The **no** form of this command reverts to the default value.

Default

retry-timer 30

Parameters

seconds

Specifies the amount of time (in s), between attempts to re-establish the LSP after it has failed. Allowed values are integers in the range of 1 to 600.

Values 1 to 600

Platforms

All

retry-timer

Syntax

retry-timer *secs*

no retry-timer

Context

[Tree] (config>service>pw-routing retry-timer)

Full Context

configure service pw-routing retry-timer

Description

This command configures a retry-timer for the spoke-SDP. This is a configurable exponential back-off timer that determines the interval between retries to re-establish a spoke-SDP if it fails and a label withdraw message is received with the status code "AII unreachable”.

The **no** form of this command reverts the timer to its default value.

Default

no retry-timer

Parameters

secs

Specifies initial retry-timer value in seconds.

Values 10 to 480

return-path-bfd-sid

Syntax
return-path-bfd-sid *ipv6-address*

no return-path-bfd-sid

Context
[Tree] (conf>router>segment-routing>sr-policies>policy>srv6 return-path-bfd-sid)

Full Context
configure router segment-routing sr-policies static-policy segment-routing-v6 return-path-bfd-sid

Description
This command configures the Seamless Bidirectional Forwarding Detection (S-BFD) session to echo mode and pushes an additional SRv6 SID in the SRH on S-BFD packets only.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The command applies to the initiator of the S-BFD sessions. The return path SID refers to a binding SID on a SRv6 policy configured on the far-end router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this SRv6 return path.

The **no** form of this command disables the controlled return-path SID and echo mode for S-BFD. If the command is deleted, the S-BFD session returns to asynchronous mode and the initiator node does not push a return-path SID. Any S-BFD packets for this SRv6 policy that the terminating router receives are sent back using a routed return path.

Parameters

ipv6-address

Specifies the IPv6 address.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

configure router mpls lsp-template bfd return-path-label

Description

This command configures the Seamless Bidirectional Forwarding Detection (S-BFD) session to echo mode and adds an additional MPLS label, referring to an MPLS-labeled reply path for the S-BFD packet, to the bottom of the label stack for the S-BFD packet.

The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

The **no** form of this command disables the controlled return-path label and echo mode for S-BFD. S-BFD returns to asynchronous mode and the initiator node does not push a return-path label. Any S-BFD packets for this LSP or path that the reflector receives are sent back using a routed return path.

Default

no return-path-label

Parameters

label-value

Specifies the label value.

Values 32 to 1048575

Platforms

All

- configure router segment-routing maintenance-policy return-path-label

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

40.11 reuse

reuse

Syntax

reuse *integer*

no reuse

Context

[Tree] (config>router>policy-options>damping reuse)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router policy-options damping reuse

Description

This command configures the reuse parameter for the route damping profile.

When the Figure of Merit (FoM) value falls below the **reuse** threshold, the route is once again considered valid and can be reused or included in route advertisements.

The **no** form of this command removes the reuse parameter from the damping profile.

Default

no reuse

Parameters

integer

Specifies the reuse value expressed as a decimal integer.

Values 1 to 20000

Platforms

All

40.12 reuse-ext-ip

reuse-ext-ip

Syntax

[**no**] **reuse-ext-ip**

Context

[Tree] (config>service>nat>pcp-server-policy reuse-ext-ip)

Full Context

configure service nat pcp-server-policy reuse-ext-ip

Description

This command enables the system to reuse the external IP address assigned to a subscriber when the requested well-known port or external IP mapping is not available.

The **no** form of this command causes a request for a well-known port to be allocated exactly as requested but on a different external IP address from the one that the subscriber is already using. This occurs if the requested well-known port is already allocated to another subscriber which is sharing the same external IP address. The existing external IP address is initially allocated to the subscriber by the virtue of initial traffic flow.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no reuse-ext-ip

Platforms

40.15 revert

revert

Syntax

revert {**latest-rb**| *checkpoint-id* | **rescue**} [**now**]

Context

[Tree] (admin>rollback revert)

Full Context

admin rollback revert

Description

This command initiates a configuration rollback revert operation that will return the configuration state of the node to a previously saved checkpoint. The rollback revert minimizes impacts to running services. There are no impacts in areas of configuration that did not change since the checkpoint. Configuration parameters that changed (or items on which changed configuration have dependencies) are first removed (revert to default) and the previous values are then restored (can be briefly service impacting in changed areas).

Parameters

latest-rb

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

checkpoint-id

Specifies the configuration to return to (which rollback checkpoint file to use). Checkpoint-id of 1 corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 9

rescue

Specifies to revert to the rescue checkpoint.

now

Forces a rollback revert without any interactive confirmations (assumes 'y' for any confirmations that would have occurred).

Platforms

All

revert

Syntax

[**no**] **revert**

Context

[Tree] (config>system>sync-if-timing revert)

Full Context

configure system sync-if-timing revert

Description

This command allows the clock to revert to a higher priority reference if the current reference goes offline or becomes unstable. When the failed reference becomes operational, it is eligible for selection. When the mode is non-revertive, a failed clock source is not selected again.

Default

no revert

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vprn>isis>link-group>level revert-members)

Full Context

configure service vprn isis link-group level revert-members

Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured **revert-members** threshold, the configured offsets are removed.

The **no** form of this command reverts the threshold back to the default, which is equal to the **oper-members** threshold value.

Default

no revert-members *oper-members*

Parameters

1..8

Specifies the number of revert members.

Values 1 to 8

Platforms

All

revert-members

Syntax

revert-members [*1..8*]

no revert-members

Context

[Tree] (config>router>isis>link-group>level revert-members)

Full Context

configure router isis link-group level revert-members

Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured revert-member threshold then the configured offsets are removed.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command reverts the threshold back to the default which is equal to the oper-member threshold value.

Default

no revert-members oper-members

Parameters

1..8

Specifies the threshold for revertive members.

Values 1 to 8

Platforms

All

40.17 revert-time

revert-time

Syntax

revert-time *time*

no revert-time

Context

[Tree] (config>eth-tunnel revert-time)

Full Context

configure eth-tunnel revert-time

Description

This command configure how long to wait before switching back to the primary path after it has been restored to Ethernet tunnel.

The **no** form of this command disables the revert behavior, effectively setting the revert time to zero.

Default

no revert-time

Parameters

time

Specifies the re-activation delay, in seconds, for the primary path.

Values 1 to 720

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

revert-time

Syntax

revert-time

Syntax

revert-time *revert-time* | **infinite**

no revert-time

Context

[Tree] (config>service>vpls>endpoint revert-time)

Full Context

configure service vpls endpoint revert-time

Description

This command configures the time to wait before reverting to primary spoke-SDP.

In a regular endpoint the revert-time setting affects just the pseudowire defined as primary (precedence 0). For a failure of the primary pseudowire followed by restoration the revert-timer is started. After it expires the primary pseudowire takes the active role in the endpoint. This behavior does not apply for the case when both pseudowires are defined as secondary. For example, if the active secondary pseudowire fails and is restored it will stay in standby until a configuration change or a force command occurs.

Parameters

revert-time

Specifies the time to wait, in seconds, before reverting back to the primary spoke-SDP defined on this service endpoint, after having failed over to a backup spoke-SDP

Values 0 to 600

infinite

Specifying this keyword makes endpoint non-revertive

Platforms

All

revert-time

Syntax

revert-time {*revert-time* | **infinite**}

no revert-time

Context

[Tree] (config>mirror>mirror-dest>endpoint revert-time)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure mirror mirror-dest endpoint revert-time

Description

This command configures the time to wait before reverting to the primary spoke SDP. This command has an effect only when used in conjunction with an endpoint which contains a SDP of type 'primary'. It is ignored and has no effect in all other cases. The revert-timer is the delay in seconds the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

The **no** form of this command resets the timer to the default value of 0. This means that the mirror-service path is switched back to the endpoint primary sdp immediately after it comes back up.

Parameters

revert-time

Specifies a delay, in seconds, the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

Values 0 to 600

infinite

Forces the mirror or LI service path to never revert to the primary SDP as long as the currently active secondary SDP is UP.

Platforms

All

revert-time

Syntax

revert-time {*revert-time* | **infinite**}

no revert-time

Context

[Tree] (config>service>sdp>mixed-lsp-mode revert-time)

Full Context

configure service sdp mixed-lsp-mode revert-time

Description

This command configures the delay period the SDP must wait before it reverts to a higher priority LSP type when one becomes available.

The **no** form of the command resets the timer to the default value of 0. This means the SDP reverts immediately to a higher priority LSP type when one becomes available.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no revert-time

Parameters

revert-time

Specifies the delay period, in seconds, that the SDP must wait before it reverts to a higher priority LSP type when one becomes available. A value of zero means the SDP reverts immediately to a higher priority LSP type when one becomes available.

Values 0 to 600

infinite

This keyword forces the SDP to never revert to another higher priority LSP type unless the currently active LSP type is down.

Platforms

All

revert-time

Syntax

revert-time *time*

no revert-time

Context

[Tree] (config>eth-ring revert-time)

Full Context

configure eth-ring revert-time

Description

This command configures the revert time for an Eth-Ring. It ranges from 60 seconds to 720 second by 1 second intervals.

The **no** form of this command means non-revertive mode and revert time is essentially 0, and the revert timers are not set.

Default

revert-time 300

Parameters

time

Specifies the guard-time, in seconds.

Values 60 to 720

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

40.18 revert-timer

revert-timer

Syntax

revert-timer *timer-value*

no revert-timer

Context

[Tree] (config>router>mpls>lsp revert-timer)

Full Context

configure router mpls lsp revert-timer

Description

This command configures a revert timer on an LSP. The timer starts when the LSP primary path recovers from a failure. The LSP reverts from a secondary path to the primary path when the timer expires, or when the secondary path fails.

The **no** form of this command cancels any currently outstanding revert timer. If the LSP is up when a no revert-timer is issued, the LSP will revert to the primary path. Otherwise the LSP reverts when the primary path is restored.

Default

no revert-timer

Parameters

timer-value

Specifies the amount of time, in one minute increments, between attempts to re-establish the LSP after it has failed.

Values 1 to 4320

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

revert-timer

Syntax

revert-timer *seconds*

no revert-timer

Context

[Tree] (config>router>mpls>fwd-policies>fwd-policy revert-timer)

Full Context

configure router mpls forwarding-policies forwarding-policy revert-timer

Description

This command configures the revert timer in an MPLS forwarding policy.

When the primary direct or indirect next hop is restored and is added back into the routing table, CPM waits for an amount of time equal to the user-programmed revert timer before activating it and updating the data path. However, if the backup direct or indirect next hop fails while the timer is running, CPM activates it and updates the data path immediately.

A value of 0 disables the revert timer; meaning the policy reverts immediately.

The **no** form of this command removes the revert timer from the MPLS forwarding policy.

Default

revert-timer 0

Parameters

seconds

Specifies the revert-timer value, in number of seconds.

Values 1 to 600

Platforms

All

revert-timer

Syntax

revert-timer *revert-timer*

no revert-timer

Context

[Tree] (config>router>segment-routing>maintenance-policy revert-timer)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service vprn mvpn provider-tunnel inclusive umh-rate-monitoring revertive-timer

Description

This command configures the timer value, after expiration, which causes the UMH to switch to the primary UMH after traffic is restored. This value must account for the traffic flapping from the primary UMH. If traffic flapping occurs, the timer resets.

The **no** form of this command leaves the UMH in standby mode, with no revertive behavior.

Default

no revertive-timer

Parameters

sec

Specifies the timer value, in seconds.

A value of 0 means revert immediately.

Values 0 to 3600

Platforms

All

40.21 revocation-check

revocation-check

Syntax

revocation-check {**crl** | **crl-optional**}

Context

[Tree] (config>system>security>pki>ca-profile revocation-check)

Full Context

configure system security pki ca-profile revocation-check

Description

This command specifies the revocation method the system uses to check the revocation status of certificate issued by the CA. If the **crl-optional** option is configured, when the user disables the **ca-profile**, the system tries to load the configured CRL (specified by the **crl-file** command). However, if the system fails to load the configured CRL for the following reasons, the system still brings the **ca-profile** operationally up, but leaves the CRL configured as non-existent:

- CRL file does not exist
- CRL is not properly encoded - maybe due to interrupted file transfer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- CRL does not match cert
- Wrong CRL version
- CRL expired

Note:
The **crl-optional** command option makes configuration of a valid CRL in a **ca-profile** optional. However, from a security point of view, it is important to always verify the revocation status of a certificate.

If the system needs to use the CRL of a specific CA profile to check the revocation status of an end-entity certificate, and the CRL is non-existent due to the preceding reasons, the system treats a case like this as being unable to get an answer from CRL and falls back to the next status verify method or default result.

If the system needs to check the revocation of a CA certificate in a certificate chain, and if the CRL is non-existent due to the preceding reasons, the system skips checking the revocation status of the CA certificate. For example, if CA1 is issued by CA2, if the revocation-check for CA2 is **crl-optional** and the CRL for CA2 is non-existent, the system does not check the certificate revocation status of CA1 and it is considered as "good”.

Note:
Users must shut down the **ca-profile** to change the **revocation-check** configuration.

Default

revocation-check crl

Parameters

crl

Specifies to use the configured CRL.

crl-optional

Specifies that the CRL is optional.

Full Context

configure service vpls mesh-sdp mld-snooping robust-count

configure service vpls sap igmp-snooping robust-count

configure service vpls spoke-sdp igmp-snooping robust-count

configure service vpls sap mld-snooping robust-count

configure service vpls igmp-snooping robust-count

configure service vpls spoke-sdp mld-snooping robust-count

configure service vpls mesh-sdp igmp-snooping robust-count

Description

If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If this SAP or SDP is expected to be 'lossy', this parameter may be increased. IGMP snooping on this SAP or SDP is robust to (robust-count-1) packet losses.

If **send-queries** is not enabled, this parameter will be ignored.

Default

robust-count 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

robust-count

Specifies the robust count for the SAP or SDP

Values 2 to 7 (for **config>service>vpls>sap>igmp-snooping**) 1 to 255 (for **config>service>vpls>igmp-snooping**)

Platforms

All

robust-count

Syntax

robust-count *robust-count*

no robust-count

Context

[Tree] (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp robust-count)

Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping robust-count

Description

This command configures the IGMP robustness variable. If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If an MSAP or SDP is expected to be "lossy", this parameter may be increased. IGMP snooping on an MSAP or SDP is robust to (robust-count-1) packet losses.

If send-queries is not enabled, this parameter is ignored.

The **no** form of this command reverts to the default.

Default

robust-count 2

Parameters

robust-count

Specifies the robust count for the SAP or SDP.

Values 2 to 7

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

40.38 rollback-location

rollback-location

Syntax

rollback-location *file-url* /*rollback filename*

no rollback-location

Context

[Tree] (config>system>rollback rollback-location)

Full Context

configure system rollback rollback-location

Description

The location and name of the rollback checkpoint files is configurable to be local (on compact flash) or remote. The *file-url* must not contain a suffix (just a path/directory + filename). The suffixes for rollback checkpoint files are ".rb", ".rb.1", ..., ".rb.9" and are automatically appended to rollback checkpoint files.

Default

no rollback-location

Parameters

file-url

Specifies the URL or rollback filename.

Values

local-url | *remote-url*	
local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length of up to 99 characters each
remote-url	[{ftp://}*login*:*pswd*@ *remote-locn*/][*file-path*] up to 255 characters, directory length of up to 99 characters each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*] *x:x:x:x:x:x:d.d.d.d*[-*interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D *interface* - up to 32 characters each, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rollback-filename

Specifies the rollback file name.

Values suffixed with .rb, .rb.1 up to .9 during rollback checkpoint creation

Platforms

All

40.39 rollback-sync

rollback-sync

Syntax

rollback-sync

Context

[Tree] (admin>redundancy rollback-sync)

Full Context

admin redundancy rollback-sync

Description

This command copies the entire set of rollback checkpoint files from the active CPM to the standby CPM.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rollback-sync

Syntax

[**no**] **rollback-sync**

Context

[Tree] (config>redundancy rollback-sync)

Full Context

configure redundancy rollback-sync

Description

The operator can enable automatic synchronization of classic CLI rollback checkpoint files between the active CPM and standby CPM. When this automatic synchronization is enabled, a classic CLI **rollback save** causes the new classic CLI checkpoint file to be saved on both the active and standby CPMs. The suffixes of the old checkpoint files on both active and standby CPMs are incremented. Note that automatic sync only causes the one new checkpoint file to be copied to both CFs (the other checkpoint files are not automatically copied from active to standby but that can be done manually with **admin redundancy rollback-sync**).

Automatic synchronization of classic CLI rollback checkpoint files across CPMs is only performed if the rollback-location is configured as a local file-url (for example, "cf3:/rollback-files/rollback). Synchronization is not done if the rollback-location is remote.

The **config redundancy synchronize {boot-env | config}** and **admin redundancy synchronize {boot-env | config}** do not apply to classic CLI rollback checkpoint files. These commands do not manually or automatically sync classic CLI rollback checkpoint files. The **rollback-sync** command must be used to sync classic CLI rollback checkpoint files.

Default

no rollback-sync

Platforms

All

40.40 rollover

rollover

Syntax

rollover *minutes* [**retention** *hours*]

no rollover

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>log>file-id rollover)

Full Context

configure log file-id rollover

Description

This command configures how often an event or accounting log is rolled over or partitioned into a new file.

An event or accounting log is actually composed of multiple, individual files. The system creates a new file for the log based on the **rollover** time, expressed in minutes.

The *retention* option, expressed in hours, allows you to modify the default time to keep the file in the system. The retention time is based on the rollover time of the file.

If logs are needed to be retained for more than 16 days, use a CRON job to move the logs to a different location, either on a local drive or a remote server. For more information, contact Nokia support.

When multiple **rollover** commands for a *file-id* are entered, the last command overwrites the previous command.

The **no** form of this command reverts to the default values.

Default

rollover 1440 retention 12

Parameters

minutes

Specifies the rollover time, in minutes.

Values 5 to 10080

retention hours

Specifies the retention period in hours, expressed as a decimal integer. The retention time is based on the time creation time of the file. The file becomes a candidate for removal once the creation datestamp + rollover time + retention time is less than the current timestamp.

Default 12

Values 1 to 500

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

40.41 root

root

Syntax

root

Context

[Tree] (config>qos>policer-control-policy root)

Full Context

configure qos policer-control-policy root

Description

The **root** node contains the policer control policies configuration parameters for the root arbiter. Within the node, the parent policer's maximum rate limit can be set, the strict priority level, and fair threshold portions may be defined per priority level.

The root node always exists and does not need to be created.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

40.42 root-address

root-address

Syntax

root-address *ip-address*

no root-address

Context

[Tree] (config>router>p2mp-sr-tree>p2mp-policy root-address)

Full Context

configure router p2mp-sr-tree p2mp-policy root-address

Description

This command configures the IP address of the P2MP SR tree root node of the P2MP policy. The root tree ID and the root address uniquely identify the P2MP policy on the root node.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the root address entry.

Parameters

ip-address

Specifies the IPv4 address of the root node.

Values a.b.c.d

Platforms

All

root-address

Syntax

root-address *ip-address*

no root address

Context

[Tree] (config>router>p2mp-sr-tree>replication-segment root-address)

Full Context

configure router p2mp-sr-tree replication-segment root-address

Description

This command configures the replication segment with the IP address of the root node of the P2MP SR tree replication segment.

The **no** form of this command removes the root node address.

Parameters

ip-address

Specifies the IPv4 address.

Values a.b.c.d

Platforms

All

Use subject to Terms available at: www.nokia.com/terms.

40.43 root-and-leaf

root-and-leaf

Syntax

[**no**] **root-and-leaf**

Context

[Tree] (config>service>vpls>provider-tunnel>inclusive root-and-leaf)

Full Context

configure service vpls provider-tunnel inclusive root-and-leaf

Description

This command configures the node to operate as both root and leaf of the I-PMSI in a specified VPLS/B-VPLS instance.

By default, a node will behave as a leaf-only node. When the node is leaf only for the I-PMSI of type P2MP RSVP LSP, no PMSI Tunnel Attribute is included in BGP-AD route update messages and therefore no RSVP P2MP LSP is signaled but the node can join RSVP P2MP LSP rooted at other PE nodes participating in this VPLS/B-VPLS service. The user must still configure a LSP template even if the node is a leaf only.

For the I-PMSI of type mLDP, the leaf-only node will join I-PMSI rooted at other nodes it discovered but will not include a PMSI Tunnel Attribute in BGP-AD route update messages. This way a leaf-only node will forward packets to other nodes in the VPLS/B-VPLS using the point-to-point spoke-SDPs.

The **no** version of this command re-instates the default value.

40.45 root-pool

root-pool

Syntax

[**no**] **root-pool** *root-pool-id*

Context

[Tree] (config>qos>hs-pool-policy>root-tier root-pool)

Full Context

configure qos hs-pool-policy root-tier root-pool

Description

Commands in this context configure root tier parameters. Within the **root-tier** context, root pools can be sized using the **allocation-weight** command or a slope policy can be associated with a root pool.

The **no** form of the command restores the default **allocation-weight** value and default slope policy to the specified root pool. Root pool 1 has a different default weight than root pools 2 through 16. The **no root-pool** command fails for root pools 2 through 16 if the root pool is currently the parent of a mid-tier pool.

Parameters

root-pool-id

Specifies the root pool ID. This is a required parameter when executing the **root-pool** command and specifies which root pool context is being entered.

Values 1 to 16

Platforms

7750 SR-7/12/12e

no route index *index*

Context

[Tree] (config>aaa>diam>node>peer route)

Full Context

configure aaa diameter node peer route

Description

This command configures the index of the static route within the Diameter peer used to reach remote realms that are not directly connected to the origin realm, or to override the route preference (peer preference) of the directly-connected realms.

The **no** form of this command removes the route index information from the configuration.

Parameters

index

Specifies the index of the static route within the Diameter peer.

Values 1 to 15

realm-string

Specifies the destination realm reachable through this static route, up to 80 characters.

application

Specifies the ID of the Diameter application of the static route.

Values nasreq, gy, gx

create

Keyword used to create the route index. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

route-distinguisher

Syntax

route-distinguisher auto-rd

route-distinguisher *rd*

no route-distinguisher

Context

[Tree] (config>subscr-mgmt>isa-svc-chain>evpn>bgp route-distinguisher)

Full Context

configure subscriber-mgmt isa-service-chaining evpn bgp route-distinguisher

Description

This command configures the Route Distinguisher (RD) field that is signaled in NLRI in EVPN routes.

The **no** form of this command reverts to the default.

Parameters

auto-rd

Specifies that the system automatically generates an RD.

rd

Specifies the RD.

Values rd: *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

ip-addr: a.b.c.d

comm-val: [0 to 65535]

2byte-asnumber: [1 to 65535]

ext-comm-val: [0 to 4294967295]

4byte-asnumber: [1 to 4294967295]

route-distinguisher

Syntax

route-distinguisher auto-rd

no route-distinguisher

route-distinguisher *rd*

Context

[Tree] (config>service>epipe>bgp route-distinguisher)

[Tree] (config>service>vpls>bgp route-distinguisher)

Full Context

configure service epipe bgp route-distinguisher

configure service vpls bgp route-distinguisher

Description

This command configures the Route Distinguisher (RD) component that will be signaled in the MP-BGP NLRI for L2VPN and EVPN families. This value will be used for BGP-AD, BGP VPLS and BGP multi-homing NLRI if these features are configured.

If this command is not configured, the RD is automatically built using the BGP-AD VPLS ID. The following rules apply:

- if BGP AD VPLS-id is configured and no RD is configured under BGP node - RD=VPLS-ID
- if BGP AD VPLS-id is not configured then an RD value must be configured under BGP node (this is the case when only BGP VPLS is configured)
- if BGP AD VPLS-id is configured and an RD value is also configured under BGP node, the configured RD value prevails

Values and format (6 bytes, other 2 bytes of type will be automatically generated)

Alternatively, the **auto-rd** option allows the system to automatically generate an RD based on the **bgp-auto-rd-range** command configured at the service level. For **BGP-EVPN** enabled VPLS and Epipe services, the **route-distinguisher** value can also be auto-derived from the **evi** value (**config>service>vpls>bgp-evpn>evi** or **config>service>epipe>bgp-evpn>evi**) if this command is not configured. See the **config>service>system>bgp-evpn>eth-seg>service-carving>manual evi** command description for more information.

Parameters

ip-addr:comm-val

Specifies the IP address.

Values *ip-addr*: a.b.c.d

comm-val: 0 to 65535

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

as-number:ext-comm-val

Specifies the AS number.

Values *as-number*: 1 to 65535

ext-comm-val: 0 to 4294967295

auto-rd

The system will generate an RD for the service according to the IP address and range configured in the **bgp-auto-rd-range** command.

Platforms

All

route-distinguisher

Syntax

route-distinguisher [*ip-addr:comm-val* | *as-number:ext-comm-val*]

no route-distinguisher

Context

[Tree] (config>service>system>bgp-evpn route-distinguisher)

Full Context

configure service system bgp-evpn route-distinguisher

Description

This command configures the Route Distinguisher (RD) component that will be signaled in the MP-BGP NLRI for EVPN corresponding to the base EVPN instance (Ethernet Segment routes). If the route-distinguisher component is not configured, the system will use system:ip-address as the default route-distinguisher

Default

no route-distinguisher

Parameters

ip-addr:comm-val

Specifies the IP address.

Values *ip-addr*: a.b.c.d

comm-val: 0 to 65535

as-number:ext-comm-val

Specifies the AS number.

Values *as-number*: 1 to 65535

configure service vprn bgp-evpn vxlan route-distinguisher

configure service vprn bgp-ipvpn segment-routing-v6 route-distinguisher

configure service vprn bgp-ipvpn mpls route-distinguisher

Description

This command specifies an identifier attached to a route, which enables the user to identify the VPN to which the route belongs. Each routing instance must have a unique (within the carrier's domain) route distinguisher (RD) associated with it.

Alternatively, the **auto-rd** option allows the system to automatically generate an RD based on the **configure service system bgp-auto-rd-range** command.

The **no** form of this command removes the RD configuration.

Default

no route-distinguisher

Parameters

auto-rd

Keyword that allows the system to generate an RD for the service according to the IP address and range configured in the **bgp-auto-rd-range** command.

rd

Specifies the route distinguisher.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values rd: *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

[Tree] (config>router>policy-options route-distinguisher-list)

Full Context

configure router policy-options route-distinguisher-list

Description

This command creates a list of entries used to match the RD in BGP routes of specific address families.

Parameters

name

Specifies the name of the RD list, up to 64 characters.

Platforms

All

route-distinguisher-list

Syntax

route-distinguisher-list *name*

no route-distinguisher-list *name*

Context

[Tree] (config>router>policy-options>policy-statement>entry>from route-distinguisher-list)

Full Context

configure router policy-options policy-statement entry from route-distinguisher-list

Description

This command configures a route distinguisher (RD) list as a match criterion for the policy statement entry.

This match condition is supported by policies applied as VRF import or BGP peer import policies. A BGP route can match a policy entry with this match criterion if the NLRI field contains an RD that is matched by at least one of the entries in the **route-distinguisher-list**.

BGP routes belonging to address families other than VPN-IPv4, VPN-IPv6, MCAST-VPN-IPv4, MCAST-VPN-IPv6, EVPN, FlowSpec-VPN IPv4, FlowSpec-VPN IPv6, MVPN-IPv4 or MVPN-IPv6 routes do not match policy entries with this match criterion.

Parameters

name

Specifies the (possibly parameterized) name of an RD list.

40.53 route-downloader

route-downloader

Syntax

route-downloader *name* [**create**]

no route-downloader *name*

Context

[Tree] (config>aaa route-downloader)

Full Context

configure aaa route-downloader

Description

Commands in this context configure a route-downloader instance. The route-downloader is a process that uses radius access-request messages to a particular server. The server returns either an access-accept or access-deny message. Access-accept messages also contain the prefixes (in the form of static blackhole routes in various formats). Only a single route-downloader object can be created.

The **no** form of this command removes the name from the configuration. The object must be shutdown prior to deletion. No prefix is needed to delete an existing route-download object.

Parameters

name

Specifies the name of this RADIUS route downloader.

create

This keyword is mandatory while creating an instance of the route-download object.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>service>vprn>sub-if>grp-if>sap>static-host>managed-routes route-entry)

Full Context

configure service ies subscriber-interface group-interface sap static-host managed-routes route-entry

configure service vprn subscriber-interface group-interface sap static-host managed-routes route-entry

Description

This command assigns a managed route to a specified subscriber host. As a consequence, a static route pointing subscriber-host IP address as a next hop is installed in the FIB.

The **no** form of this command removes the respective route. By default, there are no managed routes configured.

Parameters

ip-prefix/length

Specifies the IP prefix and length.

Syntax:

ip-prefix/length:	ip-prefix	a.b.c.d
	ip-prefix-length	1 to 32

netmask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (0.0.0.0 not allowed)

ipv6-prefix/prefix-length

Specifies the IPv6 prefix and prefix length.

Values	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H

40.55 route-exists

route-exists

Syntax

route-exists *expression*

no route-exists

Context

[Tree] (config>router>policy-options>policy-statement>entry>cond-expr route-exists)

Full Context

configure router policy-options policy-statement entry conditional-expression route-exists

Description

This command is used to specify a route existence expression to control evaluation of the policy entry. If the route existence expression evaluates to 'true' the matching and action commands of the policy entry are applied as normal. If the route existence expression evaluates to 'false' the entire policy entry is skipped and processing continues with the next entry; however, conditional expressions are only parsed when the route policy is used as a BGP export policy or VRF export policy.

Default

no route-exists

Parameters

expression

"["<pfx-list-name>"]" [all | none]

If neither the **all** nor the **none** keyword are used the match logic is 'any' – that is, the route expression evaluates as 'true' if any exact match entry in the referenced prefix-list has an active route in the route table associated with the policy.

all – the route expression evaluates as 'true' only if all the exact match entries in the referenced prefix-list have an active route in the route table associated with the policy.

none – the route expression evaluates as 'true' only if none of the exact match entries in the referenced prefix-list have an active route in the route table associated with the policy.

40.56 route-limit

route-limit

Syntax

route-limit *limit*

Context

[Tree] (config>router>nat>outside route-limit)

[Tree] (config>service>vprn>nat>outside route-limit)

Full Context

configure router nat outside route-limit

configure service vprn nat outside route-limit

Description

This command configures the router to a maximum limit of source subprefix routes that can be installed on the outside when the source IPv4 address is not translated (large scale stateful inbound filtering and DNAT-only functionality). If the actual number of generated routes exceeds this configured limit, the excess routes are not installed in the routing table, and a log message is generated.

The following commands, along with this command, are all interrelated. See the following commands for more information:

- **configure service vprn nat outside domain prefix**
- **configure router nat outside domain prefix**
- **configure service vprn nat inside large-scale nat66 hash-prefix**
- **configure router nat inside large-scale nat66 hash-prefix**

Default

route-limit 32768

Parameters

limit

Specifies the maximum number of source sub-prefix routes that can be installed on the outside.

Values 1 to 131072

Description

This command modifies the next hop to the configured IP address value, for the following routes:

- ES
- AD per-ES (irrespective of the **evi-rt-set** or **evi-rt configuration mode**)

The **no** form of the command changes the originating IP address back to the system-ip.

Default

no route-next-hop

Parameters

ip-address

Specifies an IPv4 or IPv6 address.

Values *ip-address* | *ipv6-address*

Context

[Tree] (config>log route-preference)

Full Context

configure log route-preference

Description

This command specifies the primary and secondary routing preference for traffic generated for SNMP notifications and syslog messages. If the remote destination is not reachable through the routing context specified by primary route preference then the secondary routing preference will be attempted.

The **no** form of this command reverts to the default values.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no route-preference

Parameters

primary

Specifies the primary routing preference for traffic generated for SNMP notifications and syslog messages.

Default outband

secondary

Specifies the secondary routing preference for traffic generated for SNMP notifications and syslog messages. The routing context specified by the secondary route preference will be attempted if the remote destination was not reachable by the primary routing preference, specified by primary route preference. The value specified for the secondary routing preference must be distinct from the value for primary route preference.

Default inband

inband

Specifies that the logging utility will attempt to use the base routing context to send SNMP notifications and syslog messages to remote destinations.

outband

Specifies that the logging utility will attempt to use the management routing context to send SNMP notifications and syslog messages to remote destinations.

none

Specifies that no attempt will be made to send SNMP notifications and syslog messages to remote destinations.

Full Context

configure service vprn bgp rib-management ipv6 route-table-import

configure service vprn bgp rib-management label-ipv4 route-table-import

configure service vprn bgp rib-management ipv4 route-table-import

Description

This command specifies the name of a route policy to control the importation of active routes from the IP route table into one of the BGP RIBs.

If the **route-table-import** command is not configured, or if the command refers to an empty policy, all non-BGP routes from the IP route table are imported into the applicable RIB.

If the **route-table-import** command is configured, then routes dropped or rejected by the configured policy are not installed in the associated RIB. Rejected routes cannot be advertised to BGP peers associated with the RIB, but they can still be used to resolve BGP next-hops of routes in that RIB. If the active route for a prefix is rejected by the **route-table-import** policy, then the best BGP route for that prefix in the BGP RIB can be advertised to peers as though it is used.

Aggregate routes are always imported into each RIB, independent of the **route-table-import** policy.

Route modifications specified in the actions of a **route-table-import** policy are ignored and have no effect on the imported routes.

[Tree] (config>service>vpls>bgp-ad route-target)

Full Context

configure service vpls bgp route-target

configure service epipe bgp route-target

configure service vpls bgp-ad route-target

Description

This command configures the route target (RT) component that will be signaled in the related MP- BGP attribute to be used for BGP auto-discovery, BGP VPLS, BGP multi-homing and EVPN if these features are configured in this VPLS service, or for BGP multi-homing, BGP-VPWS and EVPN in case of Epipe services.

If this command is not used in VPLS services, the RT is built automatically using the VPLS ID. The extended community can have the same two formats as the VPLS ID, a two-octet AS-specific extended community, IPv4 specific extended community. For BGP EVPN enabled VPLS and Epipe services, the route target can also be auto-derived from the **evi** value (**config>service>vpls>bgp-evpn>evi** or **config>service>epipe>bgp-evpn>evi**) if this command is not configured.

Parameters

export *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

import *ext-community*

Specifies communities allowed to be accepted from remote PE neighbors.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

40.67 route-target-list

route-target-list

Syntax

route-target-list *comm-id* [*comm-id*]]

no route-target-list [*comm-id*]

Context

[Tree] (config>router>bgp route-target-list)

Full Context

configure router bgp route-target-list

Description

This command specifies the route target(s) to be accepted from or advertised to peers. If the **route-target-list** is a non-null list, only routes with one or more of the given route targets are accepted from or advertised to peers.

The **route-target-list** is assigned at the global level and applies to all peers connected to the system.

This command is only applicable if the router is a route-reflector server.

The **no** form of this command with a specified route target community removes the specified community from the **route-target-list**. The **no** form of this command entered without a route target community removes all communities from the list.

Default

no route-target-list

Parameters

comm-id

Specifies up to 15 route target communities.

Values [**target:** {*ip-address*:*comm-val* | *2byte-asnumber*:*ext-comm-val* | *4byte-asnumber*:*comm-val*}

where:

- *ip-address* — a.b.c.d
- *comm-val* — 0 to 65535
- *2byte-asnumber* — 0 to 65535
- *ext-comm-val* — 0 to 4294967295

40.68 route-unknown

route-unknown

Syntax

[**no**] **route-unknown** [{*ip-prefix/mask* | *ipv6-address/prefix-length*}]

Context

[Tree] (config>vrrp>policy>priority-event route-unknown)

Full Context

configure vrrp policy priority-event route-unknown

Description

This command creates a context to configure a route unknown priority control event that monitors the existence of a specific active IP route prefix within the routing table.

The **route-unknown** command configures a priority control event that defines a link between the VRRP priority control policy and the Route Table Manager (RTM). The RTM registers the specified route prefix as monitored by the policy. If any change (add, delete, new next hop) occurs relative to the prefix, the policy is notified and takes correct action according to the priority event definition. If the route prefix exists and is active in the routing table according to the conditions defined, the event is in the cleared state. If the route prefix is removed, becomes inactive or fails to meet the event criteria, the event is in the set state.

The command creates a **route-unknown** node identified by *prefix/mask-length* and containing event control commands.

Multiple unique (different *prefix/mask-length*) **route-unknown** event nodes can be configured within the **priority-event** node up to the maximum limit of 32 events.

The **route-unknown** command can reference any valid IP address mask-length pair. The IP address and associated mask length define a unique IP router prefix. The dynamic monitoring of the route prefix results in one of the event operational states listed in Table 109: Route-unknown Operational States.

Table 109: Route-unknown Operational States

route-unknown Operational State	Description
Set – non-existent	The route does not exist in the route table
Set – inactive	The route exists in the route table but is not being used
Set – wrong next hop	The route exists in the route table but does not meet the **next-hop** requirements

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

route-unknown Operational State	Description
Set – wrong protocol	The route exists in the route table but does not meet the **protocol** requirements
Set – less specific found	The route exists in the route table but does is not an exact match and does not meet any **less-specific** requirements
Set – default best match	The route exists in the route table as the default route but the default route is not allowed for route matching
Cleared – less specific found	A less specific route exists in the route table and meets all criteria including the **less-specific** requirements
Cleared – found	The route exists in the route table manager and meets all criteria

An existing route prefix in the RTM must be active (used by the IP forwarding engine) to clear the event operational state. It may be less specific (the defined prefix may be contained in a larger prefix according to Classless Inter-Domain Routing (CIDR) techniques) if the event has the **less-specific** statement defined. The less specific route that incorporates the router prefix may be the default route (0.0.0.0) if the **less-specific allow-default** statement is defined. The matching prefix may be required to have a specific next hop IP address if defined by the event **next-hop** command. Finally, the source of the RTM prefix may be required to be one of the dynamic routing protocols or be statically defined if defined by the event **protocol** command. If an RTM prefix is not found that matches all the above criteria (if defined in the event control commands), the event is considered to be set. If a matching prefix is found in the RTM, the event is considered to be cleared.

When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

The **no** form of the command is used to remove the specific *prefix/mask-length* monitoring event. The event can be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances must be reevaluated. The events **hold-set** timer has no effect on the removal procedure.

Default

no route-unknown — No route unknown priority control events are defined for the priority control event policy.

Parameters

ip-prefix/mask

The IP prefix address in dotted decimal notation and the subnet mask length expressed as a decimal integer associated with the IP *prefix* defining the route prefix to be monitored by the route unknown priority control event.

Values The following values apply to the 7750 SR, 7950 XRS, and 7450 ESS:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ip-prefix/mask:	ip-prefix	a.b.c.d (host bits must be 0)
	mask	0 to 32

ipv6-address/prefix-length

The IPv6 address of the host for which the specific event will monitor connectivity. The *ipv6-address* can only be monitored by a single event in this policy. The IPv6 address can be monitored by multiple VRRP priority control policies. The IPv6 address can be used in one or multiple **ping** requests. Each VRRP priority control **host-unreachable** and **ping** destined to the same *ipv6-address* is uniquely identified on a per message basis. Each session originates a unique identifier value for the ICMP echo request messages it generates. This allows received ICMP echo reply messages to be directed to the appropriate sending application.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0..FFFF]H

Context

[Tree] (config>service>ies>sub-if>grp-if>wlan-gw router)

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw router)

Full Context

configure service ies subscriber-interface group-interface wlan-gw router

configure service vprn subscriber-interface group-interface wlan-gw router

Description

This command specifies the routing instance that wlan-gw gateway endpoint resides in.

The **no** form of this command removes the value from the wlan-gw configuration.

Default

router

Parameters

router-instance

Specifies the identifier of the virtual router instance where the tunneled UE traffic is routed.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

router

Syntax

router [*router-instance*] [**create**]

no router [*router-instance*]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config router)

Full Context

configure router

Description

Commands in this context configure router parameters including interfaces, route policies and protocols. This command is also used to create CPM router instances.

For CPM router instances, this command enters or creates a user-created CPM router instance. A CPM router instance is a not a VPRN router instance. VPRN router instances are configured under **configure service vprn**. CPM router instances are the only type of non-VPRN router instances that can be created by a user, and they have a user-defined name. CPM router instances only use CPM/CCM ethernet ports as interfaces.

Parameters

router-instance

Specifies the router name or CPM router instance.

Values

router-instance : *router name*

router-name	Base | management | *cpm-vr-name*
cpm-vr-name	[32 characters maximum]

Default Base

create

Mandatory keyword when creating a router instance. The create keyword requirement can be enabled or disabled in the **environment**>**create** context.

Platforms

All

router

Syntax

router *router-instance* **group** *tunnel-group-name*

router group *tunnel-group-name* **service-name** *service-name*

no router

[Tree] (config>service>epipe>sap>l2tpv3-session router)

Full Context

configure service vpls sap l2tpv3-session router

configure service epipe sap l2tpv3-session router

Description

This command configures the service and L2TPv3 group to which this L2TPv3 session should be associated. The associated services are used to provide transport for the L2TPv3 tunnel. The service can be specified with either the service-name or router ID. The group name specifies the L2TPv3 group parameters that should be associated with the session.

The **no** form of this command deletes the router configuration.

Parameters

router-instance

Specifies the router name or service ID used to identify the router instance.

Values *router-instance*: *router-name* or *vprn-svc-id*

router-name	"Base"
vprn-svc-id	1 to 2147483647

Default Base

tunnel-group-name

Specifies the tunnel group name, up to 32 characters.

service-name

Specifies the service name, up to 64 characters.

Platforms

Full Context

debug router

Description

Commands in this context enable debugging of various protocols and areas of a *router-instance*.

Parameters

router-instance

Specifies the router name, CPM router instance, or service ID.

Values *router-name* or *service-id*

router-instance : *router-name*

router-name Base | management | *cpm-vr-name*

cpm-vr-name [32 characters maximum]

service-id: 1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

Platforms

All

router

Syntax

router *router-instance*

router service *vprn-service-name*

Context

[Tree] (config>system>file-trans-prof router)

Full Context

configure system file-transmission-profile router

Description

This command specifies the routing instance that the transport protocol uses.

Default

router Base

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

router-instance

Specifies the router instance on which the file transmission connection will be established.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **router service** *vprn-service-name* variant can be used in all configuration modes.

Values {router-name | *vprn-svc-id*}

router-name: Base, management

router-name is an alias for input only. The *router-name* gets replaced with an id automatically by SR OS in the configuration).

vprn-svc-id: 1 to 2147483647

Default Base

service vprn-service-name

Identifies the service, up to 64 characters.

Platforms

Context

[Tree] (config>mirror>mirror-dest>encap>layer-3-encap router)

Full Context

configure mirror mirror-dest encap layer-3-encap router

Description

This command specifies the routing instance into which to inject the mirrored packets. The packets are forwarded in the routing instance based on the configurable destination IP address in the inserted IP header. If a mirror-dest is configured to inject into a VPRN service, then that VPRN service cannot be deleted. A mirror-dest with layer-3-encap is set to operationally down if the configured destination IP address is not reachable via an interface in the routing instance or service configured for the mirror-dest. No changes are allowed to the router configuration once a gateway is configured. A service must already exist before it is specified as a router-instance. VPRN and IES services share the same number space for the service-id, but IES services cannot be specified as the router-instance for routable LI encap.

Forwarding of routable encapsulated LI packets out an R-VPLS interface is not supported. A mirror-dest configured with routable encapsulation can be bound to a routing instance that also has an R-VPLS bound to it but the operator must ensure that the destination of the LI packets is not reachable via any R-VPLS interfaces. Any routable encapsulated LI packets that arrive at the egress of an R-VPLS interface are discarded. Parallel use of routable LI encapsulation and R-VPLS in the same routing instance is supported as long as the mirrored packets do not egress out the R-VPLS interface.

Default

router Base

Parameters

router-instance

Specifies the router instance.

Values <*router-name*> | <*service-id*>

router-name	"Base", *name*
service-id	1 to 2147483647

service-name

Specifies the service name, up to 64 characters.

Platforms

All

no router

Context

[Tree] (config>li>mirror-dest-template>layer-3-encap router)

Full Context

configure li mirror-dest-template layer-3-encap router

Description

This command specifies the routing instance into which to inject the mirrored packets. The packets will be forwarded in the routing instance based on the configurable destination IP address in the inserted IP header. This parameter can be overridden by RADIUS.

If a mirror destination is configured to inject into a VPRN service, that VPRN service cannot be deleted. A mirror destination with Layer 3 encapsulation will be set to operationally down if the configured destination IP address is not reachable via an interface in the routing instance or service configured for the mirror destination. A service must exist before it is specified as a router instance. VPRN and IES services share the same number space for the service ID; however, IES services cannot be specified as the router instance for routable LI encapsulation.

Default

router "Base”

Parameters

router-instance

Specifies the router instance using the router name or service ID.

Values	*router-instance*	*router-name* | *vprn-svc-id*	
		router-name	"Base”
		vprn-svc-id	1 to 2147483647

Syntax

router *router-or-service*

router service-name *service-name*

no router

Context

[Tree] (config>oam-pm>session>ip router)

Full Context

configure oam-pm session ip router

Description

This command numerically references the source context from which the TWAMP Light packet is launched. The **router-instance** *router-instance* configuration, under the same context as the **router** command, is the preferred method for referencing. This method references the launch context by name, and not number, or alias that converts **service-name** to a number.

The **no** form of this command restores the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

router-or-service

Specifies the numerical reference to the router instance or service. Well known router-name "Base" is allowed for convenience, but mapped numerically.

Values {*router-name* | *vprn-svc-id*}

router-name: Base

vprn-svc-id: 1 to 2147483647

The parameter *router-instance* is preferred for specifying the router or service.

service-name

Specifies the alias function that allows the service-name to be used converted and stored as service ID, up to 64 characters. The parameter *router-instance* is preferred for specifying the router or service.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com/terms.

interface-name

Specifies the interface name, up to 32 characters and must start with a letter, for the router to the service interface or SAP.

ingress

Keyword to specify that ingress flows are sent to the associated Cflowd Collector.

Default both

egress

Keyword to specify that egress flows are sent to the associated Cflowd Collector.

Default both

both

Keyword to specify that both ingress and egress flows are sent to the associated Cflowd Collector.

Default both

Platforms

All

router

Syntax

[**no**] **router** *router-instance*

Context

[Tree] (config>cflowd>collector>export-filter router)

Full Context

configure cflowd collector export-filter router

Description

This command allows the flow data from only specific router instances to be sent to the associated collector.

Multiple router instances can be configured by issuing the command multiple times with the different router-instances.

The **no** form of this command removes the specified router-instance restriction, which means flows from that router-instance will no longer be exported. If all router-instances are removed, then flows from all router instances are sent to the associated collector.

Default

no router

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

router-instances

Specifies the router name or router instance VPRN service ID. Only "Base" is supported.

Values router-name: Base, management Default - management

vprn-svc-id: 1 to 2147483647

Platforms

All

router

Syntax

router

Syntax

router *router-instance*

router service-name *service-name*

no router

Context

[Tree] (config>filter>redirect-policy router)

Full Context

configure filter redirect-policy router

Description

This command enhances VRF support in redirect policies. When a router instance is specified, the configured destination tests are run in the specified router instance, and the PBR action is executed in the specified router instance. If no destination is active or if the hardware does not support PBR action "next-hop router", action forward will be executed (i.e. routing will be performed in the context of the incoming interface routing instance).

The **no** form of the command preserves backward-compatibility. Tests always run in the "Base" routing instance context, and the PBR action executes in the routing context of the ingress interface that the filter using this redirect policy is deployed on.

Default

no router

Parameters

router-instance

Specifies a router instance in the form of **router-name** or **service-id**.

Values **router-name** — Base

service-id — Specifies an existing Layer 3 service [1 to 2147483647]

service-name

Specifies the name of a configured Layer 3 service.

Platforms

All

router

Syntax

router {**eq** | **neq**} *router-instance* [**regexp**]

no router

Context

[Tree] (config>log>filter>entry>match router)

Full Context

configure log filter entry match router

Description

This command specifies the log event matches for the router instance using a special vrtr-name format used by the logging system.

The **no** form of this command removes the log event matches.

Parameters

eq

Determines if the matching criteria should be equal to the specified value.

neq

Determines if the matching criteria should not be equal to the specified value.

router-instance

Specifies a router name, up to 32 characters, to be used in the match criteria. The router-instance in this command is a name for a router instance in a special format used in the logging system (called the vrtr-name). Examples of vrtr-names include **Base** and **vprn101** (where 101 is the service-id of the VPRN service). It represents the router instance that generated the log event.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of the specified router instance. When the **regexp** keyword is specified, the string in the **router** command is a regular expression string that is matched against the vrtr-name string in the log event being filtered.

Full Context

configure service vprn ospf router-id

configure service vprn router-id

configure service vprn bgp router-id

Description

This command sets the router ID for a specific VPRN context.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configuring the router ID in the base instance of OSPF it overrides the router ID configured in the **config>router** context. The default value for the base instance is inherited from the configuration in the **config>router** context. If the router ID in the **config>router** context is not configured, the following applies:

- The system uses the system interface address (which is also the loopback address).
- If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

If neither the router ID nor system interface are defined, the router ID from the base router context is inherited.

This is a **required** command when configuring multiple instances and the instance being configured is not the base instance.

When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for the instance, or reboot the entire router.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

The **no** form of this command removes the router ID definition from the given VPRN context.

Default

no router-id

Parameters

ip-address

The IP address must be given in dotted decimal notation.

Platforms

All

Description

This command configures the router ID for the router instance.

The router ID is used by both OSPF and BGP routing protocols in this instance of the routing table manager. IS-IS uses the router ID value as its system ID.

When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is initialized, the new router ID is used. This can result in an interim period of time when different protocols use different router IDs.

It is possible to configure SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for each protocol that uses the router ID, or restart the entire router.

The system uses the system interface address which is also the loopback address. If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

The **no** form of this command removes the configured value and the last 32 bits of the chassis MAC address are used.

Default

no router-id

Parameters

ip-address

Specifies the 32 bit router ID expressed in dotted decimal notation or as a decimal value.

Platforms

All

router-id

Syntax

router-id *ip-address*

no router-id

Context

[Tree] (config>router>bgp router-id)

Full Context

configure router bgp router-id

Description

This command specifies the router ID to be used with this BGP instance.

Changing the BGP router ID on an active BGP instance causes the BGP instance to restart with the new router ID.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

When no **router-id** is configured for BGP, the system interface IP address is used.

Default

no router-id

Parameters

ip-address

Specifies the router ID, expressed as any non-zero value in the range 0.0.0.1 to 255.255.255.255 (or when converted to decimal it can have any value in the range 1-4294967295). It is recommended to use the system IPv4 address.

no router-id

Context

[Tree] (config>router>ospf router-id)

[Tree] (config>router>ospf3 router-id)

Full Context

configure router ospf router-id

configure router ospf3 router-id

Description

This command configures the router ID for the OSPF instance. This command configures the router ID for the OSPF instance.

When configuring the router ID in the base instance of OSPF it overrides the router ID configured in the **config**>**router** context.

The default value for the base instance is inherited from the configuration in the **config**>**router** context. If the router ID in the **config**>**router** context is not configured, the following applies:

- the system uses the system interface address (which is also the loopback address)
- if a system interface address is not configured, it uses the last 32 bits of the chassis MAC address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This is a **required** command when configuring multiple instances and the instance being configured is not the base instance.

When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for the instance, or reboot the entire router.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

The **no** form of this command to reverts to the default value.

Context

[Tree] (config>router>static-route-entry>leak-dest router-instance)

Full Context

configure router static-route-entry leak-destination router-instance

Description

This command configures the static route leak destination router instance.

When a VPRN service is added to the list of VPRNs that receive a leaked copy of the static route, the static route is leaked into that VPRN if the following conditions are met:

- all configured next hops of the static route are direct next hops
- the static route is an active route, or it is capable of immediately becoming an active route when a more-preferred route for the same prefix is removed

Static routes leaked using this method appear as "VPN Leak" protocol routes in the route table of the VPRN.

When a VPRN receives a packet that matches a "VPN Leak" route that leaked using this method, the packet is forwarded according to the configuration of the static route in the GRT, even if the static route is currently non-best in the GRT.

The **no** form of this command removes the configuration.

Parameters

service-id

Specifies the service ID.

Values 1 to 2147483647 | svc-name: up to 64 characters

40.83 rp

rp

Syntax

rp

Context

[Tree] (config>service>vprn>pim rp)

Full Context

configure service vprn pim rp

Description

This command enables access to the context to configure the rendezvous point (RP) of a PIM protocol instance.

A Nokia PIM router acting as an RP must respond to a PIM register message specifying an SSM multicast group address by sending stop register message(s) to the first hop router. It does not build an (S, G) shortest path tree toward the first hop router. An SSM multicast group address can be either from the SSM default range of 232/8 or from a multicast group address range that was explicitly configured for SSM.

Default

rp enabled when PIM is enabled.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

[Tree] (config>router>pim>rp>ipv6 rp-candidate)

Full Context

configure router pim rp rp-candidate

configure router pim rp ipv6 rp-candidate

Description

Commands in this context configure the Candidate RP parameters.

Routers use a set of available rendezvous points distributed in Bootstrap messages to get the proper group-to-RP mapping. A set of routers within a domain are also configured as candidate RPs (C-RPs); typically, these will be the same routers that are configured as candidate BSRs.

Every multicast group has a shared tree through which receivers learn about new multicast sources and new receivers learn about all multicast sources. The rendezvous point (RP) is the root of this shared tree.

Default

rp-candidate shutdown

40.88 rpf-table

rpf-table

Syntax

rpf-table {**rtable-m** | **rtable-u** | **both**}

no rpf-table

Context

[Tree] (config>service>vprn>msdp rpf-table)

Full Context

configure service vprn msdp rpf-table

Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source/rendezvous point. However, the operator can specify the following:

- use the unicast route table only
- use the multicast route table only or
- use both the route tables

The **no** form of this command reverts to the default.

Default

rpf-table rtable-u

Parameters

rtable-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

rtable-u

Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

both

Will always look up first in the multicast route table and, if there is a route, it will use it. If PIM does not find a route in the first lookup, it will try to find it in the unicast route table. Rtable-m is checked before rtable-u.

Full Context

configure router msdp rpf-table

configure service vprn pim rpf-table

Description

This command configures the sequence of route tables used to find an RPF interface for a multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source or rendezvous point. The user can specify the following options:

- use the unicast route table only
- use the multicast route table only
- use both route tables

The **no** form of this command configures the router to only use the unicast route table.

Default

no rpf-table

Parameters

rtable-m

Keyword to specify that only the multicast route table is used by the multicast protocol (PIM) for IPv4 RPF checks. This route table contains routes submitted by static routes, IS-IS and OSPF.

rtable-u

Keyword to specify that only the unicast route table is used by the PIM for IPv4 RPF checks. This route table contains routes submitted by all the unicast routing protocols.

both

Keyword to specify that the multicast route table is used first by the PIM for checks. If the multicast route table lookup fails, the unicast route table is used.

Full Context

configure service vprn pim rpf6-table

Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a specific multicast route.

By default, only the unicast route table is looked up to calculate the RPF interface toward the source/rendezvous point. However, the operator can specify to use the following:

- unicast route table only
- multicast route table only
- both route tables

Default

rpf6-table rtable6-u

Parameters

rtable6-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

rtable6-u

Specifies that only the unicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by all unicast routing protocols.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

both

Specifies that the multicast route table will be used first by the multicast protocol (PIM) for IPv6 RPF checks, then the unicast route table will be used if the multicast route table lookup fails.

Context

[Tree] (config>router>pim rpfv)

Full Context

configure router pim rpfv

Description

This command enables RPF Vector processing for Inter-AS Rosen MVPN Option-B and Option-C. The **rpfv** must be enabled on every node for Inter-AS Option B/C MVPN support.

If **rpfv** is configured, MLDP inter-AS resolution cannot be used. These two features are mutually exclusive.

The **no** form of this command reverts to the default.

Default

no rpfv

Parameters

mvpn

Enables MVPN RPF vector processing for Inter-AS Option B/C MVPN based on RFC 5496 and RFC 6513. If a core RPF vector is received, it will be dropped before a message is processed.

core

Enables core RPF vector (no RD) processing for Inter-AS Option B/C MVPN, which allows SR OS interoperability as P-router with third-party vendors that do not encode RD in the RPF vector for Inter-AS MVPN.

core mvpn

Enables core RPF vector (no RD) processing for Inter-AS Option B/C MVPN, which allows SR OS interoperability as P-router with third-party vendors that do not encode RD in the RPF vector for Inter-AS MVPN.

The **no** version of this command disables RPF Vector processing. If RPF vector is received in a PIM join message, the vector will be removed before local processing of PIM message starts.

Context

[Tree] (config>router>origin-validation rpki-session)

Full Context

configure router origin-validation rpki-session

Description

This command configures a session with an RPKI local cache server by using the RPKI-Router protocol. It is over these sessions that the router learns dynamic VRP entries expressing valid origin AS and prefix associations. SR OS supports the RPKI-Router protocol over TCP/IPv4 or TCP/IPv6 transport. The router can set up an RPKI-Router session using the base routing table (in-band) or the management router (out-of-band). Configure the command in the **config**>**router management** instance to configure a session using the management port.

Default

no rpki-session

Parameters

ip-address

Specifies the IPv4 address or an IPv6 address. If the IPv6 address is link-local then the interface name must be appended to the IPv6 address after a hyphen (-).

Platforms

All

rpki-session

Syntax

rpl-node

Syntax

rpl-node [**owner** | **nbr**]

no rpl-node

Context

[Tree] (config>eth-ring rpl-node)

Full Context

configure eth-ring rpl-node

Description

This command configures the G.8032 ring protection link type as owner or neighbor. The **no** form of the command means this node is not connected to an RPL link. When RPL owner or neighbor is specified either the a or b path must be configured with the **rpl-end** command. An owner is responsible for operation of the rpl link. Configuring the RPL as neighbor is optional (can be left as no rpl-node) but if the command is used the nbr is mandatory.

On a sub-ring without virtual channel it is mandatory to configure sub-ring non-virtual-link on all nodes on the sub-ring to propagate the R-APS messages around the sub-ring.

The **no** form of this command removes the RPL link.

Default

no rpl-node

Parameters

owner

Specifies the owner link type.

nbr

Specifies the neighbor link type.

configure router mpls lsp rsvp-resv-style

Description
This command specifies the RSVP reservation style, shared explicit (se) or fixed filter (ff). A reservation style is a set of control options that specify a number of supported parameters. The style information is part of the LSP configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

rsvp-resv-style se

Parameters

ff

Fixed filter is single reservation with an explicit scope. This reservation style specifies an explicit list of senders and a distinct reservation for each of them. A specific reservation request is created for data packets from a particular sender. The reservation scope is determined by an explicit list of senders.

se

Shared explicit is shared reservation with a limited scope. This reservation style specifies a shared reservation environment with an explicit reservation scope. This reservation style creates a single reservation over a link that is shared by an explicit list of senders. Because each sender is explicitly listed in the RESV message, different labels can be assigned to different sender-receiver pairs, thereby creating separate LSPs.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router mpls tunnel-table-pref rsvp-te

Description

This command configures the tunnel table preference for RSVP-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default.

Default

rsvp-te 7

Parameters

value

Specifies the tunnel table preference value for RSVP-TE LSP.

Values 1 to 255

Default 7

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter rsvp-te)

Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter rsvp-te

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the use of RSVP-TE sourced tunnel entries in the TTM to resolve the associated static route next-hop.

The rsvp-te value instructs the code to search for the set of lowest metric RSVP-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of RSVP-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of RSVP-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value will be selected.

A P2P auto-lsp that is instantiated via an LSP template can be selected in TTM when resolution is set to any. However, Nokia does not recommend configuring an auto-lsp name explicitly under the rsvp-te node as the auto-generated name can change if the node reboots, which will blackhole the traffic of the static route.

40.105 rsvp-te-auto

rsvp-te-auto

Syntax

rsvp-te-auto

Context

[Tree] (config>oam-pm>session>ip>tunnel>mpls rsvp-te-auto)

Full Context

configure oam-pm session ip tunnel mpls rsvp-te-auto

Description

This command configures the specification of the RSVP-TE Auto (RSVP-TE with dynamically-created LSPs) tunnel information that is used to transport the test packets. Entering this context removes all other tunnel type options configured under the configure oam-pm session ip tunnel mpls context. Only a single mpls type can be configured for an OAM-PM session.

The **no** form of this command deletes the context and all configurations under it.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rt-buffer-size

Syntax

rt-buffer-size *rt-buffer-size*

no rt-buffer-size

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video rt-buffer-size)

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video rt-buffer-size)

Full Context

configure mcast-management multicast-info-policy bundle channel source-override video rt-buffer-size

configure mcast-management multicast-info-policy bundle channel video rt-buffer-size

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the retransmission buffer for channels within the bundle or channel range.

The **no** form of the command returns the parameter to the default value.

Default

300

Parameters

rt-buffer-size

Specifies the buffer size, in milliseconds, to store channel packets.

Values 300 to 8000

Platforms

7450 ESS, 7750 SR, 7750 SR-s

40.107 rt-payload-type

rt-payload-type

Syntax

rt-payload-type *payload-type*

no rt-payload-type

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if rt-payload-type)

Full Context

configure mcast-management multicast-info-policy video-policy video-interface rt-payload-type

Description

This command describes the format to be used by Retransmission (RT) server to send retransmission packets. The RET server interface allows the payload type within the retransmission packets to be configured.

Default

rt-payload-type 99 — Indicates that the frames will be sent in the RFC 4588, *RTP Retransmission Payload Format*, format.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

payload-type

Indicates the format expected for received retransmission packets. The value 33 indicates that the frames will be received as originally sent. A value between 96 and 127 indicates the dynamic payload type value (per RFC 3551) to be used for RFC 4588 formatted retransmission packets.

Values 33, 96 to 127

Platforms

7450 ESS, 7750 SR, 7750 SR-s

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>sd rt-rate)

Full Context

configure mcast-management multicast-info-policy video-policy video-interface rt-rate

configure mcast-management multicast-info-policy video-policy video-interface hd rt-rate

configure mcast-management multicast-info-policy video-policy video-interface pip rt-rate

configure mcast-management multicast-info-policy video-policy video-interface sd rt-rate

Description

This command sets the rate of nominal bandwidth at which retransmission packets are sent to the retransmission client for requests directed to the IP address.

The **no** form of the command returns the parameter to the default value.

Default

rt-rate 5

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

rt-burst-percentage

Specifies the percentage of nominal bandwidth to send retransmission packets.

Values 1 to 100

Default 5

Platforms

7450 ESS, 7750 SR, 7750 SR-s

40.109 rt-server

rt-server

Syntax

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video rt-server)

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>video rt-server)

Full Context

configure mcast-management multicast-info-policy bundle channel source-override video rt-server

configure mcast-management multicast-info-policy bundle channel video rt-server

configure mcast-management multicast-info-policy bundle video rt-server

Description

This command enables and configures the upstream retransmission server configuration parameters.

The **no** form of the command removes the upstream retransmission server configuration and implies the configuration is inherited from a higher context or from the default policy.

Default

no rt-server – The upstream retransmission server settings are inherited.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

disable

This keyword explicitly disables the upstream retransmission server within the policy. For the default bundle within the default Multicast Information Policy, the **no** form of the command and the disable keyword have the same meaning and imply the server is disabled.

ip-address

The IP address of the upstream retransmission server.

port *num*

The UDP port to use to send RET requests to the upstream RET server.

Values 1024 to 5999, 6251 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-s

rt-server

Syntax

rt-server [**client** *client-ip* [**source-port** *src-port*]]

no rt-server

Context

[Tree] (debug>service>id>video-interface rt-server)

Full Context

debug service id video-interface rt-server

Description

This command enables debugging for the RET server.

Parameters

client *client-ip*

Specifies the client IP address.

source *src-port*

Specifies the source port.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-s

debug router pim rtm

Description

This command enables debugging for PIM RTM.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command disables debugging for PIM RTM.

Parameters

detail

Displays detailed RTM information.

Platforms

All

rtm

Syntax

rtm [**neighbor** *ip-address* | **group** *name*]

no rtm

Context

[Tree] (debug>router>bgp rtm)

Full Context

debug router bgp rtm

Description

This command logs RTM changes in the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

All

rtm

Syntax

rtm [*ip-address*]

no rtm

Context

[Tree] (debug>router>isis rtm)

rtm-debounce-time

Syntax

rtm-debounce-time *debounce-time*

no rtm-debounce-time

Context

[Tree] (config>router>l2tp rtm-debounce-time)

[Tree] (config>service>vprn>l2tp rtm-debounce-time)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router l2tp rtm-debounce-time

configure service vprn l2tp rtm-debounce-time

Description

This command configures the amount of time, in milliseconds, that the system waits before declaring an L2TP tunnel down when the remote endpoint IP address cannot be resolved to an active IP route in the local routing table.

The default behavior is for the L2TP tunnel to not be declared down based on the remote endpoint IP address reachability.

The **no** form of this command returns the **rtm-debounce-time** to a value of 0.

Default

no rtm-debounce-time

Parameters

debounce-time

Specifies the amount of time, in milliseconds, that the system waits before declaring the associated L2TP tunnel as down.

Values 0 to 5000

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

40.112 rtp-header

rtp-header

Syntax

[**no**] **rtp-header**

Context

[Tree] (config>mirror>mirror-dest>sap>cem rtp-header)

Full Context

configure mirror mirror-dest sap cem rtp-header

Description

This command specifies whether an RTP header is used when packets are transmitted to the packet service network (PSN) by the CEM SAP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

40.113 rtr-adv-lsa-limit

rtr-adv-lsa-limit

Syntax

rtr-adv-lsa-limit [*1..4294967295*] [**log-only**] [**threshold** *percent*]

rtr-adv-lsa-limit [*1..4294967295*] [**log-only**] [**threshold** *percent*] **overload-timeout forever**

rtr-adv-lsa-limit [*1..4294967295*] [**log-only**] [**threshold** *percent*] **overload-timeout** *seconds*

no rtr-adv-lsa-limit

Context

[Tree] (config>service>vprn>ospf rtr-adv-lsa-limit)

Full Context

configure service vprn ospf rtr-adv-lsa-limit

Description

This command configures the maximum number of LSAs OSPF can learn from another router, in order to protect the system from a router that accidentally advertises a large number of LSAs. When the number of advertised LSAs reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, OSPF goes into overload.

The **overload-timeout** option allows the administrator to control how long OSPF is in overload as a result of the advertised LSA limit being reached. At the end of this duration of time the system automatically attempts to restart OSPF. One possible value for the **overload-timeout** is **forever**, which means OSPF is never restarted automatically and this corresponds to the default behavior when the **overload-timeout** option is not configured.

The **no** form of this command removes the **rtr-adv-lsa-limit**.

Default

rtr-adv-lsa-limit forever

Parameters

log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, overload is not set.

percent

The threshold value (as a percentage) that triggers a warning message to be sent.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0 to 100

seconds

Specifies duration in seconds before restarting OSPF.

Values 1 to 1800

Platforms

All

rtr-adv-lsa-limit

Syntax

rtr-adv-lsa-limit *limit* [**log-only**] [**threshold** *percent*]

rtr-adv-lsa-limit *limit* [**log-only**] [**threshold** *percent*] [**overload-timeout** {*seconds* | **forever**}]

no rtr-adv-lsa-limit

Context

[Tree] (config>router>ospf rtr-adv-lsa-limit)

[Tree] (config>router>ospf3 rtr-adv-lsa-limit)

Full Context

configure router ospf rtr-adv-lsa-limit

configure router ospf3 rtr-adv-lsa-limit

Description

This command configures the maximum number of LSAs OSPF can learn from another router, in order to protect the system from a router that accidentally advertises a large number of LSAs. When the number of advertised LSAs reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, OSPF goes into overload.

The **overload-timeout** option allows the administrator to control how long OSPF is in overload as a result of the advertised LSA limit being reached. At the end of this duration of time, the system automatically exits overload. One possible value for the **overload-timeout** is **forever**, which means OSPF is never exiting overload.

The **no** form of this command removes the **rtr-adv-lsa-limit**.

Default

no rtr-adv-lsa-limit

Parameters

log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, overload is not set.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

percent

Specifies the threshold value (as a percentage) that triggers a warning message to be sent.

Values 0 to 100

limit

Specifies the number of LSAs, expressed as a decimal integer, that can be learned.

Values 1 to 4294967295

second

Specifies duration in minutes before restarting OSPF.

Values Values 1 to 1800

forever

Specifies that OSPF is restarted only after the **clear router ospf | ospf3 overload rtr-adv-lsa-limit** command is executed.

Platforms

configure application-assurance group access-network-location source rtt-threshold

configure application-assurance group aa-sub-congestion-detection rtt-threshold

Description

This command configures the roundtrip delay threshold used by the DEM gateway algorithm to determine ANL congestion or subscriber congestion for NLB-DEM.

Default

rtt-threshold 173

Parameters

threshold

Specifies the maximum acceptable round trip time (RTT), in milliseconds, for TCP connections with no congestion. Any measured RTT above the threshold is considered an indication of possible congestion.

Values 0 to 500

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure application-assurance group access-network-location source rtt-threshold-rat

configure application-assurance group aa-sub-congestion-detection rtt-threshold-rat

Description

This command configures the roundtrip delay threshold for each RAT type to be used for a congestion detection algorithm (if applicable).

The **no** form of this command reverts to the default value.

Default

rtt-threshold-rat 173

Parameters

rat-type

Specifies the 3GPP RAT type.

Values utran, geran, wlan, gan, hspa-evol, eutran, virtual, eutran-nb, ehrpd, hrpd, cdma-1x, umb, wifi, nr, lte-m

rtt-threshold

Specifies the parameter used by the DEM-GW algorithm that determines ANL congestion or subscriber congestion in the case of NLB-DEM. It specifies the maximum acceptable round trip time (RTT), under no congestion, in milliseconds. Any measured RTT above the threshold is considered an indication of possible congestion.

Values 0 to 500

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure application-assurance group access-network-location source rtt-threshold-tolerance

configure application-assurance group aa-sub-congestion-detection rtt-threshold-tolerance

Description

This command configures the ANL roundtrip delay threshold tolerance used by the DEM gateway algorithm to determine ANL-level or subscriber-level congestion.

Default

rtt-threshold-tolerance 50

Parameters

tolerance

Specifies the ratio, in percentage, of RTTs above the configured threshold (**rtt-threshold**) over the total RTT measurements.

The ratio is calculated as follows, measured across a one-minute period:

rtt-threshold-tolerance = #(RTTs > **rtt-threshold**)/ (Total #RTTs)

If the **rtt-threshold-tolerance** ratio is exceeded, the ANL is declared congested.

Values 0 to 100

Default 50

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>service>vpls>vxlan rx-discard-on-ndf)

Full Context

configure service vpls vxlan rx-discard-on-ndf

Description

This command, supported by static and BGP-EVPN VXLAN binds, determines the type of traffic that the Non Designated Forwarder (NDF) PE discards in an EVPN multi-homed Ethernet Segment. It is only

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

relevant when the VXLAN instance is associated to a network-interconnect-vxlan ES. The option BM is the default option and discards BM on reception (unicast, known and known is allowed). The option BUM discards any BUM frame on reception. Option none allows any BUM traffic on reception.

Default

rx-discard-on-ndf bm

Parameters

bm

Discards Broadcast and Multicast on the EVPN Non Designated Forwarder (NDF) router, but not Unknown Unicast.

bum

Discards Broadcast, Multicast and Unknown Unicast traffic on the NDF.

none

Allows Broadcast, Multicast or Unknown Unicast traffic on the NDF.

40.124 rx-los-reaction

rx-los-reaction

Syntax

rx-los-reaction {**squelch**}

no rx-los-reaction

Context

[Tree] (config>port>dwdm>coherent rx-los-reaction)

Full Context

configure port dwdm coherent rx-los-reaction

Description

This command configures the reaction to an RX LOS.

Note:
If **rx-los-reaction squelch** is disabled for some coherent DWDM transceivers, the transceiver only reports local fault alarms when an RX LOS condition occurs; however, the port returns to service faster after the LOS condition is cleared. For these transceivers, if **rx-los-reaction squelch** is enabled, there is better visibility of individual alarms (for example, signal-fail, local fault, and no-am-lock), but the port takes longer to return to service after the LOS condition is cleared.

Parameters

squelch

Specifies to squelch (turn off) the transmit signal on RX LOS.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

40.125 rx-los-thresh

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure port ethernet eth-cfm mep eth-bn rx-update-pacing

Description

This command sets the pace for update messages to and from the **eth-cfm** subsystem to the QoS subsystem. The most recent update messages are held by the ETH-CFM subsystem, but the most recent update is held until the expiration of the pacing timer.

Parameters

seconds

The time to wait before sending subsequent updates (in seconds).

Values 1 to 600

Default 5

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context

[Tree] (debug>router>pim s-pmsi)

Full Context

debug router pim s-pmsi

Description

This command enables debugging for PIM selective provider multicast service interface.

The **no** form of this command disables the debugging.

Parameters

vpnSrcAddr

Specifies the VPN source address.

vpnGrpAddr

Specifies the VPN group address.

mdSrcAddr

Specifies the source address of the multicast domain.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

41.2 s-tag

s-tag

Syntax

s-tag *qtag1* **c-tag-range** *qtag2* [**to** *qtag2*]

no s-tag *qtag1* **c-tag-range** *qtag2*

Context

[Tree] (config>service>system>bgp-evpn>eth-seg>qinq s-tag)

Full Context

configure service system bgp-evpn ethernet-segment qinq s-tag

Description

This command determines the inner VIDs (for a specified outer VID) associated with the virtual Ethernet Segment on a specific qinq port or LAG based on the following:

- Values *, null, 0 to 4094 are allowed.
- Any SAP for which the outer and inner service-delimiting qtags match the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:10.* will not match port 1/1/1, s-tag 10 c-tag-range 10 to 100.
- A maximum of 8 ranges (including the s-tag ranges) are allowed in the qinq context.
- A c-tag range can be composed of a single qtag.
- Shutting down the ES is not required before making changes.
- A qtag included in the **s-tag-range** command cannot be included in the s-tag qtag of this command.

Note:
Not all qtag1 and qtag2 combinations are valid for values 0, *, and null. The following combinations are allowed:

- s-tag 0 c-tag-range *
- s-tag * c-tag-range *
- s-tag * c-tag-range null
- s-tag null c-tag-range null
- s-tag X c-tag-range 0 (where: X=1 to 4094)
- s-tag X c-tag-range * (where: X=1 to 4094)

The **no** form of the command removes the configured range. Only the first qtag1 value is required to remove the range.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

qtag1

Specifies the outer VID for the c-tag range.

Values *, null, 0 to 4094

qtag2

Specifies the inner VID for the c-tag range. When configuring a range of qtags (and not a single value), the second qtag1 value must be greater than the value of the first qtag1.

Values *, null, 0 to 4094

Platforms

All

s-tag

Syntax

s-tag

Context

[Tree] (config>test-oam>sath>svc-test>svc-stream>frm-payl>eth s-tag)

Full Context

configure test-oam service-activation-testhead service-test service-stream frame-payload ethernet s-tag

Description

Commands in this context configure service VLAN tag (s-tag) information specification.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

41.3 s-tag-range

s-tag-range

Syntax

s-tag-range *qtag1* [**to** *qtag1*]

no s-tag-range *qtag1*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>system>bgp-evpn>eth-seg>qinq s-tag-range)

Full Context

configure service system bgp-evpn ethernet-segment qinq s-tag-range

Description

This command determines the VIDs associated with the virtual Ethernet Segment on a specific qinq port or LAG based on the following considerations:

- Values *, 0 to 4094 are allowed.
- Any SAP for which the service-delimiting qtag matches the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:0.* will not match port 1/1/1, s-tag-range 100.
- Maximum 8 ranges are allowed in the qinq context.
- A range can be composed of a single qtag.
- Shutting down the ES is not required before making changes in the q-tag-range.

The **no** form of the command removes the configured range. Only the first qtag1 value is required to remove the range.

Parameters

qtag1

Specifies the outer VID. When configuring a range of qtags (and not a single value), the second qtag1 value must be greater than the first qtag1.

Values *, 0 to 4094

Platforms

All

41.4 s1-release

s1-release

Syntax

[**no**] **s1-release**

Context

Use subject to Terms available at: www.nokia.com/terms.

41.6 s2l-path

s2l-path

Syntax

[**no**] **s2l-path** *path-name* **to** *ip-address*

Context

[Tree] (config>router>mpls>lsp>primary-p2mp-instance s2l-path)

Full Context

configure router mpls lsp primary-p2mp-instance s2l-path

Description

This command creates a root-to-leaf (S2L) sub-LSP path for the primary instance of a P2MP LSP. The primary instance of a P2MP LSP is modeled as a set of root-to-leaf (S2L) sub-LSPs. The root, for example, head-end node, triggers signaling using one path message per S2L path. The leaf sub-LSP paths are merged at branching points.

Each S2L sub-LSP is signaled in a separate path message. Each leaf node will respond with its own RESV message. A branch LSR node will forward the path message of each S2L sub-LSP to the downstream LSR without replicating it. It will also forward the RESV message of each S2L sub-LSP to the upstream LSR without merging it with the RESV messages of other S2L sub-LSPs of the same P2MP LSP. The same is done for subsequent refreshes of the path and RESV states.

The S2L paths can be empty paths or can specify a list of explicit hops. The path name must exist and must have been defined using the **config>router>mpls>path** command. The same path name can be re-used by more than one S2L of the primary P2MP instance. However, the **to** keyword must have a unique argument per S2L as it corresponds to the address of the egress LER node.

This command is not supported on the 7450 ESS.

Parameters

path-name

Specifies the name of the path which consists of up to 32 alphanumeric characters.

to ***ip-address***

Specifies the IP address of the egress router.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

41.7 sa-db

sa-db

Syntax

sa-db [**group** *grpAddr*] [**source** *srcAddr*] [**rp** *rpAddr*]

no sadb

Context

[Tree] (debug>router>msdp sa-db)

Full Context

debug router msdp sa-db

Description

This command enables debugging for MSDP SA requests.

The **no** form of this command disables the MSDP SA database debugging.

Parameters

grpAddr

Debugs the IP address of the group.

srcAddr

Debugs the source IP address.

rpAddr

Debugs the specified RP address.

Platforms

All

41.8 sa-mac

sa-mac

Syntax

sa-mac *ieee-address* **da-mac** *ieee-address*

no sa-mac

Context

[Tree] (config>mirror>mirror-dest>sap>egress>ip-mirror sa-mac)

Full Context

configure mirror mirror-dest sap egress ip-mirror sa-mac

Description

This command configures the source and destination MAC addresses for IP mirroring.

The **no** form of this command reverts to the default.

Parameters

sa-mac ***ieee-address***

Specifies the source MAC address. Multicast, Broadcast and zeros are not allowed.

da-mac ***ieee-address***

Specifies the destination MAC address. Zeros are not allowed.

Platforms

All

41.9 sa-timeout

sa-timeout

Syntax

sa-timeout *seconds*

no sa-timeout

Context

[Tree] (config>service>vprn>msdp sa-timeout)

Full Context

configure service vprn msdp sa-timeout

Description

This command configures the value for the SA entries in the cache. If these entries are not refreshed within the timeout value, they are removed from the cache. Normally, the entries are refreshed at least once a minute. But under high load with many of MSDP peers, the refresh cycle could be incomplete. A higher timeout value (more then 90) could be useful to prevent instabilities in the MSDP cache.

Default

90

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

seconds

Specifies the time, in seconds, to wait for a response from the peer before declaring the peer unavailable.

Values 90 to 600

Platforms

All

sa-timeout

Syntax

sa-timeout *seconds*

no sa-timeout

Context

[Tree] (config>router>msdp sa-timeout)

Full Context

configure router msdp sa-timeout

Description

This command configures the timeout interval for the SA entries in the cache. If these entries are not refreshed within the timeout interval, they are removed from the cache. Normally, the entries are refreshed at least once a minute, but under high load with many MSDP peers, the refresh cycle could be incomplete. A higher timeout value (greater than 90) is useful to prevent instabilities in the MSDP cache.

The **no** form of this command reverts to the default timeout interval of 90 seconds.

Default

no sa-timeout

Parameters

seconds

Specifies the time, in seconds, to wait for a response from the peer before declaring the peer unavailable.

Values 90 to 600

41.10 saa

saa

Syntax

saa

Context

[Tree] (config saa)

Full Context

configure saa

Description

Commands in this context configure the Service Assurance Agent (SAA) tests.

Platforms

All

saa

Syntax

saa *test-name* [**owner** *test-owner*] {**start** | **stop**} [**no-accounting**]

Context

[Tree] (oam saa)

Full Context

oam saa

Description

This command starts or stops an SAA test that is not configured as continuous.

Parameters

test-name

Specifies the name of the SAA test, up to 32 characters. The test name must already be configured in the **config>saa>test** context.

test-owner

Specifies the owner of an SAA operation, up to 32 characters. If a *test-owner* value is not specified, the default owner is used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default "TiMOS CLI"

start

Starts the test. A test cannot be started if the same test is still running.

A test cannot be started if it is in a shut-down state. An error message and log event is generated to indicate a failed attempt to start an SAA test run. A test cannot be started if it is in a continuous state.

stop

Stops a test in progress. A test cannot be stopped if it is not in progress. A log message is generated to indicate that an SAA test run has been aborted. A test cannot be stopped if it is in a continuous state.

no-accounting

Disables the recording results in the accounting policy. When specifying **no-accounting** the MIB record produced at the end of the test is not added to the accounting file. It uses one of the three MIB rows available for the accounting module for collection.

[Tree] (config>filter>ipv6-filter>entry sample-profile)

Full Context

configure filter ip-filter entry sample-profile

configure filter ipv6-filter entry sample-profile

Description

This command allows traffic matching of an IPv4 or IPv6 filter to be sampled for cflowd processing using a specific sample profile.

This command is only compatible if the associated interface is configured for interface-based sampling and is only supported for ingress sampling.

An IP filter can only specify a single alternate sample profile for cflowd sampling, but that sample profile can be used in multiple entries.

The **no** form of this command removes the specified sampling profile from the configuration. Cflowd continues to process traffic based on the default or configured interface cflowd sampling profile.

Default

no sample-profile

Parameters

sample-profile-id

Specifies the cflowd sample profile to be used for packets matching this filter entry.

Values 1 to 5

Platforms

All

41.16 sample-rate

sample-rate

Syntax

sample-rate [*rate*]

Context

[Tree] (config>cflowd>sample-profile sample-rate)

configure service ies subscriber-interface group-interface cflowd-parameters sampling

configure service ies interface cflowd-parameters sampling

configure service vprn subscriber-interface group-interface cflowd-parameters sampling

configure service vprn network-interface cflowd-parameters sampling

Description

This command enables and configures the cflowd sampling behavior to collect traffic flow samples through a router for analysis.

This command can be used to configure the sampling parameters for unicast and multicast traffic separately. If sampling is not configured for either **unicast** or **multicast** traffic, then that type of traffic will not be sampled.

If cflowd is enabled without either **egress-only** or **both** keywords specified or with the **ingress-only** keyword specified, then only ingress sampling is enabled on the associated IP interface.

The **no** form of this command disables the associated type of traffic sampling.

Parameters

unicast | multicast

Specifies unicast or multicast sampling.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

type

Specifies the cflowd sampling type on the specific virtual router interface.

Values acl — Specifies ACL cflowd analysis be applied to the specified virtual router interface.

interface — Specifies interface cflowd analysis be applied to the specified virtual router interface

direction

Specifies the direction of the cflowd analysis that is applied to the specified virtual router interface.

Values ingress-only — Specifies an ingress only direction of the cflowd analysis be applied to the specified virtual router interface.

egress-only — Specifies an egress only direction of the cflowd analysis be applied to the specified virtual router interface.

both — Specifies both ingress and egress direction of the cflowd analysis be applied to the specified virtual router interface.

profile-id

Defines the sampling rate profile to be associated with this interface.

Values 1 to 5

Full Context

configure router interface cflowd-parameters sampling

Description

This command enables and configures the cflowd sampling behavior to collect traffic flow samples through a router for analysis.

This command can be used to configure the sampling parameters for unicast and multicast traffic separately. If sampling is not configured for either unicast or multicast traffic, then that type of traffic will not be sampled.

If cflowd is enabled without either **egress-only** or **both** specified or with the **ingress-only** keyword specified, then only ingress sampling will be enabled on the associated IP interface.

The **no** form of this command disables the associated type of traffic sampling on the associated interface.

Default

no sampling

Parameters

unicast

Specifies that the sampling command will control the sampling of unicast traffic on the associated interface/SAP.

multicast

Specifies that the sampling command will control the sampling of multicast traffic on the associated interface/SAP.

type

Specifies whether the traffic sampling is based on an **acl** match, or all traffic entering or exiting the associated interface.

Values **acl** — Specifies that the sampled traffic is controlled via an IP traffic filter entry with the action "filter-sample” configured.

interface — Specifies that all traffic entering or exiting the interface is subject to sampling.

direction

Specifies the direction to collect traffic flow samples.

Values **ingress-only** — Enables ingress sampling only on the associated interface.

egress-only — Enables egress sampling only on the associated interface.

both — Enables both ingress and egress cflowd sampling.

profile

Specifies the sampling profile to be associated with this interface.

no sap *sap-id*

Context

[Tree] (config>service>vpls sap)

Full Context

configure service vpls sap

Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the 7450 ESS or 7750 SR. Each SAP must be unique. All SAPs must be explicitly created within a service or on an IP interface.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **configure port** *port-id* **ethernet mode access** command. Channelized TDM ports are always access ports (TDM applies to the 7750 SR only).

