Parameters

id

Specifies the shunt ID.

Values 1 to 8191

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

30.115 multi-homed-prefix

multi-homed-prefix

Syntax

[**no**] **multi-homed-prefix**

Context

[Tree] (config>router>ospf>lfa multi-homed-prefix)

Full Context

configure router ospf loopfree-alternates multi-homed-prefix

Description

This command enables multihomed prefix LFA for OSPF routes (IP FRR) and SR-OSPF node SID tunnels.

This feature makes use of the multihomed prefix model described in RFC 8518 to compute a backup IP next hop using an alternate ABR or ASBR for external prefixes and to an alternate router owner for local anycast prefixes.

This feature further enhances the multihomed prefix backup path calculation beyond RFC 8518 with the addition of repair tunnels that make use of a PQ node or a P-Q set to reach the alternate exit ABR or ASBR of external prefixes or the alternate owner router of local anycast prefixes.

The computed IP next-hop based backup path is added to OSPF routes of external /32 prefixes (OSPFv2 routes types 3, 4, 5, and 7) and local /32 anycast prefixes in the RTM if the prefix is not protected by base LFA or if the user set leaf preference value to **all**. The user must enable the **ip-fast-reroute** leaf to have these backup paths programmed into the FIB in data path.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The computed IP next hop or repair tunnel based backup path is also programmed for SR-OSPF node SID tunnels of external /32 prefixes and to /32 prefixes in same area as the computing node S and which are advertised by multiple routers (anycast prefix) in both algorithm 0 and flexible-algorithm numbers.

The **no** form of this command disables multihomed prefix LFA.

Default

no multi-homed-prefix

Platforms

All

multi-homed-prefix

Syntax

[**no**] **multi-homed-prefix**

Context

[Tree] (config>router>isis>lfa multi-homed-prefix)

Full Context

configure router isis loopfree-alternates multi-homed-prefix

Description

This command enables multihomed prefix LFA for IS-IS routes (IP FRR), SR-ISIS tunnels, and SRv6-ISIS tunnels.

This feature uses the multihomed prefix model described in RFC 8518 to compute a backup IP next hop using an alternate ABR or ASBR for external prefixes and to an alternate router owner for local anycast prefixes.

This feature further enhances the multihomed prefix backup path calculation beyond RFC 8518 with the addition of repair tunnels that make use of a PQ node or a P-Q set to reach the alternate exit ABR or ASBR of external prefixes or the alternate owner router of intra-area anycast prefixes.

The computed IP next hop-based backup path is added to IS-IS routes of external /32 or /128 prefixes and intra-area /32 or /128 anycast prefixes in the RTM if the prefix is not protected by base LFA or if the user set leaf **preference** command option to **all**. The user must enable the **ip-fast-reroute** leaf to have these backup paths programmed into the FIB in datapath.

The computed IP next hop or repair tunnel-based backup path is also programmed for:

1. SR-ISIS node SID tunnels of external /32 IPv4 prefixes and /128 IPv6 prefixes, and node SID tunnels of intra-area /32 IPv4 anycast prefixes and /128 anycast IPv6 prefixes, in both algorithm 0 and flexible-algorithms
2. SRv6-ISIS locator routes and tunnels of external prefixes and of intra-area anycast prefixes of any size, in both algorithm 0 and flexible algorithm numbers

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

As a result, an SR-TE LSP, an SR-MPLS policy, or an SRv6 policy which uses an SR-ISIS SID or an SRv6-ISIS SID of those same prefixes in its configured or computed SID list benefits from the multihomed prefix LFA protection.

Once the IP next-hop based multihomed prefix LFA is enabled, the extensions to compute an SR-TE repair tunnel for the multihomed prefix LFA in the case of SR-ISIS and SRv6-ISIS are automatically enabled if the user also enabled TI-LFA or Remote LFA. The computation reuses the SID list of the primary path or of the TI-LFA or Remote LFA backup path of the alternate ABR or ASBR or alternate owner router.

The **no** form of this command disables multihomed prefix LFA.

no multi-homing

Context

[Tree] (config>service>system>bgp-evpn>eth-seg multi-homing)

Full Context

configure service system bgp-evpn ethernet-segment multi-homing

Description

This command configures the multihoming mode for the Ethernet segment as defined in RFC 7432.

By default, the use of ESI label is enabled for **all-active** and **single-active** as defined in RFC 7432 (for **single-active multi-homing,** the ESI label is used to avoid transient loops).

When **single-active no-esi-label** or **all-active no-esi-label** is specified, the system does not allocate a label for the ESI; and therefore, advertises ESI label 0 to peers. Even if the ESI is configured not to send the ESI label, on reception of an ESI label from a peer, the PE always sends traffic to that peer using the received ESI label.

The **no** form of this command removes multihoming mode on the Ethernet segment.

Full Context

configure service ies interface sap multi-service-site

configure service ies subscriber-interface group-interface sap multi-service-site

configure service vprn subscriber-interface group-interface sap multi-service-site

Description

This command creates a new customer site or edits an existing customer site with the *customer-site-name* parameter. A customer site is an anchor point to create an ingress and egress virtual scheduler hierarchy. When a site is created, it must be assigned to a chassis slot or port. When scheduler policies are defined for ingress and egress, the scheduler names contained in each policy are created according to the parameters defined in the policy. Multi-service customer sites exist for the sole purpose of creating a virtual scheduler hierarchy and making it available to queues on multiple Service Access Points (SAPs).

The scheduler policy association with the customer site normally prevents the scheduler policy from being deleted until after the scheduler policy is removed from the customer site. The multi-service-site object generates a log message indicating that the association was deleted due to scheduler policy removal.

When the multi-service customer site is created, an ingress and egress scheduler policy association does not exist. This does not prevent the site from being assigned to a chassis slot or prevent service SAP assignment. After the site has been created, the ingress and egress scheduler policy associations can be assigned or removed at any time.

The **no** form of this command removes the value from the configuration.

Default

n/a — Each customer site must be explicitly created.

Parameters

customer-site-name

Each customer site must have a unique name within the context of the customer. If *customer-site-name* already exists for the customer ID, the CLI context changes to that site name for the purpose of editing the site scheduler policies or assignment. Any modifications made to an existing site affects all SAPs associated with the site. Changing a

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

scheduler policy association may cause new schedulers to be created and existing policers and queues on the SAPs to no longer be orphaned. Existing schedulers on the site may cease to exist, causing policers and queues relying on that scheduler to be orphaned.

If the *customer-site-name* does not exist, it is assumed that an attempt is being made to create a site of that name in the customer ID context. The success of the command execution depends on the following:

The maximum number of customer sites defined for the chassis slot has not been met.

The *customer-site-name* is valid.

The **create** keyword is included in the command line syntax (if the system requires it).

When the maximum number of customer sites has been exceeded a configuration error occurs, the command will not execute and the CLI context will not change.

If the *customer-site-name* is invalid, a syntax error occurs, the command will not execute and the CLI context will not change.

Values Valid names consist of any string, up to 32 characters, composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

configure service vpls sap multi-service-site

configure service ies sap multi-service-site

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command associates the SAP with a *customer-site-name*. If the specified *customer-site-name* does not exist in the context of the service customer ID an error occurs and the command is not executed. If *customer-site-name* exists, the current and future defined queues on the SAP (ingress and egress) attempts to use the scheduler hierarchies created within *customer-site-name* as parent schedulers.

This command is mutually exclusive with the SAP ingress and egress scheduler policy commands. If a scheduler policy has been applied to either the ingress or egress nodes on the SAP, the **multi-service-site** command fails without executing. The locally applied scheduler policies must be removed prior to executing the **multi-service-site** command.

The **no** form of this command removes the SAP from any multi-service customer site the SAP belongs to. Removing the site can cause existing or future policers and queues to enter an orphaned state.

Parameters

customer-site-name

Specifies an existing customer site name, up to 32 characters. Valid names consist of any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed between double quotes. If the *customer-site-name* exists and local scheduler policies have not been applied to the SAP, the current and future policers queues defined on the SAP looks for their parent schedulers within the scheduler hierarchies defined in the customer-site-name.

When the multi-service customer site is created, an ingress and egress scheduler policy association does not exist. This does not prevent the site from being assigned to a chassis slot or prevent service SAP assignment. After the site has been created, the ingress and egress scheduler policy associations can be assigned or removed at any time.

Parameters

customer-site-name

Specifies the customer site name. Each customer site must have a unique name within the context of the customer. If *customer-site-name* already exists for the customer ID, the CLI context changes to that site name for the purpose of editing the site scheduler policies or assignment. Any modifications made to an existing site will affect all SAPs associated with the site. Changing a scheduler policy association may cause new schedulers to be created and existing policers and queues on the SAPs to no longer be orphaned. Existing schedulers on the site may cease to exist, causing policers and queues relying on that scheduler to be orphaned.

If the *customer-site-name* does not exist, it is assumed that an attempt is being made to create a site of that name in the customer ID context. The success of the command execution depends on the following:

- The maximum number of customer sites defined for the chassis has not been met.
- The *customer-site-name* is valid.
- The **create** keyword is included in the command line syntax (if the system requires).

When the maximum number of customer sites has been exceeded a configuration error occurs; the command will not execute and the CLI context will not change.

If the *customer-site-name* is invalid, a syntax error occurs; the command will not execute and the CLI context will not change.

Values Valid names consist of any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Description

This command configures NTP the node to transmit multicast packets on the CPM/CCM MGMT port. Broadcast and multicast messages can easily be spoofed; authentication is strongly recommended.

The **no** form of this command removes the multicast address from the configuration.

Parameters

key-id

Specifies the configured authentication key and authentication type used by this version to transmit NTP packets. If this command is omitted from the configuration, packets are sent unencrypted.

Values 1 to 255

keychain-name

Identifies the keychain name, up to 32 characters.

version

Specifies the NTP version number that is generated by this node. This parameter does not need to be configured when in client mode in which case all three versions are accepted.

Values 2 to 4

Default 4

30.129 multicast-import-policy

multicast-import-policy

Syntax

multicast-import-policy *policy-name*

[**no**] **multicast-import-policy**

Context

[Tree] (config>router>ospf multicast-import-policy)

Full Context

configure router ospf multicast-import-policy

Description

This command specifies the policy used by OSPF to submit routes to the multicast RTM.

This command applies only when the **multicast-import** command is enabled for OSPF. By default, enabling **multicast-import** causes OSPF to submit all IGP routes to the multicast RTM. Configuring this command allows the user to specify prefixes in the policy prefix list to control OSPF route submission.

The **no** form of this command disables the use of the policy to submit routes.

Default

no multicast-import-policy

Parameters

policy-name

Specifies the name of the policy, up to 32 characters.

Platforms

Context

[Tree] (config>mcast-management multicast-info-policy)

Full Context

configure mcast-management multicast-info-policy

Description

This command configures a multicast information policy. Multicast information policies are used to manage parameters associated with Layer 2 and Layer 3 multicast records. Multiple features use the configured information within the policy. The multicast ingress path manager uses the policy to decide the inactive and active state behavior for each multicast record using the ingress paths to the switch fabric. The system's multicast ECMP join decisions are influenced by the channel information contained within the policy.

Multicast Bundles:

A multicast information policy consists of one or multiple named bundles. Multicast streams are mapped to a bundle based on matching the destination address of the multicast stream to configured channel ranges defined within the bundles. Each policy has a bundle named 'default' that is used when a destination address does not fall within any of the configured channel ranges.

Each bundle has a set of default parameters used as the starting point for multicast channels matching the bundle. The default parameters may be overridden by optional exception parameters defined under each channel range. Further optional parameter overrides are possible under explicit source address contexts within each channel range.

Default Multicast Information Policy

A multicast information policy always exists with the name 'default' and cannot be edited or deleted. The following parameters are contained in the default multicast information policy:

Policy Description:	Default policy, cannot be edited or deleted.
Bundle:	default
Bundle Description:	Default Bundle, cannot be edited or deleted.
Congestion-Priority-Threshold:	4
ECMP-Optimization-Limit-Threshold:	7
Bundle Defaults:	
Administrative Bandwidth:	0 (undefined)
Preference:	0
CAC-Type:	Optional
Bandwidth Activity:	Dynamic with no black-hole rate
Explicit Ingress SF Path:	None (undefined)
Configured Channel Ranges:	None

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The default multicast information policy is applied to all VPLS and VPRN services and all routing contexts until an explicitly defined multicast information policy has been mapped.

Explicit Multicast Information Policy Associations

Each VPLS service and each routing context (including VPRN routing contexts) supports an explicit association with an pre-existing multicast information policy. The policy may need to be unique per service or routing context since that each context has its own multicast address space. The same multicast channels may be and most likely be used for completely different multicast streams and applications in each forwarding context.

Interaction with Ingress Multicast Path Management

When ingress multicast path management is enabled on an MDA, the system automatically creates a bandwidth manager context that manages the multicast path bandwidth into the switch fabric used by the ingress ports on the MDA. As routing or snooping protocols generate Layer 2 or Layer 3 multicast FIB records that are populated on the MDA's forwarding plane, they are processed though the multicast information policy that is associated with the service or routing context associated with the record. The policy returns the following information for the record to be used by the ingress bandwidth manager:

- The records administrative bandwidth (0 if undefined)
- Preference level (0 to 7 with 7 being highest)
- Bandwidth activity monitoring setting (use admin bw or dynamic monitoring) If admin bw is indicated, also returns active and inactive thresholds
- Initial switch fabric multicast path (primary or secondary)
- Explicit switch fabric multicast path (primary, secondary, or none)

Interaction with Multicast ECMP Optimization

The multicast information policy is used by the multicast ECMP optimization function to derive each channels administrative bandwidth. The ECMP function tallies all bandwidth information for channels joined and attempts to equalize the load between the various paths to the sender. The multicast information policy returns the following information to the ECMP path manager:

- Administrative bandwidth (0 if undefined)
- Preference (0 to 7 with 7 the highest preference value)

Default

multicast-info-policy "default"

Parameters

policy-name

Identifies the name of the policy to be either created or edited. Each multicast information policy must be uniquely named within the system. Names of up to 32 ASCII characters are supported with the normal character restrictions.

create

The create keyword is required if creating a new multicast information policy when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the multicast information policy name already exists.

[Tree] (config>router multicast-info-policy)

[Tree] (config>service>vpls multicast-info-policy)

Full Context

configure service ies multicast-info-policy

configure service vprn multicast-info-policy

configure router multicast-info-policy

configure service vpls multicast-info-policy

Description

This command overrides the default multicast information policy on a service or routing context. When the policy association is changed, all multicast channels in the service or routing context must be reevaluated.

If a multicast information policy is not explicitly associated with the service or routing context, the default multicast information policy is used when ingress multicast path management is enabled.

While a multicast information policy is associated with a service or routing context, the policy cannot be deleted from the system.

The **no** form of the command removes an explicit multicast information policy from the service or routing context and restores the default multicast information policy.

Parameters

policy-name

Specifies the policy name, up to 32 characters. The *policy-name* parameter is required and specifies an existing multicast information policy that should be associated with the service or routing context.

Platforms

All

30.131 multicast-leave-sync-propagation

multicast-leave-sync-propagation

Syntax

multicast-leave-sync-propagation *time*

Context

[Tree] (config>service>system>bgp-evpn multicast-leave-sync-propagation)

Full Context

configure service system bgp-evpn multicast-leave-sync-propagation

Description

This command configures the additional amount of time that the system waits before removing a multicast state that was synchronized in an Ethernet Segment via Multicast Join or Leave Synch routes. This value represents a delta corresponding to the time it takes for a BGP advertisement to propagate to ES peers.

The node triggering the route computes the maximum response time as the product of the locally configured values, Last Member Query Count and Last Member Query Interval (this value is taken from the **config**>**service**>**vpls**>**sap**>**igmp-snooping**>**last-member-query-interval** or **config**>**service**>**vpls**>**spoke-sdp**>**igmp-snooping**> **last-member-query-interval** commands depending on the Ethernet Segment being used), and adds the delta value to the Maximum Response Time. Increasing the Maximum Response Time by this value can help minimize the churn of removing and recreating the state on the node.

The maximum response time value should be configured consistently in all ES peers. For example, in a scenario where a maximum response time of five seconds is advertised by PE-A and there is a delay of four seconds in the BGP propagation to PE-B, the timer could already expire on PE-A while PE-B is still in LMQ time and can still receive joins (which would recreate state in A after a join synch route from B). To minimize this situation, adding an extra delta timer on PE-A, reduces the potential churn of PE-A removing and recreating the state.

Default

multicast-leave-sync-propagation 5

Parameters

time

Specifies the multicast leave sync propagation delay time, in seconds.

Values 0 to 300

Default 5

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

30.134 multicast-policer

multicast-policer

Syntax

multicast-policer *policer-id* [**fp-redirect-group**]

no multicast-policer

Context

[Tree] (config>qos>sap-ingress>fc multicast-policer)

Full Context

configure qos sap-ingress fc multicast-policer

Description

Within a **sap-ingress** QoS policy forwarding class context, the **multicast-policer** command is used to map packets that match the forwarding class and are considered multicast in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination based on the ingress service type and the service instance forwarding records. Two basic types of services

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

support multicast packets: routed services (IES and VPRN) and L2 multipoint services (VPLS, I-VPLS, and B-VPLS). For the routed service types, a multicast packet is destined to an IPv4 or IPv6 multicast address. For the L2 multipoint services, a multicast packet is a packet destined to a multicast MAC address (multicast bit set in the destination MAC address but not the ff:ff:ff:ff:ff:ff broadcast address). The VPLS services also support two other multipoint forwarding types (broadcast and unknown), which are considered separate from the multicast forwarding type.

If ingress forwarding logic has resolved a packet to the multicast forwarding type within the forwarding class, it will be mapped to either an ingress multipoint queue (using the **multicast** *queue-id* or **multicast** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**multicast-policer** *policer-id*). The **multicast** and **multicast-policer** commands within the forwarding class context are mutually exclusive. By default, the multicast forwarding type is mapped to the SAP ingress default multipoint queue. If the **multicast-policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the multicast forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site, or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

The **multicast-policer** command is ignored for instances of the policer applied to SAPs subscribers or multiservice site where broadcast packets are not supported.

When the multicast forwarding type within a forwarding class is mapped to a policer, the multicast packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the multicast forwarding type within the forwarding class to the default multipoint queue. If all forwarding class forwarding types had been removed from the default multipoint queue, the queue will not exist on the SAPs subscribers or multiservice site associated with the QoS policy, and the **no multicast-policer** command will cause the system to attempt to create the default multipoint queue on each object. If the system cannot create the queue on each instance, the **no multicast-policer** command will fail and the multicast forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no multicast-policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters

policer-id

When the forwarding class **multicast-policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

fp-redirect-group

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

30.135 multicast-queue

multicast-queue

Syntax

multicast-queue *queue-id* [**group** *queue-group-name*]

no multicast-queue

Context

[Tree] (config>qos>sap-ingress>fc multicast-queue)

Full Context

configure qos sap-ingress fc multicast-queue

Description

This command overrides the default multicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all multicast traffic on a SAP using this policy is forwarded using the *queue-id*.

The multicast forwarding type includes the **unknown** unicast forwarding type and the **broadcast** forwarding type unless each is explicitly defined to a different multipoint queue. When the unknown and broadcast forwarding types are left as default, they will track the defined queue for the multicast forwarding type.

The **no** form of this command sets the multicast forwarding type *queue-id* back to the default queue for the forwarding class. If the **broadcast** and **unknown** forwarding types were not explicitly defined to a multipoint queue, they will also be set back to the default multipoint queue (queue 11).

Parameters

queue-id

The *queue-id* parameter specified must be an existing, multipoint queue defined in the config>qos>sap-ingress context.

Values Any valid multipoint queue-ID in the policy including 2 through 32.

Default 11

group *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified queue-id within the queue-group-name. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

All

multicast-queue

Syntax

multicast-queue *queue-id*

no multicast-queue

Context

[Tree] (config>qos>network-queue>fc multicast-queue)

Full Context

configure qos network-queue fc multicast-queue

Description

This command overrides the default multicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all multicast traffic using this policy is forwarded using the *queue-id*.

The multicast forwarding type includes the **unknown** unicast forwarding type and the **broadcast** forwarding type, unless each is explicitly defined to a different multipoint queue. When the unknown and broadcast forwarding types are left as default, they will track the defined queue for the multicast forwarding type.

The **no** form of this command sets the multicast forwarding type *queue-id* back to the default queue for the forwarding class. If the **broadcast** and **unknown** forwarding types were not explicitly defined to a multipoint queue, they will also be set back to the default multipoint queue (queue 11).

Resource Utilization

When a multipoint queue is created and at least one forwarding class is mapped to the queue using the **multipoint-queue** command, a single ingress multipoint hardware queue is created per instance of the applied network-queue policy, using the queue-policy command at the ingress network FP level. Multipoint queues are not created at egress and the multipoint queues defined in the network-queue policy are ignored when the policy is applied to an egress port.

Parameters

queue-id

Specifies any valid multipoint queue-ID in the policy. The *queue-id* parameter specified must be an existing, multipoint queue defined in the **config>qos>network-queue>queue** context.

Values 1 to 16

Default 11

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

All

multicast-queue

Syntax

multicast-queue *queue-id*

Context

[Tree] (config>qos>shared-queue>fc multicast-queue)

Full Context

configure qos shared-queue fc multicast-queue

Description

This command configures the multicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all multicast traffic on a SAP using this policy is forwarded using the *queue-id*.

The multicast forwarding type includes the **unknown** unicast forwarding type and the **broadcast** forwarding type unless each is explicitly defined to a different multipoint queue. When the unknown and broadcast forwarding types are left as default, they will track the defined queue for the multicast forwarding type.

The **no** form of this command sets the multicast forwarding type *queue-id* back to the default queue for the forwarding class. If the **broadcast** and **unknown** forwarding types were not explicitly defined to a multipoint queue, they will also be set back to the default multipoint queue (queue 11).

Parameters

queue-id

The *queue-id* parameter specified must be an existing, multipoint queue defined in the **config>qos>sap-ingress** context policer-output-queues profile. For the 7950 XRS, this is not configurable in the policer-output-queues profile.

Values 9 to 16

Default 11

configure router policy-options policy-statement entry action multicast-redirection

Description

This command configures the interface where to redirect IGMP multicast traffic to.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

multicast-redirection

Syntax

multicast-redirection [**fwd-service** *service-id*] *ip-int-name*

no multicast-redirection

Context

[Tree] (config>router>policy-options>policy-statement>default-action multicast-redirection)

Full Context

configure router policy-options policy-statement default-action multicast-redirection

Description

This command enables a redirection under a filtering policy. The filtering policy in this case becomes a redirection policy and it is defined under the **router>policy-option** hierarchy.

After the redirection policy is applied to the subscriber, all IGMP messages will be processed per subscriber host before they get redirected to the referenced interface (and possibly service). However, multicast traffic will not be replicated directly per subscriber host but instead it will be forwarded on the interface that is referenced in the redirection policy. The redirected interface must have IGMP enabled.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Currently all traffic is redirected and there is no ability to selectively redirect multicast traffic based on match conditions (such as, multicast-groups, source IP address of IGMP messages). Multicast redirection is supported between VPRN services and also between interfaces within the Global Routing Context. Multicast redirection is not supported between the VPRN services and the Global Routing Context. Multicast redirection is supported in the wholesale/retail VPRN context.

Note:
Redirecting from a VPRN instance to the GRT is not supported. Redirecting from a VPRN to a different VPRN is supported and redirecting from an IES to another IES is also supported.

Default

no multicast-redirection

Parameters

fwd-service *service-id*

Specifies the service to which traffic should be redirected. This option is applied only in the VPRN context. It is possible to redirect the multicast group into another service instance routing interface.

ip-int-name

specifies the alternate interface to which IGMP messages are redirected.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

30.137 multicast-senders

multicast-senders

Syntax

multicast-senders {**auto** | **always** | **never**}

no multicast-senders

Context

[Tree] (config>service>vprn>pim>if multicast-senders)

Full Context

configure service vprn pim interface multicast-senders

Description

This command configures the way subnet matching is done for incoming data packets on this interface. An IP multicast sender is an user entity to be authenticated in a receiving host.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

auto

Subnet matching is automatically performed for incoming data packets on this interface.

always

Subnet matching is always performed for incoming data packets on this interface.

never

Subnet matching is never performed for incoming data packets on this interface.

Platforms

All

multicast-senders

Syntax

multicast-senders {**auto** | **always** | **never**}

no multicast-senders

Context

[Tree] (config>router>pim>interface multicast-senders)

Full Context

configure router pim interface multicast-senders

Description

This command configures how traffic from directly-attached multicast sources should be treated on broadcast interfaces. It can also be used to treat all traffic received on an interface as traffic coming from a directly-attached multicast source. This is particularly useful if a multicast source is connected to a point-to-point or unnumbered interface.

The **no** form of this command reverts to the default value.

Default

multicast-senders auto

Parameters

auto

Specifies that, on broadcast interfaces, the forwarding plane performs subnet-match check on multicast packets received on the interface to determine if the packet is from a directly-attached source. On unnumbered/point-to-point interfaces, all traffic is implicitly treated as coming from a remote source.

always

Treats all traffic received on the interface as coming from a directly-attached multicast source.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

never

Specifies that, on broadcast interfaces, traffic from directly-attached multicast sources will not be forwarded; however, traffic from a remote source will still be forwarded if there is a multicast state for it. On unnumbered/point-to-point interfaces, it means that all traffic received on that interface must not be forwarded.

[Tree] (config>service>vprn>video-interface multicast-service)

[Tree] (config>service>ies>video-interface multicast-service)

Full Context

configure service vprn video-interface multicast-service

configure service ies video-interface multicast-service

Description

This command adds a multicast service association to the video interface. This parameter is not required on the video interface when the service carries both unicast and multicast traffic.

When multicast and unicast are carried in separate service instances, the operator can set this parameter on the unicast video interface to form an association with the multicast service when replies need to be sent in the multicast service instance.

When multicast and unicast are carried in separate services when a downstream device (such as a DSLAM) can perform a service cross connect between the services and performs multicast replication.

The **no** form of the command removes the multicast service association.

Parameters

service-id

The service ID of the associated multicast service.

Values *service-id*: 1 to 2147483647

Syntax

multihop *ttl-value*

no multihop

Context

[Tree] (config>subscr-mgmt>bgp-prng-plcy multihop)

Full Context

configure subscriber-mgmt bgp-peering-policy multihop

Description

This command configures the time to live (TTL) value entered in the IP header of packets sent to an EBGP peer multiple hops away.

This parameter is meaningful only when configuring EBGP peers. It is ignored if set for an IBGP peer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command is used to convey to the BGP instance that the EBGP peers are directly connected.

The **no** form of this command reverts to default values.

Default

multihop 1 (EBGP peers are directly connected)

multihop 64 (IBGP)

Parameters

ttl-value

Specifies the TTL value, expressed as a decimal integer.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>service>vprn>bgp>group multipath-eligible)

Full Context

configure service vprn bgp neighbor multipath-eligible

configure service vprn bgp group multipath-eligible

Description

This command specifies that a BGP neighbor or the set of BGP neighbors in a peer group should be part of a selective multipath set. Selective multipaths are only supported by the ipv4, label-ipv4, ipv6, and label-ipv6 address families.

If no candidate multipath route for an IP prefix came from a multipath-eligible peer, multipaths are selected without further constraints.

If the best route for an IP prefix is received from a neighbor marked as multipath-eligible, other routes for the same prefix are not eligible to be used as multipaths unless they also came from peers marked as multipath-eligible.

If the best route for an IP prefix did not come from a multipath-eligible peer but there is at least one candidate multipath route for the same prefix from a multipath-eligible peer, multipath is not used.

The **no** form of this command marks a neighbor or group as non-multipath eligible. The effect of this depends on whether other neighbors and groups are marked as multipath eligible.

Default

no multipath-eligible

[Tree] (config>router>mpls>lsp>auto-bandwidth multipliers)

Full Context

configure router mpls lsp-template auto-bandwidth multipliers

configure router mpls lsp auto-bandwidth multipliers

Description

This command configures the sample multiplier and adjust multiplier for an LSP.

The sample multiplier is the number of collection intervals between periodic computations of the data rate of the LSP. The byte count includes the Layer 2 encapsulation of MPLS packets and represents traffic of all forwarding classes and priorities (in-profile versus out-of-profile) belonging to the LSP. The router calculates the average data rate (in bits per second) over each sample interval.

The adjust multiplier is the number of collection intervals between periodic evaluations by the ingress LER about whether to adjust the LSP bandwidth. The router keeps track of the maximum average data rate of each LSP since the last reset of the adjust count. The maximum of this average data rate over multiple sample intervals is the measured bandwidth input to the auto-bandwidth adjustment algorithms.

Setting the adjust multiplier to a value less than the sample multiplier is not allowed. Nokia recommends setting the adjust multiplier to a multiple of the sample multiplier.

The **no** form of this command instructs the system to use the values configured in the **configure router mpls auto-bandwidth-multipliers** command.

Default

no multipliers

Parameters

num1

Specifies the number of collection intervals in a sample interval.

Values 1 to 511

num2

Specifies the number of collection intervals in an adjust interval.

Values 1 to 16383

Platforms

configure router bgp group add-paths mvpn-ipv4

configure router bgp add-paths mvpn-ipv4

Description

This command configures the add-paths capability for multicast VPN IPv4 routes. By default, add-paths is not enabled for multicast VPN IPv4 routes.

The maximum number of paths per multicast VPN IPv4 NRLI to send is the configured *send-limit*, which is a mandatory parameter. The capability to receive multiple multicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command, receive capability is enabled by default. The **none** option disables the receive capability.

The **no** form of this command disables add-paths support for multicast VPN IPv4 routes, causing sessions established using add-paths for multicast VPN IPv4 to go down and come back up without the add-paths capability.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no mvpn-ipv4

Parameters

send-limit

Specifies the maximum number of paths per multicast VPN IPv4 NRLI that are allowed to be advertised to add-paths peers. The actual number of advertised routes may be less. If the value is **none**, the router does not negotiate the send capability with respect to multicast VPN IPv4 AFI/SAFI.

Default 1 to 16, none

receive

Specifies that the router negotiates to receive multiple routes per multicast VPN IPv4 NRLI.

none

Specifies that the router does not negotiate to receive multiple routes per multicast VPN IPv4 NRLI.

[Tree] (config>service>vpls>mrp mvrp)

Full Context

configure service vpls sap mrp mvrp

configure service vpls mrp mvrp

Description

This object consolidates the MVRP attributes. MVRP is only supported initially in the management VPLS so the object is not supported under BVPLS, IVPLS or regular VPLS not marked with the m-vpls tag.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

30.156 mvrp-control

mvrp-control

Syntax

[**no**] **mvrp-control**

Context

[Tree] (config>service>vpls>vpls-group mvrp-control)

Full Context

configure service vpls vpls-group mvrp-control

Description

This command enables MVRP control in the VPLS instances instantiated using the templates for the specified vpls-group. That means the flooding FDB will be created empty and will be populated with endpoints whenever MVRP receives a declaration and a registration on a specific endpoint. Also the VLAN ID associated by the control VPLS with the instantiated VPLS will be declared on service activation by MVRP on all virtual MVRP ports in the control VPLS. Service activation takes place when at least one other SAP is provisioned and brought up under the data VPLS. This is usually a customer facing SAP or a SAP leading outside of the MVRP controlled domain.

The **no** form of this command disallows MVRP control over this VPLS. The VPLS will be created with a regular FDB and will become as a result active upon creation time. Command change is allowed only when the related vpls-group is in shutdown state.

Default

no mvrp-control

31 n Commands

31.1 n393

n393

Syntax

n393 [*value*]

no n393

Context

[Tree] (config>port>ethernet>elmi n393)

Full Context

configure port ethernet elmi n393

Description

This command configures the monitored count of consecutive errors.

Parameters

value

Specifies the monitored count of consecutive errors.

Values 2 to 10

Platforms

All

31.2 nak-non-matching-subnet

nak-non-matching-subnet

Syntax

[**no**] **nak-non-matching-subnet**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vprn>dhcp>server>pool nak-non-matching-subnet)

[Tree] (config>router>dhcp>server>pool nak-non-matching-subnet)

Full Context

configure service vprn dhcp local-dhcp-server pool nak-non-matching-subnet

configure router dhcp local-dhcp-server pool nak-non-matching-subnet

Description

When this command is enabled, if the local DHCPv4 server receives a DHCP request with option 50 (client requested a previously allocated message as described in section 3.2 of RFC 2131, *Dynamic Host Configuration Protocol*) and the address allocation algorithm uses a pool that does not have option 50, the system returns a DHCP NAK. Otherwise, the system drops the DHCP packet.

The **no** form of this command reverts to the default.

Default

no nak-non-matching-subnet

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

31.3 name

name

Syntax

name *header-name*

Context

[Tree] (config>app-assure>group>http-enrich>field name)

Full Context

configure application-assurance group http-enrich field name

Description

This command configures an HTTP enrichment template field header name.

The **no** form of this command removes the http enrichment template field header name from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

header-name

Specifies the name of the http enrichment policy that is inserted before the actual field name (for example, x-subId = subscriberID).

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

name

Syntax

name *system-name*

no name

Context

[Tree] (config>system name)

Full Context

configure system name

Description

This command creates a system name string for the device.

For example, system-name parameter ALA-1 for the **name** command configures the device name as ALA-1.

```
ABC>config>system# name "ALA-1"
ALA-1>config>system#
```

Only one system name can be configured. If multiple system names are configured, the last one encountered overwrites the previous entry.

The **no** form of the command reverts to the default value.

Default

no name

Parameters

system-name

Specifies the system name as a character string. The string may be up to 64 characters. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Platforms

All

name *name-string* **decimal** *decimal*

name *name-string* **number** *value-number*

name *name-string* **prefix** *ip-prefix/ip-prefix-length*

no name *name-string*

Context

[Tree] (config>router>policy-options>global-variables name)

[Tree] (config>router>policy-options>policy-statement>entry>from>policy-variables name)

Full Context

configure router policy-options global-variables name

configure router policy-options policy-statement entry from policy-variables name

Description

This command configures routing policies that are often reused across BGP peers of a common type (transit, peer, customer, and so on). Using global variables allows a user to have a single variable that is consistent across all peers of a type, while retaining the flexibility to reference different policy functions (prefixes, prefix-lists, community lists, and so on) with unique names.

Depending on the parameter referenced, specify the correct type as follows:

- value-string: **as-path, as-path-group, community, prefix-list, damping**
- ip-address: **next-hop**
- value-number: **aigp-metric, as-path-prepend, local-preference, metric, origin, origin-validation, preference, tag, type**

The **no** form of this command removes the global variable.

Parameters

name-string

Specifies the name of the global variable, with the variable delimited by at-signs (@) at the beginning and the end of the name. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

value-string

The value of the policy variable. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

value-number

Specifies the numerical value of the policy variable.

Values 0 to 4294967295

ip-address

Specifies the IP address of the policy variable.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x - [0 to FFFF]H
		d - [0 to 255]D

decimal

Specifies the decimal value of the policy variable.

Values 0.000 to 4294967295.000

ip-prefix/ip-prefix-length

Specifies the IP prefix and prefix length of the policy variable.

Values		
	ip-prefix/ip-prefix-length	*ipv4-prefix*/*ipv4-prefix-length* | *ipv6-prefix*/*ipv6-prefix-length*
	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-length	[0 to 32]
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x - [0 to FFFF]H
		d - [0 to 255]D
	ipv6-prefix-length	[0 to 128]

31.4 named-display

named-display

Syntax

[**no**] **named-display**

Context

[Tree] (config>eth-cfm>system named-display)

Full Context

configure eth-cfm system named-display

Description

This command configures name-based display on the system for **show eth-cfm** CLI outputs. By default, the CLI outputs only display the values for the domain *md-index*, association *ma-index*, and bridge-identifier *bridge-number*. When this command is enabled, the outputs also display the administrative names for domains, associations, and bridge-identifiers in addition to the numerical values.

The **no** form of this command disables name-based display for **show eth-cfm** CLI outputs.

Default

no named-display

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

31.5 named-pool-policy

named-pool-policy

Syntax

named-pool-policy *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy named-pool-policy)

Full Context

configure qos copy named-pool-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command copies an existing **named-pool-policy** to another **named-pool-policy**. The **copy** command is a configuration level maintenance tool used to create new entries using an existing profile ID. If **overwrite** is not specified, an error occurs if the destination policy exists.

Parameters

src-name

Specifies the existing source **named-pool-policy**, up to 32 characters, from which the **copy** command attempts to copy.

dst-name

Specifies the destination **named-pool-policy** *dst-name*, up to 32 characters, to which the copy command attempts to copy.

overwrite

Use this parameter when the **named-pool-policy** *dst-name* already exists. If it does, everything in the existing destination **named-pool-policy** *dst-name* is completely overwritten with the contents of the **named-pool-policy** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI use {overwrite}; destination named-pool-policy "test"
exists.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make" manner and therefore should be handled with care.

nas-ip-address-origin

Syntax

nas-ip-address-origin {**isa-ip** | **system-ip**}

no nas-ip-address-origin

Context

[Tree] (config>aaa>isa-radius-plcy nas-ip-address-origin)

Full Context

configure aaa isa-radius-policy nas-ip-address-origin

Description

This command specifies the RADIUS NAS-IP-Address attribute.

The **no** form of the command reverts to the default.

Default

nas-ip-address-origin system-ip

Parameters

system-ip

Specifies that the value of the object TIMETRA-VRTR-MIB::vRiaIpAddress.1.1.1 is used.

isa-ip

Specifies that a value in the range specified by tmnxRadIsaPlcySrvSrcAddrStart and tmnxRadIsaPlcySrvSrcAddrEnd is used that corresponds to the ISA card that transmits the Access-Request packet or the Accounting-Request packet.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

31.10 nas-ipv6-address

nas-ipv6-address

Syntax

[**no**] **nas-ipv6-address**

© 2026 Nokia.

31.11 nas-port

nas-port

Syntax

[**no**] **nas-port** *binary-spec*

Context

[Tree] (config>aaa>l2tp-acct-plcy>include-radius-attribute nas-port)

Full Context

configure aaa l2tp-accounting-policy include-radius-attribute nas-port

Description

This command enables the generation of the nas-port RADIUS attribute. Enter decimal representation of a 32-bit string that indicates the port information. This 32-bit string can be compiled based on different information from the port (data types). Using number-of-bits data-type syntax indicates the number of bits from the 32 bits that are used for the specific data type. These data types can be combined up to 32 bits. In between the different data types 0s and 1s as bits can be added.

The **no** form of this command disables the **nas-port** configuration.

Parameters

binary-spec

Specifies the NAS port attribute.

Values

binary-spec	<bit-specification> <binary-spec>
bit-specification	0 | 1 | <bit-origin>
bit-origin	*<number-of-bits><origin>
number-of-bits	1 to 32
origin	s | m | p | o | i | v | c
	s slot number
	m MDA number
	p port number, lag-id, pw-id or pxc-id
	o outer VLAN ID
	i inner VLAN ID
	v ATM VPI

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

c ATM VCI or PXC subport (subport a = 0, subport b = 1)

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output shows an example.

Output Example

```
*12o*12i00*2s*2m*2p => oooo oooo oooo iiii iiii iiii 00ss mmpp
If outer vlan = 0 & inner vlan = 1 & slot = 3 & mda = 1 & port = 1
=>  0000 0000 0000 0000 0000 0001 0011 0101 => nas-port = 309
```

nas-port

Full Context

configure subscriber-mgmt diameter-application-policy gx include-avp nas-port-id

configure subscriber-mgmt diameter-application-policy nasreq include-avp nas-port-id

Description

This command includes the Nas-Port-Id AVP.

Parameters

prefix-type

Specifies what type of prefix is added to the NAS-Port-Id attribute if included in Nas-Port-Id AVP messages.

Values **none** — No prefix is added

user-string — Specifies the user configurable string to be added as prefix to the NAS-Port-Id attribute if included in DIAMETER Gx messages

prefix-string

Specifies the user configurable string up to 8 characters, to be added as a prefix.

suffix-type}

Specifies the suffix to be added to the NAS-Port attribute NAS-Port AVP.

Values **none** — No suffix is added

circuit-id — Specifies the circuit-id is added as suffix-string

remote-id — Specifies the remote-id is added as suffix-string

user-string — Specifies a user configurable suffix-string is added

suffix-string

Specifies the string, up to 64 characters, to be added as suffix.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

nas-port-id

Syntax

[**no**] **nas-port-id**

Context

[Tree] (config>filter>ip-filter>entry>action nat)

Full Context

configure filter ip-filter entry action nat

Description

This command enables NAT traffic diversion based on IPv4 filters (LSN44) or IPv6 filters (DS-Lite, NAT64). The filter contains a matching condition based on any combination of the 5 tuple. Traffic is diverted to NAT based on such defined matching condition. Filter fields outside of the 5 tuples are not valid and it will be ignored in filter based traffic diversion to NAT.

The pool selection for the outside IP address and port along with other mapping characteristics can be specified by the means on the NAT policy.

Parameters

nat-type

Specifies the NAT type.

nat-policy-name

Specifies the NAT policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

31.16 nat-access-mode

nat-access-mode

Syntax

nat-access-mode *access-mode*

Context

[Tree] (config>subscr-mgmt>sub-profile nat-access-mode)

Full Context

configure subscriber-mgmt sub-profile nat-access-mode

Description

This command configures the NAT access mode.

Access mode in L2-Aware NAT environment is a reflection of supported home set up (bridged or routed) in relation to the configured anti-spoof setting.

This configuration option is only applicable to L2-Aware NAT subscribers. It determines which home model is supported with L2-Aware NAT:

- Bridged RG with mac-ip anti-spoof
- Bridged RG with nh-mac anti-spoof
- Routed RG with NAT and mac-ip anti-spoof
- Routed RG with NAT and nh-mac anti-spoof
- Routed RG without NAT and nh-mac anti-spoof

Default

nat-access-mode auto

Parameters

access-mode

Specifies the NAT access mode.

Values auto — The supported combinations are:

- Bridged RG with mac-ip anti-spoof
- Routed RG with NAT and mac-ip anti-spoof
- Routed RG with NAT and nh-mac anti-spoof
- Routed RG without NAT and nh-mac anti-spoof

bridged — The supported combinations are:

- Bridged RG with mac-ip anti-spoof

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Bridged RG with nh-mac anti-spoof
- Routed RG with NAT and mac-ip anti-spoof
- Routed RG with NAT and nh-mac anti-spoof
- Routed RG without NAT and nh-mac anti-spoof

Platforms

31.17 nat-allow-bypass

nat-allow-bypass

Syntax

[**no**] **nat-allow-bypass**

Context

[Tree] (config>subscr-mgmt>sub-prof nat-allow-bypass)

Full Context

configure subscriber-mgmt sub-profile nat-allow-bypass

Description

This command enables Layer 2-aware NAT host for selective bypass. NAT bypass for eligible Layer 2-aware NAT subscribers must be explicitly enabled with this command. Once enabled, the IP filter configuration applied in SLA profile determines whether the traffic is bypassed.

The **no** form of this command causes traffic received from subscribers associated with this profile to not bypass the Layer 2-aware NAT.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

31.18 nat-classifier

nat-classifier

Syntax

nat-classifier *nat-classifier-name*

no nat-classifier

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>nat>nat-policy>dnat nat-classifier)

Full Context

configure service nat nat-policy dnat nat-classifier

Description

This command when configured within the nat-policy, references a nat-classifier and consequently activates DNAT functionality. Unless this command is provisioned, the destination IP address translation will not take place. The **nat-classifier** identifies the traffic (in a filter-like fashion) that is subjected to DNAT.

The **no** form of this command removes the *nat-classifier-name* from the configuration.

Parameters

nat-classifier-name

Specifies the name, up to 32 characters, of the NAT classifier.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-classifier

Syntax

nat-classifier *nat-classifier-name* [**create**]

no nat-classifier

Context

[Tree] (config>service>nat nat-classifier)

Full Context

configure service nat nat-classifier

Description

This command creates a nat-classifier. Traffic can be identified in nat-classifier based on the protocol type and destination ports. Once the traffic is identified, an action associated with identified traffic, such as destination NAT (DNAT), can be taken.

The **no** form of the command removes the *nat-classifier-name* from the configuration.

Parameters

nat-classifier-name

Specifies the name, up to 32 characters, of the referenced NAT classifier.

create

Keyword used to create the NAT classifier.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

31.19 nat-domain

nat-domain

Syntax

nat-domain router *router-name* **name** *domain-name*

no nat-domain

Context

[Tree] (config>service>nat>firewall-policy nat-domain)

Full Context

configure service nat firewall-policy nat-domain

Description

This command specifies a router and domain to which the firewall policy is applied. All associated traffic must be part of the prefixes specified by this domain. The domain must be configured in the outside routing context where firewall protection is applied.

The **no** form of this command removes the domain association from the firewall policy.

Default

no nat-domain

Parameters

domain-name

Specifies the name of the firewall domain, up to 32 characters, in the specified router instance.

router-name

Specifies the name of the router instance to use.

Values *router-name* | *vprn-svc-id*

router-name — "Base", "management"

vprn-svc-id — 1 to 2147483647

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

31.20 nat-group

nat-group

Syntax

nat-group *nat-group-id* [**create**]

no nat-group nat-group-id

Context

[Tree] (config>router>isa-svc-chain nat-group)

Full Context

configure router isa-service-chaining nat-group

Description

This command allows service chaining to be enabled for subscribers whose NAT flows are established on the set of ISAs in the specified NAT group.

The **no** form of this command removes the NAT group from the configuration.

Parameters

nat-group-id

Specifies the NAT group identifier.

Values 1 to 4

create

Keyword used to create the NAT group instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-group

Syntax

nat-group *nat-group-id* **sync-tag** *tag*

no nat-group *nat-group-id*

Context

[Tree] (config>redundancy>multi-chassis>peer>sync>nat nat-group)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure redundancy multi-chassis peer sync nat nat-group

Description

This command enables MCS for NAT. NAT group health information is exchanged between the pair of redundant NAT nodes. The system elects one of the nodes as the active node for the NAT group, while the other node becomes a standby node.

The **no** form of this command disables multi-chassis synchronization for a NAT group.

Default

no nat-group

Parameters

nat-group-id

Specifies the NAT group that is synchronized.

Values 1 to 4

tag

Specifies the synchronization tag that must be the same on both nodes of the NAT group. It is mandatory and must match its counterpart on the peering node for the NAT group that is being synchronized, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-group

Syntax

nat-group *nat-group-id* [**create**]

no nat-group *nat-group-id*

Context

[Tree] (config>isa nat-group)

Full Context

configure isa nat-group

Description

This command configures an ISA NAT group.

The **no** form of the command removes the ID from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

nat-group-id

Specifies the ISA NAT group ID.

Values 1 to 4

create

Keyword used to create the NAT group.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-group

Syntax

nat-group *nat-group-id*

no nat-group

Context

[Tree] (config>subscriber-mgmt>pfcp-association>nat nat-group)

Full Context

configure subscriber-mgmt pfcp-association nat nat-group

Description

This command configures a NAT group participating in NAT on BNG CUPS. ISAs in the NAT group are enabled for operation in BNG CUPS, but are not limited to BNG CUPS deployment. They can be used simultaneously with other versions of NAT in BNG, outside of the CUPS functionality.

The **no** version of this command deletes the NAT group.

Parameters

nat-group-id

Specifies the NAT group ID.

Values 1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.

31.21 nat-import

nat-import

Syntax

nat-import *policy-name* [*policy-name*]

no nat-import

Context

[Tree] (config>service>vprn>nat>inside nat-import)

[Tree] (config>router>nat>inside nat-import)

Full Context

configure service vprn nat inside nat-import

configure router nat inside nat-import

Description

This command references an import-policy to determine the routes that should be installed in the routing table as NAT routes, which are used to steer traffic to NAT.

A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route is associated with a NAT policy that maps traffic destined into a NAT pool and outside routing context. If the NAT policy is not explicitly configured in the import route policy, the imported NAT route is, by default, associated with the default NAT policy defined in the NAT inside routing context.

All BGP-VPN routes that are destined to be imported into NAT inside routing context must be configured with **action-type accept** in the route policy.

Parameters

policy-name

Specifies up to five NAT import policy names, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-import

Syntax

nat-import all [**inside-router** *router-instance*]

nat-import route *ipv4-address* [**inside-router** *router-instance*]

no nat-import all [**inside-router** *router-instance*]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no nat-import route *ipv4-address* [**inside-router** *router-instance*]

Context

[Tree] (debug>nat nat-import)

Full Context

debug nat nat-import

Description

This command enables debugging for routes dynamically imported into NAT from BGP.

The events related to dynamic routes in NAT can be filtered by a specific route and inside routing context.

Only events related to dynamic imports are dispayed. Events related to static route configurations are not shown.

Typical debug output displays the following information:

- `18 2021/06/15 09:29:54.436 UTC MINOR: DEBUG #2001 vprn550 NAT_IMPORT`

  This entry represents the debug event, the inside service in which the event occurred, and the process related to the event. For this particular log, the event ID is 2001 which occurred in the inside service vprn 550 and was related to a dynamic route importing into NAT.

- `dest-prefix 10.10.10.0/24 nat-policy ls-outPolicy service 500 : start import : ACCEPT by policy-statement evaluation`

  This entry represents the description of the event. The destination prefix 10.10.10.0/24 is associated with **nat-policy** *ls-outPolicy* and was successfully imported from the outside vprn 500 (into the inside vprn 550 identified by the first entry).

The **no** form of the command disables debugging of the specified parameters.

Parameters

all

Specifies to debug all routes dynamically imported into NAT from BGP.

router-instance

Specifies filtering based on specific inside routing context.

ipv4-address

Specifies filtering based on the specific route.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

31.22 nat-outside

nat-outside

Syntax

nat-outside *nat-group-id* [**create**]

no nat-outside *nat-group-id*

Context

[Tree] (config>service>epipe nat-outside)

Full Context

configure service epipe nat-outside

Description

This command binds an Epipe to a NAT context running on an ISA-BB, allowing the Epipe to act as the outside service for the NAT or firewall. When **nat-outside** is enabled, one end of the Epipe is implicitly tied to ISA BB forwarding, leaving one remaining SAP, spoke, or similar available to be configured.

The **no** version of this command removes the Epipe binding to a NAT context.