If a port is shut down, all SAPs on that port become operationally down. When a service is shut down, SAPs for the service are not displayed as operationally down although all traffic traversing the service is discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For Internet Ethernet Service (IES), the IP interface must be shut down before the SAP on that interface may be removed.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

port-id

Specifies the physical port ID in the *slot/mda/port* format.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the slot_number/MDA_number/port_number [.channel] format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

group-name

Specifies the name of the split horizon group to which the SAP belongs. This parameter applies to the 7450 ESS or 7750 SR only.

capture-sap

Specifies a capturing SAP in which triggering packets are sent to the CPM. Non-triggering packets captured by the capture SAP are dropped. This parameter applies to the 7450 ESS or 7750 SR only.

create

Keyword used to create a SAP instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

root-leaf-tag

Specifies a SAP as a root leaf tag SAP. Only SAPs of the form dot1q (for example, 1/1/1:X) or qinq (for example, 1/1/1:X.Y, 1/1/1:X.*) are supported. The default E-Tree SAP type is a root AC, if *root-leaf-tag* **(**or *leaf-ac***)** is not specified at SAP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

leaf-tag-vid

Specifies to replace the outer SAP-ID for leaf traffic. The leaf tag VID is only significant between peering VPLS but the values must be consistent on each end.

leaf-ac

Specifies a SAP as a leaf access (AC) SAP. The default E-Tree SAP type is root AC if **leaf-ac** (or **root-leaf-tag**) is not specified at SAP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

Context

[Tree] (config>service>epipe sap)

Full Context

configure service epipe sap

Description

This command creates a SAP within a service. A SAP is a combination of port and encapsulation parameters that identify the SAP on the interface and within the device. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP does not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down, although all traffic traversing the service is discarded.

The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

Ethernet SAPs support **null**, **dot1q**, and **qinq** for all routers.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For IES, the IP interface must be shutdown before the SAP on that interface may be removed.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP.

port-id

Specifies the physical port ID.

If the card in the slot has MDAs installed, the *port-id* must be in the slot_number/MDA_number/port_number format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

endpoint

Keyword used to add a SAP endpoint association.

no endpoint

Keyword used to remove the association of a SAP or a spoke SDP with an explicit endpoint name.

create

Keyword used to create a SAP instance. The **create** keyword requirement can be enabled or disabled in the **environment create** context.

qtag-normalization

Keyword to enable Q-tag normalization.

tag

Specifies the value for tag normalization. The tag value is pushed as the S-tag (outer tag) into the frames coming from this SAP and sent to EVPN. On network ingress, the inner and outer VLAN tags are looked up and the frames matching this value and the normalized C-tag value are sent to the associated SAP.

Values 1 to 4094

s-tag

Specifies the value for tag normalization. The tag value is pushed as the S-tag (outer tag) into the frames coming from this SAP and sent to EVPN. On network ingress, the inner and outer VLAN tags are looked up and the frames matching this value and the normalized C-tag value are sent to the associated SAP.

Values 1 to 4094

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

c-tag

Specifies the value for tag normalization. The tag value is pushed as the C-tag (inner tag) into the frames coming from this SAP and sent to EVPN. On network ingress, the inner and outer VLAN tags are looked up and the frames matching this value and the normalized S-tag value are sent to the associated SAP.

Values 1 to 4094

Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the device. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP will not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down although all traffic traversing the service will be discarded.

The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

Ethernet SAPs support null, dot1q, and qinq is supported for all routers.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP will also be deleted. For Internet Enhanced Service (IES), the IP interface must be shutdown before the SAP on that interface may be removed.

By default, no SAPs are defined.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP.

port-id

Specifies the physical port ID.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the slot_number/MDA_number/port_number format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

configure service ies subscriber-interface group-interface sap

configure service vprn subscriber-interface group-interface sap

configure service vprn sap

configure service ies sap

configure service vprn interface sap

Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the router. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP will not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **configure port** *port-id* **ethernet mode access** command.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down although all traffic traversing the service will be discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

Note:
Configure an IES interface as a loopback interface by issuing the **loopback** command instead of the **sap** *sap-id* command. The loopback flag cannot be set on an interface where a SAP is already defined and a SAP cannot be defined on a loopback interface.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For Internet Enhanced Service (IES), the IP interface must be shutdown before the SAP on that interface may be removed. The no form of this command causes the ptp-hw-assist to be disabled.

Default

No SAPs are defined.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

port-id

Specifies the physical port ID in the *slot/mda/port* format.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the slot_number/MDA_number/port_number format. For example 61/2/3 specifies port 3 on MDA 2 in slot 61.

sap *sap-id* [**create**] **endpoint** *name*

no sap

Context

[Tree] (config>mirror>mirror-dest sap)

Full Context

configure mirror mirror-dest sap

Description

This command creates a service access point (SAP) within a mirror destination service. The SAP is owned by the mirror destination service ID.

The SAP is defined with port and encapsulation parameters to uniquely identify the (mirror) SAP on the interface and within the box. The specified SAP may be defined on an Ethernet access port with a dot1q, null, or q-in-q encapsulation type.

Only one SAP can be created within a **mirror-dest** service ID. If the defined SAP has not been created on any service within the system, the SAP is created and the context of the CLI will change to the newly created SAP. In addition, the port cannot be a member of a multi-link bundle, APS group or IMA bundle.

If the defined SAP exists in the context of another service ID, **mirror-dest** or any other type, an error is generated.

Mirror destination SAPs can be created on Ethernet interfaces that have been defined as an access interface. If the interface is defined as network, the SAP creation returns an error.

When the **no** form of this command is used on a SAP created by a mirror destination service ID, the SAP with the specified port and encapsulation parameters is deleted.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

no-endpoint

Removes the association of a SAP or a sdp with an explicit endpoint name.

name

Specifies the name of the endpoint associated with the SAP.

sap

Syntax

sap *sap-id* {[**egress**] [**ingress**]}

no sap *sap-id* [**egress**] [**ingress**]

Context

[Tree] (config>mirror>mirror-source sap)

Full Context

configure mirror mirror-source sap

Description

This command enables mirroring of traffic ingressing or egressing a service access port (SAP). A SAP that is defined within a mirror destination cannot be used in a mirror source. The mirror source SAP referenced by the *sap-id* is owned by the service ID of the service in which it was created. The SAP is only referenced in the mirror source name for mirroring purposes. The mirror source association does not need to be removed before deleting the SAP from its service ID. If the SAP is deleted from its service ID, the mirror association is removed from the mirror source.

More than one SAP can be associated within a single **mirror-source**. Each SAP has its own **ingress** and **egress** parameter keywords to define which packets are mirrored to the mirror destination.

The SAP must be valid and properly configured. If the associated SAP does not exist, an error occurs and the command will not execute.

The same SAP cannot be associated with multiple mirror source definitions for ingress packets.

The same SAP cannot be associated with multiple mirror source definitions for egress packets.

If a particular SAP is not associated with a mirror source name, then that SAP will not have mirroring enabled for that mirror source.

Note that the ingress and egress options cannot be supported at the same time on a CEM encap-type SAP. The options must be configured in either the ingress **or** egress contexts (applies to the 7750 SR and 7950 XRS).

The **no** form of this command disables mirroring for the specified SAP. All mirroring for that SAP on ingress and egress is terminated. Mirroring of packets on the SAP can continue if more specific mirror criteria is configured. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition is removed.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

egress

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

ingress

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination before the ingress packet modification.

Platforms

All

[Tree] (config>li>li-source sap)

Full Context

configure li li-source sap

Description

This command creates a service access point (SAP) within an LI configuration. The specified SAP must define a FastE, GigE, or XGigE, or XGigE access port with a dot1q, null, or q-in-q encapsulation type.

When the **no** form of this command is used on a SAP, the SAP with the specified port and encapsulation parameters is deleted.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

egress

Specifies that the router perform lawful intercept on egress traffic. Packets egressing the SAP are mirrored to the mirror destination after egress packet modification.

ingress

Specifies that the router perform lawful intercept on ingress traffic. Packets ingressing the SAP are mirrored to the mirror destination before ingress packet modification.

no sap

Context

[Tree] (config>li>li-fltr>li-mac-fltr>entry>match sap)

Full Context

configure li li-filter li-mac-filter entry match sap

Description

This command specifies the QinQ SAP to match from the Epipe or VPLS service, where the s-tag must be a value and the outer-tag must be of type *. This filter match is used in conjunction with match criteria **outer-tag** where the outer-tag must also be provisioned for the entry match on the QinQ packet to activate.

The match criteria SAP must be an exact match with the QinQ configured on the Epipe or VPLS service. An associated outer-tag must be provisioned to match on the QinQ packet. For example, SAP 1/1/1:1.*, where the outer-tag is "*", and an outer-tag of 1 would perform LI on 1/1/1:1.1 on a 1/1/1:1.* SAP.

The **no** form of this command removes the QinQ SAP as the match criterion.

Default

no sap

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

configure service vpls proxy-nd dynamic sap

Description

This command configures the proxy ARP or ND entry for creation when the ARP or neighbor advertisement (NA) packet for the configured IP address is received on the configured SAP. This command can be configured in combination with the **configure service vpls proxy-arp dynamic mac-list** or **configure service vpls proxy-nd dynamic mac-list** command for the entry. In this case, the MAC of the ARP or NA message and the SAP on which the ARP or NA packet is received are both checked before creating the entry.

The **no** form of this command removes the SAP as the match criterion.

Default

no sap

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

Values

Full Context

configure qos sap-egress

Description

This command is used to create or edit a Service Egress QoS policy. The egress policy defines the SLA for service packets as they egress on the SAP.

Policies are templates that can be applied to multiple services as long as the scope of the policy is template. The queues defined in the policy are not instantiated until a policy is applied to a service.

Sap-egress policies determine queue mappings based on ingress DSCP, IP precedence, dot1p, and IPv4 or IPv6 match criteria. Multiple queues can be created per forwarding class and each queue can have different CIR or PIR parameters.

Egress SAP QoS policies allow the definition of queues and the mapping of forwarding classes to those queues. Each queue needs to have a relative CIR for determining its allocation of QoS resources during periods of congestion. A PIR can also be defined that forces a hard limit on the packets transmitted through the queue. When the forwarding class is mapped to the queue, a DSCP, IP precedence, or dot1p value can optionally be specified.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The sap-egress policy with *policy-id* 1 is the default sap-egress QoS policy and is applied to service egress SAPs when an explicit policy is not specified or removed. The default sap-egress policy cannot be modified or deleted.

By default, all forwarding classes map to queue 1.

Any changes made to an existing policy, using any of the sub-commands, will be applied immediately to all egress SAPs where this policy is applied. For this reason, when many changes are required on a policy, it is highly recommended that the policy be copied to a work area *policy-id*. That work-in-progress policy can be modified until complete, then written over the original policy-id. Use the **config qos copy** command to maintain policies in this manner.

The **no** form of this command deletes the sap-egress policy. A policy cannot be deleted until it is removed from all service SAPs where it is applied. When a sap-egress policy is removed from a SAP, the SAP will revert to the default sap-egress *policy-id* 1.

Parameters

policy-id

The *policy-id* uniquely identifies the policy on the router.

Values 1 to 65535

policy-name

The *policy-name* uniquely identifies the policy.

Values 64 characters maximum.

create

Required parameter when creating a SAP QoS egress policy.

name

Configures an optional policy name which adds a name identifier to a specific policy to then use that policy name in configuration references as well as display and use policy names in show commands throughout the system. This helps the service provider or administrator to identify and manage sap-egress policies within the SR OS platforms.

All sap-egress policies are required to assign a policy ID to initially create a policy. However, either the policy ID or the policy name can be used to identify and reference a specific policy once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *policy-id* as the name.

Values 64 characters maximum

Full Context

configure qos copy sap-egress

Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters

overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

Example:

```
– SR>config>qos# copy sap-egress 1 1010
– MINOR: CLI Destination "1010" exists use {overwrite}.
– SR>config>qos# copy sap-egress 1 1010 overwrite
```

src-pol dst-pol

Indicates that the source policy ID and the destination policy ID are SAP egress policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

Description

This command specifies the SAP ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the SAP-ID is matched against the Nokia vendor-specific sub-option in DHCP Option 82.

Note:
This command is used only when **sap-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the SAP ID from the configuration.

Parameters

sap-id

Specifies a SAP ID, up to 255 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

41.24 sap-ingress

sap-ingress

Syntax

sap-ingress {*policy-id* | *policy-name*} [**create**] [**name** *name*]

no sap-ingress {*policy-id* | *policy-name*}

Context

[Tree] (config>qos sap-ingress)

Full Context

configure qos sap-ingress

Description

This command is used to create or edit the ingress policy. The ingress policy defines the SLA enforcement that service packets receive as they ingress a SAP. SLA enforcement is accomplished through the definition of queues that have Forwarding Class (FC), Fair Information Rate (FIR), Committed Information Rate (CIR), Peak Information Rate (PIR), Committed Burst Size (CBS), and Maximum Burst Size (MBS) characteristics.

Policies in effect are templates that can be applied to multiple services as long as the **scope** of the policy is template. Queues defined in the policy are not instantiated until they are assigned to at least one forwarding class and a policy is applied to a service SAP.

It is possible that a SAP ingress policy will include the **dscp** map command, the **dot1p** map command, and an IP or MAC match criteria. When multiple matches occur for the traffic, the order of precedence will be used to arrive at the final action. The order of precedence is as follows:

1. 802.1p bits
2. DSCP
3. IP quintuple or MAC headers

The SAP ingress policy with *policy-id* 1 is a system-defined policy applied to services when no other policy is explicitly specified. The system SAP ingress policy cannot be modified or deleted. The default SAP ingress policy defines one unicast and one multipoint queue associated with all forwarding classes, with an FIR of zero, a CIR of zero, and a PIR of line rate.

Any changes made to the existing policy, using any of the sub-commands, are applied immediately to all services where this policy is applied. For this reason, when many changes are required on a policy, it is recommended that the policy be copied to a work area policy ID. That work-in-progress policy can be modified until complete, then written over the original policy-id. Use the **config>qos>copy** command to maintain policies in this manner.

The **no** form of this command deletes the SAP ingress policy. A policy cannot be deleted until it is removed from all services where it is applied.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

policy-id

The *policy-id* uniquely identifies the policy.

Values 1 to 65535

policy-name

The *policy-name* uniquely identifies the policy.

Values 64 characters maximum

create

Required parameter when creating a SAP QoS ingress policy.

name *name*

Configures an optional policy name which adds a name identifier to a specific policy to then use that policy name in configuration references as well as display and use policy names in show commands throughout the system. This helps the service provider and administrator to identify and manage sap-ingress policies within the SR OS platforms.

All sap-ingress policies are required to assign a policy ID to initially create a policy. However, either the policy ID or the policy name can be used to identify and reference a specific policy after it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *policy-id* as the name.

Context

[Tree] (config>subscr-mgmt sap-template)

Full Context

configure subscriber-mgmt sap-template

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a template that specifies parameters for automatically generated subscriber SAPs, for example, when creating CUPS sessions. A template with the name "default" is used if no specific name is provided, but this must be manually provisioned.

The **no** form of this command removes the template.

Parameters

name

Specifies the name of the PFCP association, up to 32 characters.

create

Keyword used to create the SAP template.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

41.30 sap-template-binding

sap-template-binding

Syntax

sap-template-binding *name/id*

no sap-template-binding

Context

[Tree] (config>service>vpls>vpls-group sap-template-binding)

Full Context

configure service vpls vpls-group sap-template-binding

Description

This command configures the binding to a SAP template to be used to instantiate SAPs in the data VPLS using as input variables the VLAN IDs generated by the vid-range command.

The **no** form of this command removes the binding and deletes the related SAP instances. The command will fail if any of the affected VPLS instances have either a provisioned SAP or an active MVRP declaration/registration or if the related vpls-group is in no shutdown state. Any changes to the **sap-template-binding** require the **vpls-group** to be in **shutdown** state. New control SAP additions to the management VPLS are allowed as long as data VPLS instantiations/removals for vpls-groups are not in progress. Control SAPs can be removed at any time generating the removal of related data SAPs from the data VPLS. The **shutdown** or **no shutdown** state for the control SAPs does not have any effect on data SAPs instantiated with this command.

configure system satellite eth-sat sat-type

Description

This command configures the type of satellite variant for the associated satellite chassis.

The **no** form of this command deletes the **sat-type** configuration.

Default

no sat-type

Parameters

sat-type

Specifies the satellite type. Configuration of the following variants is supported:

es24-1gb-sfp

Specifies the 24xGE (SFP) + 4x10GE Ethernet satellite.

es24-1gb-tx

Specifies the 24xGE (copper) + 4x10GE Ethernet satellite or the 24-port copper + PoE Ethernet satellite.

es24-sasmxp-1gb-sfp

Specifies the 7210 SAS-Mxp as an Ethernet satellite.

es24-sass-1gb-sfp

Specifies the 7210 SAS-S 24xGE (SFP) + 4x10GE Ethernet satellite.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

es24-sfpp+8-sfp28+2-qsfp28

Specifies the 7250 IXR-e 24SFP+ 8SFP28 2QSFP28 satellite.

es32-qsfp28+4-qsfpdd

Specifies the 7250 IXR-X1 satellite.

es48-1gb-sfp

Specifies the 48xGE (SFP) + 4x10GE Ethernet satellite.

es48-1gb-tx

Specifies the 48xGE (copper) + 4x10GE Ethernet satellite or the 48-port copper + PoE Ethernet satellite.

es48-sass-1gb-sfp

Specifies the 7210 SAS-S 48xGE (SFP) + 4x10GE Ethernet satellite.

es48-sfpp+6-qsfp28

Specifies the 7250 IXR-s satellite.

es6-qsfpdd+48-sfp56

Specifies the 7250 IXR-Xs satellite.

es64-10gb-sfpp+4-100gb-qsfp28

Specifies the 64x10GE + 4xQSFP28 Ethernet satellite.

template-name

Specifies the name for the associated port template.

dynamic-uplink

Keyword to enable dynamic uplink resilience for the Ethernet satellite.

maximum uplink distribution for resiliency

Specifies the forwarding complex used for satellite uplink association to the ports.

Values single-complex – all uplinks for the associated satellite must be connected to ports using a single forwarding complex.

dual-complex – all uplinks for the associated satellite can be connected to ports using at the most two forwarding complexes. This value optimizes the resources across the two complexes.

save

Syntax

save [*cflash-id*]

Context

[Tree] (bof save)

Full Context

bof save

Description

This command uses the boot option parameters currently in memory and writes them from the boot option file to the specified compact flash.

The BOF must be located in the root directory of the internal or external compact flash drives local to the system and have the mandatory filename of *bof.cfg*.

If a location is not specified, the BOF is saved to the default compact flash drive (cf3:) on the active CPM (typically the CPM in slot A, but the CPM in slot B could also be acting as the active CPM). The slot name is not case-sensitive. You can use upper or lowercase "A" or "B".

Command usage:

- **bof save** — saves the BOF to the default drive (cf3:) on the active CPM (either in slot A or B)
- **bof save cf3:** — saves the BOF to cf3: on the active CPM (either in slot A or B)

To save the BOF to a compact flash drive on the standby CPM (for example, the redundant (standby) CPM is installed in slot B), specify -A or -B option.

Command usage:

- **bof save cf3-A:** — saves the BOF to cf3: on CPM in slot A whether it is active or standby
- **bof save cf3-B:** — saves the BOF to cf3: on CPM in slot B whether it is active or standby

The slot name is not case-sensitive. You can use upper or lowercase "A" or "B".

The **bof save** and **show bof** commands allow you to save to or read from the compact flash of the standby CPM. Use the **show card** command to determine the active and standby CPM (A or B).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

Saves must be explicitly executed. The BOF is saved to cf3: if a location is not specified.

Parameters

flash-id

Specifies the compact flash ID where the *bof.cfg* is to be saved.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default cf3:

candidate save

Description

This command saves the current candidate to a file.

Parameters

file-url

Specifies the directory and filename.

Platforms

All

save

Syntax

save [**comment** *comment*] [**rescue**]

Context

[Tree] (admin>rollback save)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

admin rollback save

Description

If the optional **rescue** keyword is not used, this command saves a rollback checkpoint at the location and with the filename specified by the rollback-location with a suffix of .rb. The previously saved checkpoints will have their suffixes incremented by one (.rb.1 becomes .rb.2, and so on). If there are already as many checkpoint files as the maximum number supported, then the last checkpoint file is deleted.

If the **rescue** keyword is used, then this command saves the current operational configuration as a rescue configuration at the location and with the filename specified by the rescue location. The filename will have the suffix .rc appended.

Parameters

comment-string

Specifies a comment, up to 255 characters, that is associated with the checkpoint.

rescue

Saves the rescue checkpoint instead of a normal rollback checkpoint.

Platforms

admin save

Description

This command saves the running configuration to a configuration file. For example:

```
A:ALA-1>admin# save ftp://test:test@192.168.x.xx/./100.cfg
Saving configuration .........Completed.
```

By default, the running configuration is saved to the primary configuration file.

Parameters

file-url

Specifies the file URL location to save the configuration file.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn*/][*file-path*]
	243 chars max
	directory length 99 chars max each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default the primary configuration file location

detail

Saves both default and non-default configuration parameters.

index

Forces a save of the persistent index file regardless of the persistent status in the BOF file. The index option can also be used to avoid an additional boot required while changing your system to use the persistence indexes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure isa nat-group scaling-profile

Description

This command determines profiles for NAT scaling. Lower profile numbers allocate less resources, therefore, supporting lower scaling.

Contact your Nokia representative for more information about NAT scaling figures in each profile.

Default

scaling-profile profile1

Parameters

scaling-profile-id

Specifies the name of the profile, up to 32 characters.

Values ESA-VM supports three scaling profiles, while VSR-I supports only two.

- profile1 is a low scaling profile that requires 8 CPU cores and 32 GB of DRAM memory per ESA-VM
- profile2 is a medium scaling profile that requires 11 CPU cores and 96 GB of DRAM memory per ESA-VM
- profile3 is a high scaling profile that requires 15 CPU cores and 115 GB of DRAM memory per ESA-VM

For the number of required CPU control cores on a VSR-I in relation to profiles, see the Sysinfo section in the Virtualized Service Router Installation and Setup Guide.

For the amount of required memory on VSR-I in relation to profiles, see the Software Release Notes, section VM Memory Requirements by Function Mix.

41.41 sched-run-min-int

sched-run-min-int

Syntax

sched-run-min-int *percent-of-default*

no sched-run-min-int

Context

[Tree] (config>card>virt-sched-adj sched-run-min-int)

Full Context

configure card virtual-scheduler-adjustment sched-run-min-int

Description

This command overrides the default minimum time that must elapse before a virtual scheduler may redistribute bandwidth based on changes to the offered rates of member policers or queues. A minimum run interval is enforced to allow a minimum amount of "batching" queue changes before reacting to the changed rates. This minimum interval is beneficial since the periodic function of determining policer or queue offered rates is performed sequentially and the interval allows a number policer and queue rates to be determined before determining the distribution of bandwidth to the policers and queues.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The default minimum scheduler run interval is 0.5 seconds. The sched-run-min-int command uses a percent value to modify the default interval.

The **no** form of this command restores the default minimum scheduler run interval for all virtual schedulers on the card.

Default

no sched-run-min-int

Parameters

percent-of-default

Specifies that the percent-of-default parameter is required and is used to modify the default minimum scheduler run interval for all virtual schedulers on the card. Defining 100.00 percent is equivalent to removing the override (restoring the default) for the minimum scheduler run interval.

Values 0.01% to 1000.00%

Default 100.00%

Platforms

All

[Tree] (config>subscr-mgmt>sub-prof>ing>sched scheduler)

Full Context

configure subscriber-mgmt sub-profile egress scheduler-policy scheduler

configure subscriber-mgmt sub-profile ingress scheduler-policy scheduler

Description

This command provides a way to override parameters of the existing scheduler associated with the egress or ingress scheduler policy. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child (take bandwidth from a scheduler in a higher tier).

The **no** form of this command reverts to the default.

Parameters

scheduler-policy-name

Specify an existing scheduler policy name.

pir-rate

Specify the pir-rate, in kilobits, to override the administrative PIR used by the scheduler. When the **rate** command is executed, a valid PIR setting must be explicitly defined. Fractional values are not allowed and must be specified as a positive integer.

Values 1 to 3200000000, max

cir-rate

The **cir** parameter overrides the administrative CIR used by the scheduler. When the **rate** command is executed, a CIR setting is optional. The sum keyword specifies that the CIR be used as the summed CIR values of the children schedulers or queues. Fractional values are not allowed and must be given as a positive integer.

scheduler

Syntax

scheduler *scheduler-name* [**create**]

no scheduler *scheduler-name*

Context

[Tree] (config>service>vpls>sap>egress>sched-override scheduler)

Full Context

configure service vpls sap egress scheduler-override scheduler

Description

This command overrides specific attributes of the specified scheduler name.

A scheduler defines a bandwidth control that limits each child (other schedulers, policers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created has policers, queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword **create**), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause policers, queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce service level agreements (SLAs).

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword create), an error occurs and the current CLI context does not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs and the command does not execute, nor does the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error occurs, the command does not execute, and the CLI context does not change.

The **no** form of this command removes the scheduler name from the configuration.

Parameters

scheduler-name

Specifies name of the scheduler

Values Valid names consist of any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

create

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable create is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword create), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce service level agreements (SLAs).

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword create), an error occurs and the current CLI context will not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs and the command will not execute, nor will the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error will occur, the command will not execute, and the CLI context will not change.

Parameters

scheduler-name

The name of the scheduler. Each scheduler must be explicitly created.

Values Valid names consist of any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

create

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable create is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

Context

[Tree] (config>qos>scheduler-policy>tier scheduler)

Full Context

configure qos scheduler-policy tier scheduler

Description

This command creates a new scheduler or edits an existing scheduler within the scheduler policy tier. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however, the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword create), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce SLAs.

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword create), an error occurs and the current CLI context will not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs, the command will not execute, nor will the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error will occur, the command will not execute, and the CLI context will not change.

Context

[Tree] (config>subscr-mgmt>sla-prof>egress>sched scheduler)

Full Context

configure subscriber-mgmt sla-profile egress scheduler-policy scheduler

Description

This command provides a way to override parameters of the existing scheduler associated with the egress scheduler policy. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child (take bandwidth from a scheduler in a higher tier).

The **no** form of this command reverts to the default.

Parameters

scheduler-name

Specify an existing scheduler policy name up to 32 characters.

pir-rate

Specifies the PIR rate in kb/s. This parameter overrides the administrative PIR used by the scheduler. When the rate command is executed, a valid PIR setting must be explicitly defined. Fractional values are not allowed and must be given as a positive integer.

Values 1 to 3200000000, max

cir-rate

Specifies the CIR rate in kb/s. This parameter overrides the administrative CIR used by the scheduler. When the rate command is executed, a CIR setting is optional. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers or queues. Fractional values are not allowed and must be given as a positive integer.

Values 0 to 3200000000, sum, max

Default sum

configure qos sap-egress policer scheduler-parent

Description

This command defines an optional parent scheduler that governs the available bandwidth given to a policer in addition to the PIR setting of the policer. When multiple schedulers, queues, or policers share a child status with the parent scheduler, the **weight** or **level** parameters define how this policer contends with the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

other children for the bandwidth of the parent. This command and the configuration of a SAP policer **port-parent** or **parent** arbiter are mutually exclusive.

Multiple schedulers can exist in different scheduler policies with the same *scheduler-name*; in this command, the associated *scheduler-name* pertains to a scheduler that should exist on the SAP as the policy is applied and the policer is created. When the policer is created on the SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly applied or indirectly applied (through a multiservice customer site) to the SAP. The policer accepts packets, but is not bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP. The SAP to which the policer belongs displays an orphan policer status with the SapEgressPolicerMismatch flag in the **show service sap-using** output. The orphaned state of the policer is automatically cleared when the *scheduler-name* becomes available on the SAP.

The parent scheduler can be made unavailable by the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the policer enters the orphaned state. The policer automatically returns to normal operation when the parent scheduler is available again.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and no error message is returned. When a parent association has been removed, the former child policer attempts to operate based on its configured rate parameter.

Removing the parent association on the policer within the policy takes effect immediately on all policers using the SAP QoS policy.

Default

no scheduler-parent

Parameters

scheduler-name

Scheduler names are configured in the **config>qos>scheduler-policy>tier** context. There are no checks performed at the time of definition to ensure that the *scheduler-name* exists within an existing scheduler policy. For the policer to use the defined *scheduler-name*, the scheduler must exist on each SAP that the policer is created on. If a *scheduler-name* does not exist on the SAP, the policer operates in an orphaned state. Each parental association must be explicitly defined.

Values Any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

weight

Defines the relative weight of this policer in comparison with other child policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name* at the above-CIR priority level defined by the **level** parameter.

All weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority at the configured level and are not

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

Values 0 to 100

Default 1

level

Defines the level of hierarchy when compared with other policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name*.

Children of the parent scheduler with a lower priority will not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight

Defines the relative weight of this policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent *scheduler-name* at the within-CIR priority level defined by the **cir-level** parameter.

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100, with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

Values 0 to 100

Default 1

cir-level

Defines the level of hierarchy when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If the **cir-level** parameter is set to a value of 0 (the default value), the policer does not receive bandwidth during the schedulers within-CIR pass and the **cir-weight** parameter is ignored. If the **cir-level** parameter is 1 or greater, the **cir-weight** parameter is used.

Values 0 to 8 (8 is the highest priority)

Default 0

configure qos sap-ingress policer scheduler-parent

Description

This command defines an optional parent scheduler that governs the available bandwidth given to a policer in addition to the PIR setting of the policer. When multiple schedulers, queues, or policers share a child status with the parent scheduler, the **weight** or **level** parameters define how this policer contends with the other children for the bandwidth of the parent. This command and the configuration of a SAP policer **scheduler-parent** or **parent** arbiter are mutually exclusive.

Multiple schedulers can exist in different scheduler policies with the same *scheduler-name*; in this command, the associated *scheduler-name* pertains to a scheduler that should exist on the SAP as the policy is applied and the policer is created. When the policer is created on the SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly applied or indirectly applied (through a multiservice customer site) to the SAP. The policer accepts packets, but is not bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP.

The parent scheduler can be made unavailable by the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the policer enters the orphaned state. The policer automatically returns to normal operation when the parent scheduler is available again.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and no error message is returned. When a parent association has been removed, the former child policer attempts to operate based on its configured rate parameter.

Removing the parent association on the policer within the policy takes effect immediately on all policers using the SAP QoS policy.

Default

no scheduler-parent

Parameters

scheduler-name

Scheduler names are configured in the **config>qos>scheduler-policy>tier** context. There are no checks performed at the time of definition to ensure that the *scheduler-name* exists within an existing scheduler policy. For the policer to use the defined *scheduler-name*, the scheduler must exist on each SAP that the policer is created on. If a *scheduler-name* does

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

not exist on the SAP, the policer operates in an orphaned state. Each parental association must be explicitly defined.

Values Any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

weight

Defines the relative weight of this policer in comparison with other child policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name* at the above-CIR priority level defined by the **level** parameter.

All weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority at the configured level and are not serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

Values 0 to 100

Default 1

level

Defines the level of hierarchy when compared with other policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name*.

Children of the parent scheduler with a lower priority will not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight

Defines the relative weight of this policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent *scheduler-name* at the within-CIR priority level defined by the **cir-level** parameter.

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100, with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0 to 100

Default 1

cir-level

Defines the level of hierarchy when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If the **cir-level** parameter is set to a value of 0 (the default value), the policer does not receive bandwidth during the schedulers within-CIR pass and the **cir-weight** parameter is ignored. If the **cir-level** parameter is 1 or greater, the **cir-weight** parameter is used.

configure service ies sap egress scheduler-policy

configure service ies subscriber-interface group-interface sap ingress scheduler-policy

configure service vprn subscriber-interface group-interface sap ingress scheduler-policy

configure service vprn subscriber-interface group-interface sap egress scheduler-policy

Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by ingress SAP queues or egress SAP policers and queues associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the SAP policers or queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler. The SAPs that have policers or queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers or queues. When the **no** form of this command executed, the customer site ingress or egress node will not contain an applied scheduler policy.

Parameters

scheduler-policy-name:

Specifies the scheduler policy name to apply to an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress queues or egress policers and queues created on associated SAPs.

Values Any existing valid scheduler policy name.

scheduler-policy

Syntax

scheduler-policy *scheduler-policy-name*

no scheduler-policy

Context

[Tree] (config>port>ethernet>access>egress>vport scheduler-policy)

Full Context

configure port ethernet access egress vport scheduler-policy

Description

This command specifies a scheduler policy to associate to the Vport. Scheduler policies are configured in the **configure>qos>scheduler>policy** context. Each scheduler policy is divided up into groups of schedulers based on the tier each scheduler is created under. A tier is used to give structure to the schedulers within a policy and define rules for parent scheduler associations. The policy defines the hierarchy and operating parameters for virtual schedulers.

The **no** form of this command removes the configured egress scheduler policy from the Vport.

The **agg-rate rate**, **port-scheduler-policy** and **scheduler-policy** commands are mutually exclusive. Changing between the use of a scheduler policy and the use of an agg-rate/port-scheduler-policy involves removing the existing command and applying the new command.

The configuration of a scheduler policy under a Vport is mutually exclusive with the configuration of the egress-rate-modify parameter.

The **no** form of this command reverts to the default.

Parameters

scheduler-policy-name

Specifies the *scheduler-policy-name* parameter applies an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of egress virtual schedulers.

configure service vprn interface sap egress scheduler-policy

configure service vprn interface sap ingress scheduler-policy

configure service ies interface sap egress scheduler-policy

configure service vpls sap ingress scheduler-policy

configure service ies interface sap ingress scheduler-policy

Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by SAP queues associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the ingress SAP queues and egress SAP policers and queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler. The SAPs that have policers or queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers or queues. When the **no scheduler-policy** command is executed, the customer site's ingress or egress node will not contain an applied scheduler policy.

Parameters

scheduler-policy-name

Specifies that the *scheduler-policy-name* is applied to an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress or egress queues created on associated SAPs.

Values Any existing valid scheduler policy name.

scheduler-policy

Syntax

scheduler-policy *scheduler-policy-name* [**create**]

no scheduler-policy *scheduler-policy-name*

Context

[Tree] (config>qos scheduler-policy)

Full Context

configure qos scheduler-policy

Description

Each scheduler policy is divided up into groups of schedulers based on the tier each scheduler is created under. A tier is used to give structure to the schedulers within a policy and define rules for parent scheduler associations.

The **scheduler-policy** command creates a scheduler policy or allows editing of an existing policy. The policy defines the hierarchy and operating parameters for virtual schedulers. Creating a policy does not create the schedulers; it only provides a template for the schedulers to be created when the policy is associated with a SAP or multiservice site.

Each scheduler policy must have a unique name within the context of the system. Modifications made to an existing policy are executed on all schedulers that use the policy. This can cause queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce SLAs.

If a *scheduler-policy-name* does not exist, it is assumed that an attempt is being made to create a new policy. The success of the command execution is dependent on the following:

1. The maximum number of scheduler policies has not been configured.
2. The provided scheduler-policy-name is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of scheduler policies has been exceeded, a configuration error occurs, the command will not execute, and the CLI context will not change.

If the provided scheduler-policy-name is invalid according to the criteria below, a name syntax error occurs, the command will not execute, and the CLI context will not change.

Parameters

scheduler-policy-name

The name of the scheduler policy.

Values Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

configure service customer multi-service-site egress scheduler-policy

configure service customer multi-service-site ingress scheduler-policy

Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by SAP queues or, at egress only, policers associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the SAP policers and queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler.

The SAPs that have ingress queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers and queues. When the **no scheduler-policy** command is executed, the customer site ingress or egress node will not contain an applied scheduler policy.

Parameters

scheduler-policy-name

Applies an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress or egress queues and egress policers managed by HQoS created on associated SAPs.

Values Any existing valid scheduler policy name up to 32 characters in length.

Platforms

All

scheduler-policy

Syntax

scheduler-policy *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy scheduler-policy)

Full Context

configure qos copy scheduler-policy

Description

This command copies existing QoS policy entries for a QoS policy to another QoS policy.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

If **overwrite** is not specified, an error will occur if the destination policy exists.

Parameters

src-name dst-name

Indicates that the source policy and the destination policy are scheduler policy. Specify the source policy that the copy command will attempt to copy from and specify the destination policy to which the command will copy a duplicate of the policy.

overwrite

Forces the destination policy name to be copied as specified. When forced, everything in the existing destination policy will be completely overwritten with the contents of the source policy.

Full Context

configure port ethernet egress hs-scheduler-overrides scheduling-class

Description

This command overrides the scheduling class configuration in the HS scheduler policy applied to the port egress. The scheduling class rate or weight within the WRR group can be overridden.

The **no** form of this command removes the scheduling class override parameters from the port egress configuration.

Parameters

class

Specifies the scheduling class.

Values 1 to 6

rate

Specifies the explicit maximum frame based bandwidth limit, in megabits per second, for this HS scheduler policy scheduling class. The **rate** keyword must be followed by either the keyword **max** or a rate specified in megabits per second.

Values 1 to 100000, max

The **max** keyword specifies that a limit is not enforced for the specified class. The **max** keyword is mutually exclusive to the rate value and when specified, must directly follow the **rate** keyword. Setting the rate of the class will fail when the class is currently a member of a group.

weight-in-group

Specifies the weight the HS scheduler policy should apply to this scheduling class within the group in which it belongs. The *weight-in-group* parameter must follow the **weight** keyword and is used to specify the relative weight of class to the other scheduling classes within the group. Setting the weight will fail if the scheduling class is not currently configured in a group.

Values 1 to 127

Full Context

configure qos hs-scheduler-policy scheduling-class

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the behavior of a specific scheduling class on all HSQ schedulers associated with the policy. The **scheduler-class** command performs one of two operations: it configures a maximum rate for the scheduling class or places the scheduling class into the weighted scheduling group. The two operations are mutually exclusive.

By default, none of the scheduling classes are members of the weighted scheduling group and each class is set to a rate limit of **max** (no rate limit applied).

Specifying Scheduling Class Rate (or Removing the Scheduling Class from Group) — If the **scheduling-class** command is executed with the **rate** keyword specified, either **max** or a specified rate value must follow. If a *class-id was* previously mapped into the weighted scheduling group, the class is removed from the group. However, if removing the class from the group causes the group to no longer have contiguous class members, the command fails with no effect on the specified class. A "non-contiguous grouping error" is returned. The lowest or highest members within a weighted group must be removed prior to removing the middle members. For example, if scheduling classes 3, 4, and 5 were members of weighted group 1, class 4 cannot be removed first.

This command using the **rate** keyword also fails when an override for the group weight is in place on the scheduling class within a scheduler associated with the policy. The override expects the class to be associated with a weighted scheduling group and the policy rate definition is attempting to remove the class from the group. An "override mismatch" error is generated, specifying the scheduling object where the override exists.

After a rate has been successfully defined for a scheduling class, the specified rate is automatically updated on all HSQ scheduler instances associated with the scheduling policy. The exception is where the scheduler instance has a local override for the rate on the scheduling class.

Specifying Scheduling Class Weighted Group Membership — If the **scheduling-class** command is executed with the **group** keyword specified, the group ID value of 1 must follow. The corresponding optional **weight** keyword is used to specify the weight of the scheduling class within the group. If weight is not specified, the default weight of 1 is used. If the specified scheduling class is not contiguous with the other scheduling classes in the group, the command fails with no change to the current state of the scheduling class and a "non-contiguous grouping" error is returned, specifying the weighted scheduling group and the current group members.

The **scheduling-class** command fails using the **group** keyword when a rate override for the scheduling class exists on an HSQ scheduler instance associated with the policy. The rate override for the scheduling class indicates the class is directly attached to a strict priority level, conflicting with the policy **group** keyword trying to place the class in the specified group. The command fails without affecting the scheduling class definition on the policy and returns an error specifying the scheduling object where the override exists.

Other Override Constraints — The scheduling overrides cannot change or remove a scheduling class from a policy-defined weighted group membership.

The **no** form of the command returns the scheduling class represented by *class-id* to the default behavior. The default behavior for a scheduling class is to not be a member of the weighted scheduling class group and have a rate set to **max**. The **no scheduling-class** command fails if the scheduling class is currently a member of the weighted scheduling class group and a weight override is in effect on a scheduling object for the class, in which case an error is returned.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

class-id

Specifies the scheduling class for HS scheduler policy. The *class-id* value is a required parameter that specifies which scheduling class the scheduling-class command is acting upon.

Values 1 to 6

group-id

Specifies the group this HS scheduler policy scheduling class belongs to. The **group** and the **rate** keywords are mutually exclusive when executing this command. A group ID value of 1 must follow the **group** keyword. The **group** keyword removes the class ID from its inherent strict scheduling level and places it into the specified group ID. The associated **weight** parameter is optional and is used to specify the weight of a class ID within the weighted scheduling class group. Specifying the **group** parameter while an override for the scheduling class exists for rate causes the **scheduling-class** command to fail.

Values 1

weight-in-group

Specifies the weight the HS scheduler policy should apply to this scheduling class within the group in which it belongs. This keyword is optional and must follow the **group** parameter when specified. The *weight-in-group* parameter must follow the **weight** keyword and is used to specify the relative weight of the *class-id* to the other scheduling classes within the group. If the group is specified without the **weight** parameter, a default weight of 1 is used.

Values 1 to 127

rate

Specifies the explicit maximum frame-based bandwidth limit, in megabits per second, for this HS scheduler policy scheduling class. The **rate** and **group** keywords are mutually exclusive. Either the **rate** or **group** keyword must be specified when executing this command. When specified, the **rate** keyword must be followed by either the keyword **max** or a rate specified in megabits per second. The specified rate can be overridden at the port Ethernet egress using the scheduler override functions. A newly-created HS scheduler policy defaults each scheduling class to have its rate set to **max** and the weighted scheduling class group has no members.

Values 1 to 100000, max

The **max** keyword specifies that a limit is not enforced for the specified class ID and that the class ID is not a member of a weighted scheduling class group. The **max** keyword and the *rate* value are mutually exclusive; when **max** is specified, it must directly follow the **rate** keyword. Setting the rate of the class fails when the class currently has a group weight override defined on a scheduling object.

Description

This command copies a local file to a remote host file system. It uses ssh for data transfer, and uses the same authentication and provides the same security as ssh. The following prompt appears:

"Are you sure (y/n)?" The destination must specify a user and a host.

Parameters

local-file-url

Specifies the local source file or directory.

Values

[*cflash-id/*] *file-path*	up to 200 characters
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

destination-file-url

Specifies the destination file.

Values

*destination-file-**: *user@hostname:file-path* - up to 255 characters

user	up to 32 characters
hostname	[*dns-name* | *ipv4-address* | "["*ipv6-address*"]"]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses
dns-name	up to 128 characters
file-path	up to 200 characters, directory length up to 99 characters

user

Specifies the SSH user.

hostname

Specifies the remote host IP address of DNS name.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

file-path

Specifies the destination path.

router-instance

Specifies the router name or the VPRN service ID.

Values

router-instance: *router-name* | *vprn-svc-id*

router-name: "Base" | "management" | "vpls-management"

vprn-svc-id: 1 to 2147483647

force

Keyword that forces an immediate copy of the specified file. The command **file scp** *local-file-url destination-file-url* [**router** *router-instance*] **force** executes the command without displaying a user prompt message.

service-name

Specifies the service name used to identify the router instance. The service name can be a maximum of 64 characters long.

41.52 scramble

scramble

Syntax

[**no**] **scramble**

Context

[Tree] (config>port>tdm>ds3 scramble)

[Tree] (config>port>tdm>e3 scramble)

Full Context

configure port tdm ds3 scramble

configure port tdm e3 scramble

Description

This command enables payload scrambling on channel groups.

Scrambling randomizes the pattern of 1s and 0s carried in a SONET frame. Rearranging or scrambling the pattern prevents continuous strings of all 1s or all 0s and meets the needs of physical layer protocols that rely on sufficient transitions between 1s and 0s to maintain clocking.

Full Context

configure system script-control script

configure system script-control script-policy script

Description

This command is used to configure a script to be run.

The **no** form of the command removes the script.

Default

no script

Parameters

script-name

Specifies the name of the script. Can be up to 32 characters.

script-owner

Specifies the name of the script owner. Can be up to 32 characters.

The owner is an arbitrary name and not necessarily a user name. Commands in the scripts are not authorized against the owner. The **configure system security cli-script authorization** *x* **cli-user** command determines the user context against which commands in the scripts are authorized.

no sd-threshold

Context

[Tree] (config>esa>crc-monitor sd-threshold)

Full Context

configure esa crc-monitor sd-threshold

Description

This command configures the error rate at which to declare the signal degrade (SD) condition on an Ethernet interface. The value represents M*10E-N, a ratio of errored frames over total frames received over W seconds of the sliding window. The CRC errors on the interface are sampled once per second. A default of 10 seconds is used when no additional **window-size** is configured. If you ommit the **multiplier** value or configure **no sd-threshold**, the multiplier returns to the default value of 1.

Note: Crossing the configured SD threshold raises a log event.

The **no** form of this command removes the configuration.

Default

no sd-threshold

sd-threshold

Syntax

sd-threshold *threshold* [**coefficient** *coefficient*]

Context

[Tree] (config>port>otu sd-threshold)

Full Context

configure port otu sd-threshold

Description

This command defines the error rate at which to declare the signal degrade (SD) condition.

The parameters define an error rate of (*coefficient*/10) * 10E-*threshold*. For example, **sd-threshold 5 coefficient 20** defines an error rate of (20/10) * 10E-5, or 2 * 10E-5, or 0.000 02.

The SD threshold must be:

- greater than the SF threshold.
- 5 or higher before setting **sf-sd-method** to **bip8**.

The **coefficient** parameter is only used when **sf-sd-method** is set to **fec**. When **sf-sd-method** is set to **bip8**, **coefficient** is considered to have the value of 10.

Parameters

threshold

Specifies the exponent for the SD threshold value.

Values 5 to 9 when **sf-sd-method** is **bip8**

3 to 9 when **sf-sd-method** is **fec**

Default 7

© 2026 Nokia.

41.74 sd-threshold-clear

sd-threshold-clear

Syntax

sd-threshold-clear *threshold* [**coefficient** *coefficient*]

Context

[Tree] (config>port>otu sd-threshold-clear)

Full Context

configure port otu sd-threshold-clear

Description

This command defines the signal degrade (SD) threshold clear value.

When the bit error rate falls below this value, the SD condition is cleared. The parameters define an error rate of (*coefficient*/10) * 10E-*threshold*. For example, **sd-threshold-clear 7 coefficient 10** defines an error rate of (10/10) * 10E-7, or 10E-7, or 0.000 000 1.

This SD threshold clear setting is valid only when **sf-sd-method** is set to **fec**.

Parameters

threshold

Specifies the exponent for the SD threshold clear value.

Values 3 to 10

Default 8

coefficient

Specifies the coefficient for the SD threshold clear value.

Values 10 to 99

Default 10

Platforms

41.75 sdp

sdp

Syntax

sdp *sdp-id* [**sync-tag** *sync-tag*] [**create**]

no sdp *sdp-id*

Context

[Tree] (config>redundancy>multi-chassis>peer>sync sdp)

Full Context

configure redundancy multi-chassis peer sync sdp

Description

This command specifies the manually configured spoke SDPs to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing these spoke SDPs with the multi-chassis peer.

Manually configured spoke SDPs with the specified *sdp-id* are synchronized according to the synchronization tag. If synchronization is required only for a subset of the spoke SDPs using the configured SDP, the **range** sub-command should be used. The **range** command and the **sync-tag** parameters are mutually exclusive.

The synchronization of PIM snooping is only supported for manually configured spoke SDPs but is not supported for spoke SDPs configured within an endpoint.

The synchronization of PIM snooping is not supported on any of the following when used with the configured *sdp-id*:

- Mesh SDPs
- Spoke SDPs in non-VPLS services
- BGP-AD/BGP-VPLS (FEC 129) spoke SDPs
- Spoke SDPs configured in endpoints
- Pseudowire SAPs
- ESM-over-MPLS Pseudowires

Non-existent spoke SDPs may be specified. If these spoke SDPs are created at a later time, then all states on the spoke SDPs are synchronized according to the synchronization tag and the synchronization protocols enabled.

A synchronization tag can be changed by entering the same command with a different synchronization tag. Changing the synchronization tag removes all states relating to the previous synchronization tag for the SDP and a new synchronization tag state is created.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

sdp-id

Specifies the SDP of the spoke SDPs to be synchronized with the multi-chassis peer.

Values 1 to 32767

sync-tag

Specifies a synchronization tag, up to 32 characters, to be used when synchronizing with the multi-chassis peer.

create

Creates the SDP instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Context

[Tree] (config>service sdp)

Full Context

configure service sdp

Description

This command creates or edits a service destination point (SDP). SDPs must be explicitly configured.

An SDP is a logical mechanism that ties a far-end router to a particular service without having to specifically define far-end SAPs. Each SDP represents a method to reach another router.

One method is IP Generic Router Encapsulation (GRE), which has no state in the core of the network. GRE does not specify a specific path to the far-end router. A GRE-based SDP uses the underlying IGP routing table to find the best next hop to the far-end router.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The second method is Multi-Protocol Label Switching (MPLS) encapsulation. A router supports both signaled and non-signaled Label Switched Paths (LSPs) through the network. Non-signaled paths are defined at each hop through the network. Signaled paths are communicated by protocol from end-to-end using Resource Reservation Protocol (RSVP). Paths may be manually defined or a constraint-based routing protocol (such as OSPF-TE or CSPF) can be used to determine the best path with specific constraints. An LDP LSP can also be used for an SDP when the encapsulation is MPLS. The use of an LDP LSP type or an RSVP/Static LSP type are mutually exclusive except when the mixed-lsp option is enabled on the SDP.

Segment routing is another MPLS tunnel type and is used to allow service binding to an SR tunnel programmed in TTM by OSPF or IS-IS. The SDP of type **sr-isis** or **sr-ospf** can be used with the **far-end** option. The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-isis** and **sr-ospf** tunnel types.

L2TPv3-over-IPv6 transport is also an option for 7750 SR and 7950 XR Ethernet Pipe (Epipe) Services. Like GRE, L2TPv3 is stateless in the core of the network, as well as on the service nodes as the L2TPv3 control plane functionality is disabled for this SDP type. A unique source and destination IPv6 address combined with TX and RX Cookie values are used to ensure that the SDP is bound to the correct service.

SDPs are created and then bound to services. Many services may be bound to a single SDP. The operational and administrative state of the SDP controls the state of the SDP binding to the service.

If the *sdp-id* does not exist, a new SDP is created. When creating an SDP, either the **gre, mpls, or l2tpv3** keyword must be specified. SDPs are created in the admin down state (**shutdown**) and the **no shutdown** command must be executed once all relevant parameters are defined and before the SDP can be used.

If *sdp-id* exists, the current CLI context is changed to that SDP for editing and modification. For editing an existing SDP, neither the **gre, mpls**, or **l2tpv3** keyword is specified. If a keyword is specified for an existing *sdp-id*, an error is generated and the context of the CLI will not be changed to the specified *sdp-id*.

The **no** form of this command deletes the specified SDP. Before an SDP can be deleted, it must be administratively down (shutdown) and not bound to any services. If the specified SDP is bound to a service, the **no sdp** command will fail generating an error message specifying the first bound service found during the deletion process. If the specified *sdp-id* does not exist an error will be generated.

Parameters

sdp-id

Specifies the SDP identifier.

Values 1 to 32767

gre

Specifies the SDP will use GRE to reach the far-end router. The GRE encapsulation of the MPLS service packet uses the base 4-byte header as per RFC 2890. The optional fields Checksum (plus Reserved field), Key, and Sequence Number are not inserted. Only one GRE SDP can be created to a given destination address. Multiple GRE SDPs to a single destination address serve no purpose as the path taken to reach the far end is determined by the IGP which will be the same for all SDPs to a given destination and there is no bandwidth reservation in GRE tunnels.

mpls

Specifies the SDP will use MPLS encapsulation and one or more LSP tunnels to reach the far-end device. Multiple MPLS SDPs may be created to a given destination device. Multiple MPLS SDPs to a single destination device are helpful when they use divergent paths.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

l2tpv3

Specifies the SDP will use L2TPv3-over-IPv6 encapsulation for the 7750 SR or 7950 XRS. One SDP is created per service, regardless of whether the far-end node is common or not. Unique local and far-end addresses are configured for every L2TPv3 SDP type. The local address must exist on the local node.

eth-gre-bridged

Configures the SDP as an L2oGRE tunnel that is terminated on an FPE-based PW port. Only the end-points of such a tunnel (the far-end IPv4/IPv6 address or local-end IPv4/IPv6 address) are allowed to be configured under this SDP.

Platforms

41.76 sdp-exclude

sdp-exclude

Syntax

[**no**] **sdp-exclude** *group-name*

Context

[Tree] (config>service>pw-template sdp-exclude)

Full Context

configure service pw-template sdp-exclude

Description

This command configures SDP admin group constraints for a pseudowire template.

The admin group name must have been configured or the command is failed. The user can execute the command multiple times to include or exclude more than one admin group. The sdp-include and sdp-exclude commands can only be used with the **use-provisioned-sdp** or **prefer-provisioned-sdp** options. If the same group name is included and excluded within the same pseudowire template, only the exclude option will be enforced.

Any changes made to the admin group sdp-include and sdp-exclude constraints will only be reflected in existing spoke-sdps after the following command has been executed:

tools>perform>service>eval-pw-template>allow-service-impact

When the service is bound to the pseudowire template, the SDP selection rules will enforce the admin group constraints specified in the sdp-include and sdp-exclude commands.

In the SDP selection process, all provisioned SDPs with the correct far-end IP address, the correct tunnel-far-end IP address, and the correct service label signaling are considered. The SDP with the lowest admin metric is selected. If more than one SDP with the same lowest metric are found then the SDP with the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

highest sdp-id is selected. The type of SDP, GRE or MPLS (BGP/RSVP/LDP) is not a criterion in this selection.

The selection rule with SDP admin groups is modified such that the following admin-group constraints are applied upfront to prune SDPs that do not comply:

- if one or more **sdp-include** statement is part of the PW template, then an SDP that is a member of one or more of the included groups will be considered. With the **sdp-include** statement, there is no preference for an SDP that belongs to all included groups versus one that belongs to one or fewer of the included groups. All SDPs satisfying the admin-group constraint will be considered and the selection above based on the lowest metric and highest sdp-id is applied.
- if one or more **sdp-exclude** statement is part of the PW template, then an sdp that is a member of any of the excluded groups will not be considered.

SDP admin group constraints can be configured on all router services that makes use of the pseudowire template (BGP-AD VPLS service, BGP-VPLS service, and FEC129 VLL service). In the latter case, only support at a T-PE node is provided.

The **no** form of this command removes the SDP admin group constraints from the pseudowire template.

Parameters

group-name

Specifies the name of the SDP admin group. A maximum of 32 characters can be entered.

oam sdp-mtu

Description

Performs MTU Path tests on an SDP to determine the largest path-mtu supported on an SDP. The **size-inc** parameter can be used to easily determine the **path-mtu** of a given SDP-ID. The forwarding class is assumed to be Best-Effort Out-of-Profile. The message reply is returned with IP/GRE encapsulation from the far-end router. OAM request messages sent within an IP/GRE SDP must have the 'DF' IP header bit set to 1 to prevent message fragmentation.

To terminate an **sdp-mtu** in progress, use the CLI break sequence <Ctrl-C>.

Parameters

orig-sdp-id

Specifies the *sdp-id* to be used by **sdp-ping,** expressed as a decimal integer. The far-end address of the specified **sdp-id** is the expected *responder-id* within each reply received. The specified *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reach the far end. This can be IP/GRE or MPLS. If *orig-sdp-id* is invalid or administratively down or unavailable, the SDP echo request message is not sent and an appropriate error message is displayed (once the **interval** timer expires, **sdp-ping** attempts to send the next request, if required).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 32767

start-octets

Specifies the beginning size in octets of the first message sent for an incremental MTU test, expressed as a decimal integer.

Values 40 to 9786

end-octets

Specifies the ending size in octets of the last message sent for an incremental MTU test, expressed as a decimal integer. The specified value must be greater than *start-octets*.

Values 40 to 9786

step-size

Specifies the number of octets to increment the message size request for each message sent for an incremental MTU test, expressed as a decimal integer. The next size message is not sent until a reply is received or three messages have timed out at the current size.

If the incremented size exceeds the *end-octets* value, no more messages are sent.

Values 1 to 512

Default 32

timeout

Specifies the *timeout* parameter in seconds, expressed as a decimal integer. This value is used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

interval

Specifies the *interval* parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the *interval* is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Full Context

oam sdp-ping

configure saa test type sdp-ping

Description

This command tests SDPs for uni-directional or round trip connectivity and performs SDP MTU Path tests.

The **sdp-ping** command accepts an originating SDP-ID and an optional responding SDP-ID. The size, number of requests sent, message time-out and message send interval can be specified. All **sdp-ping** requests and replies are sent with PLP OAM-Label encapsulation, as a *service-id* is not specified.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For round trip connectivity testing, the **resp-sdp** keyword must be specified. If **resp-sdp** is not specified, a uni-directional SDP test is performed.

To terminate an **sdp-ping** in progress, use the CLI break sequence <Ctrl-C>.

An **sdp-ping** response message indicates the result of the **sdp-ping** message request. When multiple response messages apply to a single SDP echo request/reply sequence, the response message with the highest precedence is displayed. Table 111: sdp-ping Response Messages shows the response messages sorted by precedence.

Table 111: sdp-ping Response Messages

Result of Request	Displayed Response Message	Precedence
Request time out without reply	Request Timeout	1
Request not sent due to non-existent *orig-sdp-id*	Orig-SDP Non-Existent	2
Request not sent due to administratively down *orig-sdp-id*	Orig-SDP Admin-Down	3
Request not sent due to operationally down *orig-sdp-id*	Orig-SDP Oper-Down	4
Request terminated by user before reply or time out	Request Terminated	5
Reply received, invalid *origination-id*	Far End: Originator-ID Invalid	6
Reply received, invalid *responder-id*	Far End: Responder-ID Error	7
Reply received, non-existent *resp-sdp-id*	Far End: Resp-SDP Non-Existent	8
Reply received, invalid *resp-sdp-id*	Far End: Resp-SDP Invalid	9
Reply received, *resp-sdp-id* down (admin or oper)	Far-end: Resp-SDP Down	10
Reply received, No Error	Success	11

Parameters

orig-sdp-id

Specifies the SDP ID to be used by **sdp-ping,** expressed as a decimal integer. The far-end address of the specified SDP-ID is the expected *responder-id* within each reply received. The specified SDP-ID defines the encapsulation of the SDP tunnel encapsulation used to reach the far end. This can be IP/GRE or MPLS. If *orig-sdp-id* is invalid or administratively down or unavailable for some reason, the SDP Echo Request message is not sent and an appropriate error message is displayed (once the **interval** timer expires, **sdp-ping** attempts to send the next request if required).

Values 1 to 32767

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

resp-sdp-id

Specifies the return SDP-ID to be used by the far-end router for the message reply for round trip SDP connectivity testing. If *resp-sdp-id* does not exist on the far-end router, terminates on another router different than the originating router, or another issue prevents the far-end router from using *resp-sdp-id*, the SDP echo reply is sent using generic IP/GRE OAM encapsulation. The received forwarding class (as mapped on the ingress network interface for the far end) defines the forwarding class encapsulation for the reply message.

Values 1 to 32767

Default null. Use the non-SDP return path for message reply.

fc-name

Specifies the parameter to be used to indicate the forwarding class of the SDP encapsulation. The actual forwarding class encoding is controlled by the network egress DSCP or LSP-EXP mappings.

The DSCP or LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end router that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message.

The DSCP or LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router. This is displayed in the response message output upon receipt of the message reply.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the SDP encapsulation.

Default out

octets

Specifies the **size** parameter in octets. This parameter is used to override the default message size for the **sdp-ping** request. Changing the message size is a method of checking the ability of an SDP to support a **path-mtu**. The size of the message does not include the SDP encapsulation, VC-Label (if applied) or any DLC headers or trailers.

When the OAM message request is encapsulated in an IP/GRE SDP, the IP 'DF' (Do Not Fragment) bit is set. If any segment of the path between the sender and receiver cannot handle the message size, the message is discarded. MPLS LSPs are not expected to fragment the message either, as the message contained in the LSP is not an IP packet.

Values 72 to 9786

Default 72

send-count

Specifies the number of messages to send. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

Values 1 to 100

Default 1

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of time out, the test is marked complete and no more packets is processed for any of those request probes.

Values 1 to 10

Default 5

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

Values 1 to 10

Default 1

Multiple Response Connectivity Tests — When the connectivity test count is greater than one (1), a single line is displayed per SDP echo request send attempt.

The request number is a sequential number starting with 1 and ending with the last request sent, incrementing by one (1) for each request. This should not be confused with the *message-id* contained in each request and reply message.

A response message indicates the result of the message request. Following the response message is the round trip time value. If any reply is received, the round trip time is displayed.

After the last reply has been received or response timed out, a total is displayed for all messages sent and all replies received. A maximum, minimum and average round trip time is also displayed. Error response and timed out requests do not apply towards the average round trip time.