Parameters

nat-group-id

The NAT group ID where the PPPoE client is applied.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

31.23 nat-policy

nat-policy

Syntax

nat-policy *policy-name*

no nat-policy

Context

[Tree] (config>router>policy-options>policy-statement>entry>action nat-policy)

Full Context

configure router nat inside nat-policy

configure service vprn nat inside nat-policy

configure router policy-options policy-statement entry action nat-policy

Description

This command configures the NAT policy that is used for large-scale NAT in this service. If a **nat-policy** is not configured, then the default **nat-policy** is used.

The **no** form of the command removes the policy name from the configuration.

Parameters

nat-policy-name

Specifies the NAT policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

nat-policy

Syntax

nat-policy *nat-policy-name*

no nat-policy

Context

[Tree] (config>router>policy-options>policy-statement>default-action nat-policy)

Full Context

configure router policy-options policy-statement default-action nat-policy

Description

This command assigns a NAT policy to the matched routes that do not have a more specific nat-policy configured under action.

A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route must be associated with a NAT policy that maps traffic destined to it into a NAT pool and outside routing context. If the NAT policy is not specified within the route policy, the imported NAT route, by default, is associated with the default NAT policy defined in the NAT inside routing context.

All BGP-VPN routes that are destined to be imported into NAT inside routing context must have action-type set to **accept**, regardless of whether the NAT policy is configured in the action.

The **no** form of the command removes the policy name from the configuration.

Parameters

nat-policy-name

Specifies the NAT policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-policy

Syntax

nat-policy *nat-policy-name* [**create**]

no nat-policy *nat-policy-name*

Context

[Tree] (config>service>nat nat-policy)

Description

This command configures a NAT policy.

Parameters

nat-policy-name

Specifies the NAT policy name, up to 32 characters.

create

Keyword used to create the NAT policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-policy

Syntax

nat-policy *policy-name*

no nat-policy

Context

[Tree] (config>subscr-mgmt>sub-profile nat-policy)

Full Context

configure subscriber-mgmt sub-profile nat-policy

Description

This command configures the NAT policy to be used for subscribers associated with this subscriber profile.

Parameters

policy-name

Specifies the policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-policy

Syntax

[**no**] **nat-policy** *nat-policy-name*

[Tree] (config>router>nat>inside>spf-policy nat-policy)

Full Context

configure service vprn nat inside spf-policy nat-policy

configure router nat inside spf-policy nat-policy

Description

This command declares that the NAT policy for the **inside** routing context is used when SPF is requested. The predeclaration of the NAT policy used in SPF is mandatory in the following scenarios.

- when assigning SPF to NAT subscribers in pools that differ from the ones to which their corresponding source prefixes are mapped
- when the source prefixes are not configured for the NAT subscriber

The **no** form of this command removes the policy name from the configuration.

Parameters

nat-policy-name

Specifies the NAT policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

31.24 nat-policy-name

31.27 nat-prefix-list

nat-prefix-list

Syntax

nat-prefix-list *name*

no nat-prefix-list *name*

Context

[Tree] (config>subscr-mgmt>sub-prof nat-prefix-list)

Full Context

configure subscriber-mgmt sub-profile nat-prefix-list

Description

This command specifies the nat-prefix-list referenced within the subscriber-profile is used to associate L2-aware subscriber traffic with additional nat-policies based on the destination IPv4 address of the traffic.

The **no** form of the command removes the prefix list name from the configuration.

Parameters

name

Specifies the nat prefix list name. Allowed values are any string up to 32 characters long composed of printable,7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-prefix-list

Syntax

nat-prefix-list *name* [**create**] [**application** *application-choice*]

no nat-prefix-list *name*

Context

Full Context

configure service nat nat-prefix-list

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is used to create configuration context for:

- IP prefixes that are used select multiple nat-policies per subscriber in L2-aware NAT.
- Inside IP prefixes in DNAT-only scenario. The inside IP prefixes are then setup as downstream routes used to steer the return (downstream) traffic to the proper MS-ISA.

The **no** form of the command removes the prefix list name from the configuration.

Parameters

name

Specifies the nat prefix list name. Allowed values are any string up to 32 characters long composed of printable,7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

application *application-choice*

Specifies how this NAT prefix list is to be applied.

Values **l2-aware-dest-to-policy**: Specifies that the nat-prefix-list can be applied only within the sub-profile for l2-aware subscribers. It will contain mapping between the destination prefix and a nat-policy. **dnat-only-subscribers**: Specifies that the nat-prefix-list can be applied only to dnat-only-subscribers. It will contain the source-prefix that needs to be install in outside routing context so that the return traffic from the outside can be directed to proper MS-ISA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

31.37 nd-learn-unsolicited

nd-learn-unsolicited

Syntax

nd-learn-unsolicited {**global** | **link-local** | **both**}

no nd-learn-unsolicited

Context

[Tree] (config>service>ies>if>ipv6 nd-learn-unsolicited)

Full Context

configure service ies interface ipv6 nd-learn-unsolicited

Description

This command enables the ability to learn neighbor entries out of received unsolicited Neighbor Advertisement messages with or without the solicited flag set. The command can be enabled for global addresses, link-local addresses, or for both.

The **no** form of this command makes the router use standard RFC 4861 behavior, as described below, for learning of neighbor entries.

- If an unsolicited NA, regardless of the S flag, is received from a neighbor that is not yet in the ND cache, the NA is ignored.
- If an NS, RS, RA, or Redirect message with a Link Layer Address (MAC) is received from a neighbor that is not yet in the ND cache, a new neighbor entry is created in the cache to store the received Link Layer MAC. The neighbor is put in the stale state.

Parameters

global

Learns global neighbor entries out of received unsolicited Neighbor Advertisement messages.

link-local

Learns link local neighbor entries out of received unsolicited Neighbor Advertisement messages.

both

Learns both global and link local neighbor entries out of received unsolicited Neighbor Advertisement messages.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

nd-learn-unsolicited

Syntax

nd-learn-unsolicited {**global** | **link-local** | **both**}

no nd-learn-unsolicited

Context

[Tree] (config>service>vprn>if>ipv6 nd-learn-unsolicited)

Full Context

configure service vprn interface ipv6 nd-learn-unsolicited

Description

This command enables the ability to learn neighbor entries out of received unsolicited Neighbor Advertisement messages, with or without the solicited flag set. The command can be enabled for global addresses, link-local addresses, or for both.

The **no** form of this command makes the router follow standard RFC 4861 behavior for learning of neighbor entries.

- If an unsolicited NA (regardless of the S flag) is received from a neighbor that is not yet in the ND cache, the NA is ignored in line with RFC 4861.
- If an NS, RS, RA, or Redirect message with a Link Layer Address (MAC) is received from a neighbor that is not yet in the ND cache, a new neighbor entry is created in the cache to store the received Link Layer MAC. The neighbor is put in the STALE state. This is the standard RFC behavior.

Parameters

global

Learns global neighbor entries out of received unsolicited Neighbor Advertisement messages.

link-local

Learns link local neighbor entries out of received unsolicited Neighbor Advertisement messages.

both

Learns both global and link local neighbor entries out of received unsolicited Neighbor Advertisement messages.

Platforms

All

31.38 nd-populate-host-route

nd-populate-host-route

Syntax

[**no**] **nd-populate-host-route**

Context

[Tree] (config>service>ies>interface>ipv6 nd-populate-host-route)

Full Context

configure service ies interface ipv6 nd-populate-host-route

Description

This command enables the addition or deletion of host routes in the route-table derived from neighbor entries in the neighbor cache. To enable this command, the interface must be shut down. The command triggers the population of host routes in the route table out of their corresponding static, dynamic, or EVPN types in the neighbor table. Neighbor entries installed by subscriber management, local interfaces, and others, do not create host-routes.

Only reachable entries are added to the route table (entries are created from solicited NA messages). Entries created as stale — from Neighbor Solicitation (NS), unsolicited Neighbor Advertisements (NA), Router Solicitation (RS), Router Advertisement (RA), and Redirect messages — are not added to the route table because the neighbor is not confirmed as two-way.

- RA, RS, NS, and Redirect messages with a link layer address are added as STALE cache entries. Unsolicited NAs are added as STALE if **nd-learn-unsolicited** is configured.
- To speed up the addition of host routes to the route table for neighbors created as STALE, the following procedure is used:
  - If **nd-populate-host-route** is configured, the router sends an NS (unicast Neighbor Unreachability Detection (NUD) message) to the neighbor created as STALE. Only one NUD message is sent.
  - If **nd-populate-host-route** is not configured, no confirmation message is sent and regular procedures apply.
- When the solicited NA for the neighbor is received, the entry becomes reachable and is then added to the route-table.

The **no** form of this command disables the creation of host routes from the neighbor cache.

31.39 nd-proactive-refresh

nd-proactive-refresh

Syntax

nd-proactive-refresh {**global** | **link-local** | **both**}

no nd-proactive-refresh

Context

[Tree] (config>service>ies>if>ipv6 nd-proactive-refresh)

Full Context

configure service ies interface ipv6 nd-proactive-refresh

Description

This command enables a proactive refresh of the neighbor entries. When enabled, at the stale timer expiration, the router sends a NUD message to the host (regardless of the existence of traffic to the IP address on the IOM), so the entry can be refreshed or removed.

This behavior is different from ARP, where the refresh is sent 30 seconds prior to the entry's age out time. The refresh can be optionally enabled for global addresses, link-local addresses, or both.

The **no** form of this command disables the proactive behavior and the router only refreshes an entry if there is traffic that needs to be sent to the IP address.

Parameters

global

Refreshes global neighbor entries.

link-local

Refreshes link local neighbor entries.

both

Refreshes both global and link local neighbor entries.

[Tree] (config>service>vprn>router-advert>if nd-router-preference)

Full Context

configure router router-advertisement interface nd-router-preference

configure service vprn router-advertisement interface nd-router-preference

Description

This command configures the default router preference for Router Advertisement (RA) and allows IPv6 hosts to discover and select a default gateway address by listening to RAs.

This feature provides basic traffic engineering functionality for host devices. When this command is applied, the router advertises the respective router preference to the connected host to assist in its selection of the most appropriate default gateway on a link.

This extension is backward compatible, both for routers (setting the router preference bits) and hosts (interpreting the router preference bits). These bits are ignored by hosts that do not implement the RFC 4191 functionality by configuring this command. Similarly, hosts that do not implement the RFC 4191 functionality interpret the values sent by devices that do not implement the RFC 4191 extension with the **medium** preference option.

The **no** form of this command configures this command to the default value.

Default

nd-router-preference medium

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

medium

Specifies the router advertises a medium default gateway preference.

high

Specifies the router advertises a high default gateway preference.

low

Specifies the router advertises a low default gateway preference.

Platforms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn rip group neighbor

configure router rip group neighbor

configure router ripng group neighbor

Description

This command creates a context for configuring a RIP neighbor interface. By default, group interfaces are not activated with RIP, unless explicitly configured. The BNG only learns RIP routes from IPv4 host on the group interface. The RIP neighbor group interface defaults to **none**. The send operation is unchangeable for group-interface.

The **no** form of this command deletes the RIP interface configuration for this group interface. The shutdown command in the **config>router>rip>group group-name>neighbor** context can be used to disable an interface without removing the configuration for the interface.

Default

no neighbor

Parameters

ip-int-name

Specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured, an error message will be returned.

configure service ies interface ipv6 neighbor

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures IPv6-to-MAC address mapping on the IES interface.

Parameters

ipv6-address

The IPv6 address of the interface for which to display information.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

mac-address

Specifies the 48-bit MAC address for the IPv6-to-MAC address mapping in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Platforms

All

neighbor

Syntax

[**no**] **neighbor** *ip-address*

Context

[Tree] (config>router>bgp>group neighbor)

Full Context

configure router bgp group neighbor

Description

This command creates a BGP peer/neighbor instance within the context of the BGP group.

This command can be issued repeatedly to create multiple peers and their associated configuration.

The **no** form of this command is used to remove the specified neighbor and the entire configuration associated with the neighbor. The neighbor must be administratively **shutdown** before attempting to delete it. If the neighbor is not shutdown, the command will not result in any action except a warning message on the console indicating that neighbor is still administratively up.

Default

no neighbor

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-address

Specifies the IP address of the BGP peer router in dotted decimal notation.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface]
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: 32 characters maximum, mandatory for link local addresses

Platforms

All

neighbor

Syntax

[**no**] **neighbor** *ip-address*

Context

[Tree] (config>service>vprn>bgp>group neighbor)

Full Context

configure service vprn bgp group neighbor

Description

This command creates a BGP peer/neighbor instance within the context of the BGP group.

This command can be issued repeatedly to create multiple peers and their associated configuration.

The **no** form of this command is used to remove the specified neighbor and the entire configuration associated with the neighbor. The neighbor must be administratively **shutdown** before attempting to delete it. If the neighbor is not shut down, the command will not result in any action except a warning message on the console indicating that neighbor is still administratively up.

Parameters

ip-address

The IP address of the BGP peer router in dotted decimal notation.

Values ipv4-address a.b.c.d (host bits must be 0)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6-address	x:x:x:x:x:x:x:x[-interface]	
	x:x:x:x:x:x:d.d.d.d[-interface]	
	x: [0 to FFFF]H	
	d: [0 to 255]D	
	interface: 32 characters maximum, mandatory for link local addresses	

The ipv6-address applies to the 7750 SR only.

Platforms

[Tree] (config>service>vprn>ospf>area>if neighbor)

Full Context

configure service vprn ospf3 area interface neighbor

configure service vprn ospf area interface neighbor

Description

This command configures an OSPF non-broadcast multi-access (NBMA) neighbor. The OSPF interface must be configured as an NBMA interface with the **interface-type non-broadcast** command. An NBMA network has no broadcast or multicast capabilities, so the router cannot discover its neighbors dynamically. All neighbors must be configured statically with the **neighbor** command.

In addition to configuring the OSPF NBMA neighbor's IP address, the neighbor's MAC address may need to be configured with the **config>service>vprn>interface>static-arp** command for OSPFv2 neighbors using its IPv4 address, and the **config>service>vprn>interface>ipv6>neighbor** command for OSPFv3 neighbors using its IPv6 link-local address.

The **no** form of this command removes the **neighbor** configuration.

Default

No OSPF NBMA neighbors are configured.

Parameters

ip-address

Specifies the OSPFv2 neighbor's IPv4 address or the OSPFv3 neighbor's IPv6 link-local address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x [-interface]
	x:x:x:x:x:x:d.d.d.d [-interface]
	x: [0..FFFF]H

Platforms

All

neighbor

Syntax

neighbor *ipv6-address mac-address*

no neighbor *ipv6-address*

Context

[Tree] (config>router>if>ipv6 neighbor)

Full Context

configure router interface ipv6 neighbor

Description

This command configures an IPv6-to-MAC address mapping on the interface. Use this command if a directly attached IPv6 node does not support ICMPv6 neighbor discovery, or for some reason, a static address must be used. This command can only be used on Ethernet media.

The *ipv6-address* must be on the subnet that was configured from the IPv6 **address** command or a link-local address.

Parameters

ipv6-address

The IPv6 address assigned to a router interface.

Values			
	ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
		x:x:x:x:x:x:d.d.d.d	
		x:	[0 to FFFF]H
		d:	[0 to 255]D

mac-address

Specifies the MAC address for the neighbor in the form of xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

Description

This command configures an OSPF non-broadcast multi-access (NBMA) neighbor. The OSPF interface must be configured as an NBMA interface with the **interface-type non-broadcast** command. An NBMA network has no broadcast or multicast capabilities, so the router cannot discover its neighbors dynamically. All neighbors must be configured statically with the **neighbor** command.

In addition to configuring the IP address of the OSPF NBMA neighbor, the MAC address of the neighbor may need to be configured with the **config>router>interface>static-arp** command for OSPFv2 neighbors using its IPv4 address, and the **config>router>interface>ipv6>neighbor** command for OSPFv3 neighbors using its IPv6 link-local address.

The **no** form of this command removes the **neighbor** configuration.

Default

no neighbor

Parameters

ipv4-address

Specifies the IPv4 address of the OSPFv2 neighbor.

Values ipv4-address — a.b.c.d

ipv6-address

Specifies the IPv6 link-local address of the OSPFv3 neighbor.

Values

ipv6-address:	x:x:x:x:x:x:x:x [-interface]
	x:x:x:x:x:x:d.d.d.d [-interface]
	x: [0..FFFF]H
	d: [0..255]D

Full Context

configure router policy-options policy-statement entry to neighbor

configure router policy-options policy-statement entry from neighbor

Description

This command specifies the neighbor address as found in the source address of the actual join and prune message as a filter criterion. If no neighbor is specified, any neighbor is considered a match.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of the of the command removes the neighbor IP match criterion from the configuration.

Default

no neighbor

Parameters

ip-address

Specifies the neighbor IP address in dotted decimal notation.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x [-interface]
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: 32 characters maximum, mandatory for link local addresses

prefix-list *name*

Specifies the prefix-list name. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

The *name* specified must already be defined.

Syntax

neighbor-limit *limit* [**log-only**] [**threshold** *percent*]

no neighbor-limit

Context

[Tree] (config>service>ies>if>ipv6 neighbor-limit)

Full Context

configure service ies interface ipv6 neighbor-limit

Description

This command configures the maximum amount of dynamic IPv6 neighbor entries that can be learned on an IP interface.

When the number of dynamic neighbor entries reaches the configured percentage of this limit, an SNMP trap is sent. When the limit is exceeded, no new entries are learned until an entry expires and traffic to these destinations is dropped. Entries that have already been learned is refreshed.

The **no** form of this command removes the **neighbor-limit**.

Default

no neighbor-limit

Parameters

log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, entries above the limit is learned.

percent

The threshold value (as a percentage) that triggers a warning message to be sent.

Values 0 to 100

limit

The number of entries that can be learned on an IP interface expressed as a decimal integer. If the limit is set to 0, dynamic neighbor learning is disabled and no dynamic neighbor entries are learned.

Values 0 to 102400

neighbor-trust [**vpn-ipv4**] [**vpn-ipv6**] [**evpn**]

no neighbor-trust

Context

[Tree] (config>router>bgp neighbor-trust)

Full Context

configure router bgp neighbor-trust

Description

This command enables a label security feature for prefixes of a VPN family at an inter-AS boundary.

This label security feature allows the configuration of a router, acting in a PE, ASBR, or both roles, to accept packets of VPN-IP or EVPN prefixes only from direct EBGP neighbors to which it advertised a service label.

The untrusted state identifies the participating interfaces. The router supports a maximum of 15 network interfaces that can participate in this feature.

At a high level, BGP tracks each direct EBGP neighbor over an untrusted interface to which it sent a prefix label. For each of those prefixes, BGP programs a bitmap in the ILM record that indicates, on per-untrusted interface basis, whether the matching received packets must be forwarded or dropped.

The **no** form of this command disables the inter-AS security feature for the VPN family.

Parameters

vpn-ipv4

Keyword to enable the inter-AS label security for VPN IPv4 family.

vpn-ipv6

Keyword to enable the inter-AS label security for VPN IPv6 family.

evpn

Keyword to enable the inter-AS label security for EVPN family.

This command configures the Network Basic Input/Output System (NetBIOS) node type.

The **no** form of this command removes the NetBIOS node type parameters from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

netbios-node-type

Specifies the netbios node type.

Values B — Broadcast node uses broadcasting to query nodes on the network for the owner of a NetBIOS name.

P — Peer-to-peer node uses directed calls to communicate with a known NetBIOS name server for the IP address of a NetBIOS machine name.

M — Mixed node uses broadcast queries to find a node, and if that fails, queries a known P-node name server for the address.

H — Hybrid node is the opposite of the M-node action so that a directed query is executed first, and if that fails, a broadcast is attempted.

The **no** form of this command removes the specified next-hop IP address and the router instance if specified.

Parameters

ip-address

Specifies the IP address to be used as the downstream next-hop IP address in dotted decimal notation.

router-instance

Specifies the router instance to be used as an access VAS router.

Values

router-instance: *router-name* | *vprn-svc-id*

router-name: "Base”

vprn-svc-id: 1 to 2147483647

network

Syntax

network *network-policy-id* [**create**] [**name** *name*]

no network *network-policy-id*

Context

[Tree] (config>qos network)

Full Context

configure qos network

Description

This command creates or edits a QoS network policy. The network policy defines the treatment that IP or MPLS packets receive as they ingress and egress the network port.

The QoS network policy consists of an ingress and egress component. The ingress component of the policy defines how DiffServ code points and MPLS EXP bits are mapped to internal forwarding class and profile state. The forwarding class and profile state define the Per Hop Behavior (PHB) or the QoS treatment through the router. The mapping on each network interface defaults to the mappings defined in the default network QoS policy until an explicit policy is defined for the network interface.

The egress component of the network QoS policy defines the queuing parameters associated with each forwarding class. Each of the forwarding classes defined within the system automatically creates a queue on each network interface. This queue gets all the parameters defined within the default network QoS policy 1 until an explicit policy is defined for the network interface access uplink port. If the egressing packet originated on an ingress SAP, or the remarking parameter is defined for the egress interface, the egress QoS policy also defines the IP DSCP, dot1p/DE, or MPLS EXP bit marking based on the forwarding class and the profile state.

Network **policy-id 1** exists as the default policy that is applied to all network interfaces by default. The network **policy-id 1** cannot be modified or deleted. It defines the default DSCP-to-FC mapping and MPLS EXP-to-FC mapping for the ingress. For the egress, it defines six forwarding classes that represent individual queues and the packet marking criteria.

Network **policy-id 1** exists as the default policy that is applied to all network ports by default. This default policy cannot be modified or deleted. It defines the default DSCP-to-FC mapping and default unicast meters for ingress IP traffic. For the egress, it defines the forwarding class to dot1p and DSCP values and the packet marking criteria.

If a new network policy is created (for instance, policy-id 3), only the default action and egress forwarding class parameters are identical to the default policy. A new network policy does not contain the default DSCP-to-FC and MPLS-EXP-to-FC mapping for network QoS policy of type **ip-interface** or the DSCP-to-FC mapping (for network QoS policy of type **port**). The default network policy can be copied (use the copy command) to create a new network policy that includes the default ingress DSCP-to-FC and MPLS EXP-to-FC mapping (as appropriate). Parameters can be modified, or the **no** form of this command can be used to remove an object from the configuration.

Any changes made to an existing policy, using any of the sub-commands, will be applied immediately to all network interfaces where this policy is applied. For this reason, when many changes are required on a policy, it is highly recommended that the policy be copied to a work area policy-id. That work-in-progress

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policy can be modified until complete, then written over the original policy-id. Use the config qos copy command to maintain policies in this manner.

The **no** form of this command deletes the network policy. A policy cannot be deleted until it is removed from all entities where it is applied. The default network **policy** *policy-id* 1 cannot be deleted.

Default

network 1 — System Default Network Policy 1

Parameters

network-policy-id

The policy-id uniquely identifies the policy on the router.

Values 1 to 65535

Default 1

create

Required parameter when creating a QoS network policy.

name name

A name that is saved as part of the configuration data. If a name is not specified at creation time, then SR OS assigns a string version of the network policy identifier as the name.

Values A string up to 64 characters

Platforms

network

Syntax

network *src-pol dst-pol* [**overwrite**]

Context

[Tree] (config>qos>copy network)

Full Context

configure qos copy network

Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is used to create new policies using existing policies and also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

src-pol dst-pol

Indicates that the source and destination policies are network policy IDs. Specify the source policy that the copy command will copy and specify the destination policy to which the command will duplicate the policy to a new or different policy ID.

Values 1 to 65535

overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, the following error occurs if the destination policy ID exists.

```
SR>config>qos# copy network 1 427
MINOR: CLI Destination "427" exists use {overwrite}.
SR>config>qos# copy network 1 427 overwrite
```

network-address {**eq** | **neq**} **ip-prefix-list** *ip-prefix-list-name*

no network-address

Context

[Tree] (config>app-assure>group>policy>app-filter>entry network-address)

Full Context

configure application-assurance group policy app-filter entry network-address

Description

This command configures the network address to use in application definition. The network address will match the destination IP address in a from-sub flow or the source IP address in a to-sub flow.

The **no** form of this command restores the default (removes the network address from application criteria defined by this entry).

Default

no network-address

Parameters

eq

Specifies a comparison operator indicating that the value configured and the value in the flow are equal.

neq

Specifies a comparison operator indicating that the value configured differs from the value in the flow.

ip-address

Specifies a valid unicast address.

Values		
	ipv4-address	a.b.c.d[/mask]
		mask - [1..32]
	ipv6-address	x:x:x:x:x:x:x:x/prefix-length
		x:x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H

Default

network-domain "default”

Parameters

network-domain-name

Specifies the network domain name, up to 32 characters.

Platforms

All

network-domain

Syntax

[**no**] **network-domain** *network-domain-name*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>if network-domain)

Full Context

configure router interface network-domain

Description

This command assigns a given interface to a given network-domain. The network-domain is then taken into account during sap-ingress queue allocation for VPLS SAP.

The network-domain association can only be done in a base-routing context. Associating a network domain with an loop-back or system interface will be rejected. Associating a network-domain with an interface that has no physical port specified will be accepted, but will have no effect as long as a corresponding port, or LAG, is defined.

Single interfaces can be associated with multiple network-domains.