Multiple Response Round Trip Connectivity Test Output Example

```
A:router1> sdp-ping 6 resp-sdp 101size 1514 count 5
Request        Response       RTT

search

Syntax

search *base-dn*

no search

Context

[Tree] (config>system>security>ldap>server search)

Full Context

configure system security ldap server search

Description

This command configures the LDAP **search** command. The search *base-dn* tells the server which part of the external directory tree to search. The search DN uses the same LDAP attribute as *root-dn*. For example, to search a public-key for an SSH generated for a Nokia vendor, one might use "dc=public-key,dc=nokia,dc=com”.

The **no** version of this command removes the search DN; as such, no search is possible on the LDAP server.

configure service ies interface secondary

Description

This command assigns a secondary IP address or IP subnet/broadcast address format to the interface.

The **no** form of this command reverts to the default.

Default

no secondary

Parameters

ip-address

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that is used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

mask

Specifies the subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that is used in a logical and function to derive the local subnet of the IP address. Allowed values are dotted decimal addresses in the range 128.0.0.0 – 255.255.255.254.

Note:
A mask of 255.255.255.255 is reserved for system IP addresses.

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

broadcast

Overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) is received by the IP interface. (Default: host-ones)

all-ones

Specifies the broadcast address used by the IP interface for this IP address is 255.255.255.255, also known as the local broadcast.

host-ones

Specifies that the broadcast address used by the IP interface for this IP address is the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default broadcast address used by an IP interface. The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

igp-inhibit

Signals that the given secondary IP interface should not be recognized as a local interface by the running IGP. For OSPF and IS-IS, this means that the specified secondary IP interfaces are not injected and used as passive interfaces and are not advertised as internal IP interfaces into the IGP's link state database. For RIP, this means that these secondary IP interfaces do not source RIP updates.

tag-value

Specifies the administrative tag value associated with an interface IP address.

Values 1 to 4294967295

srrp-instance

Specifies the SRRP instance ID that this interface route needs to track.

Values 1 to 4294967295

Platforms

All

© 2026 Nokia.

[Tree] (config>service>vprn>if secondary)

Full Context

configure service vprn network-interface secondary

configure service vprn interface secondary

Description

This command assigns a secondary IP address to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. Each address can be configured in an IP address, IP subnet, or broadcast address format.

Caution:
Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

Default

no secondary

Parameters

ip-address

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

mask

Specifies the subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. Allowed values are dotted-decimal addresses in the range 128.0.0.0 – 255.255.255.254. A mask of 255.255.255.255 is reserved for system IP addresses.

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

broadcast

Optional parameter that overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed. This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface. *(Default: host-ones)*

all-ones

The **all-ones** keyword following the **broadcast** parameter specifies the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

host-ones

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default used by an IP interface.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

igp-inhibit

Optional parameter that signals that the given secondary IP interface should not be recognized as a local interface by the running IGP. For OSPF and IS-IS, this means that the specified secondary IP interfaces will not be injected and used as passive interfaces, and will not be advertised as internal IP interfaces into the IGP's link-state database. For RIP, this means that these secondary IP interfaces will not source RIP updates.

tag-value

Specifies the administrative tag value associated with an interface IP address.

Values 1 to 4294967295

srrp-instance

Specifies the SRRP instance ID that this interface route needs to track.

Context

[Tree] (config>router>mpls>lsp secondary)

Full Context

configure router mpls lsp secondary

Description

This command specifies an alternative path that the LSP uses if the primary path is not available. This command is optional and is not required if the **config router mpls lsp** *lsp-name* **primary** *path-name* command is specified. After the switch over from the primary to the secondary, the system continuously tries to revert to the primary path. The switch back to the primary path is based on the **retry-timer** interval.

For RSVP-TE LSPs, up to eight secondary paths can be specified (or seven if a primary is configured). For SR-TE LSPs, up to three paths of any type (with a maximum of one primary) can be configured. By default, a secondary path is non-standby unless the **standby** keyword is configured. All non-standby secondary paths are considered equal and the first available path is used.

The system does not switch among secondary paths. The system starts the signaling (RSVP-TE) or programming (SR-TE) of all non-standby secondary paths at the same time. Retry counters are maintained for each unsuccessful attempt. After the retry limit is reached on a path, the system does not attempt to signal the path and administratively shuts down the path. The first successfully established non-standby secondary path is made the active path for the LSP.

The **no** form of this command removes the association between this *path-name* and *lsp-name*. All specific configurations for this association are deleted. The secondary path must be shut down prior to deleting it. The **no secondary** *path-name* command does not result in any action except a warning message on the console indicating that the secondary path is administratively up.

Parameters

path-name

Specifies the case-sensitive alphanumeric name label for the LSP path, up to 64 characters.

Platforms

All

secondary

Syntax

secondary {*ip-address*/*mask* | *ip-address netmask*} [**broadcast** {**all-ones** | **host-ones**}] [**igp-inhibit**] [**track-srrp** *srrp-instance*] [**tag** *tag-value*]

Full Context

configure router interface secondary

Description

This command assigns additional IP addresses to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. Each address can be configured in an IP address, IP subnet, or broadcast address format.

Caution:
Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP-in-IP protocols are active on an access interface.

The **no** form of this command removes the secondary address from the interface.

Default

no secondary

Parameters

ip-address

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values 1.0.0.0 to 223.255.255.255

/

The forward slash is a parameter delimiter that separates the *ip-address* portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the *ip-addr*, the "*/*" and the *mask-length* parameter. If a forward slash does not immediately follow the *ip-addr*, a dotted decimal mask must follow the prefix.

mask

Specifies the subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the *ip-address* from the *mask* parameter. The *mask* parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1 to 32. A mask length of 32 is reserved for system IP addresses.

Values 1 to 32

netmask

Specifies the subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. A mask of 255.255.255.255 is reserved for system IP addresses.

Values 128.0.0.0 to 255.255.255.255

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

broadcast

Optional parameter that overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones,** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface.

all-ones

The **all-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

host-ones

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask* with all the host bits set to binary 1. This is the default broadcast address used by an IP interface.

igp-inhibit

The secondary IP address should not be recognized as a local interface by the running IGP.

tag-value

Specifies the administrative tag value associated with an interface IP address.

Values 1 to 4294967295

srrp-instance

Specifies the SRRP instance ID that this interface route needs to track.

41.85 secondary-config

secondary-config

Syntax

secondary-config *file-url*

no secondary-config

Context

[Tree] (bof secondary-config)

Full Context

bof secondary-config

Description

This command specifies the name and location of the secondary configuration file.

The system attempts to use the configuration as specified in **secondary-config** if the primary config cannot be located. If the **secondary-config** file cannot be located, the system attempts to obtain the configuration from the location specified in the **tertiary-config**.

Note that if an error in the configuration file is encountered, the boot process aborts.

The **no** form of this command removes the **secondary-config** configuration.

Parameters

file-url

Specifies the secondary configuration file location, expressed as a file URL.

Values

file-url	[*local-url* | *remote-url*] (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]
remote-url	[{ftp://| tftp://} *login:pswd@remote-locn*/][*file-path*]
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn dns secondary-dns

Description

This command configures the secondary DNS server for DNS name resolution. The secondary DNS server is used only if the primary DNS server does not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the secondary DNS server from the configuration.

Default

no secondary-dns — No secondary DNS server is configured.

Parameters

ip-address

The IP or IPv6 address of the secondary DNS server.

Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x[-interface]

x:x:x:x:x:x:d.d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface - 32 characters max, for link local addresses.

[Tree] (config>router>mpls secondary-fast-retry-timer)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router mpls secondary-fast-retry-timer

Description

This command specifies the value used as the fast retry timer for a secondary path. If the first attempt to set up a secondary path fails due to a path error, the fast retry timer will be started for the secondary path so that the path can be retried sooner. If the next attempt also fails, further retries for the path will use the configured value for LSP retry timer.

If retry-timer for the LSP is configured to be less than the MPLS secondary-fast-retry-timer, all retries for the secondary path will use the LSP retry-timer.

The **no** form of this command reverts to the default.

Default

no secondary-fast-retry-timer

Parameters

seconds

Specifies the value (in seconds), used as the fast retry timer for a secondary path

Values 1 to 10

Platforms

All

41.88 secondary-image

secondary-image

Syntax

secondary-image *file-url*

no secondary-image

Context

[Tree] (bof secondary-image)

Full Context

bof secondary-image

Description

This command specifies the secondary directory location for runtime image file loading.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (*.tim files) must be located in the same directory.

The **no** form of this command removes the **secondary-image** configuration.

Parameters

file-url

Specifies the file URL; can be either local (this CPM) or a remote FTP server.

Values

file-url	{*local-url* | *remote-url*} (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]
remote-url	[{ftp://| tftp://} *login:pswd@remote-locn*/][*file-path*]

no secondary-ip-address

Context

[Tree] (config>router>bgp>orr>location secondary-ip-address)

Full Context

configure router bgp optimal-route-reflection location secondary-ip-address

Description

This command specifies the secondary IP address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable to find a node in its topology database that matches the primary address, then the TE DB tries to find a node with the matching secondary address. If this attempt also fails, the TE DB then tries to find a node with the matching tertiary address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The IP addresses specified for a location should be topologically "close” to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the secondary IP address information.

Default

no secondary-ip-address

Parameters

ipv4-address

Specifies the secondary IPv4 address of a location, expressed in dotted decimal notation.

Values a.b.c.d

configure router wpp portals portal secret

Description

This command configures the secret that is used by WPPv2 to authenticate the messages between portal and BRAS.

The **no** form of this command removes the secret and hash from the configuration.

Parameters

secret

Specifies the secret key to access the server, up to 64 characters.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

security-association

Syntax

security-association spi *spi* **authentication-key** *authentication-key* **encryption-key** *encryption-key* [**crypto**]

no security-association spi *spi*

Context

[Tree] (config>grp-encryp>encryp-keygrp security-association)

Full Context

configure group-encryption encryption-keygroup security-association

Description

This command is used to create a security association for a specific SPI value in a key group. The command is also used to enter the authentication and encryption key values for the security association, or to delete a security association.

The SPI value used for the security association is a node-wide unique value, meaning that no two security associations in any key group on the node may share the same SPI value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Keys are entered in cleartext. After configuration, they are never displayed in their original, cleartext form. Keys are displayed in an encrypted form, which is indicated by the system-appended **crypto** keyword when an **info** or an **admin>save** command is run. For security reasons, keys encrypted on one node are not usable on other nodes (that is, keys are not exchangeable between nodes).

The **no** form of the command removes the security association and related key values from the list of security associations for the key group. If the **no** form of the command is attempted using the same SPI value that is configured for **active-outbound-sa**, then a warning is issued and the command is blocked. If the **no** form of the command is attempted on the last SPI in the key group and the key group is configured on a service, then the command is blocked.

Parameters

spi

Specifies the SPI ID of the SPI being referenced for the security association.

Values 1 to 127

authentication-key

Specifies the authentication key for the SPI, in hexadecimal format. The number of characters in the hexadecimal string must be 64 or 128, depending on whether the authentication algorithm is set to sha256 or sha512, respectively.

encryption-key

Specifies the encryption key for the SPI, in hexadecimal format. The number of characters in the hexadecimal string must be 32 or 64, depending on whether the encryption algorithm is set to aes128 or aes256, respectively.

crypto

Displays the keys showing on the CLI **info** display in an encrypted form.

Full Context

configure service ies interface ipsec ipsec-tunnel security-policy

configure service vprn interface ipsec ipsec-tunnel security-policy

configure router interface ipsec ipsec-tunnel security-policy

configure service vprn interface sap ipsec-tunnel security-policy

Description

This command configures an IPsec security policy. The policy may then be associated with static IPsec tunnels defined in the same routing instance.

With **strict-match** parameter enabled, when a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a re-key request, then ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry.

If there is no match, then the setup fails, and TS_UNACCEPTABLE is sent.

If there is a match, but there is an existing CHILD_SA for the matched security policy, then the setup fails, and NO_PROPOSAL_CHOSEN.

If there is a match, and there is not CHILD_SA for the matched entry, then the subnet is sent in the matched security-policy entry as TSi and TSr, and the CHILD_SA is created.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no security-policy

Parameters

security-policy-id

Specifies the IPsec security policy entry that the tunnel will use.

Values 1 to 32768

strict-match

Enables strict match of security-policy entry.

Platforms

VSR

- configure service ies interface ipsec ipsec-tunnel security-policy

41.110 security-termination-policy

security-termination-policy

Syntax

security-termination-policy *policy*

no security-termination-policy

Context

[Tree] (config>anysec>mpls>svc-enc>enc-grp security-termination-policy)

Full Context

configure anysec mpls service-encryption encryption-group security-termination-policy

Description

This command configures the security termination policy that identifies the set of attributes for locally terminating tunnels for the specified encryption group.

The security termination policy (secTP) for tunnel encryption contains the tunnel protocol information, IGP instance, and flex algorithm, in addition to the local IP address, which identifies the system IP or loopback IP used to identify the local underlaying tunnel for the encrypted service. This local IP must match the BGP source IP or TLDP source IP and is the IP address that identifies the SR tunnel terminating on the router for the service that is using the specified secTP.

Multiple encryption groups can have the same secTP.

The **no** form of this command removes the security termination policy.

Default

no security-termination-policy

Parameters

policy

Specifies the security termination policy name, up to 64 characters.

Platforms

7750 SR-1, 7750 SR-12e, 7750 SR-s

security-termination-policy

Syntax

security-termination-policy *policy*

no security-termination-policy

41.112 segment

segment

Syntax

segment [*segment-id*] [**create**]

no segment *segment-id*

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>seg-list segment)

Full Context

configure router segment-routing sr-policies static-policy segment-list segment

Description

This command creates the context to configure a segment inside a segment-list of a statically-defined segment routing policy candidate path.

A segment list of a statically-defined SR policy candidate path of type **sr-mpls** can only accept a segment of type **mpls-label**.

A segment list of a statically-defined SR policy candidate path of type **srv6** can only accept a segment of type **srv6-sid**. However, you can mix SRv6 segments derived from both classic SRv6 and micro-segment SRv6 locators.

The **no** form of this command deletes the segment context.

Default

no segment

Parameters

segment-id

Specifies the segment ID number.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 11 (for segment ID type **mpls-label**)

1 to 7 (for segment ID type **srv6-sid**) in a classic SRv6 policy candidate path

1 to 24 (for segment ID type **srv6-sid**) in a micro-segment SRv6 policy candidate path

create

Keyword used to create the list.

Full Context

configure router isis segment-routing

Description

Commands in this context configure segment routing parameters within a given IGP instance.

Segment routing adds to IS-IS and OSPF routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a specific adjacency of the node (interface or next-hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as Segment ID (SID).

When segment routing is used together with MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and in traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS or OSPF instance, the router will perform the following operations:

1. Advertise the Segment Routing Capability Sub-TLV to routers in all areas/levels of this IGP instance. However, only neighbors with which it established an adjacency interprets the SID or label range information and use it for calculating the label to swap to or push for a given resolved prefix SID.
2. Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node-SID flag) set. Then the segment routing module programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
3. Assign and advertise automatically an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
4. Resolve received prefixes and if a prefix SID sub-TLV exists, the Segment Routing module programs the ILM with a swap operation and also an LTN with a push operation both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in a given IGP instance, the main SPF and LFA SPF are computed normally and the primary next-hop and LFA backup next-hop for a received prefix are added to RTM without the label information advertised in the prefix SID sub-TLV.

Full Context

configure router ospf segment-routing

configure router ospf3 segment-routing

Description

Commands in this context configure segment routing parameters within an IGP instance.

Segment routing adds to IS-IS, OSPF, or OSPF3 routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a specific adjacency of the node (interface or next hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as a segment ID (SID).

When segment routing is used together with the MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS, OSPF, or OSPF3 instance, the router will perform the following operations:

- Advertise the Segment Routing Capability sub-TLV to routers in all areas or levels of the IGP instance. However, only neighbors with which the IGP instance established an adjacency will interpret the SID and label range information and use it for calculating the label to swap to or push for a particular resolved prefix SID.
- Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node SID flag) set. The segment routing module then programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
- Automatically assign and advertise an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
- Resolve received prefixes, and if a prefix SID sub-TLV exists, the segment routing module programs the ILM with a swap operation and programs an LSP ID to NHLFE (LTN) with a push operation, both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in an IGP instance, the main SPF and LFA SPF are computed normally and the primary next hop and LFA backup next hop for a received prefix are added to the RTM without the label information advertised in the prefix SID sub-TLV.

42 s Commands – Part II

42.1 sel-mcast-advertisement

sel-mcast-advertisement

Syntax

[**no**] **sel-mcast-advertisement**

Context

[Tree] (config>service>vpls>bgp-evpn sel-mcast-advertisement)

Full Context

configure service vpls bgp-evpn sel-mcast-advertisement

Description

This command enables the advertisement of BGP EVPN Selective Multicast Ethernet Tag (SMET) routes.

The **no** form of this command disables the advertisement of BGP EVPN SMET routes.

Default

no sel-mcast-advertisement

Platforms

All

42.2 selection-criteria

selection-criteria

Syntax

selection-criteria [**best-port** | **highest-count** | **highest-weight**] [**slave-to-partner**] [**subgroup-hold-time** *hold-time*]

no selection-criteria

Context

[Tree] (config>lag selection-criteria)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure lag selection-criteria

Description

This command specifies which selection criteria should be used to select the active sub-group. If there is a tie for highest-count or highest-weight, the LAG will prefer the port with the lowest priority. If that does not break the tie, the currently active subgroup will stay active (that is, non-revertive behavior).

The **no** form of this command reverts to the default value.

Default

selection-criteria highest-count

Parameters

highest-count

Selects a sub-group with the highest number of eligible members as an active sub-group (not applicable to "power-off" mode of operations).

highest-weight

Selects a sub-group with the highest aggregate weight as an active subgroup (not applicable to "power-off" mode of operations). Aggregate weight is calculated as the sum of (65535 - port priority) all ports within a sub-group.

best-port

Selects a sub-group containing the port with highest priority port as an active subgroup. In case of equal port priorities, the sub-group containing the port with the lowest port-id is chosen.

slave-to-partner

The **slave-to-partner** keyword specifies that it, together with the selection criteria, should be used to select the active sub-group. An eligible member is a LAG-member link which can potentially become active. This means it is operationally up (not disabled) for use by the remote side. The **slave-to-partner** keyword can be used to control whether or not this latter condition is taken into account.

hold-time

Applicable with LACP enabled. Specifies the optional delay timer for switching to a newly selected active sub-group from the existing active sub-group. The timer delay applies only if the existing sub-group remains operationally up.

Values

not specified	Equivalent to specifying a value of 0. Specifies no delay and to switchover immediately to a new candidate active sub-group.
0 to 2000	Integer specifying the timer value in 10ths of a second.
infinite	Do not switchover from existing active sub-group if the subgroup remains UP. Manual switchover possible using tools perform lag force command.

42.4 selective-label-ip

selective-label-ip

Syntax

selective-label-ip {**no-install** | **route-table-install-only**}

no selective-label-ip

Context

[Tree] (config>router>bgp selective-label-ip)

Full Context

configure router bgp selective-label-ip

Description

This command configures **selective-label-ip** for the BGP level.

The **no-install** option conserves labeled route table space on BGP-LU **next-hop-self** route reflectors. This option causes BGP-LU routes to be reflected downstream via the ABR with the **next-hop-self** update. BGP-LU routes are not installed to local MPLS tables or routing tables for use by local services.

The **route-table-install-only** option conserves labeled route table space on BGP-LU **next-hop-self** route reflectors and allows these routes to be used for IP transport, unlike the **no-install** option. When the **route-table-install-only** option is used, learned BGP-LU routes are also reflected downstream via the ABR with the **next-hop-self** update. BGP-LU routes are not installed to local MPLS tables for use by local services. These routes are installed to the RTM and used for the best route selection process.

Note: If local services need to use BGP-LU routes, the **no-install** and **route-table-install-only** options should not be used.

The default **no** form of this command installs BGP-LU routes to the datapath for local services and makes them available to the RTM for IP next-hop selection.

Default

no selective-label-ip

Parameters

no-install

Specifies that BGP-LU routes are not installed to local MPLS tables or routing tables.

route-table-install-only

Specifies the installation of BGP-LU routes to the RTM. BGP-LU routes are not installed to local MPLS tables for use by local services.

42.5 selective-label-ip-prioritization

selective-label-ip-prioritization

Syntax

[**no**] **selective-label-ip-prioritization**

Context

[Tree] (config>router>bgp selective-label-ip-prioritization)

Full Context

configure router bgp selective-label-ip-prioritization

Description

This command enables selective-label IP prioritization for BGP labeled IPv4 and IPv6 routes.

When this command is configured, every received labeled IPv4 and IPv6 route that is potentially usable by a local service is automatically prioritized for fast control plane reconvergence. When the reachability of a BGP next-hop changes, these labeled IPv4 and IPv6 routes are updated into the route table first, along with other routes manually tagged as high priority by import policies.

A /32 or /128 labeled unicast route (and associated BGP-LU tunnel) is determined to be potentially usable by a local service if one of the following conditions is met:

- the route matches the far-end address of a user-provisioned SDP of an Layer 2 service and the SDP is configured to use BGP tunnels as transport
- the route matches the BGP next-hop address of a BGP-EVPN or IP VPN route, and this VPN route is either imported into a local service or readvertised by the router acting as a next-hop-self route-reflector or a model-B ASBR

The **no** form of this command disables selective-label IP prioritization for BGP.

Default

no selective-label-ip-prioritization

Platforms

All

Use subject to Terms available at: www.nokia.com/terms.

42.6 selective-label-ipv4-install

selective-label-ipv4-install

Syntax

[**no**] **selective-label-ipv4-install**

Context

[Tree] (config>router>bgp>group selective-label-ipv4-install)

[Tree] (config>router>bgp selective-label-ipv4-install)

[Tree] (config>router>bgp>group>neighbor selective-label-ipv4-install)

Full Context

configure router bgp group selective-label-ipv4-install

configure router bgp selective-label-ipv4-install

configure router bgp group neighbor selective-label-ipv4-install

Description

This command enables selective download for BGP label-ipv4 routes.

When this command is configured so that it applies to a BGP session, label-ipv4 routes received on this session are marked as invalid if they are not needed for any eligible service. A /32 label-ipv4 route is determined to be required if one of the following applies:

1. It matches the far-end address of a manually configured or auto-created SDP Layer 2 VLL or VPLS service and the SDP is configured to use BGP tunnels as transport.
2. It matches the IPv4 BGP next hop of a BGP-EVPN route and this EVPN route is either imported into a VPLS service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
3. It matches the IPv4 BGP next hop of a VPN-IPv4 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
4. It matches the IPv4 address in the IPv4-mapped IPv6 address of a VPN IPv6 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.

The **no** form of this command at the top (**config>router>bgp**) level disables the selective installation functionality. The **no** form of this command at the **group** or **neighbor** level causes the setting to be inherited from a higher level configuration.

Default

no selective-label-ipv4-install

Platforms

All

42.7 selective-learned-fdb

selective-learned-fdb

Syntax

[**no**] **selective-learned-fdb**

Context

[Tree] (config>service>vpls selective-learned-fdb)

Full Context

configure service vpls selective-learned-fdb

Description

This command determines which line cards FDB entries are allocated on for MAC addresses in the VPLS service in which the command is configured.

By default, FDB entries for MAC addresses in VPLS services are allocated on all line cards in the system. Enabling **selective-learned-fdb** causes FDB entries to be allocated only on the line cards on which the service has a configured object, which includes all line cards:

- on which a SAP is configured
- which have ports configured in a LAG SAP
- which have ports configured in an Ethernet tunnel SAP
- which have ports configured on a network interface (which also may be on a LAG) when the service has a mesh or spoke-SDP, VXLAN or EVPN-MPLS configured

Only MAC addresses with a type "L" or "Evpn" in the **show** output displaying the FDB can be allocated selectively, unless a MAC address configured as a conditional static MAC address is learned dynamically on an object other than its monitored object; this can be displayed with type "L" or "Evpn" but is allocated as global because of the conditional static MAC configuration.

The **no** form of this command returns the FDB MAC address entry allocation mode to its default where FDB entries for MAC addresses are allocated on all line cards in the system.

Default

no selective-learned-fdb

Full Context

configure service vprn rip send

configure service vprn rip group send

configure service vprn ripng group send

configure service vprn ripng group neighbor send

configure service vprn ripng send

configure service vprn rip group neighbor send

Description

This command configures the type of RIP messages sent to RIP neighbors. This control can be issued at the global, group or interface level. The default behavior sends RIPv2 messages with the multicast (224.0.0.9) destination address.

If **version-1** is specified, the router only listens for and accepts packets sent to the broadcast address.

The **no** form of this command resets the type of messages sent back to the default value.

Default

no send

Parameters

broadcast

Send RIPv2 formatted messages to the broadcast address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

multicast

Send RIPv2 formatted messages to the multicast address.

none

Do not send any RIP messages (i.e. silent listener).

version-1

Send RIPv1 formatted messages to the broadcast address.

both

Send both RIP v1 & RIP v2 updates to the broadcast address.

configure router ripng group neighbor send

configure router ripng send

Description

This command specifies if RIPng are sent to RIP neighbors or not and what type of IPv6 address is to be used to deliver the messages.

This control can be issued at the global, group or interface level.

The **no** form of the command reverts to the default value.

Default

send ripng

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ripng

Specifies RIPng messages to be sent to the standard multicast address (FF02::9).

none

Specifies not to send any RIPng messages (i.e. silent listener).

unicast

Specifies to send RIPng updates as unicast messages to the defined unicast address configured through the **unicast-address** command. This option is only allowed within the neighbor context.

Platforms

All

42.9 send-accounting-response

send-accounting-response

Syntax

[**no**] **send-accounting-response**

42.10 send-acct-stop-on-fail

send-acct-stop-on-fail

Syntax

send-acct-stop-on-fail {[**on-request-failure**] [**on-reject**] [**on-accept-failure**]}

no send-acct-stop-on-fail

Context

[Tree] (config>subscr-mgmt>auth-policy send-acct-stop-on-fail)

Full Context

configure subscriber-mgmt authentication-policy send-acct-stop-on-fail

Description

This command activates the reporting of RADIUS authentication failures of a PPPoE session to a RADIUS accounting server with an Accounting Stop message.

Three failure categories can be enabled separately:

- **on-request-failure**: All failure conditions between the sending of an Access-Request and the reception of an Access-Accept or Access-Reject.
- **on-reject**:
- **on-accept-failure**: All failure conditions that appear after receiving an Access-Accept and before successful instantiation of the host or session.

The RADIUS accounting policy to be used for sending the Accounting Stop messages must be obtained prior to RADIUS authentication via local user database pre-authentication.

The **no** form of this command reverts to the default.

Parameters

on-request-failure

Specifies that an accounting stop message is sent when a RADIUS Access-Request message could not be sent (for example, there is no server configured, or timeout).

on-reject

Specifies that an accounting stop message is sent when an Access-Reject is received.

on-accept-failure

Specifies that an accounting stop message is sent a failure occurred after the reception of a RADIUS Access-Accept message (such as a duplicate IP address).

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

42.11 send-bvpls-evpn-flush

send-bvpls-evpn-flush

Syntax

[**no**] **send-bvpls-evpn-flush**

Context

[Tree] (config>service>vpls>pbb send-bvpls-evpn-flush)

Full Context

configure service vpls pbb send-bvpls-evpn-flush

Description

This command triggers ISID-based C-MAC flush signaling in the PBB-EVPN. When the command is enabled in an I-VPLS service, a B-MAC/ISID route is sent for the I-VPLS ISID.

Default

no send-bvpls-evpn-flush

Platforms

All

42.12 send-bvpls-flush

send-bvpls-flush

Syntax

send-bvpls-flush {[**all-but-mine**] [**all-from-me**]}

no send-bvpls-flush

Context

[Tree] (config>service>vpls>pbb send-bvpls-flush)

Full Context

configure service vpls pbb send-bvpls-flush

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables generation of LDP MAC withdrawal "flush-all-from-me” in the B-VPLS domain when the following triggers occur in the related IVPLS:

- MC-LAG failure
- Failure of a local SAP
- Failure of a local pseudowire/SDP binding

A failure means transition of link SAP/pseudowire to either down or standby status.

This command does not require send-flush-on-failure in B-VPLS to be enabled on an IVPLS trigger to send an MAC flush into the BVPLS.

Default

no send-bvpls-flush

Parameters

all-but-mine

Specifies to send an LDP flush all-but-mine and also sent into the B-VPLS. Both parameters can be set together.

all-from-me

Specifies to send an LDP flush-all-from and when STP initiates a flush, it is sent into the B-VPLS using LDP MAC flush all-from-me. Both parameters can be set together.

Platforms

All

42.13 send-chain

send-chain

Syntax

[**no**] **send-chain**

Context

[Tree] (config>ipsec>cert-profile>entry send-chain)

Full Context

configure ipsec cert-profile entry send-chain

Description

Commands in this context configure the send-chain in the **cert-profile entry**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The configuration of this command is optional, by default system will only send the certificate specified by **cert** command in the selected entry to the peer. This command allows system to send additional CA certificates to the peer. These additional CA certificates must be in the certificate chain of the certificate specified by the **cert** command in the same entry.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

send-chain

Syntax

[**no**] **send-chain**

Context

[Tree] (config>system>security>tls>cert-profile>entry send-chain)

Full Context

configure system security tls cert-profile entry send-chain

Description

This command enables the sending of certificate authority (CA) certificates, and enters the context to configure send-chain information.

By default, the system only sends the TLS server certificate or TLS client certificate specified by the **cert** command. If CA certificates are to be sent using send-chain, they must be in the chain of certificates specified by the **config**>**system**>**security**>**pki**>**ca-profile** command. The specification of the send-chain is not necessary for a working TLS profile if the TLS peer has the CA certificate used to sign the server or client certificate in its own trust anchor.

For example, given a TLS client running on SR OS, the ROOT CA certificate resides on the TLS server, but the subsequent SUB-CA certificate needed to complete the chain resides within SR OS. The **send-chain** command allows these SUB-CA certificates to be sent from SR OS to the peer to be authenticated using the ROOT CA certificate that resides on the peer.

The **no** form of the command disables the send-chain.

Default

no send-chain

Platforms

All

Full Context

configure saa test type-multi-line lsp-ping sr-policy send-count

configure saa test type-multi-line lsp-ping send-count

Description

This command configures the number of messages to send. The *send-count* value is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message *interval* value must be expired before the next message request is sent.

The **no** form of this command reverts to the default value.

Default

send-count 1

Parameters

send-count

Specifies the send count in number of packets.

Values 1 to 100

Default 1

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

42.15 send-default

send-default

Syntax

send-default [**ipv4**] [**ipv6**] [**export-policy** *export-policy*]

no send-default

Context

[Tree] (config>router>bgp send-default)

[Tree] (config>router>bgp>group send-default)

[Tree] (config>router>bgp>group>neighbor send-default)

Full Context

configure router bgp send-default

configure router bgp group send-default

configure router bgp group neighbor send-default

Description

This command enables the advertisement of a default route. When this command is configured to apply to an IBGP or EBGP session, the default route for IPv4 or IPv6 is automatically added to the Adj_RIB-OUT of that peer. The advertised default routes are unrelated to any default routes installed in the FIB of the local router.

If a BGP export policy allows an active default route in the FIB of the local router to be advertised and conflict with this command, the artificially generated default route overrides the advertisement of the installed default route.

The artificially generated default route is not matched by BGP export policies. To modify its attributes or decide whether it should be advertised (based on a conditional expression), a route policy must be created and referenced by the **export-policy** parameter. Only conditional entries with an action and no from or to criteria are parsed. If there are no such entries, only the default action is applied.

The **no** form of this command restores the default behavior. At the group and neighbor levels, the default behavior is to inherit the configuration from a higher level. At the instance level, the default behavior is to neither generate nor inject a default route.

Default

no send-default

Parameters

ipv4

Generates and advertises an IPv4 default route (0/0).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6

Generates and advertises an IPv6 default route (::/0).

export-policy

Specifies the name of a route policy, up to 64 characters. Only the route modifications in the matching conditional-expression entry or the default action are applied. These modifications change the attributes of the advertised default routes.

Context

[Tree] (config>service>vpls send-flush-on-failure)

Full Context

configure service vpls send-flush-on-failure

Description

This command enables sending out flush-all-from-me messages to all LDP peers included in affected VPLS, in the event of physical port failures or "operationally down" events of individual SAPs. This feature provides an LDP-based mechanism for recovering a physical link failure in a dual-homed connection to a VPLS service. This method provides an alternative to RSTP solutions where dual homing redundancy and recovery, in the case of link failure, is resolved by RSTP running between a PE router and CE devices. If the endpoint is configured within the VPLS and send-flush-on-failure is enabled, flush-all-from-me messages will be sent out only when all spoke-SDPs associated with the endpoint go down.

This feature cannot be enabled on management VPLS.

Default

no send-flush-on-failure

Platforms

All

Context

[Tree] (config>service>vpls>bgp-evpn>vxlan send-imet-ir-on-ndf)

Full Context

configure service vpls bgp-evpn vxlan send-imet-ir-on-ndf

Description

This command controls the advertisement of Inclusive Multicast Ethernet Tag (IMET) routes for ingress replication in the case where the PE is Non-DF for a specified network interconnect VXLAN virtual ES. When enabled, the router will advertise IMET-IR routes even if the PE is NDF. This attracts BUM traffic but also speeds up convergence in case of DF failure.

The **no** form of this command withdraws the advertisement of the IMET-IR route on the network interconnect VXLAN NDF router.

[Tree] (config>router>bgp>outbound-route-filtering>extended-community send-orf)

Full Context

configure router bgp group neighbor outbound-route-filtering extended-community send-orf

configure router bgp group outbound-route-filtering extended-community send-orf

configure router bgp outbound-route-filtering extended-community send-orf

Description

This command instructs the router to negotiate the send capability in the BGP outbound route filtering (ORF) negotiation with a peer.

This command also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD.

The **no** form of this command causes the router to remove the send capability in the BGP ORF negotiation with a peer.

The **no** form also causes the router to send an ORF remove action for a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer.

If the *comm-id* parameters are not exclusively route target communities then the router will extract appropriate route targets and use those. If, for some reason, the *comm-id* parameters specified contain no route targets, then the router will not send an ORF.

Default

no send-orf

Parameters

comm-id

Specifies up to 32 community policies, which must consist exclusively of route target extended communities. If it is not specified, then the ORF policy is automatically generated from configured route target lists, accepted client route target ORFs and locally configured route targets.

configure service vpls mesh-sdp igmp-snooping send-queries

configure service vpls sap mld-snooping send-queries

configure service vpls sap igmp-snooping send-queries

Description

This command specifies whether to send IGMP general query messages on the SAP or SDP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When send-queries is configured, all type of queries generate ourselves are of the configured version. If a report of a version higher than the configured version is received, the report will get dropped and a new wrong version counter will get incremented. If send-queries is not configured, the version command has no effect. The version used will be the version of the querier. This implies that, for example, when we have a v2 querier, we will never send out a v3 group or group-source specific query when a host wants to leave a certain group.

If **mrouter-port** is enabled on this SAP or spoke SDP, the **send-queries** command parameter cannot be set.

The **no** form of this command disables the IGMP general query messages.

configure service vprn bgp group link-bandwidth send-to-ebgp

Description

This command configures BGP to allow link-bandwidth extended community to be sent in routes advertised to EBGP peers in the scope of the command, as long the routes belong to one of the listed address families.

The link-bandwidth extended community is encoded as a non-transitive type. This means that by default it should not be attached to any route advertised to an EBGP peer and it should be discarded when received in any route from an EBGP peer. This command overrides the standard behavior.

Up to three families may be configured.

The **no** form of this command restores the default behavior of stripping the link-bandwidth extended community from any route advertised to an EBGP peer.

Default

no send-to-ebgp

Parameters

family

Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

Description

This command configures the encapsulation to be advertised with the EVPN routes for the service. The encapsulation is encoded in RFC 5512-based tunnel encapsulation extended communities.

When used in the **bgp-evpn**>**mpls** context, the supported options are none (**no send-tunnel-encap**), **mpls**, **mplsoudp** or both.

When used in the **bgp-evpn**>**vxlan** context, the supported options are **send-tunnel-encap** (the router signals a VXLAN value) or **no send-tunnel-encap** (no encapsulation extended community is sent).

Default

send-tunnel-encap mpls (in the **config**>**service**>**vpls**>**bgp-evpn**>**mpls** context)

send-tunnel-encap (in the **config**>**service**>**vpls**>**bgp-evpn**>**vxlan** context)

Parameters

mpls

Specifies the MPLS-over-UDP encapsulation value in the RFC 5512 encapsulation extended community.

mplsoudp

Specifies the MPLS encapsulation value in the RFC 5512 encapsulation extended community.

configure eth-cfm system sender-id

Description

This command allows the operator to include the configured "system name” (chassis3) or a locally configured value in ETH-CFM PDUs sent from MEPs and MIPs. The operator may only choose one of these options to use for ETH-CFM. MEPs include the **sender-id** TLV for CCM (not sub second CCM enabled MEPs), LBM/LBR, and LTM/LTR. MIPs include this value in the LBR and LTR PDUs.

Note:
LBR functions reflect all TLVs received in the LBM unchanged, including the SenderID TLV.

Parameters

local-name

Specifies a local alphanumeric string different from the "system name” chassis(3) value that can be used for other means, up to 45 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

system

Allows ETH-CFM to use the configured "system name" value as the chassis(3).

no server *index*

Context

[Tree] (config>subscr-mgmt>auth-plcy>radius-auth-server server)

Full Context

configure subscriber-mgmt authentication-policy radius-authentication-server server

Description

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to sixteen RADIUS servers can be configured at any one time in a RADIUS authentication policy. Only five can be used for authentication, all other servers should be configured as coa-only servers. RADIUS servers are accessed in order from lowest to highest index for authentication or accounting requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server index from the configuration.

Parameters

server-index

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 16 (a maximum of 5 authentication servers)

ip-address

Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

key

Specifies the secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

Values secret-key: Up to 20 characters.

hash-key: Up to 33 characters.

hash2-ke: Up to 55 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

port-num

Specifies the UDP port number on which to contact the RADIUS server for authentication.

Values 1 to 65535

coa-only

Specifies Change-of-Authorization Messages only. Servers that are marked with the coa-only flag will not be used for authentication, but they is able to accept RADIUS CoA messages, independent of the accept-authorization-change setting in the authentication policy.

For authentication purposes, the maximum number of servers is 5. All other servers may only be used as coa-only servers.

limit

Specifies the maximum number of outstanding RADIUS authentication requests for this authentication server.

Values 1 to 4096

Default The default value when not configured is 4096

configure service vprn interface dhcp server

configure service ies interface dhcp server

configure service ies subscriber-interface group-interface dhcp server

Description

This command specifies a list of servers where requests are forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP relay to work. If there are multiple servers then the request is forwarded to all servers in the list.

There can be a maximum of 8 DHCP servers configured.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command reverts to the default.

Parameters

server

Specifies up to eight DHCP server IP addresses.

Platforms

All

- configure service ies interface dhcp server
- configure service vprn interface dhcp server

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface dhcp server

no server *server-index*

Context

[Tree] (config>aaa>l2tp-acct-plcy>radius-acct-server server)

Full Context

configure aaa l2tp-accounting-policy radius-accounting-server server

Description

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. RADIUS servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server from the configuration.

Parameters

server-index

The index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 16 (a maximum of 5 accounting servers)

address ip-address

The IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

secret *key*

The secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

Values secret-key — A string up to 20 characters.

hash-key — A string up to 33 characters.

hash2-key — A string up to 55 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hash

Specifies the key is entered in an encrypted form. If the hash parameter is not used, the key is assumed to be in a non-encrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the hash parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form. If the hash2 parameter is not used, the less encrypted hash form is assumed.

custom

Specifies the custom encryption to management interface.

port

Specifies the UDP port number on which to contact the RADIUS server for authentication.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server

no server *server-name*

Context

[Tree] (config>service>vprn>radius-proxy server)

[Tree] (config>router>radius-proxy server)

Full Context

configure service vprn radius-proxy server

configure router radius-proxy server

Description

This command creates a RADIUS-proxy server in the corresponding routing instance. The proxy server can be configured for the purpose of proxying authentication or accounting or both.

If a WLAN-GW ISA group is specified, then the RADIUS proxy server is instantiated on the set of ISAs in the specified wlan-gw group. The RADIUS messages from the AP are load-balanced to these ISAs. The ISA that processes the RADIUS message then hashes this message to the ISA that anchors the UE. The hash is based on UE MAC address (required to be present in the calling-station-id attribute) in the RADIUS message.

If the **create** parameter is not specified, then this command enters configuration context of the specified RADIUS-proxy server.

The **no** form of this command removes the server-name and parameters from the radius-proxy configuration.

Parameters

server-name

Specifies the name of the RADIUS-proxy server.

create

Specifies that the system will create the specified RADIUS-proxy server.

purpose

Specifies the purpose the RADIUS-proxy server.

Values accounting — proxy accounting packets

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

authentication — proxy authentication packets

group-id

Specifies the WLAN-GW ISA group.

[Tree] (config>service>vprn>aaa>rmt-srv>tacplus server)

[Tree] (config>system>security>tacplus server)

Full Context

configure service vprn aaa remote-servers tacplus server

configure system security tacplus server

Description

This command adds a TACACS+ server and configures the TACACS+ server IP address, index, and key values.

Up to five TACACS+ servers can be configured at any one time. TACACS+ servers are accessed in order from lowest index to the highest index for authentication requests.

The **no** form of this command removes the server from the configuration.

Default

No TACACS+ servers are configured.

Parameters

index

Specifies the index for the TACACS+ server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from the lowest index to the highest index.

Values 1 to 5

ip-address

Specifies the IP address of the TACACS+ server. Two TACACS+ servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D

key

Specifies the secret key, up to 128 characters, for access to the TACACS+ server. This secret key must match the password on the TACACS+ server.

Values Up to 128 characters in length.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

port

Specifies the port ID.

Values 0 to 65535

server

Syntax

server *server* [*server*]

Context

[Tree] (config>router>if>dhcp server)

Full Context

configure router interface dhcp server

Description

This command specifies a list of servers where requests will be forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP relay to work. If there are multiple servers then the request is forwarded to all of the servers in the list. There can be a maximum of eight DHCP servers configured.

The flood command is applicable only in the VPLS case. There is a scenario with VPLS where the VPLS node only wants to add Option 82 information to the DHCP request to provider per-subscriber information, but it does not do full DHCP relay. In this case, the server is set to "flood". This means the DHCP request is still a broadcast and is sent through the VPLS domain. A node running at Layer 3 further upstream then can perform the full Layer 3 DHCP relay function.

Default

no server

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

server

Specifies the DHCP server IP address. A maximum of eight servers can be specified in a single statement.

Platforms

configure router pcp-server server

Description

Commands in this context configure a PCP server.

The **no** form of this command deletes the specified PCP server.

Parameters

pcp-server-name

Specifies the PCP server name, up to 32 characters.

create

Creates a PCP server before entering the context to configure it.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server

Syntax

server [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address* | **ptp**} [**key-id** *key-id* | **authentication-keychain** *keychain-name*] [**version** *version*] [**prefer**]

no server [**router** *router-instance* | **service-name** *service-name*] {*ip address* | *ipv6-address* | **ptp**}

Context

[Tree] (config>system>time>ntp server)

Full Context

configure system time ntp server

Description

This command configures the node to operate in client mode with the NTP server specified in the address field of this command.

If the internal PTP process is used as a source of time for System Time and OAM time then it must be specified as a server for NTP. If PTP is specified, the **prefer** parameter must be specified. After PTP has established a UTC traceable time from an external grandmaster it is always the source for time into NTP, even if PTP goes into time holdover. PTP applies only to the 7450 ESS and 7750 SR.

Using the internal PTP time source for NTP promotes the internal NTP server to stratum 1 level, which may impact the NTP network topology.

The **no** form of this command removes the server with the specified address from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

router-instance

Specifies the routing context that contains the interface in the form of *router-name* or *service-id*.

Values *router-name* — Base | Management

service-id — 1 to 2147483647

Default Base

service name

Specifies the service name for the VPRN, up to 64 characters. CPM routing instances are not supported.

ip-address

Configures the IPv4 address of an external NTP server.

Values a.b.c.d

ipv6-address

Configures the IPv6 address of an external NTP server.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

key-id

Specifies the key ID that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP server. If an NTP packet is received by this node, the authentication key-id, type, and key value must be valid, otherwise the packet is rejected and an event/trap generated. This is an optional parameter.

Values 1 to 255

keychain-name

Identifies the keychain name, up to 32 characters.

version

Configures the NTP version number that is expected by this node. This is an optional parameter.

Values 2 to 4

Default 4

ptp

Configures the internal PTP process as a time server into the NTP process. The **prefer** parameter is mandatory with this server option.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

prefer

Specifies that, when configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, the new entry overrides the old entry.

Full Context

configure service vprn aaa remote-servers radius server

configure system security radius server

Description

This command adds a RADIUS server and configures the IP address, index, and key values.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Up to five RADIUS servers can be configured at any one time. For authentication requests, RADIUS servers are accessed in order from the lowest to highest index until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

Default

no server

Parameters

index

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 5

ip-address

Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values		
	ipv4-address	a.b.c.d (host bits must be 0)
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0..FFFF]H
		d: [0..255]D

key

Specifies the secret key to access the RADIUS server, up to 64 characters. This secret key must match the password on the RADIUS server.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

custom

Specifies the custom encryption to management interface.

tls-client-profile

Specifies the TLS profile for the RADIUS server.

profile

Specifies the TLS profile name, up to 32 characters.

md5

Specifies the MD5 hash algorithm for the RADIUS server.

sm3

Specifies the SM3 hash algorithm for the RADIUS server.

Platforms

All

server

Syntax

server *server-index* [**create**]

no server *server-index*

Context

[Tree] (config>system>security>ldap server)

Full Context

configure system security ldap server

Description

This command configures an LDAP server. Up to five servers can be configured, which can then work in a redundant manner.

The **no** version of this command removes the server connection.

Parameters

server-index

Specifies a unique LDAP server connection.

Values 1 to 5

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

server

Syntax

server *server-index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**auth-port** *auth-port*] [**acct-port** *acct-port*] [**type** *server-type*]

Context

[Tree] (config>system>security>dot1x>radius-plcy server)

Full Context

configure system security dot1x radius-plcy server

Description

This command adds a Dot1x server and configures the Dot1x server IP address, index, and key values.

Up to five Dot1x servers can be configured at any one time. Dot1x servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other Dot1x servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

Default

no server

Parameters

server-index

Specifies the index for the Dot1x server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 5

ip-address

Specifies the IP address of the Dot1x server. Two Dot1x servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

key

Specifies the secret key, up to 128 characters, to access the Dot1x server. This secret key must match the password on the Dot1x server.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

acct-port

Specifies the UDP port number on which to contact the RADIUS server for accounting requests.

auth-port

Specifies a UDP port number to be used as a match criteria.

Values 1 to 65535

server-type

Specifies the server type.

Values authorization, accounting, combined

no server-address *server-address*

Context

[Tree] (config>app-assure>group>dns-ip-cache>dns-match server-address)

Full Context

configure application-assurance group dns-ip-cache dns-match server-address

Description

7

This command configures a DNS server address. DNS responses from this DNS server are used to populate the dns-ip-cache. Up to 64 server addresses can be configured.

Parameters

server-address

Specifies the IPv4 or IPv6 address of the DNS.

Values	ipv4-address	a.b.c.d[/mask]	
			mask - [1 to 32]
	ipv6-address	x:x:x:x:x:x:x:x/prefix-length	
			x:x:x:x:x:x:d.d.d.d
			x - [0 to FFFF]H
			d - [0 to 255]D
		prefix-length	[1 to 128]

server-name

Specifies an optional server name for a given server address.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server-address {**eq** | **neq**} **dns-ip-cache** *dns-ip-cache-name*

server-address {**eq** | **neq**} **ip-prefix-list** *ip-prefix-list-name*

no server-address

Context

[Tree] (config>app-assure>group>policy>app-filter>entry server-address)

Full Context

configure application-assurance group policy app-filter entry server-address

Description

This command configures the server address to use in application definition. The server IP address may be the source or destination, network or subscriber IP address and may include the use of netmasks.

The **no** form of this command restores the default (removes the server address from application criteria defined by this entry).

Default

no server-address

Parameters

eq

Specifies a comparison operator that the value configured and the value in the flow are equal.

neq

Specifies a comparison operator that the value configured differs from the value in the flow.

ip-address

Specifies a valid unicast address.

Values		
	ipv4-address	a.b.c.d[/mask]
		mask - [1..32]
	ipv6-address	x:x:x:x:x:x:x:x/prefix-length
		x:x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

prefix-length [1..128]

netmask

Specifies an IPv4 or IPv6 address mask.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit)
		x:x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D

masked-ip-address

Specifies a valid unicast IPv4 or IPv6 address.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit)
		x:x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D

dns-ip-cache-name

Specifies a DNS IP cache name, up to 32 characters.

ip-prefix-list-name

Specifies the name of an IP prefix list, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server-address

Syntax

server-address *ip-address* [**version** *version-number*] [**normal** | **preferred**]

no server-address *ip-address*

Context

[Tree] (config>system>time>sntp server-address)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure system time sntp server-address

Description

This command creates an SNTP server for unicast client mode.

Parameters

ip-address

Specifies the IP address of the SNTP server.

Values a.b.c.d

version-number

Specifies the SNTP version supported by this server.

Values 1 to 3

Default 3

normal | preferred

Specifies the preference value for this SNTP server. When more than one time-server is configured, one server can have preference over others. The value for that server should be set to **preferred**. Only one server in the table can be a preferred server.

Default normal

seconds

Specifies the frequency at which this server is queried.

Values 64 to 1024

Default 64

Platforms

All

server-cipher-list

Syntax

server-cipher-list *name* [**create**]

no server-cipher-list *name*

Context

[Tree] (config>system>security>tls server-cipher-list)

Full Context

configure system security tls server-cipher-list

Description

This command creates the cipher list that is compared against cipher lists sent by the client to the server in the client hello message. The list contains all ciphers that are supported and desired by SR OS for use in the TLS session. The first common cipher found in both the server and client cipher lists will be chosen. As such, the most desired ciphers should be added at the top of the list.

The **no** form of the command removes the cipher list.

Parameters

name

Specifies the name of the server cipher list, up to 32 characters in length.

create

Keyword used to create the server cipher list.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server server-id

configure router dhcp6 local-dhcp-server server-id

configure service vprn dhcp6 local-dhcp-server server-id

Description

This command allows the operator to customize the **server-id** attribute of a DHCPv6 message (such as DHCPv6 advertise and reply). By default, the **server-id** uses DUID-ll derived from the chassis link layer address. Operators have the option to use a unique identifier by using the **duid-en** (vendor based on an enterprise number). There is a maximum length associated with the customizable hex-string and ascii-string.

The **no** form of this command reverts to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

server-id duid-ll

Parameters

hex-string

Specifies a DUID system ID in a hex format.

Values 0x0 to 0xFFFFFFFF (maximum 116 hex nibbles)

ascii-string

Specifies a DUID system ID in an ASCII format, up to 58 characters.

duid-ll

Specifies that the DUID system ID is derived from the system link layer address.

duid-en

Specifies the enterprise number.

Full Context

configure application-assurance group policy app-filter entry server-port

Description

This command specifies the server TCP or UDP port number to use in the application definition.

The **no** form of this command restores the default (removes server port number from application criteria defined by this app-filter entry).

Default

no server-port (the server port is not used in the application definition)

Parameters

eq

Specifies that the value configured and the value in the flow are equal.

neq

Specifies that the value configured differs from the value in the flow.

gt

Specifies all port numbers greater than server-port-number match.

lt

Specifies all port numbers less than server-port-number match.

port-list-name

Specifies a named port list containing a set or range of ports.

port-num

Specifies a valid server port number.

Values 0 to 65535

start-port-num, end-port-num

Specifies the starting or ending port number.

Values 0 to 65535

Server Port Options:

The following options are available:

- **No option specified:** TCP/UDP port applications with full signature verification:
  - AA ensures that other applications that can be identified do not run over a well-known port.
  - Application-aware policy applied once signature-based identification completes (likely requiring several packets).
- **first-packet-validate:** TCP/UDP trusted port applications with signature verification:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Application identified using well known TCP/UDP port based filters and re-identified once signature identification completes.
- AA policy applied from the first packet of a flow while continuing signature-based application identification. Policy re-evaluated once the signature identification completes, allowing to detect improper/unexpected applications on a well-known port.

- **first-packet-trusted:** TCP/UDP trusted port applications - no signature verification:
  - Application identified using well known TCP/UDP port based filters only.
  - Application Aware policy applied from the first packet of a flow.
  - No signature processing assumes operator/customer trusts that no other applications can run on the well-known TCP/UDP port (statistics collected against trusted_tcp or trusted_udp protocol).

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

no server-tls-profile *name*

Context

[Tree] (config>system>security>tls server-tls-profile)

Full Context

configure system security tls server-tls-profile

Description

This command creates a TLS server profile. This profile can be used by applications that support TLS for encryption. The applications should not send any PDUs until the TLS handshake has been successful.

The **no** form of the command removes the TLS server profile.

Parameters

name

Specifies the name of the TLS server profile, up to 32 characters in length.

create

Keyword used to create the TLS server profile.

Platforms

All

42.50 server6

server6

Syntax

server6 *ipv6-address*

no server6

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host server6)

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure subscriber-mgmt local-user-db ipoe host server6

Description

This command allows DHCP6 server selection based on the host entry in LUDB.

The configured DHCP6 server IP address must reference one of the v6 addressees configured under the **config>service>vprn>sub-if>grp-if>ipv6>dhcpv6>relay** or **config>service>ies>sub-if>grp-if>ipv6>dhcpv6>relay** context.

The **no** form of this command reverts to the default.

Parameters

ipv6-address

Specifies the retailer service ID.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Context

[Tree] (config>system>security>pki>ca-profile>ocsp service)

Full Context

configure system security pki ca-profile ocsp service

Description

This command specifies the service or routing instance that used to contact OCSP responder. This applies to OCSP responders that either configured in CLI or defined in AIA extension of the certificate to be verified.

The responder-url will also be resolved by using the DNS server configured in the configured routing instance.

With VPRN services, the system checks whether the specified service ID or service name is an existing VPRN service at the time of CLI configuration. Otherwise the configuration fails.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

service-id

Specifies an existing service ID to be used in the match criteria.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **service name** *service-name* variant can be used in all configuration modes.

Values service-id: 1 to 2147483647 base-router: 0

name service-name

Identifies the service, up to 64 characters.

service-id-lag-hashing

Syntax

[**no**] **service-id-lag-hashing**

Context

[Tree] (config>system>load-balancing service-id-lag-hashing)

Full Context

configure system load-balancing service-id-lag-hashing

Description

This command enables enhanced VLL LAG service ID hashing. This command improves the LAG spraying of VLL service packets and is applied only when both ECMP and LAG hashing are performed by the same router. By default, the ECMP interface and LAG link for all packets on the VLL service are selected based on a direct modulo operation of the service ID. This command enhances distribution and hashes the service ID prior to the LAG link modulo operation when an ECMP link modulo operation is performed.

The **no** form of the command preserves the default behavior of VLL LAG service ID hashing.

no service-id-range

Context

[Tree] (config>service>md-auto-id service-id-range)

Full Context

configure service md-auto-id service-id-range

Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to services that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A service created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

Default

no service-id-range

Parameters

start *service-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

Values 1 to 2147483647

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

end ***service-id***

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

Context

[Tree] (config>service>vpls service-mtu)

[Tree] (config>service>template>vpls-template service-mtu)

Full Context

configure service vpls service-mtu

configure service template vpls-template service-mtu

Description

This command configures the service payload (Maximum Transmission Unit – MTU), in bytes, for the service. This MTU value overrides the service-type default MTU. The **service-mtu** defines the payload capabilities of the service. It is used by the system to validate the SAP and SDP binding's operational state within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, then the SAP will be placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP will be able to transition to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service will be placed in an inoperative state. If the service MTU is equal to or less than the path MTU, then the SDP binding will be placed in an operational state.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, then all associated SAP and SDP binding operational states are automatically re-evaluated.

For i-VPLS and Epipes bound to a b-VPLS, the service-mtu must be at least 18 bytes smaller than the b-VPLS service MTU to accommodate the PBB header.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

Default

service-mtu 1514

Parameters

octets

The following table displays MTU values for specific VC types.

Table 112: MTU Values

VC-Type	Example Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

[Tree] (config>service>epipe service-mtu)

Full Context

configure service cpipe service-mtu

configure service ipipe service-mtu

configure service epipe service-mtu

Description

This command configures the service payload in bytes, for the service. The configured Maximum Transmission Unit (MTU) value overrides the service-type default MTU. The **service-mtu** command defines the payload capabilities of the service. It is used by the system to validate the operational state of the SAP and SDP binding within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP transitions to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, the SDP binding is placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, all associated SAP and SDP binding operational states are automatically reevaluated.

Binding operational states are automatically reevaluated.

For I-VPLS and Epipes bound to a B-VPLS, the service MTU must be at least 18 bytes smaller than the B-VPLS service MTU to accommodate the PBB header.

Because this connects a Layer 2 to a Layer 3 service, adjust the service MTU under the Epipe service. The MTU that is advertised from the Epipe side is service MTU minus EtherHeaderSize.

Note:
In the **configure**>**service**>**epipe** context, the **adv-service-mtu** command can be used to override the configured MTU value used in T-LDP signaling to the far-end of an Epipe spoke-sdp. The **adv-service-mtu** command is also used to validate the value signaled by the far-end PE. For more information, see **adv-service-mtu** command.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

By default, if **no service-mtu** is configured, the MTU value is (1514 - 14) = 1500.

Default

no service-mtu 1508 (for Apipe, Fpipe)

no service-mtu 1500 (for Ipipe)

no service-mtu 1524 (for Epipe)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 113: MTU Values lists the MTU values for specific VC types.

Table 113: MTU Values

SAP VC-Type	Example: Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

Parameters

octets

Specifies the MTU size in octets, expressed as a decimal integer.

Values 1 to 9782
1 to 9800 (for Epipe only)

[Tree] (config>redundancy>mc>peer>mcr>l3-ring>cv service-name)

Full Context

configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify service-name

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify service-name

Description

This command specifies the service name of the SAP used for ring-node connectivity verification of this ring node. This command supersedes the configuration of a service ID.

The **no** form of this command removes the service name from the CV configuration.

Default

no service-name

Parameters

service-name

Specifies a service name, up to 64 characters.

Platforms

All

42.63 service-range

service-range

Syntax

service-range *service-id service-id*

no service-range

Context

[Tree] (config>service>dynsvc service-range)

Full Context

configure service dynamic-services service-range

Description

This command specifies the service ID range that is reserved for dynamic data service creation. The range cannot overlap with existing static configured services. Once configured with active dynamic services in the range, the service range can only be extended at the end.

The **no** form of this command removes the service-range from the configuration. This is only allowed when there are no active dynamic data services.

When **no service-range** is specified, the setup of dynamic data services fails.

Parameters

service-id

Specifies the start and end service IDs to define the service range for dynamic services.

Values 1 to 2147483647

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

service-range

Syntax

service-range *svc-id* [**to** *svc-id*]

no service-range *svc-id*

Context

[Tree] (config>service>system>bgp-evpn>eth-seg>service-id service-range)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service system bgp-evpn ethernet-segment service-id service-range

Description

This command associates a specified service range to a virtual ES, along with the **network-interconnect-vxlan** command. Up to eight service ranges per VXLAN instance can be configured, where the ranges may overlap. The service range may be configured before the service.

The **no** form of this command removes the association of the service range to the virtual ES for the configured VXLAN instance.

Parameters

svc-id

Specifies which service range will be associated with the virtual Ethernet Segment.

Values 1 to 2147483647

Platforms

All

service-range

Syntax

service-range *startid-endid* [**start-vlan-id** *startvid*]

no service-range

Context

[Tree] (config>service>vpls>vpls-group service-range)

Full Context

configure service vpls vpls-group service-range

Description

This command configures the service ID and implicitly the VLAN ID ranges to be used as input variables for related VPLS and SAP templates to pre-provision "data" VPLS instances and related SAPs using the service ID specified in the command. If the **start-vlan-id** is not specified then the service-range values are used for vlan-ids. The data SAPs will be instantiated on all the ports used to specify SAP instances under the related control VPLS.

Modifications of the service id and vlan ranges are allowed with the following restrictions.

- service-range increase can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state
  - By creating a new vpls-group
- service-range decrease can be achieved in two ways:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

  - Allowed when vpls-group is in shutdown state; when **shutdown** command is executed the associated service instances are deleted.
  - Allowed when vpls-group is in no shutdown state and has completed successfully instantiating services.
  - In both cases, only the services that do not have user configured SAPs will be deleted. Otherwise the above commands are rejected. Existing declarations or registrations do not prevent service deletion.
- start-vlan-id change can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state
  - At the time of range decrease by increasing the start-vlan-id which can be done when vpls-group is in no shutdown state and has completed successfully instantiating services

The **no** form of this command removes the specified ranges and deletes the pre-provisioned VPLS instances and related SAPs. The command will fail if any of the VPLS instances in the affected ranges have a provisioned SAP.

Default

no service-range

Parameters

startid-endid

Specifies the range of service IDs

Values 1 to 2147483647

startvid

Specifies the starting VLAN ID; it provides a way to set aside a service ID range that is not the same as the VLAN range and allows for multiple MVRP control-VPLSs to control same VLAN range on different ports.

Values 1 to 4094

Platforms

All

session

Syntax

session *session-name* [**test-family** [**ethernet** | **ip** | **mpls**] [**session-type** {**proactive** | **on-demand**}] **create**]

no session *session-name*

Context

[Tree] (config>oam-pm session)

Full Context

configure oam-pm session

Description

This command creates the individual session containers that house the test-specific configuration parameters. As this session context provides only a container abstract to house the individual test functions, it cannot be shut down. Individual test sessions within the container may be shut down. No values, parameters, or configuration within this context may be changed if any individual test is active. In the classic CLI, changes can only be made when all tests within the context are shut down. The description configuration is an exception to this requirement.

The **no** form of this command deletes the session.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

session-name

Specifies the session name, up to 32 characters.

test-family

Specifies the type family and sets the context for the individual parameters.

Values **ethernet** — Specifies that the test is based on the Ethernet layer.

ip — Specifies that the test is based on the IP layer.

mpls — Specifies that the test is based on the MPLS layer.

session-type

Specifies the test session test type.

Values **proactive** — Sets the type to always on, with an immediate start and no stop.

on-demand — Sets the type to on-demand, with an immediate start and no stop, or a stop based on the offset.

Default proactive

create

Keyword to create the PM session.

Platforms

42.74 session-accounting

session-accounting

Syntax

session-accounting [**interim-update**] [**host-update**]

no session-accounting

Context

[Tree] (config>subscr-mgmt>acct-plcy session-accounting)

Full Context

configure subscriber-mgmt radius-accounting-policy session-accounting

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables per session accounting mode. In per session accounting mode, the acct-session-id is generated per session. This acct-session-id is uniformly included in all accounting messages (START/INTERIM-UPDATE/STOP) and it can be included in RADIUS Access-Request message.

This accounting mode of operation can be used only in PPPoE environment with dual-stack host in which case both hosts (IPv4 and IPv6) are considered part of the same session. In addition to regular interim-updates, *triggered* interim-updates are sent by a host joining or leaving the session.

When an IPv4/v6 address is allocated, or released from a dual-stack host, a triggered interim-update message is immediately sent. This triggered interim-update message reflects the change in the IP address. The triggered interim-update has no effect on the interval at which the regular interim updates are scheduled.

Accounting counters are based on the queue counters and as such are aggregated for all host sharing the queues within an sla-profile instance.

CoA and LI is supported based on the acct-session-id of the session.

The **no** form of this command reverts to the default.

Parameters

interim-update

Specifies to enable interim updates. Without this keyword only START and STOP accounting messages are generated when the session is established or terminated. This is equivalent to a time-based accounting where only the duration of the session is required.

host-update

Indicates that host updates messages are sent. INTERIM-UPDATE messages can be generated (volume based accounting) by selecting this keyword.

Platforms

Full Context

configure router l2tp session-assign-method

configure service vprn l2tp session-assign-method

Description

This command configures the session assignment method.

The **no** form of this command reverts to the default value.

Default

no session-assign-method

Parameters

weighted

Specifies that the sessions are shared between the available tunnels. If necessary, new tunnels are set up until the maximum number is reached. The distribution aims at an equal ratio of the actual number of sessions to the maximum number of sessions.

weighted-random

Enhances the weighted algorithm such that when there are multiple tunnels with an equal number of sessions (equal weight), LAC randomly selects a tunnel.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-assign-method

Syntax

Full Context

configure service vprn l2tp group session-assign-method

configure router l2tp group session-assign-method

Description

This command specifies how new sessions are assigned to one of the set of suitable tunnels that are available or could be made available.

The **no** form of this command reverts to the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

session-assign-method existing-first

Parameters

existing-first

Specifies that all new sessions are placed by preference in the existing tunnels.

weighted

Specifies that the sessions are shared between the available tunnels. If necessary, new tunnels are set up until the maximum number is reached. The distribution aims at an equal ratio of the actual number of sessions to the maximum number of sessions.

weighted-random

Enhances the weighted algorithm such that when there are multiple tunnels with an equal number of sessions (equal weight), LAC randomly selects a tunnel.

Full Context

configure subscriber-mgmt gtp peer-profile session-hold-time

Description

This command configures, in seconds, the time that a GTP session context is held after the corresponding UE is disconnected. If the same UE re-connects to this system before this time has elapsed, its GTP session context is re-used. When the timer expires, the GTP session context is cleared.

The **no** form of this command reverts to the default.

Default

session-hold-time 30

Parameters

remaining-lease-time

Specifies that the timer is equal to the UE's DHCP remaining lease time.

seconds

Specifies the time, in seconds, to hold a GTP session after its UE is disconnected.

Values 0 to 3600

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure li li-source nat dslite-lsn-sub session-id

configure li li-source nat nat64-lsn-sub session-id

configure li li-source nat l2-aware-sub session-id

Description

This command configures the session ID that is inserted into the packet header for all mirrored packets of the associated LI source entry. This session ID can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs.

The session ID is only valid and used for mirror services that are configured with **ip-udp-shim** routable encapsulation (**config>mirror>mirror-dest>encap>ip-gre-shim**).

For all types of li-source entries (filter, nat, sap, or subscriber), when the mirror service is configured with **ip-udp-shim** routable encapsulation, a session-id field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value is inserted. When a mirror service is configured with **ip-gre** routable encapsulation, no *session-id* is inserted and none should be specified against the **li-source** entries.

The **no** form of this command removes the *session-id* from the configuration which results in the default value being used.

Default

no session-id (an id of 0, or no id)

Parameters

session-id

Specifies the value to insert into the header of the mirrored packets.

Values 1 to 4,294,967,295 (32b)

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

session-id

42.81 session-key

session-key

Syntax

session-key sap mac [**cid**] [**rid**]

no session-key

Context

[Tree] (config>subscr-mgmt>ipoe-plcy session-key)

Full Context

configure subscriber-mgmt ipoe-session-policy session-key

Description

This command configures the key to logically group subscriber hosts that belong to the same dual stack end device in an IPoE session.

The SAP and MAC address are always part of the IPoE session key. Optionally the Circuit-Id/Interface-Id or Remote-Id can be added to the session key.

The **no** form of this command reverts to the default.

Default

session-key sap mac

Parameters

sap

Includes the SAP as part of the IPoE session key. The **sap** parameter is mandatory and cannot be removed from the key.

mac

Includes the MAC address as part of the IPoE session key. The **mac** parameter is mandatory and cannot be removed from the key.

cid

Optionally adds the DHCPv4 Relay Agent Circuit-Id (Option 82, sub Option 1) and DHCPv6 Interface-Id (Option 18) field to the IPoE session key.

rid

Optionally adds the DHCPv4 Relay Agent Remote-Id (Option 82, sub Option 2) and DHCPv6 Remote-Id (Option 37) field to the IPoE session key. For DHCPv6, the enterprise number is excluded from the key.

sap and **mac** are mandatory parameters while **cid** and **rid** are optional and mutually exclusive. Valid IPoE session key parameters are: **sap mac**, **sap mac cid** and **sap mac rid**.

configure service vprn l2tp group session-limit

configure router l2tp group tunnel session-limit

configure router l2tp group session-limit

configure router l2tp session-limit

configure service vprn l2tp session-limit

Description

This command configures the session limit.

This command configures the L2TP session limit for the router. The value controls how many L2TP sessions will be allowed within a given context (system, group, tunnel).

L2TP is connection-oriented. The L2TP Network Server (LNS) and LAC maintain state for each call that is initiated or answered by an LAC. An L2TP session is created between the LAC and LNS when an end-to-end PPP connection is established between a remote system and the LNS. Datagrams related to the PPP connection are sent over the tunnel between the LAC and LNS. There is a one-to-one relationship between established L2TP sessions and their associated calls.

The **no** form of this command removes the value from the configuration.

42.85 session-optimized-stop

session-optimized-stop

Syntax

[**no**] **session-optimized-stop**

Context

[Tree] (config>subscr-mgmt>sub-prof>rad-acct session-optimized-stop)

Full Context

configure subscriber-mgmt sub-profile radius-accounting session-optimized-stop

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command optimizes a RADIUS Accounting Stop message for a PPPoE session termination (specifically for session accounting mode when the host update is enabled). By default when a PPPoE session terminates, the system removes a dual stack host in sequence, one host at a time. Therefore, the system will generate a RADIUS accounting interim for each host termination until only the final host is left. The final host will generate a final accounting stop message. Enabling this command will trigger a single Stop RADIUS accounting message and include information of all hosts without the host updates.

42.91 set-time

set-time

Syntax

set-time *date time*

Context

[Tree] (admin set-time)

Full Context

admin set-time

Description

This command sets the local system time.

The time entered should be accurate for the time zone configured for the system. The system will convert the local time to UTC before saving to the system clock which is always set to UTC. This command does not take into account any daylight saving offset if defined.

If SNTP or NTP is enabled (no shutdown) then this command cannot be used.

Parameters

date

Specifies the local date and time accurate to the minute in the YYYY/MM/DD format.

Values *YYYY* is the four-digit year

MM is the two-digit month

DD is the two-digit date

time

Specifies the time (accurate to the second) in the *hh*:*mm[:ss]* format. If no seconds value is entered, the seconds are reset to :00.

Values *hh* is the two-digit hour in 24 hour format (00=midnight, 12=noon)*mm* is the two-digit minute

Default 0

Specifies the amount the interface metric is increased by if the **sf-threshold** is crossed.

Values 0 to 16777215

Platforms

All

42.97 sf-sd-method

sf-sd-method

Syntax

sf-sd-method {**bip8** | **fec**}

Context

[Tree] (config>port>otu sf-sd-method)

Full Context

configure port otu sf-sd-method

Description

This command specifies the method used to determine the signal failure (SF) and signal degrade (SD) alarms. When the **bip8** method is selected, the SM-BIP8 errors are used. When the **fec** method is selected, the FEC corrected bits are used.

The following rules must be followed:

- The port's OTU must be enabled to set or change the **sf-sd-method**.
- The FEC mode must be **enhanced** or **g709** before setting **sf-sd-method** to **fec**.
- The SF threshold must be 5 or higher before setting **sf-sd-method** to **bip8**.

Default

sf-sd-method fec

Parameters

bip8

Specifies that SM-BIP8 errors are used to declare the presence of the SF and SD conditions.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fec

Specifies that FEC corrected bit errors are used to declare the presence of the SF and SD conditions.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

42.98 sf-threshold

sf-threshold

Syntax

sf-threshold *threshold* [**multiplier** *multiplier*]

no sf-threshold

Context

[Tree] (config>esa>crc-monitor sf-threshold)

Full Context

configure esa crc-monitor sf-threshold

Description

This command configures the error rate at which to declare the signal failure (SF) condition on an Ethernet interface. The value represents M*10E-N, errored frames over total frames received over W seconds of the sliding window. The CRC errors on the interface are sampled once per second. A default of 10 seconds is used when no additional **window-size** is configured. If you omit the **multiplier** value or configure **no sf-threshold**, the multiplier returns to the default value of 1.

Note: Crossing the configured signal failure (SF) threshold causes the router ESA port to enter an operational state of down when the router side detects the SF, or the port is shut down when the ESA detects the SF, which triggers redundancy for all configured ISA groups.

The **no** form of this command removes the configuration.

Default

no sf-threshold

Parameters

threshold

Specifies the SF threshold.

Values 1 to 9

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

multiplier

Specifies the SF multiplier.

Values 1

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

sf-threshold

Syntax

sf-threshold *threshold* [**coefficient** *coefficient*]

Context

[Tree] (config>port>otu sf-threshold)

Full Context

configure port otu sf-threshold

Description

This command defines the error rate at which to declare the signal failure (SF) condition.

The parameters define an error rate of (*coefficient*/10) * 10E-*threshold*. For example, **sf-threshold 5 coefficient 20** defines an error rate of (20/10) * 10E-5, or 2 * 10E-5, or 0.000 02.

The SF threshold must be the following:

- less than the SD threshold
- 5 or higher before setting **sf-sd-method** to **bip8**

The **coefficient** parameter is only used when **sf-sd-method** is set to **fec**. When **sf-sd-method** is set to **bip8**, **coefficient** is considered to have the value of 10.

Parameters

threshold

Specifies the exponent for the SF threshold value.

Values 3 to 6 when **sf-sd-method** is **bip8**

3 to 8 when **sf-sd-method** is **fec**

Default 5

coefficient

Specifies the coefficient for the SF threshold value.

Values 10 to 99

Default 10

sf-threshold

Syntax

sf-threshold *errored-frames*

Context

[Tree] (config>port>ethernet>efm-oam>link-mon>errored-frame sf-threshold)

Full Context

configure port ethernet efm-oam link-monitoring errored-frame sf-threshold

Description

The option defines the number of frame errors within the configured window which indicates the port has exceeded an acceptable error rate. A log event will be raised, and the port will be taken out of service by default. Configuration options exist to take additional actions when the error rate exceeds the threshold. These actions are defined using the **local-sf-action** configuration. This event can only be cleared through manual intervention that affects the state of the port.

Parameters

errored-frames

The number of errored frames within the configured window which indicates the port has become unusable.

Values 1 to 1000000

Default 1

Platforms

All

sf-threshold

Syntax

sf-threshold *errored-frames*

Context

[Tree] (config>port>ethernet>sym-mon sf-threshold)

Full Context

configure port ethernet symbol-monitor sf-threshold

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the error rate at which to declare the Signal Fail condition on an Ethernet interface. The value represents M*10E-N symbol errors over total symbols received over W seconds of the sliding window. The symbol errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or no sf-threshold is specified, the multiplier will return to the default value of 1.

Default

no sf-threshold

Parameters

threshold

Specifies the rate of symbol errors.

Values 1 to 9

multiplier

Specifies the multiplier used to scale the symbol error ratio.

Values 1 to 9

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

42.99 sf-threshold-clear

sf-threshold-clear

Syntax

sf-threshold-clear *threshold* [**coefficient** *coefficient*]

Context

[Tree] (config>port>otu sf-threshold-clear)

Full Context

configure port otu sf-threshold-clear

Description

This command defines the signal failure (SF) threshold clear value.

When the bit error rate falls below this value, the SF condition is cleared. The parameters define an error rate of (*coefficient*/10) * 10E-*threshold*. For example, **sf-threshold-clear 7 coefficient 10** defines an error rate of (10/10) * 10E-7, or 10E-7, or 0.000 000 1.

This SF threshold clear setting is valid only when **sf-sd-method** is set to **fec**.

Parameters

threshold

Specifies the exponent for the SF threshold clear value.

Values 3 to 9

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 6

coefficient

Specifies the coefficient for the SF threshold clear value.

Values 10 to 99

Default 10

42.102 sfm-loss-threshold

sfm-loss-threshold

Syntax

sfm-loss-threshold *num-sfm*

no sfm-loss-threshold

Context

[Tree] (config>system>switch-fabric sfm-loss-threshold)

Full Context

configure system switch-fabric sfm-loss-threshold

Description

This command sets the number of SFMs that are permitted to fail before the system goes into SFM overload state. This command is only applicable on the 7750 SR-7s and the 7750 SR-14s. Users can select the SFM limit based on the number possible for the system minus one. For the 7750 SR-7s this is a value of 3 and for the 7750 SR-14s this is a value of 7.

For networks that can accommodate more SFM failures than the default value, this command allows the selection of the number of SFMs to fail prior to the system going into SFM overload state.

The **no** form of this command reverts the threshold to the default value.

Default

7750 SR-7s: sfm-loss-threshold 1

7750 SR-14s: sfm-loss-threshold 2

Parameters

num-sfm

Specifies the number of SFMs permitted to fail before SFM overload state.

Values 1 to 7

Platforms

7750 SR-7s, 7750 SR-14s

© 2026 Nokia.

42.108 sham-link

sham-link

Syntax

sham-link *ip-int-name ip-address*

Context

[Tree] (config>service>vprn>ospf>area sham-link)

Full Context

configure service vprn ospf area sham-link

Description

This command is similar to a virtual link with the exception that metric must be included in order to distinguish the cost between the MPLS-VPRN link and the backdoor.

Parameters

ip-int-name

The local interface name used for the sham-link. This is a mandatory parameter and interface names must be unique within the group of defined IP interfaces for **config>router>if**, **config>service>ies>if** and **config>service>vprn>if** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters, the entire string must be enclosed between double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message will be returned.

ip-address

The IP address of the sham-link neighbor in IP address dotted decimal notation. This parameter is the remote peer of the sham link's IP address used to set up the sham-link. This is a mandatory parameter and must be a valid IP address.

Platforms

All

42.113 shared-circuit-id

shared-circuit-id

Syntax

[**no**] **shared-circuit-id**

Context

[Tree] (config>service>vprn>sub-if>grp-if shared-circuit-id)

[Tree] (config>service>ies>sub-if>grp-if shared-circuit-id)

Full Context

configure service vprn subscriber-interface group-interface shared-circuit-id

configure service ies subscriber-interface group-interface shared-circuit-id

Description

If configured, circuit-id in DHCPv4 Option82 is used to authenticate DHCPv6. If DHCPv6 is received before DHCPv4, it is dropped. Also, a SLAAC host is created based on DHCPv4 authentication if RADIUS returns IPv6 framed-prefix. The IPv6oE host is deleted if the linked IPv4oE host is deleted due to DHCP release or lease time-out. The linkage between IPv4 and IPv6 is based on SAP and MAC address. The sharing of circuit-id from DHCPv4 for authentication of DHCPv6 (or SLAAC) allows 7750 SR to work around lack of support for LDRA on access nodes.

The **no** form of this command reverts to the default.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure card fp ingress network pool monitor-pool-depth alarm-thresholds shared-pool-in-use

configure port network egress pool monitor-pool-depth alarm-thresholds shared-pool-in-use

Description

This command configures the threshold for the shared pool in use.

A tmnxSharedPoolUseThreshExcd trap is generated when the shared pool usage exceeds this threshold percentage. When the usage returns below the threshold percentage, the tmnxSharedPoolUseThreshNotExcd trap is generated

The **no** form of this command removes the threshold on which to alarm.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no shared-pool-in-use

Parameters

percentage

Specifies the shared pool in-use alarm threshold.

Values 0.01 to 100.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

42.116 shared-queue

shared-queue

Syntax

shared-queue *policy-name* [**create**]

no shared-queue *policy-name*

Context

[Tree] (config>qos shared-queue)

Full Context

configure qos shared-queue

Description

Commands in this context modify the QoS default shared-queue policy.

Parameters

policy-name

The name of the default shared-queue policy.

Values default

Platforms

shared-queue

Syntax

shared-queue *src-name dst-name* [**overwrite**]

Context

[Tree] (config>qos>copy shared-queue)

Full Context

configure qos copy shared-queue

Description

This command copies an existing **shared-queue** to another **shared-queue**. The **copy** command is a configuration level maintenance tool used to create new entries using an existing mapping policy name. If **overwrite** is not specified, an error occurs if the destination policy exists.

Parameters

src-name

Specifies the existing source **shared-queue**, up to 32 characters, from which the **copy** command attempts to copy.

dst-name

Specifies the destination **shared-queue**, up to 32 characters, to which the copy command attempts to copy.

overwrite

Use this parameter when the **shared-queue** *dst-name* already exists. If it does, everything in the existing destination **shared-queue** *dst-name* is completely overwritten with the contents of the **shared-queue** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI Destination "sqtest10" exists - use {overwrite}.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make” manner and therefore should be handled with care.

[Tree] (config>service>vprn>if shcv-policy-ipv6)

Full Context

configure service ies subscriber-interface group-interface shcv-policy-ipv6

configure service ies interface shcv-policy-ipv6

configure service vprn subscriber-interface group-interface shcv-policy-ipv6

configure service vprn interface shcv-policy-ipv6

Description

This command references the Subscriber Host Connectivity Verification (SHCV) policy to be used exclusive for IPv6 subscriber hosts. The policy name must already exist in the **config>subscr-mgmt** context.

The **no** form of this command removes the policy name from the service configuration.

Parameters

name

Specifies an existing SHCV policy name up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface shcv-policy-ipv6
- configure service vprn subscriber-interface group-interface shcv-policy-ipv6

All

- configure service vprn interface shcv-policy-ipv6
- configure service ies interface shcv-policy-ipv6

42.122 shell

shell

Syntax

shell [**-password** *password*] [**-token** *token*]

no shell

Context

[Tree] (environment shell)

Full Context

environment shell

Description

This command allows Nokia technical support to access the **shell** commands. The **shell** commands are used only by Nokia technical support for troubleshooting.

The **no** form of this command disables the **shell** commands.

Parameters

password

Specifies the password to access the **shell** commands, up to 256 characters.

token

Specifies the token to access the **shell** commands, up to 4096 characters.

Platforms

All

42.123 short-duration-flow-count

short-duration-flow-count

configure service vprn l2tp group tunnel mlppp short-sequence-numbers

configure service vprn l2tp group mlppp short-sequence-numbers

configure subscriber-mgmt ppp-policy mlppp short-sequence-numbers

Description

This command enables a peer request to send short sequence numbers. This command is applicable to LAC and LNS. By default, MLPPPoX negotiates 24bit long sequence numbers. This command allows this to be changed to shorter, 12-bit sequence numbers.

The **no** form of this command reverts to the default.

Syntax

[**no**] **shortcut-local-ttl-propagate**

Context

[Tree] (config>router>mpls shortcut-local-ttl-propagate)

[Tree] (config>router>ldp shortcut-local-ttl-propagate)

Full Context

configure router mpls shortcut-local-ttl-propagate

configure router ldp shortcut-local-ttl-propagate

Description

This command configures the TTL handling of locally generated packets for all LSP shortcuts originating on this ingress LER. It applies to all LDP or RSVP LSPs that are used to resolve static routes, BGP routes, and IGP routes.

The user can enable or disable the propagation of the TTL from the header of an IP packet into the header of the resulting MPLS packet independently for local and transit packets forwarded over an LSP shortcut.

Local IP packets include ICMP Ping, traceroute, and OAM packets, that are destined to a route that is resolved to the LSP shortcut. Transit IP packets are all IP packets received on any IES interface and destined to a route that is resolved to the LSP shortcut

By default, the feature propagates the TTL from the header of locally generated IP packets into the label stack of the resulting MPLS packets forwarded over the LSP shortcut. This is referred to as Uniform mode.

When the **no** form of this command is enabled, TTL propagation is disabled on all locally generated IP packets, including ICMP Ping, traceroute, and OAM packets, that are destined to a route that is resolved to the LSP shortcut. In this case, a TTL of 255 is programmed onto the pushed label stack. This is referred to as Pipe mode.

Context

[Tree] (config>router>bgp>next-hop-resolution shortcut-tunnel)

Full Context

configure router bgp next-hop-resolution shortcut-tunnel

Description

This command creates the context to configure the tunnel types that can be used to resolve unlabeled IPv4 and IPv6 BGP routes.

The following tunnel types are supported for resolving IPv4 routes and IPv6 routes with IPv4-mapped IPv6 next-hop addresses: bgp, ldp, rsvp, sr-isis, sr-ospf, sr-policy and sr-te. In this context:

- **bgp** — refers to IPv4 tunnels created by receiving BGP label-unicast IPv4 routes for /32 IPv4 prefixes.
- **ldp** — refers to /32 and shorter length LDP FEC prefixes imported into the tunnel table. For IPv4 NLRI, BGP selects the LDP FEC that is the longest-prefix-match (LPM) of the BGP next-hop address. For IPv6 NLRI, BGP selects the /32 FEC that is an exact match of the BGP next-hop address.
- **rsvp** — refers to RSVP tunnels in the tunnel table to IPv4 destinations. This option allows BGP to use the best metric RSVP LSP to the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface of the remote BGP router. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel id.
- **sr-ospf** — refers to SR tunnels (shortest path) to IPv4 destinations reachable by the OSPF protocol. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference OSPF instance. In case of a tie, the OSPF instance with the lowest metric SR tunnel is selected over the lowest numbered OSPF instance.
- **sr-ospf3** — refers to SR tunnels (shortest path) to IPv4 destinations reachable by the OSPFv3 protocol. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference OSPFv3 instance. In case of a tie, the OSPFv3 instance with the lowest metric SR tunnel is selected over the lowest numbered OSPFv3 instance.
- **sr-isis** — refers to SR tunnels (shortest path) to IPv4 destinations reachable by the IS-IS protocol. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference IS-IS instance. In case of a tie, the IS-IS instance with the lowest metric SR tunnel is selected over the lowest numbered IS-IS instance.
- **sr-policy** — refers to SR policies that are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73 or AFI 2/SAFI 73). BGP resolves an IPv4 route with an IPv4 next-hop address or an IPv6 route with IPv4-mapped IPv6 next-hop address using a SR policy selected by applying the following procedure in preference order:
  - **IPv4 endpoint**

    The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the SR policy.
  - **null IPv4 endpoint (0.0.0.0)**

    The highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.
  - **null IPv6 endpoint (0::0)**

    The highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- **sr-te** — refers to traffic engineered (TE) SR tunnels. This option allows BGP to use the best metric IPv4 SR-TE tunnel to the address of the BGP next hop. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID.
- **udp** — refers to MPLSoUDPoIPv4 tunnels set up by action of the BGP import policies.

The following tunnel types are supported for resolving IPv6 routes with IPv6 next-hops that are not IPv4-mapped IPv6 addresses: ldp, sr-isis, sr-ospf3, sr-te, and sr-policy. In this context:

- **ldp** — refers to /128 LDP FEC prefixes in the tunnel table. BGP selects the /128 FEC that is an exact match of the BGP next-hop address.
- **sr-isis** — refers to SR tunnels (shortest path) to IPv6 destinations reachable by the IS-IS protocol. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference IS-IS instance. In case of a tie, the IS-IS instance with the lowest metric SR tunnel is selected over the lowest numbered IS-IS instance.
- **sr-ospf3** — refers to SR tunnels (shortest path) to IPv6 destinations reachable by the OSPFv3 protocol. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference OSPFv3 instance. In case of a tie, the OSPFv3 instance with the lowest metric SR tunnel is selected over the lowest numbered OSPFv3 instance.
- **sr-te** — refers to traffic engineered (TE) SR tunnels. This option allows BGP to use the best metric IPv6 SR-TE tunnel to the address of the BGP next hop. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID.
- **sr-policy** — refers to SR policies that are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73 or AFI 2/SAFI 73). BGP resolves an IPv6 route with an IPv6 next hop that is not an IPv4-mapped IPv6 address using a SR policy selected by applying the following procedure in preference order:
  - **IPv6 endpoint**

    The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the IPv6 route must match the color of the SR policy.
  - **null IPv6 endpoint (0.::0)**

    The highest numbered color extended community attached to the IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.
  - **null IPv4 endpoint (0.0.0.0)**

    The highest numbered color extended community attached to the IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

admin certificate cmpv2 show-request

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command displays current the CMPv2 pending request toward the specified CA. If there is no pending request, the last pending request is displayed including the status (success/fail/rejected) and the receive time of last CMPv2 message from server.

The following information is included in the output:

- Request type, original input parameter (password is not displayed), checkAfter and reason in of last PollRepContent, time of original command input.

Parameters

ca-profile-name

Specifies a ca-profile name, up to 32 characters. If not specified, the system will display pending requests of all ca-profiles.

configure service vprn evpn-neighbor-synchronization shutdown

configure router evpn-neighbor-synchronization shutdown

Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

configure cflowd collector shutdown

Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command places the entity into an administratively enabled state.

Default

no shutdown

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>ies>sub-if>grp-if>ipoe-session shutdown)

[Tree] (config>service>vpls>sap>ipoe-session shutdown)

[Tree] (config>service>vprn>sub-if>grp-if>ipoe-session shutdown)

Full Context

configure service ies subscriber-interface group-interface ipoe-session shutdown

configure service vpls sap ipoe-session shutdown

configure service vprn subscriber-interface group-interface ipoe-session shutdown

Description

The **shutdown** command enables or disables IPoE session management on a group interface or capture SAP.

A **shutdown** of the IPoE session CLI hierarchy on a group-interface clears all active IPoE sessions on that interface, resulting in a deletion of all corresponding subscriber hosts.

On wlan-gw group interfaces it is not possible to disable an IPoE session.

The **no** form of this command reverts to the default.

Default

shutdown

no shutdown on wlan-gw group interfaces

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

configure service vprn subscriber-interface group-interface wpp shutdown

configure service vpls gsmp group shutdown

Description

The **shutdown** command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they can be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

Shutting down a subscriber interface on a 7750 SR will operationally shut down all child group interfaces and SAPs. Shutting down a group interface on a 7750 SR will operationally shut down all SAPs that are part of that group-interface.

The **no** form of this command puts an entity into the administratively enabled state.

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command places the entity into an administratively enabled state.

If the AS number was previously changed, the BGP AS number inherits the new value.

Context

[Tree] (config>python>py-policy>cache shutdown)

[Tree] (config>python>python-script shutdown)

Full Context

configure python python-policy cache shutdown

configure python python-script shutdown

Description

Shutting down a Python script triggers the system to load and compile the script from the configured location(s). Since the system supports three locations, the primary, secondary and tertiary, the system will try to load the Python script in that order.

Shutting down a Python script will disable the Python script and cause the corresponding packet to pass through without any modification.

The **no** form of this command enables the cache or policy script.

Context

[Tree] (config>subscr-mgmt>pfcp-association shutdown)

Full Context

configure subscriber-mgmt pfcp-association shutdown

Description

This command administratively enables or disables the PFCP association.

When administratively enabled, the system will try to maintain an active PFCP association with the configured peer. While no association is established, it will continue to retry setting up the association using the **association-setup-retry** configuration.

Shutting down a subscriber interface on a 7750 SR operationally shuts down all child group interfaces and SAPs. Shutting down a group interface on a 7750 SR operationally shuts down all SAPs that are part of that group interface.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>card>fp>egress>wred-queue-control shutdown)

Full Context

configure card fp egress wred-queue-control shutdown

Description

This command enables or disables egress WRED queue support on the forwarding plane. By default, WRED queue support is disabled (shutdown). While disabled, the various wred-queue-control commands may be executed on the forwarding plane and SAP egress QoS policies and egress queue group templates with wred-queue enabled may be applied to egress SAPs and port, respectively. The forwarding plane will allocate WRED pools to the WRED queues and the appropriate WRED mega-pool size and CBS reserve size will be calculated, but the WRED mega-pool will be empty and all buffers will be allocated to the default mega-pool. Each WRED queue will be mapped to its appropriate default pool.

Once the **no shutdown** command is executed, the calculated WRED mega-pool buffers will be moved from the default mega-pool to the WRED mega-pool. The WRED mega-pool CBS reserve size will be applied and each egress WRED queue will be moved from its default mega-pool buffer pool to its WRED pool within the WRED mega-pool hierarchy.

The **no** form of this command enables WRED queuing on an egress forwarding plane.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>port>ethernet>dot1x>macsec>sub-port shutdown)

Full Context

configure port ethernet dot1x macsec sub-port shutdown

Description

This command shuts down the MACsec under this sub-port specifically, including MKA negotiation. In the shutdown state, this port is not MACsec capable and all PDUs will be transmitted and expected without encryption and authentication.

The **no** form of this command puts the port in MACsec-enabled mode. A valid CA, different than any other CA configured on any other sub-port of this port and also a *max-peer* value larger than 0 must be configured. In MACsec-enabled mode, packets are sent in cleartext until the MKA session is up, and if the **rx-must-be-encrypted** is set on the port, all incoming packets with no MACsec encapsulations are dropped.

Context

[Tree] (config>service>vpls>proxy-arp shutdown)

[Tree] (config>service>vpls>proxy-nd shutdown)

Full Context

configure service vpls proxy-arp shutdown

configure service vpls proxy-nd shutdown

Description

This command enables and disables the proxy-ARP and proxy-nd functionality. ARP/GARP/ND messages will be snooped and redirected to the CPM for lookup in the proxy-ARP/proxy-ND table. The proxy-ARP/proxy-ND table is populated with IP->MAC pairs received from different sources (EVPN, static, dynamic). When the **shutdown** command is issued, it flushes the dynamic/EVPN dup proxy-ARP/proxy-ND table entries and instructs the system to stop snooping ARP/ND frames. All the static entries are kept in the table as *inactive*, regardless of their previous *Status*.

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted. For an LDP interface, the **shutdown** command exists under the main interface context and under each of the interface IPv4 and IPv6 contexts.

- **shutdown** under the **interface** context brings down both IPv4 and IPv6 Hello adjacencies and stops Hello transmission in both contexts.
- **shutdown** under the **interface** IPv4 or IPv6 contexts brings down the Hello adjacency and stops Hello transmission in that context only.

The user can also delete the entire IPv4 or IPv6 context under the interface with the **no ipv4** or **no ipv6** command which in addition to bringing down the Hello adjacency will delete the configuration.

The **no** form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the **shutdown** and **no shutdown** states are always indicated in system generated configuration files.

configure router pcep pcc shutdown

configure router pcep pce shutdown

Description

This command administratively disables the PCC or PCE process.

The following PCE parameters can only be modified when the PCEP session is shut down:

- **local-address**
- **keepalive**
- **dead-timer**

The **unknown-message-rate** PCE parameter can be modified without shutting down the PCEP session.

The following PCC parameters can only be modified when the PCEP session is shut down:

- **local-address**
- **keepalive**
- **dead-timer**
- **peer**

The following PCC parameters can be modified without shutting down the PCEP session:

- **report-path-constraints**
- **unknown-message-rate**

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>rsvp shutdown)

[Tree] (config>router>rsvp>interface shutdown)

Full Context

configure router rsvp shutdown

configure router rsvp interface shutdown

Description

This command disables the RSVP protocol instance or the RSVP-related functions for the interface. The RSVP configuration information associated with this interface is retained. When RSVP is administratively disabled, all the RSVP sessions are torn down. The existing configuration is retained.

The **no** form of this command administratively enables RSVP on the interface.

Default

shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Full Context

configure router mpls forwarding-policies forwarding-policy next-hop-group shutdown

Description

This command shuts down an NHG entry in a forwarding policy.

When an NHG is shut down, it is removed from the data path entry of the forwarding policy.

The **no** form of this command brings up an NHG entry in a forwarding policy.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>isa>aa-grp>overload-sub-quarantine shutdown)

Full Context

configure isa application-assurance-group overload-sub-quarantine shutdown

Description

This command disables the overload subscriber detection algorithm in the ISA group for the purpose of quarantining an overloaded subscriber. It is possible to manually quarantine an AA subscriber even when this command is disabled (**shutdown**).

The **no** form of this command enables the overload subscriber detection algorithm in the ISA group. When enabled, each ISA monitors the traffic on a continuous basis to identify AA subscribers that occupy more than their fair share of ISA resources and need to be quarantined.

Default

shutdown

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>nat>map-domain>mapping-rule shutdown)

Full Context

configure service nat map-domain mapping-rule shutdown

Description

This command enables or disables a rule within a MAP domain. A MAP rule can be enabled (**no shutdown**) only when all parameters within the rule are defined. Disabling a rule within an instantiated MAP domain will withdraw the rule IPv4 routes and disable forwarding for the rule.

Interactions:

config>service>vprn>nat>map>map-domain *domain-name*

config>service>router>nat>map>map-domain *domain-name*

Shutdown of an instantiated MAP rule disables the rule (the rule routes will be withdrawn and forwarding will be disabled).

Default

shutdown

configure test-oam twamp server shutdown

configure oam-pm session measurement-interval event-mon shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Entities are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the entity becomes administratively up and then tries to enter the operationally up state.

The **no** form of this command administratively enables the entity.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure test-oam twamp server prefix shutdown

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>twamp-light>reflector shutdown)

[Tree] (config>service>vprn>twamp-light>reflector shutdown)

Full Context

configure router twamp-light reflector shutdown

configure service vprn twamp-light reflector shutdown

Description

This command disables or enables TWAMP Light functionality within the context where the configuration exists, either the base router instance or the service. Enabling the base router context enables the IES prefix list since the IES service uses the configuration under the base router instance.

The **no** form of this command allows the router instance or the service to accept TWAMP Light packets for processing.

Default

shutdown

configure filter redirect-policy shutdown

configure filter redirect-policy destination shutdown

configure filter log summary shutdown

Description

Administratively enables/disabled (AdminUp/AdminDown) an entity. Downing an entity does not change, reset or remove any configuration settings or statistics. Many objects must be shutdown before they may be deleted.

The **shutdown** command administratively downs an entity. Administratively downing an entity changes the operational state of the entity to down.

Unlike other commands and parameters where the default state will not be indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

The **no** form of the command puts an entity into the administratively enabled state.

Default

no shutdown

Platforms

All

shutdown

Syntax

[**no**] **shutdown** [**active**] [**standby**]

[**no**] **shutdown** [*cflash-id*]

Context

[Tree] (file shutdown)

Full Context

file shutdown

Description

This command shuts down (unmounts) the specified CPM(s).

Use the **no shutdown** [**active**] [**standby**] command to enable one or both CPM.

Use the **no shutdown** [*cflash-id*] command to enable a compact flash (cf1:, cf2:, or cf3:) on the CPM/CCM. The **no shutdown** command can be issued for a specific slot when no compact flash is present. When a flash card is installed in the slot, the card will be activated upon detection.

In redundant systems, use the **no shutdown** command on cf3: on both SF/CPMs or CCMs in order to facilitate synchronization. See the **config>redundancy synchronize** command.

Note:
The **shutdown** command must be issued prior to removing a flash card. If no parameters are specified, then the drive referred to by the current working directory will be shut down.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

LED Status Indicators

Table 118: LED Status Indicators lists the possible states for the compact flash and their LED status indicators.

Table 118: LED Status Indicators

State	Description
Operational	If a compact flash is present in a drive and operational (no shutdown), the respective LED is lit green. The LED flickers when the compact flash is accessed. **Note:** Do not remove the compact flash during a read/write operation.
Flash defective	If a compact flash is defective, the respective LED blinks amber to reflect the error condition and a trap is raised.
Flash drive shut down	When the compact flash drive is shut down and a compact flash present, the LED is lit amber. In this state, the compact flash can be ejected.
No compact flash present, drive shut down	If no compact flash is present and the drive is shut down the LED is unlit.
No compact flash present, drive enabled	If no compact flash is present and the drive is not shut down the LED is unlit.
Ejecting a compact flash	The compact flash drive should be shut down before ejecting a compact flash card. The LED should turn to solid (not blinking) amber. This is the only mode to safely remove the flash card. If a compact flash drive is not shut down before a compact flash is ejected, the LED blinks amber for approximately 5 seconds before shutting off.

The **shutdown** or **no shutdown** state is not saved in the configuration file. Following a reboot all compact flash drives are in their default state.

Default

no shutdown

Parameters

cflash-id

Specifies the compact flash slot ID to be shut down or enabled. If *cflash-id* is specified, the drive is shut down or enabled. If no *cflash-id* is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, then the active CPM is assumed.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default the current compact flash device

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

active

Specifies that all drives on the active CPM are shutdown or enabled.

standby

Specifies that all drives on the standby CPM are shutdown or enabled.

When both **active** and **standby** keywords are specified, then all drives on both CPM are shutdown.

Platforms

All

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>satellite>eth-sat shutdown)

Full Context

configure system satellite eth-sat shutdown

Description

This command disables the associated satellite.

If the associated satellite is active, the satellite will not be reset but all satellite client ports will be shut down.

If the satellite is not active but attempts to associate with the host, the satellite chassis will be brought up according to the satellite configuration but all client ports will be shut down.

The **no** form of this command removes the shutdown state and all client ports on active satellites will be brought back up.

Default

shutdown

The **shutdown** command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. The operational state of the entity is disabled as well as the operational state of any entities contained within.

Many objects must be shut down before they may be deleted. Many entities must be explicitly enabled using the **no shutdown** command.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

The **no** form of this command puts an entity into the administratively enabled state.

configure router ripng group neighbor shutdown

configure router rip group shutdown

configure router ripng shutdown

configure router rip shutdown

Description

This command administratively disables an entity. Downing an entity does not change, reset or remove any configuration settings or statistics. Many objects must be shutdown before they may be deleted.

The **shutdown** command administratively downs an entity. Administratively downing an entity changes the operational state of the entity to down and the operational state of any entities contained within the administratively down entity.

Unlike other commands and parameters where the default state will not be indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

The **no** form of the command puts an entity into the administratively enabled state.

43 s Commands – Part III

43.1 sid

sid

Syntax

sid label *value*

Context

[Tree] (config>router>isis>segm-rtng>adjacency-set sid)

[Tree] (config>router>ospf>segm-rtng>adjacency-set sid)

Full Context

configure router isis segment-routing adjacency-set sid

configure router ospf segment-routing adjacency-set sid

Description

This command allows a static SID value to be assigned to an adjacency set in IS-IS or OSPF segment routing.

The **label** option specifies the value is assigned to an MPLS label.

The **no** form of this command removes the adjacency SID.

Parameters

label value

Specifies the value of adjacency SID label.

Values 18432 to 524287 | 1048575 (FP4 only)

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

43.2 sid-action

sid-action

Syntax

sid-action *action*

no sid-action

Context

[Tree] (config>router>p2mp-sr-tree>replication-segment>sr-mpls sid-action)

Full Context

configure router p2mp-sr-tree replication-segment segment-routing-mpls sid-action

Description

This command configures the SID action to take for the replication segment of the P2MP SR tree.

The **no** form of this command removes the SID action.

Default

no sid-action

Parameters

action

Specifies the name of the SID action.

Values **push** — Specifies that an outgoing SID list is pushed and forwarded on to the corresponding programmed outgoing interfaces.

pop — Specifies that on the leaf node the incoming SID is popped on the underlay packet forwarded to the host.

swap — Specifies, if an incoming SID is configured, that the SID is swapped with an outgoing SID or SID list and forwarded to the corresponding OIF.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

43.3 sid-allocation

sid-allocation

Syntax

sid-allocation {**sequential** | **random**}

no sid-allocation

Context

[Tree] (config>subscr-mgmt>ppp-policy sid-allocation)

Full Context

configure subscriber-mgmt ppp-policy sid-allocation

Description

This command configures the method for allocating the PPPoE session ID.

For both **sequential** and **random** options, the session ID range is 1 to 8191.

The **no** form of this command reverts to the default.

Default

sid-allocation sequential

Parameters

sequential

Specifies for PPPoE sessions with the same client MAC address and active on the same SAP, to allocate the session ID in sequential order starting with

ID = 1.

random

Specifies for PPPoE sessions with the same client MAC address and active on the same SAP, to allocate a unique session ID in random order.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

43.4 sid-length

sid-length

Syntax

sid-length *sid-length*

Context

[Tree] (conf>router>sr>srv6>micro-segment sid-length)

Full Context

configure router segment-routing segment-routing-v6 micro-segment sid-length

Description

This command configures the length of the micro-segments.

Default

sid-length 16

Parameters

sid-length

Specifies the length of micro-segments, in bits.

Values 16

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

43.5 sid-map

sid-map

Syntax

sid-map node-sid {**index** *value* [**range** *value*]} **prefix** {{*ip-address*/*mask*} | {*ip-address*} {*netmask*}} [**set-flags** {**s**}] [**level** { **1** | **2** | **1/2**}] [**clear-n-flag**]

no sid-map node-sid index *value*

Context

[Tree] (config>router>isis>segm-rtng>mapping-server sid-map)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router isis segment-routing mapping-server sid-map

Description

This command configures the Segment Routing mapping server database in IS-IS.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value can be entered. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. The user can enter the first prefix with a mask lower than 32 and the SID or label binding TLV is advertised, but the routers will not resolve these prefix SIDs and will generate a trap.

By setting the S-flag, the user can indicate to the IS-IS routers in the rest of the network that the flooding scope of the SID or label binding TLV is the entire domain. In that case, a router receiving the TLV advertisement should leak it between ISIS levels. If leaked from level 2 to level 1, the D-flag must be set and once set the TLV cannot be leaked back into level 2. Otherwise, the S-flag is clear by default and the TLV must not be leaked by routers that receive the mapping server advertisement.

Note that the SR OS does not leak this TLV between IS-IS instances and does not support the multi-topology SID/Label Binding TLV format.

In addition, the user can specify the mapping server own flooding scope for the generated SID or label binding TLV using the **level** option. This option allows the user to narrow the flooding scope configured under the router IS-IS level-capability for a one or more SID or label binding TLVs if required. The default flooding scope of the mapping server is Layer 1 or Layer 2, which can be narrowed by the value configured under the router IS-IS level-capability.

The A-flag and M-flag are not supported by the mapping server feature. The mapping client ignores the flags.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix or range of prefixes, a prefix-SID sub-TLV within a ISIS SID or label binding TLV in that instance. The flooding scope of the TLV from the mapping server is determined as explained above. No further check of the reachability of that prefix in the mapping server route table is performed. Additionally, no check is performed if the SID index is a duplicate of an existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Parameters

index

Specifies the node SID index for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

Values 0 to 4294967295

value

Specifies the node SID range for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

Values 0 to 65535

ip-address/mask

Specifies the IP address and mask.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values *ip-address:* **a.b.c.d.** (host bits must be 0)

mask: **0 to 32**

ip-address netmask

Specifies the IP address netmask.

Values **a.b.c.d.** (network bits all 1 and host bits all 0)

set-flags

Specifies the flooding scope of the SID/Label binding TLV.

Default **S-flag clear**

The TLV is not leaked by routers receiving the mapping server advertisement

level {1 | 2| 1/2}

Configures the mapping server own flooding scope for the generated SID/Label binding TLV.

Default 1/2

clear-n-flag

Specifies whether the node-sid flag (N-flag) should be cleared in a SID Label Binding TLV.

Platforms

All

sid-map

Syntax

sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*]

sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*] **scope** {**area** *area-id* | **as**}

no sid-map node-sid index *index-value*

Context

[Tree] (config>router>ospf>segm-rtng>mapping-server sid-map)

Full Context

configure router ospf segment-routing mapping-server sid-map

Description

This command configures the Segment Routing mapping server database in OSPF.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. If the user enters the first prefix with a mask lower than 32, the OSPF

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Extended Prefix Range TLV is advertised but a router which receives it will not resolve SID and instead originates a trap.

The user specifies the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV using the scope option. There is no default value. If the scope is a specific area, then the TLV is flooded only in that area.

An ABR that propagates an intra-area OSPF Extended Prefix Range TLV flooded by the mapping server in that area into other areas, sets the inter-area flag (IA-flag). The ABR also propagates the TLV if received with the inter-area flag set from other ABR nodes but only from the backbone to leaf areas and not vice-versa. However, if the exact same TLV is advertised as an intra-area TLV in a leaf area, the ABR will not flood the inter-area TLV into that leaf area.

Note: SR OS does not leak this TLV between OSPF instances.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix, or range of prefixes, a prefix-SID sub-TLV within a OSPF Extended Prefix Range TLV in that instance. The flooding scope of the TLV from the mapping server is determined as previously explained. No further check of the reachability of that prefix in the mapping server route table is performed and no check if the SID index is duplicate with some existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Default

no prefix-sid-range

Parameters

index index-value

Specifies the index.

Values 0 to 4294967295

range range-value

Specifies the range.

Values 1 to 65535

prefix ip-address/mask

Specifies the IP address in dotted decimal notation.

Values ip-address/mask:

- ip-address a.b.c.d (host bits must be 0)

mask: 0 to 132

netmask

Specifies the netmask.

Values netmask — a.b.c.d (network bits all 1 and host bits all 0)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

area area-id

Configures the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV.

Values ip-address | 0 to 4294967295

Platforms

All

43.6 sid-protection

sid-protection

Syntax

[**no**] **sid-protection**

Context

[Tree] (config>router>isis>interface sid-protection)

Full Context

configure router isis interface sid-protection

Description

This command enables or disables adjacency SID protection by LFA and remote LFA.

While LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternates** option in IS-IS or OSPF at the LER and LSR, there are applications where the user wants traffic to never divert from the strict hop computed by CSPF for a SR-TE LSP. In that case, the user can disable protection for all adjacency SIDs formed over a given network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

Default

sid-protection

43.7 signaling

signaling

Syntax

signaling *signaling*

Context

[Tree] (config>service>epipe>spoke-sdp-fec signaling)

Full Context

configure service epipe spoke-sdp-fec signaling

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables a user to configure this router as the active or passive T-PE for signaling this MS-PW, or to automatically select whether this T-PE is active or passive based on the prefix. In an active role, this endpoint initiates MS-PW signaling without waiting for a T-LDP label mapping message to arrive from the far end T-PE. In a passive role, it will wait for the initial label mapping message from the far end before sending a label mapping for this end of the PW. In auto mode, if the SAII has the greater prefix value, then the router will initiate MS-PW signaling without waiting for a label mapping message from the far end. However, if the TAII has the greater value prefix, then the router will assume that the far end T-PE will initiate MS-PW signaling and will wait for that label mapping message before responding with a T-LDP label mapping message for the MS-PW in the reverse direction.

The **no** form of this command means that the router T-PE automatically selects the which router will initiate MS-PW signaling based on the prefix values configured in the SAII and TAII of the spoke SDP, as previously described.

Default

signaling auto

Parameters

signaling

Configures this router as the active T-PE for signaling this MS-PW.

Values auto, master

Platforms

All

signaling

Syntax

signaling {**off** | **tldp** | **bgp**}

Context

[Tree] (config>service>sdp signaling)

Full Context

configure service sdp signaling

Description

This command specifies the signaling protocol used to obtain the ingress and egress pseudowire labels in frames transmitted and received on the SDP. When signaling is *off* then labels are manually configured when the SDP is bound to a service. The signaling value can only be changed while the administrative status of the SDP is down. Additionally, the signaling can only be changed on an SDP if that SDP is not in use by BGP-AD or BGP-VPLS. BGP signaling can only be enabled if that SDP does not already have pseudowires signaled over it.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note:
If the **tldp** option is selected as the mechanism for exchanging service labels over an MPLS or GRE SDP and the T-LDP session is automatically established, an explicit T-LDP session that is subsequently configured takes precedence over the automatic T-LDP session. However, if the explicit, manually-configured session is then removed, the system does not revert to the automatic session and the automatic session is also deleted. To address this, recreate the T-LDP session by disabling and re-enabling the SDP using the **shutdown** and **no shutdown** commands.

The **no** form of this command is not applicable. To modify the signaling configuration, the SDP must be administratively shut down and then the signaling parameter can be modified and re-enabled.

Default

signaling tldp

Parameters

off

Ingress and egress signal auto-labeling is not enabled. If this parameter is selected, then each service using the specified SDP must manually configure VPN labels. This configuration is independent of the SDP's transport type, GRE, MPLS (RSVP or LDP).

tldp

Ingress and egress pseudowire signaling using T-LDP is enabled. Default value used when BGP AD automatically instantiates the SDP.

bgp

Ingress and egress pseudowire signaling using BGP is enabled. Default value used when BGP VPLS automatically instantiates the SDP.

no significant-change

Context

[Tree] (config>log>acct-policy>cr significant-change)

Full Context

configure log accounting-policy custom-record significant-change

Description

This command configures the significant change required to generate the record. The custom record is only generated when the change in the reference counters equals or exceeds the configured (non-zero) significant change value. Only the reference counters for which there are corresponding counters configured under the related queues and policers are used for the significant change comparison. For reference queues and policers, the change applies to the sum of all configured reference queue and policer counters. When no reference counters are configured or **significant-change** is zero, the significant change reporting is not active.

Default

significant-change 0

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

delta

Specifies the delta change (significant change) that is required for the custom record to be written to the XML file.

Values 0 to 4294967295 (For custom-record-aa-sub only values 0 or 1 are supported.)

43.13 single-fiber

single-fiber

Syntax

[**no**] **single-fiber**

Context

[Tree] (config>port>ethernet single-fiber)

Full Context

configure port ethernet single-fiber

Description

This command enables packet gathering and redirection of IP packets from a single fiber (RX) port of the Ethernet and redistributes packets to other interfaces through either static routes or policy-based forwarding.

This parameter can be applied in conjunction with the strip-label command. If they are applied together, the port must have the single-fiber option configured before it can be associated with an interface that is configured with the strip-label option.

Once a port is configured with single-fiber, traffic will no longer be transmitted out of that port. This command can be used in conjunction with strip-label.

Default

no single-fiber

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context

[Tree] (config>service>vprn single-sfm-overload)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn single-sfm-overload

Description

This command configures OSPF, OSPFv3 and IS-IS to set overload when the router has fewer than the full set of SFMs functioning, which reduces forwarding capacity. Setting overload enables a router to still participate in exchanging routing information, but routes all traffic away from it.

The conditions to set overload are as follows:

- 7950 XRS-20, 7750 SR-12/SR-7, and 7450 ESS-12/ESS-7 platforms: if an SF/CPMs fails, the protocol will set the overload
- 7950-40 XRS and 7750 SR-12e platforms: if two SFMs fail (a connected pair on the XRS-40) the protocol will set the overload

The **no** form of this command configures the router to not set overload if an SFM fails.

Default

no single-sfm-overload

Parameters

holdoff-time

Specifies the delay between detecting SFM failures and setting overload.

Values 1 to 600 seconds

Default 0 seconds

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS, VSR

Full Context

configure redundancy bgp-multi-homing site-min-down-timer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the BGP multi-homing site minimum down time. When this value is set and the site goes operationally down, it remains operationally down for at least the length of time configured by this timer, regardless of whether other state changes might cause the site to go operationally up. This timer is restarted every time the site transitions from operationally up to down.

This timer is optimized in the following circumstances:

- If the site goes down on the DF but there are no BGP multi-homing peers with the same site in an up state, this timer is not used.
- If the site goes down on the DF but there are no active BGP multi-homing peers, this timer is not used.
- If this timer is active and a BGP multihoming update is received from the DF indicating its site is down, this timer is immediately terminated and the BGP multihoming algorithm is triggered to determine whether this PE should become the DF.

The **no** form of this command removes the value from the configuration.

Default

no site-min-down-timer

Parameters

seconds

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 1 to 100

Platforms

All

site-min-down-timer

Syntax

site-min-down-timer *min-down-time*

no site-min-down-timer

Context

[Tree] (config>service>vpls>site site-min-down-timer)

Full Context

configure service vpls site site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The above operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the **site-min-down-timer** is not started and is not used.
- If the s**ite-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to the default value.

Default

Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

Parameters

min-down-time

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 0 to 100 seconds

Platforms

All

site-min-down-timer

Syntax

site-min-down-timer *min-down-time*

no site-min-down-timer

Context

[Tree] (config>service>epipe>site site-min-down-timer)

configure qos fp-resource-policy aggregate-shapers queue-sets size

Description

This command configures the size and allocation weight for the specified queue set. The available queue sets are distributed based on the allocation weight between different queue sets.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

queue-set-size

Specifies the size of the queue sets.

Values 2 to 8

weight

Specifies the allocation weight of the queue set.

Values 0 to 100

Platforms

7750 SR-1, 7750 SR-s

size

Syntax

size *cache-size*

Context

[Tree] (config>app-assure>group>dns-ip-cache>ip-cache size)

Full Context

configure application-assurance group dns-ip-cache ip-cache size

Description

This command configures the maximum number of entries in the cache.

Default

size 10

Parameters

cache-size

Specifies the maximum number of IP addresses that can be stored in the cache.

Values 10 to 32000

Default 10

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

size

Syntax

size *url-list-size*

Context

[Tree] (config>app-assure>group>url-list size)

Full Context

configure application-assurance group url-list size

Description

This command specifies the size of the URL list that can be filtered. The size can be set to either standard or extended. Configuring the specified url-list as extended provides support for filtering on a larger number of URLs.

Default

size standard

Parameters

url-list-size

Specifies the size of the AA url-list for URL filtering.

Values standard, extended

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure saa test type-multi-line lsp-trace sr-policy size

configure saa test type-multi-line lsp-ping sr-policy size

Description

This command configures the MPLS echo request packet size.

The **no** form of this command reverts to the default value.

Default

size 1

Parameters

octets

Specifies the size in octets. The request payload is padded with zeros to the specified size.

Values 1 to 9786

Default 1

Platforms

All

size

Syntax

size *octets*

no size

Context

[Tree] (config>test-oam>icmp>ping-template size)

Full Context

configure test-oam icmp ping-template size

Description

This command configures the size of the Data field (in other words, padding) of the outgoing ICMP echo packet. Minimum packet sizes should be used to test connectivity. Larger packet size should only be used if there is a requirement to spot-check large packet size issues on a very limited number of tests and should not be used for normal connectivity testing. Packet sizes should never be configured to require fragmentation anywhere along the path. Exceeding these recommendations will negatively affect the scale and performance of icmp ping check testing.

The **no** form of this command reverts to the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

size 56

Parameters

octets

Specifies the size of the ICMP echo ping padding field, in octets.

Values 12 to 9786

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

43.43 slice-size

slice-size

Syntax

slice-size *slice-size*

no slice-size

Context

[Tree] (config>mirror>mirror-dest slice-size)

Full Context

configure mirror mirror-dest slice-size

Description

This command enables mirrored frame truncation and specifies the maximum size, in bytes, of a mirrored frame that can be transmitted to the mirror destination.

This command enables mirroring larger frames than the destination packet decode equipment can handle. It also allows conservation of mirroring resources by limiting the size of the packet stream through the router and the core network.

When defined, the mirror **slice-size** creates a threshold that truncates a mirrored frame to a specific size. For example, if the value of 256 bytes is defined, a frame larger than 256 bytes will only have the first 256 bytes transmitted to the mirror destination. The original frame is not affected by the truncation. The mirrored frame size may increase if encapsulation information is added during transmission through the network core or out the mirror destination SAP to the packet/protocol decode equipment.

The actual capability of the router to transmit a sliced or non-sliced frame is also dictated by the mirror destination SDP **path-mtu** or the mirror destination SAP physical MTU. Packets that require a larger MTU than the mirroring destination supports are discarded if the defined **slice-size** does not truncate the packet to an acceptable size.

Notes:

- When configuring IP mirroring, packet slice is rejected as an incorrect option as it will cause IP packets to be rejected by the next hop with an IP header verification error.
- Slice-size is not supported by CEM encap-types or IP-mirroring.

The **no** form of this command disables mirrored packet truncation.

Parameters

slice-size

Specifies the number of bytes to which mirrored frames are truncated, expressed as a decimal integer.

Values 128 to 9216

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure port access ingress pool slope-policy

configure port access egress pool slope-policy

configure port network egress pool slope-policy

Description

This command specifies an existing slope policy which defines high and low priority RED slope parameters and the time average factor. The policy is defined in the **config>qos>slope-policy** context.

Default

slope-policy default

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

name

Specifies the policy name, a string up to 32 characters.

Platforms

All

slope-policy

Syntax

slope-policy *slope-policy-name*

no slope-policy

Context

[Tree] (config>card>fp>egress>wred-queue-control slope-policy)

Full Context

configure card fp egress wred-queue-control slope-policy

Description

This command configures WRED slopes within the WRED mega-pool. The WRED slopes in the WRED mega-pool are used when WRED queues are requesting buffers from the mega-pool while they are over their CBS threshold. Once over the CBS threshold, the WRED queue stops receiving buffers from the CBS reserve in the mega-pool and starts competing for buffers in the shared portion of the mega-pool. If the packet resulting in the buffer request is inplus-profile, the packet will be associated with the highplus-slope. In-profile packets are associated with the high slope. Out-of-profile packets are associated with the low slope. Exceed-profile packets are associated with the exceed slope. While the queue is within its CBS threshold, the slopes are ignored.

Within the defined slope-policy, each slope is enabled or disabled (no shutdown or shutdown) and each slope's geometry is defined as percentages of shared portion depth. If a slope is shutdown, the related traffic uses the minimum of the queue MBS and egress WRED megapool size as a drop tail.

The slope-policy also defines the time average factor (TAF) value that is used to determine how the pool's weighted average depth is calculated. The higher the factor, the slower the average depth tracks the actual pool depth.

The **no** form of this command reverts to the default slope policy to the WRED mega-pool.

Default

slope-policy default

Parameters

slope-policy-name

Specifies which slope policy the system should apply to the WRED mega-pool. When slope-policy is not executed, the WRED mega-pool will use the default slope policy. The defined slope policy must already exist or the command will fail. 32 characters maximum.

slope-policy

Syntax

slope-policy *policy-name*

no slope-policy

Context

[Tree] (config>qos>hs-pool-policy>mid-tier>mid-pool slope-policy)

[Tree] (config>qos>hs-pool-policy>root-tier>root-pool slope-policy)

Full Context

configure qos hs-pool-policy mid-tier mid-pool slope-policy

configure qos hs-pool-policy root-tier root-pool slope-policy

Description

This command specifies the slope policy to be used to define the high, low, and exceed slopes within the pool. The slope (high, low, or exceed) used on the egress queue for the packet that generated the buffer request is also used in the mid-pool from the applied slope policy. The pool's current allocation amount is applied to the appropriate slope to derive the buffer rejection probability. The probability value is compared to a randomly-generated number. If the probability decision generates a rejection decision or the buffer pool has no remaining free buffers, the buffer request fails and the arriving packet is discarded. Otherwise, a buffer is allocated as long as the port-class and root-tier buffer pools also honor the buffer request.

The **no** form of the command restores the default slope policy to the associated pool.

Default

slope-policy _tmnx_hs_default

Parameters

policy-name

Specifies the slope policy associated with this pool, up to 32 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure qos hs-port-pool-policy std-port-class-pools class-pool slope-policy

configure qos hs-port-pool-policy alt-port-class-pools class-pool slope-policy

Description

This command specifies the slope policy that is used to define the high, low, and exceed slopes within the port-class pool. The slope used on the egress queue for the packet that generated the buffer request is also used in the class-pool. The pool's current allocation amount is applied to the appropriate slope to derive the buffer rejection probability. The probability value is compared to a randomly generated number. If the probability decision generates a rejection or the buffer pool has no remaining free buffers, the buffer request fails and the arriving packet is discarded. Otherwise, a buffer is allocated as long as the mid-tier and root-tier buffer pools also honor the buffer request.

The **no** form of the command restores the default slope policy to the associated class-pool.

Default

slope-policy _tmnx_hs_default

Parameters

policy-name

Specifies the policy name, up to 32 characters. This parameter is required when executing the **slope-policy** command and must refer to an existing slope policy within the system. If a slope policy with the specified name does not exist, the **slope-policy** command fails without modifying the slope behavior on the pool. A non-existent slope-policy error is generated. After a slope policy is associated with any HSQ queue or buffer pool, the policy cannot be deleted.

Context

[Tree] (config>qos>copy slope-policy)

Full Context

configure qos copy slope-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters

slope-policy

Indicates that the source policy ID and the destination policy ID are slope policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