Default

network-domain "default”

Platforms

All

31.64 network-ip

network-ip

Syntax

network-ip *ip-address*[*/mask*]

no network-ip

Context

[Tree] (config>app-assure>group>transit-prefix-policy>entry>match network-ip)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure application-assurance group transit-prefix-policy entry match network-ip

Description

This command configures an entry for an address of prefix transit aa-sub and is used when the site is a remote site on the same opposite side of the system as the parent SAP. The network IP addresses represents the dest-IP in the from-SAP direction and src-IP in the to-SAP direction.

The **no** form of this command removes the network IP address/mask from the match criteria.

Parameters

ip-address[/mask]

specifies the network address prefix and length associated with this transit prefix policy entry.

Values

ip-address[/mask] :	ipv4-address - a.b.c.d[/mask]
	mask - [1..32]
	ipv6-address - x:x:x:x:x:x:x:x/prefix-length
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
	prefix-length [1..128]

Platforms

31.65 network-queue

network-queue

Syntax

network-queue *policy-name* [**create**]

no network-queue *policy-name*

Context

[Tree] (config>qos network-queue)

Full Context

configure qos network-queue

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a context to configure a network queue policy. Network queue policies define the ingress network queuing at the FP network node level and on the Ethernet port and SONET/SDH path level to define network egress queuing.

Default

network-queue "default”

Parameters

policy-name

The name of the network queue policy.

Values Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

create

Required keyword when creating a network queue policy.

Platforms

All

network-queue

Syntax

network-queue *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy network-queue)

Full Context

configure qos copy network-queue

Description

This command copies or overwrites existing network queue QoS policies to another network queue policy ID.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters

network-queue

Indicates that the source policy ID and the destination policy ID are network-queue policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, the following message is generated indicating that the destination policy ID exists.

Example:

```
– SR7>config>qos# copy network-queue nq1 nq2
– MINOR: CLI Destination "nq2" exists - use {overwrite}.
– SR7>config>qos# copy network-queue nq1 nq2 overwrite
```

Platforms

network-type

Syntax

network-type {**sdh** | **sonet**}

Context

[Tree] (config>system>ptp network-type)

Full Context

configure system ptp network-type

Description

This command configures the codeset to be used for the encoding of QL values into PTP clockClass values and vice versa when the profile is configured for G.8265.1 or G.8275.2.

This setting only applies to the range of values observed in the clockClass values transmitted out of the node in Announce messages. The router supports the reception of any valid value in Table 1/G.8265.1 and Table2/G.8275.2.

Default

network-type sdh

Parameters

sdh

Specifies the values used on a G.781 Option 1 compliant network.

sonet

Specifies the values used on a G.781 Option 2 compliant network.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure system ethernet new-qinq-untagged-sap

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command controls the behavior of QinQ SAP y.0 (for example, 1/1/1:3000.0). If the flag is not enabled (no new-qinq-untagged-sap), the y.0 SAP works the same as the y.* SAP (for example, 1/1/1:3000.*); all frames tagged with outer VLAN y and no inner VLANs or inner VLAN x where inner VLAN x is not specified in a SAP y.x configured on the same port (for example, 1/1/1:3000.10).

If the flag is enabled, then the following new behavior immediately applies to all existing and future y.0 SAPs: the y.0 SAP maps all the ingress frames tagged with outer tag VLAN-id of y (qinq-etype) and no inner tag or with inner tag of VLAN-id of zero (0). When the flag is disabled, there is no disruption for existing usage of this SAP type.

Default

no new-qinq-untagged-sap

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, VSR

new-session-id

Syntax

[**no**] **new-session-id**

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>gy>efh new-session-id)

Full Context

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling new-session-id

Description

This command determines the Diameter session ID when Extended Failure Handling (EFH) is active and an attempt is made to establish a new Diameter Gy session with the Online Charging Server (OCS). An attempt to establish a new Diameter Gy session is made when the allocated interim credit is used or the validity time expires for a rating group of a Diameter Gy session. The first attempt always uses a new Diameter session ID. This command controls the behavior for each subsequent attempt. The behavior is as follows:

- no new-session-id (default) — The same Diameter session ID is used for each subsequent attempt.
- new-session-id — A new Diameter session ID is used for each attempt.

The **no** form of this command reverts to the default.

Platforms

Syntax

next-attempt {**same-preference-level** | **next-preference-level**}

no next-attempt

Context

[Tree] (config>service>vprn>l2tp next-attempt)

[Tree] (config>router>l2tp next-attempt)

Full Context

configure service vprn l2tp next-attempt

configure router l2tp next-attempt

Description

This command enables tunnel selection algorithm based on the tunnel preference level.

The **no** form of this command reverts to the default.

Default

next-attempt next-preference-level

Parameters

same-preference-level

If the **tunnel-spec** selection algorithm evaluates into a tunnel that is currently unavailable (for example, a tunnel in a denylist) then the next elected tunnel, if available, is chosen within the same preference-level as the last attempted tunnel. Only when all tunnels within the same preference level are exhausted, the tunnel selection algorithm moves to the next preference level.

In case that a new session setup request is received while all tunnels on the same preference level are denylisted, the L2TP session tries to be established on denylisted tunnels before the tunnel selection moves to the next preference level.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

next-preference-level

If the **tunnel-spec** selection algorithm evaluates into a tunnel that is currently unavailable (for example tunnel in a denylist) then the selection algorithm tries to select the tunnel from the next preference level, even though the tunnels on the same preference level might be available for selection.

Default next-preference-level

31.74 next-header

next-header

Syntax

next-header *next-header*

no next-header

Context

[Tree] (config>system>security>mgmt-access-filter>ipv6-filter>entry next-header)

Full Context

configure system security management-access-filter ipv6-filter entry next-header

Description

This command specifies the next header to match. The protocol type such as TCP, UDP or OSPF is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6), UDP(17). IPv6 Extension headers are identified by the next header IPv6 numbers as per RFC 2460. This command only applies to the 7750 SR and 7950 XRS.

Parameters

next-header

Specifies for IPv4 MAF the IP protocol field, and for IPv6 the next header type to be used in the match criteria for this Management Access Filter Entry.

Values

next-header:	0 to 255, protocol numbers accepted in DHB
keywords:	none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, drp, igmp, igp, ip, ipv6, ipv6-icmp, ipv6-no-nxt, isis, iso-ip, l2tp, spf-igp, pim, pnni, ptp, rdp, rsvp, stp, tcp, udp, vrrp

[Tree] (config>service>vprn>static-route-entry next-hop)

Full Context

configure service vprn static-route-entry next-hop

Description

This command specifies the directly connected next hop IP address or interface used to reach the destination. If the next hop is over an unnumbered interface or a point-to-point interface, the *ip-int-name* of the unnumbered or point-to-point interface (on this node) can be configured.

If the next hop is over an unnumbered interface in the 7450 ESS router, the *ip-int-name* of the unnumbered interface (on this node) can be configured.

The configured *ip-address* can be either on the network side or the access side on this node. The address must be associated with a network directly connected to a network configured on this node.

Default

no next-hop

Parameters

ip-int-name, ipv4-address, ipv6-address

the IP-INT, IPv4, and IPv6 addresses

Values The following values apply to the 7750 SR and 7950 XRS:

ip-int-name	32 characters max
ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x-[interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H
	d: [0 to 255]D

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

interface: 32 characters maximum, mandatory for link local addresses

IPv6 static routes are not supported on the 7450 ESS except in mixed mode.

configure router mpls forwarding-policies forwarding-policy next-hop-group primary-next-hop next-hop

configure router mpls forwarding-policies forwarding-policy next-hop-group backup-next-hop next-hop

Description

This command configures the address of primary or backup next hop of an NHG entry in a forwarding policy.

The **no** form of this command removes the address of primary or backup next hop of an NHG entry in a forwarding policy.

Parameters

ip-address

Specifies the destination IPv4 or IPv6 address.

Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

next-hop

Syntax

next-hop {*ip-int-name* | *ip-address* | *ipv6-address*}

Context

[Tree] (config>router>static-route-entry next-hop)

Full Context

configure router static-route-entry next-hop

Description

This command specifies the directly connected next hop IP address or interface used to reach the destination. If the next hop is over a point-to-point unnumbered interface, the **ip-int-name** of the unnumbered point-to-point interface (on this node) can be configured.

If the next hop is over an unnumbered interface in the 7450 ESS router, the *ip-int-name* of the unnumbered interface (on this node) can be configured.

The configured *ip-address* can be either on the network side or the access side on this node. The address must be associated with a network directly connected to a network configured on this node.

Default

no next-hop

Parameters

ip-int-name* | *ip-address* | *ipv6-address

Specifies the interface or IPv4/IPv6 address of the next hop.

Values The following values apply to the 7750 SR, 7450 ESS, and 7950 XRS:

ip-int-name	32 characters max
ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x-[interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses

Platforms

All

next-hop

Syntax

[**no**] **next-hop** *ip-address*

Context

[Tree] (config>vrrp>policy>priority-event>route-unknown next-hop)

Full Context

configure vrrp policy priority-event route-unknown next-hop

Description

This command enables an allowed next hop IP address to match the IP route prefix for a route-unknown priority control event.

If the next-hop IP address does not match one of the defined *ip-address*, the match is considered unsuccessful and the **route-unknown** event transitions to the set state.

The **next-hop** command is optional. If no **next-hop** *ip-address* commands are configured, the comparison between the RTM prefix return and the **route-unknown** IP route prefix are not included in the next hop information.

When more than one next hop IP addresses are eligible for matching, a **next-hop** command must be executed for each IP address. Defining the same IP address multiple times has no effect after the first instance.

The **no** form of the command removes the *ip-address* from the list of acceptable next hops when looking up the **route-unknown** prefix. If this *ip-address* is the last next hop defined on the **route-unknown** event, the returned next hop information is ignored when testing the match criteria. If the *ip-address* does not exist, the **no next-hop** command returns a warning error, but continues to execute if part of an **exec** script.

Default

no next-hop — No next hop IP address for the route unknown priority control event is defined.

Parameters

ip-address

The IP address for an acceptable next hop IP address for a returned route prefix from the RTM when looking up the **route-unknown** route prefix.

Values The following values apply to the 7450 ESS:

ipv4-address: a.b.c.d

Values The following values apply to the 7750 SR and 7950 XRS:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x[-interface]	
	x:	[0..FFFF]H
	interface:	32 chars maximum, mandatory for link local addresses

The link-local IPv6 address must have an interface name specified. The global IPv6 address must not have an interface name specified.

Syntax

next-hop *ip-address*

next-hop prefix-list *name*

no next-hop

Context

[Tree] (config>router>policy-options>policy-statement>entry>from next-hop)

Full Context

configure router policy-options policy-statement entry from next-hop

Description

This command enables BGP routes to be matched based on the BGP next-hop address. The match condition is evaluated against the IPv4 or IPv6 address in the NEXT_HOP or MP_REACH_NLRI attribute.

When the next-hop match is applied to VPN-IP routes, the Route Distinguisher (RD) is ignored.

A non-BGP route does not match a policy entry if it contains the **next-hop** command.

Default

no next-hop

Parameters

ip-address

An IPv4 or IPv6 address.

Values a.b.c.d or x:x:x:x:x:x:x:x or x:x:x:x:x:x:d.d.d.d

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

name

Specifies the name of a prefix-list (up to 64 characters).

prefix-list

Specifies that the BGP next hop should be matched against a prefix-list instead of an individual IP address.

Platforms

All

next-hop

Syntax

next-hop {*ip-address* | **peer-address**}

no next-hop

Context

Full Context

configure router policy-options policy-statement entry action next-hop

configure router policy-options policy-statement default-action next-hop

Description

This command assigns the specified next hop IP address to routes matching the policy statement entry.

If a next-hop IP address is not specified, the next-hop attribute is not changed.

The **no** form of this command disables assigning a next hop address in the route policy entry.

Default

no next-hop

Parameters

ip-address

Specifies the next hop IP address in dotted decimal notation.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

param-name: The next-hop parameter variable name.

Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

peer-address

Set the next-hop IP address to the peer's IP address.

configure service vprn bgp group neighbor bfd-strict-mode next-hop-reachability

configure router bgp bfd-strict-mode next-hop-reachability

configure router bgp group neighbor bfd-strict-mode next-hop-reachability

Description

This command configures the router to consider next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met:

- The BFD session to the peer is in a down state.
- There is a valid interface BFD configuration that applies to the peer.
- There is a valid BFD liveness configuration that applies to the peer.

The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer.

The behavior of the router when this command is enabled does not depend on whether Strict-BFD is used, as both features are independent.

Enabling this command only affects routes belonging to the following address families:

- IPv4
- IPv6
- IPv4 VPN
- IPv6 VPN
- labeled unicast IPv4
- labeled unicast IPv6
- EVPN
- IPv4 multicast
- IPv6 multicast
- IPv4 VPN multicast
- IPv6 VPN multicast

The **no** form of this command prevents the router from considering next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Default

no next-hop-reachability

configure router bgp group neighbor next-hop-self

Description

This command enables BGP to advertise routes to members of a group or to a specific neighbor using a local address of the BGP instance as the BGP next-hop address. Note that **next-hop-self** is set without exception, regardless of the route source (EBGP or IBGP) or its family. When used with VPN-IPv4 and VPN-IPv6 routes the **enable-rr-vpn-forwarding** command should also be configured.

The **no** form of this command uses protocol standard behavior to decide whether or not to set **next-hop-self** in advertised routes.

Default

no next-hop-self

Platforms

All

next-hop-self

Syntax

[**no**] **next-hop-self**

Context

[Tree] (config>router>policy-options>policy-statement>entry>action next-hop-self)

Full Context

configure router policy-options policy-statement entry action next-hop-self

configure router policy-options policy-statement default-action next-hop-self

Description

This command configures BGP to advertise routes that match a policy entry (or that match no other policy entry and, therefore, to which the default action applies) using a local address of the BGP instance as the BGP next-hop address. The command applies to IPv4, IPv6, label-IPv4, and label-IPv6 routes. It also applies to VPN-IPv4 and VPN-IPv6 routes, but only when used in conjunction with the **enable-rr-vpn-forwarding** command.

This command affects how routes are advertised to IBGP peers, regardless of whether or not they were learned from an IBGP or EBGP peer

The **no** form of this command uses protocol standard behavior to decide whether or not to set **next-hop-self** in advertised routes.

Default

no next-hop-self

nh-type {**ip** | **tunnel**}

no nh-type

Context

[Tree] (config>router>route-next-hop-policy>template nh-type)

Full Context

configure router route-next-hop-policy template nh-type

Description

This command configures the next-hop type constraint into the route next-hop policy template.

The user can select if tunnel backup next-hop or IP backup next-hop is preferred. The default in SR OS implementation is to prefer IP next-hop over tunnel next-hop. The implementation will fall back to the other type if no LFA next-hop of the preferred type is found.

When the route next-hop policy template is applied to an IP interface, all prefixes using this interface as a primary next-hop will follow the next-hop type preference specified in the template.

The **no** form deletes the next-hop type constraint from the route next-hop policy template.

Default

nh-type ip

Parameters

{ip | tunnel}

Specifies the two possible values for the next-hop type.

Default ip

node

Syntax

node *origin-host-string* [**destination-realm** *destination-realm-string*]

no diameter-node

Context

[Tree] (config>aaa>diam node)

Full Context

configure aaa diameter node

Description

This command creates a Diameter client node in the SR OS. Multiple Diameter client nodes with their own peer definitions are simultaneously supported in SR OS.

Each such node is defined by a unique DiameterIdentity (the origin host and realm names).

The **no** form of this command removes the origin host string from the configuration.

Parameters

origin-host-string

Specifies the origin host name, up to 80 characters, is a mandatory parameter that translates to an Origin-Host AVP that is carried in all Diameter messages. The origin host and origin realm form a Diameter Identity that must be unique within the Diameter network in which they participate.

destination-realm-string

Specifies the destination realm name, up to 80 characters, is an optional parameter that translates to an Origin-Realm AVP that is carried in all Diameter messages. The destination host and destination realm form a Diameter Identity that must be unique within the Diameter network in which they participate

If the realm name is not configured, it will be extracted from the host parameter as follows:

- it is set to the string after the first dot (.) in the configured origin-host-string
- it is set to the configured origin-host-string if a dot (.) is not present in the string

node-id

Syntax

node-id *node-id*

no node-id

Context

[Tree] (config>router>mpls>mpls-tp node-id)

Full Context

configure router mpls mpls-tp node-id

Description

This command configures the MPLS-TP Node ID for the node. This is used as the 'from' Node ID used by MPLS-TP LSPs originating at this node. The default value of the node-id is the system interface IPv4 address. The Node ID may be entered in 4-octet IPv4 address format, <a.b.c.d>, or as an unsigned 32 bit integer. The Node ID is not treated as a routable IP address from the perspective of IP routing, and is not advertised in any IP routing protocols.

The MPLS-TP context cannot be administratively enabled unless at least a system interface IPv4 address is configured because MPLS requires that this value is configured.

Default

no node-id

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

node-id

Specifies the MPLS-TP node ID for the node.

Values a.b.c.d or 1 to 4294967295

Default System interface IPv4 address

configure eth-ring node-id

Description

This optional command configures the MAC address of the RPL control. The default is to use the chassis MAC for the ring control. This command overrides the chassis MAC address with a different MAC address.

The **no** form of the command removes the RPL link.

Default

no node-id

Parameters

mac-address

xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context

[Tree] (config>router>rsvp node-id-in-rro)

Full Context

configure router rsvp node-id-in-rro

Description

This command enables the option to include node-id sub-object in RRO. Node-ID sub-object propagation is required to provide fast reroute protection for LSP that spans across multiple area domains.

If this option is disabled, then node-id is not included in RRO object.

Default

node-id-in-rro exclude

Platforms

All

31.89 node-protect

node-protect

configure router mpls lsp fast-reroute node-protect

configure router mpls lsp-template fast-reroute node-protect

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables or disables node and link protection on the specified LSP. Node protection ensures that traffic from an LSP traversing a neighboring router will reach its destination even if the neighboring router fails.

Default

node-protect (for a provisioned LSP)

no node-protect (for a P2P LSP template)

Platforms

All

node-protect

Syntax

node-protect [**max-pq-nodes** *value*]

no node-protect

Context

[Tree] (config>router>isis>loopfree-alternates>remote-lfa node-protect)

Full Context

configure router isis loopfree-alternates remote-lfa node-protect

Description

This command enables node-protect in which the router prefers a node-protect over a link-protect repair tunnel for a given prefix if both are found in the Remote LFA or TI-LFA SPF computations. The SPF computations may only find a link-protect repair tunnel for prefixes owned by the protected node.

The **no** form of this command disables node-protect.

Default

no node-protect

Parameters

value

Specifies the maximum number of PQ nodes found in the LFA SPFs for which the node protection check is performed. The node-protect condition means the router must run the original Remote LFA algorithm plus one extra forward SPF on behalf of each PQ node found, potentially after applying the **max-pq-cost** parameter, to check if the path from the PQ node to the destination does not traverse the protected node. Setting this parameter to a lower value means the LFA SPFs will use less computation time and resources but may result in not finding a node-protect repair tunnel.

configure router ospf3 segment-routing ingress-statistics node-sid

configure router ospf segment-routing ingress-statistics node-sid

configure router ospf segment-routing egress-statistics node-sid

configure router isis segment-routing egress-statistics node-sid

Description

This command enables the allocation of statistic indices to each node SID (received by means of IGP advertisement). All NHLFEs associated to a given SID share the same index. If a statistics index is not available at allocation time, the allocation fails, then the system re-tries the allocation. The system generates a log on the first fail and a log on the final successful allocation.

The **no** form of this command disables the allocation of statistic indices to each node SID, releases the statistic indices, and clears the associated counters.

Default

no node-sid

[Tree] (config>router>ospf>area>interface node-sid)

Full Context

configure router ospf3 area interface node-sid

configure router ospf area interface node-sid

Description

This command assigns a node SID index or label value to the prefix representing the primary address of a network interface of type system or loopback. A separate SID value can be configured for each IPv4 and IPv6 primary address of the interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address.

In OSPFv2 and OSPFv3, the node SID is configured in the primary area but is inherited in any other area in which the interface is added as secondary.

This command fails if the network interface is not of type loopback or if the interface is defined in an IES or VPRN context. Assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node.

The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, the segment routing module checks that the same index or label value is not assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required because the index, and therefore, the label ranges of IGP instances are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an OSPF or OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system. By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID; that is, it belongs to this node only. However, to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations, which may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receive end and accepts duplicate prefix SIDs with the N-flag set or clear. SR OS will resolve to the closest owner, or owners if ECMP, of the prefix SID cost-wise.

31.97 non-dr-attract-traffic

non-dr-attract-traffic

Syntax

[**no**] **non-dr-attract-traffic**

Context

[Tree] (config>service>vprn>pim non-dr-attract-traffic)

Full Context

configure service vprn pim non-dr-attract-traffic

Description

This command specifies whether the router should ignore the designated router state and attract traffic even when it is not the designated router.

An operator can configure an interface (router or IES or VPRN interfaces) to IGMP and PIM. The interface IGMP state will be synchronized to the backup node if it is associated with the redundant peer port. The interface can be configured to use PIM which will cause multicast streams to be sent to the elected DR only. The DR will also be the router sending traffic to the DSLAM. Since it may be required to attract traffic to both routers a flag non-dr-attract-traffic can be used in the PIM context to have the router ignore the DR state and attract traffic when not DR. While using this flag, the router may not send the stream down to the DSLAM while not DR.

When enabled, the designated router state is ignored. When disabled, **no non-dr-attract-traffic**, the designated router value is honored.

Default

no non-dr-attract-traffic

Full Context

configure service vpls allow-ip-int-bind evpn-mcast-gateway non-dr-attract-traffic

Description

This command triggers the required procedures so that multicast traffic can be attracted to the router when it is not elected as DR.

The **no** form of this command disables the attraction of non-DR traffic.

Default

non-dr-attract-traffic from-pim-mvpn

Parameters

from-evpn

Specifies that non-DR traffic generates a wildcard SMET route to attract the MCAST traffic from the OISM domain. No Layer 3 IFF or PIM/C-MCAST route is triggered from received SMET routes on the non-DR.

from-pim-mvpn

Specifies that non-DR traffic does not generate a wildcard SMET route but it does create an IIF or generate PIM/C-MCAST join upon receiving an SMET route. Local joins on a non-SBD service generate PIM/C-MCAST routes or SMETs despite this.

Platforms

Full Context

configure system l2tp non-multi-chassis-tunnel-id-range

Description

This command sets the tunnel-id range that is used to allocate a new tunnel-id for a tunnel for which no multi-chassis redundancy is configured.

The **no** form of this command is a double negation and means all tunnel-IDs are configured for multi-chassis redundancy.

Default

Sets the tunnel-id range to the full tunnel-id range available on this system meaning that by default no tunnel-ID has multi-chassis redundancy.

non-multi-chassis-tunnel-id-range default or non-multi-chassis-tunnel-id-range start 1 end <maximum *tunnel-id*>

The default for **start** *l2tp-tunnel-id* is 1. No tunnel-ids are available for which no multi-chassis redundancy is configured when set to 0.

The default for **end** *l2tp-tunnel-id* is the maximum tunnel-id allowed on this system. The **end** *l2tp-tunnel-id* must be set to 0 when the **start** *l2tp-tunnel-id* is set to 0 and vice versa.

Parameters

start *l2tp-tunnel-id*

Specifies the start of the range of L2TP tunnel identifiers that can be allocated by L2TP on this system, to be synchronized with Multi Chassis Redundancy Synchronization (MCS).

Values 0 to 16383

end *l2tp-tunnel-id*

Specifies the end of the range of L2TP tunnel identifiers that can be allocated by L2TP on this system, to be synchronized with Multi Chassis Redundancy Synchronization (MCS).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service vpls sap sub-sla-mgmt single-sub-parameters non-sub-traffic

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt single-sub-parameters non-sub-traffic

Description

This command configures traffic profiles for non-IP traffic such as PPPoE packets on a VPLS SAP. It is used in conjunction with the **profiled-traffic-only** command to forward non-IP traffic through the single subscriber SAP without the need for SAP queues.

The **no** form of this command removes any configured profile.

Parameters

sub-profile-name

Specifies an existing subscriber profile name to be associated with the non-sub-traffic L2 host. The subscriber profile is configured in the **config>subscr-mgmt>sub-profile** context.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sla-profile-name

Specifies an existing SLA profile name to be associated with the non-sub-traffic L2 host. The SLA profile is configured in the **config>subscr-mgmt>sla-profile** context.

sub-ident-string

Specifies the subscriber ID to be associated with the non-sub-traffic L2 host. The *sub-ident-string* should match the dynamic subscriber associated with the SAP. If no *sub-ident-string* is configured and no dynamic subscriber is yet associated, then the system will use a default subscriber ID that is overridden when a dynamic subscriber is created on the SAP.

app-profile-name

Specifies an existing app profile name to be associated with the non-sub-traffic L2 host. The application profile is configured in the **config>app-assure>group>policy>app-prof** context.

31.104 normal-state

normal-state

Syntax

normal-state {**open** | **closed**}

Context

[Tree] (config>system>alarm-contact-input normal-state)

Full Context

configure system alarm-contact-input normal-state

Description

This command configures the normal state of the alarm contact input circuit. When the system detects a transition from the normal state, an alarm is generated. The alarm is cleared when the system detects a transition back to the normal state.