```
ALA-7>config>qos# copy slope-policy default sp1
MINOR: CLI Destination "sp1" exists - use {overwrite}.
ALA-7>config>qos#overwrite
```

43.47 slow-queue-threshold

slow-queue-threshold

Syntax

slow-queue-threshold *kilobits-per-second*

no slow-queue-threshold

Context

[Tree] (config>card>virt-sched-adj slow-queue-threshold)

Full Context

configure card virtual-scheduler-adjustment slow-queue-threshold

Description

This command overrides the system default rate threshold where policers and queues are placed in the "slow" queue category. Slow rate policers and queues use a different minimum rate calculation interval time than fast rate queues. The rate is determined based on the previous calculated offered rate for the policer or queue.

The default slow policer or queue rate is 1 Mb/s. The fast rate is derived by multiplying the slow rate by a factor of 1.5 resulting in a default fast rate of 1.5 Mb/s. The slow-queue-threshold command uses a "Kilobit-Per-Second" value to modify the default slow queue rate threshold and indirectly changes the fast queue rate threshold.

The **no** form of this command restores the default slow queue and fast rate thresholds.

Default

no slow-queue-threshold

Parameters

kilobits-per-second

Specifies that the kilobit-per-second parameter is required and is used to modify the default slow rate threshold. Defining a value of 0 forces all policers and queues to be

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

treated as fast rate. Defining a value of 1000 (1 Mb/s) returns the threshold to the default value and is equivalent to executing **no slow-queue-threshold**.

The fast rate threshold is derived by multiplying the new slow rate threshold by a factor of 1.5.

Values 0 to 1000000 kb/s

Default 1000 kb/s

Full Context

configure service vprn log snmp-trap-group

Description

This command creates the context to configure a group of SNMP trap receivers and their operational parameters for a specific *log-id*.

A group specifies the types of SNMP traps and specifies the log ID that will receive the group of SNMP traps. The user must configure a trap group before SNMP traps can be sent.

To suppress the generation of all alarms and traps, see the **event-control** command. To suppress alarms and traps that are sent to this log-id, see the **filter** command. After alarms and traps are generated, they can be directed to one or more SNMP trap groups. Log events that can be forwarded as SNMP traps are always defined on the main event source.

The **no** form of this command deletes the SNMP trap group.

Parameters

log-id* | *log-name

Specifies the log ID or name (up to 32 characters).

Values *log-id*: 1 to 100

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

name *log-name*

Specifies an optional log name of a log configured in the **log-id** context, up to 32 characters, that can be used to refer to the log after it is created. Alarms and traps cannot be sent to the trap receivers until a valid *log-id* exists.

configure service vpls sap dhcp snoop

configure service vprn interface dhcp option snoop

configure service vpls mesh-sdp dhcp snoop

configure service vprn nw-if dhcp snoop

configure service vpls spoke-sdp dhcp snoop

Description

This command enables snooping of DHCP or DHCP6 messages on the SAP or SDP. Enabling DHCP or DHCP6 snooping on interfaces (SAPs and SDP bindings) is required where DHCP or DHCP6 messages important to lease state table population are received, or where Option 82 information is to be inserted. This includes interfaces that are in the path to receive messages from either DHCP or DHCP6 servers or from subscribers.

The **no** form of this command disables DHCP or DHCP6 snooping on the specified SAP or SDP binding.

Default

no snoop

Platforms

43.55 sntp

sntp

Syntax

[**no**] **sntp**

Context

[Tree] (config>system>time sntp)

Full Context

configure system time sntp

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates the context to edit the Simple Network Time Protocol (SNTP).

SNTP can be configured in either broadcast or unicast client mode. SNTP is a compact, client-only version of the NTP. SNTP can only receive the time from SNTP/NTP servers. It cannot be used to provide time services to other systems.

The system clock is automatically adjusted at system initialization time or when the protocol first starts up.

When the time differential between the SNTP/NTP server and the system is more than 2.5 seconds, the time on the system is gradually adjusted.

SNTP is created in an administratively enabled state (**no shutdown**).

The **no** form of the command removes the SNTP instance and configuration. SNTP does not need to be administratively disabled when removing the SNTP instance and configuration.

software-repository

Syntax

software-repository *repository-name* [**create**]

no software-repository *repository-name*

Context

[Tree] (config>system software-repository)

Full Context

configure system software-repository

Description

This command creates or deletes an instance of a software repository. The instance is identified by a repository name.

A software repository is used to obtain files to upgrade software on certain subsystems of the router (for example, Ethernet satellites).

Up to three locations can be specified within a software repository for the router to access files in the repository. The router will first attempt to access the file at the primary location. If the primary location is not configured or the files are not found at the primary location, then the router will attempt to access the files at the secondary location. If the secondary location is not configured or the files are not found at the secondary location, then the router will attempt to access the files at the tertiary location. If the tertiary location is not configured or the files are not found at the tertiary location, then the software repository access will fail.

The **no** form of the command removes the software repository.

Parameters

repository-name

Specifies a string, up to 32 characters, that uniquely identifies the software repository.

create

Specifies the keyword required when the software-repository context is first created. Once the context is created, it can be accessed without the **create** keyword.

configure service ies subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection solicit-delay

configure service vprn subscriber-interface ipv6 dhcp6 relay advertise-selection solicit-delay

Description

This command configures the default time to delay DHCPv6 Solicit messages. The delay is applied to all DHCPv6 Solicit messages for which no per DHCPv6 server or per client MAC delay or preference option value is configured.

The **no** form of this command removes the delay timeout.

Parameters

delay

Specifies the default amount of time to delay DHCPv6 Solicit messages, in deciseconds.

Values 1 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vpls spoke-sdp igmp-snooping static group source

Description

This command specifies a IPv4 or IPv6 unicast address that sends data on an interface. This enables a multicast receiver host to signal a router the group to receive multicast traffic from, and from the sources that the traffic is expected.

The **source** command is mutually exclusive with the specification of individual sources for the same group.

The **source** command in combination with the group is used to create a specific (S,G) static group entry.

Static (s,g) entries cannot be entered when a starg is already created.

Use the **no** form of this command to remove the source from the configuration.

Parameters

ip-address

Specifies the IPv4 unicast address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

src-ipv6-address

Specifies the IPv6 unicast address.

Platforms

All

source

Syntax

source *ip-address*

no source

Context

[Tree] (config>service>vprn>if>sap>ip-tunnel source)

[Tree] (config>service>ies>if>sap>ip-tunnel source)

Full Context

configure service vprn interface sap ip-tunnel source

configure service ies interface sap ip-tunnel source

Description

This command configures the source IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The IPv4 or IPv6 address must belong to the one of the IP subnets associated with the public SAP interface of the tunnel-group. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the source address contains an IPv6 address it must be a global unicast address.

The **no** form of this command deletes the source address from the tunnel configuration. The tunnel must be administratively shutdown before issuing the **no source** command.

Default

no source

Parameters

ip-address

Specifies an IPv4 address or an IPv6 address.

Values

ipv4-address	a.b.c.d	
ipv6-address		x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d

source

Syntax

[**no**] **source** *unicast-ip-prefix/mask*

Context

[Tree] (config>service>vprn>msdp source)

Full Context

configure service vprn msdp source

Description

This command limits the number of active source messages the router accepts from sources in the specified address range.

If the prefix and mask provided is already a configured then this command only provides the context to configure the parameters pertaining to this active source-message filter.

If the prefix and mask provided is not already a configured, then the source node instance must be created and the context to configure the parameters pertaining to this node should be provided. In this case, the $ prompt to indicate that a new entity (source) is being created should be used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The source active msdp messages are not rate limited based on the source address range.

The **no** form of this message removes the source active rate limiter for this source address range.

Parameters

unicast-ip-prefix

Specifies the IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area.

Values ip-prefix/mask: ip-prefix a.b.c.d (host bits must be 0)

mask

Specifies the subnet mask for the range expressed as a decimal integer mask length or in dotted decimal notation.

Values 0 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

[Tree] (config>oam-pm>session>ethernet source)

Full Context

configure oam-pm session ethernet source

Description

This command configures the source launch point identification Y.1731 parameters that are used by the individual tests within the session. If an MEP matching the configuration does not exist, the session is allowed to become active; however, the frames sent frames and received as seen under the **show oam-pm statistics session** command is zero. The preferred reference to the MEP launch point is by *admin-name*. Therefore, the syntax **source mep** *mep-id* **domain-name** *admin-name* **association-name** *admin-name* should be used.

The **no** form of this command removes this session parameter.

Parameters

mep-id

Specifies the maintenance association endpoint identifier of the launch point.

Values 1 to 8191

md-index

Specifies the maintenance domain (MD) index value of the launch point. The **domain-name** *admin-name* parameter is preferred for specifying the domain information.

Values 1 to 4294967295

ma-index

Specifies the maintenance association (MA) index value of the launch point. The **association-name** *ma-name* parameter is preferred for specifying the association information.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 4294967295

admin-name

Specifies the name reference for the maintenance domain (MD), or the association (MA) *admin-name* value of the launch point, up to 64 characters.

Platforms

All

source

Syntax

source *ip-address*

no source

Context

[Tree] (config>oam-pm>session>ip source)

Full Context

configure oam-pm session ip source

Description

This command defines the source IP address that the session controller (launch point) uses for the test. The source address must be a local resident IP address in the context; otherwise, the response packets are processed by the TWAMP Light application. Only source addresses configured as part of TWAMP tests can process the reflected TWAMP packets from the session reflector.

The **no** form of this command removes the source address parameters.

Parameters

source

Indicates the launch point.

ip-address

Specifies the source IP address that the session controller (launch point) uses for the test.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

source

Syntax

source {**line-ref** | **internal-clock**}

Context

[Tree] (config>system>sync-if-timing>bits>output source)

Full Context

configure system sync-if-timing bits output source

Description

This command configures the values used to identify the source of the BITS (Building Integrated Timing Supply) output. This is either the signal recovered directly from ref1, ref2 or ptp, or it is the output of the node's central clock. The directly recovered signal would be used when the BITS output signal is feeding into an external standalone timing distribution device (BITS/SASE). The specific directly recovered signal used is the best of the available signals based of the QL and/or the ref-order. The central clock output would be used when no BITS/SASE device is present and the BITS output signal is used to monitor the quality of the recovered clock within the system.

Default

source line-ref

Parameters

line-ref

Specifies that the BITS output timing is selected from one of the input references, without any filtering.

internal-clock

Specifies that the BITS output timing is driven from the system timing.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure router interface if-attribute delay dynamic twamp-light ipv4 source

Description

This command configures the unicast IPv4 address used as the source of the TWAMP Light test packet. When this command is not configured, the primary IPv4 address, or the reference IPv4 address in the case of unnumbered interfaces, is used as the source. This command can be used when the IPv4 primary address or reference interface is not the desired source address for the packet.

Changes are allowed without administratively disabling the IPv4 protocol.

The **no** form of this command removes the specified address, which causes the source address to be auto-learned.

Default

no source

Parameters

ip-address

Specifies TWAMP Light IPv4 source address.

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vprn subscriber-interface ipv6 dhcp6 relay source-address

Description

This command configures the source IPv6 address of the DHCPv6 relay messages.

The **no** form of this command reverts to the default.

Parameters

ipv6-address

Specifies the source IPv6 address of the DHCPv6 relay messages.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure subscriber-mgmt authentication-policy radius-authentication-server source-address

Description

This command configures the source address of the RADIUS packet.

The system IP address must be configured in order for the RADIUS client to work. See Configuring a System Interface in the Router Configuration Guide.

Note:
The system IP address must only be configured if the source-address is not specified. When the **no source-address** command is executed, the source address is determined at the moment the request is sent. This address is also used in the nas-ip-address attribute: over there it is set to the system IP address if **no source-address** was given.

The **no** form of this command reverts to the default value.

Default

System IP address

Parameters

ip-address

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-address

Syntax

source-address *ip-address* [**allow-connections**]

no source-address

Context

[Tree] (config>aaa>diam>node source-address)

Full Context

configure aaa diameter node source-address

Description

This command configures the IPv4 source address that the SR OS node uses for its peering connection.

The **no** form of this command removes the IP address from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no source-address

Parameters

ip-address

Specifies an IP prefix for the IP match criterion in dotted-decimal notation.

Values 0.0.0.0 **to** 255.255.255.255

allow-connections

Keyword used to accept inter-peering connection on the configured source IPv4 address. A listening TCP socket is opened on the Diameter node within the corresponding router context, IP address, and Diameter port. When this keyword is enabled, each Diameter node within the same routing context in SR must be configured with a unique IP address.

The peer initiating the connection must be an inter-chassis peer. Specifically, the Origin-Host in the CER message must match the locally configured peer identity.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure router ldp lsp-bfd source-address

Description

This command configures the source address of periodic LSP ping packets and BFD control packets for LSP BFD sessions that are associated with LDP prefixes in the prefix list. The system IP address is used by default. If the system IP address is not routable from the far-end node of the BFD session, then an alternate routable IP address that is local to the source node should be used.

Default

no source-address

Parameters

ip-address

Specifies a routable IPv4 or IPv6 address that is local to the node.

Values *ipv4-address* — a.b.c.d

ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

d: [0 to 255]D

Platforms

All

source-address

Syntax

source-address

Context

[Tree] (config>system>security source-address)

Full Context

configure system security source-address

Description

This command configures the IP source address that is used in all unsolicited packets sent by the application.

The configured source address applies only to packets transmitted in-band (for example, a network port on an IOM). Packets transmitted out-of-band on the management interface on the CPM Ethernet port use the address of the CPM Ethernet port as the IP source address in the packet.

When a source address is specified for the **ptp** application, the port-based 1588 hardware timestamping assist function will be applied to PTP packets matching the IPv4 address of the router interface used to ingress the SR/ESS or IP address specified in this command. If the IP address is removed, then the port-based 1588 hardware timestamping assist function will only be applied to PTP packets matching the IPv4 address of the router interface.

Full Context

configure router policy-options policy-statement entry from source-address

Description

This command specifies the source address that is embedded in the join or prune packet as a filter criterion.

The **no** form of this command removes the criterion from the configuration.

This command specifies a multicast data source address as a match criterion for this entry.

Default

no source-address

Parameters

ip-address

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

prefix-list-name

The prefix list name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Platforms

All

source-address

Syntax

source-address *ipv6-address*

no source-address

Context

[Tree] (config>router>segment-routing>srv6 source-address)

Full Context

configure router segment-routing segment-routing-v6 source-address

Description

This command configures the global default source IPv6 address used in the SA field of the outer IPv6 header of the SRv6 encapsulated packet. This value is inherited in the BGP and service contexts by default, but can be overwritten in each context. A maximum of 16 address values can be configured in all contexts in the system.

There is no default value for this command. A default source IPv6 address must be configured in this context or in the BGP or service context. The system does not check if the entered address is a valid local address.

The **no** form of this command removes the source IPv6 address from the configuration.

Parameters

ipv6-address

Specifies the source IPv6 address of the SRv6.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)

configure aaa isa-radius-policy servers source-address-range

Description

This command specifies the first IP address in the range of IPv4 addresses that are assigned to a BB-ISA in a given NAT group for NAT RADIUS accounting. The IP addresses are unique within the NAT group and are used to bind the RADIUS client instantiated on each BB-ISA card. The number of IPv4 addresses

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

allocated is equal to the number of BB-ISAs in a NAT group that are enabled for NAT RADIUS accounting. Although only the first IPv4 address is explicitly configured with this command, each internally allocated IPv4 address associated with the BB-ISA card can be seen in the routing table (via show commands) as /32 with protocol designation 'NAT'.

Default

no source-address-range

Parameters

start-ip-address

The starting IP address of the IP address range.

Values 0.0.0.0 - 255.255.255.255

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-bmac

Syntax

source-bmac *ieee-address*

no source-bmac

Context

[Tree] (config>service>pbb source-bmac)

Full Context

configure service pbb source-bmac

Description

This command configures the source B-VPLS MAC address to use with PBB and provisions a chassis level source B-MAC.

Parameters

ieee-address

The MAC address assigned to the B-MAC. The value should be input in either a xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

source-bmac

Syntax

source-bmac *ieee-address*

Context

[Tree] (config>service>vpls>pbb source-bmac)

Full Context

configure service vpls pbb source-bmac

Description

This command configures the base source B-MAC for the B-VPLS. The first 32 bits must be the same with what is configured in the MC-LAG peer. If not configured here, it will inherit the chassis level B-MAC configured under the new PBB object added in the previous section. If the **use-sap-bmac** command is on, the value of the last 16 bits (lsb) of the source B-MAC must be part of the **reserved-source-bmac-lsb** configured at chassis level, under service PBB component. If that is not the case, the command will fail.

Platforms

Context

[Tree] (config>service>system>bgp-evpn>eth-seg source-bmac-lsb)

Full Context

configure service system bgp-evpn ethernet-segment source-bmac-lsb

Description

This command configures the least significant two bytes of the B-MAC used as the source B-MAC for packets generated from the Ethernet-Segment in PBB-EVPN.

When the multi-homing mode is **all-active**, this value and the first high order four bytes must match on all the PEs that are part of the same Ethernet-Segment.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **es-bmac-table-size** parameter modifies the default value (8) for the maximum number of virtual bmacs that can be associated to the Ethernet-Segment, that is, the es-bmacs. When the **source-bmac-lsb** is configured, the associated **es-bmac-table-size** is reserved out of the total FDB. The es-bmac will consume a separate B-MAC per B-VPLS that is linked to an Ethernet-Segment.

Parameters

MAC-Lsb

Specifies the two least significant bytes of the es-bmac.

Values 1 to 65535, or xx-xx or xx:xx

size

Specifies the reserved space in the FDB for a specified es-bmac. By default the system reserves 8 entries for a specified Ethernet-Segment B-MAC.

Values 1 to 511999

Default 8

Platforms

[Tree] (config>service>sdp source-bmac-lsb)

Full Context

configure service sdp source-bmac-lsb

Description

This command defines the 16 least significant bits (lsb) which, when combined with the 32 most significant bits of the PBB **source-bmac**, are used as the virtual backbone MAC associated with this SDP. The virtual backbone MAC is used as the source backbone MAC for traffic received on a PBB EPIPE spoke-SDP with **use-sdp-bmac** configured (that is, a redundant pseudowire) and forwarded into the B-VPLS domain.

The control-pw-vc-id defines VC identifier of the spoke-SDP relating to the control pseudowire whose status is to be used to determine whether SPBM advertises this virtual backbone MAC. This is a mandatory parameter when the **source-bmac-lsb** is added or changed. The spoke SDP must have the parameter **use-sdp-bmac** for the control pseudowire to be active.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no source-bmac-lsb

Parameters

mac-lsb

Specifies the 16 least significant bits of the virtual backbone MAC associated with this SDP.

Values 1 to 65535 or xx-xx or xx:xx

control-pw-vc-id *vc-id*

Specifies the VC identifier of the control pseudowire.

Values 1 to 4294967295

Platforms

All

source-class

Syntax

source-class *source-index*

no source-class

Context

[Tree] (config>service>vprn>static-route-entry>follow source-class)

Full Context

configure service vprn static-route-entry follow source-class

Description

This command configures the source class for this static route. Packets matching this follow route are classified into the indicated source class.

The **no** form of this command removes the associated source class from the associated static route follow.

Default

no source-class

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

source-index

Specifies the destination index integer value.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

source-class

Syntax

source-class *source-index*

no source-class [*source-index*]

Context

[Tree] (config>service>vprn>static-route-entry>ipsec-tunnel source-class)

Full Context

configure service vprn static-route-entry indirect source-class

configure service vprn static-route-entry next-hop source-class

configure service vprn static-route-entry ipsec-tunnel source-class

Description

This command configures the policy accounting source-class index to be used when incrementing accounting statistic for traffic matching the associated static route.

If source route policy accounting is enabled and a source-class index is configured, traffic with a source IP address matches the associated static route, the source accounting statistics for the specified class will be incremented.

The **no** form of this command removes the associated destination-class from the associated static route nexthop.

Default

no source-class

Parameters

source-index

Specifies an integer value for the accounting source class index.

Values 1 to 255

Context

[Tree] (config>subscr-mgmt>shcv-policy>vpls source-mac)

Full Context

configure subscriber-mgmt shcv-policy vpls source-mac

Description

Specifies the MAC address to be used as source address for connectivity verification in a VPLS service.

The **no** form of this command reverts to the default.

Parameters

ieee-address

Specifies the 48-bit MAC address in the xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

43.74 source-override

source-override

Syntax

source-override *ip-address* [**create**]

no source-override *ip-address*

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel source-override)

Full Context

configure mcast-management multicast-info-policy bundle channel source-override

Description

This command defines a multicast channel parameter override context for a specific multicast sender within the channel range. The specified sender's IP address must be the same IP type, IPv4 or IPv6, as defined in the **channel** command.

The **no** form of this command removes the specified sender override context from the channel range.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-address

Specifies either an IPv4 or IPv6 address and must be the same IP type as the containing **channel** command range.

Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

create

The **create** keyword is required if creating a new source override when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the specified source override IP address already exists.

configure cflowd collector aggregation source-prefix

Description

This command configures cflowd aggregation based on source prefix information.

The **no** form of this command removes this type of aggregation from the collector configuration.

Platforms

All

source-prefix

Syntax

no source-prefix

source-prefix *ipv6-address/prefix-length*

Context

[Tree] (config>aaa>isa-radius-plcy>servers>ipv6 source-prefix)

Full Context

configure aaa isa-radius-policy servers ipv6 source-prefix

Description

This command configures an IPv6 prefix containing individual /128 addresses. These addresses are used as the source address for connections to IPv6 RADIUS servers.

The prefix must be large enough to accommodate all BB-ISAs or ESA VMs in the system.

The **no** form of this command removes the IPv6 prefix.

Default

no source-prefix

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ipv6-address/prefix-length

Specifies an IPv6 address and prefix length for the address.

Values

ipv6-prefix:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
prefix-length:	0 to 128

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-prefix

Syntax

source-prefix *ip-prefix/length* **nat-policy** *nat-policy-name*

no source-prefix *ip-prefix/length*

Context

[Tree] (config>router>nat>inside source-prefix)

[Tree] (config>service>vprn>nat>inside source-prefix)

Full Context

configure router nat inside source-prefix

configure service vprn nat inside source-prefix

Description

This command configures the source prefix used to identify traffic for NAT processing. After the traffic is diverted to the ESA-VM or vISA, its source IP address is checked to determine if it belongs to the configured prefix. If it does, the traffic is processed by NAT, otherwise, it is dropped.

The **no** form of this command removes the source prefix used to identify traffic for NAT processing.

Parameters

nat-policy-name

Specifies the NAT policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

43.77 source-prefix-list

source-prefix-list

Syntax

source-prefix-list *prefix-list-name*

no source-prefix-list

Context

[Tree] (config>router>nat>inside source-prefix-list)

[Tree] (config>service>vprn>nat>inside source-prefix-list)

Full Context

configure router nat inside source-prefix-list

configure service vprn nat inside source-prefix-list

Description

This command references the **nat-prefix-list** that contains source IP addresses on the inside (private side).

The source IP addresses on the inside must be known in advance in a **dnat-only** instance. This is required so the corresponding routes can be installed in the routing table and thus the downstream traffic is properly routed towards the MS-ISAs where the original translation was performed (and state is kept).

In the **dnat-only** case, it is mandatory that the inside (private side) and the outside (public side) are in separated VPRNs.

Parameters

prefix-list-name

Specifies the name, up to 32 characters in length, of the NAT prefix list that contains the source IP addresses (original IP addresses).

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

43.78 source-prefix-only

source-prefix-only

Syntax

[**no**] **source-prefix-only**

Context

[Tree] (config>router>nat>inside>traffic-identification source-prefix-only)

[Tree] (config>service>vprn>nat>inside>traffic-identification source-prefix-only)

Full Context

configure router nat inside traffic-identification source-prefix-only

configure service vprn nat inside traffic-identification source-prefix-only

Description

This command enables the identification of traffic that is subject to NAT processing based on the source IP address in the packet.

Traffic is diverted to the ESA-VM or vISA for NAT processing using a configured destination prefix or a IPv4 filter. When this command is configured, after traffic arrives on the ESA-VM or vISA, the source IP address in the packet determines whether the traffic is processed by NAT or dropped. If the source IP address belongs to the configured source-prefix, traffic is processed by NAT. Otherwise, it is discarded.

Use the following commands to configure the source prefix:

configure service vprn nat inside source-prefix

configure router nat inside source-prefix

If traffic identification based on the source IP address is disabled, all traffic arriving to the ESA-VM or vISA is subject to NAT processing.

The **no** form of this command disables the identification of traffic that is subject to NAT processing.

Default

no source-prefix-only

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

43.79 source-specific-mcac

source-specific-mcac

Syntax

[**no**] **source-specific-mcac**

Context

[Tree] (config>router>mcac>policy source-specific-mcac)

Full Context

configure router mcac policy source-specific-mcac

Description

This command specifies that both multicast group and multicast source are used for MCAC accounting. For example, if multiple, multicast joins are for the same multicast group but each are a different multicast source, the MCAC accounts for for each multicast group and source combination.

If the multicast source is configured as a subnet instead of an address, the MCAC automatically accounts for every source address within the subnet.

If the multicast source is not configured, the MCAC only accounts for the multicast groups and ignores the source address from the multicast joins. In other words, only one source is accounted for.

The **no** form of this specifies that only the multicast group is used for MCAC accounting. The multicast source address is not used for MCAC accounting. For example, if multiple, multicast joins are for the same multicast group but each with a different multicast source, the MCAC only accounts for the multicast group once.

Default

no source-specific-mcac

Platforms

All

source-specific-mcac

Syntax

source-specific-mcac {**true** | **false** | **use-policy-settings**}

43.82 source-vtep

source-vtep

Syntax

source-vtep *ip-address*

no source-vtep

Context

[Tree] (cfg>service>vprn>vxlan source-vtep)

Full Context

configure service vprn vxlan source-vtep

Description

This command enables the router to use the configured IPv4 address as the tunnel source IP address (source VTEP) when originating VXLAN-encapsulated packets for this VPRN service. This command does modify the next hop of the EVPN IFL routes advertised for the VPRN service.

When unconfigured, the system uses the IPv4 address as the VTEP source.

The **no** form of this command removes the IPv4 address as the source VTEP.

Default

no source-vtep

Parameters

ip-address

Specifies the source VTEP IP address.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

Platforms

7750 SR-1, 7750 SR-s

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

43.83 source-vtep-security

source-vtep-security

Syntax

[**no**] **source-vtep-security**

Context

[Tree] (config>service>vpls>vxlan source-vtep-security)

Full Context

configure service vpls vxlan source-vtep-security

Description

This command enables the outer IP Source Address lookup of incoming VXLAN packets, and discards those coming from untrusted VTEPs. The list of trusted VTEPs is shown in the **show service vxlan** command. Specifically, it shows the existing learned EVPN VTEPs (always trusted), and the statically configured VTEPs in any service (Epipe and VPLS).

The command is supported in VXLAN instances with static egress VTEPs or VXLAN instances with EVPN created VTEPs.

The **no** version of this command disables the outer IP source address lookup.

Default

no source-vtep-security

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-vtep-security

Syntax

Full Context

configure service vprn vxlan instance source-vtep-security

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the lookup of the source VXLAN Termination End Point (VTEP) on received VXLAN packets and discards packets coming from untrusted VTEPs.

The **no** form of this command disables the lookup.

Default

no source-vtep-security

Platforms

7750 SR-1, 7750 SR-s

43.84 sp-reverse-route

sp-reverse-route

Syntax

sp-reverse-route [**ignore-default-route**]

no sp-reverse-route

Context

[Tree] (config>ipsec>tnl-temp sp-reverse-route)

Full Context

configure ipsec tunnel-template sp-reverse-route

Description

This command enables the system to automatically create a reverse route based on dynamic LAN-to-LAN tunnel's TSi in private service.

If **ignore-default-route** is specified, the system ignores any full range traffic selector when creating a reverse route. Otherwise, the system refuses to create a CHILD_SA if any full range traffic selector is included in TSi.

The **no** form of this command disables sp-reverse-route.

Default

no sp-reverse-route

Parameters

ignore-default-route

Specifies to ignore any full range traffic selector in TSi.

Full Context

configure service vpls sap spb

configure service vpls spb

configure service vpls spoke-sdp spb

Description

This command enables Shortest Path Bridging (SPB) on a B-VPLS instance. SPB uses IS-IS that supports multiple instances, therefore an instance must be specified. The declaration of SPB in this context is the control configuration for the SPB. This is an SPB management interface and it manages the configuration for IS-IS. Various parameters that define this SPB instance are configured under this SPB instance. Several of the parameters are shared with other B-VPLS service instances using SPB.

SPB enables an instance of IS-IS protocol with the **no shutdown** command. Alternatively, the IS-IS protocol instance under SPB is disabled with the **shutdown** command in the **config>service>vpls b-vpls>spb** context.

A Forwarding Identifier (FID) is optionally specified which is an abstraction of the BVID used for forwarding in SPB. When no FID is configured the control VPLS is advertised with FID value 1. When a FID value is specified, the control VPLS is advertised and associated with the FID value specified. The default algorithm for any FID declared or implicit is low-path-id. When a FID is specified, the ect-algorithm can be specified for the FID and changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID for a control instance cannot be changed after it is created. To change a FID the SPB component would have to be shutdown, deleted and re-created with a new FID.

Note:
SPB operates with disable-learning, disable aging and discard-unknown. The state of these commands is ignored when SPB is configured.

Default

no spb

Parameters

isis-instance

Specifies the instance ID for an SPB IS-IS instance.

Values 1024 to 2047 (4 available)

Default 1024

FID

Specifies the FID value.

Values 1 to 4095

Default 1

spbm-control-vpls

Syntax

spbm-control-vpls *service-id* **fid** *fid*

no spbm-control-vpls

Context

[Tree] (config>service>vpls spbm-control-vpls)

Full Context

configure service vpls spbm-control-vpls

Description

This command associates a user B-VPLS with a particular control B-VPLS and a FID. The ECT algorithm and the behavior of unicast and multicast come from the association to the FID.

A Forwarding Identifier (FID) is specified which is an abstraction of the BVID used for forwarding in SPB. The ect-algorithm is associated with the FID and can be changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID must be independent from the FID assigned to other services.

Parameters

service-id

The B-VPLS service identifier.

Values 1 to 2147483647 | *svc-name*: 64 characters max

fid

The forwarding identifier.

Values 1 to 4095

43.88 spe-address

spe-address

Syntax

spe-address *global-id:prefix*

no spe-address

Context

[Tree] (config>service>pw-routing spe-address)

Full Context

configure service pw-routing spe-address

Description

This command configures a single S-PE Address for the node to be used for dynamic MS-PWs. This value is used for the pseudowire switching point TLV used in LDP signaling, and is the value used by pseudowire status signaling to indicate the PE that originates a pseudowire status message. Configuration of this parameter is mandatory to enable dynamic MS-PW support on a node.

If the S-PE Address is not configured, spoke-sdps that use dynamic MS-PWs and pw-routing local-prefixes cannot be configured on a T-PE. Furthermore, the node will send a label release for any label mappings received for FEC129 AII type 2.

The S-PE Address cannot be changed unless the dynamic ms-pw configuration is removed. Furthermore, changing the S-PE Address will also result in all dynamic MS-PWs for which this node is an S-PE being released. It is recommended that the S-PE Address should be configured for the life of an MS-PW configuration after reboot of the router.

The **no** form of this command removes the configured S-PE Address.

Default

no spe-address

Parameters

global-id

Specifies a 4-octet value that is unique to the service provider. For example, the global ID can contain the 2-octet or 4-octet value of the provider's Autonomous System Number (ASN).

Values

<global-id:prefix>:	<global-id>:{<prefix>| <ipaddress>}
global-id	1 to 4294967295
prefix	1 to 4294967295

Context

[Tree] (config>port>ethernet speed)

Full Context

configure port ethernet speed

Description

For ports that support multiple speeds, this command configures the port speed to be used. This applies to the following:

- fast Ethernet when autonegotiate is disabled
- 10/100/1000 Ethernet when autonegotiate is disabled
- 10/1G ports supporting 10G SFP+ or 1G SFP
- 40/100G ports supporting QSFP28s on non-connector-based MDAs

If the port is configured to autonegotiate this parameter is ignored. Speed cannot be configured for ports that are part of a Link Aggregation Group (LAG).

Default

dependent on port type

Parameters

10

Sets the link to 10 Mb/s speed.

100

Sets the link to 100 Mb/s speed.

1000

Sets the link to 1000 Mb/s speed.

43.92 spf-wait

spf-wait

Syntax

spf-wait *spf-wait* [**spf-initial-wait** *spf-initial-wait*] [**spf-second-wait** *spf-second-wait*]

no spf-wait

Context

[Tree] (config>service>vpls>spb>timers spf-wait)

Full Context

configure service vpls spb timers spf-wait

Description

This command defines the maximum interval between two consecutive SPF calculations in milliseconds. Timers that determine when to initiate the first, second, and subsequent SPF calculations after a topology change occurs can be controlled with this command.

Subsequent SPF runs (if required) occur at exponentially increasing intervals of the *spf-second-wait* interval. For example, if the *spf-second-wait* interval is 1000, the next SPF runs after 2000 milliseconds, and then the next SPF runs after 4000 milliseconds, and so on, until it reaches the *spf-wait* value. The SPF interval stays at *spf-wait* value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval drops back to *spf-initial-wait*.

Note: The IS-IS timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default

no spf-wait

Parameters

spf-wait

Specifies the maximum interval in milliseconds between two consecutive SPF calculations.

Values 10 to 120000

Default 10000

spf-initial-wait

Specifies the initial SPF calculation delay in milliseconds after a topology change.

Values 10 to 100000

Default 1000

no spi-range-index

Context

[Tree] (config>isa>tunnel-grp spi-range-index)

Full Context

configure isa tunnel-group spi-range-index

Description

This command configures the SPI range index value for the tunnel group. Each index value corresponds to a subrange of SPI values from the entire SPI space to allocate to the tunnel group.

This command must be configured with a unique value across all multichassis peering systems in following cases:

- A multichassis-enabled tunnel group contains ESA-VMs with weight.
- The **active-mda-number** configurations of a tunnel group are different on different peering systems.

See the *7450 ESS, 7750 SR, and VSR Multiservice ISA and ESA Guide* for more information.

The tunnel group must be shut down to modify the SPI range allocation.

The **no** form of this command removes the SPI range allocation for the tunnel group.

Default

no spi-range-index

Parameters

1..4

Specifies the SPI range index value.

Values 1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

Full Context

configure subscriber-mgmt local-user-db ipoe host identification-strings spi-sharing-group-id

configure subscriber-mgmt local-user-db ppp host identification-strings spi-sharing-group-id

Description

This command configures the SLA Profile Instance (SPI) sharing group identifier for an IPoE or PPPoE session. It overrides the default SPI sharing method (**def-instance-sharing**) configured in the SLA profile.

When an spi-sharing-group-id is configured, the IPoE or PPPoE session shares the SLA Profile Instance with other IPoE or PPPoE sessions from the same subscriber that: have the same SLA profile associated, are active on the same SAP, and have the same group identifier.

Configuring an **spi-sharing-group-id** *group-id* for an IPoE host, when the IPoE session is disabled on the group interface, results in a setup failure.

The **no** form of this command returns the SPI sharing group identifier to its default.

Parameters

group-id

Specifies the SPI group identifier.

Values 0 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn bgp split-horizon

configure service vprn bgp group split-horizon

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service vprn bgp group neighbor split-horizon

Description

This command enables the use of split-horizon. When applied globally, to a group, or a specific peer, split-horizon prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

The configuration default is **no split-horizon**, meaning that no effort is taken to prevent a best route from being reflected back to the sending peer.

Caution:
Use of the **split-horizon** command may have a detrimental impact on peer and route scaling and therefore operators are encouraged to use it only when absolutely needed.

The **no** form of this command disables split horizon command which allows the lower level to inherit the setting from an upper level.

configure service vprn ripng group neighbor split-horizon

Description

This command enables the use of split-horizon. RIP uses split horizon with poison reverse to protect from such problems as "counting to infinity". Split horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **no** form of this command disables the **split-horizon** command, which allows the lower level to inherit the setting from an upper level.

Default

split-horizon enable

Parameters

enable

Enables split horizon and poison reverse.

disable

Enables split horizon without poison reverse. This allows the routes to be readvertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular, if no value is set (**no split-horizon**), the lower level inherits the setting from the less-specific level.

configure router bgp group split-horizon

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the use of split-horizon. Split-horizon prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

The configuration default is **no split-horizon**, meaning that no effort is taken to prevent a best route from being reflected back to the sending peer.

Default

no split-horizon

Description

This command enables the use of split-horizon.

RIP uses split-horizon with poison-reverse to protect from such problems as "counting to infinity". Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **split-horizon disable** command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (**no split-horizon**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command disables split horizon command which allows the lower level to inherit the setting from an upper level.

Default

enabled

Parameters

enable

Specifies enable split horizon and poison reverse.

disable

Specifies disable split horizon allowing routes to be re-advertised on the same interface on which they were learned with the advertised metric incremented by the **metric-in** value.

Syntax

split-horizon-group [*group-name*] [**residential-group**] [**create**]

Context

[Tree] (config>service>vpls split-horizon-group)

Full Context

configure service vpls split-horizon-group

Description

This command creates a new split horizon group for the VPLS instance. Traffic arriving on a SAP or spoke-SDP within this split horizon group will not be copied to other SAPs or spoke-SDPs in the same split horizon group.

A split horizon group must be created before SAPs and spoke-SDPs can be assigned to the group.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The split horizon group is defined within the context of a single VPLS. The same group-name can be re-used in different VPLS instances.

Up to 30 split horizon groups can be defined per VPLS instance. Half are supported in i-VPLS.

The **no** form of this command removes the group name from the configuration.

Default

A split horizon group is by default not created as a residential-group.

Parameters

group-name

Specifies the name of the split horizon group to which the SDP belongs

residential-group

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

a) SAPs which are members of this Residential Split Horizon Group will have:

- Double-pass queuing at ingress as default setting (can be disabled)
- STP disabled (cannot be enabled)
- ARP reply agent enabled per default (can be disabled)
- MAC pinning enabled per default (can be disabled)
- Downstream broadcast packets are discarded thus also blocking the unknown, flooded traffic
- Downstream multicast packets are allowed when IGMP snooping is enabled

b) Spoke SDPs which are members of this Residential Split Horizon Group will have:

- Downstream multicast traffic supported
- Double-pass queuing is not applicable
- STP is disabled (can be enabled)
- ARP reply agent is not applicable (dhcp-lease-states are not supported on spoke-SDPs)
- MAC pinning enabled per default (can be disabled)

Full Context

configure service vpls bgp-evpn segment-routing-v6 split-horizon-group

configure service vpls bgp-evpn mpls split-horizon-group

Description

This command allows the user to configure an explicit split-horizon-group for all BGP-EVPN MPLS or SRv6 destinations that can be shared by other SAPs and/or spoke SDPs. The use of explicit split-horizon-groups for EVPN-MPLS or SRv6 and spoke SDPs allows the integration of VPLS and EVPN-MPLS or SRv6 networks.

If the **split-horizon-group** command for **bgp-evpn>mpls/srv6** contexts is not used, the default split-horizon-group (that contains all the EVPN destinations) is still used, but it is not possible to refer to it on SAPs/spoke SDPs. User-configured split-horizon-groups can be configured within the service context. The same group-name can be associated to SAPs, spoke SDPs, pw-templates, pw-template-bindings and EVPN-MPLS or SRv6 destinations. The configuration of **bgp-evpn>mpls/srv6> split-horizon-group** is only allowed if **bgp-evpn>mpls/srv6** is shutdown; no changes are allowed when **bgp-evpn>mpls/srv6** is **no shutdown**.

When the SAPs and/or spoke SDPs (manual or BGP-AD-discovered) are configured within the same **split-horizon-group** as the EVPN-MPLS or SRv6 endpoints, MAC addresses are still learned on them but they are not advertised in BGP-EVPN. If provider-tunnel is enabled in the bgp-evpn service, the SAPs and SDP bindings that share the same split-horizon-group of the EVPN-MPLS provider-tunnel are brought operationally down if the point-to-multipoint tunnel is operationally up.

split-horizon-group

Syntax

split-horizon-group *group-name*

no split-horizon-group

Context

[Tree] (config>service>pw-template split-horizon-group)

Full Context

configure service pw-template split-horizon-group

Description

This command creates a new split horizon group (SGH).

Comparing a "residential" SGH and a "regular" SHG is that a residential SHG:

- Has different defaults for the SAP or SDP that belong to this group (ARP reply agent enabled (SAP only), MAC pinning enabled). These can be disabled in the configuration.
- Does not allow enabling spanning tree (STP) on a SAP. It is allowed on an SDP.
- Does not allow for downstream broadcast (broadcast/unknown unicast) on a SAP. It is allowed on an SDP.
- On a SAP, downstream multicast is only allowed when IGMP is enabled (for which an MFIB state exists; only IP multicast); on a SDP, downstream mcast is allowed.

When the feature was initially introduced, residential SHGs were also using ingress shared queuing by default to increase SAP scaling.

A residential SAP (SAP that belongs to a RSHG) is used to scale the number of SAPs in a single VPLS instance. The limit depends on the hardware used and is higher for residential SAPs (where there is no need for egress multicast replication on residential SAPs) than for regular SAPs. Therefore, residential SAPs are useful in residential aggregation environments (for example, triple play networks) with a VLAN/subscriber model.

The **no** form of the command removes the group name from the configuration.

Parameters

group-name

Specifies the name of the split horizon group to which the SDP belongs.

residential-group

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

- SAPs which are members of this Residential Split Horizon Group will have:
  - Double-pass queuing at ingress as default setting (can be disabled)
  - STP disabled (cannot be enabled)
  - ARP reply agent enabled per default (can be disabled)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- MAC pinning enabled per default (can be disabled)
- Downstream Broadcast packets are discarded thus also blocking the unknown, flooded traffic
- Downstream Multicast packets are allowed when IGMP snooping is enabled

- Spoke SDPs which are members of this Residential Split Horizon Group will have:
  - Downstream multicast traffic supported
  - Double-pass queuing is not applicable
  - STP is disabled (can be enabled)
  - ARP reply agent is not applicable on the 7750 SR and 7450 ESS (dhcp-lease-states are not supported on spoke SDPs)
  - MAC pinning enabled per default (can be disabled)

Context

[Tree] (config>service>vpls spoke-sdp)

Full Context

configure service vpls spoke-sdp

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command binds a service to an existing service destination point (SDP).

A spoke SDP is treated like the equivalent of a traditional bridge port where flooded traffic received on the spoke SDP is replicated on all other ports (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPLS service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end 7450 ESS or 7750 SR devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. After the SDP binding is removed, no packets are forwarded to the far-end router.

Parameters

sdp-id

Specifies the SDP identifier.

Values 1 to 32767

vc-id

Specifies the virtual circuit identifier.

Values 1 to 4294967295

vc-type

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ether, vlan

ether

Defines the VC type as Ethernet. The **ethernet**, **vlan,** and **vpls** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding (hex 5).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vlan

Defines the VC type as VLAN. The **ethernet**, **vlan,** and **vpls** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. The VLAN VC-type requires at least one dot1Q tag within each encapsulated Ethernet packet transmitted to the far end.

group-name

Specifies the name of the split horizon group to which the SDP belongs.

leaf-ac

Specifies a SDP as a leaf access (AC) SDP. The default E-Tree SAP type is root AC if **leaf-ac** (or **root-leaf-tag**) is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

create

Keyword used to create the spoke SDP. The create keyword requirement can be enabled or disabled in the **environment>create** context.

endpoint

Specifies the service endpoint to which this SDP bind is attached. The service ID of the SDP binding must match the service ID of the service endpoint.

no endpoint

Removes the association of a spoke-SDP with an explicit endpoint name.

root-leaf-tag

Specifies a tagging spoke-SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this SDP binding is a tag SDP that will use a default VID tag of 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

leaf-ac

Specifies an access (AC) spoke-SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP binding type is a root-ac if *leaf-ac* or *root-leaf-tag* is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

Description

This command binds a service to an existing service destination point (SDP).

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **configure service sdp** context in order to associate an SDP with an IES service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

Class-based forwarding is not supported on a spoke SDP used for termination on an IES or VPRN services. All packets are forwarded over the default LSP.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router. The spoke SDP must be shut down first before it can be deleted from the configuration.

Default

no spoke-sdp

Parameters

sdp-id

Specifies the SDP identifier. Allowed values are integers in the range of 1 and 17407 for existing SDPs.

vc-id

Specifies the virtual circuit identifier.

Values 1 to 4294967295

vc-type

Specifies the encapsulation and pseudowire type for the spoke SDP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values ether: specifies Ethernet pseudowire as the type of virtual circuit (VC) associated with the SDP binding

ipipe: specifies Ipipe pseudowire as the type of virtual circuit (VC) associated with the SDP binding

Default ether

create

Keyword used to create the spoke SDP. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Context

[Tree] (config>service>epipe spoke-sdp)

Full Context

configure service epipe spoke-sdp

Description

This command binds a service to an existing SDP. A spoke SDP is equivalent to a traditional bridge "port", where flooded traffic received on the spoke SDP is replicated on all other "ports" (including other spoke and mesh SDPs or SAPs), and not transmitted on the port on which it was received.

The SDP has an operational state that determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

To associate an SDP with an Epipe, VPLS, VPRN, or VPRN service, the SDP must be predefined in the **configure service sdp** context. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* exists, a binding between that *sdp-id* and the service is created.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

SDPs must be explicitly associated with and bound to a service; otherwise, no far-end devices can participate in the service.

This command can also be used to associate a GRE tunnel carrying Ethernet payload with an Epipe and terminate it on a PW port referenced within the same Epipe service. The spoke SDP represents a L2oGRE tunnel with SDP delivery type set to **eth-gre-bridged**. With this configuration, the **vc-id** is unused since there is no multiplexing of Ethernet payload within the same tunnel. The **vc-id** value is included only to maintain the expected spoke SDP structure within an Epipe service. For L2oGRE tunnels, the **vc-id** can be set to any arbitrary value within its configurable range.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected. After it is removed, no packets are forwarded to the far-end router.

Default

No *sdp-id* is bound to a service.

Parameters

sdp-id

The SDP identifier.

Values 1 to 17407

vc-id

Specifies the virtual circuit identifier. The VC-ID is not used with L2TPv3 SDPs or L2oGRE tunnels, however, it must be configured.

Values 1 to 4294967295

vc-type

Keyword that specifies the VC type, which overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value that represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the **dot1q** value expected by the far-end provider equipment. A change of the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ethernet

ether

Keyword used to specify the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. If the VC type is not defined, the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type**; it restores the default VC type for the spoke SDP binding.

vlan

Keyword used to specify the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a VLAN tag is inserted

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined, the default is Ethernet for spoke SDP bindings.

The VLAN VC-type requires at least one dot1q tag within each encapsulated Ethernet packet transmitted to the far end.

Note: The system expects a symmetrical configuration with its peer. Specifically, it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions may not function for asymmetrical configurations as they would for symmetrical configurations, resulting in unexpected behavior.

no-endpoint

Keyword used to remove the association of a spoke SDP with an explicit endpoint name.

endpoint-name

Specifies the name of the service endpoint.

icb

Keyword used to specify the spoke SDP as an inter-chassis backup SDP binding.

Context

[Tree] (config>service>ies>aarp-interface spoke-sdp)

Full Context

configure service ies aarp-interface spoke-sdp

Description

This command binds a service to an existing SDP. A spoke SDP is treated like the equivalent of a traditional bridge port where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Default

no spoke-sdp

Parameters

sdp-id

Specifies the SDP identifier.

Values 1 to 17407

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vc-id

Specifies the virtual circuit identifier. The VC-ID is not used with L2TPv3 SDPs, however it must be configured.

Values 1 to 4294967295

create

Keyword used to create the spoke SDP.

Context

[Tree] (config>mirror>mirror-dest>remote-source spoke-sdp)

[Tree] (config>mirror>mirror-dest spoke-sdp)

Full Context

configure mirror mirror-dest remote-source spoke-sdp

configure mirror mirror-dest spoke-sdp

Description

This command binds an existing (mirror) service distribution path (SDP) to the mirror destination service ID.

Spoke SDPs are used to send and receive mirrored traffic between mirror source and destination routers in a remote mirroring solution. A spoke SDP configured in the remote-source context (**remote-src>spoke-sdp**) is used on the destination router. A spoke SDP configured in the mirror service context (**mirror-dest>spoke-sdp**) is used on the source router.

The destination node should be configured with **remote-src>spoke-sdp** entries when using L2TPv3, MPLS-TP or LDP IPv6 LSP SDPs in the remote mirroring solution. For all other types of SDPs, r**emote-source>far-end** entries should be used.

Spoke SDPs are not applicable when routable LI encapsulation is employed (mirror-dest>encap).

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The **no** form of this command removes the SDP binding from the mirror destination service.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

An SDP ID is bound to a mirror destination service ID. If no SDP is bound to the service, the mirror destination will be local and cannot be sent to another router over the core network.

Parameters

sdp-id:vc-id

Specifies a locally unique SDP identification (ID) number. The SDP ID must exist. If the SDP ID does not exist, an error will occur and the command will not execute.

For mirror services, the *vc-id* defaults to the *service-id*. However, there are scenarios where the *vc-id* is being used by another service. In this case, the SDP binding cannot be created. So, to avoid this, the mirror service SDP bindings now accepts *vc-ids*.

Values 1 to 17407

no-endpoint

Removes the association of a SAP or a SDP with an explicit endpoint name.

name

Specifies the name of the endpoint associated with the SAP.

icb

Indicates that the SDP is of type Inter-Chassis Backup (ICB). This is a special pseudowire used for MC-LAG and pseudowire redundancy application.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. The ICB SDP cannot be added to the endpoint if the SAP is not part of a MC-LAG instance. This means that all other SAP types cannot exist on the same endpoint as an ICB SDP since non Ethernet SAP cannot be part of a MC-LAG instance. Conversely, a SAP which is not part of a MC-LAG instance cannot be added to an endpoint which already has an ICB SDP.

An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

Default Null. The user should explicitly configure this option at create time. The user can remove the ICB type simply by retyping the SDP configuration without the **icb** keyword.

Context

[Tree] (config>service>epipe spoke-sdp-fec)

Full Context

configure service epipe spoke-sdp-fec

Description

This command binds a service to an existing service destination point (SDP), using a dynamic MS-PW.

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

When using dynamic MS-PWs, the particular SDP to bind-to is automatically selected based on the Target Attachment Individual Identifier (TAII) and the path to use, specified under spoke SDP FEC. The selected SDP will terminate on the first hop S-PE of the MS-PW. Therefore, an SDP must already be defined in the config>service>sdp context that reaches the first hop router of the MS-PW. The router will in order to associate an SDP with a service. If an SDP to that is not already configured, an error message is generated. If the sdp-id does exist, a binding between that sdp-id and the service is created.

It differs from the spoke-sdp command in that the spoke-sdp command creates a spoke SDP binding that uses a pseudowire with the PW ID FEC. However, the spoke-sdp-fec command enables pseudowires with other FEC types to be used. Only the Generalized ID FEC (FEC129) may be specified using this command.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Parameters

spoke-sdp-fec-id

An unsigned integer value identifying the spoke SDP.

Values 1 to 4294967295

fec-type

An unsigned integer value for the type of the FEC used by the MS-PW.

Values 129 to 130

aii-type

An unsigned integer value for the Attachment Individual Identifier (AII) type used to identify the MS-PW endpoints.

Values 1 to 2

endpoint-name

Specifies the name of the service endpoint.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no endpoint

Adds or removes a spoke SDP association.

icb

Configures the spoke SDP as an inter-chassis backup SDP binding.

Full Context

configure service vprn pim spt-switchover-threshold

Description

This command configures a shortest path tree (SPT tree) switchover threshold for a group prefix.

Parameters

grp-ip-address

Specifies the multicast group address.

grp-ipv6-address

Specifies the multicast group address.

prefix-length

Specifies the address prefix length.

Values

grp-ipv6-address	: x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x [0 to FFFF]H

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

d [0 to 255]D

prefix-length [1 to 128]

mask

Defines the mask of the multicast-ip-address.

Values 4 to 32

netmask

The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

spt-threshold

Specifies the configured threshold in kilobits per second (kb/s) for the group to which this (S,G) belongs. For a group G configured with a threshold, switchover to SPT for an (S,G) is attempted only if the (S,G)'s rate exceeds this configured threshold.

Platforms

All

spt-switchover-threshold

Syntax

Context

[Tree] (config>router>pim spt-switchover-threshold)

Full Context

configure router pim spt-switchover-threshold

Description

This command configures shortest path (SPT) tree switchover thresholds for group prefixes.

PIM-SM routers with directly connected routers receive multicast traffic initially on a shared tree rooted at the Rendezvous Point (RP). Once the traffic arrives on the shared tree and the source of the traffic is known, a switchover to the SPT tree rooted at the source is attempted.

For a group that falls in the range of a prefix configured in the table, the corresponding threshold value determines when the router should switch over from the shared tree to the source specific tree. The switchover is attempted only if the traffic rate on the shared tree for the group exceeds the configured threshold.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

In the absence of any matching prefix in the table, the default behavior is to switchover when the first packet is seen. In the presence of multiple prefixes matching a given group, the most specific entry is used.

The **no** form of this command removes the parameters from the PIM configuration.

Parameters

grp-ipv4-prefix

Specifies the group IPv4 multicast address in dotted decimal notation.

Values a.b.c.d

ipv4-prefix-length

Specifies the length of the IPv4 prefix.

Values 4 to 32

netmask

Specifies the netmask associated with the IPv4 prefix, expressed in dotted decimal notation. Network bits must be 1, and host bits must be 0.

Values a.b.c.d

grp-ipv6-prefix

Specifies the group IPv6 multicast address in hexadecimal notation.

Values xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

xx — 0 to FF (hex)

ipv6-prefix-length

Specifies the length of the IPv6 prefix.

Values 8 to 128

spt-threshold

Specifies the configured threshold in kilobits per second (kb/s) for a group prefix. A switchover is attempted only if the traffic rate on the shared tree for the group exceeds this configured threshold. When the **infinity** keyword is specified, no switchover will occur at any time, regardless of the traffic level is detected.

Values 1 to 4294967294, infinity

configure service vpls mesh-sdp eth-cfm squelch-ingress-ctag-levels

configure service epipe spoke-sdp eth-cfm squelch-ingress-ctag-levels

configure service epipe sap eth-cfm squelch-ingress-ctag-levels

Description

This command defines the levels of the ETH-CFM packets that are silently discarded on ingress into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding plus an additional VLAN, up to a maximum tag length of two tags. All ETH-CFM packets inbound to the SAP or SDP binding that match the configured levels are dropped without regard for any other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option. The list of levels must be a complete contiguous list from 0 up to the highest level to be dropped. The command must be retyped in complete form to modify a previous configuration, if the operator does not want to delete it first. Entering the command without any valid level information removes the command from the configuration and disables the feature.

The **no** form of this command removes the silent discarding of previously matching ETH-CFM PDUs.

configure service vpls bgp-evpn mpls auto-bind-tunnel resolution-filter sr-isis

Description

This command selects the SR tunnel type programed by an IS-IS instance in TTM.

When the **sr-isis**, **sr-ospf**, or **sr-ospf3** command is enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the OSPF, OSPFv3, or IS-IS instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

The **no** form of this command disables the SR-ISIS setting for the auto-bind tunnel.

Description

This command selects the SR tunnel type programmed by an IS-IS instance in TTM for next-hop resolution of BGP routes and labeled routes. This option allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference IS-IS instance. In the case of a tie, the IS-IS instance with the lowest metric SR tunnel is selected over the lowest numbered IS-IS instance.

The **no** form of this command disables the use of SR-ISIS tunnel type to resolve the next hop of BGP routes and labeled routes.

sr-isis

Syntax

[**no**] **sr-isis**

Context

[Tree] (config>oam-pm>session>ip>tunnel>mpls sr-isis)

Full Context

configure oam-pm session ip tunnel mpls sr-isis

Description

This command configures the specification of **sr-isis** specific tunnel information that is used to transport the test packets. Entering this context removes all other tunnel type options configured under the **configure oam-pm session ip tunnel mpls** context. Only a single **mpls** type can be configured for an OAM-PM session.

The **no** form of this command deletes the context and all configurations under it.

Parameters

ipv4-address

Specifies IPv4 address.

Values ipv4-address: a.b.c.d (host bits must be 0)

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure router policy-options policy-statement entry action sr-label-index

configure router policy-options policy-statement default-action sr-label-index

Description

This command associates a BGP segment-routing label index value with all /32 BGP labeled IPv4 routes matching the entry or policy **default-action**.

Note:
Avoid using this action in a policy entry that matches more than one /32 label-ipv4 route, otherwise SID conflicts are created.

The **sr-label-index** action only takes effect in BGP peer import policies (and only on received /32 label-ipv4 routes) and in route-table-import policies associated with the label-ipv4 RIB.

The **prefer-igp** applies only in a route-table-import policy. If **prefer-igp** is specified and BGP segment-routing uses **prefix-sid-range global**, then BGP tries, as a first priority, to use the IGP segment routing label index for the IGP route matched by the **route-table-import** policy. If the IGP route does not have an SID index, or **prefer-igp** is not configured or **prefix-sid-range** is not **global**, BGP tries to use the label index value specified by this command.

When this action occurs in a policy applied as a peer-import policy, it can add a prefix SID attribute to a received /32 label-ipv4 route that was not sent with this attribute, or it can replace the received prefix SID attribute with a new one.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If this command specifies an index value that causes a SID conflict with another BGP route, then all conflicting BGP routes are re-advertised with label values based on dynamic allocation rather than SID-based allocation.

If this command specifies an index value that causes a SID conflict with an IGP route, the BGP route is re-advertised with a label value based on dynamic allocation rather than an SID-based allocation.

The **no** form of this command causes matched BGP routes to be advertised without any new or changed prefix SID attributes.

Default

no sr-label-index

Parameters

value

Specifies the BGP segment routing label index to associate with the matched route or routes.

Values 0 to 52487

param-name

Specifies the **type** parameter variable name, up to 32 characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

prefer-igp

A keyword that is applicable only in **route-table-import** policies, to instruct BGP to borrow the SID index from the IGP route if it has an SID index and the **prefix-sid-range** is **global**.

Description

This command configures the range of the Segment Routing Global Block (SRGB). It is a label block which is used for assigning labels to segment routing prefix SIDs originated by this router. This range is carved from the system dynamic label range and is not instantiated by default.

This is a reserved label and once configured it cannot be used by other protocols such as RSVP, LDP, and BGP to assign a label dynamically.

Default

no sr-labels

Parameters

start-value

Specifies the start label value in the SRGB

Values 18432 to 524287 | 1048575 (FP4 or FP5 only)

The label value is selectable within the dynamic label range which begins anywhere from 32 to 18432 (default).

end-value

Specifies the end label value in the SRGB

Values 18432 to 524287 | 1048575 (FP4 or FP5 only)

The label value is selectable within the dynamic label range which begins anywhere from 32 to 18432 (default).

Syntax

sr-mpls-local {**none** | **all**}

Context

[Tree] (config>router>ttl-propagate sr-mpls-local)

Full Context

configure router ttl-propagate sr-mpls-local

Description

This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy.

This command configures TTL or hop-limit propagation for CPM originated IP packets. Use the **sr-mpls-transit** command to configure TTL or hop-limit propagation for transit IP packets.

Default

sr-mpls-local all

Parameters

none

Keyword to specify that the IP TTL or hop limit is not propagated into the segment routing transport label stack.

all

Keyword to specify that the IP TTL or hop limit is propagated to all labels in the segment routing transport label stack.

sr-mpls-transit

Syntax

sr-mpls-transit {**none** | **all**}

Context

[Tree] (config>router>ttl-propagate sr-mpls-transit)

Full Context

configure router ttl-propagate sr-mpls-transit

Description

This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy.

This command configures TTL or hop-limit propagation for transit IP packets. Transit IP packets are packets of base router prefixes received on an access interface or a network interface (with or without tunnel encapsulation) and whose FIB lookup results in forwarding them over an SR-MPLS tunnel. Use the **sr-mpls-local** command to configure TTL or hop-limit propagation for CPM originated IP packets.

Default

sr-mpls-transit all

Parameters

none

Keyword to specify that the IP TTL or hop limit is not propagated into the segment routing transport label stack.

all

Keyword to specify that the IP TTL or hop limit is propagated to all labels in the segment routing transport label stack.

configure router bgp next-hop-resolution shortcut-tunnel family resolution-filter sr-policy

Description

This command enables the use of SR policies to resolve the next hop of BGP routes.

The SR policies are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73 or AFI 2/SAFI 73). BGP resolves an IPv4 route with an IPv4 next-hop address or an IPv6 route with IPv4-mapped IPv6 next-hop address using an SR policy selected by applying the following procedure in preference order:

- **IPv4 endpoint**

  The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the labeled IPv4 or IPv6 route must match the color of the SR policy.

- **null IPv4 endpoint (0.0.0.0)**

  The highest numbered color extended community attached to the labeled IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

- **null IPv6 endpoint (0::0)**

  The highest numbered color extended community attached to the labeled IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

BGP resolves an IPv6 route with an IPv6 next hop that is not an IPv4-mapped IPv6 address using an SR policy selected by applying the following procedure in preference order:

- **IPv6 endpoint**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the labeled IPv6 route must match the color of the SR policy.

- **null IPv6 endpoint (0.::0)**

  The highest numbered color extended community attached to the labeled IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

- **null IPv4 endpoint (0.0.0.0)**

  The highest numbered color extended community attached to the labeled IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

The **no** form of this command disables SR policies for next-hop resolution.

Full Context

configure router policy-options policy-statement entry action sr-return-path-bfd-label

configure router policy-options policy-statement default-action sr-return-path-bfd-label

Description

This command configures an additional MPLS label to add to the bottom of the label stack for the S-BFD packet and sets the S-BFD session to echo mode.

This command applies to the initiator of the S-BFD sessions. The label value can either be a binding SID for an SR policy or another MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through the MPLS return path. This value takes precedence over the return path label value in a maintenance policy (configured using the **configure router segment-routing maintenance-policy return-path-label** command) that is also applied as the policy-statement action. This command can only be configured if the **sr-maintenance-policy** command is also configured.

The **no** form of this command deletes the label value. If this command is not configured and there is no **return-path-label** command configuration in the maintenance policy that is also applied as an action, S-BFD returns to asynchronous mode and no return path label is pushed by the initiator node. S-BFD packets for this LSP or path received by the reflector are routed through the IGP path.

Default

no sr-return-path-bfd-label

Parameters

value

Specifies the label value.

Values 32 to 1048575

param-name

Specifies the parameter name to use as the label value, which can be up to 32 characters and must start and end with an at sign (@).

configure service vprn bgp-ipvpn mpls auto-bind-tunnel resolution-filter sr-te

configure service vprn bgp-evpn mpls auto-bind-tunnel resolution-filter sr-te

Description

This command selects the Segment Routing (SR) Traffic Engineered (SR-TE) LSP programmed in TTM.

The **sr-te** value instructs the system to search for the best metric SR-TE LSP to the address of the BGP next hop. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple SR-TE LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID.

The **no** form of this command disables the SR-TE LSP setting for the auto-bind tunnel.

Default

no sr-te

sr-te

Syntax

sr-te *value*

no sr-te

Context

[Tree] (config>router>mpls>tunnel-table-pref sr-te)

Full Context

configure router mpls tunnel-table-pref sr-te

Description

This command configures the tunnel table preference for an SR-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default

sr-te 8

Parameters

value

Specifies the tunnel table preference value for SR-TE LSP.

Values 1 to 255

Default 8

sr-te

Syntax

[**no**] **sr-te**

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter sr-te)

Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter sr-te

Description

The sr-te value instructs the code to search for the set of lowest metric SR-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of SR-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of SR-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value are selected.

configure router ospf traffic-engineering-options sr-te

Description

This command configures the advertisement of TE attributes of each link on a per-application basis. Two applications are supported in SR OS: RSVP-TE and SR-TE. Although the **legacy** mode of advertising TE attributes is supported, additional configurations are possible.

The **no** form of this command deletes the context.

Default

no sr-te

Parameters

legacy

Advertises the TE attributes for MPLS-enabled SR links using TE Opaque LSAs.

Note:
Do not configure the **legacy** mode if the network has both RSVP-TE and SR-TE attributes and the links are not congruent.

application-specific-link-attributes

Advertises TE information for MPLS-enabled SR links using the new Application Specific Link Attributes (ASLA) TLVs.

43.120 sr-te-lsp

sr-te-lsp

Syntax

[**no**] **sr-te-lsp** *lsp-name*

Context

[Tree] (config>service>sdp sr-te-lsp)

Full Context

configure service sdp sr-te-lsp

Description

This command configures an MPLS SDP of LSP type SR-TE.

The user can specify up to 16 SR-TE LSP names. The destination address of all LSPs must match that of the SDP far-end option. Service data packets are sprayed over the set of LSPs in the SDP using the same procedures as for tunnel selection in ECMP. Each SR-TE LSP can, however, have up to 32 next-hops at the ingress LER when the first segment is a node SID-based SR tunnel. Thus, the service data packet is forwarded over one of a maximum of 16x32 next-hops.

The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-te** tunnel type.

The signaling protocol for the service labels for an SDP using a SR-TE LSP can be configured to static (**off**), T-LDP (**tldp**), or BGP (**bgp**).

43.122 src-access-list

src-access-list

Syntax

src-access-list *list-name*

no src-access-list *list-name*

Context

[Tree] (config>system>security>snmp src-access-list)

Full Context

configure system security snmp src-access-list

Description

This command configures a list of source IP addresses used to validate SNMPv1 and SNMPv2c requests after the list is associated with one or more SNMPv1 and SNMPv2c communities.

A source access list referenced by one or more **community** instances is used to verify the source IP addresses of an SNMP request using the community, regardless of the VPRN/VRF interface (or "Base" interface) on which the request arrived. For example, if an SNMP request arrives on an interface in VPRN "100" but the request is referencing a community, the source IP address in the packet is validated against the source address list configured for the community. This occurs regardless of whether the request is destined to a VPRN interface address and the VPRN has SNMP access enabled, or the request is destined to the base system address via GRT leaking. If the source IP address of the request message does not match the IP address of any of the **src-host** entries contained in the list, the request is discarded and logged as an SNMP authentication failure.

Caution:
Using source access list validation can impact the time it takes for an SR OS node to reply to an SNMP request. Nokia recommends keeping the lists short by including only the addresses that are needed, and to place SNMP managers that send the highest volume of requests, such as the NSP NFM-P, at the top of the list.

A maximum of 16 source access lists can be configured. Each source access lists can contain a maximum of 16 source hosts.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the named source access list. Users cannot remove a source access list that is referenced by one or more **community** instances.

Parameters

list-name

Specifies the name or key of the source access list. This parameter must begin with a letter (a-z or A-Z).

Full Context

configure qos sap-egress ip-criteria entry match src-ip

configure qos sap-ingress ip-criteria entry match src-ip

Description

This command configures a source IPv4 address range to be used as an SAP QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask; for example, 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

Default

no src-ip

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

prefix-list-name

Specifies the IPv4 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Platforms

configure qos network egress ipv6-criteria entry match src-ip

configure qos network ingress ipv6-criteria entry match src-ip

configure qos network ingress ip-criteria entry match src-ip

configure qos network egress ip-criteria entry match src-ip

Description

This command configures a source IPv4 or IPv6 address range to be used as a network QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, when specifying an IPv4 address, 10.1.0.0/16 or 10.1.0.0 255.255.0.0 can be used.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ip-prefix-list-name

Specifies an IPv4 prefix list which contains IPv4 address prefixes to be matched.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

mask

Specifies the length of the ipv6-address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

ipv6-prefix-list-name

Specifies an IPv6 prefix list which contains IPv6 address prefixes to be matched.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms

All

src-ip

Syntax

IPv4:

src-ip {*ip-address/mask* | *ip-address ipv4-address-mask* | **ip-prefix-list** *prefix-list-name*}

IPv6:

src-ip {*ipv6-address/prefix-length* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *prefix-list-name*}

no src-ip

[Tree] (config>filter>ip-exception>entry>match src-ip)

[Tree] (config>filter>ipv6-filter>entry>match src-ip)

Full Context

configure filter ipv6-exception entry match src-ip

configure filter ip-exception entry match src-ip

configure filter ipv6-filter entry match src-ip

Description

This command configures a source IPv4 or IPv6 address range to be used as an IP filter or IP exception match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, 10.1.0.0/16 for IPv4. The conventional notation of 10.1.0.0 255.255.0.0 may also be used for IPv4.

The **no** form of the command removes the source IP address match criterion.

Default

no src-ip

Parameters

ip-address

Specifies the destination IPv4 address specified in dotted decimal notation.

Values a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-listoripv6-prefix-list prefix-list-name

Specifies to use a list of IP prefixes, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies an IPv6 prefix for the IP match criterion in hex digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

prefix-length

Specifies whether a the IPv6 prefix length for the specified *ipv6-address* expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

Platforms

Full Context

configure system security management-access-filter ip-filter entry src-ip

Description

This command configures a source IP address range or an IP prefix list to be used as a management access filter match criterion.

The **no** form of this command removes the source IP address match criterion.

Default

no src-ip

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-prefix

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

mask

Specifies the subnet mask length expressed as a decimal integer.

Values 1 **to** 32 (mask length), 0.0.0.0 **to** 255.255.255.255 (dotted decimal)

netmask

Specifies the dotted quad equivalent of the mask length.

Values 0.0.0.0 to 255.255.255.255

ip-prefix-list-name

Specifies the IP prefix list used as a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes .

Platforms

configure system security management-access-filter ipv6-filter entry src-ip

Description

This command configures a source IPv6 address range or an IPv6 prefix list to be used as a management access filter match criterion. This command only applies to the 7750 SR and 7950 XRS.

The **no** form of this command removes the source IPv6 address match criterion.

Default

no src-ip

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ipv6-address/prefix-length

Specifies the IPv6 address for the IPv6 match criterion in dotted decimal notation. An IPv6 IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:0:217A.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D
prefix-length	1 to 128

ipv6-prefix-list-name

Specifies the IPv6 prefix list used a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes .

Platforms

All

src-ip

Syntax

src-ip [*ipv6-address*/ *prefix-length* | **ip-prefix-list** *prefix-list-name*]

no src-ip

Context

[Tree] (cfg>sys>sec>cpm>ip-filter>entry>match src-ip)

Full Context

configure system security cpm-filter ip-filter entry match src-ip

Description

This command specifies the IP address to match the source IP address of the packet.

To match on the source IP address, specify the address and its associated mask, such as 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 may also be used.

The **no** form of this command removes the source IP address match criterion.

Default

no src-ip

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ipv6-address/prefix-length

Specifies the IP address for the match criterion in dotted decimal notation. An IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:0:217A.

Values

ipv4-address	a.b.c.d (host bits must be 0)
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses
prefix-length	1 to 128

ip-prefix-list

Creates a list of IPv4 prefixes for match criteria in IPv4 ACL and CPM filter policies.

ip-prefix-list-name

Specifies a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

src-ip

Syntax

src-ip [*ip-address*/*mask* | **ipv6-prefix-list** *ipv6-prefix-list-name*]

no src-ip

Context

[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match src-ip)

44 s Commands – Part IV

44.1 src-ip-address

src-ip-address

Syntax

src-ip-address *ip-address*

no src-ip-address

Context

[Tree] (config>saa>test>type-multi-line>lsp-trace>sr-policy src-ip-address)

[Tree] (config>saa>test>type-multi-line>lsp-ping src-ip-address)

[Tree] (config>saa>test>type-multi-line>lsp-ping>sr-policy src-ip-address)

Full Context

configure saa test type-multi-line lsp-trace sr-policy src-ip-address

configure saa test type-multi-line lsp-ping src-ip-address

configure saa test type-multi-line lsp-ping sr-policy src-ip-address

Description

This command configures the source IP address. This option is used when an OAM packet must be generated from a different address than the node's system interface address. For example, when the OAM packet is sent over an LDP LSP and the LDP LSR-ID of the corresponding LDP session to the next hop is set to an address other than the system interface address.

The **no** form of this command removes the configuration.

Parameters

ip-address

Specifies the source IP address.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

44.2 src-ipv4-address

src-ipv4-address

Syntax

src-ipv4-address *a.b.c.d*

no src-ipv4-address

Context

[Tree] (debug>oam>build-packet>packet>field-override>header>ipv4 src-ipv4-address)

[Tree] (config>test-oam>build-packet>header>ipv4 src-ipv4-address)

Full Context

debug oam build-packet packet field-override header ipv4 src-ipv4-address

configure test-oam build-packet header ipv4 src-ipv4-address

Description

This command defines the source IPv4 address to be used in the IPv4 header.

The **no** form of this command removes the source IPv4 address.

Default

src-ipv4-address 0.0.0.0

Parameters

a.b.c.d

Specifies the IPv4 source address to be used in the IPv4 header.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

44.4 src-mac

src-mac

Syntax

src-mac *ieee-address*

no src-mac

Context

[Tree] (config>redundancy>mc>peer>mcr>l3ring>node>cv src-mac)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify src-mac

Description

This command specifies the source MAC address used for the ring-node connectivity verification of this ring node.

If all zeros are specified, the MAC address of the system management processor (CPM) is used.

The **no** form of this command reverts to the default.

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Platforms

All

src-mac

Syntax

src-mac *ieee-address*

no src-mac

Context

[Tree] (config>redundancy>mc>peer>mcr>node>cv src-mac)

Full Context

configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify src-mac

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the source MAC address used for the Ring-Node Connectivity Verification of this ring node.

A value of all zeros (000000000000 H (0:0:0:0:0:0)) specifies that the MAC address of the system management processor (CPM) is used.

Default

no src-mac

Parameters

ieee-address

Specifies the source MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

All

src-mac

Syntax

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>li>li-filter>li-mac-filter>entry>match src-mac)

Full Context

configure li li-filter li-mac-filter entry match src-mac

Description

This command configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the source mac as the match criteria.

Parameters

ieee-address

Specifies the 48-bit IEEE mac address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

Specifies a 48-bit mask. The following table describes the format styles to configure the 48-bit mask.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 119: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFF000000

Default 0xFFFFFFFFFFFF (exact match)

Values 0x00000000000000 to 0xFFFFFFFFFFFF

Platforms

All

src-mac

Syntax

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match src-mac)

Full Context

configure qos sap-ingress mac-criteria entry match src-mac

Description

This command configures a source MAC address or range to be used as a service ingress QoS policy match criterion.

The **no** form of this command removes the source mac as the match criteria.

Default

no src-mac

Parameters

ieee-address

Enter the 48-bit IEEE MAC address to be used as a match criterion.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

This 48-bit mask can be configured using the following formats:

Table 120: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure all packets with a source MAC OUI value of 00-03-FA to be subject to a match condition, the entry should be specified as: 003FA000000 0xFFFFFF000000

Values 0x00000000000000 to 0xFFFFFFFFFFFF (hex)

Default 0xFFFFFFFFFFFF (hex) (exact match)

[Tree] (config>filter>ipv6-filter>entry>match src-mac)

Full Context

configure filter ip-filter entry match src-mac

configure filter mac-filter entry match src-mac

configure filter ipv6-filter entry match src-mac

Description

Configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of the command removes the source mac as the match criteria.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no src-mac

Parameters

ieee-address

Specifies the 48-bit IEEE MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit; both upper and lower case are supported.

ieee-address-mask

Specifies the 48-bit mask to match a range of MAC address values.

To configure so that all packets with a source MAC OUI value of 00:03:FA are subject to a match condition then the entry should be specified as: 00:03:FA:00:00:00 FF:FF:FF:00:00:00

Default ff:ff:ff:ff:ff:ff (exact match)

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is an hexadecimal digit; both upper and lower case are supported.

Platforms

All

src-mac

Syntax

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>system>security>mgmt-access-filter>mac-filter>entry>match src-mac)

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries entry match src-port

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries entry match src-port

Description

This command configures the source port match condition.

The **no** form of this command reverts to the default.

Parameters

lt | gt | eq

Specifies the operators.

src-port-number

Specifies the source port number as a decimal hex or binary.

Values 0 to 65535

dst-port-number

Specifies the destination port number as a decimal hex or binary.

Values 0 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

src-port

Syntax

src-port {**eq** | **neq**} *port-num*

src-port {**eq** | **neq**} **port-list** *port-list-name*

src-port {**eq** | **neq**} **range** *start-port-num end-port-num*

no src-port

Context

[Tree] (config>app-assure>group>policy>aqp>entry>match src-port)

Full Context

configure application-assurance group policy app-qos-policy entry match src-port

Description

This command specifies a source IP port, source port list, or source range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no src-port

Parameters

eq

Specifies that a successful match occurs when the flow matches the specified port.

neq

Specifies that a successful match occurs when the flow does not match the specified port.

port-num

Specifies the source port number.

Values 0 to 65535

start-port-num end-port-num

Specifies the start or end source port number.

Values 0 to 65535

port-list-name

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

no src-port

Context

[Tree] (config>app-assure>group>sess-fltr>entry>match src-port)

Full Context

configure application-assurance group session-filter entry match src-port

Description

This command specifies a source IP port, source port list, or source range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no src-port

Parameters

eq

Specifies that a successful match occurs when the flow matches the specified port.

gt

Specifies all port numbers greater than the port-number match.

lt

Specifies all port numbers less than the port-number match.

port-num

Specifies the source port number.

Values 0 to 65535

start-port-num end-port-num

Specifies the start or end source port number.

Values 0 to 65535

port-list-name

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure li li-filter li-ip-filter entry match src-port

configure li li-filter li-ipv6-filter entry match src-port

Description

This command configures a source TCP or UDP port number or port range for an IP LI filter match criterion. Note that an entry containing Layer 4 match criteria will not match non-initial (second, third, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the source port match criterion.

Parameters

lt

Specifies all port numbers less than *src-port-number* match.

gt

Specifies all port numbers greater than *src-port-number* match.

eq

Specifies that *src-port-number* must be an exact match.

src-port-number

Specifies the source port number to be used as a match criteria expressed as a decimal integer.

Values [0..65535]D
[0x0..0xFFFF]H
[0b0..0b1111111111111111]B

configure qos sap-egress ipv6-criteria entry match src-port

configure qos sap-ingress ip-criteria entry match src-port

configure qos sap-egress ip-criteria entry match src-port

Description

This command configures a source TCP or UDP port number or port range for a SAP QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

Default

no src-port

Parameters

{lt | gt | eq} *src-port-number*

The TCP or UDP port numbers to match, specified as less than (**lt**), greater than (**gt**), or equal to (**eq**) to the source port value, specified as a decimal integer.

Values 1 to 65535 (decimal)

range *startend*

The range of TCP or UDP port values to match, specified as between the *start* and *end* source port values inclusive.

Values 1 to 65535 (decimal)

Description

This command configures a source TCP or UDP port number, port range, or a port list for a network QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

Default

no src-port

Parameters

lt

Keyword used to specify TCP or UDP port numbers to match that are less than the source port value.

gt

Keyword used to specify TCP or UDP port numbers to match that are greater than the source port value.

eq

Keyword used to specify TCP or UDP port numbers to match that are equal to the source port value.

src-port-number

The source port value, specified as a decimal integer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 65535

port-list-name

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

start

Specifies the starting range of TCP or UDP source port values to match.

Values 1 to 65535

end

Specifies the end range of TCP or UDP source port values to match.

Values 1 to 65535

configure filter ip-exception entry match src-port

Description

This command configures a source TCP, UDP, or SCTP port number, port range, or port match list for an IP filter or IP exception match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing "**src-port eq** 0" match criterion, may match non-initial

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fragments when the source port value is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the source port match criterion.

Default

no src-port

Parameters

lt | gt | eq

Specifies the operator to use relative to *src-port-number* for specifying the port number match criteria.

lt specifies that all port numbers less than *src-port-number* match.

gt specifies that all port numbers greater than *src-port-number* match.

eq specifies that *src-port-number* must be an exact match.

src-port-number

Specifies the source port number to be used as a match criteria expressed as a decimal integer, and in hexadecimal or binary format. Below shows decimal integer only.

Values 0 to 65535

port-list-name

Specifies to use a list of ports referred to by *port-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

src-port-number src-port-number

Specifies inclusive port range between two src-port-number values.

src-udp-port

Syntax

src-udp-port *port-number*

no src-udp-port

Context

[Tree] (config>test-oam>link-meas>template>twl src-udp-port)

Full Context

configure test-oam link-measurement measurement-template twamp-light src-udp-port

Description

This command configures a source UDP port to be used by the link measurement tests linked to this template.

Unless required, Nokia suggests that the link measurement dynamically select an available source UDP port from the dynamic range. Before a UDP port in the configurable range can be configured as a source it must be owned by the application. Use the **config**>**test-oam**>**twamp**>**twamp-light**> **source-udp-port-pools**>**port**>**pool-type** command to map the port range to the application.

To use a source port in this range for link-measurement, the selected port number must have a **pool-type link-measurement** configured. The source UDP port must be owned by the application prior to the configuration under the application. A configured **source-udp-port** cannot be used when multiple tests are configured between the same source IP, destination IP and destination UDP port. A conflict may occur when non-unique addressing is used between two peers. A conflicting situation may occur when tests between peers are using IPv6 discovery and the link-local addresses on both nodes are the same. Other conflicts exist, such as, multiple tests between peers using the same source and destination IP system address instead of an interface address. When this condition exists, the operational state of the link-measurement test is operationally down with a failure condition UdpPortUnavailable.

The **no** form of the command removes the port number from the link measurement template.

Default

no src-udp-port

Parameters

port-number

Specifies the source UDP port number.

Values 64374 to 64383

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

srlg

Syntax

[**no**] **srlg**

Context

[Tree] (config>router>mpls>lsp>secondary srlg)

Full Context

configure router mpls lsp secondary srlg

Description

This command enables the use of the SRLG constraint in the computation of a secondary path for an LSP at the head-end LER. The command is configurable for both RSVP-TE and SR-TE LSPs.

When SRLG is enabled, CSPF includes the SRLG constraint in the computation of the secondary LSP path if **path-computation-method local-cspf** is configured on the LSP. CSPF returns the list of SRLG groups along with the ERO during primary path CSPF computation. At a subsequent establishment of a secondary path with the SRLG constraint, the MPLS task again queries CSPF by providing the list of SRLG group numbers to be avoided. CSPF prunes all links with interfaces that belong to the same SRLGs as the interfaces included in the ERO of the primary path. If CSPF finds a path, the secondary path is set up. If a path is not found, MPLS keeps retrying the requests to CSPF.

An SRLG enabled secondary or standby path of the LSP configured with a value of the **path-computation-method** command other than **local-cspf** remains operationally down with a failure code of srlgPrimaryCspfDisabled(25).

When an LSP is administratively enabled, the SRLG-enabled secondary path is not tried if the first attempt to bring up the primary path is in progress. The SRLG enabled secondary path is kept down temporarily with failure code srlgPrimaryPathDown(26). After this first attempt, MPLS begins setting up the SRLG-

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

enabled standby paths. If primary path computation fails or primary path was not configured, MPLS requests CSPF to compute the secondary path using an empty primary SRLG list. The SRLG *disjoint* state field shows *True* in this scenario.

If the primary path is re-optimized, has undergone MBB, or has come back up after being down, the MPLS task check determines if any SRLG secondary paths should be re-signaled. If MPLS finds that a secondary path is no longer SRLG disjointed, and therefore becomes ineligible, MPLS puts it on a delayed MBB immediately after the expiry of the retry timer. If MBB fails at the first try, the secondary path is torn down and the path is put on retry if not active. If the secondary path is active, then it is only torn down and resignaled when the primary path is activated. The secondary path can remain active even when ineligible while the revert timer to activate the primary path is still running.

If the primary goes down while active, the LSP uses the path of an eligible SRLG secondary path if it is up. If all secondary eligible SRLG paths are down, MPLS uses a non-SRLG secondary path, if configured and up. While the LSP is using a non-SRLG secondary path, if an eligible SRLG secondary path comes back up, MPLS switches the path of the LSP to the eligible SRLG secondary path. As soon as a path for the primary is successfully computed by CSPF, MPLS schedules the delay retry MBB for the secondary path using the new SRLG list.

If the primary path goes down while inactive, for example it is waiting for the revert timer to expire, MPLS resets the SRLG list of the primary to empty and changes the state of all secondary paths, including the currently active one, to the Disjointed state. A delay retry MBB is still performed but results in no change to the active secondary path.

A secondary path that becomes ineligible as a result of an update to the SRLG membership list of the primary path has the ineligibility status removed on any of the following events:

- a successful delay retry MBB of the secondary SRLG path that makes it eligible again
- the secondary path goes down. MPLS puts the standby on retry at the expiry of the retry timer. If successful, it becomes eligible. If not successful after the retry-timer expires or the number of retries reached the number configured under the **retry-limit** parameter, it is left down.

Once the primary path of the LSP is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface that the primary path is using is not considered until the next opportunity the primary path is re-signaled. The primary path may be re-signaled due to a failure or to a make-before-break operation. Make-before-break occurs as a result of a global revertive operation, a timer based or manual re-optimization of the LSP path, or an operator change to any of the path constraints.

Once an SRLG secondary path is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface the secondary path is using is not considered until the next opportunity when the secondary path is re-signaled. The secondary path is re-signaled due to a failure, to a re-signaling of the primary path, or to a make before break operation. Make-before-break occurs as a result of a timer based or manual re-optimization of the secondary path, or an operator change to any of the path constraints of the secondary path, except for enabling or disabling the **srlg** command itself. Enabling or disabling the **srlg** command on an active secondary or on an active or inactive secondary standby path causes the path to be torn down and re-signaled.

In addition, the user-configured **include** or **exclude** admin group statements for a secondary path are also checked together with the SRLG constraints by CSPF.

The following behavior of the feature is specific to the SR-TE LSP.

- An SRLG-enabled SR-TE LSP secondary path with SID label hops remains operational with failure code srlgPathWithSidHops(59).
- An SR-TE LSP uses IGP advertised link SRLG information in the TE database. It does not support the use of SRLG information in the static user SRLG database (**configure router mpls srlg-database**).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Delay Retry MBB for making a non-disjointed path a disjointed one is not supported with an SR-TE LSP. Instead, the system performs a break-before-make (that is, teardown and retry) operation. If a non-disjointed path is the active path of the LSP, that path is torn down and retried after the router switches to another path (for example, after **revert-timer** expires). If the non-disjointed path is not an active path, it is torn down and retried immediately.

The **no** form of this command reverts to the default value.

configure router isis multi-part-tlv srlg

configure service vprn isis multi-part-tlv srlg

Description

This command enables the origination of multiple instances of SRLG TLVs (TLV 138 and TLV 238). When enabled, the router splits TLVs that exceed the maximum size (255 bytes) into MP-TLVs of the same type and key.

The **no** form of this command disables this capability for SRLG TLVs. TLVs that exceed the maximum size are truncated to fit the limit.

configure router route-next-hop-policy template srlg-enable

Description

This command configures the SRLG constraint into the route next-hop policy template.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this command is applied to a prefix, the LFA SPF will attempt to select an LFA next-hop, among the computed ones, which uses an outgoing interface that does not participate in any of the SLRGs of the outgoing interface used by the primary next-hop.

The SRLG criterion is applied before running the LFA next-hop selection algorithm.

The **no** form deletes the SRLG constraint from the route next-hop policy template.