Note:
Configure the normal state as **closed** if an external power source is used to power the alarm contact inputs.

Default

normal-state open

Parameters

open

Specifies that the normal state of the alarm contact input circuit is open. When the system detects a transition to the closed state, an alarm is generated. The alarm is cleared when the system detects a transition back to the open state.

closed

Specifies that the normal state of the alarm contact input circuit is closed. When the system detects a transition to the open state, an alarm is generated. The alarm is cleared when the system detects a transition back to the closed state.

31.111 nssa

nssa

Syntax

[**no**] **nssa**

Context

[Tree] (config>service>vprn>ospf>area nssa)

[Tree] (config>service>vprn>ospf3>area nssa)

Full Context

configure service vprn ospf area nssa

configure service vprn ospf3 area nssa

Description

This command creates the context to configure an OSPF Not So Stubby Area (NSSA) and adds/removes the NSSA designation from the area.

NSSAs are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is that an NSSA has the capability to flood external routes that it learns throughout its area and via an ABR to the entire OSPF domain.

Existing virtual links of a non-stub or NSSA area are removed when the designation is changed to NSSA or stub.

An area can be designated as stub or NSSA but never both at the same time.

By default, an area is not configured as an NSSA area.

The **no** form of this command removes the NSSA designation and configuration context from the area.

Default

no nssa — The OSPF area is not an NSSA.

Context

[Tree] (config>vrrp>policy>priority-event>lag-port-down number-down)

Full Context

configure vrrp policy priority-event lag-port-down number-down

Description

This command creates a context to configure an event set threshold within a lag-port-down priority control event.

The **number-down** command defines a sub-node within the **lag-port-down** event and is uniquely identified with the *number-of-lag-ports-down* parameter. Each **number-down** node within the same **lag-**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port-down event node must have a unique *number-of-lag-ports-down* value. Each **number-down** node has its own **priority** command that takes effect whenever that node represents the current threshold.

The total number of sub-nodes (uniquely identified by the *number-of-lag-ports-down* parameter) allowed in a single **lag-port-down** event is equal to the total number of possible physical ports allowed in a LAG.

A **number-down** node is not required for each possible number of ports that could be down. The active threshold is always the closest lower threshold. When the number of ports down equals a given threshold, that is the active threshold.

The **no** form of the command deletes the event set threshold. The threshold may be removed at any time. If the removed threshold is the current active threshold, the event set thresholds must be re-evaluated after removal.

Default

no number-down — No threshold for the LAG priority event is created.

Parameters

number-of-lag-ports-down

The number of LAG ports down to create a set event threshold. This is the active threshold when the number of down ports in the LAG equals or exceeds *number-of-lag-ports-down*, but does not equal or exceed the next highest configured *number-of-lag-ports-down*.

Values 1 to 64 (applies to 64-link LAG) 1 to 32 (applies to other LAGs)

All

31.119 number-paths

number-paths

Syntax

number-paths *number-of-paths* [**redundant-sfm** *number-of-paths*]

Context

[Tree] (config>mcast-mgmt>bw-plcy>t2>sec-path number-paths)

Full Context

configure mcast-management bandwidth-policy t2-paths secondary-path number-paths

Description

This command is used to explicitly provision the number of secondary paths (and imply the number of primary paths) supported by the TChip based forwarding plane the bandwidth policy is managing. The default (and minimum) number of secondary paths is 1 and the maximum configurable is 15. The number of primary paths is total number of available paths minus the number of secondary paths.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Secondary paths are used by:

- Expedited VPLS, IES and VPRN service ingress multipoint queues
- Expedited network ingress multipoint queues
- Managed multicast explicit path primary channels (using the primary paths managed multipoint queue)
- All managed multicast dynamic path channels when the primary paths or multicast planes are not at their limit (using the primary paths managed multipoint queue)
- Highest preference managed multicast dynamic path channels when the primary paths or multicast planes are at their limit (using the primary paths managed multipoint queue)

Secondary paths are used by:

- Best-Effort VPLS, IES and VPRN service ingress multipoint queues
- Best-Effort network ingress multipoint queues
- Managed multicast explicit path secondary channels (using the secondary paths managed multipoint queue)
- Lower preference managed multicast dynamic path channels when the primary paths or multicast planes are at their limit (using the secondary paths managed multipoint queue)

The number of secondary paths should be increased from the default value of 1 when a single secondary path is enough for explicit secondary path managed traffic or the amount of best-effort multipoint non-managed queue traffic.

The **no** form of this command restores the default number of secondary paths.

Default

number-paths 1 redundant-sfm 1

Parameters

number-of-paths

Specifies the number of secondary paths when only one switch fabric is active, while the dual-sfm parameter specifies the same value when two switch fabrics are active.

Values 1 to 15

Default 1

Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

Parameters

session-name

Identifies the session name, up to 32 characters, that the test is associated with.

dm

Specifies the MPLS delay measurement test that is affected by the command.

dmm

Specifies the DMM test that is affected by the command.

lmm

Specifies the LMM test that is affected by the command.

slm

Specifies the SLM test that is affected by the command.

twamp-light

Specifies the TWAMP-light test that is affected by the command.

start

Manually starts the test.

stop

Manually stops the test.

32.3 oam-template

oam-template

Syntax

[**no**] **oam-template** *name*

Context

[Tree] (config>router>mpls>mpls-tp oam-template)

Full Context

configure router mpls mpls-tp oam-template

Description

This command creates or edits an OAM template Generally applicable proactive OAM parameters are configured using templates. The top-level template is the OAM template.

Generic MPLS-TP OAM and fault management parameters are configured in the OAM Template.

Proactive CC/CV uses BFD and parameters such as Tx/Rx timer intervals, multiplier and other session/ fault management parameters specific to BFD are configured using a BFD Template, which is referenced from the OAM template.

Default

no oam-template

Parameters

name

Specifies a text string name for the template of up to 32 characters in printable 7-bit ASCII, enclosed in double quotes. Named OAM templates are referenced from the MPLS-TP path MEP configuration.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure router mpls lsp working-tp-path mep oam-template

configure router mpls lsp protect-tp-path mep oam-template

Description

This command applies an OAM template to an MPLS-TP working or protect path. It contains configuration parameters for proactive OAM mechanisms that can be enabled on the path; for example, BFD. Configuration of an OAM template is optional.

The **no** form of this command removes the OAM template from the path.

Default

no oam-template

Parameters

name

Specifies a text string name for the template up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

32.4 ocsp

ocsp

Syntax

32.10 offered-measurement

offered-measurement

Syntax

offered-measurement

Context

[Tree] (config>qos>adv-config-policy>child-control offered-measurement)

Full Context

configure qos adv-config-policy child-control offered-measurement

Description

This command modifies the offered rate measurement used to determine the bandwidth the queue or policer is requesting from its parent virtual scheduling context.

This command modifies the parameters that control the child requested bandwidth for all policers and queues associated with the policy.

Platforms

All

32.11 offset

offset

Syntax

offset *offset*

Context

[Tree] (config>system>time>dst-zone offset)

Full Context

configure system time dst-zone offset

Description

This command specifies the number of minutes that are added to the time when summer time takes effect. The same number of minutes is subtracted from the time when the summer time ends.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

offset 60

Parameters

offset

Specifies the number of minutes added to the time at the beginning of summer time and subtracted at the end of summer time, expressed as an integer.

Values 0 to 60

Default 60

Platforms

All

32.12 on-cac-failure

on-cac-failure

Syntax

[**no**] **on-cac-failure**

Context

[Tree] (config>router>rsvp>te-threshold-update on-cac-failure)

Full Context

configure router rsvp te-threshold-update on-cac-failure

Description

This command is used to enable a CAC failure-triggered IGP update.

The **no** form of this command should reset on-cac-failure to the default value and disable the CAC failure-triggered IGP update.

Default

no on-cac-failure

Platforms

All

Context

[Tree] (debug>diam>application>policy on-error)

[Tree] (debug>diam>application on-error)

Full Context

debug diameter application policy on-error

debug diameter application on-error

Description

This command debugs Diameter application errors and reports only peer error conditions, for example, an unknown session-id.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

32.14 on-failure

on-failure

Syntax

on-failure [**failover** {**enabled** | **disabled**}] [**handling** {**continue** | **retry-and-terminate** | **terminate**}]

no on-failure

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy on-failure)

Full Context

configure subscriber-mgmt diameter-application-policy on-failure

Description

This command is applicable to both legacy (pre-Release 16.0.R4) and new (Release 16.0.R4 and later) implementations of Diameter base in the SR OS:

- Legacy Diameter base description:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command configures session failure handling. The behavior of the application's session in case of a peer failure can be controlled by the Diameter server through two AVPs carried in CCA messages that are defined in RFC 4006, *Diameter Credit-Control Application*:

– CC-Session-Failover AVP
  - FAILOVER_NOT_SUPPORTED
  - FAILOVER_SUPPORTED

– Credit-Control-Failure-Handling AVP
  - TERMINATE
  - CONTINUE
  - RETRY_AND_TERMINATE

If those AVPs are not provided by the Diameter server, the local configuration provided by this command takes effect. This command defines the following:

– peer-failover behavior to a secondary peer if the primary peer is unresponsive

  From the application point of view, the primary peer is considered unresponsive if the request message that was sent to it, times out. The time out of the message is determined by the tx-timer command.

  The peer-failover action based on the request message timeout is defined per session. In other words, a request message timeout for one session cannot cause the failover for some other session.

  The maximum number of transmissions per session is hard-coded to 2 and the same message is never re-transmitted to the same TCP socket (a TCP socket is defined as a current peering connection defined by the TCP source/destination IP addresses/ports; closing and then reopening a connection to the same peer results in creation of a new TCP socket). When the original message for the session times out on the primary peer, the message is re-transmitted to the secondary peer, if the secondary peer is available and the failover is enabled with the corresponding handling mechanism. If the secondary peer is unavailable, the original message is not re-transmitted to the same primary peer again.

  After receiving a reply from a peer, the session is tied to that peer until the next timeout. The session always sticks to the peer from which it received the last response.

– handling behavior if the response from the peer is not received or the peers are not available (all peering connections are closed)

  If the response to a session initiation message is not received, the fate of the session depends on the configuration (the session can terminate or continue to exist with default parameters).

- New Diameter base description:

  This command configures session failure handling. The behavior of a Diameter application (Gx, Gy, or NASREQ) that fails to receive a response (an answer message CCA) to a transmitted request message (CCR) for a session, can be controlled by the Diameter server through two AVPs carried in CCA messages that are defined in RFC 4006, *Diameter Credit-Control Application*:

  – CC-Session-Failover AVP
    - FAILOVER_NOT_SUPPORTED
    - FAILOVER_SUPPORTED

  – Credit-Control-Failure-Handling AVP
    - TERMINATE

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- CONTINUE
- RETRY_AND_TERMINATE

If the Diameter server does not provide these AVPs, the local configuration provided by this command takes effect. This command defines the following:

– Retransmission behavior of the application in case that the response to a transmitted request message is not received. The Diameter base notifies the application after the lifetime of the transmitted request message expires (tx timeout) or the route to the destination-realm is unavailable. Depending on the configuration option, the application can then retransmit the message, or suppress retransmission.

– Handling behavior defines whether the session is terminated or continues to exist in absence of the response from the Diameter server.

Default

on-failure failover enabled handling terminate

Parameters

failover enabled

Specifies that application session is allowed to switch to the secondary peer (for legacy Diameter base). For new Diameter base, this keyword specifies that application session is allowed to retransmit the request message (CCR).

failover disabled

Specifies that the application session is not allowed to switch to the secondary peer (for legacy Diameter base). For new Diameter base, this keyword specifies that the application session is not allowed to retransmit the request message (CCR).

handling continue

Specifies that the sessions continue to exist if the response to a transmitted CCR message is not received. Whether the transmitted message is re-transmitted depends on the failover configuration. In case of session initiation procedure in the Gx case (CCR-I timeout), the subscriber host is nonetheless instantiated with the default parameters, assuming that they are provided. If the default parameter are not provided, the subscriber host initiation fails.

handling retry-and-terminate

Specifies that the message is re-transmitted if the peer-failover is enabled and the secondary peer is available. When the retransmitted request message times out, the application session terminates (for legacy Diameter base). For new Diameter base, this keyword specifies that the message is re-transmitted if the failover is enabled. If the response to the retransmitted request message is not received (re-transmission times out), the application session terminates.

handling terminate

Specifies that the session is terminated if the response to the original request message is not received. No re-transmissions is attempted, regardless if the failover is enabled.

32.17 one-time-http-redirection

one-time-http-redirection

Syntax

one-time-http-redirection ip-filter *filter-id*

one-time-http-redirection

Context

[Tree] (config>subscr-mgmt>sla-prof one-time-http-redirection)

Full Context

configure subscriber-mgmt sla-profile one-time-http-redirection

Description

This command specifies the one-time HTTP redirection filter ID. This filter applies to the host when it is created, and is replaced by the SLA profile ingress filter (configured in the **configure subscriber-mgmt sla-profile ingress** context) after the first HTTP request from the host is redirected.

Note: The system does not check if the configured filter includes the HTTP redirection entry. If the filter does not include the HTTP redirection, it is not replaced in the future.

If the 7750 SR receives a filter insertion via CoA or access-accept when the one-time redirection filter is still active, the received filter entries are only applied to the SLA profile ingress filter. Also, after the first HTTP redirection, the original SLA profile ingress filter and the received filter replace the redirection filter.

The **no** form of this command reverts to the default.

Default

no one-time-http-redirection

Parameters

filter-id

Specifies the ID of filter that is used for HTTP redirection.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (oam>eth-cfm one-way-delay-test)

Full Context

oam eth-cfm one-way-delay-test

Description

This command issues an ETH-CFM one-way delay test.

Parameters

mac-address

Specifies a unicast destination MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

remote-mepid *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

opaque-data

Syntax

opaque-data *hex-string*

no opaque-data

Context

[Tree] (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>action>insert-nsh>meta-data opaque-data)

Full Context

configure subscriber-mgmt isa-service-chaining vas-filter entry action insert-nsh meta-data opaque-data

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies 16-byte opaque data HEX string to be inserted in NSH meta-data (with MD-Type set to 1). The opaque data can also be provided (overridden) by AAA server. AAA server has precedence over static configuration. The **opaque-data** and **insert-subscriber-id** commands are mutually exclusive.

The **no** form of this command removes the HEX string from the configuration.

Parameters

hex-string

Specifies the HEX string up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

32.22 opcode

opcode

Syntax

Context

[Tree] (debug>router>bgp open)

Full Context

debug router bgp open

Description

This command decodes and logs all sent and received open messages in the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

32.26 oper-group

oper-group

Syntax

oper-group *name*

no oper-group

Context

[Tree] (config>service>epipe oper-group)

Full Context

configure service epipe oper-group

Description

This command associates an operational group to the status of the Epipe. When this oper-group is used in Epipes with static VXLAN or BGP-EVPN, the oper-group behaves as follows:

- The Epipe (and the oper-group) goes down if a SAP or spoke SDP goes operationally down because of an administrative shutdown, service shutdown, or non-DF status as a result of EVPN multi-homing single-active election.
- The Epipe (and oper-group) goes down if the Epipe's EVPN destination is removed (because of an EVPN AD per-EVI route withdrawal, for example).
- The Epipe (and oper-group) does not go down if a static VXLAN destination exists and the egress VTEP is not in the global route table.

The operational group must be monitored in a different service and not in the service where it is defined.

The **no** version of this command removes the oper-group association.

Parameters

name

Specifies the name of the **oper-group**, up to 32 characters.

Platforms

All

oper-group

Syntax

oper-group *name*

no oper-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service system bgp-evpn ethernet-segment oper-group

configure service vpls bgp-evpn mpls oper-group

configure service vpls bgp-evpn vxlan oper-group

configure service epipe bgp-evpn mpls oper-group

Description

This command adds the BGP EVPN MPLS, SRv6, or VXLAN instance or Ethernet Segment (ES) as a member of the operational group.

When configured on an ES, the state of the operational group depends on the state of the SAPs contained in the ES. The operational group transitions to up if at least one SAP in the ES is up. The operational group goes down when all the associated SAPs are operationally down. The ES operational group should be monitored on the LAG associated with the ES, along with single-active multi-homing, so that the NDF state can be signaled to the CE by LAG standby signaling.

When configured on a BGP EVPN instance, the operational group is up when it is either empty (meaning that the operational group has no members) or at least an EVPN destination is created under the EVPN instance added as member. When configured, no other SAP, SDP binding, or BGP EVPN instance can be added to the same operational group within the same or a different service.

The operational group is down when the following apply:

- on a BGP EVPN instance
- the service is disabled
- the BGP EVPN MPLS, VXLAN or SRv6 instance are disabled
- all the EVPN destinations in the instance are removed

Default

no oper-group

Parameters

name

Specifies the name of the operational group, up to 32 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Specifies the operational group identifier, up to 32 characters.

Platforms

All

oper-group

Syntax

oper-group *group-name* [**create**]

no oper-group *group-name*

Context

[Tree] (config>service oper-group)

Full Context

configure service oper-group

Description

This command creates a system-wide group (operational group) name which can be used to associate a number of service objects (for example, SAPs or pseudowires). The status of the group is derived from the status of its members. The status of the group can then be used to influence the status of non-member objects. For example, when a group status is marked as down, the object(s) that monitor the group change their status accordingly.

The **no** form of the command removes the group. All the object associations need to be removed before the no form of the command can be executed.

Default

no oper-group

Parameters

group-name

Specifies the operational group identifier up to 32 characters in length.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

create

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

Full Context

configure service vprn subscriber-interface group-interface srrp oper-group

configure service ies subscriber-interface group-interface srrp oper-group

Description

This command configures the state of an operational group under SRRP instance as up when the SRRP instance is in a Master state, and down for any other SRRP state. The operational group name must be already configured under the **config>service** context before its name is referenced in this command.

The **no** form of this command removes the association from the configuration.

Default

no oper-group

Parameters

name

Specifies a character string, up to 32 ASCII characters, identifying the group instance.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

oper-group

Syntax

oper-group *name*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no oper-group

Context

[Tree] (config>isa>nat-group oper-group)

Full Context

configure isa nat-group oper-group

Description

This command configures the state of the operational group associated with a NAT group; it is considered up only when the NAT group itself is up. In all other NAT group states, the operational group is marked as down. This includes the "degraded" state, where the number of active ESA-VMs in the NAT group falls below the configured active threshold limit. In this case, the operational group will be operationally down.

The **no** form of this command removes the association from the configuration.

Default

no oper-group

Parameters

name

Specifies a character string, up to 32 ASCII characters, identifying the group instance.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

oper-group

Syntax

oper-group *name*

no oper-group

Context

[Tree] (config>lag oper-group)

configure lag oper-group

Description

This command configures the operational group associated with a LAG; it is considered up only when the LAG itself is up. In all other states, the operational group is marked as down.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note: A LAG can be configured to transition to a down state if the number of active member links falls below the configured port threshold. When this threshold is breached, the operational group also transitions to a down state.

The **no** form of this command removes the association from the configuration.

Default

no oper-group

Parameters

name

Specifies a character string, up to 32 ASCII characters, identifying the group instance.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

oper-group

Syntax

oper-group *oper-group-name*

no oper-group

Context

[Tree] (config>isa>aa-grp oper-group)

Full Context

configure isa application-assurance-group oper-group

Description

This command configures the operational group that is associated with an AA group.

The AA operational group state is either up or down. The state is up when the number of operational and administratively enabled AA-ESA-VMs meets or exceeds the configured limit of the AA group. If the available AA-ESA-VMs fall below this limit, because of an AA ESA VM failure or administrative state shutdown, the operational group status is changed to the down state.

The **no** form of this command removes the association from the configuration.

Default

no oper-group

Parameters

oper-group-name

Specifies a character string, up to 32 ASCII characters, identifying the group instance.

© 2026 Nokia.

configure filter dhcp-filter entry option

Description

This command configures match criteria for the DHCP filter policy entry.

The **no** form of this command reverts to the default.

Parameters

dhcp-option-number

Specifies the DHCP option number.

Values 0 to 255

present

Specifies that the related DHCP option must be present.

absent

Specifies that the related DHCP option must be absent.

hex-string

Specifies that the option must partially match a specified hex string.

Values 0x0 to 0xFFFFFFFF (up to 254 hex nibbles)

ascii-string

Specifies that the option must partially match a specified ASCII string, up to 127 characters.

exact

Specifies that this option requires an exact match of a hex or ASCII string.

Full Context

configure subscriber-mgmt local-user-db ipoe host to-client-options ipv4 option

Description

This command configures DHCPv4 options via LUDB that are passed in all DHCP messages to the client. The options are blindly appended to any options already present in the DHCP message. In other words, there is no intelligent merging of the options where overlapping options from different sources are further evaluated to determine whether only one option or multiple options should be returned to the client.

Multiple DHCP options can be configured at the same time although each option requires its own option statement. Those options are equivalent to RADIUS VSAs **Alc-ToCLient-Dhcp4-Options**.

DHCPv4 options can be provided via DHCPv4 server in the relay case. In addition, DHCPv4 options provided via LUDB or RADIUS can be supplied and consequently appended to the already existing options. If DHCPv4 options are provided simultaneously via LUDB and RADIUS, the RADIUS as a source of DHCPv4 option is blocked and the options supplied via LUDB are passed to the client. This is valid for the relay and proxy case.

Any DHCP option may be encoded in the option statement. The following is an example of the option statement for DHCPv4 default-gateway:

option 3 192.168.1.254

DHCPv4 options may be fixed length or variable length. They are appended at the end of DHCPv4 messages. All options begin with a tag octet, which uniquely identifies the option. Fixed-length options without data consist of only a tag octet. Only options 0 and 255 are fixed length. All other options are variable-length.

The **no** form of the removes the option from the configuration.

Parameters

option-number

Specifies up to four option numbers. This can be a well-known or an anonymous option.

Values 1 to 254

ipv4-address

Specifies an IPv4 address as an option.

Values a.b.c.d

hex-string

Specifies options coded as hex characters.

Values 0x0..0xFFFFFFFF, up to 254 hex nibbles

ascii-string

Specifies options coded as an ASCII string, up to 27 characters.

no origin

Context

[Tree] (config>router>policy-options>policy-statement>entry>from origin)

Full Context

configure router policy-options policy-statement entry from origin

Description

This command configures the match criteria for the origin attribute of the route. The origin attribute is applicable to BGP routes and to the following subscriber-management routes.

- Host routes (for example, IPv4 /32 address, or IPv6 SLAAC prefix) carry the origin attribute with the **aaa**, **dynamic**, or **static** options, depending on the address assignment method. For CUPS hosts, the **pfcp** option is used for the origin attribute. Host routes can also be distinguished using the **sub-mgmt** option for the **protocol** command.
- Dynamically provisioned prefixes or loopback addresses carry the origin attribute with the **aaa** or **pfcp** options, depending on the protocol that provides the prefix and address. Dynamic routes can also be distinguished using the **direct** option for the **protocol** command.
- Statically configured prefixes under the subscriber interface do not have an origin attribute.These routes can be distinguished using the **direct** option for the **protocol** command.
- Framed routes for non-CUPS hosts do not have an origin attribute. Framed routes for CUPS hosts use the **pfcp** option for the origin attribute. Alternatively, framed routes can be distinguished using the **managed** option for the **protocol** command.

These values that are specific to subscriber-management routes are never carried in BGP updates as part of the BGP origin attribute and are not visible within the BGP process.

Default

no origin

Parameters

igp

Specifies path-matching information that originates within the local AS.

egp

Specifies path-matching information that originates in another AS.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

incomplete

Configures path-matching information learned by another method.

any

Specifies to ignore this criteria.

aaa

Specifies to use the subscriber-host address that originates from AAA.

Values IPv4 — subscriber-management /32 host routes that originate from the RADIUS framed-ip-address VSA other than 255.255.255.254. The 255.255.255.254 returned by the RADIUS indicates that the BNG (NAS) should assign an IP address from its own pool.

IPv6 — subscriber-management routes that originate through framed-ipv6-prefix (SLAAC), delegated-ipv6-prefix (IA_PD) or alc-ipv6-address (IA_NA) RADIUS attributes. It is also applicable to VSA Alc-IPv6-Sub-If-Prefix, where the subscriber interface prefix can originate from RADIUS. This is valid for IPoE and PPPoE type hosts.

dynamic

Specifies to use the subscriber host address that originates from DHCP, DHCPv6, or the local address server.

Values IPv4 — subscriber-management /32 host routes that originate from the DHCP server (local or remote) or RADIUS framed-ip-address=255.255.255.254 (RFC 2865).

IPv6 — subscriber-management routes that are assigned via local DHCPv6 server pools whose name is obtained through the Alc-Delegated-IPv6-Pool (PD pool) and Framed-IPv6-Pool (NA pool) RADIUS attributes, or the local address server whose name is obtained through the Alc-SLAAC-IPv6-Pool (SLAAC pool) RADIUS attribute. This is valid for IPoE and PPPoE type hosts.

For IPoEv6 only, the pool name can also be obtained from ipv6-delegated-prefix-pool (PD pool) and ipv6-wan-address-pool (NA pool) from the LUDB.

static

Specifies to use the subscriber-host address that originates from the local user database.

Values IPv4 — subscriber-management /32 host routes that originate from the LUDB and also covers the RADIUS fallback category (RADIUS falls back to system defaults or to the LUDB).

IPv6 — subscriber-management routes that originate from the LUDB from ipv6-address (IA_NA) or ipv6-prefix (IA_PD), or ipv6-slaac-prefix (SLAAC).

bonding

Specifies to use bonding.

pfcp

Specifies to use routes learned using the PFCP protocol.

[Tree] (config>router>policy-options>policy-statement>entry>action origin)

Full Context

configure router policy-options policy-statement default-action origin

configure router policy-options policy-statement entry action origin

Description

This command sets the BGP origin assigned to routes exported into BGP.

If the routes are exported into protocols other than BGP, this option is ignored.

The **no** form of this command disables setting the BGP origin for the route policy entry.

Default

no origin

Parameters

igp

Sets the path information as originating within the local AS.

egp

Sets the path information as originating in another AS.

incomplete

Sets the path information as learned by some other means.

param-name

The origin parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

configure service vprn ospf area nssa originate-default-route

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies whether when configuring an NSSA with no summaries, the Area Border Router (ABR) injects a type-7 LSA default route into the NSSA area. The default behavior is to inject a type-3 LSA default route, but some older implementations expect a type-7 LSA default route.

When configuring an NSSA with no summaries, the ABR will inject a type 3 LSA default route into the NSSA area. Some older implementations expect a type 7 LSA default route.

The **no** form of this command disables origination of a default route.

Default

no originate-default-route — A default route is not originated.

Parameters

type-nssa

Specifies that a type 7 LSA should be used for the default route.

Configure this parameter to inject a type 7 LSA default route into an NSSA configured with no summaries, instead of a type 3 LSA.

To revert to a type 3 LSA, execute the **originate-default-route** command without the **type-nssa** parameter.

Default type 3 LSA default route

adjacency-check

Specifies whether adjacency checks are performed before originating a default route. If this parameter is configured, then no area 0 adjacency is required for the ABR to advertise the default route.

Default Adjacency checks are performed, and an area 0 adjacency is required for the ABR to advertise the default route

Platforms

All

Full Context

configure router ospf3 area nssa originate-default-route

configure router ospf area nssa originate-default-route

Description

This command enables the generation of a default route and its LSA type (3 or 7) into a Not So Stubby Area (NSSA) by an NSSA Area Border Router (ABR).

When configuring an NSSA with no summaries, the ABR will inject a type 3 LSA default route into the NSSA area. Some older implementations expect a type 7 LSA default route.

The **no** form of this command disables origination of a default route.

Default

no originate-default-route

Parameters

type-7

Specifies a type 7 LSA should be used for the default route in the **config**>**router**>**ospf**>**area**>**nssa** context.

Configure this parameter to inject a type-7 LSA default route instead the type 3 LSA into the NSSA configured with no summaries.

To revert to a type 3 LSA, enter **originate-default-route** without the **type-7** parameter.

Default Type 3 LSA default route.

type-nssa

Specifies an NSSA-LSA type should be used for the default route in the **config**>**router**>**ospf3**>**area**>**nssa** context.

no-adjacency-check

Specifies whether adjacency checks are performed before originating a default route. If this parameter is configured, then no area 0 adjacency is required for the ABR to advertise the default route.

Default Adjacency checks are performed, and an area 0 adjacency is required for the ABR to advertise the default route.

32.49 orphan-override

orphan-override

Syntax

orphan-override [**level** *priority-level*] [**weight** *weight*] [**cir-level** *cir-level*] [**cir-weight** *cir-weight*]

no orphan-override

Context

[Tree] (config>qos>port-scheduler-policy orphan-override)

Full Context

configure qos port-scheduler-policy orphan-override

Description

This command overrides the default orphan behavior for port schedulers created using the port scheduler policy. The default orphan behavior is to give all orphan queues and schedulers bandwidth after all other properly parented queues and schedulers. Orphans by default do not receive any within-CIR bandwidth and receive above-CIR bandwidth after priority levels 8 through 1 have been allocated. The orphan-override command accepts the same parameters as the port-parent command in the SAP egress and network queue policy contexts. The defined parameters are used as a default port-parent association for any queue or scheduler on the port that the port scheduler policy is applied.

Orphan queues and schedulers are identified as:

- Any queue or scheduler that does not have a port-parent or parent command applied

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Any queue that has a parent command applied, but the specified scheduler name does not exist on the queue's SAP, MSS, or SLA Profile instance.

A queue or scheduler may be properly parented to an upper level scheduler, but that scheduler may be orphaned. In this case, the queue or scheduler receives bandwidth from its parent scheduler based on the parent schedulers ability to receive bandwidth as an orphan.

Within-CIR Priority Level Parameters

The within-CIR parameters define which port priority level the orphan queues and schedulers should be associated with when receiving bandwidth for the queue or schedulers within-CIR offered load. The within-CIR offered load is the amount of bandwidth the queue or schedulers could use that is equal to or less than its defined or summed CIR value. The summed value is only valid on schedulers and is the sum of the within-CIR offered loads of the children attached to the scheduler. The parameters that control within-CIR bandwidth allocation for orphans are the orphan-override commands cir-level and cir-weight keywords. The cir-level keyword defines the port priority level that the scheduler or queue uses to receive bandwidth for its within-CIR offered load. The cir-weight is used when multiple queues or schedulers exist at the same port priority level for within-CIR bandwidth. The weight value defines the relative ratio that is used to distribute bandwidth at the priority level when more within-CIR offered load exists than the port priority level has bandwidth.

A cir-weight equal to zero (the default value) has special meaning and informs the system that the orphan queues and schedulers do not receive bandwidth from the within-CIR distribution. Instead, all bandwidth for the orphan queues and schedulers must be allocated from the port scheduler's above-CIR pass.

Above-CIR Priority Level Parameters

The above-CIR parameters define which port priority level the orphan queues and schedulers should be associated with when receiving bandwidth for the queue or schedulers above-CIR offered load. The above-CIR offered load is the amount of bandwidth the queue or schedulers could use that is equal to or less than its defined PIR value (based on the queue or schedulers rate command) less any bandwidth that was given to the queue or scheduler during the above-CIR scheduler pass. The parameters that control above-CIR bandwidth allocation for orphans are the orphan-override commands level and weight keywords. The **level** keyword defines the port priority level that the scheduler or queue uses to receive bandwidth for its above-CIR offered load. The weight is used when multiple queues or schedulers exist at the same port priority level for above-CIR bandwidth. The weight value defines the relative ratio that is used to distribute bandwidth at the priority level when more above-CIR offered load exists than the port priority level has bandwidth.

The **no** form of this command removes the orphan override port parent association for the orphan queues and schedulers on port schedulers created with the port scheduler policy. Any orphan queues and schedulers on a port associated with the port scheduler policy will revert to default orphan behavior.

Parameters

level *priority-level*

Defines the port priority the orphan queues and schedulers will use to receive bandwidth for their above-CIR offered-load.

Values 1 to 8 (8 is the highest priority)

Default 1

weight *weight*

Defines the weight the orphan queues and schedulers will use in the above-CIR port priority level (defined by the level parameter).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 100

Default 1

cir-level ***cir-level***

Defines the port priority the orphan queues and schedulers will use to receive bandwidth for their within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the orphan queues and schedulers do not receive bandwidth during the port scheduler's within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 1 to 8 (8 is the highest level)

cir-weight ***cir-weight***

Defines the weight the orphan queues and schedulers will use in the within-CIR port priority level (defined by the cir-level parameter). When the cir-weight parameter is set to a value of 0 (the default value), the orphan queues and schedulers do not receive bandwidth during the port scheduler's within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 1 to 100 (100 is the highest weight)

Context

[Tree] (config>service>vprn ospf)

Full Context

configure service vprn ospf

Description

This command enables access to the context to enable an OSPF protocol instance.

OSPF instances are **shutdown** when created, so that all parameters can be configured prior to the instance being enabled.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command deletes the OSPF protocol instance removing all associated configuration parameters.

Default

no ospf

Parameters

router-id

Specifies the OSPF router ID to be used with the associated OSPF instance. The *router-id* must be given a dot decimal notation format.

Values a.b.c.d

Platforms

All

ospf

Syntax

ospf *ospf-instance* [*router-id*]

[**no**] **ospf** *ospf-instance*

Context

[Tree] (config>router ospf)

Full Context

configure router ospf

Description

This command creates an OSPF routing instance and then enters the associated context to configure the associated protocol parameters.

Additionally, the router ID can be specified as another parameter of the OSPF command. This parameter is required for all non-base OSPF instances.

The default value for the base instance is inherited from the configuration in the **config**>**router** context. When that is not configured, the following apply:

1. the system uses the system interface address (which is also the loopback address)
2. if a system interface address is not configured, it uses the last 32 bits of the chassis MAC address

This is a required command when configuring multiple instances and the instance being configured is not the base instance. When configuring multiple instances of OSPF, there is a risk of loops because networks are advertised by multiple domains configured with multiple interconnections to one another. To prevent this from happening, all routers in a domain should be configured with the same domain ID. Each domain (OSPF-instance) should be assigned a specific bit value in the 32-bit tag mask.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The default value for non-base instances is 0.0.0.0 and is invalid; in this case, the instance of OSPF will not start. When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

Issue the shutdown and no shutdown commands for the instance for the new router ID to be used, or reboot the entire router.

OSPF instances are **shutdown** when created, so that all parameters can be configured prior to the instance being enabled.

The **no** form of this command to reverts to the default value.

Default

no ospf

Parameters

ospf-instance

Specifies a unique integer that identifies a specific instance of a version of the OSPF protocol running in the router instance specified by the router ID.

Values 1 to 31

router-id

Specifies the OSPF router ID to be used with the associated OSPF instance. This IP address must be given a dot decimal notation format.

other-sub-tags

Syntax

other-sub-tags *action*

no other-sub-tags

Context

[Tree] (config>service>vpls>sap>pppoe>intermediate-agent>bbf-vendor-specific-tag other-sub-tags)

Full Context

configure service vpls sap pppoe intermediate-agent bbf-vendor-specific-tag other-sub-tags

Description

This command specifies the action that the PPPoE Intermediate Agent performs on sub-tags in the BBF vendor specific PPPoE tag that are different from Circuit ID and Remote ID.

The **no** form of this command resets the configuration to its default.

Default

other-sub-tags remove

Parameters

action

Specifies the action.

Values		
	keep	Keep the Circuit ID sub-tag when present in the received packet. Do not insert a Circuit ID sub-tag when not present in the received packet.
	remove	Remove the Circuit ID sub-tag when present in the received packet. Do not insert a Circuit ID sub-tag when not present in the received packet.

32.55 otu

otu

Syntax

[**no**] **otu**

Context

[Tree] (config>port otu)

Full Context

configure port otu

Description

This command specifies whether or not to enable OTU encapsulation. The port must be shut down before OTU is enabled. This command is valid only for ports on assemblies that support this encapsulation mode. Refer to the appropriate Installation Guide for ports assembly to determine if OTU encapsulation is supported.

Note that OTU cannot be disabled on OTU3 encapsulated OC768 or 40-Gigabit Ethernet.by the **no otu** command. Therefore, the default depends on the port type. The default for OTU3 encapsulated OC768 or 40-Gigabit Ethernet is **otu**.

The **no** form of this command disables OTU (clear channel 10GE-LAN/WAN or OC192).

Default

no otu

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

32.56 otu2-lan-data-rate

otu2-lan-data-rate

Syntax

otu2-lan-data-rate {**11.049** | **11.096**}

Context

[Tree] (config>port>otu otu2-lan-data-rate)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure port otu otu2-lan-data-rate

Description

This command specifies the data rate to use when configured for an OTU encapsulated 10GE-LAN signal. The port must be shut down before changing the 10GE LAN OTU2 data rate.

Default

otu2-lan-data-rate 11.049

Parameters

11.049

Configures the port to transmit and receive an 11.049 Gb/s synchronous OTU encapsulated 10GE-LAN signal (No fixed stuffing bytes in the OTU2 frame).

11.096

Configures the port to transmit and receive an 11.096 Gb/s synchronous OTU encapsulated 10GE-LAN signal (with fixed stuffing bytes in the OTU2 frame).

Platforms

no out-label

Context

[Tree] (config>router>mpls>lsp>protect-tp-path out-label)

[Tree] (config>router>mpls>lsp>working-tp-path out-label)

Full Context

configure router mpls lsp protect-tp-path out-label

configure router mpls lsp working-tp-path out-label

Description

This command configures the outgoing label value to use for an MPLS-TP working or protect path. The out-link is the outgoing interface on the node that this path will use, and must be specified. If the out-link refers to a numbered IP interface, the user may optionally configure the **next-hop** parameter and the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

system will determine the interface to use to reach the configured next-hop, but will check that the user-entered value for the *out-link* corresponds to the link returned by the system. If they do not correspond, then the path will not come up.

Default

no out-label

Parameters

out-label

Specifies the out label.

Values 32 to 16415

if-name

Specifies the interface name.

ip-address

Specifies the IPv4 address in a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure system security cpu-protection policy out-profile-rate

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command applies a packet arrival rate limit for the entire SAP/interface, above which packets will be market as discard eligible, in other words, out-profile/low-priority/yellow. The rate defined is a global rate limit for the interface regardless of the number of traffic flows. It is a per-SAP/interface rate.

The **no** form of this command sets out-profile-rate parameter back to the default value.

Default

out-profile-rate 3000 for cpu-protection-policy-id 1-253

out-profile-rate 6000 for cpu-protection-policy-id 254 (default access interface policy)

out-profile-rate 3000 for cpu-protection-policy-id 255 (default network interface policy)

Parameters

packet-rate-limit

Specifies a packet arrival rate limit in packets per second.

Values 1 to 65535, **max** (max indicates no limit)

log-events

Issues a tmnxCpmProtViolSapOutProf, tmnxCpmProtViolIfOutProf, or tmnxCpmProtViolSdpBindOutProf log event and tracks violating interfaces when the out-profile-rate is exceeded. Supported on CPM3 and above only.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

Full Context

configure qos sap-ingress fc out-remark

Description

This command is used in a SAP ingress QoS policy to define an explicit out-of-profile remark action for a forwarding class or subclass. While the SAP ingress QoS policy may be applied to any SAP, the remarking

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

functions are only enforced when the SAP is associated with an IP or subscriber interface (in an IES or VPRN). When the policy is applied to a Layer 2 SAP (for example, Epipe or VPLS), the remarking definitions are silently ignored.

In the case where the policy is applied to a Layer 3 SAP, the out-of-profile remarking definition will be applied to packets that have been classified to the forwarding class or subclass. It is possible for a packet to match a classification command that maps the packet to a particular forwarding class or subclass, only to have a more explicit (higher priority match) override the association. Only the highest priority match forwarding class or subclass association will drive the out-of-profile marking.

The out-remark command is only applicable to ingress IP routed packets that are considered out-of-profile. The profile of a SAP ingress packet is affected by either the explicit in-profile/out-of-profile definitions or the ingress policing function applied to the packet. Table 93: Out-remark Command Effect describes the effect of the out-remark command on received SAP ingress packets. Within the out-of-profile IP packet's ToS field, either the six DSCP bits or the three precedence bits are remarked.

Table 93: Out-remark Command Effect

SAP Ingress Packet State	out-remark Command Effect
Non-Routed, Policed In-Profile	No Effect (non-routed packet)
Non-Routed, Policed Out-of-Profile	No Effect (non-routed packet)
Non-Routed, Explicit In-Profile	No Effect (non-routed packet)
Non-Routed, Explicit Out-of-Profile	No Effect (non-routed packet)
IP Routed, Policed In-Profile	No Effect (in-profile packet)
IP Routed, Policed Out-of-Profile	out-remark value applied to IP header ToS field
IP Routed, Explicit In-Profile	No Effect (in-of-profile packet)
IP Routed, Explicit Out-of-Profile	out-remark value applied to IP header ToS field

A packet that is explicitly remarked at ingress will not be affected by any egress remarking decision. Explicit ingress remarking has highest priority.

An explicit dscp name or precedence value must be specified for out-of-profile remarking to be applied.

The **no** form of this command disables ingress remarking of out-of-profile packets classified to the forwarding class or subclass.

Default

no out-remark

Parameters

dscp *dscp-name*

Specifies that the matching packet's DSCP bits should be overridden with the value represented by *dscp-name*.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The *dscp-name* parameter is a 6-bit value. It must be one of the predefined DSCP names defined on the system.

Values be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, c p35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, e f, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

prec ***ip-prec-value***

Specifies that the matching packet's precedence bits should be overridden with the value represented by *ip-prec-value*.

The value specified by *ip-prec-value* is used to overwrite the precedence bits within a matching routed packets IP header ToS field.

Values 0 to 7

32.72 outer-tag

outer-tag

Syntax

outer-tag *value* [*vid-mask*]

no outer-tag

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match outer-tag)

Full Context

configure qos sap-ingress mac-criteria entry match outer-tag

Description

This command configures the matching of the first tag that is carried transparently through the service. Service delimiting tags are stripped from the frame and the outer tag on ingress is the first tag after any service delimiting tags. The outer tag is the first tag before any service delimiting tags on egress. This allows matching VLAN tags for explicit filtering or QoS setting when using default or null encapsulations.

On dot1Q SAPs, the outer tag is the only tag that can be matched. On dot1Q SAPs with exact match (sap 2/1/1:50), the outer tag will be populated with the next tag that is carried transparently through the service or 0 if there is no additional VLAN tags on the frame.

On QinQ SAPs that strip a single service delimiting tag, the outer tag will contain the next tag (which is still the first tag carried transparently through the service.) On SAPs with two service delimiting tags (two tags stripped), the **outer-tag** will contain 0 even if there are more than two tags on the frame.

The optional *vid_mask* is defaulted to 4095 (exact match) but may be specified to allow pattern matching. The masking operation is ((value & vid-mask) = = (tag & vid-mask)). A value of 6 and a mask of 7 would match all VIDs with the lower 3 bits set to 6.

For QoS, the VID type cannot be specified on the default QoS policy.

The default vid-mask is set to 4095 for exact match.

Platforms

All

Context

[Tree] (config>li>li-fltr>li-mac-fltr>entry>match outer-tag)

Full Context

configure li li-filter li-mac-filter entry match outer-tag

Description

This command configures the outer-tag to match on and must be used in conjunction with the match criteria SAP for the entry match to activate.

The match criteria SAP must be an exact match with the QinQ configured on the Epipe or VPLS service. An associated outer-tag must be provisioned. For example, SAP 1/1/1:1.*, where the outer-tag is "*", and an outer-tag of 1 would perform LI on 1/1/1:1.1 on a 1/1/1:1.* SAP.

The **no** form of this command removes the outer-tag as the match criterion.

Default

no outer-tag

Parameters

number

Specifies the outer-tag value.

Values 1 to 4094 in decimal
0x1 to 0xFFFE in hexadecimal

configure system sync-if-timing bits output

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command provides a context to configure and enable or disable the external BITS timing reference output to the central clock of the router. On redundant systems, there are two possible BITS-out interfaces, one for each CPM or CCM.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

32.74 output-authorization

output-authorization

Syntax

output-authorization

Context

[Tree] (config>system>security>management-interface output-authorization)

Full Context

configure system security management-interface output-authorization

Description

This command configures the authorization of the configuration and state output in model-driven interfaces and telemetry. When enabled, commands that display configuration or state output authorize every element in the output. If a remote AAA server is configured, this can cause delays in displaying output while it is authorized. If a large amount of output is displayed, for example, when displaying the system configuration, the remote AAA server receives a large number of authorization requests.

Input to edit the configuration is not affected by this command, and is always authorized.

32.80 overall-rate

overall-rate

Syntax

overall-rate *packet-rate-limit*

no overall-rate

Context

[Tree] (config>sys>security>cpu-protection>policy overall-rate)

Full Context

configure system security cpu-protection policy overall-rate

Description

This command applies a maximum packet arrival rate limit (applied per SAP/interface) for the entire SAP/interface, above which packets will be discarded immediately. The rate defined is a global rate limit for the interface regardless of how many traffic flows are present on the SAP/interface. It is a per-SAP/interface rate.

The **no** form of this command sets overall-rate parameter back to the default value.

Default

overall max for cpu-protection-policy-id 1 to 253

overall 6000 for cpu-protection-policy-id 254 (default access interface policy)

overall max for cpu-protection-policy-id 255 (default network interface policy)

Parameters

packet-rate-limit

Specifies a packet arrival rate limit in packets per second.

Values 1 to 65535, **max** (the max indicates no limit)

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

32.81 overflow

overflow

Syntax

overflow *percent*

no overflow

Context

[Tree] (config>cflowd overflow)

Full Context

configure cflowd overflow

Description

This command specifies the percentage of the flow cache entries removed when the maximum number of entries is exceeded. The entries removed are the entries that have not been updated for the longest amount of time.

The **no** form of this command resets the number of entries cleared from the flow cache on overflow to the default value.

Default

overflow 1

Parameters

percent

Specifies the percentage of the flow cache entries removed when the maximum number of entries is exceeded.

Values 1 to 50 percent

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

32.82 overflow-limit

overflow-limit

Syntax

overflow-limit *number* **threshold** *percent* [**bw** *rate-in-mbps*]

no overflow-limit

Context

[Tree] (config>router>mpls>lsp>auto-bandwidth overflow-limit)

[Tree] (config>router>mpls>lsp-template>auto-bandwidth overflow-limit)

Full Context

configure router mpls lsp auto-bandwidth overflow-limit

configure router mpls lsp-template auto-bandwidth overflow-limit

Description

This command configures overflow-triggered auto-bandwidth adjustment. The bandwidth adjustment is initiated when the configured *number* of overflow samples is reached, regardless of how much time remains until the adjust interval ends.

A sample interval is counted as an overflow if the average data rate during the sample interval is higher than the currently reserved bandwidth by at least the thresholds configured for this command.

If overflow-triggered auto-bandwidth adjustment is successful, the overflow count, maximum average data rate, and adjust count are reset. If overflow-triggered auto-bandwidth adjustment fails, the overflow count is reset but the maximum average data rate and adjust count maintain the current values.

The **no** form of this command disables overflow-triggered auto-bandwidth adjustment.

Default

no overflow-limit

Parameters

number

Specifies the number of overflow samples to trigger an overflow auto-bandwidth adjustment attempt.

Values 1 to 10

percent

Specifies the minimum difference between the current bandwidth reservation of the LSP and the sampled data rate, expressed as a percentage of the current bandwidth reservation, for counting an overflow sample.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0 to 100

rate-in-mbps

Specifies the minimum difference between the current bandwidth reservation of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s), for counting an overflow sample.

Values 0 to 6400000

Platforms

All

32.83 overlapping-reverse-route

overlapping-reverse-route

Syntax

[**no**] **overlapping-reverse-route**

Context

[Tree] (config>service>vprn>ipsec overlapping-reverse-route)

Full Context

configure service vprn ipsec overlapping-reverse-route

Description

This command configures the router to accept overlapping DL2L tunnel reverse routes from different tunnels and install the routes based on the preference, metric, or ECMP configuration.

This command is mutually exclusive with the **configure service vprn ipsec allow-reverse-route-override-type** command.

The **no** form of this command disables the acceptance of overlapping reverse routes. The router handles the overlapping route according to the **allow-reverse-route-override-type** command configuration. See the *7450 ESS, 7750 SR, and VSR Multiservice ISA and ESA Guide* for more information.

Default

no overlapping-reverse-route

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

32.84 overload

overload

Syntax

overload [**timeout** *seconds*]

no overload

Context

[Tree] (config>service>vpls>spb overload)

Full Context

configure service vpls spb overload

Description

This command administratively sets the SPB to operate in the overload state for a specific time period, in seconds, or indefinitely. During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is only used if the destination is reachable by SPB and is not used for other transit traffic.

If a time period is specified, the overload state persists for the configured length of time. If no time is specified, the overload state operation is maintained indefinitely.

The overload command can be useful in circumstances where SPB is overloaded or used prior to executing a shutdown command to divert traffic around the switch.

The **no** form of this command causes the router to exit the overload state.

Default

no overload

Parameters

seconds

The time, in seconds, that this router must operate in overload state.

Values 60 to 1800

Default Infinity (overload state maintained indefinitely)

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

overload

Syntax

overload [**timeout** *seconds*] [**max-metric**]

no overload

Context

[Tree] (config>service>vprn>isis overload)

Full Context

configure service vprn isis overload

Description

This command administratively sets the IS-IS router to operate in the overload state for a specific time period, in seconds, or indefinitely.

During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is only used if the destination is reachable by the router and will not be used for other transit traffic.

If a time period is specified, the overload state persists for the configured length of time. If no time is specified, the overload state operation is maintained indefinitely.

The **overload** command can be useful in circumstances where the router is overloaded or used prior to executing a **shutdown** command to divert traffic around the router.

The **max-metric** parameter can be set to advertise transit links with the maximum metric of 0xffffffe (wide metrics) or 0x3f (regular metrics), instead of setting the overload bit when placing the router in overload.

The **no** form of this command causes the router to exit the overload state.

Default

no overload

Parameters

seconds

Specifies the time, in seconds, that this router must operate in overload state.