Syntax

srlg-frr [**strict**]

no srlg-frr

Context

[Tree] (config>router>mpls srlg-frr)

Full Context

configure router mpls srlg-frr

Description

This command enables the use of the SRLG constraint in the computation of FRR bypass or detour to be associated with any primary LSP path on this system.

When this option is enabled, CSPF includes the SRLG constraint in the computation of a FRR detour or bypass for protecting the primary LSP path.

CSPF prunes all links with interfaces that belong to the same SRLG as the interface that is being protected, that is, the outgoing interface at the PLR the primary path is using. If one or more paths are found, the MPLS task will select one based on best cost and will signal the bypass/detour. If not found and the user has included the **strict** option, the bypass/detour is not setup and the MPLS task will keep retrying the request to CSPF. Otherwise, if a path exists that meets the other TE constraints, other than the SRLG one, the bypass/detour is setup.

A bypass or a detour LSP path is not intended to be SRLG disjoint from the entire primary path. Only the SRLGs of the outgoing interface at the PLR that the primary path is using are avoided.

When the MPLS task is searching for an SRLG bypass tunnel to associate with the primary path of the protected LSP, it will first check if any configured manual bypass LSP with CSPF enabled satisfies the SRLG constraints. The search skips any non-CSPF manual bypass LSP because there is no ERO

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

returned to check the SRLG constraint. If no path is found, the task will check if an existing dynamic bypass LSP satisfies the SRLG and other primary path constraints. If not found, it will make a request to CSPF.

Once the primary path of the LSP is configured and is operationally up, subsequent changes to the SRLG group membership of an interface the primary path is using are not considered by the MPLS task at the PLR for bypass/detour association until the next opportunity the bypass LSP path or the primary path is resignaled. The path may be resignaled due to a failure or a Make-Before-Break (MBB) operation. MBB occurs as a result of a global revertive operation, a timer based or manual re-optimization of the bypass LSP or LSP primary path, or a user update of the primary path constraints.

Once the bypass or detour path is set up and is operationally up, subsequent changes to the SRLG group membership of an interface the bypass/detour path is using are not considered by the MPLS task at the PLR until the next opportunity when the association with the primary LSP path is rechecked. The association is rechecked if the bypass path is re-optimized using the timer or manual resignal MBB. Detour paths cannot be re-optimized separately from the primary path.

Enabling or disabling **srlg-frr** command only takes effect when the LSP primary path or the bypass path is resignaled. The user can either wait for the resignal timer to expire or cause the paths to be resignaled immediately by executing, at the ingress LER, the manual resignal command for the LSP primary path or for the bypass LSP path.

A MPLS interface can belong to a maximum of 64 SRLG groups. The SRLG groups are configured using the **config>router>if-attribute>srlg-group** command. The SRLG groups that an RSVP interface belong to are configured using the **srlg-group** command in the **config>router>mpls>interface** context.

The **no** form of this command reverts to the default value.

Default

no srlg-frr

configure service vprn interface if-attribute srlg-group

configure service ies interface if-attribute srlg-group

configure router interface if-attribute srlg-group

configure router mpls interface srlg-group

Description

This command configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface.

An interface can belong to up to 64 SRLG groups. However, each single operation of the **srlg-group** command allows a maximum of five (5) groups to be specified at a time. Once an SRLG group is bound to one or more interface, its value cannot be changed until all bindings are removed.

The configured SRLG membership is applied in all levels/areas the interface is participating in. The same interface cannot have different memberships in different levels/areas.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

The **no** form of this command deletes one or more of the SRLG memberships of an interface. The user can also delete all memberships of an interface by not specifying a group name.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain. Each single operation of the **srlg-group** command allows a maximum of 5 groups to be specified at a time.

Platforms

Context

[Tree] (config>router>if-attribute srlg-group)

Full Context

configure router if-attribute srlg-group

Description

This command defines a Shared Risk Link Group (SRLG) which can be associated with an IP or MPLS interface.

SRLG is used to tag IP or MPLS interfaces which share a specific fate with the same identifier. For example, an SRLG group identifier could represent all links which use separate fibers but are carried in the same fiber conduit. If the conduit is accidentally cut, all the fiber links are cut which means all interfaces using these fiber links will fail.

The user first configures locally on each router the name and identifier of each SRLG group. A maximum of 1024 SRLGs can be configured per system.

The user then configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface. A maximum of 64 SRLGs can be applied to a given interface.

When SRLGs are applied to MPLS interfaces, CSPF at an LER will exclude the SRLGs of interfaces used by the LSP primary path when computing the path of the secondary path. CSPF at an LER or LSR will also exclude the SRLGs of the outgoing interface of the primary LSP path in the computation of the path of the FRR backup LSP. This provides path disjointness between the primary path and the secondary path or FRR backup path of an LSP.

When SRLGs applied to IES, VPRN, or network IP interfaces, they are evaluated in the route next-hop selection by adding the **srlg-enable** option in a route next-hop policy template applied to an interface or a set of prefixes. For instance, the user can enable the SRLG constraint to select a LFA next-hop for a prefix which avoids all interfaces that share fate with the primary next-hop.

The following provisioning rules are applied to SRLG configuration. The system will reject the creation of a SRLG if it re-uses the same name but with a different group value than an existing group. The system will also reject the creation of an SRLG if it re-uses the same group value but with a different name than an existing group.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

A user may specify a penalty weight (**penalty-weight**) associated with an SRLG. This controls the likelihood of paths with links sharing SRLG values with a primary path being used by a bypass or detour LSP. The higher the penalty weight, the less desirable it is to use the link with a given SRLG.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain.

group-value

Specifies the integer value associated with the group. The association of group name and value should be unique within an IP/MPLS domain.

© 2026 Nokia.

[Tree] (config>service>vprn>sub-if>grp-if srrp)

Full Context

configure service ies subscriber-interface group-interface srrp

configure service vprn subscriber-interface group-interface srrp

Description

This command creates a Subscriber Router Redundancy Protocol (SRRP) instance on a group IP interface. An SRRP instance manages all subscriber subnets within the group interfaces subscriber IP interface or other subscriber IP interfaces that are associated through a wholesale/retail relationship. Only one unique SRRP instance can be configured per group interface.

The **no** form of this command removes an SRRP instance from a group IP interface. Once removed, the group interface ignores ARP requests for the SRRP gateway IP addresses that may exist on subscriber subnets associated with the group IP interface. Then the group interface stops routing using the redundant IP interface associated with the group IP interface and will stop routing with the SRRP gateway MAC address. Ingress packets destined to the SRRP gateway MAC will also be silently discarded. This is the same behavior as a group IP interface that is disabled (shutdown).

The **no** form of this command removes the SRRP ID from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no srrp

Parameters

srrp-id

Specifies a 32 bit instance ID that must be unique to the system. The instance ID must also match the instance ID used by the remote router that is participating in the same SRRP context. SRRP is intended to perform a function similar to VRRP where adjacent IP hosts within local subnets use a default gateway to access IP hosts on other subnets.

configure fwd-path-ext fpe srv6

Description

This command configures whether the SRv6 FPE application type is used for the origination or termination of SRv6 tunnels.

The origination or termination of SRv6 on services requires the configuration of a dedicated SRv6 FPE and cannot share the same FPE. A single FPE can be configured for SRv6 origination. One or more FPEs can be configured for SRv6 termination, where a termination SRv6 FPE is assigned one or more configured locators. Transit SRv6 routers do not need SRv6 FPEs.

The **no** form of this command disables SRv6 on an FPE.

Default

no srv6

Parameters

origination

Keyword used to specify the origination FPE application type.

routed-vpls

Keyword used to specify the creation of internal SDPs for handling R-VPLS traffic when SRv6 origination is configured for the specified FPE.

termination

Keyword used to specify the termination FPE application type.

Full Context

configure router policy-options policy-statement entry action srv6-return-path-bfd-sid

configure router policy-options policy-statement default-action srv6-return-path-bfd-sid

Description

This command applies to the initiator of Seamless Bidirectional Forwarding Detection sessions. This command configures the S-BFD session to echo mode and pushes an additional SRv6 SID in the SRH for S-BFD packets only when it is sent on the imported SRv6 policy.

The return-path SID refers to a binding SID on a SRv6 policy configured on the far-end router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this SRv6 return path. The **no** form of this command disables the controlled return-path SID and echo mode for S-BFD.

Parameters

ipv6-address

Specifies the IPv6 address.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

param-name

Specifies the parameter variable name, up to 32 characters. Policy parameters must start and end with an at-sign (@).

Platforms

Full Context

configure router policy-options policy-statement entry from srv6-sid-prefix

Description

This command configures either the name of a prefix policy variable or an IPv6 prefix and prefix length, as match criterion for a BGP route.

Note: If the name of a prefix policy variable is the match criterion, the name must start and end with an at sign (@).

A BGP route matches this criterion if it has an SRv6 TLV, and the SID or micro-segment (uSID) value in that TLV is matched by the bits of the IPv6 prefix (up to the specified prefix length).

This match criterion is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.

Default

no srv6-sid-prefix

Parameters

ipv6-prefix/prefix-length

Specifies the IPv6 address and prefix length.

Values

ipv6-prefix:	x:x:x:x:x:x:x:x (host bits must be 0)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
prefix-length:	0 to 128

param-name

Specifies the name of a prefix policy variable, which can be up to 32 characters and must start and end with an at sign (@)

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

no srv6-tlv

Context

[Tree] (config>router>policy-options>policy-statement>entry>from srv6-tlv)

Full Context

configure router policy-options policy-statement entry from srv6-tlv

Description

This command configures whether the entry matches a BGP route with a prefix SID attribute containing an SRv6 TLV. This match criterion is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.

Note: Routes of the MVPN family do not match to entries with the SRv6 TLV condition, regardless of whether this command is configured to **present** or **not-present**.

The **no** form of this command disables the router from taking whether a BGP route has a prefix SID attribute containing an SRv6 TLV into consideration when matching a BGP route with the entry.

Default

no srv6-tlv

Parameters

present

Specifies that a BGP route only matches this entry if it has a prefix SID attribute containing an SRv6 TLV.

not-present

Specifies that a BGP route only matches this entry if it does not have a prefix SID attribute containing an SRv6 TLV.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Full Context

configure qos sap-ingress mac-criteria entry match ssap

Description

This command configures an Ethernet 802.2 LLC SSAP value or range for an ingress SAP QoS policy match criterion.

This is a 1-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The **no** form of this command removes the ssap match criterion.

Default

no ssap

Parameters

ssap-value

The 8-bit ssap match criteria value in hex.

Values 0x00 to 0xFF (hex)

ssap-mask

This is optional and can be used when specifying a range of ssap values to use as the match criteria.

This 8-bit mask can be configured using the following formats.

Table 122: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDD	240
Hexadecimal	0xHH	0xF0
Binary	0bBBBBBBBB	0b11110000

Values 0x00 to 0xFF

configure filter mac-filter entry match ssap

Description

This command configures an Ethernet 802.2 LLC SSAP value or range for a MAC filter match criterion.

This is a one-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria.

The **no** form of the command removes the ssap match criterion.

Default

no ssap

Parameters

ssap-value

Specifies the 8-bit ssap match criteria value in decimal, hexadecimal or binary.

Values 0 to 255

ssap-mask

Specifies an optional parameter that may be used when specifying a range of ssap values to use as the match criteria.

This 8 bit mask and the ssap value can be configured as described in Table 123: 8-bit Mask Syntax.

Table 123: 8-bit Mask Syntax

ssh

Syntax

ssh *host* [**-l** *username*] [**-v** *ssh-version*] [{**router** *router-instance* | **service-name** *service-name*}] [**re-exchange-min** *minutes*] [**re-exchange-mbyte** *megabytes*] [**-i** *private-key-filename*] [**-p** *port*]

Context

[Tree] (ssh)

Full Context

ssh

Description

This command initiates a client SSH session with the remote host and is independent from the administrative or operational state of the SSH server. However, to be the target of an SSH session, the SSH server must be operational. This command also allows the user to initiate an SSH session, with a key reexchange, based on maximum megabytes or minutes, whichever occurs first. If the reexchange options are not set, the default behavior does not perform a key reexchange.

Quitting SSH while in the process of authentication is accomplished by either executing a ctrl-c or "~." (tilde and dot), assuming the "~" is the default escape character for the SSH session.

Parameters

host

Specifies the remote host for the SSH session.

Values

host: *user@hostname* - [up to 255 characters]	
user	up to 32 characters
hostname	[*dns-name* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface: up to 32 characters, mandatory for link local addresses

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

dns-name up to128 characters

username

Specifies the user name to use when opening the SSH session, up to 32 characters.

router-instance

Specifies the router name or service ID.

Values *router-instance*: *router-name* or *vprn-svc-id*

router-name "Base", "management", "vpls-management"

vprn-svc-id 1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

minutes

Specifies the time interval after which the SSH client will initiate the key reexchange.

Values 1 to 1440 minutes

megabytes

Specifies the number of megabytes, on a SSH session, after which the SSH client will initiate the key reexchange.

Values 1 to 64000 MB

private-key-filename

Specifies the name of the file containing the private key for public-key authentication on the SR OS SSH client, up to 255 characters. (The public key must be provided to the SSH server.) When using the *private-key-filename* option, if the file containing the private key is encrypted, the system asks for the password to decrypt the file.

port

Specifies the listening port for the SR OS SSH client to establish the SSH session with the SSH server.

Values 1 to 65535

44.34 ssh-reply

ssh-reply

Syntax

[**no**] **ssh-reply**

Context

[Tree] (config>service>ies>if>vrrp ssh-reply)

Full Context

configure service ies interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner vrrp virtual-router-id nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply

Full Context

configure service vprn interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instance's IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner **vrrp** *virtual-router-id* nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply

Platforms

All

ssh-reply

Syntax

[**no**] **ssh-reply**

Context

[Tree] (config>router>if>vrrp ssh-reply)

Full Context

configure router interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH requests directed at the virtual router instance IP addresses. This command is only applicable to IPv4.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses.

This limitation can be disregarded for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ssh-reply** command enables the non-owner master to reply to SSH requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Correct login and CLI command authentication is still enforced.

When **ssh-reply** is not enabled, SSH requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH requests regardless of the **ssh-reply** setting.

The **ssh-reply** command is only available in non-owner **vrrp** nodal context.

By default, SSH requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command discards all SSH request messages destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply — SSH requests to the virtual router instance IP addresses are discarded.

44.41 stable-pool-sizing

stable-pool-sizing

Syntax

[**no**] **stable-pool-sizing**

Context

[Tree] (config>card>fp stable-pool-sizing)

Full Context

configure card fp stable-pool-sizing

Description

This command provides a stable buffer pool allocation environment for all default port buffer pools on a forwarding plane. This stable environment is provided at the expense of optimal buffer allocation between the various port buffer pools. Normally, port pools are sized according to a ports relative bandwidth with other ports and the ability of a port to use pool buffers. As an example, on a forwarding plane with two potential MDAs and only one equipped, the normal behavior is to provide all available default pool buffers to the ports on the currently equipped MDA. If a second MDA is equipped in the future, buffers are freed from the existing MDA and provided to the ports on the new MDA. Stable pool sizing alters this behavior by reserving buffers for both MDAs whether they are equipped or not thus preventing a resizing event when an MDA is equipped. In addition, existing ports on a module always receive their maximum bandwidth share of buffers independent on any sub-rate condition that may currently exist. This provides a stable amount of buffers to other ports on the module independent of link or configuration events that may occur on the port.

Stable pool sizing preserves the ability to modify the effective bandwidth used to determine a port's relative share of the available buffers through the use of the ing-percentage-of-rate and egr-percentage-of-rate commands under the port configuration. Changing the values associated with these commands will cause a reevaluation of buffer distribution and thus a possible resizing of pools on each port within the module. These commands have no effect on ports associated with other modules on the forwarding plane.

Stable pool sizing may be enabled or disabled at any time on a forwarding plane. The system will dynamically change the pool sizes according to the stable pool sizing state.

When a port connector breakout is configured, its ports is included in the stable pool sizing calculation. Consequently, adding or removing a port connector breakout to or from the configuration will cause the buffer pool allocation to be recalculated even when stable pool sizing is enabled.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command disables stable pool sizing on a forwarding plane. Existing buffer pools are resized according to normal pool sizing behavior.

standard-multi-instance

Syntax

[**no**] **standard-multi-instance**

Context

[Tree] (config>service>vprn>isis standard-multi-instance)

Full Context

configure service vprn isis standard-multi-instance

Description

This command enables IS-IS multi-instance (MI) as described in draft-ginsberg-isis-mi-bis-01. Multiple instances allow instance-specific adjacencies to be formed that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV identifying the instance and the topology to which the PDU belongs. A single topology is supported in each instance, so the instance-specific topology identifier (ITID) is set to 0 and cannot be changed.

The **standard-multi-instance** (based on draft-ginsberg-isis-mi-bis-01) and **iid-tlv-enable** (based on draft-ietf-isis-mi-02) commands cannot be configured in the same instance, because the MAC addresses and PDUs from the two standards are incompatible.

configure router isis standard-multi-instance

Description

This command enables IS-IS multi-instance (MI) as described in *draft-ginsberg-isis-mi-bis-01*. Multiple instances allow instance-specific adjacencies to be formed that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV identifying the instance and the topology to which the PDU belongs. A single topology is supported in each instance, so the instance-specific topology identifier (ITID) is set to 0 and cannot be changed.

The **standard-multi-instance** (based on *draft-ginsberg-isis-mi-bis-01*) and **iid-tlv-enable** (based on *draft-ietf-isis-mi-02*) commands cannot be configured in the same instance, because the MAC addresses and PDUs from the two standards are incompatible.

The **no** form of this command removes the **standard-multi-instance** configuration.

Default

no standard-multi-instance

44.47 standby

standby

Syntax

[**no**] **standby**

Context

[Tree] (config>router>mpls>lsp>secondary standby)

Full Context

configure router mpls lsp secondary standby

Description

The secondary path LSP is normally signaled once the primary path LSP fails. The **standby** keyword ensures that the secondary path LSP is signaled and maintained indefinitely in a hot standby state. Standby paths are selected in preference to non-standby secondary paths. When multiple standby secondary paths exist, then the path-preference is used to determine the order in which the paths are selected. If multiple standby secondary paths have the same, lowest, path-preference value then the system will select the path with the lowest up-time. When the primary path is re-established then the traffic is switched back to the primary path LSP.

The **no** form of this command specifies that the secondary LSP is signaled when the primary path LSP fails.

[Tree] (config>service>epipe>spoke-sdp standby-signaling-slave)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service epipe endpoint standby-signaling-slave

configure service epipe spoke-sdp standby-signaling-slave

Description

When this command is enabled, the node will block the transmit forwarding direction of a spoke SDP based on the pseudowire standby bit received from a T-LDP peer.

This command is present at the endpoint level as well as the spoke SDP level. If the spoke SDP is part of an explicit-endpoint, it will not be possible to change this setting at the spoke SDP level. An existing spoke SDP can be made part of the explicit endpoint only if the settings do not conflict. A newly created spoke SDP, which is part of a specific explicit-endpoint, will inherit this setting from the endpoint configuration.

This command is mutually exclusive with an endpoint that is part of an mc-lag, mc-aps or an ICB.

If the command is disabled, the node assumes the existing independent mode of behavior for the forwarding on the spoke SDP.

configure qos slope-policy low-slope start-avg

configure qos slope-policy exceed-slope start-avg

configure qos slope-policy highplus-slope start-avg

configure qos slope-policy high-slope start-avg

Description

This command sets the exceed, low, high, or highplus Random Early Detection (RED) slope position for the shared buffer average utilization value where the packet discard probability starts to increase above zero. The percent parameter is expressed as a percentage of the shared buffer size.

The **no** form of this command restores the start-avg value to the default setting. If the max-avg setting is smaller than the default, an error will occur and the start-avg setting will not be changed to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

start-avg 85 - Highplus slope default is 85% buffer utilization before discard probability starts to increase above zero.

start-avg 70 — High slope default is 70% buffer utilization before discard probability starts to increase above zero.

start-avg 50 — Low slope default is 50% buffer utilization before discard probability starts to increase above zero.

start-avg 30 — Exceed slope default is 30% buffer utilization before discard probability starts to increase above zero.

Parameters

percent

The percentage of the shared buffer space for the buffer pool at which point the drop probability starts to increase above zero. The value entered must be less than or equal to the current setting of **max-avg**. If the entered value is greater than the current value of **max-avg**, an error will occur and no change will take place.

configure router dhcp local-dhcp-server failover startup-wait-time

configure router dhcp6 server pool failover startup-wait-time

configure router dhcp6 local-dhcp-server failover startup-wait-time

Description

This command enables the startup wait time during which each peer waits after the initialization process before assuming the active role for the prefix designated as local or access-driven. This is to avoid transient issues during the initialization process.

The **startup-wait-time** should be configured to an interval in which, after boot, both nodes can set up an MCS TCP link and start MCS. The timer is restarted each time the server downloads a lease from the MCS database and stops when the last state record from the peer is synchronized. The next state is (PRE-)NORMAL, unless the timer times out or is forced to stop via the tools command (**tools>perform>router>dhcp** or **dhcp6>local-dhcp-server** *server-name*>**pool**/**failover**>**abort-startup-wait**), in which case the local DHCP server transitions immediately to the COMMUNICATIONS-INTERRUPTED state.

configure subscriber-mgmt sla-profile egress qos queue stat-mode

configure subscriber-mgmt sla-profile ingress qos policer stat-mode

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is used to configure the forwarding plane octet and packet counters of a policer or queue to count packets of a specific type or state. For example separate counters for IPv4/IPv6 or separate counters for offered high and low priority policed traffic.

For policers, this command overrides the policer stat-mode configuration as defined in the sap-ingress or sap-egress qos policy. For details on sap-ingress and sap-egress policer stat-mode, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide*. For use in Enhanced Subscriber Management (ESM) context only, an additional stat-mode enables separate counters for IPv4 and IPv6 packets.

When a policer's stat-mode is changed while the sla profile is in use, any previous counter values are lost and any new counters are set to zero.

For queues, this command sets the stat-mode. Queue stat-mode is only available for use in Enhanced Subscriber Management (ESM) context to enable separate IPv4/IPv6 counters.

A queue's stat-mode cannot be changed while the SLA profile is in use.

The **no** form of this command reverts to the default.

Default

For policers, the default is no stat-mode override. The sap-ingress or sap-egress stat-mode is used instead.

For queues, the default is to count in-/out-of-profile octets and packets.

Parameters

stat-mode

Specifies the stat mode for the policer.

For ingress and egress qos queue stat-mode overrides.

For ingress and egress qos policer stat-mode overrides, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for details on the **sap-ingress** and **sap-egress policer stat-mode** parameters.

For use in Enhanced Subscriber Management (ESM) context only:

Values no-stats, minimal, offered-profile-no-cir, offered-priority-no-cir, offered-profile-cir, offered-priority-cir, offered-total-cir, offered-limited-profile-cir, offered-profile-capped-cir, offered-limited-capped-cir, v4-v6 (count IPv4 and IPv6 forwarded/dropped octets and packets separately)

Context

[Tree] (config>card>fp>ingress>network>qgrp>policer-over>plcr stat-mode)

[Tree] (config>card>fp>ingress>access>qgrp>policer-over>plcr stat-mode)

Full Context

configure card fp ingress network queue-group policer-override policer stat-mode

configure card fp ingress access queue-group policer-override policer stat-mode

Description

This command configures the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, high priority or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported which prevents any packet accounting, the use of the policer's **parent** command requires at the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. Once a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

configure service epipe sap egress policer-override policer stat-mode

configure service cpipe sap egress policer-override policer stat-mode

configure service ipipe sap egress policer-override policer stat-mode

Description

The SAP QoS policy's **policer stat-mode** command is used to configure the forwarding plane counters that allow offered, output, and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potentially large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and indicates how the offered packet types and output conditions should be mapped to the counters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's parent command requires that the policer's **stat-mode** to be set at least to the minimal setting so that offered statistics are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free statistics can be viewed by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The current active stat mode setting will continue to be used by the policer.

The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

The **no** form of this command attempts to return the policer's stat-mode setting to **minimal**.

Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for detailed information about the supported parameters for the **policer stat-mode** command.

configure service vpls sap egress policer-override policer stat-mode

Description

The SAP-egress QoS policy's policer stat-mode command is used to configure the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The stat-mode command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a no-stats mode is supported which prevents any packet accounting, the use of the policer's parent command requires that the policer's stat-mode to be set at least to the minimal setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat-mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The default stat-mode when a policer is created within the policy is minimal.

The stat-mode setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The previous stat-mode setting active for the policer will continue to be used by the policer.

The **no** form of the command returns the policer's stat-mode setting to minimal.

Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for detailed information about the **policer stat-mode** command parameters.

Full Context

configure qos sap-ingress policer stat-mode

configure qos sap-ingress dynamic-policer stat-mode

Description

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority, or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 124: Ingress Policer Stat Mode Summary .

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 124: Ingress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in-profile and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped, and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 125: Ingress Accounting Statistics Collected in minimal stat-mode .

For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

offered-profile-no-cir

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) traffic nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 126: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 127: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode .

© 2026 Nokia.

For. LowPrio	lpf	LowPriorityPacketsForwarded
	lof	LowPriorityOctetsForwarded

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises hard in/out and uncolored traffic. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 129: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 130: Ingress Accounting Statistics Collected in offered-total-cir stat-mode .

Table 130: Ingress Accounting Statistics Collected in offered-total-cir stat-mode

	ood	OutOfProfileOctetsDropped
For. InProf	ipf	InProfilePacketsForwarded
	iof	InProfileOctetsForwarded
For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

offered-profile-cir

Counter resource allocation: 4

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (Uncolor).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 132: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

configure qos sap-egress dynamic-policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in Table 134: Egress Policer Stat-mode Summary.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 134: Egress Policer Stat-mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In or out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-profile-cir	4	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In or out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 135: Egress Accounting Statistics Collected in minimal stat-mode .

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 136: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 137: Egress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 138: Egress Accounting Statistics Collected in offered-total-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 139: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using o**ffered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 140: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

configure qos sap-egress policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in Table 141: Egress Policer Stat-mode Summary.

Table 141: Egress Policer Stat-mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In or out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-profile-cir	4	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In or out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is reclassified at egress to exceed-profile
offered-four-profile-no-cir	4	Inplus, in, out, or exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				is reclassified at egress to inplus and/ or exceed-profile
offered-total-cir-four-profile	4	Single counter entering policer	Inplus, in, out, or exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is reclassified at egress to profile inplus

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

© 2026 Nokia.

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 143: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 144: Egress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 145: Egress Accounting Statistics Collected in offered-total-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 146: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using o**ffered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 147: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

offered-total-cir-exceed

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 148: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode .

offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus, in, out and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped, and forwarded counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus and/or exceed-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 149: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode .

offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both **profile inplus** and **profile exceed**.

This mode is intended to be used when traffic is reclassified at egress to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 150: Egress Accounting Statistics Collected in offered-total-cir-four-profile stat-mode .

Full Context

configure qos queue-group-templates ingress queue-group policer stat-mode

Description

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority or low-priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The stat-modes are described in Table 151: Stat Mode Descriptions.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 152: Ingress Accounting Statistics Collected in minimal stat-mode .

offered-profile-no-cir

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 153: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 154: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 155: Ingress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as 'out-of-profile' due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the 'offered undefined' statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

configure qos queue-group-templates egress queue-group policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 161: Egress Policer Stat Mode Summary.

Table 161: Egress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				to profile inplus and/ or exceed.
offered-total-cir-four-profile	4	Single counter entering policer	Inplus/in/out/exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is egress reclassified to profile inplus.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates one forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the **show** output and those collected when **collect-stats** is enabled are described in Table 162: Egress Accounting Statistics Collected in minimal stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-of profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped and forwarded statistics are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 163: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover traffic reclassified to in-profile (that includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 164: Egress Accounting Statistics Collected in offered-profile-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 165: Egress Accounting Statistics Collected in offered-total-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover in-profile traffic (that includes traffic reclassified to inplus-profile) and out-of-profile traffic (that includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft-in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 166: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is comprised of hard inplus, hard in, hard out, and hard exceed, as well as soft in and soft out. The offered counters cover traffic reclassified to in-profile (that includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (uncolor).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in**, and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 167: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-exceed

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 168: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus-profile, in-profile, out-of-profile, and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped and forwarded counters for both profile inplus and profile exceed.

This mode is intended to be used when traffic is egress reclassified to profile inplus and/or exceed. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 169: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out, and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 170: Egress Accounting Statistics Collected in offered-total-cir-four-profile stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

Full Context

configure subscriber-mgmt wlan-gw ue-query state

Description

This command enables matching on a specific UE state. Multiple states can be provisioned.

The **no** form of this command disables matching on the specified UE state (all UEs match).

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

state

Syntax

state *state*

no state

Context

[Tree] (config>router>policy-options>policy-statement>entry>from state)

Full Context

configure router policy-options policy-statement entry from state

Description

This command identifies in resilient gateways which routes are associated with an active context and which routes are associated with a standby context.

Default

no state

Parameters

state

Specifies the state.

Values srrp-master — This is used in non-CUPS BNG resiliency to identify routes associated with an active SRRP instance.

srrp-non-master — This is used in non-CUPS BNG resiliency to identify routes associated with a standby SRRP instance.

ipsec-master-with-peer — This is used in stateful multi-chassis IPsec (MC-IPsec) redundancy to identify routes associated with an active MC-IPsec node with a reachable peer.

ipsec-non-master — This is used in stateful MC-IPsec redundancy to identify routes associated with a standby MC-IPsec node.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipsec-master-without-peer — This is used in stateful MC-IPsec redundancy to identify routes associated with an active MC-IPsec node without a reachable peer.

fsg-active — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on the active BNG-UP. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

fsg-active-path-restoration — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on an active BNG-UP that is in a headless state. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

fsg-standby — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on the standby BNG-UP. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

no static *ipv6-address*

Context

[Tree] (config>service>vpls>proxy-nd static)

Full Context

configure service vpls proxy-nd static

Description

This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either dynamic or CStatic (Conditional Static MAC) in order to become active. Along with the IPv6 and MAC, the entry must also be configured as either host or router. This will determine if the received NS for the entry will be replied with the R flag set to 1 (router) or 0 (host).

Parameters

ipv6-address

Specifies the IPv6 address for the static entry.

ieee-address

Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

host

Specifies that the entry is type "host”.

router

Specifies that the entry is type "router”.

no static-arp *ip-address* [*ieee-mac-address*]

Context

[Tree] (config>service>vprn>if static-arp)

[Tree] (config>service>ies>if static-arp)

Full Context

configure service vprn interface static-arp

configure service ies interface static-arp

Description

This command configures a static address resolution protocol (ARP) entry associating a subscriber IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address will be replaced with the new MAC address.

The **no** form of this command removes a static ARP entry.

Parameters

ip-address

Specifies the IP address for the static ARP in IP address dotted decimal notation.

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Platforms

Context

[Tree] (config>router>if static-arp)

Full Context

configure router interface static-arp

Description

This command configures a static Address Resolution Protocol (ARP) entry associating an IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a specific IP address already exists and a new MAC address is configured for the IP address, the existing MAC address is replaced by the new MAC address.

The number of static-arp entries that can be configured on a single node is limited to 1000.

Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address. Use proxy ARP so the router responds to ARP requests on behalf of another device.

The **no** form of this command removes a static ARP entry.

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa-bb-cc-dd -ee-ff*, where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Full Context

configure service vprn bgp-ipvpn mpls auto-bind-tunnel static-blackhole-first

Description

This command configures the router to use a modified next-hop resolution sequence for each imported VPN-IP route. The router first checks for a static route in the Base routing table that matches the BGP next-hop address. If at least one such static route exists, and the route that is the longest match of the BGP next-hop address is a blackhole static route, the router resolves the VPN-IP route and programs it into the VPRN IP FIB table with a next-hop action that discards all matching packets. If there is no matching static route, or the longest matching static route is not a blackhole, the router resolves the VPN-IP route in the Base routing table as normal, that is, according to the configured VPRN auto-bind filter options.

The **no** form of this command configures the router to resolve VPN-IP routes in the Base routing table according to the configured VPRN auto-bind filter options.

Default

no static-blackhole-first

Context

[Tree] (config>router>origin-validation static-entry)

Full Context

configure router origin-validation static-entry

Description

This command configures a static VRP entry indicating that a specific origin AS is either valid or invalid for a specific IP prefix range. Static VRP entries are stored along with dynamic VRP entries (learned from local cache servers using the RPKI-Router protocol) in the origin validation database of the router. This database is used for determining the **origin-validation** state of IPv4 and/or IPv6 BGP routes received over sessions with the **enable-origin-validatio**n command configured.

Static entries can only be configured under the **config**>**router**>**origin-validation** context of the base router.

Parameters

ip-prefix/ip-prefix-length

Specifies an IPv4 or IPv6 address with a minimum prefix length value.

Values 60 to 3600

prefix-length2

Specifies the maximum prefix length.

Values 1 to 128

as-number

Specifies as-number.

Values 0 to 4294967295

valid

Specifies a keyword meaning the static entry expresses a valid combination of origin AS and prefix range.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

invalid

Specifies a keyword meaning the static entry expresses an invalid combination of origin AS and prefix range.

[Tree] (config>service>ies>sub-if>grp-if>sap static-host)

Full Context

configure service vprn subscriber-interface group-interface sap static-host

configure service ies subscriber-interface group-interface sap static-host

Description

This command creates a static subscriber host for the SAP. Static subscriber hosts may be used by the system for various purposes. Applications within the system that make use of static host entries include anti-spoof, ARP reply agent and source MAC population into the VPLS forwarding database.

Multiple static hosts may be defined on the SAP. Each host is identified by either a source IP address, a source MAC address or both a source IP and source MAC address. Every static host definition must have at least one address defined, IP or MAC.

Static hosts can exist on the SAP even with anti-spoof and ARP reply agent features disabled. When enabled, each feature has different requirements for static hosts.

The **no** form of this command removes a static entry from the system. The specified *ip-address* and *mac-address* must match the host's exact IP and MAC addresses as defined when it was created. When a static host is removed from the SAP, the corresponding anti-spoof filter entry and/or FDB entry is also removed.

Parameters

ip-prefix[/prefix-length

Specifies information for the specified IP address and mask.

mac-address

Specifies a MAC address. The MAC address must be specified for **anti-spoof mac**, and **anti-spoof ip-mac** and arp-reply-agent (**arp-reply-agent** is supported by the 7450 ESS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

only). Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

Every static host definition must have at least one address defined, IP or MAC.

force

Specifies the forced removal of the static host addresses.

create

Keyword used to create the static host instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure router mpls-labels static-label-range

Description

This command configures the range of MPLS static label values shared among static LSP, MPLS-TP LSP, and static service VC label. This command also sets the lower bound of the dynamic label range which is contiguous to the static label range. Once this range is configured, it is reserved and cannot be used by other protocols such as RSVP, LDP, BGP, or Segment Routing to assign a label dynamically.

Default

static-label-range 18400

Parameters

static-range

Specifies the size of the static label range in number of labels. The minimum label value in the range is 32. The maximum label value is therefore computed as {32+ static-range-1}.

Values 0 to 262112

Default 18400

configure router mpls static-lsp

Description

This command is used to configure a static LSP on the ingress router. The static LSP is a manually set up LSP where the nexthop IP address and the outgoing label (push) must be specified.

The **no** form of this command deletes this static LSP and associated information.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The LSP must be shutdown first in order to delete it. If the LSP is not shut down, the **no static-lsp** *lsp-name* command does nothing except generate a warning message on the console indicating that the LSP is administratively up.

Parameters

lsp-name

Specifies the name that identifies the LSP.

Values Up to 32 alphanumeric characters.

Platforms

All

44.79 static-lsp-fast-retry

static-lsp-fast-retry

Syntax

static-lsp-fast-retry *seconds*

no static-lsp-fast-retry

Context

[Tree] (config>router>mpls static-lsp-fast-retry)

Full Context

configure router mpls static-lsp-fast-retry

Description

This command specifies the value used as the fast retry timer for a static LSP.

When a static LSP is trying to come up, the MPLS request for the ARP entry of the LSP next-hop may fail when it is made while the next-hop is still down or unavailable. In that case, MPLS starts a retry timer before making the next request. This enhancement allows the user to configure the retry timer, so that the LSP comes up as soon as the next-hop is up.

The **no** form of this command reverts to the default.

Default

no static-lsp-fast-retry

Parameters

seconds

Specifies the value (in s), used as the fast retry timer for a static LSP.

[Tree] (config>service>vpls>sap static-mac)

Full Context

configure service vpls mesh-sdp static-mac

configure service vpls spoke-sdp static-mac

configure service vpls sap static-mac

Description

This command creates a remote static MAC entry in the Virtual Private LAN Service (VPLS) forwarding database (FDB) associated with the service destination point (SDP).

In a VPLS service, MAC addresses are associated with a SAP or with an SDP. MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Local and remote static MAC entries create a permanent MAC address to SDP association in the forwarding database for the VPLS instance so that MAC address is not learned on the edge device.

Note:
Static MAC definitions on one edge device are not propagated to other edge devices participating in the VPLS instance, that is, each edge device has an independent forwarding database for the VPLS.

Only one static MAC entry (local or remote) can be defined per MAC address per VPLS instance.

By default, no static MAC address entries are defined for the SDP.

The **no** form of this command deletes the static MAC entry with the specified MAC address associated with the SDP from the VPLS forwarding database.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa-bb-cc-dd -ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

create

Keyword used to create the static MAC instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

All

static-mac

Syntax

static-mac

Context

[Tree] (config>service>vpls static-mac)

Full Context

configure service vpls static-mac

Description

A set of conditional static MAC addresses can be created within a VPLS supporting BGP-EVPN. Conditional Static Macs are also supported in B-VPLS with SPBs. Unless they are configured as **black-hole**, conditional Static Macs are dependent on the SAP/SDP state.

This command allows the assignment of a set of conditional Static MAC addresses to a SAP/ spoke-SDP or **black-hole**. In the FDB, the static MAC is then associated with the active SAP or spoke-SDP.

When configured in conjunction with SPBM services, Static MACs are used for PBB Epipe and I-VPLS services that may terminate external to SPBM. If this is configured under a Control B-VPLS the interface referenced will not use IS-IS for this neighbor. This may also be configured under a User B-VPLS where the corresponding interface is not supported under the Control B-VPLS.

Static MACs configured in a BGP-EVPN service are advertised as protected (EVPN will signal the MAC as protected).

bof static-route

Description

This command creates a **static route** entry for the CPM management Ethernet port in the running configuration and the Boot Option File (BOF).

This command allows manual configuration of static routing table entries. These static routes are only used by traffic generated by the CPM Ethernet port. To reduce configuration, manual address aggregation should be applied where possible.

A maximum of 10 static routes can be configured on the CPM port.

The **no** form of this command deletes the static route.

Default

no static-route

Parameters

ip-prefix/ip-prefix-length

Specifies the destination address of the static route in dotted decimal notation.

Values

ip-prefix/ip-prefix-length	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-le	0 to 32
	ipv6-prefix	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0to 255]D
	ipv6-prefix-le	0 to128
ip-address	ipv4-address	a.b.c.d
	ipv6-address	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

x: [0 to FFFF]H

d: [0 to 255]D

Note:
IPv6 is applicable to the 7750 SR and 7950 XRS only.

mask

Specifies the subnet mask, expressed as an integer or in dotted decimal notation.

Values 1 to 32 (mask length), 128.0.0.0 to255.255.255.255 (dotted decimal)

ip-address

Specifies the next hop IP address used to reach the destination.

Platforms

All

45.3 static-route-entry

static-route-entry

Syntax

static-route-entry *ip-prefix*/*prefix-length* [**mcast**]

no static-route-entry *ip-prefix*/*prefix-length* [**mcast**]

Context

[Tree] (config>service>vprn static-route-entry)

Full Context

configure service vprn static-route-entry

Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

Once the static route context for the specified prefix and netmask has been created, additional parameters associated with the static route(s) may be specified through the inclusion of additional static-route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

IPv6 static routes are not supported on the 7450 ESS except in mixed mode.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

No static routes are defined.

Parameters

ip-prefix/prefix-length

The destination address of the static route.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

Values The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

mcast

Specifies that the associated static route should be populated in the associated VPRN multicast route table.

Platforms

All

static-route-entry

Syntax

[**no**] **static-route-entry** *ip-prefixlprefix-length* [**mcast**]

Context

[Tree] (config>router static-route-entry)

Full Context

configure router static-route-entry

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

After the static route context for the specified prefix and netmask has been created, additional parameters associated with the static routes may be specified through the inclusion of additional static route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

Default

No static routes are defined.

Parameters

ip-prefix/prefix-length

Specifies the destination address of the static route.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-prefix	a.b.c.d (host bits must be 0)	
ipv4-prefix-length	0 to 32	
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x	[0 to FFFF]H
	d	[0 to 255]D
ipv6-prefix-length	0 to 128	

Values The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

ip-address

Specifies the IP address of the IP interface. The *ip-addr* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

x:x:x:x:x:x:d.d.d.d[-interface]

x: [0..FFFF]H

d: [0..255]D

interface: 32 characters maximum, mandatory for link local addresses

Values The following value applies to the 7450 ESS:

ipv4-address a.b.c.d (host bits must be 0)

mcast

Indicates that static route being configured is used for multicast table only.

configure router static-route-hold-down

Description

This command enables the hold down time feature globally for static routes in the system.

The static route hold-down time is a mechanism to protect from rapid, fluctuating state changes of static routes resulting from issues with reachability because of link flap.

This command applies to all static routes in the VPRN and the base router instance in which this hold-down time is configured.

The **no** form of this command disables the hold down time feature globally for static routes in the system.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no static-route-hold-down

Parameters

initial

Specifies the initial value of the hold down time, in seconds, globally for static routes in the system.

Values 1 to 65535

multiplier

Specifies the multiplier value of the hold down time feature globally for static routes in the system.

Values 1 to 10

max-value

Specifies the maximum value of the hold down time, in seconds, globally for static routes in the system.

Values 1 to 65535

[Tree] (config>service>ies>if static-tunnel-redundant-next-hop)

Full Context

configure service vprn interface static-tunnel-redundant-next-hop

configure service ies interface static-tunnel-redundant-next-hop

Description

This command configures a redundant next-hop address on a public or private IPsec interface (with a public or private tunnel SAP) for a static IPsec tunnel in 1:1 MC-IPsec. A standby node uses the specified next-hop address to shunt traffic to the master in case it receives traffic destined to a tunnel endpoint address. The standby tunnel group needs to be operationally up for the feature to work.

The next-hop address will be resolved in routing table of corresponding service.

The **no** form of this command removes the address from the interface configuration.

Parameters

ip-address

Specifies the static ISA tunnel redundant next-hop address.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure router bgp group monitor station

configure service vprn bgp group neighbor monitor station

configure router bgp monitor station

Description

This command configures the set of BMP monitoring stations for which BMP messages are to be sent, at the global BGP instance level, per group or for a particular neighbor.

Whatever value is configured for the station parameter at the most specific BGP hierarchy level is used.

- If a station list or the **no station** command is configured at a neighbor context, then that value is used.
- If **no station** command is configured at the neighbor context, the group value is used.
- If a station list or the **no station** command is configured at a group context, then that value is used.
- If **no station** command is configured at the group context, the global value is used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If a station list or the **no station** command is configured at the global context, then that value is used.
- If **no station** command is configured at the global context, then a **no station** is assumed.

The **no** form of this command disables sending BMP messages to BMP monitoring stations.

Parameters

name

Specifies up to eight station names up to 32 characters. Allowed values are any string up to 32 characters long composed of printable,7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

all

Specifies all configured stations.

Full Context

configure bmp station connection station-address

Description

This command configures the IP address and TCP port number of the remote BMP monitoring station. This is a mandatory parameter and must be configured before the associated station can transitioned out of the shut down state.

The **no** form of this command removes the configured station IP address and port number for the BMP session. The **no station-address** command cannot be accepted unless the BMP or station instance is shut down.

Parameters

ip-address

Specifies the station address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address

Specifies the station address expressed in dotted decimal notation. Allowed value is a valid routable IPv6 address on the router, either an interface or system IPv6 address.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

port

Specifies the TCP (destination) port number to be used when establishing the connection to the associated BMP station.

Values 1 to 65535

status-verify

Syntax

status-verify default-result {revoked | good}

no status-verify

Context

[Tree] (config>system>security>tls>client-tls-profile status-verify)

[Tree] (config>system>security>tls>server-tls-profile status-verify)

Full Context

configure system security tls client-tls-profile status-verify

configure system security tls server-tls-profile status-verify

Description

This command configures the certificate revocation status verification parameters for end-entity (EE) certificates in the TLS client or server. This configuration overrides the existing revocation check policy.

By default the router checks the certification revocation status, but if this command is set to **good**, the end-entity certificate revocation status is overwritten and a good revocation status is returned for the EE certificate.

If this command is set to **revoked**, the router returns the actual revocation status of the end-entity certificate.

The **no** form of this command returns the actual revocation status to that of the end entity certificate.

Default

status-verify default-result revoked

Parameters

good

Specifies that the certificate is considered acceptable.

revoked

Specifies that the certificate is considered revoked.

configure service vprn nat inside redundancy steering-route

Description

This command configures specifies the IP address and prefix length of the steering route. The steering route is used in the realm of this virtual router instance as an indirect next-hop for all the traffic that must be routed to the large scale NAT function.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

steering-route

Syntax

steering-route *ip-prefix/length*

no steering-route

Context

[Tree] (config>router>nat>inside>redundancy steering-route)

Full Context

configure router nat inside redundancy steering-route

Description

This command is optionally used in LSN44 multi-chassis redundancy when filters are used on the inside to send traffic destined for the LSN44 function to MS-ISA, where NAT is performed.

If configured, the steering-route is advertised only from the active LSN44 node: the purpose is to bring the LSN44 node activity awareness to downstream routers. In this fashion, downstream routers can make a more intelligent decision when forwarding traffic in the upstream direction. Based on the steering-route, traffic can be sent directly towards the active LSN44 node. This route avoids an extra forwarding hop which would ensue in the case without LSN44 activity awareness, where the upstream traffic can be forwarded to the standby LSN44 node and then to the active LSN44 node.

LSN44 node activity (active/standby) is evaluated per isa-group based on monitoring routes advertised on the outside.

The **no** form of the command removes the ip-prefix/length from the configuration.

Parameters

ip-prefix/length

Specifies the IP address and length of the steering route.

Values

ip-prefix:	a.b.c.d
ip-prefix-length:	0 to 32

Full Context

configure filter redirect-policy sticky-dest

configure filter ip-filter entry sticky-dest

configure filter ipv6-filter entry sticky-dest

configure filter mac-filter entry sticky-dest

Description

This command configures sticky destination behavior for redundant PBR/PBF actions. Configuring sticky destination has an effect on PBR/PBF actions whether a secondary action is configured.

The *hold-time-up* parameter allows the operator to delay programming of a PBR/PBF action for a specified amount of time. The timer is only started when transitioning from all configured targets being down (that is, the primary target if no secondary target is configured, or both the primary and secondary targets when both are configured) to at least one target being up.

When the timer expires, the primary PBR/PBF action is programmed if its target is up. If the primary PBR/PBF target is down and a secondary PBR/PBF action has been configured and its target is up, then this secondary PBR/PBF action is programmed. In all other cases, no specific programming occurs when the timer expires.

When sticky destination is configured and the secondary PBR/PBF target is up and its associated action is programmed, it is not automatically replaced by the primary PBR/PBF action when its target transitions from down to up. In this situation, programming the primary PBR/PBF action can be forced using the **activate-primary-action** tools command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Changing the value of the timer while the timer is running takes effect immediately (that is, the timer is restarted immediately using the new value).

The **no** form of the command disables sticky destination behavior.

Default

no sticky-dest

Parameters

hold-time-up

Specifies the initial delay in seconds. Zero is equivalent to **no-hold-time-up** (no delay).

Values 0 to 65535 seconds

Platforms

All

45.21 sticky-dr

sticky-dr

Syntax

sticky-dr [**priority** *dr-priority*]

no sticky-dr

Context

[Tree] (config>service>vprn>pim>if sticky-dr)

Full Context

configure service vprn pim interface sticky-dr

Description

This command enables sticky-dr operation on this interface. When enabled, the priority in PIM hellos sent on this interface when elected as the designated router (DR) is modified to the value configured in *dr-priority*. This is done to avoid the delays in forwarding caused by DR recovery, when switching back to the old DR on a LAN when it comes back up.

By enabling **sticky-dr** on this interface, it will continue to act as the DR for the LAN even after the old DR comes back up.

The **no** form of this command disables sticky-dr operation on this interface.

Default

no sticky-dr

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

priority *dr-priority*

Sets the DR priority to be sent in PIM Hello messages following the election of that interface as the DR, when sticky-dr operation is enabled.

45.22 sticky-ecmp

sticky-ecmp

Syntax

sticky-ecmp

no sticky-ecmp

Context

[Tree] (config>router>policy-options>policy-statement>entry>action sticky-ecmp)

[Tree] (config>router>policy-options>policy-statement>default-action sticky-ecmp)

Full Context

configure router policy-options policy-statement entry action sticky-ecmp

configure router policy-options policy-statement default-action sticky-ecmp

Description

This command specifies that BGP routes matching an entry or default-action of a route policy should be tagged internally as requiring sticky ECMP behavior. When a BGP route with multiple equal-cost BGP next-hops is programmed for sticky ECMP the failure of one or more of its BGP next-hops causes only the affected traffic flows to be re-distributed to the remaining next-hops; by default (without sticky-ECMP) all flows are potentially affected, even those using a next-hop that did not fail.

Default

no sticky-ecmp

Platforms

All

45.23 sticky-msaps

sticky-msaps

Syntax

sticky-msaps [**idle-timeout** *seconds*]

no sticky-msaps

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>subscr-mgmt>msap-policy sticky-msaps)

Full Context

configure subscriber-mgmt msap-policy sticky-msaps

Description

This command prevents MSAPs associated with the specified MSAP policy from being deleted unless a manual **clear** command is issued. If this command is not enabled, an MSAP is deleted when a host creation fails or when a subscriber is no longer associated with the MSAP, for example, when a subscriber ends the session. This feature is useful for an operator who wants to keep historical statistics on MSAPs. It can also speed up host creation on an MSAP since the MSAP is already created. The **idle-timeout** parameter allows the removal of MSAPs that are idle for longer than the specified time.

The **no** form of this command allows an MSAP to be deleted when a host creation fails or when a subscriber is no longer associated with the MSAP.

Default

no sticky-msaps

Parameters

seconds

Specifies the idle timeout, in seconds.

Values 5 to 604800

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure mcast-management multicast-info-policy bundle channel video stream-selection-buffer

configure mcast-management multicast-info-policy bundle video stream-selection-buffer

configure mcast-management multicast-info-policy bundle channel source-override video stream-selection-buffer

Description

This command configures the buffer time for the stream selection. The buffer time is the maximum time before a video packet is aged out of the active cache. Nokia recommends to set the buffer time based on the maximum jitter for the stream. The video group must be administratively disabled and then enabled again (**configure isa video-group shutdown**) for the changed buffer time to take effect.

The **no** form of this command reverts to the default.

Default

stream-selection-buffer 1400

Parameters

stream-selection-buffer-time

Specifies the time, in milliseconds, to buffer the stream selection.

45.29 strict

strict

Syntax

[**no**] **strict**

Context

[Tree] (config>app-assure>group>tcp-validate strict)

Full Context

configure application-assurance group tcp-validate strict

Description

This command specifies whether enforcement of TCP sequence and acknowledgment numbers is applied. If a packet does not meet the expected sequence or acknowledgment number, it is dropped.

This command should only be enabled if the expected bit error rate or packet loss is low. For example, if acknowledgments are lost before being detected by AA, the server timeouts are triggered and retransmissions occur. If **strict** is enabled, these retransmissions would resemble a reply attack and would be dropped by AA.

The **no** form of this command removes TCP sequence and acknowledgment number enforcement.

Default

no strict

45.30 strict-adjacency-check

strict-adjacency-check

Syntax

[**no**] **strict-adjacency-check**

Context

[Tree] (config>service>vprn>isis strict-adjacency-check)

Full Context

configure service vprn isis strict-adjacency-check

Description

This command enables strict checking of address families (IPv4 and IPv6) for IS-IS adjacencies. When enabled, adjacencies do not come up unless both routers have exactly the same address families configured. If there is an existing adjacency with unmatched address families, it is torn down.

This command is used to prevent black-holing traffic when IPv4 and IPv6 topologies are different. When disabled (**no strict-adjacency-check**) a BFD session failure for either IPv4 or IPv6 will cause the routes for the other address family to be removed as well.

When disabled (**no strict-adjacency-check**), both routers only need to have one common address family to establish the adjacency.

Context

[Tree] (config>router>mpls strict-ero-nhop-direct-resolution)

Full Context

configure router mpls strict-ero-nhop-direct-resolution

Description

This command enables the strict Explicit Route Object (ERO) next-hop direct resolution. The feature restricts the routes used to resolve the next hop of an ERO address to local and host routes. This command avoids using a next hop over a parallel link when a half link is up in the routing table.

When enabled, this command applies to an ERO when all of the following conditions are met:

- the ERO next hop is an IPv4 address
- the ERO object is a strict hop
- the IPv4 address matches the primary subnet of a local numbered interface

An ERO that meets the preceding conditions restricts resolution of the next hop to a LOCAL or a HOST route. If no such route exists, RSVP rejects the PATH message with ErrCode = Routing Error (24) and SubErrCode = Bad Strict Node (2).

The **no** form of this command disables the strict ERO next-hop direct resolution.

Default

no strict-ero-nhop-direct-resolution

45.37 strip-label

strip-label

Syntax

[**no**] **strip-label**

Context

[Tree] (config>router>if strip-label)

Full Context

configure router interface strip-label

Description

This command forces packets to be stripped of all (max 5) MPLS labels before the packets are handed over for possible filter (PBR) processing.

If the packets do not have an IP header immediately following the MPLS label stack after the strip, they are discarded. Only MPLS encapsulated IP, IGP shortcuts and VPRN over MPLS packets will be processed. However, IPv4 and IPv6 packets that arrive without any labels are supported on an interface with **strip-label** enabled.

This command operates in promiscuous mode. This means that the router does not filter on the destination MAC address of the Ethernet frames. In some network designs, multiple ports may be tapped and combined into interface toward the router. Promiscuous mode allows all of these flows to be processed without requiring the destination MAC address to be updated to match the router address.

This command is supported on:

- Optical ports for the 7750 SR and 7450 ESS
- Null/Dot1q encaps
- Network ports
- IPv4
- IPv6

In order to associate an interface that is configured with the strip-label parameter with a port, the port must be configured as single-fiber for the command to be valid.

Packets that are subject to the strip-label action and are mirrored (using mirrors or lawful interception) will contain the original MPLS labels (and other L2 encapsulation) in the mirrored copy of the packet, as they appeared on the wire, when the mirror-dest type is the default type "ether". If the mirror-dest type is "ip-only", then the mirrored copy of the packet will not contain the original L2 encapsulation or the stripped MPLS labels.

The **no** form of this command removes the strip-label command.

Default

no strip-label

Syntax

[**no**] **sub-hosts-only**

Context

[Tree] (config>router>igmp>group-interface sub-hosts-only)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router igmp group-interface sub-hosts-only

Description

This command disables the processing of IGMP messages outside of the subscriber-host context. No other hosts outside of the subscriber-hosts can create IGMP states.

Disabling this command allows the creation of the IGMP states that correspond to the AN that operate in IGMP proxy mode. In this mode, the AN will hide source IP addresses of IGMP messages and will source IGMP messages with its own IP address. In this case, an IGMP state can be created under the **sap** context. This IGMP state creation under the SAP is controlled via the import policy under the group-interface.

The IGMP state processing for regular subscriber-hosts is unaffected by this command.

The **no** form of the command disables the command.

Default

sub-hosts-only

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-hosts-only

Syntax

[**no**] **sub-hosts-only**

Context

[Tree] (config>router>mld>group-interface sub-hosts-only)

Full Context

configure router mld group-interface sub-hosts-only

Description

This command processes the handling of MLD joins received from hosts that are not known in subscriber management or on which no MLD policy is applied.

Disabling this command allows the creation of the MLD states that correspond to the AN that operate in MLD proxy mode. In this mode, the AN will hide source IP addresses of MLD messages and will source MLD messages with its own IP address. In this case, an MLD state can be created under the **sap** context. This MLD state creation under the SAP is controlled via the import policy under the group-interface.

The MLD state processing for regular subscriber-hosts is unaffected by this command.

The **no** form of the command enables the command.

Default

sub-hosts-only

Full Context

configure subscriber-mgmt sub-ident-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a subscriber identification policy. Each subscriber identification policy can have a default subscriber profile defined. The subscriber identification policy default subscriber profile overrides the system default and the subscriber SAP default subscriber profiles. Defining a subscriber identification policy default subscriber profile is optional.

The subscriber identification policy default subscriber profile cannot be defined with the subscriber profile name default.

Defining a subscriber profile as a subscriber identification policy default subscriber profile will cause all active subscribers currently associated with a subscriber SAP using the policy and associated with a subscriber policy through the system default or subscriber SAP default subscriber profiles to be reassigned to the subscriber policy defined as default on the subscriber identification policy.

Attempting to delete a subscriber profile that is currently defined as a default for a subscriber identification policy will fail.

When attempting to remove a subscriber identification policy default subscriber profile definition, the system will evaluate each active subscriber on all subscriber SAPs the subscriber identification policy is currently associated with that are using the default definition to determine whether the active subscriber can be either reassigned to a subscriber SAP default or the system default subscriber profile. If all active subscribers cannot be reassigned, the removal attempt will fail.

The **no** form of this command reverts to the default.

Parameters

sub-ident-policy-name

Specifies the name of the subscriber identification policy, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt sub-ident-policy

configure subscriber-mgmt msap-policy sub-sla-mgmt sub-ident-policy

configure service vpls sap sub-sla-mgmt sub-ident-policy

Description

This command associates a subscriber identification policy to this SAP. The subscriber identification policy must be defined prior to associating the profile with a SAP in the **config>subscr-mgmt>sub-ident-policy** context.

Subscribers are managed by the system through the use of subscriber identification strings such as a subscriber identifier, an sla-profile string, a sub-profile string and an app-profile string.

The subscriber identification policy performs following functions for subscriber hosts and sessions associated with the SAP or MSAP:

- mapping of sla-profile, sub-profile and app-profile strings obtained from authentication (for example, LUDB, RADIUS, Diameter, or Python) into profile names that are configured on the router
- for IPoE DHCPv4 hosts, the subscriber identification strings can be derived from the DHCP ACK message sent to the subscriber host using a Python script referenced in the sub-ident-policy
- for PPPoE hosts that get an IPv4 address via the PPPoE DHCPv4 client and for IPoE DHCPv4 hosts, an SR OS DHCPv4 server in combination with an LUDB returns the identification strings in a DHCPv4 option. The **strings-from-option** command in the sub-ident-policy tells the system from which option to extract the identification strings.

The **no** form of this command removes the default subscriber identification policy from the SAP configuration.

Parameters

sub-ident-policy-name

Specifies a subscriber identification policy for this SAP.

no sub-ident-policy

Context

[Tree] (config>app-assure>group>transit-ip-policy sub-ident-policy)

Full Context

configure application-assurance group transit-ip-policy sub-ident-policy

Description

This command associates a subscriber identification policy to this SAP. The subscriber identification policy must be defined prior to associating the profile with a SAP in the **config>subscribermgmt>sub-ident-policy** context.

Subscribers are managed by the system through the use of subscriber identification strings. A subscriber identification string uniquely identifies a subscriber. For static hosts, the subscriber identification string is explicitly defined with each static subscriber host.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For dynamic hosts, the subscriber identification string must be derived from the DHCP ACK message sent to the subscriber host. The default value for the string is the content of Option 82 CIRCUIT-ID and REMOTE-ID fields interpreted as an octet string. As an option, the DHCP ACK message may be processed by a subscriber identification policy which has the capability to parse the message into an alternative ASCII or octet string value.

When multiple hosts on the same port are associated with the same subscriber identification string they are considered to be host members of the same subscriber.

A sub-ident-policy can also be used for identifying dynamic transit subscriber names.

The **no** form of this command removes the default subscriber identification policy from the SAP configuration.

Default

no sub-ident-policy

Parameters

sub-ident-policy-name

Specifies the subscriber identification policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

45.50 sub-mcac-policy

sub-mcac-policy

Syntax

sub-mcac-policy *sub-mcac-policy-name* [**create**]

no sub-mcac-policy *b*

Context

[Tree] (config>subscr-mgmt sub-mcac-policy)

Full Context

configure subscriber-mgmt sub-mcac-policy

Description

This command creates a policy template with MCAC bandwidth limits that are applied to the subscriber.

Per interface mcac bandwidth limits are set directly under the interface (regular interface or group-interface) and no such policy templates are needed.

The need for a separate policy template for subscribers is due to the fact that groups of subscribers under the same group-interface can share certain settings that can be configured via this template.

To summarize, the MCAC bandwidth constraints for subscribers are defined in the sub-mcac-policy while the mcac bandwidth constraints for the interface are configured directly under the **igmp>interface>mcac** or **igmp>grp-if>mcac** context without the need for policy templates.

Note:
The sub-mcac-policy only deals with the mcac bandwidth limits and not the channel bandwidth definitions. Channels bandwidth is defined in a different policy (in the **config>router>mcac** context) and that policy is applied on the interface level as follows:

- For group-interface: under the **config>service>vprn>igmp>grp-if>mcac** context
- For regular interface: under the **config>service/router>igmp>interface>mcac** context.

In case of HQoS Adjustment, it is mandatory that the sub-mcac-policy be created and applied to the subscriber. The sub-mac-policy does not have to contain any bandwidth constrains, but it has to be in a no shutdown state in order for HQoS Adjustment to work.

The **no** form of this command reverts to the default.

Parameters

policy-name

Specifies the name of the policy up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sub-mcac-policy *policy-name*

no sub-mcac-policy

Context

[Tree] (config>subscr-mgmt>sub-prof sub-mcac-policy)

Full Context

configure subscriber-mgmt sub-profile sub-mcac-policy

Description

This command references the policy template in which the mcac bandwidth limits are defined. Mcac for the subscriber is effectively enabled with this command when the sub-profile is applied to the subscriber. The bandwidth of the channels is defined in a different policy (under the **config>router>mcac** context) and this policy is applied on the interface level as follows:

- For group-interfaces under the **config>service>vprn>igmp>grp-if>mcac** context
- For regular interfaces under the **config>service/router>igmp>interface>mcac** context

In case of HQoS Adjustment, it is mandatory that the sub-mcac-policy be created and applied to the subscriber. The sub-mac-policy does not have to contain any bandwidth constrains, but it has to be in a no shutdown state in order for HQoS Adjustment to work.

The **no** form of this command removes the policy from the configuration.

Parameters

policy-name

Specifies the policy name configured in the config>subscr-mgmt>sub-mcac-policy context.

sub-profile

Syntax

[**no**] **sub-profile** *subscriber-profile-name*

Context

[Tree] (config>subscr-mgmt sub-profile)

Full Context

configure subscriber-mgmt sub-profile

Description

Commands in this context configure a subscriber profile. A subscriber profile is a template used to define the aggregate QoS for all hosts within a subscriber context. This is done through the definition of the egress and ingress scheduler policies that govern the aggregate SLA for subscribers using the subscriber profile. Subscriber profiles also allow for specific SLA profile definitions when the default definitions from the subscriber identification policy must be overridden.

Subscribers are either explicitly mapped to a subscriber profile template or are dynamically associated by one of various non-provisioned subscriber profile definitions.

A subscriber host can be associated with a subscriber profile in the following ways, listed from lowest to highest precedence:

1. The subscriber profile named default.
2. The subscriber profile defined as the subscriber SAP default.
3. The subscriber profile found by the subscriber identification policy sub-profile-map.
4. The subscriber profile found by the subscriber identification policy explicit map.

In the event that no defaults are defined and the subscriber identification string is not explicitly provisioned to map to a subscriber profile, either the static subscriber host creation will fail or the dynamic subscriber host DHCP ACK is discarded.

Default Subscriber profile:

When a subscriber profile is created with the *subscriber-profile-name* default, it is used when no other subscriber profile is associated with the subscriber host by the system. Creating a subscriber profile with the *subscriber-profile-name* default is optional. If a default subscriber profile is not created, all subscriber hosts subscriber identification strings must match either a non-provisioned default or be provisioned as an explicit match to a subscriber profile.

The default profile has no effect on existing active subscriber on the system as they exist due to higher precedence mappings.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Attempting to delete any subscriber profile (including the profile named default) while in use by existing active subscribers will fail.

The **no** form of this command reverts to the default.

Parameters

subscriber-profile-name

Specifies the name of the subscriber profile, up to 32 characters.

create

Keyword used to create the subscriber profile.

Parameters

string

Specifies the string used to look up the subscriber profile.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

45.57 sub-ring

sub-ring

Syntax

[**no**] **sub-ring** {**virtual-link** | **non-virtual-link**}

Context

[Tree] (config>eth-ring sub-ring)

Full Context

configure eth-ring sub-ring

Description

This command specifies this ring-id to be sub-ring as defined in G.80312. By declaring this ring as a sub-ring object, this ring will only have one valid path and the sub-ring will be connected to a major ring or a VPLS instance.

The **virtual-link** keyword declares that a sub-ring is connected to another ring and control messages can be sent over the attached ring to the other side of the sub-ring.

The **non-virtual-link** channel parameter declares that a sub-ring may be connected to another ring or to a VPLS instance but no control messages from the sub-ring use the attached ring or VPLS instance. The non-virtual channel behavior is standard G.8032 capability.

The **no** form of this command deletes the sub-ring and its virtual channel associations.

Default

no sub-ring

Parameters

virtual-link

Specifies that the interconnection is to a ring and a virtual link will be used.

non-virtual-link

Specifies that the interconnection is to a ring or a VPLS instance and a virtual link will not be used.

Use subject to Terms available at: www.nokia.com/terms.

configure router interface external-reference openconfig subinterface

Description

This command configures the subinterface ID used to map a Nokia vendor-specific configuration and the OpenConfig state.

This command configures the ability to query the OpenConfig state through NETCONF, gRPC, and the MD-CLI from any configuration mode without having to add any OpenConfig model configuration. As part of the configuration, a user must also add a port to the Layer 3 interface.

The **no** form of this command reverts to the default.

Default

no subinterface

Parameters

subinterface

Specifies the subinterface ID.

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

45.60 subject

subject

Syntax

subject {**eq** | **neq**} *subject* [*regexp*]

no subject

Context

[Tree] (config>service>vprn>log>filter>entry>match subject)

Full Context

configure service vprn log filter entry match subject

Description

This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the subject match criterion.

Default

no subject

Parameters

eq | neq

This operator specifies the type of match. Valid operators are listed below.

Values

Table 171: Valid Operators

Operator	Notes
eq	equal to
neq	not equal to

subject

A string used as the subject match criterion.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered.

When **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

Platforms

All

subject

Syntax

subject {**eq** | **neq**} *subject* [*regexp*]

no subject

Context

[Tree] (config>log>filter>entry>match subject)

[Tree] (config>service>vprn>dhcp>server>pool subnet)

Full Context

configure router dhcp local-dhcp-server pool subnet

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service vprn dhcp local-dhcp-server pool subnet

Description

This command creates a subnet of IP addresses to be served from the pool. The subnet cannot include any addresses that were assigned to subscribers without those addresses specifically excluded. When the subnet is created, no IP addresses are made available until a range is defined.

The **no** form of the removes the subnet parameters from the configuration.

Parameters

ip-prefix/mask

Specifies the address prefix and mask. A mask of 255.255.255.255 is reserved for system IP addresses.

Values ip-prefix: a.b.c.d

mask: 8 to 32

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

Values a.b.c.d, any mask expressed as dotted quad

create

Keyword used to create the subnet. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure router dhcp local-dhcp-server pool subnet options subnet-mask

configure subscriber-mgmt local-user-db ipoe host options subnet-mask

Description

This command specifies the subnet-mask option to the client. The mask can either be defined (for supernetting) or taken from the pool address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the address from the configuration.

Parameters

ip-address

Specifies the IP address of the subnet mask. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

45.64 subrate

subrate

Syntax

subrate {**digital-link** | **larscom**} *rate-step*

no subrate

Context

[Tree] (config>port>tdm>ds3 subrate)

Full Context

configure port tdm ds3 subrate

Description

This command configures the channel service unit (CSU) compatibility mode to interoperate with existing DS-3 subrate standards.

This configuration applies only for non-channelized DS-3s on ASAP TDM MDAs.

The **no** form of this command remove the subrate functionality.

Default

no subrate

Parameters

digital-link

Enables the Digital-Link (Quick Eagle) CSU compatibility mode.

larscom

Enables the Larscom CSU compatibility mode.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rate-step

Specifies the subrate value for the associated DS-3.

Values 1 to 147 (digital-link) 1 to 14 (larscom)

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

configure service vprn interface sap static-host subscriber

Description

This command specifies an existing subscriber identification profile to be associated with the static subscriber host.

Parameters

sub-ident

Specifies the subscriber identification.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

subscriber

Syntax

subscriber *sub-ident-string* [**sap** *sap-id*] [**ip** *ip-address*] [{[**mac** *ieee-address*] | **sla-profile** *sla-profile-name*}] [**fc** {[**be**] [**l2**] [**af**] [**l1**] [**h2**] [**ef**] [**h1**] [**nc**]}] {[**ingress**] [**egress**]} [**host-type** *host-type*] [**family** *family*]

no subscriber *sub-ident-string*

Context

[Tree] (config>mirror>mirror-source subscriber)

Full Context

configure mirror mirror-source subscriber

Description

This command adds hosts of a subscriber to mirroring service.

Parameters

sub-ident-string

Specifies the name of the subscriber identification policy.

sap-id

Specifies the physical port identifier portion of the SAP definition.

ip-address

Specifies the service IP address (system IP address) of the remote device sending LI traffic. If 0.0.0.0 is specified, any remote router is allowed to send to this service.

Values 1.0.0.1 to 223.255.255.254

ieee-address

Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name

Each host of a subscriber can use a different sla-profile. This option allows interception of only the hosts using the specified sla-profile. In some deployments sla-profiles are assigned per type of traffic. There can be, for example, a specific sla-profile for voice traffic (which could be used for all SIP-hosts). The name can have up to 32 characters.

fc

Specifies the name of the forwarding class with which to associate traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error will be returned and the **fc** command will have no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* will override the default forwarding class.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values be, l2, af, l1, h2, ef, h1, nc

egress

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

ingress

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination prior to ingress packet modification.

host-type

Specifies the host type for mirroring. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipoe, ppp

family

Specifies the IP family for mirroring. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipv4, ipv6

Platforms

All

subscriber

Syntax

subscriber *sub-ident-string* [**sap** *sap-id* [**ip** *ip-address*] [**mac** *ieee-address*] | **sla-profile** *sla-profile-name*] [**fc** {[**be**] [**l2**] [**af**] [**l1**] [**h2**] [**ef**] [**h1**] [**nc**]}] [**intercept-id** *intercept-id*] [**session-id** *session-id*] {[**ingress**] [**egress**]} [**host-type** *host-type*] [**family** *ip-family*]

no subscriber *sub-ident-string*

Context

[Tree] (config>li>li-source subscriber)

Full Context

configure li li-source subscriber

Description

This command adds hosts of a subscriber to mirroring service.

Parameters

sub-ident-string

Specifies the name of the subscriber identification policy.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sap-id

Specifies the physical port identifier portion of the SAP definition.

ip-address

Specifies the service IP address (system IP address) of the remote device sending LI traffic. If 0.0.0.0 is specified, any remote router is allowed to send to this service.

Values 1.0.0.1 to 223.255.255.254

ieee-address

Specifies a MAC address when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name

Specifies an SLA profile name, up to 32 characters. Each host of a subscriber can use a different sla-profile. This option allows interception of only the hosts using the specified sla-profile. In some deployments sla-profiles are assigned per type of traffic. There can be, for example, a specific sla-profile for voice traffic (which could be used for all SIP-hosts).

fc

The name of the forwarding class with which to associate LI traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error will be returned and the **fc** command will have no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* will override the default forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

intercept-id

Specifies the intercept-id that is inserted into the packet header for all mirrored packets of the associated li-source entry. This *intercept-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs.

For all types of **li-source** entries (**filter**, **nat**, **sap**, or **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** or **ip-udp-shim-sampled** routable encap, no *intercept-id* is inserted and none can be specified against the **li-source** entries.

Values 1 to 4294967295 (32b) For **nat li-source** entries that are using a mirror service that is not configured with routable encap

Values 1 to 1,073,741,824 (30b) For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and no direction-bit.

Values 1 to 536,870,912 (29b) For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and with the direction-bit enabled.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

session-id

Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encapsulation (**config>mirror>mirror-dest>encap>ip-udp-shim**).

For all types of **li-source** entries (**filter**, **nat**, **sap**, or **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, a *session-id* field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** or **ip-udp-shim-sampled** routable encap, no *session-id* is inserted and none can be specified against the **li-source** entries.

Values 1 to 4,294,967,295 (32b)

ingress

Specifies the ingress policy for lawful intercept.

egress

Specifies the egress policy for lawful intercept.

host-type

Specifies the host type for lawful intercept. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipoe, ppp

ip-family

Specifies the IP family for lawful intercept. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipv4, ipv6

[Tree] (config>service>ies subscriber-interface)

Full Context

configure service vprn subscriber-interface

configure service ies subscriber-interface

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command allows the operator to create special subscriber-based interfaces. It is used to contain multiple group interfaces. Multiple subnets associated with the subscriber interface can be applied to any of the contained group interfaces in any combination. The subscriber interface allows subnet sharing between group interfaces.

The **no** form of this command reverts to the default.

Parameters

ip-int-name

Specifies the interface name of a subscriber interface, up to 32 characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

create

Keyword used to create the subscriber interface.

fwd-service *service-id*

Specifies the wholesale service ID or service name.

Values *service-id*: 1 to 214748364

svc-name: A string up to 64 characters

ip-int-name

Specifies the wholesale subscriber interface.

wan-mode *mode*

Specifies the WAN mode as 64-bit or 128-bit. To change the WAN mode after creation, the interface must first be removed then recreated.

Values *mode64*, *mode128*

Default *mode64*

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

45.72 subscriber-limit

subscriber-limit

Syntax

subscriber-limit *limit*

no subscriber-limit

Context

[Tree] (config>service>vprn>nat>outside>pool subscriber-limit)

Full Context

configure service vprn nat outside pool subscriber-limit

Description

This command configures the maximum number of subscribers per outside IP address.

If multiple port blocks per subscriber are used, the block size is typically small; all blocks assigned to a given subscriber belong to the same IP address; the subscriber limit guarantees that any subscriber can get a minimum number of ports.

The subscribers are counted per protocol (UDP, TCP and ICMP). For example, in LSN44 a source IPv4 address that uses ports on each of the three protocols (UDP, TCP and ICMP) on an outside IP address count as 3 subscribers on that outside IP address. The ‘no subscriber-limit’ removes the limit for the number of subscribers per outside IP address.

This command is not applicable to pools with:

- arbitrary address pooling enabled
- flexible port allocations (application configured under a pool)

Parameters

limit

Specifies the maximum number of subscribers per outside IP address.

Values 1 to 65535

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

subscriber-mgmt

Syntax

subscriber-mgmt

Context

[Tree] (config subscriber-mgmt)

Full Context

configure subscriber-mgmt

Description

Commands in this context configure subscriber management entities. A subscriber is uniquely identified by a subscriber identification string. Each subscriber can have several DHCP sessions active at any time. Each session is referred to as a subscriber host and is identified by its IP address and MAC address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

All subscriber hosts belonging to the same subscriber are subject to the same hierarchical QoS (HQoS) processing. The HQoS processing is defined in the sub-profile (the subscriber profile). A sub-profile refers to an existing scheduler policy (configured in **the config>qos>scheduler-policy** context) and offers the possibility to overrule the rate of individual schedulers within this policy.

Because all subscriber hosts use the same scheduler policy instance, they must all reside on the same complex.

Description

This command configures the IPv6 prefix length of the DS-Lite subscribers.

The **no** form of this command reverts the default.

Default

subscriber-prefix-length 128

Parameters

prefix-length *prefix-length*

Specifies the IPv6 prefix length of the DS-Lite subscriber.

Values 32 to 64, 128

Default 128

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

subscriber-prefix-length

Syntax

subscriber-prefix-length *prefix-length*

no subscriber-prefix-length

Context

[Tree] (config>router>nat>inside>dual-stack-lite subscriber-prefix-length)

Full Context

configure router nat inside dual-stack-lite subscriber-prefix-length

Description

This command sets the value for the number of high order bits of the source IPv6 address that will be considered as DS-Lite subscriber. The remaining bits of the source IPv6 address will be masked off, effectively aggregation all IPv6 source addresses under the configured prefix length into a single DS-Lite subscriber. Source IPv4 addresses/ports of the traffic carried within the DS-Lite subscriber will be translated into a single outside IPv4 address and the corresponding deterministic port-block (port-blocks can be extended).

The range of values for subscriber-prefix-length in non-deterministic DS-Lite is limited from 32 to 64 (a prefix will be considered as a DS-Lite subscriber) or it can be set to a value of 128 (the source IPv6 address is considered as a DS-Lite subscriber).

In cases where deterministic DS-Lite is enabled in a giver inside routing context, the range of values of the **subscriber-prefix-length** depends on the value of *dslite-max-subscriber-limit* parameter as follows:

subscriber-prefix-length – n = [32..64,128]

where n = log2(dslite-max-subscriber-limit)

[or in an alternate form: dslite-max-subscriber-limit = 2^n.]

In other words the largest prefix length for the deterministic DS-Lite subscriber will be 32+n, where n = log2(dslite-max-subscriber-limit). The subscriber prefix length can extend up to 64 bits. Beyond 64 bits for the subscriber prefix length, there only one value is allowed: 128. In the case n must be 0, which means that the mapping between B4 elements (or IPv6 address) and the IPv4 outside addresses is in 1:1 ratio (no sharing of outside IPv4 addresses).

This parameter can be changed only when there are no deterministic prefixes configured in the same routing context.

The **no** form of the command reverts to the default.

Default

128

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

prefix-length

In non-deterministic DS-Lite this value can be [32..64,128], assuming that the deterministic DS-Lite is not concurrently enabled in the same inside routing context. In case that deterministic DS-Lite is enabled, this value can be within the range [(32+n)..64,128] where n = log2(dslite-max-subscriber-limit). The value of 128 is allowed only when n=0 (each subscriber is mapped to a single outside IPv4 IP address).

Values 32 to 64

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscriber-prefix-length

subscriber-prefix-length *prefix-length*

no subscriber-prefix-length

Context

[Tree] (config>service>vprn>nat>inside>nat66 subscriber-prefix-length)

[Tree] (config>router>nat>inside>nat66 subscriber-prefix-length)

Full Context

configure service vprn nat inside nat66 subscriber-prefix-length

configure router nat inside nat66 subscriber-prefix-length

Description

This command configures the router to enable the aggregation of watermarks and other scaling limits, such as session limits.

The IPv6 large-scale stateful inbound filtering does not translate IP addresses or ports, but it can maintain these parameters per prefix. For example, in a bridged home environment where multiple IPv6 addresses are exposed, resource control can be applied per home (for example, /64) prefix rather than per individual IPv6 address.

The **no** form of this command reverts to the default.

Default

subscriber-prefix-length 128

Parameters

prefix-length

Specifies the subscriber identification for Large Scale NAT.

Values 32 to 64, 128

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service vprn isis summary-address

Description

This command creates summary-addresses for the specified router or VPRN instance.

Parameters

ip-prefix/mask

Specifies information for the specified IP prefix and mask length.

Values		
	ip-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-length	0 to 32
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	ipv6-prefix-length	0 to 128

netmask

The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level

Specifies IS-IS level area attributes. If no level parameter is specified, the default is level-1/2.

Values level-1, level-2, level-1/2

© 2026 Nokia.

no summary-address {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*}

Context

[Tree] (config>router>isis summary-address)

Full Context

configure router isis summary-address

Description

This command creates a summary IPv4, IPv6, or SRv6 locator address.

When an IS-IS domain exists out of multiple areas, the user must redistribute IP addresses and SRv6 locators between areas for inter-area SRv6-based transport services.

Scaling may be impacted if all existing IPv4, IPv6, and SRv6 locators are redistributed between all existing areas. SRv6 locators and IP addresses can be summarized when they are redistributed from one area into another area. Summarization reduces the number of entries redistributed, which reduces the size of the Link State Database (LSDB) and increases network stability.

The **no** form of this command reverts to the default.

Default

no summary-address

Parameters

ip-prefix/ip-prefix-length

Specifies the IP prefix and prefix length of the summary address.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

netmask

Specifies the subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level

Specifies IS-IS level area attributes.

Values level-1, level-2, level-1/2

Default level-1/2

tag

Specifies the route tag to assign for the summary address.

Values 1 to 4294967295

algo-id

Specifies the algorithm topology applied for the summary address.

Values 0, 128 to 255

Default 0

match-route-tag *tag*

Specifies the route tag to match the Unreachable Prefix Announcements (UPAs). This selects a subset of summary member prefixes to monitor for reachability.

Values 1 to 4294967295

Default no match-route-tag

advertise-route-tag *tag*

Specifies the route tag to advertise in the UPA. The UPA tag can be used when there are multiple ASBR redistributing prefixes between two IGP areas.

Values 1 to 4294967295

Default no advertise-route-tag

summary-crit src-addr

no summary-crit

Context

[Tree] (config>filter>log>summary summary-crit)

Full Context

configure filter log summary summary-crit

Description

This command defines the key of the index of the mini-table. If key information is changed while summary is administratively enabled (no shutdown), the filter summary mini-table is flushed and recreated with different key information. Log packets received during the reconfiguration time will be handled as if summary was not active.

The **no** form of the command reverts to the default parameter.

Default

summary-crit src-addr

Parameters

dst-addr

Specifies that received log packets are summarized based on the destination IPv4, IPv6, or MAC address.

src-addr

Specifies that received log packets are summarized based on the source IPv4, IPv6 or MAC address.

45.86 super-backbone

super-backbone

Syntax

[**no**] **super-backbone**

Context

[Tree] (config>service>vprn>ospf super-backbone)

Full Context

configure service vprn ospf super-backbone

Description

This command specifies whether CE-PE functionality is required or not. The OSPF super backbone indicates the type of the LSA generated as a result of routes redistributed into OSPF. When enabled, the redistributed routes are injected as summary, external or NSSA LSAs. When disabled, the redistributed routes are injected as either external or NSSA LSAs only.

Default

no super-backbone

45.89 suppress

suppress

Syntax

suppress *integer*

no suppress

Context

[Tree] (config>router>policy-options>damping suppress)

Full Context

configure router policy-options damping suppress

Description

This command configures the suppression parameter for the route policy damping profile.

A route is suppressed when it has flapped frequently enough to increase the Figure of Merit (FoM) value to exceed the **suppress** threshold limit. When the **FoM** value exceeds the **suppress** threshold limit, the route is removed from the route table or inclusion in advertisements.

The **no** form of this command removes the suppress parameter from the damping profile.

Default

no suppress

Parameters

integer

Specifies the suppress value expressed as a decimal integer.

Values 1 to 20000

45.93 suppress-lsn-events

suppress-lsn-events

Syntax

[**no**] **suppress-lsn-events**

Context

[Tree] (configure>isa>wlan-gw-group>nat suppress-lsn-events)

Full Context

configure isa wlan-gw-group nat suppress-lsn-events

Description

This command suppresses the generation of Large Scale NAT (LSN) events when RADIUS accounting is enabled.