Values 60 to 1800

Default infinity (overload state maintained indefinitely)

max-metric

Set the maximum metric instead of overload.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

overload

Syntax

overload [**timeout** *seconds*]

no overload

Context

[Tree] (config>service>vprn>ospf overload)

[Tree] (config>service>vprn>ospf3 overload)

Full Context

configure service vprn ospf overload

configure service vprn ospf3 overload

Description

This command changes the overload state of the local router so that it appears to be overloaded. When overload is enabled, the router can participate in OSPF routing, but is not used for transit traffic. Traffic destined for directly attached interfaces continue to reach the router.

To put the IGP in an overload state, enter a **timeout** value. The IGP enters the overload state until the **timeout** timer expires or a **no overload** command is executed.

If the **overload** command is performed during the execution of an **overload-on-boot** command, the **overload** command takes precedence. This could occur as a result of a saved configuration file in which both parameters are saved. When the file is saved by the system, the **overload-on-boot** command is saved after the **overload** command.

Use the **no** form of this command to return to the default. When the **no overload** command is executed, the overload state is terminated, regardless the reason the protocol entered overload state.

Default

no overload

Parameters

timeout seconds

Specifies the number of seconds to reset overloading.

Values 60 to1800

Default 60

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

overload

Syntax

overload [**timeout** *seconds*] [**max-metric**]

no overload

Context

[Tree] (config>router>isis overload)

Full Context

configure router isis overload

Description

This command administratively sets the IS-IS router to operate in the overload state for a specific time period, in seconds, or indefinitely.

During normal operation, the router may be forced to enter an overload state because of a lack of resources. When in the overload state, the router is only used if the destination is reachable by the router and is not used for other transit traffic.

If a time period is specified, the overload state persists for the configured length of time. If no time is specified, the overload state operation is maintained indefinitely.

The overload command is cleared from the configuration after a reboot if **overload-on-boot** is configured with or without a timeout value. To keep the IS-IS router in the overload state indefinitely after rebooting, configure **overload-on-boot** with no timeout value or configure the **overload** command with **no overload-on-boot** command.

The **overload** command can be useful in circumstances where the router is overloaded or used before executing a **shutdown** command to divert traffic around the router.

The **max-metric** parameter can be set to advertise transit links with the maximum metric of 0xffffffe (wide metrics) or 0x3f (regular metrics), instead of setting the overload bit when placing the router in overload.

The **no** form of this command causes the router to exit the overload state.

Default

no overload

Parameters

seconds

Specifies the time, in seconds, that this router must operate in overload state.

Default infinity (overload state maintained indefinitely)

Values 60 to 1800

max-metric

Sets the maximum metric instead of overload.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

All

overload

Syntax

overload [**timeout** *seconds*]

no overload

Context

[Tree] (config>router>ospf3 overload)

[Tree] (config>router>ospf overload)

Full Context

configure router ospf3 overload

configure router ospf overload

Description

This command changes the overload state of the local router so that it appears to be overloaded. When overload is enabled, the router can participate in OSPF routing, but is not used for transit traffic. Traffic destined to directly attached interfaces continues to reach the router.

To put the IGP in an overload state enter a timeout value. The IGP will enter the overload state until the timeout timer expires or a **no overload** command is executed.

If the **overload** command is encountered during the execution of an **overload-on-boot** command then this command takes precedence. This could occur as a result of a saved configuration file where both parameters are saved. When the file is saved by the system the **overload-on-boot** command is saved after the **overload** command. **However**, when **overload-on-boot** is configured under OSPF with no timeout value configured, the router will remain in overload state indefinitely after a reboot.

The **no** form of this command reverts to the default. When the **no overload** command is executed, the overload state is terminated regardless of the reason the protocol entered overload state.

Default

no overload

Parameters

timeout seconds

Specifies the number of seconds to reset overloading.

Values 1 to 1800 in the following context.

```
configure router ospf
```

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

60 to 1800 in the following context.

```

configure application-assurance group policy app-qos-policy entry action overload-drop

Description

This command configures a drop action for cases where flow records are not created (overload).

Parameters

event-log-name

Specifies the event log name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

overload-drop

Syntax

overload-drop direction *direction* [**create**]

no overload-drop direction *direction*

Context

[Tree] (config>app-assure>group>statistics>tca overload-drop)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure application-assurance group statistics threshold-crossing-alert overload-drop

Description

This command configures a TCA for the counter capturing drops due to the overload-drop AQP command. An overload-drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating an overload-drop TCA.

Parameters

direction

Specifies the traffic direction.

Values from-sub, to-sub

create

Keyword used to create the TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>router>isis overload-fib-error-notify-only)

Full Context

configure service vprn isis overload-fib-error-notify-only

configure router isis overload-fib-error-notify-only

Description

This command configures the IS-IS router to send a notification when an overload condition occurs when programming the FIB, instead of advertising the overload condition of the router in the IS-IS LSP.

Note: Nokia recommends being careful using this command. When you configure the router not to advertise the IS-IS overload state in the IS-IS LSP, other routers are not instructed to take the overloaded router out of the IS-IS forwarding topology and this will cause suboptimal forwarding and non-deterministic behavior on the overloaded router. To avoid changing the default IS-IS overflow behavior, leave this command disabled.

When this command is configured, the IS-IS router enters a suboptimal state where it only sends a notification trap; the router can still be used by transit traffic in this state. The IS-IS router tracks the segment routing prefix SIDs where FIB programming failed. With the **retry** parameter configured, the router retries programming the segment routing prefix SIDs in the FIB using this tracked information.

When this command is not configured, during normal operation, the system may force the router to enter an overload state because of a lack of FIB resources. In this state, the router is used to terminate traffic and is not used to transit traffic.

The removal of the **overload-fib-error-notify-only** command configuration causes the system to program the failed entries in the FIB by triggering an immediate SPF.

The **no** form of this command causes the router to enter the full overload state.

Default

no overload-fib-error-notify-only

Parameters

seconds

Specifies the time, in seconds, this router uses to retry programming the failed entries in the FIB when **overload-fib-error-notify-only** is configured. The **overload-fib-error-notify-only** command must be configured to use the retry timer.

Values 10 to 1800

Full Context

configure service vpls spb overload-on-boot

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

When the router is in an overload state, SPB the B-VPLS is used only if there is no other SPB B-VPLS to reach the destination. This command configures the IGP upon bootup in the overload state until one of the following events occur:

- The timeout timer expires.
- A manual override of the current overload state is entered with the **no** form of the **config**>**service**>**vpls**>**spb overload** command.

The **no** form of this command does not affect the overload-on-boot function.

If no timeout is specified, SPB IS-IS goes into overload indefinitely after a reboot. After the reboot, the SPB IS-IS status displays a permanent overload state:

```
L1 LSDB Overload: Manual on boot (Indefinitely in overload)
```

This state can be cleared with the **configure service vpls spb no overload**command.

When specifying a timeout value, SPB IS-IS goes into overload for the configured timeout after a reboot. After the reboot, SPB IS-IS status displays the remaining time the system stays in overload:

```
L1 LSDB Overload: Manual on boot (Overload Time Left: 17)
```

The overload state can be cleared before the timeout expires with the **no** form of the **configure service vpls spb overload** command.

The **no** form of this command removes the overload-on-boot functionality from the configuration.

Default

no overload-on-boot

Parameters

seconds

Specifies the time, in seconds, that this router must operate in overload state.

Values 60 to 1800

Default Infinity (overload state maintained indefinitely)

Platforms

All

override-tunnel-elc

Syntax

[**no**] **override-tunnel-elc**

Context

[Tree] (config>router>bgp override-tunnel-elc)

Full Context

configure router bgp override-tunnel-elc

Description

This command enables or disables entropy label capability (ELC) on BGP tunnels.

When this command is enabled, the system assumes that all far ends for BGP tunnels are entropy-label-capable, regardless of any received capability signaling. This ensures that the entropy label will be inserted on BGP tunnels in the absence of capability signaling support by the far end.

This is a system-wide configuration, since efficient entropy label operation requires that all LSRs in a network support entropy labels. This command should be used with care, particularly in inter-AS use cases, since entropy label capability may differ between domains.

Default

no override-tunnel-elc

Full Context

configure service vpls provider-tunnel inclusive owner

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command selects the owner protocol of the inclusive PMSI tunnel in the service. Only one of the protocols will support the provider tunnel.

The **bgp-vpls** and **bgp-evpn-mpls** parameters cannot be configured together in the same service. Although **bgp-ad** and **bgp-evpn** can coexist in the same service, **bgp-ad** cannot be configured as the owner of the provider-tunnel. In addition, the following applies to this configuration:

- The owner must be explicitly set before the provider-tunnel can be **no shutdown**.
- If the owner is **bgp-ad**, then BGP-EVPN MPLS and BGP-EVPN VXLAN will fail to **no shutdown**.
- The provider-tunnel must be shutdown to change the owner; on the fly change is not allowed.

Default

no owner

Parameters

bgp-ad

Specifies that bgp-ad is the owner of the provider-tunnel.

bgp-vpls

Specifies that bgp-vpls is the owner of the provider-tunnel.

bgp-evpn-mpls

Specifies that BGP-EVPN MPLS is the owner of the provider-tunnel.

Platforms

All

[Tree] (config>router>mpls>lsp p2mp-id)

Full Context

configure router mpls lsp p2mp-id

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the identifier of an RSVP P2MP LSP. An RSVP P2MP LSP is fully identified by the combination of: <P2MP ID, tunnel ID, extended tunnel ID> part of the P2MP session object, and <tunnel sender address, LSP ID> fields in the p2mp sender_template object.

The **p2mp-id** is a 32-bit identifier used in the session object that remains constant over the life of the P2MP tunnel. It is unique within the scope of the ingress LER.

The **no** form restores the default value of this parameter.

This command is not supported on the 7450 ESS.

Default

0

Parameters

id

Specifies a P2MP identifier.

Values 0 to 65535

Platforms

Context

[Tree] (config>service>vprn>pim>if p2mp-ldp-tree-join)

Full Context

configure service vprn pim interface p2mp-ldp-tree-join

Description

This command configures the option to join P2MP LDP tree toward the multicast source for the VPRN service. If p2mp-ldp-tree-join is enabled, a PIM multicast join received on an interface is processed to join P2MP LDP LSP using the in-band signaled P2MP tree for the same multicast flow. LDP P2MP tree is setup toward the multicast source. Route to source of the multicast node is looked up from the RTM. The next-hop address for the route to source is set as the root of LDP P2MP tree.

The **no** form of command disables joining P2MP LDP tree for IPv4 or IPv6 or both (if both or none is specified).

Default

no p2mp-ldp-tree-join

Parameters

ipv4

Enables dynamic mLDP in-band signaling for IPv4 PIM joins. IPv4 multicast must be enabled; see **ipv4-multicast-disable**. For backward compatibility **p2mp-ldp-tree-join** is equivalent to **p2mp-ldp-tree-join ipv4**.

ipv6

Enables dynamic mLDP in-band signaling for IPv6 PIM joins. IPv6 multicast must be enabled; see **ipv6-multicast-disable**.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

oam p2mp-lsp-ping

Description

This command performs an in-band connectivity test for an RSVP P2MP LSP. The Echo Request message is sent on the active P2MP instance and replicated in the datapath over all branches of the P2MP LSP instance. By default, all egress LER nodes that are leaves of the P2MP LSP instance reply to the Echo Request message.

Use the LDP P2MP generic identifier, along with source IP address of the head-end node, to uniquely identify the LDP P2MP LSP in a 7750 SR or 7950 XRS network. Use the LDP **p2mp-identifier** mandatory parameter to test LSP ping. A user must use the LDP P2MP identifier specified to configure a tunnel interface on the head-end node as **p2mp-identifier** to test a specific LSP.

Use the P2MP-policy option, along with the root-address tree ID and instance ID to identify a tree SID candidate path and instance to send an in-band Echo Request to all the leaves and bud nodes on that P2MP policy tree.

To reduce the scope of the Echo Reply messages, explicitly enter a list of addresses for the egress LER nodes that are required to reply. A maximum of five addresses can be specified in a single run of the **p2mp-lsp-ping** command. An LER node can parse the list of egress LER addresses and, if its address is included in the list, send back an Echo Reply message.

The output of the command without the **detail** keyword provides a high-level summary of received error codes and success codes. The output of the command with the **detail** keyword shows a line for each replying node, as in the output of the LSP ping for a P2P LSP.

The display is delayed until all responses are received or the timer configured in the **timeout** parameter expires. No other CLI commands can be entered while waiting for the display. Entering A ^C aborts the ping operation.

Note: The **p2mp-lsp-ping** command is not supported in a VPLS/B-VPLS PMSI context.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **configure test-oam mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, the timestamp is in seconds and microseconds since 1900; otherwise, it is in seconds and microseconds since 1970.

Parameters

detail

Displays detailed P2MP LSP information.

fc-name

Specifies the **fc** and **profile** parameters used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the EXP of the packet is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, the **fc** and **profile** parameter values are dictated by the LSP-EXP mappings of the incoming interface.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When an MPLS echo reply packet is generated in CPM and forwarded to the outgoing interface, the packet is queued in an egress network queue. This queue is selected according to the **fc** and **profile** parameter values determined by the classification of the echo request packet that is being replied to at the incoming interface. The marking of the EXP of the packet is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. The following table describes this behavior.

Table 94: p2mp-lsp-ping Request Packet and Behavior

Request Packet	Behavior
CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by the user in the OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

instance-id

Specifies the path instance ID on the root.

instance-name

Specifies the name, up to 32 characters, of the specific instance of the P2MP LSP to send the echo request.

label-ttl

Specifies the TTL value for the MPLS label, expressed as a decimal integer.

Values 1 to 255

Default 255

leaf-addr *ipv4-address*

Specifies up to five egress LER system addresses that are required to reply to the LSP ping Echo Request message as defined in RFC 6425 (applies to the 7750 SR and 7950 XRS only).

Values ipv4-address: a.b.c.d

lsp-name

Specifies the name, up to 64 characters, that identifies an P2MP LSP to ping.

ldp-ssm

Specifies a specific multicast stream to be tested when using dynamic multicast in mLDP. The source and group addresses correspond to the <S,G> being advertised by this mLDP FEC.

Values

source	*ipv4-address*	*a.b.c.d*
	ipv6-address	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x - [0 to FFFF]H
		d - [0t o 255]D
group	*mcast-address*	
	mcast-v6-address	
router	*router-name*	Base | management
		Default - Base
	service-id	[1 to 2147483647]
	service-name	up to 64 characters

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sender-addr	*ipv4-address*	*a.b.c.d*
leaf-addr	*ipv4-address*	*a.b.c.d*

p2mp-identifier

Specifies the identifier for an LDP P2MP LSP to ping (applies to the 7750 SR and 7950 XRS only).

Values 1 to 4294967295

profile {in | out}

Specifies the profile of the LSP ping Echo Request message.

Default out

octets

Specifies the size of the MPLS echo request packet in octets, expressed as a decimal integer, including the IP header but not the label stack. The request payload is padded with zeros to the specified size.

Note: An OAM command is not failed if the user enters a size lower than the minimum required to build the packet for the Echo Request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

root-address *ipv4-address*

Specifies the IPv4 identifier of the root.

Note: IPv6 is not supported.

root-tree-id *tree-id*

Specifies the tree identifier of the P2MP LSP on the root.

s2l-dest-addr *ipv4-address*

Specifies up to five egress LER system addresses that are required to reply to the LSP ping Echo Request message.

sender-addr *ipv4-address*

Specifies the IPv4 address used in the ICMP packet configured as the source IP of the UDP ICMP packet and used for the echo reply destination IP address (applies to the 7750 SR and 7950 XRS only).

Note: By default, the source IP address of the ICMP packet is set to the root address. When the sender address is set this source address is changed to the sender address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

timeout

Specifies the time, in seconds, that is used to override the default *timeout* value and is the amount of time that the router waits for an Echo Reply message from all leaves of the P2MP LSP after sending the message request message. After the expiration of the message time out, the requesting router no longer waits for reply messages. Any Echo Reply message received after the request times out is silently discarded.

Values 1 to 120

Default 10

vpn-recursive-fec

Specifies a VPN recursive FEC element to the launched packet (useful for pinging a VPN BGP inter-AS Option B leaf). This parameter issues an OAM **p2mp-lsp-ping** with RFC 6512 VPN recursive opaque FEC type 8.

See the "OAM" subsection of the "Label Distribution Protocol" chapter in the *7450 ESS, 7750 SR, 7950 XRS, and VSR MPLS Guide* for more information.

p2mp-lsp-trace *lsp-name* **p2mp-instance** *instance-name* **s2l-dest-address** *ip-address* [**fc** *fc-name* [**profile** {**in** | **out**}]] [**size** *octets*] [**max-fail** *no-response-count*] [**probe-count** *probes-per-hop*] [**min-ttl** *min-label-ttl*] [**max-ttl** *max-label-ttl*] [**timeout** *timeout*] [**interval** *interval*] [**detail**]

Context

[Tree] (oam p2mp-lsp-trace)

Full Context

oam p2mp-lsp-trace

Description

This command discovers and displays the hop-by-hop path for a source-to-leaf (S2L) sub-LSP of an RSVP P2MP LSP.

The LSP trace capability allows the user to trace the path of a single S2L path of a P2MP LSP. Its operation is like **p2mp-lsp-ping**, but the sender of the echo reply request message includes the downstream mapping TLV to request the downstream branch information from a branch LSR or bud LSR. The branch LSR or bud LSR also includes the downstream mapping TLV to report the information

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

about the downstream branches of the P2MP LSP. An egress LER does not include this TLV in the echo response message.

The parameter probe-count operates in the same way as in LSP Trace on a P2P LSP. It represents the maximum number of probes sent per TTL value before stops waiting for Echo Reply messages. If a response is received from the traced node before reaching maximum number of probes, then no more probes are sent for the same TTL. The sender of the echo request then increments the TTL and uses the information it received in the downstream mapping TLV to start sending probes to the node downstream of the last node which replied. This continues until the egress LER for the traced S2L path replies.

Like **p2mp-lsp-ping**, an LSP trace probe reports on all egress LER nodes that eventually receive the Echo Request message, but only the traced egress LER node replies to the last probe.

Any branch LSR node or bud LSR node in the P2MP LSP tree may receive a copy of the Echo Request message with the TTL in the outer label expiring at this node. However, only a branch LSR or bud LSR that has a downstream branch over which the traced egress LER is reachable responds.

When a branch LSR or bud LSR responds, it sets the global return code in the echo response message to RC=14 - "See DDMAP TLV for Return Code and Return Sub-Code" and the return code in the DDMAP TLV corresponding to the outgoing interface of the branch used by the traced S2L path to RC=8 - "Label switched at stack-depth <RSC>". Note that **p2mp-lsp-trace** is not supported in a VPLS/B-VPLS PMSI context.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Parameters

lsp-name

Specifies the name that identifies an P2MP LSP, up to 64 characters, to ping.

instance-name

Specifies the name, up to 32 characters, of the specific instance of the P2MP LSP to send the echo request.

ip-address

Specifies the egress LER system address of the S2L sub-LSP path which is being traced.

Values a.b.c.d

fc-name

Specifies the **fc** and **profile** parameters are used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, the **fc** and **profile** parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in an egress network queue. The egress network queue is selected according to the **fc** and **profile** parameter values determined by the classification

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

of the echo request packet that is being replied to at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. Table 95: p2mp-lsp-trace Request Packet and Behavior summarizes this behavior.

Table 95: p2mp-lsp-trace Request Packet and Behavior

Request Packet	Behavior
CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet{tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

Values be, l2, af, l1, h2, ef, h1, nc

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default be

profile {in | out}

Specifies the profile of the LSP trace echo request message.

Default out

octets

Specifies the size in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request payload is padded with zeros to the specified size. Note that an OAM command is not failed if the user enters a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

no-response-count

Specifies the maximum number of consecutive MPLS echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL.

Values 1 to 10

Default 5

probes-per-hop

Specifies the number of LSP trace echo request messages to send per TTL value.

Values 1 to 10

Default 1

min-label-ttl

Specifies the minimum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

Values 1 to 255

Default 1

max-label-ttl

Specifies the maximum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

Values 1 to 255

Default 30

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for an echo reply message from all leaves of the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

P2MP LSP after sending the message request message. Upon the expiration of the message time out, the requesting router no longer waits for reply messages. Any echo reply message received after the request times out is silently discarded.

Values 1 to 60

Default 3

interval

Specifies the time, in seconds, used to override the default echo request message send interval and defines the minimum amount of time that must expire before the next echo request message is sent.

If the **interval** is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of an echo reply message corresponding to the outstanding message request.

33.8 p2mp-merge-point-abort-timer

p2mp-merge-point-abort-timer

Syntax

p2mp-merge-point-abort-timer *seconds*

no p2mp-merge-point-abort-timer

Context

[Tree] (config>router>rsvp p2mp-merge-point-abort-timer)

Full Context

configure router rsvp p2mp-merge-point-abort-timer

Description

This command configures a timer to abort Merge-Point (MP) node procedures for an S2L of a P2MP LSP instance. When a value higher than zero is configured for this timer, it enters into effect anytime this node activates Merge-Point procedures for one or more P2MP LSP S2L paths. As soon an ingress interface goes operationally down, the Merge-Point node starts the abort timer. Upon expiry of the timer, MPLS cleans up all P2MP LSP S2L paths which ILM is on the failed interface and which have not already received a Path refresh over the bypass LSP.

The **no** form of this command disables the timer.

Default

no p2mp-merge-point-abort-timer

Parameters

seconds

Specifies the length of the abort timer in seconds

Values 1 to 65535

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

33.9 p2mp-policy

p2mp-policy

Syntax

[**no**] **p2mp-policy** *policy-name*

Context

[Tree] (config>router>p2mp-sr-tree p2mp-policy)

Full Context

configure router p2mp-sr-tree p2mp-policy

Description

This command creates a P2MP policy entry for the P2MP SR tree.

The **no** form of this command deletes the specified policy entry.

Parameters

policy-name

Specifies the policy name, up to 32 characters.

Platforms

All

33.10 p2mp-policy-mpls

p2mp-policy-mpls

configure service vprn mvpn provider-tunnel selective p2mp-sr p2mp-policy-mpls

configure service vprn mvpn provider-tunnel selective multistream-spmsi p2mp-policy-mpls

Description

This command enables a P2MP policy for the MVPN provider tunnel.

The **no** form of this command disables the P2MP policy.

Platforms

All

33.11 p2mp-resignal-timer

p2mp-resignal-timer

Syntax

p2mp-resignal-timer *minutes*

no p2mp-resignal-timer

Context

[Tree] (config>router>mpls p2mp-resignal-timer)

Full Context

configure router mpls p2mp-resignal-timer

Description

This command configures the re-signal timer for a P2MP LSP instance. MPLS requests CSPF to re-compute the whole set of S2L paths of a given active P2MP instance each time the P2MP re-signal timer expires. The P2MP re-signal timer is configured separately from the P2P LSP parameter. MPLS performs a global MBB and moves each S2L sub-LSP in the instance into its new path using a new P2MP LSP ID if the global MBB is successful, regardless of the cost of the new S2L path.

This command is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

The **no** form of this command disables the timer-based re-signaling of P2MP LSPs on this system.

Parameters

minutes

Specifies the time MPLS waits before attempting to re-signal the P2MP LSP instance.

Values 60 to 10080

Platforms

All

33.15 p2mp-template-lsp

p2mp-template-lsp

Syntax

[**no**] **p2mp-template-lsp rsvp-session-name** *SessionNameString* **sender** *sender-address*

Context

[Tree] (config>router>mpls>ingress-stats p2mp-template-lsp)

Full Context

configure router mpls ingress-statistics p2mp-template-lsp

Description

This command configures an ingress statistics context matching on the RSVP session name for a RSVP P2MP LSP at the egress LER.

This command is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

When the ingress LER signals the path of the S2L sub-LSP, it includes the name of the LSP and that of the path in the Session Name field of the Session Attribute object in the Path message. The encoding is as follows:

Session Name: <lsp-name::path-name>, where lsp-name component is encoded as follows:

- P2MP LSP through the user configuration for L3 multicast in global routing instance: "LspNameFromConfig”
- P2MP LSP as I-PMSI or S-PMSI in L3 mVPN: templateName-SvcId-mTTmIndex
- P2MP LSP as I-PMSI in VPLS/B-VPLS: templateName-SvcId-mTTmIndex

The ingress statistics CLI configuration allows the user to match either on the exact name of the P2MP LSP as configured at the ingress LER or on a context that matches on the template name and the service-id as configured at the ingress LER.

When the matching is performed on a context, the user must enter the RSVP session name string in the format "templateName-svcId” to include the LSP template name as well as the mVPN VPLS/B-VPLS service ID as configured at the ingress LER. In this case, one or more P2MP LSP instances signaled by the same ingress LER could be associated with the ingress statistics configuration and the user is provided

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

with CLI parameter max-stats to limit the maximum number of stat indexes that can be assigned to this context. If the context matches more than this value, the additional request for stat indices from this context is rejected. A background tasks monitors the ingress statistics templates which have one or more matching LSP instances with unassigned stat index and assigns one to them as they are freed.

Note the following rules when configuring an ingress statistics context based on template matching:

- max-stats, after allocated, can be increased but not decreased unless the entire ingress statistics context matching a template name is deleted.
- To delete ingress statistics context matching a template name, a shutdown is required.
- An accounting policy cannot be configured or de-configured until the ingress statistics context matching a template name is shut down.
- After deleting an accounting policy from an ingress statistics context matching a template name, the policy is not removed from the log until a "no shut” is performed on the ingress statistics context.

If there are no stat indexes available at the time the session of the P2MP LSP matching a template context is signaled and the session state installed by the egress LER, no stats are allocated to the session.

Furthermore, the assignment of stat indexes to the LSP names that match the context will also be not deterministic. The latter is due to the fact that a stat index is assigned and released following the dynamics of the LSP creation or deletion by the ingress LER. For example, a multicast stream crosses the rate threshold and is moved to a newly signaled S-PMSI dedicated to this stream. Later on, the same steam crosses the threshold downwards and is moved back to the shared I-PMSI and the P2MP LSP corresponding to the S-PMSI is deleted by the ingress LER.

The **no** form deletes the ingress statistics context matching on the RSVP session name.

Parameters

rsvp-session-name *SessionNameString*

Specifies the name of the RSVP P2MP session in the format of "templateName-svcId”. This field can hold up to 64 characters.

sender *sender-address*

Specifies a string of 15 characters representing the IP address of the ingress LER for the LSP.

Context

[Tree] (config>router>mpls>ingress-stats p2p-template-lsp)

Full Context

configure router mpls ingress-statistics p2p-template-lsp

Description

This command configures an ingress statistics context matching on the RSVP session name for a RSVP P2P auto-LSP at the egress LER.

When the ingress LER signals the path of a template based **one-hop-p2p** or **mesh-p2p auto-lsp**, it includes the name of the LSP and that of the path in the Session Name field of the Session Attribute object in the Path message. The encoding is as follows:

Session Name: *lsp-name::path-name*, where *lsp-name* component is encoded as follows:

P2MP LSP through the user configuration for Layer 3 multicast in global routing instance: "LspNameFromConfig”

- P2MP LSP as I-PMSI or S-PMSI in L3 mVPN: templateName-SvcId-mTTmIndex
- P2MP LSP as I-PMSI in VPLS/B-VPLS: templateName-SvcId-mTTmIndex.

The ingress statistics CLI configuration allows the user to match either on the exact name of the P2P auto-LSP or on a context that matches on the template name and the destination of the LSP at the ingress LER.

When the matching is performed on a context, the user must enter the RSVP session name string in the format "templateName-svcId” to include the LSP template name as well as the mVPN VPLS/B-VPLS service ID as configured at the ingress LER. In this case, one or more P2MP LSP instances signaled by the same ingress LER could be associated with the ingress statistics configuration. The user is provided with CLI parameter max-stats to limit the maximum number of stat indices which can be assigned to this context. If the context matches more than this value, the additional request for stat indices from this context is rejected.

Note the following rules when configuring an ingress statistics context based on template matching:

- **max-stats**, once allocated, can be increased but not decreased unless the entire ingress statistics context matching a template name is deleted.
- To delete ingress statistics context matching a template name, a shutdown is required.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- An accounting policy cannot be configured or de-configured until the ingress statistics context matching a template name is shut down.
- After deleting an accounting policy from an ingress statistics context matching a template name, the policy is not removed from the log until a **no shut** is performed on the ingress statistics context.

If there are no stat indexes available at the time the session of the P2P LSP matching a template context is signaled and the session state installed by the egress LER, no stats are allocated to the session.

Furthermore, the assignment of stat indexes to the LSP names that match the context is not deterministic. The latter is because a stat index is assigned and released following the dynamics of the LSP creation or deletion by the ingress LER. For example, a multicast stream crosses the rate threshold and is moved to a newly signaled S-PMSI dedicated to this stream. Later on, the same steam crosses the threshold downwards and is moved back to the shared I-PMSI and the P2MP LSP corresponding to the S-PMSI is deleted by the ingress LER.

The **no** form deletes the ingress statistics context matching on the RSVP session name.

Parameters

rsvp-session-name *SessionNameString*

Specifies the name of the RSVP P2MP session in the format of "templateName-svcId". This field can hold up to 64 characters.

sender *sender-address*

Specifies a string of 15 characters representing the IP address of the ingress LER for the LSP.

packet

Syntax

packet jitter-buffer *milliseconds* [**payload-size** *bytes*]

packet payload-size *bytes*

no packet

Context

[Tree] (config>mirror>mirror-dest>sap>cem packet)

Full Context

configure mirror mirror-dest sap cem packet

Description

This command specifies the jitter buffer size, in milliseconds, and payload size, in bytes.

Default

The default value depends on the CEM SAP endpoint type, and if applicable, the number of timeslots.

Table 96: Packet CEM SAP Endpoint Types

Endpoint Type	Timeslots	Default Jitter Buffer (in ms)
unstructuredE1	n/a	5
unstructuredT1	n/a	5
unstructuredE3	n/a	5
unstructuredT3	n/a	5
nxDS0 (E1/T1)	N = 1	32
	N = 2 to 4	16
	N = 5 to 15	8
	N >= 16	5
nxDS0WithCas (E1)	N	8
nxDS0WithCas (T1)	N	12

Parameters

milliseconds

Specifies the jitter buffer size in milliseconds (ms).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Configuring the payload size and jitter buffer to values that result in less than 2 packet buffers or greater than 32 packet buffers is not allowed.

Setting the jitter butter value to 0 sets it back to the default value.

Values 1 — 250

bytes

Specifies the payload size (in bytes) of packets transmitted to the packet service network (PSN) by the CEM SAP. This determines the size of the data that will be transmitted over the service. If the size of the data received is not consistent with the payload size then the packet is considered malformed.

Default The default value depends on the CEM SAP endpoint type, and if applicable, the number of timeslots.

Table 97: CEM SAP Endpoint Types

Endpoint Type	Timeslots	Default Payload Size (in bytes)
unstructuredE1	n/a	256
unstructuredT1	n/a	192
unstructuredE3	n/a	1024
unstructuredT3	n/a	1024
nxDS0 (E1/T1)	N = 1	64
	N = 2 to 4	N x 32
	N = 5 to 15	N x 16
	N >= 16	N x 8
nxDS0WithCas (E1)	N	N x 16
nxDS0WithCas (T1)	N	N x 24

For all endpoint types except for nxDS0WithCas, the valid payload size range is from the default to 2048 bytes.

For nxDS0WithCas, the payload size divide by the number of timeslots must be an integer factor of the number of frames per trunk multiframe (for example, 16 for E1 trunk and 24 for T1 trunk).

For 1xDS0, the payload size must be a multiple of 2.

For NxDS0, where N > 1, the payload size must be a multiple of the number of timeslots.

For unstructuredE1, unstructuredT1, unstructuredE3 and unstructuredT3, the payload size must be a multiple of 32 bytes.

Configuring the payload size and jitter buffer to values that result in less than 2 packet buffers or greater than 32 packet buffer is not allowed.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Setting the payload size to 0 sets it back to the default value.

Values 16 to 2048

Full Context

debug oam build-packet packet

Description

This command configures a packet to be launched by the OAM **find-egress** tool.

The **no** form of this command removes the packet number value.

Parameters

packet-number

Specifies a packet to be launched by the OAM **find-egress** tool.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (debug>eth-cfm>mip packet)

Full Context

debug eth-cfm mep packet

debug eth-cfm mip packet

Description

This command defines the ETH-CFM opcodes of interest to be debugged.

The **no** form of this command stops packet debugging and the collection of PDUs.

Parameters

all

Specifies that debugging is enabled for all ETH-CFM packets.

opcode

Specifies a standard numerical reference or common three-letter acronym (TLA) that identifies the CFM PDU type. Up to five opcodes can be specified, and a combination of both numbers and TLAs can be used.

MEPs support all opcodes.

MIPs support 2 (LBR), 3 (LBM), 4 (LTR), and 5 (LTM).

Unknown or unsupported opcodes in TLA form are rejected. The applicable numerical opcode can be used instead. When numerical references are used, they are converted to a known TLA or left in numerical form if the TLA is unknown.

Re-entering the **packet** command overwrites the previous opcode entries for the MEP or MIP.

Values MEP: 1 to 255 | common TLA

MIP: 2 to 5 | common TLA

Description

This command enables debugging for IP packets.

Parameters

ip-int-name

Only displays the interface information associated with the specified IP interface name.

Values 32 characters maximum

ip-address

Only displays the interface information associated with the specified IP address.

headers

Only displays information associated with the packet header.

protocol-id

Specifies the decimal value representing the IP protocol to debug. Well-known protocol numbers include ICMP(1), TCP(6), UDP(17). The **no** form the command removes the protocol from the criteria.

Values 0 to 255 (values can be expressed in decimal, hexadecimal, or binary)

no packet-byte-offset

Context

[Tree] (config>qos>sap-egress>dynamic-queue packet-byte-offset)

Full Context

configure qos sap-egress dynamic-queue packet-byte-offset

Description

This command configures the packet-byte offset the system uses to modify the size of the input packets handled by the queue, by adding or subtracting the specified number of bytes. This also applies to any charging statistics. The actual packet size is not modified, only the size used to determine the egress scheduling and profiling is changed.

Parameters

add *bytes*

Specifies the packet byte offset. The **add** keyword is mutually exclusive to the **subtract** keyword. Either **add** or **subtract** must be specified. When **add** is defined the corresponding bytes parameter specifies the number of bytes that is added to the size each packet.

Values 0 to 31

Default 0

subtract *bytes*

Specifies the packet byte offset. The **subtract** keyword is mutually exclusive to the **add** keyword. Either **add** or **subtract** must be specified. When defined, the corresponding

Full Context

configure subscriber-mgmt sla-profile ingress qos policer packet-byte-offset

configure subscriber-mgmt sla-profile egress qos policer packet-byte-offset

Description

This command is used to modify the size of each packet handled by the policer by adding or subtracting a number of bytes. The actual packet size is not modified; only the size used to determine the bucket depth impact is changed. The **packet-byte-offset** command is meant to be an arbitrary mechanism the can be used to either add downstream frame encapsulation or remove portions of packet headers. Both the policing metering and profiling throughput is affected by the offset as well as the stats associated with the policer.

When child policers are adding to or subtracting from the size of each packet, the parent policer's **min-thresh-separation** value should also need to be modified by the same amount.

The policer's **packet-byte-offset** defined in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. Packet byte offset settings are not included in the applied rate when (queue) frame based accounting is configured and the policer is managed by HQoS, however the offsets are applied to the statistics.

The **no** form of this command removes the per packet size modifications from the policer.

Parameters

add *bytes*

Specifies the packet byte offset. The **add** keyword is mutually exclusive to the **subtract** keyword. Either **add** or **subtract** must be specified. When **add** is defined the corresponding bytes parameter specifies the number of bytes that is added to the size each packet associated with the policer for rate metering, profiling and accounting

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

purposes. From the policer's perspective, the maximum packet size is increased by the amount being added to the size of each packet.

Values 0 to 31

subtract *bytes*

Specifies the packet byte offset. The **subtract** keyword is mutually exclusive to the **add** keyword. Either **add** or **subtract** must be specified. When b is defined the corresponding bytes parameter specifies the number of bytes that is subtracted from the size of each packet associated with the policer for rate metering, profiling and accounting purposes. From the policer's perspective, the maximum packet size is reduced by the amount being subtracted from the size of each packet.

Note:
The minimum resulting packet size used by the system is 1 byte.

Values ingress 1 to 32
egress: 1 to 64

no packet-byte-offset

Context

[Tree] (config>qos>sap-ingress>queue packet-byte-offset)

Full Context

configure qos sap-ingress queue packet-byte-offset

Description

This command modifies the size of each packet handled by the queue by adding or subtracting the specified number of bytes. The actual packet size is not modified, only the size used to determine the ingress scheduling and profiling is changed. The **packet-byte-offset** command is an arbitrary mechanism

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

that can be used to either add downstream frame encapsulation or remove portions of packet headers. Both the scheduling and profiling throughput is affected by the offset as well as the statistics (accounting) associated with the queue. The **packet-byte-offset** does not apply to drop statistics, received valid statistics, or the offered managed and unmanaged statistics used by Ingress Multicast Path Management.

The **no** form of this command removes per-packet size modifications from the queue.

Parameters

add-bytes

Specifies the number of bytes added to the size of each packet associated with the queue for scheduling, profiling, and accounting purposes. From the queue's perspective, the packet size is increased by the amount specified.

Values 0 to 30, in increments of 2

sub-bytes

Specifies the number of bytes subtracted from the size of each packet associated with the queue for scheduling, profiling, and accounting purposes. From the queue's perspective, the packet size is reduced by the amount specified. The minimum resulting packet size used by the system is 1 byte.

Values 0 to 64, in increments of 2

packet-byte-offset

Syntax

packet-byte-offset {**add** *add-bytes* | **subtract** *sub-bytes*}

no packet-byte-offset

Context

[Tree] (config>qos>sap-egress>queue packet-byte-offset)

Full Context

configure qos sap-egress queue packet-byte-offset

Description

This command is used to modify the size of each packet handled by the queue by adding or subtracting a number of bytes. The actual packet size is not modified; only the size used to determine the bucket depth impact is changed.

The packet-byte-offset command is meant to be an arbitrary mechanism the can be used to either add downstream frame encapsulation or remove portions of packet headers.

When a packet-byte-offset value is applied to a queue instance, it adjusts the immediate packet size. This means that the queue rates, in other words, operational PIR and CIR, and queue bucket updates use the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

adjusted packet size. In addition, the queue statistics also reflects the adjusted packet size. Scheduler policy rates, which are data rates, uses the adjusted packet size.

The port scheduler max-rate and the priority level rates and weights, if a Weighted Scheduler Group is used, are always on-the-wire rates and uses the actual frame size. The same applies for the agg-rate-limit on a SAP, a subscriber, or a multiservice Site (MSS) when the queue is port-parented.

When the user enables frame-based-accounting in a scheduler policy or queue-frame-based-accounting with agg-rate-limit in a port scheduler policy, the queue rate will be capped to a user-configured on-the-wire rate and the packet-byte-offset is not included. However, the offsets are applied to the statistics.

The **no** form of this command is used to remove per packet size modifications from the queue.

Parameters

add-bytes

The **add** keyword is mutually exclusive to the **subtract** keyword. Either parameter must be specified. When **add** is defined, the corresponding bytes parameter specifies the number of bytes that is added to the size of each packet associated with the queue for scheduling and accounting purposes.

Values 0 to 32

sub-bytes

The **subtract** keyword is mutually exclusive to the **add** keyword. Either parameter must be specified. When subtract is defined, the corresponding bytes parameter specifies the number of bytes that is subtracted from the size of each packet associated with the queue for scheduling and accounting purposes. The minimum resulting packet size used by the system is 1 byte.

33.35 pad-tlv-size

pad-tlv-size

Syntax

pad-tlv-size *octets*

no pad-tlv-size

Context

[Tree] (config>oam-pm>session>mpls>dm pad-tlv-size)

Full Context

configure oam-pm session mpls dm pad-tlv-size

Description

This command allows the operator to add an optional Pad TLV to PDU and increase the frame on the wire by the specified amount. Note that this command only configures the size of the padding added to the PDU, and does not configure the total size of the frame on the wire. Since the bit count for the length is a maximum of 255 (8bits) the maximum pad per pad-tlv is between 0, 2 and 257 (type 1B, Length 1B, Length 255). Only a single pad-tlv can be added.

The **no** form of this command removes the optional TLV.

Parameters

octets

Specifies the overall length of the pad-tlv.

Values 0, 2 to 257

Default 0

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

pad-tlv-size

Syntax

pad-tlv-size *octets*

no pad-tlv size

Context

[Tree] (config>test-oam>link-meas>template>twl pad-tlv-size)

Full Context

configure test-oam link-measurement measurement-template twamp-light pad-tlv-size

Description

This command configures an optional pad TLV size that allows a STAMP PDU to include the PAD TLV. This increases the size of the STAMP PDU by the size of the added TLV. The PAD TLV includes an all-zeros pattern.

Note: This command only applies when the Session-Sender type is **stamp**. It has no effect when the Session-Sender type is **twamp-light**.

The **no** form of this command disables adding a PAD TLV to the STAMP PDU.

Default

no padding

Parameters

octets

Specifies the length of the PAD TLV.

Values 4 to 9714

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context

[Tree] (config>oam-pm>session>ip>twamp-light pad-tlv-size)

Full Context

configure oam-pm session ip twamp-light pad-tlv-size

Description

This command configures the PAD TLV to be included in the STAMP test packet with a total byte count equivalent to the value of this leaf.

TWAMP Light does not support TLVs. To pad the size of the TWAMP Light test packet the user must configure the **pad-size** command. STAMP test packets (the standard form of TWAMP Light) introduces TLVs for padding. Therefore, STAMP test packets must use the pad-tlv-size value.

The **no** form of this command removes the TWAMP Light test function from the OAM-PM session.

Parameters

test-id

Specifies the value of the 4-byte local test identifier not sent in the TWAMP Light packets.

Values 0 to 2147483647

create

Creates the test.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

33.40 parallel

parallel

Syntax

parallel [**no-advertise**]

no parallel

Context

[Tree] (config>router>ospf>segm-rtng>adjacency-set parallel)

[Tree] (config>router>isis>segm-rtng>adjacency-set parallel)

Full Context

configure router ospf segment-routing adjacency-set parallel

configure router isis segment-routing adjacency-set parallel

Description

This command indicates that all members of the adjacency set must terminate on the same neighboring node. The system raises a trap if a user attempts to add an adjacency terminating on a neighboring node that differs from the existing members of the adjacency set. In addition, the system stops advertising the adjacency set in IS-IS or OSPF and locally deprograms it.

By default, parallel adjacency sets are advertised in the IGP. The **no-advertise** option prevents an adjacency set from being advertised in the IGP. It is only allowed in CLI and SNMP if the **parallel** command is configured.

The **no** form of this command indicates that the adjacency set can include adjacencies to different next hop nodes.

Default

parallel

33.42 parent

parent

Syntax

parent [**weight** *weight*] [**cir-weight** *cir-weight*]

no parent

Context

[Tree] (config>port>ethernet>access>egr>qgrp>qover>q parent)

Full Context

configure port ethernet access egress queue-group queue-overrides queue parent

Description

This command, when used in the *queue-overrides* context for a queue group queue, defines an optional **weight** and **cir-weight** for the queue treatment by the parent scheduler that further governs the available bandwidth for the queue aside from the queue PIR setting. When multiple schedulers and or queues share a child status with the parent scheduler, the weight or level parameters define how this queue contends with the other children for the parent bandwidth.

Parameters

weight

Specifies the relative weight of this queue in comparison to other child schedulers and queues while vying for bandwidth on the parent scheduler-name. Any queues or schedulers defined as weighted receive no parental bandwidth until all strict queues and schedulers on the parent have reached their maximum bandwidth or are idle. In this manner, weighted children are considered to be the lowest priority.

Values 0 to 100

Default 1

cir-weight

Specifies the weight the queue uses at the within-cir port priority level. The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-cir pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 100

© 2026 Nokia.

no parent

Context

[Tree] (config>port>ethernet>access>egr>qgrp>sched-override>scheduler parent)

[Tree] (config>port>ethernet>access>ing>qgrp>sched-override>scheduler parent)

Full Context

configure port ethernet access egress queue-group scheduler-override scheduler parent

configure port ethernet access ingress queue-group scheduler-override scheduler parent

Description

This command can be used to override the scheduler's parent weight and CIR weight. The weights apply to the associated level/cir-level configured in the applied scheduler policy. The scheduler name must exist in the applied scheduler policy.

The override weights are ignored if the scheduler does not have a parent command configured in the scheduler policy - this allows the parent of the scheduler to be removed from the scheduler policy without having to remove all of the queue group overrides. If the parent scheduler does not exist, causing the configured scheduler to be fostered on an egress port scheduler, the override weights will be ignored and the default values used; this avoids having non-default weightings for fostered schedulers.

The **no** form of this command returns the scheduler's parent weight and cir-weight to the value configured in the applied scheduler policy.

Default

no parent

Parameters

weight

Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same strict level defined by the level parameter in the applied scheduler policy. Within the level, all weight values from active children at that level are summed and the ratio of each active child's weight to the total distributes the available bandwidth at that level. A weight is considered to be active when the queue or scheduler the weight pertains to has not reached its maximum rate and still has packets to transmit.

A 0 (zero) weight value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict level.

Values 0 to 100

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

cir-weight

Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same cir-level defined by the cir-level parameter in the applied scheduler policy. Within the strict cir-level, all cir-weight values from active children at that level are summed and the ratio of each active child's cir-weight to the total distributes the available bandwidth at that level. A cir-weight is considered to be active when the policer, queue, or scheduler that the cir-weight pertains to has not reached the CIR and still has packets to transmit.

A 0 (zero) cir-weight value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict cir-level.

Values 0 to 100

configure service cpipe sap egress queue-override queue parent

configure service ipipe sap egress queue-override queue parent

configure service ipipe sap ingress queue-override queue parent

configure service epipe sap ingress queue-override queue parent

configure service epipe sap egress queue-override queue parent

Description

This command defines an optional parent scheduler that further governs the available bandwidth given the queue aside from the queue's PIR setting. When multiple schedulers and/or queues share a child status with the parent scheduler, the **weight** or **level** parameters define how this queue contends with the other children for the parent's bandwidth.

Checks are not performed to see if a *scheduler-name* exists when the parent command is defined on the queue. Scheduler names are configured in the **config>qos>scheduler-policy>tier** *level* context. Multiple schedulers can exist with the *scheduler-name* and the association pertains to a scheduler that should exist on the egress SAP as the policy is applied and the queue created. When the queue is created on the egress SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly or indirectly applied (through a multi-service customer site) to the egress SAP. If the *scheduler-name* does not exist, the queue is placed in the orphaned operational state. The queue will accept packets but will not be bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP. The orphaned state must generate a log entry and a trap message. The SAP which the queue belongs to must also depict an orphan queue status. The orphaned state of the queue is automatically cleared when the *scheduler-name* becomes available on the egress SAP.

The parent scheduler can be made unavailable due to the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the queue enters the orphaned state and automatically returns to normal operation when the parent scheduler is available again.

When a parent scheduler is defined without specifying weight or strict parameters, the default bandwidth access method is weight with a value of 1.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and returns without an error. Once a parent association has been removed, the former child queue attempts to operate based on its configured rate parameter. Removing the parent association on the queue within the policy takes effect immediately on all queues using the SAP egress QoS policy.

Parameters

weight

These optional keywords are mutually exclusive to the **level** keyword. Specifies the relative weight of this queue in comparison to other child schedulers, policers, and queues while vying for bandwidth on the parent *scheduler-name*. Any policers, queues, or schedulers defined as weighted receive no parental bandwidth until all policers, queues, and schedulers with a higher (numerically larger) priority on the parent have reached their maximum bandwidth or are idle.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

All **weight** values from all weighted active policers, queues, and schedulers with a common parent scheduler are added together. Then, each individual active weight is divided by the total, deriving the percentage of remaining bandwidth provided to the policer, queue, or scheduler. A weight is considered to be active when the pertaining policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority level and are not serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

Values 0 to 100

Default 1

cir-weight

Specifies the weight the queue or scheduler will use at the within-cir port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the policer, queue, or scheduler does not receive bandwidth during the port schedulers within-cir pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

configure service ipipe sap egress scheduler-override scheduler parent

Description

This command can be used to override the scheduler's parent weight and cir-weight information. The weights apply to the associated level/cir-level configured in the applied scheduler policy. The scheduler name must exist in the scheduler policy applied to the ingress or egress of the SAP or multi-service site.

The override weights are ignored if the scheduler does not have a parent command configured in the scheduler policy – this allows the parent of the scheduler to be removed from the scheduler policy without having to remove all of the SAP/MSS overrides. If the parent scheduler does not exist causing the configured scheduler to be fostered on an egress port scheduler, the override weights will be ignored and the default values used; this avoids having non-default weightings for fostered schedulers.

The **no** form of this command returns the scheduler's parent weight and cir-weight to the value configured in the applied scheduler policy.

Default

no parent

Parameters

weight

Specifies the relative weight of this scheduler in comparison to other child schedulers, policers, and queues at the same strict **level** defined by the level parameter in the applied scheduler policy. Within the level, all weight values from active children at that level are summed and the ratio of each active child's weight to the total is used to distribute the available bandwidth at that level. A weight is considered to be active when the policer, queue, or scheduler the weight pertains to has not reached its maximum rate and still has packets to transmit.

A 0 (zero) weight value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict level.

Values 0 to 100

cir-weight

Specifies the relative weight of this scheduler in comparison to other child schedulers, policers, and queues at the same *cir-level* defined by the **cir-level** parameter in the applied scheduler policy. Within the strict **cir-level**, all **cir-weight** values from active children at that level are summed and the ratio of each active child's **cir-weight** to the total is used to distribute the available bandwidth at that level. A **cir-weight** is considered to be active

when the policer, queue, or scheduler that the **cir-weight** pertains to has not reached the CIR and still has packets to transmit.

A 0 (zero) **cir-weight** value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict cir-level.

Values 0 to 100

Platforms

All

- configure service epipe sap egress scheduler-override scheduler parent
- configure service ipipe sap egress scheduler-override scheduler parent