By default, only one logging facility for tracking subscribers in LSN44, DS-Lite, and NAT64 can be enabled at the time, either the SR OS event logging facility or the RADIUS logging facility. Note that SR OS event logs can be sent to multiple destinations, such as the console session, a telnet or SSH session, memory logs, file destinations, SNMP trap groups, and syslog destinations.

If RADIUS logging is enabled, the NAT logs are sent to the RADIUS destination and the NAT logs are suppressed in the SR OS event logging facility, for example, NAT logs are not sent to the syslog server.

If RADIUS logging is disabled, the NAT logs are sent to the SR OS event logging facility, for example, syslog, assuming that the events are enabled via the SR OS event-control (**configure log event-control nat** *event* **generate**).

The **no** form of this command, the NAT logs can be sent to both logging facilities simultaneously, the SR OS event logging facility and RADIUS logging facility.

45.94 suppress-lsn-sub-blks-free

suppress-lsn-sub-blks-free

Syntax

[**no**] **suppress-lsn-sub-blks-free**

Context

[Tree] (configure>isa>wlan-gw-group>nat suppress-lsn-sub-blks-free)

Full Context

configure isa wlan-gw-group nat suppress-lsn-sub-blks-free

Description

This command suppresses the tmnxNatLsnSubBlksFree summary notification and use the tmnxNatPlBlockAllocationLsn notifications. When the SR OS node is in a state of excessive logging, the queue associated with the transmission of logs on the MS-ISA can become congested. This event further delays the generation of logs, and with this, further allocations and deallocations of NAT resources (port-

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

blocks) is stalled until the queue is relieved of congestion. For example, an excessive logging state in the system can be caused by issuing a command to clear a large number of NAT subscribers where a large number of resources (port-blocks) are released at once.

The **suppress-lsn-sub-blks-free** command enables the generation of individual logs carried in event-id 2012 for every released port block regardless of the state of the transmission queue (whether congested or not). If NAT subscribers have a large number of allocated port blocks (this could be hundreds of port blocks per subscriber), generating individual logs per port-block release contributes to the congestion.

To alleviate transmission queue congestion, this behavior can be changed by disabling this command (**no suppress-lsn-sub-blks-free**). This causes the suppression of logs related to the release of individual port blocks of a NAT subscriber when the transmission queue is congested. As a result, only a summarized release log via event-id 2021 for the subscriber is generated. The purpose of this new log is to inform the operator in a single message that all ports blocks for the subscriber are released. For example, the log message for LSN is "LSN subscriber all blocks freed". The benefit of such summarization (or log aggregation) is to alleviate the congestion of the transmission queue and consequently accelerate resource releases. An effect is the decreased granularity of information.

If summarization is enabled (**no suppress-lsn-sub-blks-free**) while there is no logging congestion in the system, the port block releases continue to be logged individually via the event-id 2012 (assuming that this is enabled in the event control), except for the last port block of the subscriber. When the last port block is released, the log with event-id 2021 is generated indicating that all port blocks for the subscriber are now released without carrying the specific information about this last port block that is released.

Syntax

svc-ping *ip-address* [**service** *service-id*] [**local-sdp**] [**remote-sdp**]

Context

[Tree] (oam svc-ping)

Full Context

oam svc-ping

Description

This command tests a service ID for correct and consistent provisioning between two service end points.

The **svc-ping** command accepts a far-end IP address and a service ID for local and remote service testing. The following information can be determined from **svc-ping**:

Local and remote service existence

- Local and remote service state
- Local and remote service type correlation

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Local and remote customer association
- Local and remote service-to-SDP bindings and state
- Local and remote ingress and egress service label association

Unlike **sdp-ping**, only a single message is sent per command; no count nor interval parameter is supported and round trip time is not calculated. A time out value of 10 seconds is used before failing the request. The forwarding class is assumed to be Best-Effort Out-of-Profile.

If no request is sent or a reply is not received, all remote information is shown as N/A.

To terminate a **svc-ping** in progress, use the CLI break sequence <Ctrl-C>.

Upon request time out, message response, request termination, or request error the following local and remote information is displayed. See Table 173: Svc-ping. Local and remote information is dependent upon service existence and reception of reply.

Table 173: Svc-ping

Field	Description	Values
Request Result	The result of the **svc-ping** request message.	Sent - Request Timeout
		Sent - Request Terminated
		Sent - Reply Received
		Not Sent - Non-Existent Service-ID
		Not Sent - Non-Existent SDP for Service
		Not Sent - SDP For Service Down
		Not Sent - Non-existent Service Egress Label
Service-ID	The ID of the service being tested.	service-id
Local Service Type	The type of service being tested. If *service-id* does not exist locally, N/A is displayed.	Epipe, Ipipe, Fpipe, Apipe
		TLS
		IES
		Mirror-Dest
		—

Field	Description	Values
	The local operational state of the responder's *sdp-id* binding to *service-id*. If an *sdp-id* is not bound to the service, N/A is displayed.	Oper-Down
		—
Originating VC-ID	The originator's VC-ID associated with the *sdp-id* to the far-end address that is bound to *service-id*. If the *sdp-id* signaling is off, *originator-vc-id* is 0. If the *originator-vc-id* does not exist, N/A is displayed.	*originator-vc-id*
		—
Responding VC-ID	The responder's VC-ID associated with the *sdp-id* to *originator-id* that is bound to *service-id*. If the *sdp-id* signaling is off or the service binding to *sdp-id* does not exist, *responder-vc-id* is 0. If a response is not received, N/A is displayed.	*responder-vc-id*
		—
Originating Egress Service Label	The originating service label (VC-Label) associated with the *service-id* for the originating *sdp-id*. If *service-id* does not exist locally, N/A is displayed. If *service-id* exists, but the egress service label has not been assigned, Non-Existent is displayed.	*egress-vc-label*
		—
		Non-Existent
Originating Egress Service Label Source	The originating egress service label source. If the displayed egress service label is manually defined, Manual is displayed. If the egress service label is dynamically signaled, Signaled is displayed. If the *service-id* does not exist or the egress service label is non-existent, N/A is displayed.	Manual
		Signaled
		—
Originating Egress Service Label State	The originating egress service label state. If the originating router considers the displayed egress service label operational, Up is displayed. If the originating router considers the egress service label inoperative, Down is displayed. If the *service-id* does not exist or the egress service label is non-existent, N/A is displayed.	Up
		Down
		—
Responding Service Label	The actual responding service label in use by the far-end router for this *service-id* to the originating router. If *service-id* does not exist in the remote router, N/A is displayed. If *service-id* does exist remotely but the remote egress service label has not been assigned, Non-Existent is displayed.	*rec-vc-label*
		—
		Non-Existent
Responding Egress Service Label Source	The responder's egress service label source. If the responder's egress service label is manually defined, Manual is displayed. If the responder's egress service label is dynamically signaled, Signaled is displayed. If the *service-id* does not exist on the responder or the responder's egress service label is non-existent, N/A is displayed.	Manual

		—

Parameters

ip-address

Specifies the far-end IP address to which to send the **svc-ping** request message in dotted decimal notation.

Values a.b.c.d

service-id

Specifies the service ID of the service being tested must be indicated with this parameter. The service ID need not exist on the local router to receive a reply message.

Values 1 to 2147483647, service-name: up to 64 characters

local-sdp

Specifies the **svc-ping** request message should be sent using the same service tunnel encapsulation labeling as service traffic. If **local-sdp** is specified, the command attempts to use an egress *sdp-id* bound to the service with the specified **far-end** IP address with the VC-Label for the service. The far-end address of the specified *sdp-id* is the expected *responder-id* within the reply received. The *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reach the far end; this can be IP/GRE or MPLS. On originator egress, the service-ID must have an associated VC-Label to reach the far-end address of the *sdp-id* and the *sdp-id* must be operational for the message to be sent.

If **local-sdp** is not specified, the **svc-ping** request message is sent with GRE encapsulation with the OAM label.

Table 174: Message Encapsulation indicates whether a message is sent and how the message is encapsulated based on the state of the service ID.

Table 174: Message Encapsulation

Local Service State	local-sdp Not Specified		local-sdp Specified	
	Message Sent	Message Encapsulation	Message Sent	Message Encapsulation
Invalid Local Service	Yes	Generic IP/GRE OAM (PLP)	No	None
No Valid SDP-ID Bound	Yes	Generic IP/GRE OAM (PLP)	No	None

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Local Service State	local-sdp Not Specified		local-sdp Specified	
	Message Sent	Message Encapsulation	Message Sent	Message Encapsulation
SDP-ID Valid But Down	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid and Up, But No Service Label	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid, Up and Egress Service Label	Yes	Generic IP/GRE OAM (PLP)	Yes	SDP Encapsulation with Egress Service Label (SLP)

remote-sdp

Specifies **svc-ping** reply message from the **far-end** should be sent using the same service tunnel encapsulation labeling as service traffic.

If **remote-sdp** is specified, the **far-end** responder attempts to use an egress *sdp-id* bound to the service with the message originator as the destination IP address with the VC-Label for the service. The *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reply to the originator; this can be IP/GRE or MPLS. On responder egress, the service-ID must have an associated VC-Label to reach the originator address of the *sdp-id* and the *sdp-id* must be operational for the message to be sent.

If **remote-sdp** is not specified, the **svc-ping** request message is sent with GRE encapsulation with the OAM label.

Table 175: Message Response Encapsulation indicates how the message response is encapsulated based on the state of the remote service ID.

Table 175: Message Response Encapsulation

Remote Service State	Message Encapsulation	
	remote-sdp Not Specified	remote-sdp Specified
Invalid Ingress Service Label	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
Invalid Service-ID	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
No Valid SDP-ID Bound on Service-ID	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid But Down	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, but No Service Label	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, Egress Service Label, but VC-ID Mismatch	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)

45.100 svlan-statistics

svlan-statistics

Syntax

svlan-statistics

Context

[Tree] (config>subscr-mgmt svlan-statistics)

Full Context

configure subscriber-mgmt svlan-statistics

Description

Commands in this context enable subscriber VLAN statistics collection.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

45.101 swap

swap

Syntax

swap {*out-label* | **implicit-null-label**} **nexthop** *ip-address*

no swap

Context

[Tree] (config>router>mpls>if>label-map swap)

Full Context

configure router mpls interface label-map swap

Description

This command swaps the incoming label and specifies the outgoing label and next hop IP address on an LSR for a static LSP.

The **no** form of this command removes the swap action associated with the *in-label*.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

implicit-null-label

Specifies the use of the implicit label value for the outgoing label of the swap operation.

out-label

Specifies the label value to be swapped with the in-label. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment
- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services
- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services
- label values 131,072 through 1,048,575 are reserved for future use

Values 16 to 1048575

nexthop *ip-address*

Specifies the IP address to forward to. If an ARP entry for the next hop exists, then the static LSP will be marked operational. If ARP entry does not exist, software will set the operational status of the static LSP to down and continue to ARP for the configured nexthop. Software will continuously try to ARP for the configured nexthop at a fixed interval.

45.102 sweep

sweep

Syntax

sweep start *dispersion-start* **end** *dispersion-end*

Context

[Tree] (config>port>dwdm>coherent sweep)

Full Context

configure port dwdm coherent sweep

Description

This command allows users to configure the dispersion sweep 'start' and 'end' values for the automatic mode of coherent control. If the user knows the approximate or theoretical residual dispersion of the link,

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

this command can be used to limit the range of sweeping for the automatic control mode and thus achieve faster link up.

Parameters

dispersion-start

Specifies the lower range limit for the dispersion compensation.

Values -50000 to 50000

Default -25500

dispersion-end

Specifies the upper range limit for the dispersion compensation.

Values -50000 to 50000

Default 2000

45.104 switchover-exec

switchover-exec

Syntax

switchover-exec *file-url*

no switchover-exec

Context

[Tree] (config>system switchover-exec)

Full Context

configure system switchover-exec

Description

This command specifies the location and name of the CLI script file executed following a redundancy switchover from the previously active CPM card. A switchover can happen because of a fatal failure or by manual action.

The CLI script file can contain commands for environment settings, classic CLI debug configuration (excluding mirroring settings), and other commands not maintained by the configuration redundancy.

The following commands are not supported in the switchover-exec file: clear, configure, candidate, oam, tools, oam, ping, traceroute, mstat, mtrace and mrinfo.

Default

no switch-over-exec

Parameters

file-url

Specifies the location and name of the CLI script file.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn*/][*file-path*]
	243 chars max
	directory length 99 chars max each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

configure redundancy multi-chassis peer sync

Description

Commands in this context configure synchronization parameters.

Default

no sync

Platforms

All

sync

Syntax

[**no**] **sync**

Context

[Tree] (config>isa>nat-group>inter-chassis-redundancy sync)

Full Context

configure isa nat-group inter-chassis-redundancy sync

Description

This command configures synchronization of NAT flows between the nodes.

The **no** form of this command disables synchronization of NAT flows that were enabled between the ISAs or ESAs across the nodes. This allows NAT reconfiguration on both nodes. The synchronization of flows must be disabled on both nodes, active and standby, while NAT configuration changes are performed. The active NAT node continues to forward traffic while flow synchronization is disabled.

configure card xiom mda sync-e

Description

This command enables synchronous Ethernet on the MDA. Then any port on the MDA can be used as a source port in the sync-if-timing configuration.

The **no** form of this command disables synchronous Ethernet on the MDA.

Platforms

All

- configure card mda sync-e

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- configure card xiom mda sync-e

sync-e

Syntax

[**no**] **sync-e**

Context

[Tree] (config>system>satellite>eth-sat sync-e)

Full Context

configure system satellite eth-sat sync-e

Description

This command enables the Ethernet satellite for synchronous Ethernet operation so that the transmit timing of the satellite access ports use the frequency of the host router's central clock.

To enable this functionality, both host ports on the router that connect to the U1 and U2 ports of the satellite must be synchronous Ethernet-capable ports.

When the Ethernet satellite is configured for synchronous Ethernet, ESMC frames are enabled on the host ports. The SSM code-type used between the host and the satellite should be manually configured on the host ports to match the code-type desired on the satellite client ports. The code-type setting on the host ports does not restrict the code-type used on the satellite client ports, as those may be configured on an individual port basis.

Platforms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command manually synchronizes system files on the active CPM to the standby CPM. Either the **boot-env**, **cert** or **config** parameter must be specified.

Parameters

boot-env

Synchronize all files required for the boot process.

cert

Synchronize the PKI certificate files.

config

Synchronize the configuration files.

Platforms

All

45.112 synchronous-execution

synchronous-execution

Syntax

synchronous-execution *seconds*

synchronous-execution never

Context

[Tree] (config>system>management-interface>ops>global-timeouts synchronous-execution)

Full Context

configure system management-interface operations global-timeouts synchronous-execution

Description

This command configures the period of time that operations launched as "'synchronous" (the default method for all operations) are allowed to execute before they are automatically stopped, and their associated data is deleted.

If a specific execution timeout is not included in the request for a particular synchronous operation, this system-level timeout applies.

Note:
This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own **timeout** parameter).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Caution:
This timeout also applies to operations requested in the MD-CLI interface (for example, ping, file dir, and so on). If **synchronous-execution** is enabled with a specific time value, MD-CLI operations are subject to this timeout and are interrupted if they execute longer than the configured **synchronous-execution** time.

Default

synchronous-execution never

Parameters

seconds

Specifies the period of time, in seconds, that synchronous operations are allowed to execute.

Values 1 to 604800

never

Keyword to specify that an execution timeout is not applied to synchronous operations.

Platforms

All

45.113 syslog

Use subject to Terms available at: www.nokia.com/terms.

Parameters

name

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

Platforms

All

syslog

Syntax

syslog *syslog-id* [**name** *syslog-name*]

no syslog *syslog-id*

Context

[Tree] (config>service>vprn>log syslog)

Full Context

configure service vprn log syslog

Description

This command creates the context to configure a Syslog target host that is capable of receiving selected Syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 30 Syslog IDs can be configured.

No log events are sent to a Syslog target address until the syslog-id has been configured as the log destination (**to**) in the log-id node.

The Syslog ID configured in the **configure**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config>log**.

Default

No syslog IDs are defined.

Parameters

syslog-id

Specifies the Syslog ID for the Syslog destination.

Values 1 to 30

name syslog-name

Specifies an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

no syslog *syslog-id*

Context

[Tree] (config>log syslog)

Full Context

configure log syslog

Description

Commands in this context configure a Syslog target host capable of receiving selected syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 10 Syslog IDs can be configured.

Log events are not sent to a Syslog target address until the *syslog-id* is configured as the log destination (**to**) in the node specified by the Log ID.

The Syslog ID configured in the **config**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config**>**log**.

The **no** form of this command removes the Syslog configuration.

Parameters

syslog-id

Specifies the Syslog ID for the Syslog destination.

Values 1 to 10

name syslog-name

Configures an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

Platforms

45.114 syslog-export-policy

syslog-export-policy

Syntax

syslog-export-policy *policy-name*

no syslog-export-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>nat>nat-policy syslog-export-policy)

Full Context

configure service nat nat-policy syslog-export-policy

Description

This command creates a syslog export policy with a set of transport parameters that will be used to transmit NAT flow records in syslog format to an external collector node. This policy name is then referenced from the nat-policy applied to an inside routing context.

Default

no syslog-export-policy

Parameters

policy-name

Specifies the name of the syslog export policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

syslog-export-policy

Syntax

syslog-export-policy *name* [**create**]

no syslog-export-policy *name*

Context

[Tree] (config>service>nat>syslog syslog-export-policy)

Full Context

configure service nat syslog syslog-export-policy

Description

This command creates a syslog export policy with a set of transport parameters that are used to transmit NAT flow records in syslog format to an external collector node. This policy name is then referenced from the NAT policy applied to an inside routing context.

The **no** form of the command removes the policy name from the configuration.

Parameters

name

Specifies the syslog export policy name, up to 32 characters.

45.116 system-base-mac

system-base-mac

Syntax

system-base-mac *mac-address*

no system-base-mac

Context

[Tree] (bof system-base-mac)

Full Context

bof system-base-mac

Description

This command is used to specify the base MAC address for a VSR-based system. The specified MAC address is used as the first MAC address by the system to assign MAC addresses to individual interfaces.

It is strongly recommended that a unique base MAC address is assigned to each VSR instance with a minimum gap of 1024 between base addresses to avoid a MAC address overlap.

The **no** form of this command removes the configured system base MAC address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default
no system-base-mac

Parameters
mac-address
Specifies the MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms
7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS-20, 7950 XRS-20e, VSR

45.119 system-id

system-id

Syntax

system-id *system-id*

no system-id

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident system-id)

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification system-id

Description

This command specifies the system ID to match for a host lookup. When the LUDB is accessed through a DHCPv4 server, the system ID is matched against the Nokia vendor specific sub-option in DHCP Option 82.

Note:
This command is only used when **system-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the system ID from the configuration.

Parameters

system-id

Specifies the system ID, up to 255 characters

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.

system-id

Syntax

system-id *isis-system-id*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no system-id

Context

[Tree] (config>service>vprn>isis system-id)

Full Context

configure service vprn isis system-id

Description

This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference order:

1. **config>service>vprn>isis>system-id**
2. **config>service>vprn>isis>router-id**
3. **config>service>vprn>router-id**
4. **config>service>vprn>if>address**
5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, a **shutdown** and then **no shutdown** must be performed on the IS-IS instance. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

Default

no system-id

Parameters

isis-system-id

12 hexadecimal characters in dotted-quad notation.

Values aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

Platforms

All

system-id

Syntax

[**no**] **system-id**

Context

45.120 system-ip-load-balancing

system-ip-load-balancing

Syntax

[**no**] **system-ip-load-balancing**

Context

[Tree] (config>system>load-balancing system-ip-load-balancing)

Full Context

configure system load-balancing system-ip-load-balancing

Description

This command enables the use of the system IP address in the ECMP hash algorithm to add a per system variable. This can help guard against cases where multiple routers, in series, will end up hashing traffic to the same ECMP/LAG path.

This command is set at a system wide basis, however if certain IOMs do not support the new load-balancing algorithm, they will continue to use the default algorithm. By default, the IPv4 system IP address is used in the hash algorithm. When no IPv4 system IP address is configured, the IPv6 system IP address, when configured, is used in the hash algorithm.

The **no** form of the command resets the system wide algorithm to default.

Default

no system-ip-load-balancing

Platforms

All

Use subject to Terms available at: www.nokia.com/terms.

45.125 system-profile

system-profile

Syntax

system-profile {**profile-a** | **profile-b**}

no system-profile

Context

[Tree] (bof system-profile)

Full Context

bof system-profile

Description

This command configures the system profile in the BOF.

System profile none represents the existing system capabilities and allows hardware based on FP3 and later generations (for example, FP4, FP5) to co-exist within a system. This profile is indicated by the omission of the **system-profile** parameter in the BOF.

System profile **profile-a** is primarily targeted at subscriber services and layer 2 and 3 VPN business services.

System profile **profile-b** is primarily targeted at infrastructure routing, core, peering, and DC-GW applications.

System profiles **profile-a** and **profile-b** support only line cards based on FP4 and later generations (for example, FP5).

On 7750 SR-1 and 7750 SR-s systems, the following conditions apply about the profile parameter:

- The parameter should be configured to either **profile-a** or **profile-b**.
- If the parameter is omitted, profile **profile-a** is used by the system.
- If the parameter is configured to an invalid value, it is ignored and profile **profile-a** is used by the system.

On 7750 SR-7-B/12-B/12e and 7950 XRS-20/20e systems, the following conditions apply about the profile parameter:

- The default system profile is **none** when the parameter is omitted.
- The parameter can be configured to either **profile-a** or **profile-b**, in which case only FP4-based line cards are supported.
- If the parameter is configured to an invalid value, it is ignored and profile **none** is used by the system.

On all other systems, the following conditions apply about the profile parameter:

- These systems must use profile **none** (the existing system capabilities). As a result, the parameter must not be configured.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the parameter is configured to **profile-a** or **profile-b**, the system boots, allowing access using the console and CPM management interface, but FP2-based and FP3-based line cards cannot be provisioned; if these card types are present in the boot configuration, the boot sequence aborts loading the configuration file when it encounters their configuration. This issue can be corrected by removing the parameter and rebooting the system.
- If the parameter is configured to an invalid value, it is ignored and profile **none** is used by the system.

See "System profiles" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Basic System Configuration Guide* for more information.

The **no** form of this command removes the **system-profile** parameter from the BOF.

Parameters

profile-a

Specifies that the system profile is for subscriber services and Layer 2 and 3 VPN business services.

profile-b

Specifies that the system profile is primarily targeted at infrastructure routing, core, peering, and DC-GW applications.

Platforms

All

45.126 system-reserve

system-reserve

Syntax

system-reserve *percent-of-buffers*

no system-reserve

Context

[Tree] (config>qos>hs-pool-policy system-reserve)

Full Context

configure qos hs-pool-policy system-reserve

Description

This command defines the amount of HSQ IOM buffers that is set aside for internal system use. By default, 5% of the total buffer space is reserved for system internal queues. The command is provided for the case where the reserved buffer space is either insufficient or excessive. Exercise care when modifying this value.

When the system reserve value is changed, all the provisioned port-class, mid-tier, and root pool sizes are reevaluated and possibly changed.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Use the **show hs-pools** *card-slot-number* **fp** *forwarding-plane* **egress** command to display the current buffer allocation and buffer usage conditions on an HSQ IOM.

The **no** form of the command reverts to the default system reserve value.

Default

system-reserve 5.0

Parameters

percent-of-buffers

Specifies the percentage of HS buffers that are reserved for internal system use. This parameter is required when executing the **system-reserve** command. The parameter accepts a percent value with two decimal places (100th of a percent).

Values 1.00 to 30.00

Platforms

7750 SR-7/12/12e

Full Context

configure service vpls proxy-nd table-size

configure service vpls proxy-arp table-size

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command adds a table-size limit per service. By default, the table-size limit is 250; it can be set up to 16k entries per service. A non-configurable implicit high watermark of 95% and low watermark of 90% exists, per service and per system. When those watermarks are reached, a syslog/trap is triggered. When the system/service limit is reached, entries for a specified IP can be replaced (a different MAC can be learned and added) but no new IP entries will be added, regardless of the type (Static, evpn, dynamic). If the user attempts to change the **table-size** value to a value that cannot accommodate the number of existing entries, the attempt will fail.

Default

table-size 250

Parameters

table-size

Specifies the table-size as number of entries for the service.

Values 1 to 16384

Platforms

All

46.6 tacplus

tacplus

Syntax

no tacplus

tacplus [**create**]

Context

[Tree] (config>service>vprn>aaa>rmt-srv tacplus)

configure router policy-options policy-statement entry action tag

Description

This command assigns a tag to routes matching the entry, which is then applied to IGP routes. A decimal or hexadecimal value of 4 octets can be entered.

For IS-IS and OSPF, all four octets can be used.

For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag.

Default

no tag

Parameters

tag

Assigns an IS-IS, OSPF, RIP or RIPng tag to routes matching the entry.

Values Accepts decimal or hexadecimal formats:

IS-IS and OSPF: 0x0–0xFFFFFFFF or 1–4294967295

RIP and RIPng: 0x0–0xFFFF or 1–65535

name — The tag parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

configure qos sap-ingress ipv6-criteria entry tag

Description

This command associates a tag with the criteria entry.

Tag identifiers are not supported in SAP ingress QoS policies, MAC criteria statements, or in SAP egress QoS policies.

The **no** form of this command removes the tag.

Parameters

tag-id

Specifies the tag ID.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure service epipe spoke-sdp pw-path-id taii-type2

configure service cpipe spoke-sdp pw-path-id taii-type2

configure service vpls spoke-sdp pw-path-id taii-type2

Description

This command configures the Target Individual Attachment Identifier (TAII) for an MPLS-TP spoke SDP. If this is configured on a spoke SDP for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the saii-type2 of the mate spoke SDP.

Parameters

global-id

Specifies the global ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values 0 to 4294967295

node-id

Specifies the node ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values a.b.c.d or 0 to 4294967295

ac-id

Specifies the attachment circuit ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

taii-type2

Syntax

taii-type2 *global-id:prefix:ac-id*

no taii-type2

Context

[Tree] (config>service>epipe>spoke-sdp-fec taii-type2)

Full Context

configure service epipe spoke-sdp-fec taii-type2

Description

taii-type2 configures the target attachment individual identifier for the SDP SDP. This is only applicable to FEC129 AII type 2.

This command is blocked in CLI if this end of the spoke SDP is configured for single-sided auto configuration (using the **auto-config** command).

Parameters

global-id

Specifies a global ID of this router T-PE. This value must correspond to one of the global_id values configured for a local-prefix under **config>service>pw-routing>local-prefix** context.

Values 1 to 4294967295

prefix

Speecifies prefix on this router T-PE that the spoke SDP SDP is associated with. This value must correspond to one of the prefixes configured under **config>service>pw-routing>local-prefix** context.

Values an IPv4-formatted address a.b.c.d or 1 to 4294967295

ac-id

Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

Platforms

All

© 2026 Nokia.

configure system grpc-tunnel tunnel handler target-type

Description

This command assigns a server as a handler for all tunnel sessions.

The **no** form of this command disables the tunnel handler server.

Default

no target-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

grpc-server

Keyword that assigns the gRPC server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "GNMI_GNOI”.

ssh-server

Keyword that assigns the SSH server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "SSH”.

custom-type

Keyword that assigns an arbitrary string as the target type.

type

Specifies a string, up to 255 characters, defining the client to serve as a handler for all tunnel sessions. Values used by gRPC tunnel protocol, such as "GNMI_GNOI” or "SSH” can also be used.

Platforms

All

46.16 targeted-session

targeted-session

Syntax

targeted-session

Context

[Tree] (config>router>ldp targeted-session)

Full Context

configure router ldp targeted-session

Description

This command configures targeted LDP sessions. Targeted sessions are LDP sessions between non-directly connected peers. Hello messages are sent directly to the peer platform instead of to all the routers on this subnet multicast address. The user can configure different default parameters for IPv4 and IPv6 LDP targeted hello adjacencies.

The discovery messages for an indirect LDP session are addressed to the specified peer and not to the multicast address.

Keyword used to specify detailed information about PCE or connection task events.

Platforms

VSR-NRC

46.18 task-scheduling-int

task-scheduling-int

Syntax

task-scheduling-int *percent-of-default*

no task-scheduling-int

Context

[Tree] (config>card>virt-sched-adj task-scheduling-int)

Full Context

configure card virtual-scheduler-adjustment task-scheduling-int

Description

This command overrides the system default time between scheduling the hierarchical virtual scheduling task. By default, the system "wakes” the virtual scheduler task every 50ms; this is equivalent to five 10ms timer ticks. The task-scheduling-int command uses a percent value parameter to modify the number of timer ticks.

While the system accepts a wide range of percent values, the result is rounded to the nearest 10ms tick value. The fastest wake interval is 10ms (1 timer tick).

The **no** form of this command restores the default task scheduling interval of the card’s hierarchical virtual scheduler task.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

percent-of-default:

Specifies that the percent-of-default parameter is required and is used to modify the default task scheduling interval for the hierarchical virtual scheduling task on the card. Defining 100.00 percent is equivalent to removing the override.

Values 0.01% to 1000.00%

Default 100.00%

[Tree] (cfg>sys>sec>cpm>ip-filter>entry>match tcp-ack)

Full Context

configure system security cpm-filter ipv6-filter entry match tcp-ack

configure system security cpm-filter ip-filter entry match tcp-ack

Description

This command configures matching on the ACK bit being set or reset in the control bits of the TCP header of an IP or IPv6 packet as an IP filter match criterion.

Note:
An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the criterion from the match entry.

Default

no tcp-ack

Parameters

true

Specifies matching on IP or IPv6 packets that have the ACK bit set in the control bits of the TCP header of an IP or IPv6 packet.

false

Specifies matching on IP or IPv6 packets that do not have the ACK bit set in the control bits of the TCP header of the IP or IPv6 packet.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure filter ipv6-filter entry match tcp-ece

configure filter ip-filter entry match tcp-ece

Description

This command configures an IP filter match criterion based on the ECN-Echo (ECE) TCP Flag bit, defined in RFC 3168, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-ece

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

configure filter ipv6-filter entry match tcp-fin

Description

This command configures an IP filter match criterion based on the FIN TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-fin

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

All

46.27 tcp-keepalive

tcp-keepalive

Syntax

tcp-keepalive

Context

[Tree] (config>system>grpc tcp-keepalive)

Full Context

configure system grpc tcp-keepalive

Description

Commands in this context configure the sending of TCP keepalives by the router towards all gRPC clients.

Enabling TCP keepalive speeds up the detection of certain failures. The TCP keepalives sent by the router are controlled by three commands: **idle-time**, **interval**, and **retries**. The router starts sending TCP keepalives when the connection has been idle (no TCP segments sent or received) for more than **idle-time**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

seconds. At that point, the router sends a probe (TCP ACK with a sequence number = current sequence number - 1) and expects a TCP ACK. It repeats this probe every **interval** seconds for the configured number of **retries**. If no response is received to any of the probes, the connection is immediately closed, which starts the purge timer if the TCP connection is currently supporting the RibApi service.

Context

[Tree] (config>router>bgp tcp-mss)

[Tree] (config>service>vprn>bgp tcp-mss)

Full Context

configure router bgp tcp-mss

configure service vprn bgp tcp-mss

Description

This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

Default

no tcp-mss

Parameters

mss-value

Specifies the The router uses the TCP SYN to advertise the TCP MSS option value towards its peer. MSS value, in bytes, to use with the peers that fall within the scope of the command.

Values 384 to 9746

Platforms

no tcp-mss-adjust

Context

[Tree] (config>service>nat>map-domain tcp-mss-adjust)

Full Context

configure service nat map-domain tcp-mss-adjust

Description

This command enables the TCP maximum segment size (MSS) adjustments in a MAP domain. The TCP SYN and SYN-ACK packets are intercepted in both directions, and if their MSS value is larger than the one configured using this command, the MSS value in the packet is re-written (lowered) to the configured value. The end hosts use the lowest setting of the two hosts. The MSS value does not account for the IP or TCP header length.

If the MSS value in the SYN or SYN-ACK is not found, a new value is added and set to the configured value.

Default

no tcp-mss-adjust

Parameters

segment-size

Specifies the maximum size of the segment.

Values 160 to 8626

Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

[Tree] (config>filter>ipv6-filter>entry>match tcp-syn)

Full Context

configure filter ip-filter entry match tcp-syn

configure filter ipv6-filter entry match tcp-syn

Description

This command configures an IP filter match criterion based on the Synchronize (SYN) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-syn

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

no tcp-syn

Context

[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match tcp-syn)

[Tree] (cfg>sys>sec>cpm>ip-filter>entry>match tcp-syn)

Full Context

configure system security cpm-filter ipv6-filter entry match tcp-syn

configure system security cpm-filter ip-filter entry match tcp-syn

Description

This command configures matching on the SYN bit being set or reset in the control bits of the TCP header of an IP or IPv6 packet as an IP filter match criterion.

Note:
An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The SYN bit is normally set when the source of the packet wants to initiate a TCP session with the specified destination IP or IPv6 address.

The **no** form of this command removes the criterion from the match entry.

Default

no tcp-syn

Parameters

true

Specifies matching on IP or IPv6 packets that have the SYN bit set in the control bits of the TCP header.

false

Specifies matching on IP or IPv6 packets that do not have the SYN bit set in the control bits of the TCP header.

tcp-validate

Syntax

tcp-validate *tcp-validate-name*

no tcp-validate

Context

[Tree] (config>app-assure>group>policy>aqp>entry>action tcp-validate)

Full Context

configure application-assurance group policy app-qos-policy entry action tcp-validate

Description

This command assigns an existing TCP validation policy as an action on flows matching this AQP entry.

tcp-validate can only be called from AQP entries that:

- have no matching conditions that relate to information extracted from the incoming IP packets; for example, no application or IP address.
- allow the following match conditions:
  - none
  - aa-sub
  - characteristic
  - traffic-direction (both only)

    traffic-direction cannot be unidirectional (from or to sub). It can either be set to both or left unspecified.

The **no** form of this command removes the TCP validation policy action from flows matching this AQP entry.

Default

no tcp-validate

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

tcp-validate-name

Specifies the name of the TCP validation policy for this application assurance profile. The TCP validation policy is configured using the **config**>**app-assure**>**group**>**tcp-validate** *tcp-validate-name* command.

Platforms

tdm

Syntax

tdm

Context

[Tree] (config>port tdm)

Full Context

configure port tdm

Description

Commands in this context configure DS-1/E-1 and DS-3/E-3 parameters for a port on a channelized MDA T1/E1. This context cannot be accessed on non-channelized MDAs.

TDM is a mechanism to divide the bandwidth of a stream into separate channels or time slots by assigning each stream a different time slot in a set. TDM repeatedly transmits a fixed sequence of time slots over a single transmission channel. Each individual data stream is reassembled at the receiving end based on the timing.

Full Context

configure router rsvp interface te-down-threshold

configure router rsvp te-down-threshold

Description

This command configures the specific threshold levels per node and per interface. Threshold levels are for reserved bandwidth per interface. The **te-threshold-update** command is used to enable or disable threshold-based IGP TE updates. Any reserved bandwidth change per interface is compared with all the threshold levels and trigger an IGP TE update if a defined threshold level is crossed in either direction (LSP setup or teardown). Threshold-based updates must be supported with both ISIS and OSPF. A minimum of one and a maximum of 16 threshold levels is supported.

Threshold levels configured per node is inherited by all configured RSVP interfaces. Threshold levels defined under the RSVP interface is used to trigger IGP updates if non-default threshold levels are configured.

The **no** form of this command resets te-down-threshold to its default value.

Default

no te-down-threshold (equals following values 100 99 98 97 96 95 90 85 80 75 60 45 30 15 0)

Parameters

threshold-level

Specifies the threshold level.

Values 0 to 100

Platforms

46.49 te-metric

te-metric

Syntax

te-metric *value*

no te-metric

Context

[Tree] (config>router>mpls>interface te-metric)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router mpls interface te-metric

Description

This command configures the TE metric used on the interface. This metric is in addition to the interface metric used by IGP for the shortest path computation.

This metric is flooded as part of the TE parameters for the interface using an opaque LSA or an LSP. The IS-IS TE metric is encoded as sub-TLV 18 as part of the extended IS reachability TLV. The metric value is encoded as a 24-bit unsigned integer. The OSPF TE metric is encoded as a sub-TLV Type 5 in the Link TLV. The metric value is encoded as a 32-bit unsigned integer.

When the use of the TE metric is enabled for an LSP, CSPF will first prune all links in the network topology which do not meet the constraints specified for the LSP path. Such constraints include bandwidth, admin-groups, and hop limit. Then, CSPF will run an SPF on the remaining links. The shortest path among the all SPF paths will be selected based on the TE metric instead of the IGP metric which is used by default.

The TE metric in CSPF LSP path computation can be configured by entering the command **config>router>mpls>lsp>metric-type te**.

Note that the TE metric is only used in CSPF computations for MPLS paths and not in the regular SPF computation for IP reachability.

The **no** form of this command reverts to the default value.

Default

no te-metric

The value of the IGP metric is advertised in the TE metric sub-TLV by IS-IS and OSPF.

Parameters

value

Specifies the metric value.

Values 1 to 16777215

admin satellite eth-sat tech-support

Description

This command creates a system core dump. If the *file-url* is omitted, and a *ts-location* is defined, then the **tech support** file will have an automatic SR OS generated file name based on the system name and the date and time and will be saved to the directory indicated by the configured *ts-location*.

The format of the auto-generated filename is ts-XXXXX.YYYYMMDD.HHMMUTC.dat where:

- XXXXX: system name with special characters expanded to avoid problems with file systems (for example, a '.' is expanded to %2E.)
- YYYYMMDD: Date with leading zeros on year, month and day
- HHMM: Hours and Minutes in UTC time (24hr format, always 4 chars, with leading zeros on hours and minutes)

Note:
This command should only be used with authorized direction of Nokia support.

Parameters

file-url

Specifies the file URL location to save the binary file.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn*/][*file-path*] 199 chars max

Syntax

telnet {*ip-address* | *dns-name*} [*port*] **service-name** *service-name* [**source** *ip-address*]

telnet {*ip-address* | *dns-name*} [*port*] [**router** *router-instance*] [**source** *ip-address*]

Context

[Tree] (telnet)

Full Context

telnet

Description

This command opens a Telnet session to a remote host. In 7450 ESS, 7750 SR, 7950 XRS, and VSR networks, the Telnet servers limit Telnet clients to three login attempts; if unsuccessful, the Telnet client session is disconnected. The number is not user configurable.

If a source address is specified, it is used for the source IP address in the originated IP packets for the Telnet session.

Parameters

ip-address

Specifies the IP address or the DNS name (if DNS name resolution is configured).

Values

ipv4-address	*a.b.c.d*	
ipv6-address	*x:x:x:x:x:x:x:x*[-interface]	*x*: [0 to FFFF]H
	x:x:x:x:x:x:d.d.d.d[-interface]	*d*: [0 to 255]D *ipv6-address*
		interface: up to 32 characters, mandatory for link local addresses
dns-name	up to 128 characters	

Note:
IPv6 applies to the 7750 SR and 7950 XRS.

dns-name

Specifies the DNS name (if DNS name resolution is configured), up to 128 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port

Specifies the TCP port number to use Telnet to the remote host, expressed as a decimal integer.

Values 1 to 65535

Default 23

router-instance

Specifies the router name or service ID used to identify the router instance.

Values

router-instance: *router-name* or *vprn-svc-id*

router-name	"Base", "management", vpls-management"
vprn-svc-id	1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

source ip-address

Specifies the source IP address to use as the source of the Telnet packets.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]

configure service ies interface ipv6 vrrp telnet-reply

Description

This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Proper login and CLI command authentication is still enforced.

When telnet-reply is not enabled, TCP port 23 Telnet packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the telnet-reply configuration.

The **telnet-reply** command is only available in non-owner VRRP nodal context. If the telnet-reply command is not executed, Telnet packets to the virtual router instance IP addresses will be silently discarded.

The **no** form of this command restores the default operation of discarding all Telnet packets destined to the non-owner virtual router instance IP addresses.

configure router interface ipv6 vrrp telnet-reply

configure router interface vrrp telnet-reply

Description

This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances' IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

This limitation can be disregarded for certain applications. Ping, SSH and Telnet can each be individually enabled or disabled on a per-virtual-router-instance basis.

The **telnet-reply** command enables the non-owner master to reply to Telnet requests directed at the virtual router instances' IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Correct login and CLI command authentication is still enforced.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When **telnet-reply** is not enabled, Telnet requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the **telnet-reply** setting.

The **telnet-reply** command is only available in non-owner **vrrp** nodal context.

By default, Telnet requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of the command configures discarding all Telnet request messages destined to the non-owner virtual router instance IP addresses.

Default

no telnet-reply — Telnet requests to the virtual router instance IP addresses are discarded.

configure service template vpls-template temp-flooding

configure service vpls temp-flooding

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

The temporary flooding is designed to minimize failover times by eliminating the time it takes to flush the MAC tables and if MVRP is enabled the time it takes for MVRP registration. Temporary flooding is initiated only upon xSTP TCN reception. During this procedure while the MAC flush takes place the frames received on one of the VPLS SAPs/pseudowires are flooded in a VPLS context which for MVRP case includes also the unregistered MVRP trunk ports. The MAC Flush action is initiated by the STP TCN reception or if MVRP is enabled for the data VPLS, by the reception of a MVRP New message for the SVLAN ID associated with the data VPLS. As soon as the MAC Flush is done, regardless of whether the temp-flooding timer expired or not, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. This command provides a flood-time value that configures a fixed amount of time, in seconds, during which all traffic is flooded (BUM or known unicast) as a safety mechanism. Once the flood-time expires, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. The temporary flooding timer should be configured in such a way to allow auxiliary processes like MAC Flush, MMRP and/or MVRP to complete/converge. The temporary flooding behavior applies to regular VPLS, VPLS instantiated with VPLS-template, IVPLS and BVPLS when MMRP is disabled.

The **no** form of this command disables the temporary flooding behavior.

Default

no temp-flooding

Parameters

flood-time

Specifies the flood time, in seconds

configure application-assurance group http-error-redirect template

Description

This command refers to the template of parameters passed from the AA-ISA to the redirect server via JavaScript in the redirect packet. The template is specific to the redirect server being used in the network.

Currently, two partners are used and tested with AA-ISA redirect solution, Barefruit and Xerocole.

The **no** form of this command reverts to the default.

Parameters

template-id

Specifies an HTTP error redirect template.

1 = Barefruit specific template

2 = xerocole specific template.

Values 0 to 4294967295

Platforms

configure application-assurance group http-redirect template

Description

This command configures the template that defines which parameters are appended to the HTTP host redirect field in the redirect message.

The HTTP redirect template provides HTTP 302 redirect containing only the URL specified in the redirect policy, with no other parameters.

The **no** form of this command removes the template from the configuration.

Default

no template

Parameters

template-id

Specifies the HTTP Policy Redirect template.

Values 1 — Javascript based redirect embedded in HTTP 200 OK response with a predefined number of arguments automatically appended to the redirect URL

2 — HTTP 302 Redirect with a predefined number of arguments automatically appended to the redirect URL.

3 — HTTP 302 Redirect with no parameters appended to the URL (empty).

4 — Empty Redirect format using Javascript.

5 — Redirect supporting macro substitution using HTTP 302.

[Tree] (config>router>route-next-hop-policy template)

Full Context

configure router route-next-hop-policy template

Description

This command creates a template to configure the attributes of a Loop-Free Alternate (LFA) Shortest Path First (SPF) policy. An LFA SPF policy allows the user to apply specific criteria, such as admin group and

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

SRLG constraints, to the selection of an LFA backup next-hop for a subset of prefixes that resolve to a specific primary next-hop.

The user first creates a route next-hop policy template under the global router context and then applies it to a specific OSPF or IS-IS interface in the global routing instance or in a VPRN instance.

A policy template can be used in both IS-IS and OSPF to apply the specific criteria to prefixes protected by LFA. Each instance of IS-IS or OSPF can apply the same policy template to one or more interface.

The commands within the route next-hop policy template use the **begin-commit-abort** model. The following are the steps to create and modify the template:

To create a template, the user enters the name of the new template directly under the route-next-hop-policy context.

1. To delete a template that is not in use, the user enters the **no** form for the template name under the route-next-hop-policy context.
2. The user enters the editing mode by executing the begin command under the route-next-hop-policy context. The user can then edit and change any number of route next-hop policy templates. However, the parameter value will still be stored temporarily in the template module until the commit is executed under the route-next-hop-policy context. Any temporary parameter changes will be lost if the user enters the abort command before the commit command.
3. The user is allowed to create or delete a template instantly once in the editing mode without the need to enter the commit command. Furthermore, the abort command, if entered, will have no effect on the prior deletion or creation of a template.

Once the commit command is issued, IS-IS or OSPF will re-evaluate the templates and if there are any net changes, it will schedule a new LFA SPF to re-compute the LFA next-hop for the prefixes associated with these templates.

no template-format

Context

[Tree] (config>service>ipfix>ipfix-export-policy template-format)

Full Context

configure service ipfix ipfix-export-policy template-format

Description

This command selects one of two template formats that contains a set of element IDs and their interpretation in IPFIX NAT flow logging. The difference between the two formats is related to the fields conveying information about the translated source IP addresses and ports (outside IP addresses and ports). Further, format 1 conveys information about the translated source port (post NAT) in the sourceTransportPort information element while format 2 conveys this information in the postNAPTsourceTrasportPort element.

Further, format1 conveys information about the translated source port (post NAT) in the information element sourceTransportPort while a new information element postNAPTsourceTrasportPort is introduced in format2 to carry this information.

For more information about template formats, refer to "Template Formats” in the *7450 ESS, 7750 SR, and VSR Multiservice Integrated Service Adapter and Extended Services Appliance Guide*, where the table lists supported information elements and their description for each format.

The **no** form of the command reverts to the default value.

Default

template-format format1

Parameters

format1

Specifies that template format 1 is used by the IPFIX collectors associated with this IPFIX Export policy.

format2

Specifies that template format 2 is used by the IPFIX collectors associated with this IPFIX Export policy.

Full Context

configure cflowd collector template-set

Description

This command specifies the set of templates sent to the collector when using cflowd Version 9 or Version 10.

Default

template-set basic

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

basic

Specifies that basic flow data is sent.

mpls-ip

Specifies that extended flow data is sent that includes IP and MPLS flow information.

If the sampled traffic is part of a locally configured service or IPv4 or IPv6 traffic is being forwarded with an MPLS shortcut, then the MPLS labels associated with that service encapsulation are included in the extended flow data for both network ingress and egress sampling.

l2-ip

Specifies that extended flow data is sent that includes Layer 2 (Ethernet) and IP flow information. This template is only applicable for V10 (IPFIX) collectors.

mpls-transport

Specifies that cflowd can collect flow statistics for MPLS traffic using only the outer transport label, EXP bit value, and ingress interface as the flow identifier. This template enables the collection of flow statistics on a core router to develop LSP usage statistics.

Description

This command configures the tertiary DNS server for DNS name resolution. The tertiary DNS server is used only if the primary DNS server and the secondary DNS server do not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the tertiary DNS server from the configuration.

Default

no tertiary-dns

Parameters

ip-address

Specifies the IP or IPv6 address of the tertiary DNS server.

Values

ipv4-address	a.b.c.d
ipv6-address	*x:x:x:x:x:x:x:x*[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H

Use subject to Terms available at: www.nokia.com/terms.

		d: [0 to 255]D
	interface	32 chars max, for link local addresses

Note:
IPv6 is applicable to the 7750 SR and 7950 XRS only.

Platforms

All

46.76 tertiary-image

tertiary-image

Syntax

tertiary-image *file-url*

no tertiary-image

Context

[Tree] (bof tertiary-image)

Full Context

bof tertiary-image

Description

This command specifies the tertiary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (*.tim files) must be located in the same directory.

The **no** form of this command removes the **tertiary-image** configuration.

Parameters

file-url

Specifies the file URL; can be either local (this CPM) or a remote FTP server.

Values

file-url	{*local-url* | *remote-url*} (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]
remote-url	[{ftp://| tftp://} *login:pswd@remote-locn*/][*file-path*]

no tertiary-ip-address

Context

[Tree] (config>router>bgp>orr>location tertiary-ip-address)

Full Context

configure router bgp optimal-route-reflection location tertiary-ip-address

Description

This command specifies the tertiary IP address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable to find a node in its topology database that matches the primary address, then the TE DB tries to find a node with the matching secondary address. If this attempt also fails, the TE DB then tries to find a node with the matching tertiary address.

The IP addresses specified for a location should be topologically "close" to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IP address information.

Default

no tertiary-ip-address

Parameters

ipv4-address

Specifies the tertiary IPv4 address of a location, expressed in dotted decimal notation.

Values a.b.c.d

no tertiary-ipv6-address

Context

[Tree] (config>router>bgp>orr>location tertiary-ipv6-address)

Full Context

configure router bgp optimal-route-reflection location tertiary-ipv6-address

Description

This command specifies the tertiary IPv6 address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable find a node in its topology database that matches a primary address of the location, then it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address.

The IP addresses specified for a location should be topologically "close" to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IPv6 address information.

Default

no tertiary-ipv6-address

Parameters

ipv6-address

Specifies the tertiary IPv6 address of a location.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H

46.81 test

test

Syntax

[**no**] **test** *test-name* [**owner** *test-owner*]

Context

[Tree] (config>saa test)

Full Context

configure saa test

Description

This command identifies a test and enables the context to provide the test parameters for the named test. After the creation of the test instance, the test can be started in the OAM context.

A test can only be modified while it is shut down.

The **no** form of this command removes the test from the configuration. To remove a test, it cannot be active at the time.

Parameters

test-name

Identifies the SAA test name, up to 32 characters.

test-owner

Specifies the owner, up to 32 characters, of an SAA operation. If a value is not specified, the default owner is used.

Default "TiMOS CLI"

Full Context

configure service vprn bgp group neighbor third-party-nexthop

configure service vprn bgp group third-party-nexthop

configure service vprn bgp third-party-nexthop

Description

Use this command to enable the router to send third-party next-hop to EBGP peers in the same subnet as the source peer, as described in RFC 4271. If enabled when an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next-hop is left unchanged. Third-party next-hop is not done if the address family of the transport does not match the address family of the route.

The **no** form of this command prevents BGP from performing any third party next-hop processing toward any single-hop EBGP peers within the scope of the command. No third-party next-hop means the next-hop will always carry the IP address of the interface used to establish the TCP connection to the peer.

Description

Use this command to enable the router to send third-party next-hop to EBGP peers in the same subnet as the source peer, as described in RFC 4271. If enabled when an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next-hop is left unchanged. Third-party next-hop is not done if the address family of the transport does not match the address family of the route.

The **no** form of this command prevents BGP from performing any third party next-hop processing toward any single-hop EBGP peers within the scope of the command. No third-party next-hop means the next-hop will always carry the IP address of the interface used to establish the TCP connection to the peer.

46.99 throttle-rate

throttle-rate

Syntax

throttle-rate *events* [**interval** *seconds*]

no throttle-rate

Context

[Tree] (config>log throttle-rate)

Full Context

configure log throttle-rate

Description

This command configures the number of events and interval length to be applied to all event types that have throttling enabled by the **event-control** command and do not have a **specific-throttle-rate** configured.

The **no** form of this command reverts to the default values.

Default

throttle-rate 2000 interval 1

Parameters

events

Specifies the number of log events that can be logged within the specified interval for a specific event. Once the limit has been reached, any additional events of that type will be dropped, for example, the event drop count will be incremented. At the end of the throttle interval if any events have been dropped a trap notification will be sent.

Values 1 to 20000

Default 2000

seconds

Specifies the number of seconds that an event throttling interval lasts.

Values 1 to 1200

Default 1

no ti-lfa

Context

[Tree] (config>router>isis>lfa ti-lfa)

Full Context

configure router isis loopfree-alternates ti-lfa

Description

This command enables the use of the Topology-Independent LFA (TI-LFA) algorithm in the LFA SPF calculation for this IS-IS instance.

The **no** form of this command disables the use of the TI-LFA algorithm in the LFA SPF calculation for this IS-IS instance.

Default

no ti-lfa

Parameters

value

Specifies the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

Values 0 to 3

Default 2

sids-value

Specifies the maximum number of SRv6 SIDs allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

46.102 tier

tier

Syntax

tier {**1** | **2**}

Context

[Tree] (config>qos>policer-control-policy tier)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure qos policer-control-policy tier

Description

This command is used to create, configure, and delete tiered arbiters. Two tiers are supported that always exist, specified as tier 1 and tier 2. Tiered arbiters enable the creation of a bandwidth control hierarchy for managing child policers in an arbitrary fashion. Each arbiter enables parenting of child policers within eight strict levels of priority and a maximum aggregate rate may be defined for the children that the arbiter will enforce. Arbiters created on tier 1 are automatically parented to the root arbiter that is always present. Arbiters created on tier 2 default to the root arbiter as parent but can also be explicitly parented to a tier 2 arbiter. Child policers associated with an instance of the **policer-control-policy** can be parented to any tiered arbiter or to the root arbiter.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

tier

Syntax

[**no**] **tier** *tier*

Context

[Tree] (config>qos>scheduler-policy tier)

Full Context

configure qos scheduler-policy tier

Description

This command identifies the level of hierarchy that a group of schedulers are associated with. Within a tier level, a scheduler can be created or edited. Schedulers created within a tier can only be a child (take bandwidth from a scheduler in a higher tier). Tier levels increase sequentially with 1 being the highest tier. All tier 1 schedulers are considered to be root and cannot be a child of another scheduler. Schedulers defined in tiers other than 1 can also be root (parentless).

3 tiers (levels 1, 2, and 3) are supported.

The **save config** and **show config** commands only display information on scheduler tiers that contain defined schedulers. When all schedulers have been removed from a level, that level ceases to be included in output from these commands.

Parameters

tier

This parameter is required to indicate the group of schedulers to create or be edited. Tier levels cannot be created or deleted. If a value for level is given that is out-of-range, an error will occur and the current context of the CLI session will not change.

46.104 time-average-factor

time-average-factor

Syntax

time-average-factor *taf-value* [**dec-only**]

no time-average-factor

Context

[Tree] (config>qos>adv-config-policy>child-control>offered-measurement time-average-factor)

Full Context

configure qos adv-config-policy child-control offered-measurement time-average-factor

Description

This command is used to weight the new offered rate with a portion of the previous offered rate. It would be expected that this command would mainly be used with the dec-only option enabled.

The adjustment to the offered rate is performed using the following formula when taf-value is not set to '0':

Adjusted_Rate = ((Prev_Offered_Rate x (taf-value – 1)) + New_Offered_Rate) / taf-value

If the dec-only option is specified, the adjustment is only applied when New_Offered_Rate is less than the Prev_Offered_Rate. When taf-value is set to '0', the adjustment is never applied.

The **no** form of this command is used to remove the time average factor adjustments to new offered rate measurements.

Parameters

taf-value

The taf-value is specified as a whole number between 0 and 64. The value '0' has special meaning in that it disables the time average factor adjustment and has the same effect as no time-average-factor.

Default 0

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0 to 64

dec-only

This keyword is an optional parameter. When enabled, the time average factor adjustment is only applied if the new offered rate is decreasing compared to the previous offered rate. If the new offered rate is greater than the previous offered rate, the adjustment is not applied.

Platforms

All

time-average-factor

Syntax

time-average-factor *value*

no time-average-factor

Context

[Tree] (config>qos>slope-policy time-average-factor)

Full Context

configure qos slope-policy time-average-factor

Description

This command sets a weighting factor to calculate the new shared buffer average utilization after assigning buffers for a packet entering a queue. To derive the new shared buffer average utilization, the buffer pool takes a portion of the previous shared buffer average and adds it to the inverse portion of the instantaneous shared buffer utilization.

The **time-average-factor** command sets the weighting factor between the old shared buffer average utilization and the current shared buffer instantaneous utilization when calculating the new shared buffer average utilization

The TAF value applies to all high- and low-priority RED slopes for ingress and egress access buffer pools controlled by the slope policy.

The **no** form of this command restores the default setting.

Default

time-average-factor 7

Parameters

value

Represents the Time Average Factor (TAF), expressed as a decimal integer. The value specified for TAF affects the speed at which the shared buffer average utilization tracks the instantaneous shared buffer utilization. A low value weights the new shared buffer average utilization calculation more to the shared buffer instantaneous utilization; zero using it

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

exclusively. A high value weights the new shared buffer average utilization calculation more to the previous shared buffer average utilization value.

46.105 time-display

time-display

Syntax

time-display {**local** | **utc**}

Context

[Tree] (environment time-display)

Full Context

environment time-display

Description

This command displays time stamps in the CLI session based on local time or Coordinated Universal Time (UTC).

The system keeps time internally in UTC and is capable of displaying the time in either UTC or local time based on the time zone configured.

This environment command only applies to times displayed in the current CLI session. This includes displays of event logs and all other places where a time stamp is displayed.

In event logs, the selected time is used to control the timestamps in the CLI output of **show log log-id** and in YANG state in the /state/log/log-id branch (for logs such as session, cli, memory, SNMP and NETCONF).

Also see the **configure log log-id time-format** command.

Default

time-display local

Parameters

local

Indicates that local time should be used.

utc

Indicates that UTC time should be used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service ies subscriber-interface group-interface sap static-host managed-routes route-entry cpe-check timeout

Description

This command configures the time the system waits for a reply to a specific ping before concluding the ping has been missed.

Default

timeout 1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

seconds

Specifies the time, in seconds, that the router waits for a response.

Values 1 to 10

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

timeout

Syntax

timeout *seconds*

no timeout

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>router>mpls>lsp-self-ping timeout)

Full Context

configure router mpls lsp-self-ping timeout

Description

This command configures a timeout value for LSP Self Ping. The LSP Self Ping timer is started when the RESV message is received for an LSP. The system then periodically sends LSP Self Ping packets until the timer expiry or the receipt of the first LSP Self Ping reply, whichever comes first. If the timeout expires before an LSP Self Ping packet is received, then the configured **timeout-action** is performed.

The **no** form of this command reverts to the default value.

Default

timeout 300

Parameters

seconds

Specifies the value, in seconds, of the fast retry timer for a secondary path.

Values 3 to 3600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

configure filter redirect-policy destination ping-test timeout

Description

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far-end host. If a reply is not received within this time the far-end host is considered unresponsive.

Default

timeout 1

Parameters

seconds

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far end host.

Values 1 to 60

Platforms

All

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>vrrp>policy>priority-event>host-unreachable timeout)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure vrrp policy priority-event host-unreachable timeout

Description

This command defines the time, in seconds, that must pass before considering the far-end IP host unresponsive to an outstanding ICMP echo request message.

The **timeout** value is not directly related to the configured **interval** parameter. The **timeout** value may be larger, equal, or smaller, relative to the **interval** value.

If the **timeout** value is larger than the **interval** value, multiple ICMP echo request messages may be outstanding. Every ICMP echo request message transmitted to the far end host is tracked individually according to the message identifier and sequence number.

With each consecutive attempt to send an ICMP echo request message, the timeout timer is loaded with the **timeout** value. The timer decrements until:

- an internal error occurs preventing message sending (request unsuccessful)
- an internal error occurs preventing message reply receiving (request unsuccessful)
- a required route table entry does not exist to reach the IP address (request unsuccessful)
- a required ARP entry does not exist and ARP request timed out (request unsuccessful)
- a valid reply is received (request successful)

It is possible for a required ARP request to succeed or timeout after the message timeout timer expires. In this case, the message request is unsuccessful.

If an ICMP echo reply message is not received prior to the **timeout** period for a given ICMP echo request, that request is considered to be dropped and increments the consecutive message drop counter for the priority event.

If an ICMP echo reply message with the same sequence number as an outstanding ICMP echo request message is received prior to that message timing out, the request is considered successful. The consecutive message drop counter is cleared and the request message no longer is outstanding.

If an ICMP Echo Reply message with a sequence number equal to an ICMP echo request sequence number that had previously timed out is received, that reply is silently discarded while incrementing the priority event reply discard counter.

The **no** form of the command reverts to the default value.

Default

timeout 1

Parameters

seconds

The number of seconds before an ICMP echo request message is timed out. Once a message is timed out, a reply with the same identifier and sequence number is discarded.

Values 1 to 60

Platforms

All

configure system security ldap timeout

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

The **timeout** value is the number of seconds that the SR OS will wait for a response from the current server that it is trying to establish a connection with. If the server does not reply within the configured **timeout** value, the SR OS will increment the retry counter by 1. The SR OS attempts to establish the connection to the current server up to the configured **retry** value before it moves to the next configured server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

The length of time that the SR OS waits for a response from the server.

Values 1 to 90

Default 3

Platforms

All

timeout

Full Context

configure router l2tp tunnel-selection-blacklist timeout-action

configure service vprn l2tp tunnel-selection-blacklist timeout-action

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command defines an action that is executed on the entity (peer/tunnel) in the denylist once the entity becomes eligible for selection again.

The **no** form of this command reverts to the default.

Default

timeout-action remove-from-blacklist

Parameters

action

Specifies the Action to be taken when a tunnel or peer has been in the denylist for the max-period of time.

Values **remove-from-blacklist** — The peer or tunnel in the denylist is removed completely from the denylist and made eligible for the selection process once the max-time expires. In this mode of operation, multiple new sessions can be mapped into the same, newly released tunnel from the denylist. The first such session will try to setup the tunnel, while the other is buffered until the tunnel establishment process is completed. In case that the tunnel remains unavailable, it is placed in the denylist again. Consequently, all new sessions are re-negotiated over an alternate tunnel.

try-one-session — Once the max-time expired, the peer or tunnel in the denylist is made available for selection only to a single new session request. Only upon successful tunnel establishment will the incoming new sessions be eligible to be mapped into this tunnel. This behavior will avoid session establishment delays in case that the tunnel just removed from the denylist is still unavailable.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

timeout-action

Syntax

timeout-action {**retry** | **switch**}

no timeout-action

Context

[Tree] (config>router>mpls>lsp-self-ping timeout-action)

Full Context

configure router mpls lsp-self-ping timeout-action

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures an action that the router takes when the timeout LSP self ping timeout timer expires. The lsp-self-ping timer is started when the RESV is received for an LSP. If the retry is configured and the timeout expires before an LSP self ping packet is received, then the system tears down the candidate path and goes back to CSPF for a new path. If the switch is configured and the timeout expires before an LSP self ping packet is received, then the system switches to the candidate path.

The **no** form of this command reverts to the default value.

Default

timeout-action retry

Parameters

retry

Specifies to retry the candidate path when the timeout expires.

switch

Specifies to switch to the candidate path when the timeout expires.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vprn rip group neighbor timers

configure service vprn ripng group timers

configure service vprn rip timers

configure service vprn rip group timers

configure service vprn ripng group neighbor timers

configure service vprn ripng timers

Description

This command configures the values for the update, timeout, and flush timers:

- **update timer**

  Determines how often RIP updates are sent.

- **timeout timer**

  If a router is not updated by the time the timer expires, the route is declared invalid, but maintained in the RIP database.

- **flush timer**

  Determines how long a route is maintained in the RIP database, after it has been declared invalid. Once this timer expires it is flushed from the RIP database completely.

The **no** form of this command resets all timers to their default values of 30, 180, and 120 seconds respectively.

Default

no timers

Parameters

update

The RIP update timer value in seconds.

Values 1 to 600

Default 30

timeout

The RIP timeout timer value in seconds.

Values 1 to 1200

Default 180

flush

The RIP flush timer value in seconds.

configure router isis timers

Description

This command configures the IS-IS timer values.

Platforms

All

timers

Syntax

timers

Context

[Tree] (config>router>ospf3 timers)

[Tree] (config>router>ospf timers)

Full Context

configure router ospf3 timers

configure router ospf timers

Description

Commands in this context configure OSPF timers. Timers control the delay between receipt of a link state advertisement (LSA) requiring a Dijkstra (Shortest Path First (SPF)) calculation and the minimum time between successive SPF calculations.

Changing the timers affects CPU utilization and network re-convergence times. Lower values reduce convergence time but increase CPU utilization. Higher values reduce CPU utilization but increase re-convergence time.

[Tree] (config>router>rip>group timers)

Full Context

configure router rip timers

configure router ripng group timers

configure router ripng timers

configure router rip group neighbor timers

configure router ripng group neighbor timers

configure router rip group timers

Description

This command configures values for the update, timeout and flush RIP timers.

The RIP update timer determines how often RIP updates are sent.

If the route is not updated by the time the RIP timeout timer expires, the route is declared invalid but is maintained in the RIP database.

The RIP flush timer determines how long a route is maintained in the RIP database after it has been declared invalid. After the flush timer expires, the route is removed from the RIP database.

The **no** form of the command reverts to the default values.

Default

timers 30 180 120

Parameters

update

Specifies the RIP update timer value in seconds expressed as a decimal integer.

Values 1 to 600

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

timeout

Specifies the RIP timeout timer value in seconds expressed as a decimal integer.

Values 1 to 1200

flush

Specifies the RIP flush timer value in seconds expressed as a decimal integer.

Values 1 to 1200

47.9 timing

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ethernet>lmm>availability timing)

Full Context

configure oam-pm session ethernet lmm availability timing

Description

This command defines various availability parameters for LMM availability testing. This command does not define the probe interval. Validation occurs when the LMM test is activated using the **no shutdown** command. The maximum size of the availability window cannot exceed 100 seconds (100 000 milliseconds). LMM test activation fails if the availability window exceeds the maximum value.

The **no** form of this command restores the default values for all timing parameters, and uses those values to compute availability and set the loss frequency.

Parameters

frames

Specifies the number of SLM frames that define the size of the small measurement window. Each delta-t is marked as a high-loss interval or non-high-loss interval based on the **flr-threshold**. The size of the delta-t measurement is the product of the number of frames and the interval.

Values 1 to 50

Default 10

deltas

Specifies the number of consecutive delta-t measurement intervals that make up the sliding window over which availability and unavailability determined. Transitions from one state to another occurs when the **consec-delta-t** are in a new state. The sliding window cannot exceed 100 seconds.

Values 2 to 10

Default 10

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

threshold

Specifies the number of consecutive unavailable delta-t intervals that, when reached or exceeded, increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold of consecutive unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is incremented during times of availability.

Values 1 to 9

Default 5

Platforms

All

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **interval** *milliseconds* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ethernet>slm timing)

Full Context

configure oam-pm session ethernet slm timing

Description

This command configures availability parameters and the probe spacing (interval) for the SLM frames. The maximum size of the availability window cannot exceed 10 s (10 000 ms).

The **no** form of this command installs the default values for all timing parameters and use those values to compute availability and set the SLM frequency. If an SLM test is in the **no shutdown** state, it always has timing parameters, default or user configured.

Parameters

frames

Specifies the of SLM frames that define the size of the Delta-T (small measurement window). Each Delta-T is marked as available or unavailable based on the **flr-threshold**. The size of the Delta-T measurement is the product of the number of frames and the interval.

Values 1 to 50

Default 10

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

deltas

Specifies the number of consecutive Delta-T small measurement intervals that make up the sliding window over which availability and unavailability is determined. Transitions from one state to another occurs when the **consec-delta-t** is in a new state.

Values 2 to 10

Default 10

milliseconds

Specifies the number of milliseconds between the transmission of the SLM frames.

Values 50, 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000

Default 100

threshold

Specifies the number of consecutive high loss intervals (unavailable Delta-T) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable Delta-T intervals. A CHLI can only be incremented once during a sliding window and, by default, it is only incremented during times of availability.

Values 1 to 9

Default 5

Platforms

All

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss timing)

Full Context

configure oam-pm session ip twamp-light loss timing

Description

This command defines various availability parameters but not the probe interval. A single TWAMP-Light frame is used to collect both delay and loss metrics; the interval is common to both and as such not unique per metric type. Any TWAMP light test that is attempting to become active validates the configuration of the timing parameter regardless of which statistics are being recorded.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command restores the default values for all timing parameters and use those values to compute availability and set the loss frequency.

Default

timing frames-per-delta-t 1 consec-delta-t 10 chli-threshold 5

Parameters

frames

Defines the size of the small measurement window. Each delta-t is marked as available of unavailable based on the flr-threshold. The size of the delta-t measurement is the product of the number of frames and the interval. This value defaults to a different value thank single probe per metric approaches.

Values 1 to 50

Default 1

deltas

Specifies the number of consecutive delta-t small measurement intervals that make up the sliding window over which availability and unavailability are determined. Transitions from one state to another occurs when the consec-delta-t are now in a new state. The sliding window cannot exceed 100 seconds.

Values 2 to 10

Default 10

threshold

Specifies the number of consecutive high loss intervals (unavailable delta-t) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is only incremented during times of availability.

Values 1 to 9

Default 5

[Tree] (config>log>syslog tls-client-profile)

Full Context

configure service vprn log syslog tls-client-profile

configure log syslog tls-client-profile

Description

This command specifies the Transport Layer Security (TLS) client profile used to encrypt syslog communications for event logs. When configured, log event syslog messages are sent using TLS.

This command is ignored for filter logs.

Any change to this command results in a brief interruption of the event log, which may cause the loss of a few syslog messages.

The **no** form of this command removes TLS encryption of syslog communications and sends syslog messages over UDP.

Parameters

tls-client-profile

Specifies the name of a TLS profile configured in the **config**>**system**>**security**>**tls** context, up to 32 characters.

Platforms

All

tls-client-profile

Syntax

tls-client-profile *profile-name*

no tls-client-profile

Context

[Tree] (config>router>pcep>pcc>peer tls-client-profile)

Full Context

configure router pcep pcc peer tls-client-profile

Description

This command configures a TLS client profile on the PCC. When the TLS profile is configured, the PCC tries to establish a PCEP connection with the PCE over TLS. Because SR OS supports a strict TLS-only mode, both the PCE and PCC must support TLS. If a TLS failure occurs, the connection over TLS is closed and a new connection is retried within 60 seconds.

The **no** form of this command removes TLS encryption from the communication between this PCC and the PCE.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no tls-client-profile

Parameters

profile-name

Specifies the TLS client profile name, up to 32 characters.

Platforms

All

47.13 tls-profile

tls-profile

Syntax

tls-profile *tls-profile-name*

no tls-profile

Context

[Tree] (config>system>security>ldap>server tls-profile)

Full Context

configure system security ldap server tls-profile

Description

This command attaches a TLS client profile to the LDAP client. The parameter in the TLS profile is used to encrypt the LDAP connection to the server. Each LDAP server can use its own TLS profile.

When a TLS profile is assigned, the LDAP application will send encrypted PDUs from the client to the LDAP server. If TLS is operationally down, the LDAP application should not send any PDUs.

The **no** form of this command removes the TLS profile from LDAP and disables the TLS encryption from LDAP.

Parameters

tls-profile-name

Specifies the TLD profile for encryption.

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

47.14 tls-re-negotiate-timer

tls-re-negotiate-timer

Syntax

tls-re-negotiate-timer *timer-min*

no tls-re-negotiate-timer

Context

Context

[Tree] (config>system>grpc tls-server-profile)

Full Context

configure system grpc tls-server-profile

Description

This command adds a configured TLS server profile to the gRPC session. The TLS server is used for encryption of the gRPC session. gRPC will not transmit any PDUs if there is a TLS server profile assigned to it and the TLS connection is down.

The **no** form of this command removes the specified TLS server profile from the gRPC session.

Parameters

name

Specifies the name of the TLS server profile configured under the **config**>**system**>**security**>**tls** context.

Platforms

All

tls-server-profile

Syntax

tls-server-profile *name*

no tls-server-profile

Context

[Tree] (config>router>pcep>pce tls-server-profile)

Full Context

configure router pcep pce tls-server-profile

Description

This command configures a TLS server profile on the PCE. When a TLS server profile is configured, the PCE accepts TLS handshakes from the PCC. Because SR OS supports a strict TLS mode only, both the PCE and the PCC must support TLS. If a TLS failure occurs, the connection over TLS is closed and a new connection is retried within 60 seconds.

The **no** form of this command removes the specified TLS server profile.

Default

no tls-server-profile

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

name

Specifies the name of the TLS server profile, up to 32 characters.

Platforms

VSR-NRC

Context

[Tree] (config>router>mpls>lsp to)

Full Context

configure router mpls lsp to

Description

This command specifies the IP address or MPLS-TP node-id of the egress router for the LSP. This command is mandatory to create an LSP.

An IP address for which a route does not exist is allowed in the configuration. If the LSP signaling fails because the destination is not reachable, an error is logged and the LSP operational status is set to down.

For a non MPLS-TP LSP, the **to** *ip-address* can be an IP address of a network IP interface, the system interface, or a loopback interface of the egress router. When used in a SDP, if the LSP **to** address does not match the SDP address, the LSP is not included in the SDP definition.

For an MPLS-TP LSP, the **to node-id** may be either in 4-octet IPv4 address format, or a 32-bit unsigned integer. This command is mandatory to create an MPLS-TP LSP. A value of zero is invalid. This **to** address is used in the MPLS-TP LSP ID, and the MPLS-TP MEP ID for the LSP.

Default

no default

Parameters

ip-address

Specifies the IP address of the egress router. When the LSP type is **sr-te**, then an IPv6 address can be used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values ipv4-address — a.b.c.d
ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)

node-id ***a.b.c.d.*** **|** ***1...4294967295***
4-octet IPv4 formatted or unsigned 32-bit integer MPLS-TP node-id of the egress router.

All

to

Syntax

to memory [*size*]

to netconf [*size*]

to session

to snmp [*size*] [**send-using-vprn** *service-id*]

Context

[Tree] (config>li>log>log-id to)

Full Context

configure li log log-id to

Description

Commands in this context configure the destination type for the event log.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The source of the data stream must be specified in the **from** command prior to configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of a memory log, NETCONF log, or SNMP log needs to be modified, the log ID must be removed and then re-created.

Parameters

memory

Specifies that log events are directed to a memory file. A memory file is a circular buffer; when the file is full, each new entry replaces the oldest entry in the log. If the optional size parameter is not configured, the default value is used.

Default 100

netconf

Specifies that log events are directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream** *stream-name* for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.

session

Specifies that log events are directed to the current console or telnet session. This command is only valid for the duration of the session. When the session is terminated, the **to session** configuration is removed. A log ID with a **session** destination is saved in the configuration file but the **to session** part is not stored.

snmp

Specifies that log events are directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.

size

The size parameter indicates the number of events that can be stored into memory.

Default 100

Values 50 to 1024

send-using-vprn ***service-id***

Configures the lawful intercept (LI) SNMP notifications to transmit in a VPRN. The parameter is the service ID of the VPRN. This configuration is useful when doing management of LI using a VPRN.

The specified VPRN service must exist. After an LI log is configured using the **send-using-vprn** command, the VPRN service cannot be deleted without removing the LI log ID first.

When this command is configured, an LI log ID uses the snmp-trap-group configured for the VPRN.

When unconfigured, the outgoing routing instance of LI SNMP notifications is determined by the **configure log route-preference** command, and the LI log ID uses the **snmp-trap-group** configured in the main system log configuration.

configure oam-pm session mpls lsp rsvp-auto to

Description

This command specifies an IPv4 address used (with the LSP template) to identify the LSP to be tested.

One of three mandatory configuration statements that are required to identify automatically created RSVP LSPs, using **config>router>mpls>lsp-template**. The **config>router>mpls>auto-lsp>lsp-template** links three distinct functions, the **config>router>policy-options>prefix-list**, **config>router>policy-options>policy-statement>entry>from** and the **config>router>mpls> lsp-template**. The **to** address is the same address configured as the **from** address for the **config>router>policy-options>policy-statement>entry>from**. The required identifiers are **from**, **lsp-template** and **to**, all under this node.

Parameters

ipv4-address

Specifies the IPv4 address.

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

to file *file-id*

Context

[Tree] (config>log>accounting-policy to)

Full Context

configure log accounting-policy to

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the destination for the accounting records selected for the accounting policy.

Parameters

file-id

Specifies the destination for the accounting records selected for this destination. The characteristics of the file ID must have already been defined in the **config>log>file** context. A file ID can only be used once.

The file is generated when the file policy is referenced. This command identifies the type of accounting file to be created. The file definition defines its characteristics.

If the **to** command is executed while the accounting policy is in operation, then it becomes active during the next collection interval.

Values 1 to 99

Platforms

All

to

Syntax

[**no**] **to**

Context

[Tree] (config>router>policy-options>policy-statement>entry to)

Full Context

configure router policy-options policy-statement entry to

Description

This command creates the context to configure export policy match criteria based on a route's destination or the protocol into which the route is being advertised.

If no condition is specified, all route destinations are considered to match.

The **to** command context only applies to export policies. If it is used for an import policy, match criteria is ignored.

The **no** form of this command deletes export match criteria for the route policy statement entry.

to

Syntax

to cli [*size*]

to console

to file *log-file-id*

to memory [*size*]

to netconf [*size*]

to session

to snmp [*size*]

to syslog *syslog-id*

Context

[Tree] (config>log>log-id to)

Full Context

configure log log-id to

Description

This command specifies a destination for the log event data.

The source of the data stream must be specified in the **from** command before configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of an SNMP or memory log needs to be modified, the log ID must be removed and then recreated.

Parameters

cli

Specifies that log events are directed to any subscribed CLI session. Subscribe to a CLI log from within a CLI session using the **tools**>**perform**>**log**>**subscribe-to log-id** *log-id* command. Events are sent to the CLI session for the duration of that CLI session, or until an **unsubscribe-from** command is issued. A local circular memory log is maintained for CLI logs.

console

Specifies that log events events are directed to the console port. If the console is not connected, all the entries are dropped.

file *log-file-id*

Specifies that log events are directed to a file with the specified *log-file-id*. The characteristics of the *log-file-id* referenced in this parameter must have already been defined in the **config**>**log**>**file** *file-id* context. When the *file-id* location parameter is modified, log files are not written to the new location until a rollover occurs or the log is manually cleared. A rollover can be forced by using the **clear**>**log** command. Subsequent

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

log entries are then written to the new location. If a rollover does not occur or the log is not cleared, the old location continues to be used.

Values 1 to 99, *name* (up to 64 characters max)

memory

Specifies that log events are directed to a memory file. A memory file is a circular buffer; when the file is full, each new entry replaces the oldest entry in the log. If the optional size parameter is not configured, the default value is used.

Default 100

netconf

Specifies that log events are directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream** *stream-name* for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.

session

Specifies that log events are directed to the current console or telnet session. This command is only valid for the duration of the session. When the session is terminated, the **to session** configuration is removed. A log ID with a **session** destination is saved in the configuration file but the **to session** part is not stored.

size

Specifies the maximum size of the log data destination, in bytes.

Values 50 to 3000

snmp

Specifies that log events are directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.

syslog *syslog-id*

Specifies that log events are directed to the specified syslog collector. To remain consistent with the standards governing syslog, messages to syslog are truncated to 1024 bytes. The characteristics of the *syslog-id* referenced in this parameter must have already been defined in the **config**>**log**>**syslog** *syslog-id* context.

Values 1 to 10

Full Context

configure service ies interface tos-marking-state

configure service ies subscriber-interface group-interface tos-marking-state

configure service vprn interface tos-marking-state

configure service vprn subscriber-interface group-interface tos-marking-state

Description

This command is used to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field are not remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interface as untrusted.

When the ingress interface is set to untrusted, all egress network IP interfaces remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions.

Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.

The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** form of this command restores the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

tos-marking-state trusted

Parameters

trusted

The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set.

untrusted

Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

Full Context

configure isa video-group watermark bandwidth total

configure isa video-group watermark session total

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command sets the watermark to trigger the SNMP trap if the combined FCC and RET bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the bandwidth available is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

Default

total 90

Parameters

percent

Specifies the percentage of the system resources per ISA.

[Tree] (debug>call-trace>ipoe trace)

Full Context

debug call-trace ipoe trace

Description

This command enables tracing for IPoE sessions specified by the configured parameters. This command can trace a single session or multiple sessions, and can use wildcard characters.

This command can be executed multiple times to start multiple traces. When rules overlap, such as for a wildcard SAP and a specific SAP, the rule that a specific trace is associated with cannot be guaranteed.

The **no** form of this command prevents new traces from being configured and terminates all trace jobs that were previously started using the **trace** command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

circuit-id

Specifies a circuit ID that is used to filter sessions to trace. The *circuit-id* and *remote-id* parameters are mutually exclusive.

ieee-address

Specifies a MAC address that is used to identify a session to trace, in the format "ab:cd:ef:01:23:45”. A wildcard character can be used to match all remaining octets; for example, the format "ab:cd:ef:*” can be used to filter by OUI.

num

Specifies the maximum number of jobs that may be started with this rule.

Values 1 to 50

Default 1

remote-id

Specifies a remote ID that is used to filter sessions to trace. The *remote-id* and *circuit-id* parameters are mutually exclusive.

sap-id

Specifies a SAP to trace. The following formats are accepted:

- *port*/*lag*/*pw-port*:*svlan*.*cvlan*
- *port*/*lag*/*pw-port*:*vlan*
- *port*/*lag*/*pw-port*
- *port*/*lag*/*pw-port*:*vlan*.*
- *port*/*lag*/*pw-port*:* (also matches *.*)

trace-existing-sessions

Specifies that existing IPoE sessions is traced. If this parameter is not included, only new IPoE sessions is traced.

trace-name

Specifies the name by which the trace is referenced, up to 16 characters.

trace-profile-name

Specifies the name of the trace profile to be applied. The default parameters is used if a trace profile is not specified.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

47.36 trace-profile

trace-profile

Syntax

trace-profile *profile-name* [**create**]

no trace-profile *profile-name*

Context

[Tree] (config>call-trace trace-profile)

Full Context

configure call-trace trace-profile

Description

This command creates a profile that can be applied to a specific trace job.

Parameters

profile-name

Specifies the unique name of the call trace profile.

create

Keyword used to create the trace profile instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

47.37 traceroute

traceroute

Syntax

Context

[Tree] (traceroute)

Full Context

traceroute

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command determines the route to a destination address. DNS lookups for the responding hosts are enabled by default.

Parameters

candidate-path

Specifies a candidate path of the SRv6 policy to traceroute. The candidate path does not need to be the currently active candidate path.

dest-port-udp-fixed

Specifies that the destination UDP port number should not increment with each packet transmitted. By default, the UDP traceroute starts with destination UDP port 33434 and each subsequent packet sent to this destination UDP port increases by 1. The next packet uses UDP seat port 33435, the next 33436, and so on.

For a UDP test, this parameter prevents the per-transmitted packet increment of the destination UDP port number. The TCP protocol does not increment the destination TCP port, using a single destination TCP port for all traceroute packets for the test.

decode

Perform additional original datagram parsing functions. This parameter must be used with the **detail** parameter.

detail

Specifies to display additional information about the resulting packet.

distinguisher

Specifies the distinguisher of the SRv6 policy candidate path to send the traceroute probe on. This parameter must be configured if **protocol-owner** is configured to **bgp**.

Values 1 to 4294967295

dns-name

Specifies the DNS name, up to 63 characters, of the far-end device on which to send the traceroute request message.

endpoint *ipv6-address*

Specifies an SRv6 policy for a specific endpoint as the target of the traceroute.

Values

ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

ip-address

Specifies the far-end IP address on which to send the traceroute request message in dotted decimal notation.

Values

ipv4-address:	a.b.c.d

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6-address: x:x:x:x:x:x:x:x
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

max-ttl

Specifies the maximum Time-To-Live (TTL) value to include in the traceroute request, expressed as a decimal integer.

Values 1 to 255

Default 30

milliseconds

Specifies the time in milliseconds to wait for a response to a probe, expressed as a decimal integer.

Values 1 to 60000

Default 5000

min-ttl

Specifies the IP TTL in the initial traceroute packet to target a specific node or starting node along the path.

Values 1 to 255

Default 1

no-dns

Specifies that, when the **no-dns** keyword is specified, DNS lookups of the responding hosts are not performed, and only the IP addresses are printed.

original-datagram

Parse the returned original datagram including any IPv6 and SRH header information.

pad-size

Specifies the number of bytes added to the UDP or TCP payload.

Values 0 to 9786

Default 0

port-number

Specifies the transport protocol destination port number.

Values 1 to 65535

Default 33434

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

preference

Specifies the preference of the SRv6 policy candidate path to send the traceroute probe on.

Values 0 to 4294967295

Default 100

probes-per-hop

Specifies the number of probes per hop.

Values 1 to 10

Default 3

protocol-owner

Specifies the protocol owner of the SRv6 policy candidate path to traceroute.

Values bgp — Specifies a BGP SRv6 policy.

static — Specifies a locally configured static SRv6 policy.

protocol udp | tcp

Sets the transport protocol for the traceroute packet. The TCP protocol is silently discarded on a targeted VRPN service. VPRN services only respond to UDP traceroutes.

Default udp

router-or-service

Specifies the routing instance or service, by number. The *router-instance* parameter is the preferred parameter to specify the router or service.

Values router-name: Base, management, vpls-management

vprn-svc-id: 1 to 2147483647

Default Base

router-instance

Specifies the preferred method for entering a service name. Stored as the service name, this is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

Values router-name: Base, management, vpls-management

vprn-svc-name: up to 64 characters

service-name

Specifies the alias function that allows the service name to be used, converted, and stored as service ID.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

source *ip-address*

Specifies the source IP address to use as the source of the probe packets, in dotted decimal notation. If the IP address is not one of the device's interfaces, an error is returned.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

type-of-service

Specifies the Type-of-Service (ToS) bits in the IP header of the probe packets, expressed as a decimal integer.

Values 0 to 255

Default 0

srv6-policy

Keyword to specify that the traceroute probe is applied to an SRv6 policy matching a specific color and endpoint. The traceroute probe may optionally be targeted at a specific segment list of the SRv6 policy. When the segment list is not specified, the traceroute probe is sent on the lowest available segment list.

color-id

Specifies the SRv6 policy color ID.

Values 0 to 4294967295

segment-list

Specifies the SRv6 policy segment list to trace.

Values 1 to 32

Platforms

All

Output

Table 177: ICMPv4 Type 3 symbols in CLI, Table 178: ICMPv6 Type 1 symbols in CLI, and Table 179: ICMPv6 Type 2 symbols in CLI describe the ICMPv4 Type 3, and the ICMPv6 Type 1 and 2 symbols in the CLI outputs. For references without a symbol in the form !<code>, see www.iana.org/assignments/icmp-parameters/icmp-parameters.xhtml.

The following output is an example of traceroute for an IPv4 prefix.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Output Example

```
A:node-2# traceroute 192.168.xx.xx4
traceroute to 192.168.xx.xx4, 30 hops max, 40 byte packets
 1  192.168.xx.xx4 0.000 ms  0.000 ms  0.000 ms
```

The following output is an example of traceroute for an IPv4 prefix resolved to an IPv4 SR policy with ICMP tunneling enabled.

Output Example

```
A:node-2# traceroute 11.21.1.6 detail no-dns

47.38 traceroute-reply

traceroute-reply

Syntax

[**no**] **traceroute-reply**

Context

[Tree] (config>service>ies>if>ipv6>vrrp traceroute-reply)

Full Context

configure service ies interface ipv6 vrrp traceroute-reply

Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **traceroute-reply** status.

Default

no traceroute-reply

Platforms

Full Context

configure service vprn radius-proxy server cache track-accounting

configure router radius-proxy server cache track-accounting

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the type of RADIUS accounting packets from RADIUS client (a WIFI AP) that the router should track.

The **no** form of this command removes the parameters from the configuration.

Parameters

start

Specifies that the router will update the associated ESM-host with the RADIUS client (for example, a WIFI AP) that generated the accounting-start. This is required in cases where a UE roams to a new AP that does not re-authenticate due to key caching.

stop

Specifies that the router will remove the corresponding ESM host and forward the accounting-stop packet to the external RADIUS server.

accounting-on | accounting-off

Specifies that the router will remove all ESM hosts associated with the RADIUS client (a WIFI AP), and forward the accounting-on packet to the external RADIUS server.

interim-update

Specifies that the router will update the associated ESM-host with the RADIUS client (a WIFI AP) that generated the interim-update. The interim-updates with the updated information are sent to the RADIUS server as scheduled.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service vprn radius-proxy server cache track-authentication

configure router radius-proxy server cache track-authentication

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies if RADIUS authentication (from the AP) should be tracked in order to update the ESM host with the RADIUS client (for example, WIFI AP) on UE mobility. It also specifies the authentication packet from RADIUS client (for example, a WIFI AP) that the router should track for mobility.

The **no** form of this command stops tracking authentication for UE mobility.

Default

track-authentication accept

Parameters

accept

Indicates access-accept is tracked for mobility.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-delete-hold-time *seconds*

no track-delete-hold-time

Context

[Tree] (config>router>radius-proxy>server>cache track-delete-hold-time)

Full Context

configure router radius-proxy server cache track-delete-hold-time

Description

This command specifies the delete hold-time in case the DHCP host gets a trigger to delete from the matched RADIUS Proxy server.

The **no** form of this command reverts to the default.

Default

track-delete-hold-time 0

Parameters

seconds

Specifies the delete hold time, in seconds.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0 to 600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service vprn l2tp group l2tpv3 track-password-change

Description

This command enables tracking of password changes, allowing password tunnel passwords to be changed without bringing down active tunnels or sessions. This is only supported with L2TPv3.

The **no** form of this command disables password change tracking.

Default

no track-password-change

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

47.44 track-srrp

track-srrp

Syntax

track-srrp *srrp-instance* **peer** *ip-address* **sync-tag** *sync-tag*

no track-srrp *srrp-instance*

Context

[Tree] (config>router>l2tp>failover track-srrp)

[Tree] (config>service>vprn>l2tp>failover track-srrp)

Full Context

configure router l2tp failover track-srrp

configure service vprn l2tp failover track-srrp

Description

This command sets the sync-tag to be used to synchronize the tunnels with track-srrp *srrp-id* to MCS *peer IP-@*. The same sync-tag should be configured on the MCS peer.

The **no** form of this command reverts to the default.

Default

Removes the sync-tag for the indicated track-srrp.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

srrp-instance

Specifies the Simple Router Redundancy Protocol (SRRP) instance used for Multi-Chassis redundancy failover that is associated with this Layer Two Tunneling Protocol Tunnel.

sync-tag

Specifies a synchronization tag to be used while synchronizing with the peer.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-srrp

Syntax

[**no**] **track-srrp** [*srrp-instance*]

Context

[Tree] (config>redundancy>multi-chassis>peer>sync>track-srrp-instances track-srrp)

Full Context

configure redundancy multi-chassis peer sync track-srrp-instances track-srrp

Description

This command configures a tracked SRRP instance.

The **no** form of this command removes the SRRP instance identifier from the configuration.

Parameters

srrp-instance

Indicates the unique identifier of the tracked SRRP instance.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-srrp

Context

[Tree] (config>service>vpls>sap track-srrp)

Full Context

configure service vpls sap track-srrp

Description

This command configures the SRRP instance this capture SAP will track. This is a capture SAP level command. This command is important in PPPoE deployments with MSAPs. PPPoE operation requires that the MAC address learned by the client at the very beginning of the session negotiation phase remains unchanged for the lifetime of the session (RFC 2516). This command ensures that the virtual MAC address used during the PPPoE session negotiation phase on the capture SAP is the same virtual MAC address that is used by the SRRP on the group interface on which the session is established. Therefore, it is mandated that the SRRP instance (and implicitly the group-interface) where the session belongs to is known in advance. If the group interface name for the session is returned by the RADIUS, it must be ensured that this group interface is the one on which the tracked SRRP instance is configured. PPPoE sessions on the same capture SAP cannot be shared across multiple group interfaces, but instead they all must belong to a single group interface that is known in advance.

The same restrictions apply to IPoE clients in MC Redundancy scenario if they are to be supported concurrently on the same capture SAP as PPPoE.

The supported capture SAP syntax is this:

sap <port-id>:X.* capture-sap

The capture SAP syntax that is not supported is this:

sap <port-id>:*.* capture-sap

The **no** form of this command removes the SRRP ID from this configuration.

Parameters

srrp-id

Specifies the SRRP instance number.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

debug oam build-packet packet field-override header mpls traffic-class

configure test-oam build-packet header mpls traffic-class

Description

This command defines the traffic class value to be used in the MPLS header.

The **no** form of this command removes the traffic class value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

traffic-class 0 (BE)

Parameters

traffic-class

Specifies the MPLS traffic class to be used in the MPLS header.

Values 0 to 7

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

47.49 traffic-direction

traffic-direction

Syntax

traffic-direction {**subscriber-to-network** | **network-to-subscriber** | **both**}

Context

[Tree] (config>app-assure>group>policy>aqp>entry>match traffic-direction)

Full Context

configure application-assurance group policy app-qos-policy entry match traffic-direction

Description

This command specifies the direction of traffic where the AQP match entry will be applied.

To use a policer action with the AQP entry the match criteria must specify a traffic-direction of either subscriber-to-network or network-to-subscriber.

Default

traffic-direction both

Parameters

subscriber-to-network

Traffic from a local subscriber will match this AQP entry.

network-to-subscriber

Traffic to a local subscriber will match this AQP entry.

both

Combines subscriber-to-network and network-to-subscriber.

47.57 transit

transit

Syntax

transit [**inherit** | **all** | **vc-only** | **none**]

Context

[Tree] (config>service>vprn>ttl-propagate transit)

Full Context

configure service vprn ttl-propagate transit

Description

This command overrides the global configuration of the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in a given VPRN service context.

The global configuration is performed under config>router>ttl-propagate>vprn-transit.

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

Default

transit inherit

Parameters

inherit

specifies the TTL propagation behavior is inherited from the global configuration under config>router>ttl-propagate>vprn-transit.

none

specifies the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack.

vc-only

specifies the TTL of the IP packet is propagated into the VC label and not into the labels. in the transport label stack

all

specifies the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

configure service epipe spoke-sdp transit-policy

configure service vprn interface sap transit-policy

Description

This command associates a transit AA subscriber IP or prefix policy to the service. The transit policy must be defined prior to associating the policy with a SAP in the **config**>**app-assure**>**group**>**transit-ip-policy** or **transit-prefix-policy** context.

The **no** form of this command removes the association of the policy to the service.

Default

no transit-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-aasub-policy-id

Specifies a transit IP policy ID.

Values 1 to 65535

prefix-aasub-policy-id

Specifies a transit prefix policy ID.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

transit-policy

Syntax

transit-policy prefix *prefix-aasub-policy-id*

no transit-policy

Context

[Tree] (config>service>ipipe>sap transit-policy)

[Tree] (config>service>ipipe>spoke-sdp transit-policy)

Full Context

configure service ipipe sap transit-policy

configure service ipipe spoke-sdp transit-policy

Description

This command associates an AA transit policy to the service. The transit IP policy must be defined prior to associating the policy with a SAP in the **config>application assurance>group>policy>transit-ip-policy** context.

Transit AA subscribers are managed by the system through this service policy, which determines how transit subs are created and removed for that service.

The no form of this command removes the association of the policy to the service.

Default

no transit-policy

Parameters

prefix-aasub-policy-id

Specifies an integer identifying a prefix transit profile entry.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 65535

Platforms

47.64 transit-prefix-ipv6-entries

transit-prefix-ipv6-entries

Syntax

transit-prefix-ipv6-entries *entries* [**create**]

no transit-prefix-ipv6-entries

Context

[Tree] (config>isa>aa-grp transit-prefix-ipv6-entries)

Full Context

configure isa application-assurance-group transit-prefix-ipv6-entries

Description

This command configures the ISA-AA-group transit prefix IPv6 entry limit for each ISA in the group. This entry space is allocated on the IOM within a common area with the second MDA / ISA position of the IOM and also used for ipv6-filter entries for system SDPs. The per-ISA size allocated for transit-prefix-ipv6 entries should be set to allow sufficient space on the IOM for SDP ipv6-filters.

The **no** form of this command removes the assignment of entries space from the configuration. All entries must be removed in order to delete the configuration.

Default

no transit-prefix-ipv6-entries

Parameters

entries

Specifies the ISA-AA-Group transit prefix IPv6 entry limit.

Values 0 to 8191

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

no transmission-profile

Context

[Tree] (config>system>security>pki>ca-profile>ocsp transmission-profile)

Full Context

configure system security pki ca-profile ocsp transmission-profile

Description

This command specifies the transmission-profile for OCSP. When specified, this configuration overrides the **service** *service-id* or **service** *service-name* configured in the **config>system>security>pki>ca-profile>ocsp** context.

The **no** form of the command removes the profile name from the configuration.

Default

no transmission-profile

Parameters

name

Specifies the file transmission profile name, up to 32 characters.

Platforms

All

transmission-profile

Syntax

transmission-profile *name*

no transmission-profile

Context

[Tree] (config>system>security>pki>est-profile transmission-profile)

Full Context

configure system security pki est-profile transmission-profile

Description

This command specifies the transmission profile name created in the **config>system file-transmission-profile** context for the EST profile.

The **no** form of the command removes the name from the EST profile configuration.

Default

no transmission-profile

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

name

Specifies the file transmission profile name, up to 32 characters.

Platforms

All

47.67 transmit-interval

transmit-interval

Syntax

[**no**] **transmit-interval** *interval* [**multiplier** *multiplier*]

Context

[Tree] (config>port>ethernet>efm-oam transmit-interval)

Full Context

configure port ethernet efm-oam transmit-interval

Description

This command configures the transmit interval of OAM PDUs.

Default

transmit-interval 10 multiplier 5

Parameters

interval

Specifies the transmit interval, in 100 milliseconds.

Values 1 to 600

multiplier

Specifies the multiplier for transmit-interval to set local link down timer.

Values 2 to 5

Platforms

All

Use subject to Terms available at: www.nokia.com/terms.

transmit-interval

Syntax

transmit-interval *transmit-interval*

no transmit-interval

Context

[Tree] (config>lag>bfd>family transmit-interval)

Full Context

configure lag bfd family transmit-interval

Description

This command specifies the transmit timer used for micro-BFD session over the associated LAG links.

The **no** form of this command removes the transmit timer from the configuration.

Default

transmit-interval 100

Parameters

transmit-interval

Specifies the interval value, in milliseconds.

Values 10 to 100000

Default 100 for CPM3 or later, 1000 for all others

Platforms

All

transmit-interval

Syntax

transmit-interval *transmit-interval*

no transmit-interval

Context

[Tree] (config>router>bfd>bfd-template transmit-interval)

Full Context

configure router bfd bfd-template transmit-interval

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the transmit timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.

The **no** form of this command reverts to the default value.

Default

transmit-interval 100

Parameters

transmit-interval

Specifies the transmit interval. The minimum interval that can be configured is hardware dependent.

Values 10 ms to 100,000 ms in 1 ms intervals

Default 10 ms for CPM3 or higher; 1 second for other hardware

Platforms

All

transmit-interval

Syntax

transmit-interval *transmit-interval*

no transmit-interval

Context

[Tree] (config>router>lsp-bfd>tail-end transmit-interval)

Full Context

configure router lsp-bfd tail-end transmit-interval

Description

This command configures the LSP BFD minimum transmit interval for the tail end of LSP BFD sessions.

The **no** form of this command reverts to the default value.

Default

transmit-interval 1000

Parameters

transmit-interval

Specifies the transmit interval, in milliseconds.

configure router ldp interface-parameters interface ipv4 transport-address

Description

This command configures the transport address to be used when setting up the LDP TCP sessions. The transport address can be configured as **interface** or **system**. The transport address can be configured globally (applies to all LDP interfaces) or per interface. The most specific value is used.

The **config**>**router**>**ldp**>**if-params**>**ipv6**> **transport-address** command is not supported on the 7450 ESS.

With the transport-address command, you can set up the LDP interface to the connection which can be set to the interface address or the system address. However, there can be an issue of which address to use when there are parallel adjacencies. This situation can not only happen with parallel links, it could be a link and a targeted adjacency since targeted adjacencies request the session to be set up only to the system IP address.

The **transport-address** value should not be **interface** if multiple interfaces exist between two LDP neighbors. Depending on the first adjacency to be formed, the TCP endpoint is chosen. In other words, if one LDP interface is set up as **transport-address interface** and another for **transport-address system**, then, depending on which adjacency was set up first, the TCP endpoint addresses are determined. After that, because the hello contains the LSR ID, the LDP session can be checked to verify that it is set up and then match the adjacency to the session.

For any iLDP interface, as the **local-lsr-id** parameters is changed to **interface**, the **transport-address** configuration loses effectiveness. Since it will be ignored and the iLDP session will always use the relevant interface IP address as transport-address even though system is chosen.

The **no** form of this command, at the global level, sets the transport address to the default value.

The **no** form of this command, at the interface level, sets the transport address to the value defined under the global level.

Default

system

Parameters

interface

Specifies the IP interface address is used to set up the LDP session between neighbors. The transport address interface cannot be used if multiple interfaces exist between two neighbors, since only one LDP session is set up between two neighbors.

system

Specifies the system IP address is used to set up the LDP session between neighbors.

47.72 transport-tunnel

transport-tunnel

Syntax

transport-tunnel

Context

[Tree] (config>router>bgp>next-hop-res>labeled-routes transport-tunnel)

Full Context

configure router bgp next-hop-resolution labeled-routes transport-tunnel

Description

Commands in this context configure options for the next-hop resolution of BGP labeled routes (VPN-IP and labeled-unicast) using tunnels in TTM. The context allows the selection of different tunnel resolution options for different types of BGP labeled routes: label-unicast IPv4, label-unicast IPv6, and VPN-IP routes (both VPN-IPv4 and VPN-IPv6).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

By default (if this context and the resolution options are not configured), these routes resolve only to LDP tunnels.

If the **resolution** option is explicitly set to **disabled**, the default binding to LDP tunnel resumes. If **resolution** is set to **any**, then any supported tunnel type is allowed and the selection is based on the lowest numerical TTM preference value.

no trap-target *name*

Context

[Tree] (config>service>vprn>log>snmp-trap-group trap-target)

Full Context

configure service vprn log snmp-trap-group trap-target

Description

This command adds/modifies a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group**, and at least one **snmp-trap-group** must be configured.

The **snmp-trap-group** command is used to add or remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Default

No SNMP trap targets are defined.

Parameters

name

specifies the name of the trap target up to 28 characters in length

address ***ip-address***

The IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group.

Values		
	ipv4-address	a.b.c.d (host bits must be 0)
	ipv6-address	x:x:x:x:x:x:x:x[-interface]
		x:x:x:x:x:x:d.d.d.d[-interface]
		x: [0 to FFFF]H
		d: [0 to 255]D
		interface: 32 characters maximum, mandatory for link local addresses

The ipv6-address applies to the 7750 SR.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port

Specifies the destination UDP port used to send traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Values 1 to 65535

Default 162

snmpv1* | *snmpv2c* | *snmpv3

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

Pre-existing conditions are checked before the snmpv3SecurityName is accepted. These are:

- The username must be configured.
- The v3 access group must be configured.
- The v3 notification view must be configured.

Values snmpv1, snmpv2c, snmpv3

Default snmpv3

notify-community community* | *security-name

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If no **notify-community** is configured, then no alarms nor traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community

The community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

security-name

The *security-name* as defined in the config>system>security>user context for SNMP v3. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy}

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Values no-auth-no-privacy, auth-no-privacy, privacy

Default no-auth-no-privacy. This parameter can only be configured if SNMPv3 is also configured.

replay

Enable replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table. Because of route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-start-wait and route-recovery-wait timers under config>log>app-route-notifications can help reduce the probability of lost events.

Context

[Tree] (config>log>snmp-trap-group trap-target)

Full Context

configure log snmp-trap-group trap-target

Description

This command configures a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group** and at least one **trap-target** must be configured.

The **trap-target** command is used to add/remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

Note:
If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Parameters

name

Specifies the name of the trap target, up to 28 characters.

ip-address

Specifies the IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group. ipv6 applies to the 7750 SR only.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

x:x:x:x:x:x:d.d.d.d[-interface]

x: [0..FFFF]H

d: [0..255]D

interface: 32 characters maximum, mandatory for link local addresses

port

Specifies the destination UDP port used for sending traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Default 162

Values 1 **to** 65535

snmpv1* | *snmpv2c* | *snmpv3

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. The security name is the name of a locally configured user. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

The following conditions must all be met before traps will be issued using an SNMPv3 trap-target:

The user name must be configured, and must be configured with an snmp group that exists.

The v3 access group must be configured, or be one of the built-in SR OS views.

The v3 notification view must be configured, or be one of the built-in SR OS views.

Default snmpv3

Values snmpv1, snmpv2c, snmpv3

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

community* | *security-name

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If the **notify-community** is not configured, then no alarms or traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community-name

Specifies the community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

security-name

For SNMPv3 trap targets, specifies the *security-name* as defined in the **config>system>security>user** context. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy}

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Default **no-auth-no-privacy**. This parameter can only be configured if SNMPv3 is also configured.

Values no-auth-no-privacy, auth-no-privacy, privacy

replay

Enables the replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table.

Note:
Due to route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-

48.1 trigger

trigger

Syntax

trigger *trigger-type*

Context

[Tree] (config>subscr-mgmt>shcv-policy trigger)

Full Context

configure subscriber-mgmt shcv-policy trigger

Description

This command enables to context to configure SHCV triggers.

Parameters

trigger-type

Specifies the trigger SHCV properties for the subscriber management group-interface.

Values **ip-conflict** — Upon detecting an IP conflict for the new host, a trigger SHCV is sent using a unicast ARP/NS. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

host-limit-exceeded — Upon exceeding the limit for (**sla-profile host-limits** or **session-limits**, **sub-profile host-limits** or **session-limits**, **ipoe-session sap-session-limit**, **ipoe-session session-limit**, and **arp-host host-limit**), a trigger SHCV is sent. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

inactivity — A trigger SHCV is sent to the idle host to verify the host's connectivity to the BNG. An unresponsive host is removed from the system.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mobility — Detects an IP or MAC conflict between different SAPs. Upon detecting a MAC or an IP conflict, a trigger SHCV is sent. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

mac-learning — Specifies the trigger SHCV properties to learn the MAC address of static hosts. Upon a **no shutdown**, a trigger SHCV is sent to the host to learn the host's MAC address.

configure service vprn subscriber-interface group-interface wlan-gw mobility trigger

configure service ies subscriber-interface group-interface wlan-gw mobility trigger

Description

This command specifies the type of packet used as a mobility trigger.

The **no** form of this command removes the parameters from the configuration and disables data-plane mobility.

Parameters

data

Specifies that data traffic be used as a trigger.

iapp

Specifies that Inter Access Point Protocol (IAPP) messages be used as a trigger.

control

Specifies that control traffic can be used as a trigger.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

48.2 trigger-alarm-msg

trigger-alarm-msg

Syntax

trigger-alarm-msg *message-string*

no trigger-alarm-msg

Context

[Tree] (config>system>alarm-contact-input trigger-alarm-msg)

Full Context

configure system alarm-contact-input trigger-alarm-msg

Description

This command configures a message string to send with SNMP trap and log event messages that are generated when the system generates an alarm. The system generates the default message "Alarm Input Triggered" if no message is configured. The **trigger-alarm-msg** string is included in the log event when the pin changes from the normal state.

The **no** form of this command reverts to the default message "Alarm Input Triggered".

Default

no-trigger-alarm-msg

Parameters

message-string

Specifies a printable character string, up to 160 characters.

Platforms

7750 SR-a

48.3 trigger-entry

trigger-entry

Syntax

[**no**] **trigger-entry** *entry-id*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>log>event-trigger>event trigger-entry)

Full Context

configure log event-trigger event trigger-entry

Description

This command configures an instance of a trigger for an EHS handler. A trigger entry binds a set of matching criteria for a log event to a particular handler. If the log event occurs in the system and matches the criteria configured in the associated log filter then the handler will be executed.

The **no** form of this command removes the specified trigger entry.

Parameters

entry-id

Specifies the identifier of the EHS event trigger entry.

Values 1 to 1500

Platforms

All

48.4 trigger-fault

trigger-fault

Syntax

trigger-fault {**dying-gasp** | **critical-event**}

no trigger-fault

Context

[Tree] (config>port>ethernet>efm-oam trigger-fault)

Full Context

configure port ethernet efm-oam trigger-fault

Description

This command configures the appropriate flag field in the Information OAM PDU, bursting three consecutive packets during the off cycle. If the local port state is operational, this command changes the local port state to "Link Up". If the local port state is not operational, this configuration is installed as an EFM reason to prevent the port from returning to an Up operational state. This command can be used as a precursor to a port shutdown. This terminates the peering relationship without having to wait for protocol

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

timeouts, assuming the peer supports the necessary action when receiving the dying gasp or critical event flag setting.

The **no** form of this command disables this functionality.

Default

no trigger-fault

Parameters

dying-gasp

Keyword to set the dying gasp flag.

critical-event

Keyword to set the critical event flag.

Platforms

All

48.5 trigger-packet

trigger-packet

Syntax

trigger-packet [**dhcp**] [**pppoe**] [**arp**] [**dhcp6**] [**rtr-solicit**] [**data**]

no trigger-packet

Context

[Tree] (config>service>vpls>sap trigger-packet)

Full Context

configure service vpls sap trigger-packet

Description

This command enables triggering packet to initiate RADIUS authentication that provides a service context. The authentication, together with the service context for this request, creates a managed SAP. The VLAN is the same as the triggering packet. This SAP behaves as a regular SAP but the configuration is not user-editable and not maintained in the configuration file. The managed SAP remains active as long as the session is active.

The **no** form of this command reverts to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

dhcp

Specifies whether the receipt of DHCP trigger packets on this VPLS SAP when the keyword **capture-sap** is specified in the **sap** command creation string, will result in a RADIUS authentication that will provide a service context and the creation of a SAP with a value of managed.

pppoe

Specifies whether the receipt of PPPoE trigger packets on this VPLS SAP when the keyword **capture-sap** is specified in the **sap** command creation string, will result in a RADIUS authentication that will provide a service context and the creation of a SAP with a value of managed.

arp

Indicates that ARP is the type of trigger packets for this entry.

dhcp6

Indicates that DHCP6 is the type of trigger packets for this entry.

rtr-solicit

Indicates that router solicit is the type of trigger packets for this entry.

data

Indicates that data is the type of trigger packets for this entry.

48.6 triggered-policy

triggered-policy

Syntax

[**no**] **triggered-policy**

Context

[Tree] (config>router triggered-policy)

Full Context

configure router triggered-policy

Description

This command triggers route policy re-evaluation.

By default, when a change is made to a policy in the **config router policy options** context and then committed, the change is effective immediately. There may be circumstances when the changes should or must be delayed; for example, if a policy change is implemented that would affect every BGP peer on a router, the consequences could be dramatic. It is more effective to control changes on a peer by peer basis.

If the **triggered-policy** command is enabled, and a given peer is established, and you want the peer to remain up, then, in order for a change to a route policy to take effect, a **clear** command with the *soft* or *soft-inbound* option must be used. In other words, when a **triggered-policy** is enabled, any routine policy change or policy assignment change within the protocol will not take effect until the protocol is reset or a clear command is issued to re-evaluate route policies; for example, **clear router bgp neighbor x.x.x.x soft**. This keeps the peer up and the change made to a route policy is applied only to that peer, or group of peers.

Default

no triggered-policy

Platforms

Full Context

configure router interface dhcp trusted

configure service vprn interface dhcp trusted

configure service ies subscriber-interface group-interface dhcp trusted

configure service ies interface dhcp trusted

Description

This command enables relaying untrusted packets. According to RFC 3046, *DHCP Relay Agent Information Option*, a DHCP request where the giaddr is 0.0.0.0 and which contains an Option 82 field in the packet, should be discarded, unless it arrives on a "trusted" circuit. If the **trusted** mode is enabled on an IP interface, the Relay Agent (the router) modifies the requested giaddr to be equal to the ingress interface and forward the request.

The **no** form of this command reverts to the default.

Default

48.14 ts-location

ts-location

Syntax

ts-location *file-url*

no ts-location

Context

[Tree] (config>system>security>tech-support ts-location)

Full Context

configure system security tech-support ts-location

Description

The **ts-location** command is used (along with an automatic system generated file name) when no *file-url* parameter is provided for the **admin tech-support** command. If **no ts-location** is defined then the operator must provide a file-url with the **admin tech-support** command itself.

The directory specified for the ts-location is not auto-created by SR OS. The operator must ensure that it exists.

See the **admin tech-support** command for more details about the system generated file name.

Default

no ts-location

Parameters

file-url

Specifies the destination directory for auto-named tech-support files (when no *file-url* is specified with the **admin tech-support** command). The *file-url* for the **ts-location** must be a directory (no filename or extension). The root directory (for example, cf1:\) is blocked for local compact flash destinations. A sub-directory (for example, cf2:\tech-support) must be used if local cf is the location.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[ftp://*login:pswd@remote-locn*/][*file-path*]
	247 chars max

Description

This command configures the TTL value used in the outgoing ping packet. The interface being tested must be directly connected on the same subnet.

The **no** form of this command reinstates the default value for TTL.

Default

ttl 1

Parameters

value

Specifies the value to be used in the TTL field.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ttl

Syntax

ttl *time-to-live*

Context

[Tree] (config>test-oam>link-meas>template>twl ttl)

Full Context

configure test-oam link-measurement measurement-template twamp-light ttl

Description

This command configures the Time to Live (TTL) value in the TWAMP Light test packet.

Default

ttl 1

Parameters

time-to-live

Specifies the value to be used in the TTL field.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ttl

Syntax

ttl {**lt** | **gt** | **eq**} *ttl-value*

ttl range *ttl-value ttl-value*

no ttl

Context

[Tree] (config>filter>ip-filter>entry>match ttl)

Full Context

configure filter ip-filter entry match ttl

Description

This command configures the Time To Live (TTL) match criteria.

The **no** form of this command removes the configuration.

Default

no ttl

Parameters

lt

Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt

Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq

Specifies "equal to”.

ttl-value

Specifies the maximum TTL value.

Values 0 to 255

Platforms

All

ttl

Syntax

ttl *time-to-live*

Context

[Tree] (config>test-oam>lag-meas>template>twl ttl)

Full Context

configure test-oam lag-ip-measurement lag-ip-measurement-template twamp-light ttl

Description

This command configures the time-to-live (TTL) in the IP header of the launched TWAMP Light packet.

Default

ttl 1

Parameters

time-to-live

Specifies the TTL value, expressed as a decimal integer.

48.18 ttl-expired

ttl-expired

Syntax

ttl-expired *number seconds*

no ttl-expired [*number seconds*]

Context

[Tree] (config>service>ies>if>icmp ttl-expired)

Full Context

configure service ies interface icmp ttl-expired

Description

This command configures the rate Internet Control Message Protocol (ICMP) TTL expired messages are issued by the IP interface.

By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the limiting the rate of TTL expired messages on the router interface and reverts to the default values.

Default

ttl-expired 100 10

Parameters

number

The maximum number of ICMP TTL expired messages to send, expressed as a decimal integer. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds

The time frame in seconds used to limit the *number* of ICMP TTL expired messages that can be issued, expressed as a decimal integer.

Full Context

configure router bgp group ttl-security

configure router bgp group neighbor ttl-security

configure router ldp tcp-session-parameters peer-transport ttl-security

configure system login-control telnet ttl-security

configure system login-control ssh ttl-security

Description

This command configures TTL security parameters for incoming packets. When the feature is enabled, LDP will accept incoming IP packets from a peer only if the TTL value in the packet is greater than or equal to the minimum TTL value configured for that peer. Per-peer-queueing must be enabled in order for TTL protection to operate.

The **no** form of this command disables TTL security.

Parameters

min-ttl-value

Specifies the minimum TTL value for an incoming BGP packet.

Values 1 to 255

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router l2tp group tunnel

configure service vprn l2tp group tunnel

Description

This command configures an L2TP tunnel. A tunnel exists between a LAC-LNS pair and consists of a Control Connection and zero or more L2TP sessions. The tunnel carries encapsulated PPP datagrams and control messages between the LAC and the L2TP Network Server (LNS).

The **no** form of this command removes the tunnel name from the configuration.

Parameters

tunnel-name

Specifies a valid string to identify an L2TP, up to 32 characters.

create

Mandatory keyword to create a new tunnel.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax

tunnel *connection-id*

Context

[Tree] (debug>router>l2tp tunnel)

Full Context

debug router l2tp tunnel

Description

This command enables debugging for an L2TP tunnel.

Parameters

connection-id

Specifies the connection ID of the L2TP session associated with this session.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel *service-id* **backbone-dest-mac** *ieee-address* **isid** *ISID*

no tunnel

Context

[Tree] (config>service>epipe>pbb tunnel)

Full Context

configure service epipe pbb tunnel

Description

This command configures a Provider Backbone Bridging (PBB) tunnel with Backbone VPLS (B-VPLS) service information.

Parameters

service-id

Specifies the B-VPLS service for the PBB tunnel associated with this service.

Values *service-id*: 1 to 2147483648

svc-name: 64 characters maximum

backbone-dest-mac *mac-name*

Specifies the backbone destination MAC name for PBB packets up to 32 characters in length.

backbone-dest-mac *ieee-address*

Specifies the backbone destination MAC-address for PBB packets as xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

isid *ISID*

Specifies a 24 bit service instance identifier for the PBB tunnel associated with this service. As part of the PBB frames, it is used at the destination PE as a demultiplexer field.

Values 0 to 16777215

Platforms

All

© 2026 Nokia.

Full Context

configure port ethernet dot1x tunnel-dot1q

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the tunneling of single tagged (dot1q) dot1x packets arriving on the port. When enabled, the router extracts these packets to the CPM.

The **no** form of this command disables the tunelling of the dot1q dot 1x packets on the port.

Default

tunnel-dot1q

Platforms

All

48.26 tunnel-down-damp-time

tunnel-down-damp-time

Syntax

tunnel-down-damp-time *seconds*

no tunnel-down-damp-time

Context

[Tree] (config>router>ldp tunnel-down-damp-time)

Full Context

configure router ldp tunnel-down-damp-time

Description

This command specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager (TTM).

When LDP can no longer resolve a FEC and de-activates it, it de-programs the NHLFE in the data path. It will however delay deleting the LDP tunnel entry in the TTM until the tunnel-down-damp-time timer expires. This means users of the LDP tunnel, such as SDPs (all services) and BGP (L3 VPN), will not be notified immediately. Traffic is still blackholed because the forwarding engine NHLFE has been de-programmed.

If the FEC gets resolved before the tunnel-down-damp-time timer expires, then LDP programs the forwarding engine with the new NHLFE and performs a tunnel modify event in TTM updating the dampened entry in TTM with the new NHLFE information. If the FEC does not get resolved and the tunnel-down-damp-time timer expires, LDP posts a tunnel down event to TTM which deletes the LDP tunnel.

When there is an upper layer (user of LDP) which depends of LDP control plane for failover detection then label withdrawal delay and tunnel-down-damp-time options must be set to 0.

An example is pseudowire redundancy where the primary PW does not have its own fast failover detection mechanism and the node depends on LDP tunnel down event to activate the standby PW.

The **no** form of this command resumes the default value of this command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no tunnel-down-damp-time (which equals a value of 3 seconds)

Parameters

seconds

Specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager.

Platforms

All

48.27 tunnel-elmi

tunnel-elmi

Syntax

[**no**] **tunnel-elmi**

Context

[Tree] (config>service>vpls tunnel-elmi)

Full Context

configure service vpls tunnel-elmi

Description

This command enables the tunneling of E-LMI packets in a VPLS service. The following must also be the case for this command to function:

- the **configure port ethernet elmi mode uni-n** command is not configured
- the **configure service vpls tunnel-elmi true** command is enabled
- the E-LMI packets map to that VPLS service

This command configures E-LMI packets in a VPLS service to be tunneled when the **configure port ethernet elmi mode uni-n** is not configured and the **configure service vpls tunnel-elmi** is enabled and the E-LMI packets map to that VPLS service.

The **no** form of this command disables tunneling of the E-LMI packets for a VPLS service.

Default

no tunnel-elmi

48.32 tunnel-far-end

tunnel-far-end

Syntax

tunnel-far-end *ip-address* | *ipv6-address*

no tunnel-far-end [*ip-address* | *ipv6-address*]

Context

[Tree] (config>service>sdp tunnel-far-end)

Full Context

configure service sdp tunnel-far-end

Description

This command enables the user to specify an SDP tunnel destination address that is different from the configuration in the SDP far-end option. The SDP must be shutdown first to add or change the configuration of the **tunnel-far-end** option.

When this option is enabled, service packets are encapsulated using an LDP LSP with a FEC prefix matching the value entered in ip-address. By default, service packets are encapsulated using an LDP LSP with a FEC prefix matching the address entered in the SDP far-end option.

The T-LDP session to the remote PE is still targeted to the address configured under the **far-end option**. This means that targeted hello messages are sent to the far-end address, which is also the LSR-ID of the remote node. TCP based LDP messages, such as initialization and label mapping messages, are sent to the address specified in the transport-address field of the "hello" message received from the remote PE. This address can be the same as the remote PE LSR-ID, or a different address. This feature works, however, if the signaling option in the SDP is set to off instead of tldp, in which case, the service labels are statically configured.

This feature operates on an SDP of type LDP only. It can be used with VLL, VPLS, and VPRN services when an explicit binding to an SDP with the **tunnel-far-end** is specified. It also operates with a spoke interface on an IES or VPRN service. Finally, this feature operates with a BGP AD based VPLS service when the **use-provisioned-sdp** option is enabled in the pseudowire template.

This feature is not supported in an SDP of type MPLS when an RSVP LSP name is configured under the SDP. It also does not work with a mixed-lsp SDP.

The **no** form of this command disables the use of the **tunnel-far-end** option and returns to using the address specified in the far-end.

Default

no tunnel-far-end

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-address* | *ipv6-address

Specifies the system address of the far-end router for the SDP in dotted decimal notation.

configure service ipipe eth-cfm tunnel-fault

configure service vprn subscriber-interface group-interface sap eth-cfm tunnel-fault

configure service epipe eth-cfm tunnel-fault

configure service vprn interface sap eth-cfm tunnel-fault

Description

Allows the individual service SAPs to react to changes in the tunnel MEP state. When tunnel-fault accept is configured at the service level, the SAP will react according to the service type, Epipe will set the operational flag and VPLS, IES and VPRN SAP operational state will become down on failure or up on clear. This command triggers the OAM mapping functions to mate SAPs and bindings in an Epipe service as well as setting the operational flag. If AIS generation is the requirement for the Epipe services this command is not required. See the **ais-enable** command under the **config>service>epipe>sap>eth-cfm>ais-enable** context for more details. This works in conjunction with the tunnel-fault accept on the individual SAPs. Both must be set to accept to react to the tunnel MEP state. By default the service level command is "ignore” and the SAP level command is "accept”. This means simply changing the service level command to "accept” will enable the feature for all SAPs. This is not required for Epipe services that only wish to generate AIS on failure.

Default

tunnel-fault ignore (Service Level)

tunnel-fault accept (SAP Level for Epipe and VPLS)

Parameters

accept

Shares fate with the facility tunnel MEP.

ignore

Does not share fate with the facility tunnel MEP.

48.34 tunnel-group

tunnel-group

Syntax

tunnel-group *tunnel-group-id* [**create**]

tunnel-group *tunnel-group-id* **isa-scale-mode** *isa-scale-mode* [**create**]

no tunnel-group *tunnel-group-id*

Context

[Tree] (config>isa tunnel-group)

Full Context

configure isa tunnel-group

Description

This command allows a tunnel group to be created or edited. A tunnel group is a set of one or more MS-ISAs that support the origination and termination of IPsec and IP/GRE tunnels. All of the MS-ISAs in a tunnel group must have **isa-tunnel** as their configured mda-type.

The **no** form of this command deletes the specified tunnel group from the configuration

Parameters

tunnel-group-id

Identifies the tunnel group.

Values 1 to 16

isa-scale-mode

Defines the maximum number of tunnels (all types combined) which can be established on each ISA of the tunnel group and for the whole tunnel-group. When it is not explicitly specified, **isa-scale-mode** has a default value, but that value is different on different platforms.

Values tunnel-limit-2k, tunnel-limit-32k, tunnel-limit-64k, tunnel-limit-8, tunnel-limit-32

create

Mandatory keyword used when creating tunnel group in the ISA context. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context

[Tree] (config>router tunnel-interface)

[Tree] (config>router>igmp tunnel-interface)

Full Context

configure router tunnel-interface

configure router igmp tunnel-interface

Description

This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces and associate each to a different RSVP P2MP LSP.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain "::" (two :s) nor contain a ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

Parameters

rsvp-p2mp *lsp-name*

Specifies the LSP. The LSP name can be up to 32 characters long and must be unique.

ldp-p2mp *p2mp-id*

Identifier used for signaling MLDP P2MP LSP.

Values 1 to 4294967296 (on leaf node)

1 to 8192 (on root node)

sender *sender-address*

Specifies the sender IP address: a.b.c.d.

tunnel-mtu

Syntax

tunnel-mtu *bytes*

no tunnel-mtu

Context

[Tree] (config>router>isis>segment-routing tunnel-mtu)

Full Context

configure router isis segment-routing tunnel-mtu

Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into TTM is determined like in the case of an IGP tunnel; for example, LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU is determined by IGP as explained below.

The MTU of the SR tunnel in bytes is then determined as follows:

*SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr-overhead)*4}*

Where:

Cfg_SR_MTU is the MTU configured by the user for all SR tunnels within a given IGP instance using the above CLI. If no value was configured by the user, the SR tunnel MTU will be determined by the IGP interface calculation explained next.

IGP_Tunnel_MTU is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.

frr-overhead is set to 1 if **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated anytime any of the above parameters used in its calculation changes. This includes when the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default

no tunnel-mtu

Parameters

bytes

Specifies the size of the Maximum Transmission Unit (MTU) in bytes.

Values 512 to 9786

© 2026 Nokia.

[Tree] (config>router>ospf>segm-rtng tunnel-mtu)

Full Context

configure router ospf3 segment-routing tunnel-mtu

configure router ospf segment-routing tunnel-mtu

Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into the TTM is determined as the same as an IGP tunnel; for example, for an LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU will be determined by IGP as follows:

The MTU of the SR tunnel in bytes is then determined as follows:

SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr—overhead)X4}

Where:

- *Cfg_SR_MTU* is the MTU configured by the user for all SR tunnels within an IGP instance using the tunnel-mtu command. If no value is configured by the user, the SR tunnel MTU is determined by the IGP interface calculation explained in the next bullet point.
- *IGP_Tunnel_MTU* is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.
- *frr-overhead* is set to 1 if the **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated whenever any of the above parameters used in its calculation changes. This includes if the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default

no tunnel-mtu

tunnel-next-hop

Syntax

tunnel-next-hop

Context

[Tree] (config>router>isis>igp-shortcut tunnel-next-hop)

Full Context

configure router isis igp-shortcut tunnel-next-hop

Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next-hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note:
An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable (disable) IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note:
An SR tunnel cannot resolve to SR-TE IGP shortcuts.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable or disable IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

Platforms

48.44 tunnel-port-policy

tunnel-port-policy

Syntax

tunnel-port-policy [*tunnel-port-policy*]

no tunnel-port-policy

Context

[Tree] (config>isa>wlan-gw-group tunnel-port-policy)

Full Context

configure isa wlan-gw-group tunnel-port-policy

Description

This command configures the tunnel port policy of this WLAN Gateway ISA group. If a tunnel port policy is associated with a WLAN Gateway ISA group, ports created for this group can take applicable configuration from that policy. This policy is applicable to those ports that take part in the per-tunnel QoS processing.

The **no** form of the command removes the **tunnel-port-policy** name from the configuration.

Default

no-tunnel-policy

Parameters

tunnel-port-policy

Specifies the tunnel port policy of this WLAN Gateway ISA group, up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure subscriber-mgmt wlan-gw tunnel-query

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a tunnel query where filter criteria over WLAN-GW tunnels are defined. This query can later be used to retrieve the state of the tunnels and Layer 2 access points (which are modeled as tunnels) matching the configured criteria.

The **no** form of this command removes the query.

Parameters

query-id

Specifies the ID assigned to a query.

Values 1 to 1024

name

Specifies the name assigned to a query, up to 32 characters.

create

Creates a tunnel query.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

48.47 tunnel-remote-address

48.53 tunnel-set-size

tunnel-set-size

Syntax

tunnel-set-size *tunnel-set-size*

no tunnel-set-size

Context

[Tree] (config>router>flex-algo-class-forwarding tunnel-set-size)

Full Context

configure router flex-algo-class-forwarding tunnel-set-size

Description

This command controls the maximum number of tunnels that IS-IS is allowed to include in a single flexible algorithm bundle of tunnels. The algorithm 0 tunnel is always included in this count, so the maximum number of non-zero-algorithm tunnels toward any remote router is **tunnel-set-size** minus 1. A commit is rejected if the number of unique algorithms across all configured **map** entries is greater than **tunnel-set-size** minus 1.

The **no** form of this command reverts to the default.

Default

no tunnel-set-size

Parameters

tunnel-set-size

Specifies the tunnel set size value.

Values 2 to 8

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

48.54 tunnel-source-ip

tunnel-source-ip

Syntax

tunnel-source-ip *ipv6-address/prefix-length*

no tunnel-source-ip

Context

48.56 tunnel-table-pref

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>ldp tunnel-table-pref)

Full Context

configure router ldp tunnel-table-pref

Description

This command configures the tunnel table preference for LDP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default

tunnel-table-pref 9

Parameters

preference

Specifies the preference value.

Values 1 to 255

Default 9

Platforms

Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>isis>segment-routing tunnel-table-pref)

Full Context

configure router isis segment-routing tunnel-table-pref

Description

This command configures the TTM preference of SR tunnels created by the IGP instance. This is used in the case of BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the new tunnel binding commands are configured to the **any** value which parses the TTM for tunnels in the protocol preference order. The user can choose to either go with the global TTM preference or list explicitly the tunnel types they want to use. When they list the tunnel types explicitly, the TTM preference will still be used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected one fails. Also, a reversion to a more preferred tunnel type is performed as soon as one is available.

The SR module adds to TTM a SR tunnel entry for each resolved remote node SID prefix and programs the data path with the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the setting of the default preference of the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as **SR-ISIS** and **SR-OSPF**).

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value for each tunnel type.

Default

tunnel-table-pref 11

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

preference

Specifies the integer value to represent the preference of IS-IS or OSPF SR tunnels in TTM.

Values 1 to 255

Platforms

All

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>ospf>segm-rtng tunnel-table-pref)

[Tree] (config>router>ospf3>segm-rtng tunnel-table-pref)

Full Context

configure router ospf segment-routing tunnel-table-pref

configure router ospf3 segment-routing tunnel-table-pref

Description

This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel types explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The SR module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note:
The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value for each tunnel type.

Default

tunnel-table-pref 10

Parameters

preference

Specifies the integer value to represent the preference of IS-IS, OSPF, or OSPF3 SR tunnels in the TTM.

Values 1 to 255

configure service vprn vxlan tunnel-termination

Description

This command instructs the system to redirect traffic to the corresponding PXC interface associated with the configured FPE when the destination IP address matches the configured tunnel termination IP address. Because the IP address is registered, the system can respond to ICMP packets directed to it.

The **no** form of this command removes the non-system IP address as the tunnel termination IP address.

Parameters

ip-address* | *ipv6-address

Specifies the non-system IPv4 or IPv6 address that terminates the VXLAN.

Values ip-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

where:

x: [0 to FFFF]H

d: [0 to 255]D

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fpe-id

Specifies the FPE identifier associated with the PXC port or LAG that processes and terminates the VXLAN.

Values 1 to 64

create

Mandatory keyword to create the FPE.

Platforms

All

tunnel-termination

Syntax

tunnel-termination *ip-address* **fpe** *fpe-id* [**create]**

no tunnel-termination *ip-address*

tunnel-termination

Syntax

tunnel-termination [*ip-address* | *ipv6-address*] **fpe** *fpe-id* [**create**]

no tunnel-termination [*ip-address* | *ipv6-address*]

Context

[Tree] (config>service>system>gre-eth-bridged tunnel-termination)

Full Context

configure service system gre-eth-bridged tunnel-termination

Description

This command configures an end-point IP address for a GRE tunnel carrying Ethernet payload that is to be terminated on a PW SAP. It also associates this IP address with the FPE object that is providing cross-connect logic between the tunnel and the PW port. This IP address fully supports ICMP protocols such as PING, traceroute, and others.

Parameters

ip-address

The tunnel end-point IP address in the SR OS node.

ipv6-address

The tunnel end-point IPv6 address in the SR OS node.

fpe id

The FPE ID that is providing cross-connect service between the GRE tunnel and the PW port.

Values 1 to 64

Context

[Tree] (config>subscr-mgmt>wlan-gw>ue-query tunnel-type)

Full Context

configure subscriber-mgmt wlan-gw ue-query tunnel-type

Description

This command enables matching on UEs that are active on a tunnel of the specified type. The **not-specified** value disables matching on the tunnel type.

The **no** form of this command reverts to the default.

Default

tunnel-type not-specified

Parameters

gre

Specifies that the tunnel is of type GRE.

l2tp

Specifies that the tunnel is of type L2TPv3.

l2

Specifies that the UE is connected over a Layer 2 access point.

vxlan

Specifies that the tunnel is of type VXLAN.

not-specified

Specifies that no tunnel type matches on UEs.

Full Context

configure port ethernet efm-oam tunneling

Description

This command enables EFM OAM PDU tunneling. Enabling tunneling will allow a port mode Epipe SAP to pass OAM frames through the pipe to the far end.

The **no** form of this command disables tunneling.

Default

no tunneling

Platforms

All

tunneling

Syntax

[**no**] **tunneling**

Context

[Tree] (config>port>ethernet>dot1x tunneling)

Full Context

configure port ethernet dot1x tunneling

Description

This command enables the tunneling of untagged 802.1x frames received on a port and is supported only when **dot1x port-control** is set to **force-auth**. 802.1x tunneling is applicable to both Epipe and VPLS services using either a null SAP or a default SAP on a dot1q port. When configured, untagged 802.1x frames will be switched into the service with the corresponding supported SAP.

The **no** form of this command disables tunneling of untagged 802.1x frames.

Default

Syntax

[**no**] **tunneling**

Context

[Tree] (config>router>ldp>targ-session>auto-tx>ipv4 tunneling)

[Tree] (config>router>ldp>targ-session>auto-rx>ipv4 tunneling)

Full Context

configure router ldp targeted-session auto-tx ipv4 tunneling

configure router ldp targeted-session auto-rx ipv4 tunneling

Description

This command enables the local system to use the targeted LDP session to send FEC/label bindings that it has advertised to other LDP peers. For LDP rLFA, the source node requires the PQ node's label binding information in order to reach the destination. Therefore, this command must be enabled for the **auto-rx** context. However, because **auto-rx** has lower precedence, **tunneling** must be enabled under the **auto-tx** command, in case **auto-rx** is in a **no shutdown** state on the same system.

The **no** form of this command disables the local system from sending FEC/label bindings.

Default

no tunneling

oam eth-cfm two-way-delay-test

Description

This command issues an ETH-CFM two-way delay test.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

mac-address

Specifies a unicast destination MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

remote-mepid *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

priority

Specifies the priority.

Values 0 to 7

Default 7

Context

[Tree] (oam>eth-cfm two-way-slm-test)

Full Context

oam eth-cfm two-way-slm-test

Description

This command configures an Ethernet CFM two-way SLM test in SAA.

Parameters

mac-address

Specifies a unicast destination MAC address in the format xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

remote-mepid *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the source MEP for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

priority

Specifies the priority.

Values 0 to 7

Default 7

send-count

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. The message interval value must be expired before the next message request is sent.

Values 1 to 1000

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 1

data-size

Specifies the size of the data portion of the data TLV. If 0 is specified, no data TLV is added to the packet.

Values 0 to 1500

Default 0

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. After the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded. The *timeout* value must be less than the interval.

Values 1 to 10

Default 5

interval

Specifies the **interval** parameter in seconds, expressed as a decimal integer. This parameter is used to configure the spacing between probes within a test run.

Values 0.1 to 0.9, 1 to 10

Default 5

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx string *identifier*

no tx

Context

[Tree] (config>port>otu>pm-tti tx)

Full Context

configure port otu pm-tti tx

Description

This command enables the user to configure the transmit (tx) trail trace identifier (TTI) for path monitoring (PM) in the ODU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes.

The **no** form of this command reverts to the default TTI value.

Default

Auto-generated in the format of *nodename:iomnum/mdanum/portnum/dwdmchan*

The auto-generated value has five sections:

- Nodename — The first section is the name of the node.
- iomnum — The second section contains the IOM slot number.
- mdanum — The third section contains the MDA slot number.
- portnum — The fourth section contains the port number.
- dwdmchan — The fifth section contains the DWDM channel number (see the table "DWDM Channel Numbers” in the **channel** command [**config>port>dwdm channel** and **config>port>dwdm>coherent channel**]).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

auto-generated

Specifies to use the system generated (default) TTI.

identifier

Sets the PM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0.

byte-string

Sets the PM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings. Up to 64 byte strings can be specified in a single statement.

Values 0 to FF, in hexadecimal byte notation

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

Syntax

tx *byte*

tx auto

Context

[Tree] (config>port>otu>psi-payload tx)

Full Context

configure port otu psi-payload tx

Description

This command allows the user to configure the transmit payload type value in byte 0 of the payload structure identifier (PSI) of the OPU overhead.

Default

3 for 10GE-LAN/WAN or OC192 with OTU encapsulation; 5 for GFP framed 10GE-LAN with OTU encapsulation.

Parameters

auto

Transmits the standard value in the payload type field.

byte

Specifies the transmit payload type value in bytes.

Values [00 to FF] Hexadecimal notation

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

Syntax

tx auto-generated

tx bytes *byte-string* [*byte-string*)]

tx string *identifier*

no tx

Context

[Tree] (config>port>otu>sm-tti tx)

Full Context

configure port otu sm-tti tx

Description

This command allows the user to configure the transmit (tx) trail trace identifier (TTI) for section monitoring (SM) in the OTU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes.

The **no** form of this command reverts to the default TTI value.

Default

Auto-generated in the format of *nodename:iomnum/mdanum/portnum/dwdmchan*

The auto-generated value has five sections:

- Nodename — The first section is the name of the node.
- iomnum — The second section contains the IOM slot number.
- mdanum — The third section contains the MDA slot number.
- portnum — The fourth section contains the port number.
- dwdmchan — The fifth section contains the DWDM channel number (see the table "DWDM Channel Numbers” in the **channel** command [**config>port>dwdm channel** and **config>port>dwdm>coherent channel**]).

Parameters

auto-generated

Specifies to use the system generated (default) TTI.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

identifier

Sets the SM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0. Up to 64 byte strings can be specified in a single statement.

byte-string

Sets the SM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings.

Values 0 to FF, in hexadecimal byte notation

configure router interface eth-cfm mep grace eth-ed tx-eth-ed

Description

This command enables the transmission of the ITU-T Y.1731 ETH-ED PDU from the MEP when a system soft reset notification is received for one or more cards.

The **config**>**eth-cfm**>**system**>**grace-tx-enable** command must be configured to instruct the system that the node is capable of transmitting expected defect windows to the peers. Only one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED) may be transmitted.

The **no** form of this command disables the transmission of the ITU-T Y.1731 ETH-ED PDU from the MEP.

Default

Context

[Tree] (config>port>ethernet>lldp>dstmac tx-tlvs)

Full Context

configure port ethernet lldp dest-mac tx-tlvs

Description

This command specifies which LLDP TLVs to transmit. The TX TLVs, defined as a bitmap, includes the basic set of LLDP TLVs whose transmission is allowed on the local LLDP agent by the network management. Each bit in the bitmap corresponds to a TLV type associated with a specific optional TLV. Organizationally-specific TLVs are excluded from this bitmap.

There is no bit reserved for the management address TLV type since transmission of management address TLVs are controlled by another object.

The **no** form of this command resets the value to the default.

Default

no tx-tlvs

Parameters

port-desc

Indicates that the LLDP agent should transmit port description TLVs.

sys-name

Indicates that the LLDP agent should transmit system name TLVs.

sys-desc

Indicates that the LLDP agent should transmit system description TLVs.

sys-cap

Indicates that the LLDP agent should transmit system capabilities TLVs.

[Tree] (config>router>twamp-light>reflector type)

Full Context

configure service vprn twamp-light reflector type

configure router twamp-light reflector type

Description

This command configures the processing behavior of the TWAMP Light reflector. When the value is **twamp-light**, the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is **stamp**, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet.

In mixed environments where different types of session senders may be targeting a common TWAMP Light reflector, the value should be set to stamp. When the reflector is operating in stamp mode, the primary parsing is based on STAMP, checking and processing known TLVs, and also determining when TLVs are not present and the arriving PDU is a TWAMP Light PDU. A session sender launching a TWAMP Light-based packet must use all zeros and a padding pattern zero when the pad size is non zero.

Default

type twamp-light

Parameters

reflector-type

Specifies the type of processing behavior for the reflector.

Values stamp, twamp-light

Full Context

configure service vprn type

Description

This command designates the type of VPRN instance being configured for hub and spoke topologies. Use the **no** form to reset to the default of a fully meshed VPRN.

Default

no type

Parameters

hub

Specifies a hub VPRN which allows all traffic from the hub SAPs to be routed to the destination directly, while all traffic from spoke VPRNs or network interfaces can only be routed to a hub SAP.

spoke

Specifies a spoke VPRN which allows traffic from associated SAPs or spoke terminations to only be forwarded through routes learned from separate VPRN, which should be configured as a type Hub VPRN.

subscriber-split-horizon

Controls the flow of traffic for wholesale subscriber applications.

Platforms

All

type

Syntax

[**no**] **type**

Context

[Tree] (config>saa>test type)

Full Context

configure saa test type

Description

This command creates the context to provide the test type for the named test. Only a single test type can be configured.

A test can only be modified while the test is in shut down mode.

Once a test type has been configured, the command can be modified by re-entering the command. However, the test type must be the same as the previously entered test type.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

To change the test type, the old command must be removed using the **config>saa>test>no type** command.

The **no** form of this command removes the test type parameters from the configuration.

[Tree] (config>qos>sap-ingress>ipv6-criteria type)

[Tree] (config>qos>sap-ingress>ip-criteria type)

Full Context

configure qos sap-ingress ipv6-criteria type

configure qos sap-ingress ip-criteria type

Description

This command sets the **ip-criteria** and **ipv6-criteria** type to control the type of match entries configurable in this context.

Default

type normal

Parameters

filter-type

Specifies which type of entries that the **ip-criteria** and **ipv6-criteria** statements can contain.

Values **normal** — Regular match criteria are allowed; VXLAN VNI matching is not allowed.

tagged-entries — Specifies that entries within that criteria statement are tagged. Tagged entries are not populated by default, they are only populated when their tag value is activated using the criteria override under an Ethernet SAP.

The **type** can only be changed from **normal** to **tagged-entries** if there are no **ip-criteria** or **ipv6-criteria** entries configured and the SAP ingress QoS policy is not applied to any object.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A SAP ingress QoS policy configured with a criteria statement with **type tagged-entries** is not supported within an SLA profile, sub profile or MSAP policy, or under an IES/VPRN group interface SAP.

The configuration of **type tagged-entries** is mutually exclusive with the configuration of the **match dst-port** in the same criteria statement.

vxlan-vni — Matching is allowed on a VXLAN VNI for VXLAN and VXLAN GPE frames.

The type cannot be changed when **ip-criteria** or **ipv6-criteria** entries are configured. If there are no **ip-criteria** or **ipv6-criteria** entries configured, the type can be changed from **vxlan-vni** to **normal**. The type can only be changed from **normal** to **vxlan-vni** if there are no **ip-criteria** or **ipv6-criteria** entries configured but it is necessary that the SAP ingress QoS policy is also not applied to any object in order to change from **normal** to **vxlan-vni**.

A SAP ingress QoS policy configured with **type vxlan-vni** can be applied to any Ethernet SAPs, except for a PW-SAP, B-VPLS SAP, or CCAG SAP, in any applicable service.

Platforms

[Tree] (config>router>bgp>group>neighbor type)

Full Context

configure router bgp group type

configure router bgp group neighbor type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command designates the BGP peer as type internal or external.

The type of **internal** indicates the peer is an IBGP peer while the type of external indicates that the peer is an EBGP peer.

By default, the router derives the type of neighbor based on the local AS specified. If the local AS specified is the same as the AS of the router, the peer is considered **internal**. If the local AS is different, then the peer is considered **external**.

The **no** form of this command used at the group level reverts to the default value.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

no type

Parameters

internal

Configures the peer as internal.

external

Configures the peer as external.

Platforms

All

type

Syntax

type {**1** | **2**}

no type

Context

[Tree] (config>router>policy-options>policy-statement>entry>from type)

Full Context

configure router policy-options policy-statement entry from type

Description

This command configures an OSPF type metric as a match criterion in the route policy statement entry.

If no type is specified, any OSPF type is considered a match.

The **no** form of this command removes the OSPF type match criterion.

Default

no type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

1

Matches OSPF routes with type 1 LSAs.

2

Matches OSPF routes with type 2 LSAs.

Platforms

All

type

Syntax

type {*type* | *param-name*}

no type

Context

[Tree] (config>router>policy-options>policy-statement>entry>action type)

[Tree] (config>router>policy-options>policy-statement>default-action type)

Full Context

configure router policy-options policy-statement entry action type

configure router policy-options policy-statement default-action type

Description

This command sets the subtype for the Type 5 LSA (external LSA).

The **no** form of this command disables assigning a type in the route policy entry.

Default

type 2

Parameters

type

Specifies the type metric.

Values Subtype 1 — The external metric in the external LSA is comparable with the internal metric, and thus one can sum up all the metrics along the path (both internal and external) to get the total cost to the destination.

Subtype 2 — The metric in the external LSA is much more important than the internal metric, so the internal metrics should only be considered when comparing two external routes that have the same external metric.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

param-name

The type parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

49 u Commands

49.1 ua

ua

Syntax

[**no**] **ua** *function-value*

Context

[Tree] (config>router>segment-routing>srv6>inst>ms-loc>func ua)

Full Context

configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function ua

Description

Commands in this context configure the attributes of the uA micro-SID function associated with a P2P interface. The uA micro-SID function encodes the behavior of an adjacency SID.

The range of allowed configurable values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1] to form a uA micro-SID.

Static micro-SID values range in [1024*global-sid-entries, 1024*global-sid-entries + max-entries – 1].

A static function value can be configured for each combination of SRH mode and protection type.

For a specified interface, the static function value associated with the same combination of protection type and SRH mode overrides any corresponding automatically allocated function value (**ua-auto-allocate** command configuration).

If more than one value is configured for an interface and combination of SRH mode and protection type, they are all advertised in IS-IS.

When used in remote TI-LFA repair tunnel programming, IS-IS uses rules to select one uA value from the multiple values received in IS-IS link advertisements.

The values assigned to loopback and system interfaces are not advertised in IS-IS.

The uA micro-SID functions for adjacencies over broadcast interfaces are always automatically allocated based on the configuration of the following command:

```
configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator
 function ua-auto-allocate
```

The **no** form of this command removes the function value from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

function-value

Specifies the SRv6 uA function.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

49.2 ua-auto-allocate

ua-auto-allocate

Syntax

[**no**] **ua-auto-allocate srh-mode** *srh-mode* **protection** *protection*

Context

[Tree] (config>router>segment-routing>srv6>inst>ms-loc>func ua-auto-allocate)

Full Context

configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function ua-auto-allocate

Description

This command configures a list entry for the automatic allocation of the uA micro-SID function for all adjacencies over all network interfaces on the router (P2P and broadcast interfaces).

Auto-allocated uA function value (N) is drawn by the system from the following range [max-entries + 1, 2^sid-length – 1024*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro SID range [1024*global-sid-entries, 2^sid-length – 1]. Dynamic micro-SID values range in [1024*global-sid-entries + max-entries, 2^sid-length – 1].

A list entry is a combination of the protection type and the SRH mode. Any combinations in addition to the maximum number of entries supported by this command must be allocated statically for each P2P interface. The maximum number of entries in this list is two.

When no list entries are configured, no uA function values are automatically allocated by default for a micro-segment locator.

Note:
Any change to this list causes a re-allocation of new function values to all interfaces on the router that results in flooding them to the network and triggers a new SPF in all routers.

The **no** form of this command removes the function value from the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

srh-mode

Specifies the SRH mode for the SID.

Values psp — Penultimate Segment Pop (PSP) of the SRH

usp — Ultimate Segment Pop (USP) of the SRH

psp-usd — Supports both PSP of the SRH and Ultimate Segment Decapsulation (USD) on the same SID

usp-usd — Supports both USP of the SRH and USD on the same SID

psp-usp-usd — Supports PSP and USP of the SRH with USD on the same SID

protection

Specifies whether the adjacency SID is protected.

Values protected, unprotected

49.9 udp-port

udp-port

Syntax

udp-port *udp-port-number*

Context

[Tree] (config>service>vprn>mtrace2 udp-port)

[Tree] (config>router>mtrace2 udp-port)

Full Context

configure service vprn mtrace2 udp-port

configure router mtrace2 udp-port

Description

This command specifies the destination and listening port for the **mtrace2** command. When it is configured, this command generates Mtrace2 packets with the configured UDP port, and also listens on the same port for any incoming Mtrace2 packets.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Port 33435 is the IANA-assigned port for Mtrace2. On several operating systems (for example, Linux OS, SR OS), this port is also used by traceroute. On SR OS, if port 33435 is configured as the Mtrace2 port, SR OS does not respond to traceroute on this port.

Default

5000

Parameters

udp-port-number

Specifies the UDP port for the test.

Values 1024 to 49151

Platforms

All

49.10 udp-protocols

udp-protocols

Syntax

udp-protocols *protocol-set*

Context

[Tree] (config>app-assure>group>tether-detect>ttl-mon udp-protocols)

Full Context

configure application-assurance group tethering-detection ttl-monitoring udp-protocols

Description

This command configures whether AA analyzes all UDP traffic or only traffic from standard applications that generate consistent TTL values. Configuring AA to analyze only standard UDP traffic is recommended.

Default

udp-protocols standard

Parameters

protocol-set

Specifies the scope of analysis for UDP traffic.

Values standard, all

[Tree] (config>oam-pm>session>mpls>lsp>rsvp-auto udp-return-object)

Full Context

configure oam-pm session mpls lsp rsvp udp-return-object

configure oam-pm session mpls lsp rsvp-auto udp-return-object

Description

This command configures the destination IP address used by the far end of the test to send a test response. The UDP port in the UDP-Return Object is set to 64353 for MPLS DM PDUs.

RSVP tunnels are unidirectional and must include a configured local address for the responder can route the response back by the IP control plane. If the configuration is absent, the DN test fails to activate. If the configured IP address is not a local address, the command fails.

The **no** form of this command removes the udp-return-object IP address.

Parameters

ip-address

Specifies the destination IP.

Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

Full Context

configure service vpls segment-routing-v6 micro-segment-locator function udt2m

Description

This command configures the SRv6 uDT2M behavior and function value that is associated with the SRv6 instance in the service. This means that decapsulation and table lookup for IPv6 prefixes occurs in the VPLS service.

The range of allowed configurables values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1] to form a uDT2M micro-SID. Static micro-SID values range in [1024*global-sid-entries, 1024*global-sid-entries + max-entries – 1].

If no value is configured, the system draws a function value (N) from the following range [max-entries + 1, 2^sid-length – 1024*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro-SID range [1024*global-sid-entries, 2^sid-length – 1]. Dynamic micro-SID values range in [1024*global-sid-entries + max-entries, 2^sid-length – 1].

The **no** form of this command removes the function behavior and value from the configuration.

Parameters

function-value

Specifies the SRv6 micro-segment uDT2M function value.

Values 1 to 1048575

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

umh-selection {**highest-ip** | **hash-based** | **tunnel-status** | **unicast-rt-pref**}

no umh-selection

Context

[Tree] (config>service>vprn>mvpn umh-selection)

Full Context

configure service vprn mvpn umh-selection

Description

This command specifies which UMH selection mechanism to use, highest IP address, hash based or provider tunnel status.

The **no** form of this command resets it back to default.

Default

umh-selection highest-ip

Parameters

highest-ip

Specifies that the highest next-hop IP address is selected as UMH. The RTM may have just one next-hop to the source, but **highest-ip** uses all of the next-hops available to BGP that appear in the BGP database.

hash-based

Specifies that the UMH selection is based on hash-based procedures set out in RFC 6513, section 5.1.3. The RTM may have just one next-hop to the source, but **hash-based** uses all of the next-hops available to BGP that appear in the BGP database.

tunnel-status

Specifies that UMH selection is based on the state of the tunnel as well as the available unicast routes through the tunnel. Not supported for IPv6.

unicast-rt-pref

When selected, best unicast route will decide which UMH is chosen. All PE routers shall prefer the same route to the UMH for the UMH selection criterion (for example BGP path selection criteria must not influence one PE to choose different UMH from another PE).

configure oam-pm session ethernet lmm loss-events unavailability-event

Description

This command sets the threshold to be applied to the overall count of the unavailability indicators, not transitions, per configured direction. This value is compared to the 32-bit unavailability counter specific to the direction which tracks the number of individual Delta-Ts that have been recorded as unavailable.

The **no** form of this command removes the event threshold for the frame loss ratio. The direction must be included with the **no** command.

Default

no unavailability-event forward

no unavailability-event backward

no unavailability-event aggregate

Parameters

forward

Keyword to apply the threshold to the forward direction count.

backward

Keyword to apply the threshold to the backward direction count.

aggregate

Keyword to apply the threshold to the aggregate count (sum of forward and backward). The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics.

raise-threshold

Specifies a numerical value compared to the unavailability counter that is the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior to configure a percentage of loss value lower than the rising percentage to indicate when to generate the clear event.

If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within the measurement interval.

If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to the following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

Values 0 to 863999

A value of zero means that the unavailability counter must be 0.

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping mcac unconstrained-bw

Description

This command configures the bandwidth for the interface or subscriber's multicast CAC policy traffic. When disabled (**no unconstrained-bw**), there is no checking of bandwidth constraints on the interface or subscriber level. When enabled and a policy is defined, enforcement is performed. The allocated bandwidth for optional channels should not exceed the **unconstrained-bw** minus the **mandatory-bw** and the mandatory channels have to stay below the specified value for the **mandatory-bw**. After this interface and subscriber check, the bundle checks are performed.

The **no** form of this command reverts to the default.

Parameters

bandwidth

Specifies bandwidth assigned for interface's MCAC policy traffic, in kilobits per second (kb/s).

Values 0 to 2147483647

mandatory-bw

Specifies the bandwidth pre-reserved for all the mandatory channels on a given interface in kilobits per second (kb/s).

If the *bandwidth* value is 0, no mandatory channels are allowed. If the value of *bandwidth* is '-1', then all mandatory and optional channels are allowed.

If the value of *mandatory-bw* is equal to the value of *bandwidth*, then all the unconstrained bandwidth on a given interface is allocated to mandatory channels configured through multicast CAC policy on that interface and no optional groups (channels) are allowed.

The value of *mandatory-bw* should always be less than or equal to that of *bandwidth*, An attempt to set the value of *mandatory-bw* greater than that of *bandwidth*, will result in inconsistent value error.

Values 0 to 2147483647

Description

This command enables MCAC (or HMCAC) function on the corresponding level (subscriber, group-interface or redirected interface). When MCAC (or HMCAC) is enabled and a channel definition policy is referenced, admission control is performed. The allocated bandwidth for optional channels should not exceed the unconstrained-bw minus the mandatory-bw. The mandatory channels have to stay below the specified value for the mandatory-bw.

In HMCAC, the subscriber is checked first against its bandwidth limits followed by the check on the redirected interface or the group-interface against the bandwidth limits defined there.

In case that redirection is enabled and HMCAC enabled, the channel definition policy must be referenced under the redirected interface level. If it is referenced under the group-interface level, it will be ignored.

Subscriber MCAC (only subscriber is checked for available resources) is supported only with direct subscriber replication (no redirection). In this case the channel definition policy must be referenced under the group-interface.

If the redirection is enabled but the policy is referenced only under the group-interface, no admission control is executed (HMCAC or MCAC).

The **no** form of this command removes the values from the configuration.

Default

no unconstrained-bw

Parameters

bandwidth

Specifies the unconstrained bandwidth in kb/s for the MCAC policy.

Values 0 to 2147483647

mandatory-bw

Specifies the mandatory bandwidth in kb/s for the MCAC policy.

Values 0 to 2147483647

49.35 unconsumed-agg-rate

unconsumed-agg-rate

Syntax

unconsumed-agg-rate percent *percent-of-unconsumed-agg-rate*

no unconsumed-agg-rate

Context

[Tree] (config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance unconsumed-agg-rate)

Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance unconsumed-agg-rate

Description

This command configures the percentage of the unconsumed aggregate rate that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **unconsumed-agg-rate percent** to its default value.

Default

unconsumed-agg-rate 100.00

Parameters

percent-of-unconsumed-agg-rate

Specifies the percentage of the unconsumed aggregate rate that can be given to a queue.

Values 0.00 to 100.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

unconsumed-higher-tier-rate

Syntax

unconsumed-higher-tier-rate percent *percent-of-unconsumed-higher-tier-rate*

no unconsumed-higher-tier-rate

Context

[Tree] (config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance unconsumed-higher-tier-rate)

Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance unconsumed-higher-tier-rate

Description

This command configures the percentage of the unconsumed higher tier rate that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. Higher tier refers to the Vport aggregate rate and port scheduler level, group, and maximum rates.

This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **unconsumed-higher-tier-rate percent** to its default value.

Default

unconsumed-higher-tier-rate 100.00

Parameters

percent-of-unconsumed-higher-tier-rate

Specifies the percentage of the unconsumed higher tier rate that can be given to a queue.

Values 0.00 to 100.00

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

49.37 underflow-limit

underflow-limit

Syntax

underflow-limit *number* **threshold** *percent* [**bw** *rate-in-mbps*]

no underflow-limit

Context

[Tree] (config>router>mpls>lsp-template>auto-bandwidth underflow-limit)

[Tree] (config>router>mpls>lsp>auto-bandwidth underflow-limit)

Full Context

configure router mpls lsp-template auto-bandwidth underflow-limit

configure router mpls lsp auto-bandwidth underflow-limit

Description

This command configures underflow-triggered auto-bandwidth adjustment. An underflow auto-bandwidth adjustment can occur any time during the adjust interval; it is triggered when the number of consecutive underflow samples reaches the threshold *number* configured for this command. The new bandwidth of the LSP after a successful underflow adjustment is the maximum data rate observed in the last *number* of consecutive underflow samples.

A sample interval is counted as an underflow if the average data rate during the sample interval is lower than the currently reserved bandwidth by at least the thresholds configured for this command.

The **no** form of this command disables underflow-triggered auto-bandwidth adjustment.

Default

no underflow-limit

Parameters

number

Specifies the number of consecutive underflow samples to trigger an underflow auto-bandwidth adjustment attempt.

Values 1 to 10

percent

Specifies the minimum difference between the current bandwidth reservation of the LSP and the sampled data rate, expressed as a percentage of the current bandwidth reservation, for counting an underflow sample.

Values 0 to100

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rate-in-mbps

Specifies the minimum difference between the current bandwidth reservation of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s), for counting an underflow sample.

Values 0 to 6400000

Platforms

All

49.38 undet-availability-event

undet-availability-event

Syntax

undet-availability-event {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]

no undet-availability-event {**forward** | **backward** | **aggregate**}

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss-events undet-availability-event)

[Tree] (config>oam-pm>session>ethernet>slm>loss-events undet-availability-event)

[Tree] (config>oam-pm>session>ethernet>lmm>loss-events undet-availability-event)

configure oam-pm session ip twamp-light loss-events undet-availability-event

configure oam-pm session ethernet slm loss-events undet-availability-event

configure oam-pm session ethernet lmm loss-events undet-availability-event

Description

This command configures the threshold to apply to the overall count of the undetermined availability indicators, not transitions, per configured direction. This value is compared to the 32-bit unavailability counter specific to the direction which tracks the number of individual Delta-Ts that have been recorded as undetermined available.

The **no** form of this command removes the event threshold for the frame loss ratio. The direction must be included with the **no** command.

Default

no undet-availability-event forward

no undet-availability-event backward

no undet-availability-event aggregate

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

forward

Keyword to apply the threshold to the forward direction count.

backward

Keyword to apply the threshold to the backward direction count.

aggregate

Keyword to apply the threshold to the aggregate count (sum of forward and backward). The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics.

raise-threshold

Specifies the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within the measurement interval.

If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

Values 0 to 863999

A value of zero means that the undetermined availability counter must be 0.

Default clear threshold disabled

configure oam-pm session ip twamp-light loss-events undet-unavailability-event

configure oam-pm session ethernet slm loss-events undet-unavailability-event

configure oam-pm session ethernet lmm loss-events undet-unavailability-event

Description

This command configures the threshold to apply to the overall count of the undetermined unavailability indicators, not transitions, per configured direction. This value is compared to the 32-bit unavailability counter specific to the direction which tracks the number of individual Delta-Ts that have been recorded as undetermined unavailable.

The **no** form of this command removes the event threshold for the frame loss ratio. The direction must be included with the **no** command.

Default

no undet-unavailability-event forward

no undet-unavailability-event backward

no undet-unavailability-event aggregate

Parameters

forward

Keyword to apply the threshold to the forward direction count.

backward

Keyword to apply the threshold to the backward direction count.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

aggregate

Keyword to apply the threshold to the aggregate count (sum of forward and backward). The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics.

raise-threshold

Specifies the rising threshold that determines when the event is to be generated, when the value is reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

If the **clear** *clear-threshold* parameter is not specified the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and without regard to any previous window. Each unique event can only be raised once within the measurement interval.

If the optional **clear** *clear-threshold* parameter is specified the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is not raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

Values 0 to 863999

A value of zero means that the undetermined availability counter must be 0.

49.40 undo

undo

Syntax

undo [*count*]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (candidate undo)

Full Context

candidate undo

Description

This command removes the most recent change(s) done to the candidate. The changes can be reapplied using the **redo** command. All undo or redo history is lost when the operator exits the **edit-cfg** mode. Undo can not be used to recover a candidate that has been discarded with **candidate discard**.

An **undo** command is blocked if another user has made changes in the same CLI branches that would be impacted during the undo.

Parameters

count

Specifies the number of previous changes to remove.

Values 1 to 50

Default 1

Description

This command specifies the method used to compute the unidirectional delay value.

Default

unidirectional-measurement derived

Parameters

measurement-type

Specifies the method to compute a unidirectional delay measurement.

Values **actual** — Keyword to use the forward delay as the unidirectional measurement. The forward delay is calculated using T2-T1 timestamps.

derived — Keyword to compute the unidirectional measurement using the round trip delay divided by two. This option should be used when the nodal clocks are not synchronized using an accurate time synchronization method or protocol, like PTP.

no unique-sid-per-sap

Context

[Tree] (config>subscr-mgmt>ppp-policy unique-sid-per-sap)

Full Context

configure subscriber-mgmt ppp-policy unique-sid-per-sap

Description

This command assigns a unique session ID to each PPPoE session active on a single SAP.

On a capture SAP, a unique session ID is assigned per capture SAP: multiple sessions that are active on the same or different MSAP have a unique session ID per capture SAP.

With the optional parameter **per-msap**, a unique session ID is assigned per MSAP:

- multiple sessions that are active on the same MSAP have a unique session ID per MSAP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- multiple sessions that are active on different MSAPs are not guaranteed to have a unique session ID

The session ID range is 1 to 8191.

By default, all PPPoE sessions with a different client MAC address and active on a given SAP or MSAP have a session ID of 1 (**sid-allocation sequential**) or a random value in the range 1 to 8191 (**sid-allocation random**).

The **no** form of this command reverts to the default.

Parameters

per-msap

Assigns a unique session ID for PPPoE sessions that are active on the same MSAP. This parameter has no effect on regular SAPs.

49.48 unknown-mac-route

unknown-mac-route

Syntax

[**no**] **unknown-mac-route**

Context

[Tree] (config>service>vpls>bgp-evpn unknown-mac-route)

Full Context

configure service vpls bgp-evpn unknown-mac-route

Description

This command enables the advertisement of the unknown-mac-route in BGP. This will be coded in an EVPN MAC route where the MAC address is zero and the MAC address length 48. By using this unknown-mac-route advertisement, the user may decide to optionally turn off the advertisement of MAC addresses learned from SAPs and SDP-bindings, hence reducing the control plane overhead and the size of the FDB tables in the data center. All the receiving NVEs supporting this concept will send any unknown-unicast packet to the owner of the unknown-mac-route, as opposed to flooding the unknown-unicast traffic to all other nodes part of the same VPLS. Although the 7750 SR, 7450 ESS, or 7950 XRS can be configured to generate and advertise the unknown-mac-route, the router will never honor the unknown-mac-route and will flood to the vpls flood list when an unknown-unicast packet arrives to an ingress SAP/SDP-binding.

Use of the unknown-mac-route is only supported for BGP-EVPN VXLAN.

Default

no unknown-mac-route

49.51 unknown-policer

unknown-policer

Syntax

unknown-policer *policer-id* [**fp-redirect-group**]

no unknown-policer

Context

[Tree] (config>qos>sap-ingress>fc unknown-policer)

Full Context

configure qos sap-ingress fc unknown-policer

Description

Within a **sap-ingress** QoS policy forwarding class context, the **unknown-policer** command is used to map packets that match the forwarding class and are considered unknown in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination based on the ingress service type and the service instance forwarding records. If the service type is VPLS and the destination MAC address is unicast, but the MAC has not been learned and populated within the VPLS services FDB, the packet is classified into the unknown forwarding type.

Unknown forwarding type packets are mapped to either an ingress multipoint queue (using the **unknown** *queue-id* or **unknown** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**unknown-policer** *policer-id*). The **unknown** and **unknown-policer** commands within the forwarding class context are mutually exclusive. By default, the unknown forwarding type is mapped to the SAP ingress default multipoint queue. If the **unknown-policer** *policer-id* command is executed, any previous policer mapping

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

or queue mapping for the unknown forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site, or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

The **unknown-policer** command is ignored for instances of the policer applied to SAPs or subscribers' multiservice site where unknown packets are not supported.

When the unknown forwarding type within a forwarding class is mapped to a policer, the unknown packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unknown forwarding type within the forwarding class to the default multipoint queue. If all forwarding class forwarding types had been removed from the default multipoint queue, the queue will not exist on the SAPs or subscriber or multiservice site associated with the QoS policy and the **no broadcast-policer** command will cause the system to attempt to create the default multipoint queue on each object. If the system cannot create the queue on each instance, the **no unknown-policer** command will fail and the unknown forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no unknown-policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters

policer-id

When the forwarding class **unknown-policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

fp-redirect-group

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

Syntax

unknown-queue *queue-id* [**group** *queue-group-name*]

no unknown-queue

Context

[Tree] (config>qos>sap-ingress>fc unknown-queue)

Full Context

configure qos sap-ingress fc unknown-queue

Description

This command overrides the default unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters

queue-id

Specifies an existing multipoint queue defined in the **config>qos>sap-ingress** context.

Values Any valid multipoint *queue-id* in the policy including 2 through 32.

Default 11

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

group *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified queue-id within the queue-group-name. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts.

Platforms

All

unknown-queue

Syntax

unknown-queue *queue-id*

no unknown-queue

Context

[Tree] (config>qos>shared-queue>fc unknown-queue)

Full Context

configure qos shared-queue fc unknown-queue

Description

This command configures the unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters

queue-id

The *queue-id* must be an existing, multipoint queue defined in the **config>qos>sap-ingress** context policer-output-queues profile. For the 7950 XRS, this is not configurable in the policer-output-queues profile.

49.55 unnumbered

unnumbered

Syntax

unnumbered [*ip-int-name* | *ip-address*]

no unnumbered

Context

[Tree] (config>service>vprn>sub-if unnumbered)

[Tree] (config>service>ies>sub-if unnumbered)

Full Context

configure service vprn subscriber-interface unnumbered

configure service ies subscriber-interface unnumbered

Description

This command can be configured only for subscriber interfaces that do not have an IPv4 address explicitly configured and is therefore operationally in a DOWN state. By configuring this command, the subscriber interface borrows the IPv4 address from the referenced interface (directly or indirectly via IP address) that must be operationally UP and located in the same routing instance as the subscriber interface. This allows the subscriber interface to be operationally UP and consequently allow forwarding of the subscriber traffic.

Such interface is referred as unnumbered interface, since it does not have explicitly configured a unique IP address. Subscriber hosts under the unnumbered subscriber interface are installed in the fib as /32 hosts.

Without this command the subscriber interface is operationally DOWN and subscriber-host instantiation is not possible.

This command is mutually exclusive with the allow-unmatched-subnets command under the same CLI hierarchy.

The operation of IPv6 host is not affected by this command.

The **no** form of this command reverts to the default.

Parameters

ip-int-name

Specifies the interface name from which an IPv4 address is borrowed.

ip-address

Specifies the IP address from an optionally up interface that is used for subscriber interface.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

no unnumbered

Context

[Tree] (config>router>if unnumbered)

Full Context

configure router interface unnumbered

Description

This command sets an IP interface as an unnumbered interface and specifies the IP address to be used for the interface.

To conserve IP addresses, unnumbered interfaces can be configured. The address used when generating packets on this interface is the *ip-addr* parameter configured.

An error message will be generated if an **unnumbered** interface is configured, and an IP address already exists on this interface.

The **no** form of this command removes the IP address from the interface, effectively removing the unnumbered property. The interface must be **shutdown** before **no unnumbered** is issued to delete the IP address from the interface, or an error message will be generated.

Default

no unnumbered

Parameters

ip-int-name* | *ip-address

Optional. Specifies the IP address or IP interface name to associate with the unnumbered IP interface in dotted decimal notation. The configured IP address must exist on this node. It is recommended to use the system IP address as it is not associated with a specific interface and is therefore always reachable. The system IP address is the default if no *ip-addr* or *ip-int-name* is configured.

configure subscriber-mgmt shcv-policy layer-3 unnumbered-source-ip

Description

This command configures the source IPv4 address (also known as the sender IP address) used in SHCV ARP requests for unnumbered hosts. When unconfigured, 0.0.0.0 is used as the source IPv4 address in SHCV ARP requests.

The **no** form of this command removes the IPv4 address from Layer 3.

Parameters

ip-address

Specifies the unicast IPv4 address to be used as the source address in SHCV ARP requests for unnumbered hosts.

Values a.b.c.d

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn subscriber-interface group-interface icmp unreachables

configure service ies interface icmp unreachables

configure service vprn interface icmp unreachables

configure service vprn interface ipv6 icmp6 unreachables

Description

This command configures the rate for ICMP host and network destination unreachable messages issued on the router interface.

The **unreachables** command enables the generation of ICMP destination unreachables on the router interface. The rate at which ICMP unreachables is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of destination unreachable messages which can be issued on the interface for a given time interval.

By default, generation of ICMP destination unreachables messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP destination unreachable messages on the router interface and reverts to the default values.

Default

unreachables 100 10

Parameters

number

Specifies the maximum number of ICMP unreachable messages to send. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds

Specifies the time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued.

Values 1 to 60

Platforms

configure router interface icmp unreachables

Description

This command enables and configures the rate for ICMP host and network destination unreachable messages issued on the router interface.

The **unreachables** command enables the generation of ICMP destination unreachables on the router interface. The rate at which ICMP unreachables is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of destination unreachable messages that can be issued on the interface for a given time interval.

By default, generation of ICMP destination unreachables messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP destination unreachables on the router interface.

Default

unreachables 100 10 — Maximum of 100 unreachable messages in 10 seconds.

Parameters

number

The maximum number of ICMP unreachable messages to send, expressed as a decimal integer. The *seconds* parameter must also be specified.

Values 10 to 2000

seconds

The time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued, expressed as a decimal integer.

no untrusted

Context

[Tree] (config>router>if untrusted)

Full Context

configure router interface untrusted

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the state of untrusted for a network IP interface.

The untrusted state identifies the participating interfaces in the label security feature for prefixes of a VPN family at an inter-AS boundary. The router supports a maximum of 15 network interfaces that can participate in this feature.

The user normally applies this command to an inter-AS interface. PIP keeps track of the untrusted status of each interface. In the data path, such an interface causes the default forwarding to be set to the *default-forwarding* value.

For backward compatibility reasons, the interface **default-forwarding** is set to the **forward** value; this means that labeled packets are checked in the normal way against the table of programmed ILMs to decide if they should be dropped or forwarded in a GRT, a VRF, or a L2 service context.

If the user sets the *default-forwarding* value to **drop**, all labeled packets received on that interface are automatically dropped.

This command sets the default behavior for an untrusted interface in the data path and for all ILMs. When enabling the label security for VPN IPv4 or VPN IPv6 prefixes, BGP programs the data path to provide an exception to the normal way of forwarding handling away from the default for those VPRN ILMs.

The **no** form of this command returns the interface into the default state of trusted.

Default

no untrusted

Parameters

default-forwarding

Specifies the default forwarding behavior of labeled packets received on this interface.

Values forward, drop

Default forward

Context

[Tree] (file unzip)

Full Context

file unzip

Description

This command expands the contents of a ZIP file to the local file system. Any file that is zipped using the store, deflate, or zip64 compression methods can be unzipped. The source ZIP file location can be a locally installed solid-state storage device or a remote FTP or TFTP server. Files can only be unzipped to the active CPM.

Parameters

source-file-url, dest-file-url

Specifies the source or destination file URL.

Values

local-url	[*cflash-id*/]*file-path*
	200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	{ftp | tftp | sftp}://[*login*:*pswd*@]
	remote-locn / [*file-path*]
	247 chars max, *file-path* 199 chars max
remote-locn	{*hostname* | *ipv4-address* | "["i*pv6-address*"]" }[:*port*]|
ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H
	d: [0 to 255]D
	interface - 32 characters max, for link local addresses
port	[0 to 65535]
cflash-id	cf1: | cf1-A: | cf2: | cf2-A: | cf3: | cf3-A:

create-destination

Specifies that a non-existent directory structure that is explicitly entered as the destination file URL is created as part of the unzip operation. This parameter is required to create new directories.

list

Keyword that lists the content of the ZIP file without performing the unzip operation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

force

Keyword that overwrites, without prompting, any file or directory contained within the ZIP file that already exists in the destination URL. This keyword does not automatically create new directories explicitly specified by *dest-file-url*. To create these directories, use the **create-destination** flag.

router-instance

Specifies the router name or the VPRN service ID.

Values

router-instance:	*router-name* | *vprn-svc-id*
router-name:	"Base" | "management" | "vpls-management"
vprn-svc-id:	1 to 2147483647

configure service vprn redundant-interface hold-time up

configure service ies redundant-interface hold-time up

configure service ies subscriber-interface hold-time up

configure service vprn network-interface hold-time up

configure service vpls interface hold-time up

Description

This command causes a delay in the deactivation of the associated IP interface by the specified number of seconds. The delay is invoked whenever the system attempts to bring the associated IP interface down.

The **no** form of this command removes the command from the active configuration and removes the delay in deactivating the associated IP interface. If the configuration is removed during a delay period, the currently running delay will continue until it expires.

Default

no up ip

Parameters

seconds

The time delay, in seconds, to make the interface operational.

Values 1 to 1200

49.62 up-nat-policy

up-nat-policy

Syntax

up-nat-policy *name* [**create**]

Context

[Tree] (config>service>nat up-nat-policy)

Full Context

configure service nat up-nat-policy

Description

This command creates a NAT policy template for BNG CUPS UPF. This template is instantiated for a set of subscribers sharing in a NAT pool. The policy includes parameters that define the BNG CUPS UPF NAT behavior, such as, but not limited to, the following:

- ALGs
- filtering mode
- watermarks
- ports and NAT flow limits
- priority NAT flows
- protocol timers

When the BNG CPF does not receive the NAT policy template, a default template takes effect if it is configured on the BNG UPF. The name of the default NAT policy template on the BNG UPF must equal default.

Parameters

create

Keyword required to create a new NAT policy for BNG CUPS UPF.

name

Specifies the UP NAT policy name, up to 32 characters. The name default has a special meaning representing the default NAT policy template. The system uses the default template when the BNG CPF does not receive a more specific name when the subscriber is instantiated.

49.64 up-threshold

up-threshold

Syntax

up-threshold *percent-change* [**bw** *absolute-change*]

Context

[Tree] (config>router>rsvp>dbw-accounting up-threshold)

Full Context

configure router rsvp dbw-accounting up-threshold

Description

This command sets the minimum change (in percent of the latest advertised value) above which an increase in MRLB (IS-IS TE sub-TLV 10) or MRB (OSPF TE sub-TLV 7) triggers an IGP-TE update. This configuration only applies to a change in MRLB or MRB caused by dark bandwidth. Other events affecting MRLB or MRB (such as the change of the subscription factor or the loss of link in a LAG over which the RSVP interface is defined) trigger an immediate TE update, regardless of the importance of the impact.

Optionally, the threshold can also be expressed as an absolute value. In this case, the evaluation of the change is made using the percent change and the absolute change. An IGP-TE update is sent if both of these thresholds are crossed. Changing this parameter in the course of dark bandwidth accounting does not affect the accounting cycle.

Default

up-threshold 0

Parameters

percent-change

Specifies the minimum increase in MRLB/MRB, expressed in percent.

Values 0 to 100

absolute-change

Specifies the minimum increase in MRLB/MRB, expressed in Mb/s.

Values 0 to 1000000

Platforms

update-interval

Syntax

update-interval [**hrs** *hours*] [**min** *minutes*] [**days** *days*]

no update-interval

Context

[Tree] (config>service>dynsvc>acct-1 update-interval)

[Tree] (config>service>dynsvc>acct-2 update-interval)

Full Context

configure service dynamic-services dynamic-services-policy accounting-1 update-interval

configure service dynamic-services dynamic-services-policy accounting-2 update-interval

Description

This command specifies the interval between each RADIUS Accounting Interim-Update message (minimum 5 minutes; maximum 180 days).

The **no** form of this command disables the sending of Accounting Interim-Update messages.

A RADIUS specified Accounting Interim Interval overrides the CLI configured value.

Default

no update-interval (do not send Accounting Interim-Update messages)

Parameters

hrs

specifies the interval in hours.

Values 1 to 23

min

Specifies the interval in minutes.

Values 1 to 59

days

specifies the interval in days.

Values 1 to 180

update-interval

Syntax

update-interval *minutes*

no update-interval

Context

[Tree] (config>subscr-mgmt>acct-plcy update-interval)

Full Context

configure subscriber-mgmt radius-accounting-policy update-interval

Description

This command specifies the interval at which accounting data of subscriber hosts is updated in a RADIUS Accounting Interim-Update message. Requires interim-update to be enabled when specifying the accounting mode in the radius accounting policy.

A RADIUS specified interim interval (attribute [85] Acct-Interim-Interval) overrides the CLI configured value.

The **no** form of this command reverts to the default.

Parameters

minutes

Specifies the interval, in minutes, at which accounting data of subscriber hosts is updated.

Values 5 to 259200

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

update-interval

Syntax

update-interval *minutes* [**jitter** *seconds*]

no update-interval

configure ipsec radius-accounting-policy update-interval

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the system to send RADIUS interim-update packets for IKEv2 remote-access tunnels. The RADIUS attributes in the interim-update packet are the same as acct-start. The value of the Acct-status-type in the interim-update message is 3.

Default

update-interval 10

Parameters

minutes

Specifies the interval in minutes.

Values 5 to 259200

seconds

Specifies the jitter as the number of seconds when the system sends each interim-update packet.

Values 0 to 3600

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

update-interval

Syntax

update-interval *seconds*

Context

[Tree] (config>test-oam>link-meas>template>twl>ipv6-dest-disc update-interval)

Full Context

configure test-oam link-measurement measurement-template twamp-light ipv6-destination-discovery update-interval

Description

This command configures the transmission frequency used to maintain the peer address. IPv6 discovery packets are generated to ensure that the peer address has not changed. After the **discovery-timer** expires or a peer is discovered during the **discovery-timer** phase the value of **update-interval** is used to continue to monitor the address of the peer. When set to zero, maintaining the peer address is disabled after the initial discovery phase. If the peer has not been discovered during that phase, disabling and enabling the IPv6 protocol can be used to restart the discovery process.

Default

update-interval 600

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

seconds

Specifies the frequency used for probe packets once **discovery-timer** expires.

Values 0 to 3600

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com/terms.

[Tree] (config>card>mda upgrade)

Full Context

configure card xiom upgrade

configure card upgrade

configure card mda upgrade

Description

This command assigns a license level upgrade to the card, XIOM, or XMA. There can be multiple upgrades applied to a card, XIOM, or XMA. The first upgrade must use index 1 and then next index 2 and so on. Also, when removing upgrades, the largest index must be removed first and then the next largest removed and so on.

The path indicates the starting level and the new level that will apply due to the upgrade. For example, "cr1200g-cr1600g" can be applied to an XMA that is currently at the cr1200g level and after application of the upgrade, the operational level of the XMA shall be cr1600g.

There must be an upgrade license available for the path specified. Available upgrades can be checked using the **show licensing entitlements** command.

Note:
Some upgrades require a hard reset of the card or MDA to take effect. In general, this is required when the Full Duplex bandwidth is being changed.

Parameters

index

Specifies the order of the upgrade.

Values 1 to 6

upgrade-name

Specifies the upgrade name to be applied, up to 32 characters.

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

Use subject to Terms available at: www.nokia.com/terms.

uplink scheduler *scheduler-name*

no uplink

Context

[Tree] (config>subscr-mgmt>gtp>apn-policy>apn>ambr-qos-mapping uplink)

Full Context

configure subscriber-mgmt gtp apn-policy apn ambr-qos-mapping uplink

Description

When enabled, the uplink rate in the APN-AMBR IE in an incoming GTP message is interpreted as a rate override for the specified ingress QoS object. For queues and policers, the PIR is overridden.

This override uses standard SR OS QoS overrides. Therefore, a subsequent Gx/RADIUS-based override removes this override.

The **no** form of this command disables the override mechanism.

Default

no uplink

Parameters

arbiter-name

Specifies the name of the arbiter to be overridden, up to 32 characters.

policer-id

Specifies the ID of the policer to be overridden.

Values 1 to 63

queue-id

Specifies the ID of the queue to be overridden.

Values 1 to 32

scheduler-name

Specifies the name of the scheduler to be overridden, up to 32 characters.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure subscriber-mgmt sub-profile upnp-policy

Description

This command enables UPnP IGD services for the subscriber. All ESM hosts of the subscriber could use the UPnP protocol to create port mapping. This feature only support L2-Aware NAT host.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

UPnP parameters are defined in the referenced upnp-policy configured in the **configure service upnp** context.

Default

no upnp-policy

Parameters

policy-name

Specifies the UPnP policy associated with this subscriber profile up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

49.85 upstream-ip-filter

upstream-ip-filter

Syntax

upstream-ip-filter *filter-id*

no upstream-ip-filter

Context

[Tree] (config>service>vprn>nat>outside upstream-ip-filter)

[Tree] (config>router>nat>outside upstream-ip-filter)

Full Context

configure service vprn nat outside upstream-ip-filter

configure router nat outside upstream-ip-filter

Description

This command configures the ip-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance; it is useful for traffic that bypasses the ingress filters applied in the inside virtual router instance, such as DS-Lite traffic.

Default

no upstream-ip-filter

Parameters

filter-id

Specifies the identifier of an IP filter.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

49.86 upstream-ipv6-filter

upstream-ipv6-filter

Syntax

upstream-ipv6-filter *filter-id*

no upstream-ipv6-filter

Context

[Tree] (config>service>vprn>nat>outside upstream-ipv6-filter)

[Tree] (config>router>nat>outside upstream-ipv6-filter)

Full Context

configure service vprn nat outside upstream-ipv6-filter

configure router nat outside upstream-ipv6-filter

Description

This command configures the ipv6-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance. This is useful for shared v6 filters that apply to all v6 DSM hosts.

Default

no upstream-ipv6-filter

Parameters

filter-id

Specifies the identifier of an ipv6-filter.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

49.87 url

url

Syntax

url *rdr-url-sting*

no url

Context

[Tree] (config>subscr-mgmt>http-rdr-plcy url)

Full Context

configure subscriber-mgmt http-redirect-policy url

Description

This command configures the HTTP URL to re-direct the matching traffic to. It also can specify inclusion of original URL, MAC address and IP address of the subscriber in the redirect URL.

Parameters

rdr-url-sting

Specifies the URL to redirect to.

Values

rdr-url-string		Up to 255 characters
macro substitutions:		
	$URL	Request-URI in the HTTP GET Request received
	$MAC	A string that represents the MAC address of the subscriber host
	$IP	A string that represents the IP address of the subscriber host

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

url

Syntax

url *url*

no url

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update>crl-urls>url-entry url)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry url

Description

This command specifies the HTTP URL of the CRL file for the **url-entry**. The system supports both IPv4 and IPv6 HTTP connections.

Note:
The URL must point to a DER encoded CRL.

Default

no url

Parameters

url

Specifies the URL, which specifies the location, where an updated CRL can be downloaded from.

Platforms

All

url

Syntax

url *url-string* [**service-id** *service-id*]

url *url-string* [**service-name** *service-name*]

no url

Context

[Tree] (config>system>security>pki>ca-profile>cmpv2 url)

Full Context

configure system security pki ca-profile cmpv2 url

Description

This command specifies HTTP URL of the CMPv2 server. The URL must be unique across all configured ca-profiles.

The URL is resolved by the DNS server configured (if configured) in the corresponding router context.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the *service-id* is 0 or omitted, then system tries to resolve the FQDN via DNS server configured in bof.cfg. After resolution, the system connects to the address in the management routing instance first, then the base routing instance.

Note:
If the service is VPRN, the system only allows HTTP ports 80 and 8080.

Parameters

url-string

Specifies the HTTP URL of the CMPv2 server, up to 180 characters.

service-id *service-id*

Specifies the service instance that used to reach CMPv2 server.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **url** *url-string* **service-name** *service-name* variant can be used in all configuration modes.

Values service-id: 1 to 2147483647 base-router: 0

service-name service-name

Identifies the service, up to 64 characters.

Platforms

All

49.88 url-entry

url-entry

Syntax

url-entry *entry-id* [**create**]

no url-entry *entry-id*

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update>crl-urls url-entry)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry

Description

This command creates a new **crl-url** entry with the **create** parameter, or enters an existing url-entry configuration context without **create** parameter.

The **no** form of this command removes the specified entry.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

entry-id

Specifies a URL configured on this system.

Values 1 to 8

create

Creates an auto URL entry.

Platforms

All

49.89 url-filter

url-filter

Syntax

url-filter *url-filter-name* [**characteristic** *characteristic-name*]

no url-filter

Context

[Tree] (config>app-assure>group>policy>aqp>entry>action url-filter)

Full Context

configure application-assurance group policy app-qos-policy entry action url-filter

Description

This command configures a url-filter action for flows matching this entry. The **characteristic** parameter enables the system to use the value of the characteristic name specified in the app-qos-policy url-filter action for the configurable ICAP x-header name provisioned in the url-filter policy. The ICAP server can then use this value to decide which url-filter policy to apply instead of applying a filter policy based on the subscriber name.

Parameters

url-filter-name

Specifies the name of the url-filter policy, up to 32 characters.

characteristic-name

Specifies the name of the application service option characteristic used to determine the custom X-Header value.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.

url-filter

Syntax

url-filter *url-filter-name* [**create**]

no url-filter *url-filter-name*

Context

[Tree] (config>app-assure>group url-filter)

Full Context

configure application-assurance group url-filter

Description

This command configures a URL filter action for flows of a specific type matching this entry.

If no URL filters are specified then no URL filters will be evaluated.

Parameters

url-filter-name

Specifies the Application-Assurance URL filter that will be evaluated.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

49.90 url-list

url-list

Syntax

url-list *url-list-name* [**create**]

no url-list *url-list-name*

Context

[Tree] (config>app-assure>group url-list)

Full Context

configure application-assurance group url-list

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a url-list object. The url-list points to a file containing a list of URLs located on the system Compact Flash. The url-list is then referenced in a url-filter object in order to filter and redirect subscribers when a URL from this file is accessed.

The **no** form of this command removes the url-list object.

Parameters

url-list-name

Specify the Application-Assurance url-list

create

Keyword used to create the URL list.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

url-list

Syntax

url-list *url-list-name* **upgrade**

Context

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn bgp next-hop-resolution use-bgp-routes

Description

This command enables the use of BGP routes to resolve BGP next hops. When this command is enabled, any unlabeled IPv4 or IPv6 BGP route received from a VPRN BGP peer becomes resolvable by up to four other BGP routes in order to resolve the route to a VPRN IP interface.

This command also allows unlabeled IPv4 or IPv6 BGP routes leaked from the GRT with unresolved next hops (in the GRT) to be resolvable by BGP-VPN routes (of the VPRN).

The **no** form of this command reverts to the default behavior. By default, a VPRN BGP route is not resolvable by another VPRN BGP route or by a BGP-VPN route.

Default

no use-bgp-routes

Platforms

[**no**] **use-def-mcast**

Context

[Tree] (config>service>vpls>isid-policy>entry use-def-mcast)

Full Context

configure service vpls isid-policy entry use-def-mcast

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

The **use-def-mcast** option prevents local installation of the ISIDs in the range in the MFIB and uses the default multicast tree instead for a B-VPLS. In a node that does not have I-VPLS or static-isids, this command prevents the building of an MFIB entry for this ISID when received in a SPBM TLV and allows the broadcast of ISID based traffic on the default multicast tree. If an **isid-policy** exists, the core nodes can have this policy to prevent connectivity problems when some nodes are advertising an ISID and others are not. In a I-VPLS service if the customer MAC (C-MAC) is unknown, a frame will have the Multicast DA for an ISID (PBB-OUI + ISID) flooded on the default multicast tree and not pruned.

Default

no use-def-mcast

use-gi-address

Syntax

use-gi-address [**scope** *scope*]

Context

[Tree] (config>router>dhcp>server use-gi-address)

[Tree] (config>service>vprn>dhcp>server use-gi-address)

Full Context

configure router dhcp local-dhcp-server use-gi-address

configure service vprn dhcp local-dhcp-server use-gi-address

Description

This command enables the use of gi-address matching. If the gi-address flag is enabled, a pool can be used even if a subnets is not found. If the **local-user-db-name** is not used, the gi-address flag is used and addresses are handed out by GI only. If a user must be blocked from getting an address the server maps to a local user database and configures the user with no address.

A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface the pool may provide IP addresses from any of the subnets included when the GI is matched to any of its subnets. This allows a pool to be created that represents a sub-int.

The **no** form of the reverts to the default.

Parameters

scope

Specifies if addresses are handed out for a certain subnet where the gi-address belongs to only or for all subnets part of the pool.

Values **subnet** — Addresses are only handed out for the subnet where the gi-address is part.

pool — All subnets part of the pool which contain subnet where the gi-address is part of can hand out addresses.

configure router dhcp6 local-dhcp-server use-link-address

configure service vprn dhcp6 local-dhcp-server use-link-address

Description

This command configures the local pool selection for IPv6 address or prefix assignment for the configured link-address under relay configuration. The selected pool will contain a prefix covering the link-address. The scope option defines the scope for the match. With scope **subnet**, the prefix or address selection is limited to the prefix in the pool that covers the link-address. With scope **pool**, all the prefixes in the selected pool are eligible for assignment.

The **no** form of the reverts to the default.

Default

scope subnet

Parameters

scope

Specifies the scope of the IP address selection.

Values **subnet** — Specifies that the prefix or address selection is limited to the prefix in the pool that covers the link address.

pool — Specifies that all prefixes in the selected pool are eligible for assignment.

Full Context

configure service epipe spoke-sdp use-sdp-bmac

Description

This command indicates that this spoke SDP is expected to be part of a redundant pseudowire connected to a PBB Epipe service. Enabling this parameter will cause traffic forwarded from this spoke SDP into the B-VPLS domain to use a virtual backbone MAC as its source MAC address when both this, and the control pseudowire, are in the active state on this BEB. This virtual backbone MAC is derived from the SDP source-bmac-lsb configuration.

This command will fail when configuring it under a spoke SDP within a PBB-Epipe that is connected to a B-VPLS with mac-notification enabled.

Default

no use-sdp-bmac

Context

[Tree] (config>cflowd use-vrtr-if-index)

Full Context

configure cflowd use-vrtr-if-index

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is used to export flow data using interface indexes (ifIndex values), which can be used directly as the index into the IF-MIB tables for retrieving interface statistics. Specifically, if this command is enabled, the ingressInterface (ID=10) and egressInterface (ID= 14) fields in IP flow templates used to export the flow data to cflowd version 9 and version 10 collectors will be populated with the IF-MIB ifIndex of that interface. In addition, for version 10 templates, two fields are available in the IP flow templates to specify the virtual router ID associated with the ingress and egress interfaces.

The **no** form of this command removes the command from the active configuration and causes cflowd to return to the default behavior of populating the ingress and egress interface ID with the global IF index IDs.

Default

no use-vrtr-if-index

Platforms

All

49.116 user

user

Syntax

[**no**] **user** *user-name*

Context

[Tree] (config>system>security user)

Full Context

configure system security user

Description

This command creates a local user and a context to edit the user configuration.

If a new *user-name* is entered, the user is created. When an existing *user-name* is specified, the user parameters can be edited.

When creating a new user and then entering the **info** command, the system displays a password in the output. This is expected behavior in the hash2 scenario. However, when using that user name, there will be no password required. The user can login to the system and then <ENTER> at the password prompt, the user will be logged in.

Unless an administrator explicitly changes the password, it will be null. The hashed value displayed uses the username and null password field, so when the username is changed, the displayed hashed value will change.

The **no** form of this command deletes the user and all configuration data. Users cannot delete themselves.

Full Context

configure service ies subscriber-interface group-interface ipoe-session user-db

configure service vprn subscriber-interface group-interface ipoe-session user-db

configure service vpls sap ipoe-session user-db

Description

This command configures the local user database to use for IPoE session authentication.

When configured on a capture SAP, the group interface must have the same local user database configured.

On a wlan-gw group interface, the **no** form of this command indicates that the user database is picked from the following sources in the order shown:

1. dhcp
2. ipv6>dhcp6
3. ipv6>router-solicit

If no user database can be found in any of these locations, processing continues as if no user database was configured. This behavior is for backwards compatibility reasons only; when using a LUDB, it should be explicitly added to the IPoE session configuration.

The **no** form of this command reverts to the default.

Parameters

local-user-db-name

Specifies the local user database name up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn subscriber-interface group-interface ipv6 dhcp6 user-ident

configure service ies subscriber-interface group-interface ipv6 dhcp6 user-ident

Description

This feature is only applicable when DHCPv6-snooping is enabled. The Ethernet header MAC address on DHCPv6 is used as the default key host identification. This command allows addition the keys for identifying the DHCPv6 host. The *interface-id* can be included in addition to the MAC key to further differentiate each DHCPv6 host.

The **no** form of this command reverts to the default.

Default

user-ident mac

Parameters

user-ident

Specifies the DHCP6 user-identification for this interface.

Values **mac** — Specifies to use only the Ethernet MAC of the DHCPv6 message to identify the host.

mac-interface-id — Specifies to additionally use the interface-id to identify the DHCPv6 host.

Platforms

[Tree] (config>service>vprn>dhcp>server user-ident)

Full Context

configure router dhcp local-dhcp-server user-ident

configure service vprn dhcp local-dhcp-server user-ident

Description

This command configures the user identification method for the DHCPv4 server.

The **no** form of the reverts to the default.

Default

user-ident mac-circuit-id

Parameters

user-ident

Specifies the user identification method

Values **client-id** — Specifies to use the DHCPv4 client identifier as the user identification method.

circuit-id — Specifies to use the circuit identifier of the DHCPv4 client as the user identification method.

mac — Specifies to use the MAC address of the DHCPv4 client as the user identification method.

mac-circuit-id — Specifies to use the MAC address and circuit identifier of the DHCPv4 client as the user identification method.

remote-id — Specifies to use the MAC address of the remote end as the user identification method.

Platforms

user-ident

Syntax

user-ident *user-ident*

no user-ident

Context

[Tree] (config>router>dhcp6>server user-ident)

[Tree] (config>service>vprn>dhcp6>server user-ident)

Full Context

configure router dhcp6 local-dhcp-server user-ident

configure service vprn dhcp6 local-dhcp-server user-ident

Description

This command configures the keys for identification of the DHCPv6 lease being held in the lease-database (for configured period after lease timeout). Subscriber requesting a lease via DHCPv6 that matches an existing lease based on this configured key is handed the matched prefix or address. This allows address and prefix "stickiness" for DHCPv6 assigned prefixes (IA_NA or PD).

The **no** form of the reverts to the default.

Default

user-ident duid

Parameters

user-ident

Specifies the user identification method.

Values **duid** — Specifies the IPv6 DHCP unique identifier from DHCPv6.

interface-id — Specifies the IPv6 interface-id option.

interface-id-link-local — Specifies the interface-id and link-local address.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service dynamic-services local-auth-db user-name

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a user name entry in the local authentication database. The user name entry is used to match with the user name of a local authenticated dynamic service data trigger. The user name of a dynamic service data trigger is fixed to the **sap-id**. When matched, the corresponding authentication data is used to set up the dynamic data services.

The **no** form of this command removes the user name entry from the local authentication database configuration.

Parameters

name

Specifies the user name entry name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-name-format *format* **default-domain** *domain-name* [**mac-format** *mac-format*]

user-name-format *format* **replace** *domain-name* [**mac-format** *mac-format*]

user-name-format *format* **strip** [**mac-format** *mac-format*]

no user-name-format

Context

[Tree] (config>subscr-mgmt>auth-plcy user-name-format)

Full Context

configure subscriber-mgmt authentication-policy user-name-format

Description

This command defines the format of the "user-name" field in the session authentication request sent to the RADIUS server. By default, the MAC source address of the DHCPv4 DISCOVER or DCHPv6 SOLICIT message is used in the user-name field.

The **no** form of this command reverts to the default.

Parameters

format

Specifies the user name format in RADIUS message.

Values ascii-converted-circuit-id, ascii-converted-tuple, circuit-id, dhcp-client-vendor-opts, mac, mac-giaddr, tuple

ascii-converted-circuit-id — Identical to circuit-id, but the user name is sent to the RADIUS server as a string of hex digits, for use if there is binary data in the circuit-id

ascii-converted-tuple — Identical to tuple, but the circuit-id part of the user name is sent to the RADIUS server as a string of hex digits, for use if there is binary data in the circuit-id

circuit-id — If the system serves as a DHCP relay server which inserts option 82 info, the user name is formatted as defined under DHCP information option. If the system is not a DHCP relay server, the circuit-id is taken from option 82 in the received DHCP message. If no circuit-id can be found, the DHCP-msg is rejected.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

dhcp-client-vendor-opts — IPoEv4 host (IPoE session enabled or disabled on group-interface) — The RADIUS user-name is a concatenation of the DHCPv4 Client Identifier Option 61, an "@" delimiter, and the DHCPv4 Vendor Class Identifier Option 60. Non-printing characters in the DHCP option values are converted as described below.

IPoEv6 host (IPoE session enabled on group-interface) — The RADIUS user-name is a concatenation of the identifier field of a type 2 DUID in the DHCPv6 Client Identifier Option 1, the "@" delimiter, and the opaque data field of the first vendor class data in the DHCPv6 Vendor Class Option 16. Non-printing characters in the DHCP option values are converted as described below.

IPoEv6 host (IPoE session disabled on group-interface) — The MAC source address of the DHCPv6 SOLICIT message.

In the absence of a DHCPv4 Client Identifier Option 61 or a DHCPv6 Client Identifier Option 1 containing a DUID type 2, the DHCP client MAC address is used.

In the absence of a DHCPv4 Vendor Class Identifier Option 60 or a DHCPv6 Vendor Class Option 16, the "@" delimited is omitted and nothing is appended.

Non-printing characters, that is, characters outside the ASCII range hex 21 through hex 7E, are converted into an underscore (hex 5F) character.

mac — The MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message is used in the user-name field. The format of the MAC address string used as the user name in the RADIUS authentication requests uses lowercase hex digits, and ":" as the inter-digit separator, for example, 00:11:22:aa:bb:cc is valid but 00-11-22-AA-BB-CC will return an error. The RADIUS server must be configured accordingly, otherwise the authentication request will fail.

mac-giaddr — A concatenation of the MAC address and the Relay Agent IP address (giaddr)

tuple — Specifies that the concatenation of MAC source address and circuit-ID are used in the user-name field

mac-format

Specifies how a MAC address is represented when contacting a RADIUS server. This is only used while the value of is equal to the DHCP client vendor options and if the MAC address is used by default of the DHCP client vendor options.

Examples:	ab:	00:0c:f1:99:85:b8 7xxx style
	XY-	00-0C-F1-99-85-B8 IEEE canonical style
	mmmm.	0002.03aa.abff Cisco style

append

Specifies the data type which is an enumerated integer that indicates what needs to be appended to the user-name sent to the RADIUS server.

Values 1 — nothing 2 — domain name

domain

Specifies to user the domain name. In some instances it is desired to add a domain only to usernames which have omitted the domain (@domain). In these instances a default-domain can be appended to usernames which lack a @domain.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

append

Adds a "@” delimiter and the specified string after the PAP/CHAP username. No allowance is made for the presence of an existing domain or @ delimited.

replace

Replaces the character-string after the "@” delimiter with the string specified.

strip

Removes all characters after and including the "@” delimiter.

For example:

```
Command: append
String:     domainA-1.com
PAP/CHAP User:    someuser
Resulting User:    someuser@domainA-1.com

Command: append
String:     domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@existing-domain.net@domainA-1.com

Command: strip
String:
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser

Command: replace
String:     domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@domainA-1.com

Command: default-domain
String:    domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@existing-domain.net

Command: default-domain
String: domainA-1.com
PAP/CHAP User:    someuser
Resulting User:    someuser@domainA-1.com
```

Syntax

user-name-format *format*

no user-name-format

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>nasreq user-name-format)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure subscriber-mgmt diameter-application-policy nasreq user-name-format

Description

This command defines the format of the User-Name AVP value in Diameter NASREQ AA-Requests for IPoE hosts.

The **no** form of this command reverts to the default.

Parameters

format

Specifies the format of the User-Name AVP value.

Values **mac** — Specifies to use the MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message in the user-name field. The format of the MAC address string is defined with the **mac-forma**t CLI command.

circuit-id — Specifies to use the circuit ID to identify the user toward the server. If the system serves as a DHCP relay server which inserts option 82 info, the user name is formatted as defined under DHCP information option. If the system is not a DHCP relay server, the circuit-id is taken from option 82 in the received DHCP message. If no circuit-id can be found, the DHCP-msg is rejected.

tuple — Specifies to use a concatenation of MAC source address and circuit-ID.

ascii-converted-circuit-id — Identical to circuit-id, but the user name is a string of hex digits, for use if there is binary data in the circuit-id.

ascii-converted-tuple — Specifies a string of hex digits, for use if there is binary data in the circuit-id.

dhcp-client-vendor-opts — Specifies to use a concatenation of the DHCPv4 Client Identifier Option 61, the "@" delimiter, and the DHCPv4 Vendor Class Identifier Option 60. Non-printing characters in the DHCP option values are converted as described below.

In the absence of a DHCPv4 Client Identifier Option 61, the DHCP client MAC address is used.

In the absence of a DHCPv4 Vendor Class Identifier Option 60, the "@" delimiter is omitted and nothing is appended.

Non-printing characters, that is, characters outside the ASCII range hex 21 through hex 7E, are converted into an underscore (hex 5F) character.

mac-giaddr — Specifies to use a concatenation of MAC source address and DHCP GI address.

nas-port-id — Specifies to use a value of the nas-port-id with format defined in the include-avp section.

no user-name-format

Context

[Tree] (config>aaa>isa-radius-plcy user-name-format)

Full Context

configure aaa isa-radius-policy user-name-format

Description

This command defines the format of the user-name field in the session authentication request sent to the RADIUS server. For authentication of IPv6 triggers (ICMPv6, DHCPv6, IPv6 data-trigger) the user-name format will always fall back to mac only.

The **no** form of the command switches to the default format, **mac**.

Default

user-name-format mac mac-format alu (the MAC source address of the DHCP DISCOVER message is used in the user-name field)

Parameters

user-name-format

Specifies the user name format in RADIUS message.

mac-format

Specifies how a MAC address is represented when contacting a RADIUS server. This is only used while the value of is equal to the DHCP client vendor options and if the MAC address is used by default of the DHCP client vendor options.

Examples:	ab:	00:0c:f1:99:85:b8 Nokia 7xxx style

49.123 user-name-operation

user-name-operation

Syntax

user-name-operation *operation* [**domain** *domain-name*]

no user-name-operation

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>nasreq user-name-operation)

Full Context

configure subscriber-mgmt diameter-application-policy nasreq user-name-operation

Description

This command enables domain name manipulation of the user name, such as append, strip, replace or add as default.

For IPoE, this command only applies when **user-name-format** is configured to **dhcp-client-vendor-opts**.

The **no** form of this command reverts to the default.

Parameters

operation

Specifies the user name manipulations with respect to domain name values.

Values **append-domain** – appends an "@" delimiter with the specified domain-name at the end of the user-name, independent if a domain name was already present

strip-domain – removes all characters after and including the "@" delimiter

default-domain – adds an "@" delimiter and the specified domain name to user-names that have no domain name present

replace-domain – replaces the characters after the "@" delimiter with the specified domain-name

domain-name

Specifies the domain name string to be used in the specified operation, up to 128 characters.

49.124 user-srlg-db

user-srlg-db

Syntax

user-srlg-db [**enable** | **disable**]

Context

[Tree] (config>router>mpls user-srlg-db)

Full Context

configure router mpls user-srlg-db

Description

This command enables the use of CSPF by the user SRLG database. When the MPLS module makes a request to CSPF for the computation of an SRLG secondary path, CSPF will query the local SRLG and compute a path after pruning links that are members of the SRLG IDs of the associated primary path. When MPLS makes a request to CSPF for an FRR bypass or detour path to associate with the primary path, CSPF queries the user SRLG database and computes a path after pruning links that are members of the SRLG IDs of the PLR outgoing interface.

If an interface was not entered into the user SRLG database, it is assumed that it does not have any SRLG membership. CSPF will not query the TE database for IGP advertised interface SRLG information.

The disable keyword disables the use of the user SRLG database. CSPF will then resume queries into the TE database for SRLG membership information. The user SRLG database is maintained.

Default

user-srlg-db disable

Context

[Tree] (config>system>security user-template)

Full Context

configure system security user-template

Description

This command configures default security user template parameters.

Parameters

tacplus_default

Specifies the default TACACS+ user template. All parameters of the tacplus_default template except the "profile" are actively applied to all TACACS+ users if tacplus **use-default-template** is enabled. The **profile** parameter is used for AAA command authorization if TACACS+ authorization is disabled, or if the TACACS+ server does not return a priv-lvl for a user when **use-priv-lvl** is enabled under **tacplus authorization**. See the **tacplus authorization** command for more details.

radius_default

Specifies the default RADIUS user template. The radius_default template is actively applied to a RADIUS user if radius authorization is enabled, radius **use-default-template** is enabled, and no VSAs are returned with the auth-accept from the RADIUS server.

ldap_default

Specifies the default LDAP user template.

Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure subscriber-mgmt local-user-db ppp host host-identification username

Description

This command specifies the PPPoE username to match for a host lookup. When **no-domain** or **domain-only** is specified, the username "user[@domain]" is converted to a user and a domain entity by splitting it on the first @-sign before matching on the specific entity.

Note:
This command is only used when **username** is configured as one of the **match-list** parameters.

The **no** form of this command removes the username from the configuration.

Parameters

username

Specifies the user name, up to 253 characters, of this host. For example, "jane@nokia.com”.

no-domain

Only the user user part of the username is specified and used for matching. For example "jane".

domain-only

Only the domain part of the username is specified and used for matching, for example, nokia.com.

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

49.127 usm-community

usm-community

Syntax

usm-community *community-string* [**hash** | **hash2** | **custom**] **group** *group-name* [**src-access-list** *list-name*]

no usm-community *community-string* [**hash** | **hash2** | **custom**]

Context

[Tree] (config>system>security>snmp usm-community)

Full Context

configure system security snmp usm-community

Description

This command is used to associate a community string with an SNMPv3 access group and its view. The access granted with a community string is restricted to the scope of the configured group.

Nokia's SR OS implementation of SNMP uses SNMPv3. In order to implement SNMPv1 and SNMPv2c configurations, several access groups are predefined. In order to implement SNMP with security features (Version 3), security models, security levels, and USM communities must be explicitly configured. Optionally, additional views which specify more specific OIDs (MIB objects in the subtree) can be configured.

The **no** form of this command removes a community string.

Parameters

community-string

Specifies the SNMPv1/SNMPv2c community string to determine the SNMPv3 access permissions to be used. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

group

Specifies the group that governs the access rights of this community string. This group must be configured first in the **config**>**system**>**security**>**snmp**> **access group** context.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Nokia does not recommend associating a **usm-community** with an SNMP access group that is configured with the **li** (lawful intercept) context.

list-name

Specifies the usm-community to reference a specific src-access-list that will be used to validate the source IP address of all received SNMP requests that use this usm-community. Multiple **community**, **usm-community**, or **vprn snmp community** instances can reference the same **src-access-list**.

50 v Commands

50.1 v4-routed-override-filter

v4-routed-override-filter

Syntax

v4-routed-override-filter *ip-filter-id*

no v4-routed-override-filter

Context

[Tree] (config>service>ies>if>vpls>egress v4-routed-override-filter)

Full Context

configure service ies interface vpls egress v4-routed-override-filter

Description

This command configures an IPv4 filter ID that is applied to packets egressing the IES R-VPLS interface. The filter overrides existing egress IPv4 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of this command removes the IPv4 routed override filter from the egress IES R-VPLS interface. When removed, egress IPv4 packets will use the IPv4 egress filter applied to the VPLS endpoint, if configured.

Default

no v4-routed-override-filter

Parameters

ip-filter-id

Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

Platforms

All

v4-routed-override-filter *ip-filter-id*

no v4-routed-override-filter

Context

[Tree] (config>service>ies>if>vpls>ingress v4-routed-override-filter)

Full Context

configure service ies interface vpls ingress v4-routed-override-filter

Description

This command configures an IPv4 filter ID that is applied to routed unicast ingress packets entering the VPLS or I-VPLS service and destined to the R-VPLS interface MAC address. The filter overrides any existing ingress IPv4 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed. The IPv4 routed packets use any existing ingress IPv4 filter on the VPLS virtual port.

The **no** form of this command removes the IPv4 routed override filter from the ingress IP interface. When removed, the IPv4 ingress routed packets within a VPLS service attached to the IP interface use the IPv4 ingress filter applied to the packets virtual port, when defined.

Parameters

ip-filter-id

Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

Context

[Tree] (config>service>vprn>if>vpls>ingress v4-routed-override-filter)

Full Context

configure service vprn interface vpls ingress v4-routed-override-filter

Description

This command configures an IPv4 filter ID that is applied to all ingress packets entering the VPLS service. The filter overrides any existing ingress IPv4 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IPv4 routed packet's will use the any existing ingress IPv4 filter on the VPLS virtual port.

The **no** form of this command removes the IPv4 routed override filter from the ingress IP interface. When removed, the IPv4 ingress routed packets within a VPLS service attached to the IP interface will use the IPv4 ingress filter applied to the packets virtual port, when defined.

Parameters

ip-filter-id

Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

no v6-routed-override-filter

Context

[Tree] (config>service>ies>if>vpls>ingress v6-routed-override-filter)

Full Context

configure service ies interface vpls ingress v6-routed-override-filter

Description

This command configures an IPv6 filter ID that is applied to routed unicast ingress packets entering the VPLS or I-VPLS service and destined to the R-VPLS interface MAC address. The filter overrides any existing ingress IPv6 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IPv6 routed packets use any existing ingress IPv6 filter on the VPLS virtual port.

The no v6-routed-override-filter command is used to remove the IPv6 routed override filter from the ingress IP interface. When removed, the IPv6 ingress routed packets within a VPLS service attached to the IP interface will use the IPv6 ingress filter applied to the packet's virtual port, when defined.

Default

no v6-routed-override-filter

Parameters

ipv6-filter-id

Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

configure subscriber-mgmt local-user-db ppp host ipv6-lease-times valid-lifetime

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server valid-lifetime

Description

This command configured valid-lifetime for DHCPv6 lease (address/prefix).

The valid lifetime is the length of time an address/prefix remains in the valid state (for example, the time until invalidation). The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address/prefix becomes invalid and must not be used in communications. RFC 2461, sec 6.2.1 recommends default value of 30 days.

Each address/prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (DHCP server, RADIUS, ESM). To request an extension of the lifetimes

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

assigned to an address, the client sends a Renew message to the addressing authority. The addressing authority sends a Reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption.

The lifetimes are transmitted from the addressing authority to the client in the IA option on the top level (not the address or prefix level).

The **no** form of this command reverts to the default.

Default

valid-lifetime days 1

Parameters

infinite

Specifies that the valid lifetime is infinite.

Values		
	days:	0 to 49710
	hours:	0 to 23
	minutes:	0 to 59

50.6 validate

validate

Syntax

validate [*file-url*]

Context

[Tree] (admin>system>license validate)

Full Context

admin system license validate

Description

This command performs a validation on the license file pointed to by the command line argument. A validation ensures that the license is compatible with the current state of the target system but it does not change the existing license. Aspects that can cause a failure in the validation include:

- The license file was created for a different target system. The UUID encoded into the file must match that defined by the specific hardware platform.
- The license file does not include license information for the release of software currently running on the system.
- The current date/time reported to system is outside the validity period encoded in the license.
- The system is currently using a hardware upgrade license that is not included in the new file being validated.

Note:
If the CLM tool is being used for license management, it shall perform the validation and activation and there is no need to enter these commands manually.

Parameters

file-url

Specifies the file URL location to read the license file.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values local-url, remote-url

Note:
IPv6 addresses apply only to 7750 SR and 7950 XRS.

configure service vprn bgp flowspec validate-redirect-ip

Description

This command enables the validation of the redirect-to-IPv4 action attached to FlowSpec-IPv4 routes received by the BGP instance.

The SR OS FlowSpec implementation supports the redirect-to-IPv4 action encoded as an IPv4-address-specific BGP extended community.

When this command is configured, a FlowSpec-IPv4 route is considered invalid and is not installed as a filter rule if it is determined to have originated from a different AS than the IP route that resolves the redirection IPv4 address. The originating AS of a FlowSpec route is identified based on its AS path.

The **no** form of this command disables the validation procedure based on the redirect-to-IPv4 action.

Description

This command enables procedures to validate the **redirect-to-IPv4** action attached to FlowSpec IPv4 routes received by the BGP instance.

The SR OS FlowSpec implementation supports the **redirect-to-IPv4** action encoded as an IPv4-address-specific BGP extended community.

When this command is configured, a FlowSpec IPv4 route is considered invalid and not installed as a filter rule if the FlowSpec IPv4 route is deemed to have originated in a different AS than the IP route that resolves the redirection IPv4 address. The originating AS of a FlowSpec route is determined from its AS path.

The **no** form of this command disables the check described above.

Default

no validate-redirect-ip

50.11 validate-sequence-number

validate-sequence-number

Syntax

validate-sequence-number direction *direction* [**create**]

no validate-sequence-number direction *direction*

Context

[Tree] (config>app-assure>group>statistics>tca>gtp-filter validate-sequence-number)

Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter validate-sequence-number

Description

This command configures a TCA for the counter capturing drops because of the GTP filter invalid GTP sequence number. A validate-sequence-number drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a validate-sequence-number TCA.

Parameters

direction

Specifies the traffic direction.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values from-sub, to-sub

create

Keyword used to create the TCA.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

validate-sequence-number

Syntax

[**no**] **validate-sequence-number**

Full Context

configure application-assurance group gtp gtp-filter gtp-tunnel-database validate-source-ip-addr

Description

This command configures the checking for spoofed or invalid UE IP addresses. Upstream GTP packets that contain invalid UE IP addresses are discarded. When a packet is dropped because of the **source-ip-address** "invalid source IP add", the statistics counter is updated.

The **validate-gtp-tunnels** command must be enabled before using this command.

The **no** form of this command disables the checking for spoofed or invalid UE IP addresses.

Default

no validate-source-ip-addr

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

50.13 validate-src-ip-addr

validate-src-ip-addr

Syntax

validate-src-ip-addr direction *direction* [**create**]

no validate-src-ip-addr direction *direction*

Context

[Tree] (config>app-assure>group>statistics>tca>gtp-filter validate-src-ip-addr)

Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter validate-src-ip-addr

Description

This command configures a TCA for the counter capturing drops due to the GTP filter anti-spoofing of the UE IP address check. A validate-src-ip-addr drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**). The **create** keyword is mandatory when creating a validate-src-ip-addr TCA.

Parameters

direction

Specifies the traffic direction.

Values from-sub

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

create

Keyword used to create the TCA.

validity-time

Syntax

validity-time *seconds*

no validity-time

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>gy>efh>interim-c validity-time)

Full Context

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit validity-time

Description

This command configures the validity time for the interim credit allocated to rating groups of a Diameter Gy session when Extended Failure Handling (EFH) is active. When either the allocated interim credit is consumed or the validity time expires, a new attempt is made to establish a Diameter Gy session with the Online Charging Server (OCS).The validity time applies to all interim credit allocated via the **config>subscr-mgmt>diam-appl-plcy** *application-policy-name*>**gy>extended-failure-handling>interim-credit>volume** and **config>subscr -mgmt>category-map** *category-map-name*>**category** *category-name*>**default-credit** CLI commands.

A validity time value of 0 (zero) disables the validity time for the assigned interim credit.

The **no** form of this command resets the value to the default value.

Default

validity-time 1800

Parameters

seconds

Specifies the validity time, in seconds, applicable to the interim credit.

Values 0 to 4294967295

configure service ies interface vas-if-type

Description

This command configures the type of a Value Added Service (VAS) facing interface. To change the **vas-if-type**, the **shutdown** command is required. The **vas-if-type** and **loopback** commands are mutually exclusive.

The **no** form of this command removes the VAS interface type configuration.

Default

no vas-if-type

Parameters

to-from-access

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from access interfaces (upstream) is redirected to a PBR target reachable over this interface for upstream VAS processing. Downstream traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

to-from-network

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from network interfaces (downstream) is redirected to a PBR target reachable over this interface for downstream VAS processing. Upstream traffic after VAS processing must arrive on this interface, so that regular routing can be applied.

to-from-both

Used when a single interface is used for VAS connectivity (no local-to-local traffic). For service chaining, both traffic arriving from access interfaces and from network interfaces is redirected to a PBR target reachable over this interface for upstream/downstream VAS processing. Traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

[Tree] (config>service>system>bgp-evpn>ethernet-segment vc-id-range)

Full Context

configure service system bgp-evpn ethernet-segment vc-id-range

Description

This command determines the VC-IDs associated with the virtual Ethernet Segment on a specific SDP based on the following considerations:

- VC-IDs for manual spoke-SDP and BGP-AD are included in the range.
- Th mesh-sdp VC-IDs are not allowed on a SDP used by a virtual ES.
- A maximum of 8 ranges are allowed.
- A range can be comprised of a single VC-ID.
- A **vc-id-range** can be comprised of a single VC-ID.
- Shutting down the ES is not required prior to making changes.

The **no** form of the command removes the configured range. Only the first VC-ID value is required to remove the range.

Parameters

vc-id

Specifies the VC-ID. When configuring a range of VC-IDs (and not a single value), the value of the second VC-ID must be greater than the first VC-ID.

configure service vprn aarp-interface spoke-sdp egress vc-label

configure service vprn aarp-interface spoke-sdp ingress vc-label

Description

This command configures the egress and ingress VC label.

The **no** version of this command removes the VC label.

Parameters

vc-label

A VC egress value that indicates a specific connection.

Values egress: 16 to 1048575

ingress: 32 to 18431

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vc-label

Syntax

configure mirror mirror-dest remote-source spoke-sdp egress vc-label

Description

This command configures the spoke SDP egress VC label.

The **no** form of this command removes the egress VC label value from the configuration.

Parameters

egress-vc-label

Specifies a VC egress value that indicates a specific connection.

Values 16 to 1048575

Platforms

All

vc-label

Syntax

vc-label *ingress-vc-label*

no vc-label [*ingress-vc-label*]

Syntax

vc-type {**ether** | **vlan**}

no vc-type

Context

[Tree] (config>service>sdp>binding>pw-port vc-type)

Full Context

configure service sdp binding pw-port vc-type

Description

This command sets the forwarding mode for the pseudowire port. The vc-type is signaled to the peer, and must be configured consistently on both ends of the pseudowire. vc-type VLAN is only configurable with dot1q encapsulation on the pseudowire port. The tag with vc-type vlan only has significance for transport, and is not used for service delineation or ESM. The top (provider tag) is stripped while forwarding out of the pseudowire, and a configured vlan-tag (for vc-type vlan) is inserted when forwarding into the pseudowire. With vc-type ether, the tags if present (max 2), are transparently preserved when forwarding in our out of the pseudowire.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of the command reverts to the default value.

Default

vc-type ether

Parameters

ether

Specifies **ether** as the virtual circuit (VC) associated with the SDP binding.

vlan

Specifies **vlan** as the virtual circuit (VC) associated with the SDP binding.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vc-type

Syntax

vc-type {**ether** | **vlan**}

Context

[Tree] (config>service>pw-template vc-type)

Full Context

configure service pw-template vc-type

Description

This command overrides the default VC type signaled for the binding to the far end SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

- The VC type value for Ethernet is 0x0005.
- The VC type value for an Ethernet VLAN is 0x0004.

Parameters

ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding. (hex 5)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vlan

Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a vlan-tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

Note:
The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

Full Context

oam vccv-ping

configure saa test type vccv-ping

Description

This command configures a Virtual Circuit Connectivity Verification (VCCV) ping test. A VCCV ping test checks the connectivity of a VLL inband. This test verifies that the destination (target) PE is the egress for the Layer 2 Forwarding Equivalence Class (FEC), and provides a cross-check between the dataplane and the control plane. This test is inband, which means that the **vccv-ping** message is sent using the same encapsulation and along the same path as user packets in the VLL. The VCCV ping test is the equivalent of the LSP ping test for a VLL service. This command reuses an LSP ping message format and can be used to test a VLL configured over both an MPLS and a GRE SDP.

Note: A VCCV ping can be initiated on T-PE or S-PE. If initiated on the S-PE, the **reply-mode** parameter must be used with the **ip-routed** value. The ping from the T-PE can either have values or be omitted, in which case the default value is used.

If a VCCV ping is initiated from T-PE to a neighboring S-PE (one segment only), it is sufficient to use only the **spoke-sdp-fec-id** parameter. However, if the ping is across two or more segments, at least the **spoke-sdp-fec-id**, **src-ip-address** *ip-addr*, **dst-ip-address** *ip-addr*, **ttl** *vc-label-ttl* parameters are used

where:

- The **src-ip-address** is the system IP address of the router preceding the destination router.
- The *vc-label-ttl* parameter must have a value equal to or higher than the number of PW segments.

Note: VCCV ping is a multi-segment PW. For a single-hop PW, only the peer VCCV CC bit of the control word is advertised when the control word is enabled on the PW.

VCCV ping on multi-segment PWs requires that the control word is enabled in all segments of the VLL. If the control word is not enabled on a spoke SDP, it is signaled peer VCCV CC bits to the far end, consequently the **vccv-ping** command cannot be successfully initiated on the specific spoke SDP.

If the **saii-type-2** and **taii-type-2** parameters are specified for a FEC 129 PW, these values are used by the VCCV ping echo request message instead of the source access individual identifiers (SAII) and target attachment individual identifier (TAII) of the spoke-SDP indexed by the **spoke-sdp-fec** parameter, or any SAII and TAII received in a switching point TLV for the PW. Furthermore, the user must enter the SAII and TAII in accordance with the direction of the PW as seen from the node on which the **vccv-ping** command is executed. However, the values of the SAII and TAII sent in the echo request message are swapped with respect to the user-entered values to match the order in the installed FEC on the targeted node. The output of the command for a FEC 129 type 2 PW reflects the order of the SAII and TAII stored on the targeted node.

When used with the **static** option, this command configures a VCCV ping test for static MPLS-TP PWs used in a VLL service. The test verifies that the destination (target) PE is the egress for the static PW FEC, and provides a cross-check between the dataplane and the configuration. The **vccv-ping static** command reuses an **lsp-ping** message format and can be used to test an MPLS-TP PW VLL configured over an MPLS SDP. VCCV ping for MPLS-TP PWs always use the VCCV control word (associated channel header) with either an IPv4 channel type (0x0021) or on-demand CV message channel type (0x0025).

Note: vccv-ping static can only be initiated on a T-PE. Both the echo request and reply messages are sent using the same, in-band, encapsulation. If the **target-fec-type** option is not specified, the target FEC stack contains a static PW FEC TLV. The contents of this TLV

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

are populated based on the source node ID, source global ID, destination global ID, and destination node ID in the **vccv-ping** command (or taken from the PW context, if omitted from the command).

The **target-fec-type** option allows the user to test a segment of a MS-PW that does not have the same FEC type as the local segment from the T-PE where the **vccv-ping** command is issued. This is applicable for performing VCCV ping on an MS-PW that consists of static PW FEC segments and dynamically signaled PW ID FEC segments.

The timestamp format that is sent, and is expected when received in a PDU, is configured using the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Parameters

fec-128

Keyword to specify that the VCCV ping test is of the type FEC 128.

sdp-id:vc-id

Specifies that if a FEC 128 PW is tested, its VC ID must be indicated with this parameter. The VC ID must exist on the local router and the far-end peer must indicate that it supports VCCV to allow the user to send a VCCV ping message.

Values sdp-id: 1 to 32767

vc-id: 1 to 4294967295

reply-mode {ip-routed | control-channel}

Indicates to the far end the method to send the reply message. The **ip-routed** option specifies an out-of-band reply mode using the VCCV control channel. The **control-channel** option specifies an in-band reply mode using the VCCV control channel.

Default control-channel

src-ip-address *ip-addr*

Specifies the source IP address.

Values a.b.c.d

dst-ip-address *ip-addr*

Specifies the destination IP address.

Values a.b.c.d

pw-id

Specifies the PW ID for performing a VCCV ping operation. The PW ID is a non-zero 32-bit connection ID required by FEC 128, as defined in RFC 8029, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*.

Values 1 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

target-fec-type

Specifies the FEC type for a remote PW segment targeted by a VCCV ping echo request. This parameter is used if VCCV ping is used with an MS-PW, where a static MPLS-TP PW segment using the static PW FEC is switched to a T-LDP signaled segment using the PW ID FEC (FEC 128), or vice versa, which requires the user to explicitly specify a target FEC that is different from the local segment FEC.

Values **pw-id-fec** — Specifies that the FEC element for the remote target PW segment is of the type PW ID (FEC 128).

static-pw-fec — Specifies that the FEC element for the remote target PW segment is of the type static PW FEC.

attachment-group-identifier

Specifies the attachment group identifier for the target FEC. This parameter is valid only in combination with the **target-fec-type** *static-pw-fec* options.

Values 0 to 4294967295

pw-path-id-saii *global-id:node-id:ac-id*

Specifies the SAII of the target FEC. This parameter is valid only in combination with the **target-fec-type** *static-pw-fec* options.

global-id — Specifies the global ID for the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

node-id — Specifies the node ID on far end T-PE that the PW being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the PW being tested at the far end T-PE.

Values 1 to 4294967295

pw-path-id-taii *global-id:node-id:ac-id*

Specifies the TAII of the target FEC. This parameter is valid only in combination with the **target-fec-type** *static-pw-fec* options.

global-id — Specifies the global ID of the TAII of the targeted static PW FEC element.

Values 0 to 4294967295

node-id — Specifies the node ID on the far end T-PE that the PW being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ac-id — Specifies an unsigned integer representing a locally unique TAII for the PW being tested at the far end T-PE.

Values 1 to 4294967295

saii-type2 *global-id*:*prefix*:*ac-id*

Specifies that if a FEC 129 AII type 2 PW is tested, the SAII must be indicated. The **saii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

taii-type2 *global-id:prefix:ac-id*

Specifies that if a FEC 129 AII type 2 PW is tested, the TAII must be indicated. The **taii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

global-id — Specifies the global ID of the far end T-PE of the FEC129 PW.

Values 0 to 4294967295

Default 0

node-id — Specifies the node ID on the far end T-PE that the PW being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique TAII for the PW being tested at the far end T-PE.

Values 1 to 4294967295

spoke-sdp-fec-id

Specifies that if a FEC 129 PW is tested, the *spoke-sdp-fec-id* option must be indicated using this parameter. The *spoke-sdp-fec-id* must already exist on the local router and the far-end peer must indicate that it supports VCCV to allow the user to send a message using the **vccv-ping** command.

spoke-sdp-fec is mutually exclusive with the *sdp-id:vc-id* parameter.

Values 1 to 4294967295

assoc-channel {ipv4 | non-ip}

Specifies the associated channel encapsulation format to use for the VCCV ping echo request and echo reply packet for a PW that uses the static PW FEC. An associated channel type of ipv4 must be used if a VCCV ping is performed to a remote segment of a different FEC type.

Values **ipv4**

IPv4 encapsulation in an IPv4 PW associated channel (channel type 0x0021)

non-ip

MPLS-TP encapsulation without UDP/IP headers, in a PW associated channel using the channel type 0x025.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default non-ip

global-id

Specifies the MPLS-TP global ID for the far end node of the PW under test. If this is not entered, the *dest-global-id* is taken from the PW context.

Values 0 to 4294967295

Default 0

node-id

Specifies the MPLS-TP node ID of the far end node for the PW under test. If this is not entered, then the *dest-global-id* is taken from the PW context.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

Default 0

sender-src-address ip-addr

Specifies the 4-octet IPv4 address of the node originating the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

remote-dst-address ip-addr

Specifies the 4-octet IPv4 address of the far end node that is a target of the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

pw-type

Specifies the PW type value of the PW segment targeted on the far end node. This field must be included to populate the PW type field of the PW ID FEC in the FEC static TLV, when the far end FEC type is different form the local FEC type and the **target-fec-type** *pw-id-fec*.

Values atm-cell (=3), atm-sdu (=2), atm-vcc (=9), atm-vpc (=10), cesopsn (=21), cesopsn-cas (=23), ether (=5), satop-e1 (=17), satop-t1 (=18), 1 to 65535

send-count

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message interval value must have expired before the next message request is sent.

Values 1 to 100

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 1

fc-name

Specifies the **fc** parameter be used to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

The LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end 7750 SR that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message. The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating SR.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

The ToS byte is not modified. Table 180: vccv-ping Request Packet and Behavior summarizes this behavior.

Table 180: vccv-ping Request Packet and Behavior

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	• EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

Default out

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

octets

Specifies the size, in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request pay-load is padded with zeros to the specified size. Note that an OAM command is not failed if the user entered a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vc-label-ttl

Specifies the time-to-live value for the vc-label of the echo request message. The outer label TTL is still set to the default of 255 regardless of this value.

Values 1 to 255

Default 1

Platforms

All

Output

The following output is an example of VCCV ping information.

Output Example

```
Ping TPE to SPE on a LDP/GRE tunnel

[Tree] (oam vccv-trace)

[Tree] (config>saa>test>type vccv-trace)

Full Context

oam vccv-trace

configure saa test type vccv-trace

Description

This command configures a Virtual Circuit Connectivity Verification (VCCV) automated trace test. The automated VCCV-trace can trace the entire path of a PW with a single command issued at the T-PE or at an S-PE. This is equivalent to LSP-Trace and is an iterative process by which the source T-PE or S-PE node sends successive VCCV-Ping messages with incrementing the TTL value, starting from TTL=1. In each iteration, the T-PE builds the MPLS echo request message in a way like VCCV-Ping. The first message with TTL=1 has the next-hop S-PE T-LDP session source address in the Remote PE Address field in the PW FEC TLV. Each S-PE which terminates and processes the message includes in the MPLS echo reply message the FEC 128 TLV corresponding the PW segment to its downstream node. The source T-PE or S-PE node can then build the next echo reply message with TTL=2 to test the next-next hop for the MS-PW. It copies the FEC TLV it received in the echo reply message into the new echo request message. The process is terminated when the reply is from the egress T-PE or when a time out occurs.

The user can specify to display the result of the VCCV-trace for a fewer number of PW segments of the end-to-end MS-PW path. In this case, the **min-ttl** and **max-ttl** parameters are configured accordingly. However, the T-PE/S-PE node still probes all hops up to **min-ttl** to correctly build the FEC of the subset of segments.

Note that if the **saii-type-2** and **taii-type-2** parameters are specified this command for a FEC129 pseudowire, then these values are used by the vccv-ping echo request message instead of the saii and taii of the spoke SDP indexed by the **spoke-sdp-fec** parameter, or any saii and taii received in a switching point TLV for the pseudowire. Furthermore, the use must enter the saii and taii in accordance with the direction of pseudowire as seen from the node on which the **vccv-trace** command is executed. However, the values of the saii and taii sent in the echo request message are swapped with respect to the user-entered values to match the order in the installed FEC on the targeted node. The output of the command for a FEC129 type 2 pseudowire reflects the order of the saii and taii stored on the targeted node.

This command, when used with the **static** option, configures a VCCV-automated trace test for static MPLS-TP pseudowires used in a VLL service. VCCV trace for MPLS-TP pseudowires always uses the VCCV control word (associated channel header) with either an IPv4 channel type (0x0021) or on-demand CV message channel type (0x0025).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note that **vccv-trace static** can only be initiated on a T-PE. Both the echo request and reply messages are send using the same, in-band, encapsulation. The target FEC stack contains a static PW FEC TLV. The contents of this TLV are populated based on the source Node ID, source global ID, and destination global ID and destination node ID taken from the pseudowire context.

The **target-fec-type** option allows the user to perform a vccv-trace to a segment of a MS-PW that does not have the same FEC type as the local segment from the T-PE where the **vccv-trace** command is issued. This is applicable for performing VCCV ping on an MS-PW consists of static PW FEC segments and dynamically signaled PW ID FEC segments.

Parameters

sdp-id:vc-id

Specifies that if a FEC 128 PW is being tested, then its VC ID must be indicated with this parameter. The VC ID needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

Values sdp-id: 1 to 32767

vc-id: 1 to 4294967295

reply-mode {ip-routed | control-channel}

Indicates to the far end, the method to send the reply message. The option **ip-routed** indicates an out-of-band reply mode using the vccv control channel. The option **control-channel** indicates an in-band reply mode using the vccv control channel.

Default control-channel

target-fec-type

Specifies the FEC type for a remote PW segment targeted by a VCCV Ping echo request. This parameter is used if VCCV Ping is used along a MS-PW where a static MPLS-TP PW segment using the static PW FEC is switched to a T-LDP signaled segment using the PW ID FEC (FEC128), or vice versa, thus requiring the user to explicitly specify a target FEC that is different from the local segment FEC.

Values **pw-id-fec** — Indicates that FEC element for the remote target PW segment is of type PW ID (FEC128).

static-pw-fec — Indicates that FEC element for the remote target PW segment is of type Static PW FEC.

attachment-group-identifier

Specifies the attachment group identifier for the target FEC. This parameter is only valid in combination with the **target-fec-type static-pw-fec**.

Values 0 to 4,294,967,295

pw-path-id-saii *global-id:node-id:ac-id*

Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 0

node-id — Specifies the node ID on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

pw-path-id-taii *global-id:node-id:ac-id*

Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

Default 0

node-id — Specifies the node ID of the far-end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

saii-type2 *global-id:prefix:ac-id*

If a FEC129 AII Type 2 pseudowire is being tested, then the source attachment individual identifier (SAII) must be indicated.

The **saii-type2** parameter is mutually exclusive with the **sdp-id:vc-id** parameter.

global-id — Specifies the global ID of this T-PE node.

Values 1 to 4294967295

prefix — Specifies the prefix on this T-PE node that the spoke SDP is associated with.

ac-id — Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

taii-type2 ***global-id:prefix:ac-id***

Specifies that if a FEC129 AII Type 2 pseudowire is being tested, then the target attachment individual identifier (TAII) must be indicated. The **taii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

global-id — Specifies the global ID of the far end T-PE of the FEC129 pseudowire.

Values 0 to 4294967295

node-id — Specifies the node ID on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique TAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

spoke-sdp-fec-id

Specifies that if a FEC 129 PW is being tested, then its *spoke-sdp-fec-id* must be indicated with this parameter. The **spoke-sdp-fec-id** needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

spoke-sdp-fec is mutually exclusive with the *sdp-id:vc-id* parameter.

Values 1 to 4294967295

assoc-channel {ipv4 | non-ip}

Specifies the associated channel encapsulation format to use for the VCCV trace echo request and echo reply packet for a PW that uses the static PW FEC. An associated channel type of ipv4 must be used if a vccv-ping is performed to a remote segment of a different FEC type.

Values ipv4 – IPv4 encapsulation in an IPv4 pseudowire associated channel (channel type 0x0021)

non-ip – MPLS-TP encapsulation without UDP/IP headers, in pseudowire associated channel using channel type 0x025.

Default non-ip

src-ip-address ***ipv4-address***

Specifies the 4-octet IPv4 address of the source node.

Values a.b.c.d

sender-src-address ***ipv4-address***

Specifies the 4-octet IPv4 address of the node originating the VCCV trace.

Values a.b.c.d

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

remote-dst-address ***ipv4-address***

Specifies the 4-octet IPv4 address of the far end node that is a target of the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

pw-id

Specifies the pseudowire ID to be used for performing a VCCV ping operation. The pseudowire ID is a non-zero 32-bit connection ID required by the FEC 128, as defined in RFC 8029, Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures.

Values 1 to 4294967295

pw-type

Specifies the PW type of the PW segment targeted on the far end node. This field must be included to populate the PW type field of the PW ID FEC in the FEC static TLV, when the far end FEC type is different form the local FEC type and the **target-fec-type** is **pw-id-fec**.

Values atm-cell (=3), atm-sdu (=2), atm-vcc (=9), atm-vpc (=10), cesopsn (=21), cesopsn-cas (=23), ether (=5), satop-e1 (=17), satop-t1 (=18), 1 to 65535

fc-name

Specifies the FC and profile parameters are used to indicate the forwarding class of the VCCV trace echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

The LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end router that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message. The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

The ToS byte is not modified. Table 181: vccv trace Request Packet and Behavior summarizes this behavior.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 181: vccv trace Request Packet and Behavior

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet{tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

profile {in | out}

Specifies the profile state of the VCCV trace echo request packet.

Default out

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

interval-value

Specifies the interval parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 255

Default 1

no-response-count

Specifies the maximum number of consecutive VCCV trace echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL value.

Values 1 to 255

Default 5

max-vc-label-ttl

Specifies the TTL value for the VC label of the echo request message for the last hop of the MS-PW for which the results are to be displayed. This is expressed as a decimal integer. The outer label TTL is still set to the default regardless of the value of the VC label.

Values 1 to 255

Default 8

min-vc-label-ttl

Specifies the TTL value for the VC label of the echo request message for the first hop of the MS-PW for which the results are to be displayed. This is expressed as a decimal integer. Note that the outer label TTL is still set to the default regardless of the value of the VC label.

Values 1 to 255

Default 1

probe-count

Specifies the number of VCCV trace echo request messages to send per TTL value.

Values 1 to 10

Default 1

octets

Specifies the size in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request pay-load is padded

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

with zeros to the specified size. An OAM command is not failed if the user enters a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

timeout-value

Specifies the *timeout* parameter, in seconds, expressed as a decimal integer. This value is used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response are not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 3

[Tree] (config>service>epipe>bgp-vpws>remote-ve-name ve-id)

Full Context

configure service epipe bgp-vpws ve-name ve-id

configure service epipe bgp-vpws remote-ve-name ve-id

Description

This command configures a ve-id for either the local VPWS instance when configured under the ve-name, or for the remote VPWS instance when configured under the remote-ve-name.

A single ve-id can be configured per ve-name or remote-ve-name. The ve-id can be changed without shutting down the VPWS instance. When the ve-name ve-id changes, BGP withdraws the previously advertised route and sends a route-refresh to all the peers which would result in reception of all the remote routes again. The old PWs are removed and new ones are instantiated for the new ve-id value.

When the remote-ve-name ve-id changes, BGP withdraws the previously advertised route and send a new update matching the new ve-id. The old pseudowires are removed and new ones are instantiated for the new ve-id value.

NLRIs received whose advertised ve-id does not match the list of ve-ids configured under the remote ve-id will not have a spoke SDP binding auto-created but will remain in the BGP routing table but not in the Layer 2 route table. A change in the locally configured ve-ids may result in auto-sdp-bindings either being deleted or created, based on the new matching results.

Each ve-id configured within a service must be unique.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPWS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default

no ve-id

Context

[Tree] (config>subscr-mgmt>msap-policy>vpls-only-sap-parameters>igmp-snp version)

Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping version

Description

This command specifies the version of IGMP which is running on an MSAP. This object can be used to configure a router capable of running either value. For IGMP to function correctly, all routers on a LAN must be configured to run the same version of IGMP on that LAN.

When the **send-query** command is configured, all type of queries generated are of the configured **version**. If a report of a version higher than the configured version is received, the report gets dropped and a new "wrong version" counter is incremented.

If the **send-query** command is not configured, the **version** command has no effect. The version used on that SAP or SDP is the version of the querier. This implies that, for example, when there is a v2 querier, a v3 group or group-source specific query when a host wants to leave a certain group will never be sent.

Default

version 3

Parameters

version

Specifies the IGMP version.

Values 1, 2, 3

video-interface

Syntax

video-interface *ip-address* [**create**]

no video-interface *ip-address*

Context

[Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy video-interface)

Full Context

configure mcast-management multicast-info-policy video-policy video-interface

Description

This command creates a video interface policy context that correlates to the IP address assigned for a video interface. This interface is created in a subscriber service to which the multicast information policy is assigned. If the specified IP address does not correlate to a video interface ip address, the parameters defined within this context have no effect.

The **no** form of the command deletes the video interface policy context.

Parameters

ip-address

The IP address of a video interface provisioned within the context of a service to which the Multicast Information Policy is assigned. If the IP address does not match the IP address assigned to a video interface, the parameters defined within this context have no effect.

create

Mandatory keyword needed when creating a new video interface within the video policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-s

Context

[Tree] (config>service>ies video-interface)

[Tree] (config>service>vprn video-interface)

Full Context

configure service ies video-interface

configure service vprn video-interface

Description

This command creates a video interface within the service. The video interface and associated IP addresses are the addresses to which clients within the service will send requests. The video interface must be associated with an ISA group using the video-sap command and have IP addresses for it to be functional.

The **no** form of the command deletes the video interface. The video interface must be administratively shut down before issuing the **no video-interface** command.

Parameters

ip-int-name

Specifies the name of the video interface, up to 32 characters. An interface name cannot be in the form of an IP address. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

create

This keyword is mandatory when creating a video interface.

Platforms

7450 ESS, 7750 SR, 7750 SR-s

view *view-name* **subtree** *oid-value*

no view *view-name* [**subtree** *oid-value*]

Context

[Tree] (config>system>security>snmp view)

Full Context

configure system security snmp view

Description

This command configures a view. Views control the accessibility of a MIB object within the configured MIB view and subtree. Object identifiers (OIDs) uniquely identify MIB objects in the subtree. OIDs are organized hierarchically with specific values assigned by different organizations.

Once the subtree (OID) is identified, a mask can be created to select the portions of the subtree to be included or excluded for access using this particular view. See the **mask** command.

The view(s) configured with this command can subsequently be used in read, write, and notify commands which are used to assign specific access group permissions to created views and assigned to particular access groups.

Multiple subtrees can be added or removed from a view name to tailor a view to the requirements of the user access group.

A subtree statement matches (covers) any OID that is a descendant of the specified OID value. For example, the subtree 1.3.6.1 matches 1.3.6.1.x (for any value of x), 1.3.6.1.x.y (for any values of x & y), and so on.

Subtrees that are not covered by **view** statements are not accessible in the view.

Per RFC 2575, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP),* each MIB view is defined by two sets of view subtrees, the included view subtrees, and the excluded view subtrees (see the **included** and **excluded** parameters of the **mask** command). Every such view subtree, both the included and the excluded ones, are defined in this table. To determine if a particular object instance is in a particular MIB view, compare the object instance's OID with each of the MIB view's active entries in this table. If none match, then the object instance is not in the MIB view. If one or more match, then the object instance is included in, or excluded from, the MIB view according to the value of vacmViewTreeFamilyType in the entry whose value of vacmViewTreeFamilySubtree has the most sub-identifiers.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no view** *view-name* command removes a view and all subtrees.

The **no view** *view-name* **subtree** *oid-value* removes a sub-tree from the view name.

Parameters

view-name

Specifies a view name, up to 32 characters.

oid-value

Specifies the object identifier (OID) value for the *view-name*. This value, for example, 1.3.6.1.6.3.11.2.1, combined with the mask and include and exclude statements, configures the access available in the view.

It is possible to have a view with different subtrees with their own masks and include and exclude statements. This allows for customizing visibility and write capabilities to specific user requirements**.**

Platforms

50.39 virtual-link

virtual-link

Syntax

[**no**] **virtual-link** *router-id* **transit-area** *area-id*

Context

[Tree] (config>service>vprn>ospf3>area virtual-link)

[Tree] (config>service>vprn>ospf>area virtual-link)

Full Context

configure service vprn ospf3 area virtual-link

configure service vprn ospf area virtual-link

Description

This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of this command deletes the virtual link.

Default

No virtual link is defined.

Parameters

router-id

The router ID of the virtual neighbor in IP address dotted decimal notation.

transit-area ***area-id***

The area-id specified identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

Platforms

All

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify vlan

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the VLAN tag of the SAP used for ring-node connectivity verification of this ring node. It is only meaningful if the value of is not zero.

The **no** form of this command reverts to the default.

Parameters

vlan-encap

Specifies the node cc VLAN IP.

Platforms

All

vlan

Syntax

vlan *tag*

no vlan

Context

[Tree] (config>subscr-mgmt>wlan-gw>ue-query vlan)

Full Context

configure subscriber-mgmt wlan-gw ue-query vlan

Description

This command enables matching on UEs, based on the VLAN tag within the tunnel, which typically used to indicate an SSID.

The **no** form of this command disables matching on the VLAN.

Default

no vlan

Parameters

tag

Specifies the VLAN tag.

Values 0 to 4096

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vlan

Syntax

vlan *vlan-encap*

no vlan

Context

[Tree] (config>redundancy>mc>peer>mcr>node>cv vlan)

[Tree] (cfg>eth-cfm>domain>assoc>bridge vlan)

Full Context

configure eth-cfm domain association bridge-identifier vlan

Description

This command configures the bridge identifier primary VLAN ID. This is informational only, and no verification is done to ensure MEPs on this association are on the configured VLAN.

The **no** form of this command reverts to the default value.

Default

no vlan

Parameters

vlan-id

Specifies a VLAN ID monitored by MA.

Values 1 to 4094

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

50.44 vlan-aware-bundle

vlan-aware-bundle

Syntax

vlan-aware-bundle *name* [**eth-tag** *value*]

no vlan-aware-bundle

Context

[Tree] (config>service>vpls>bgp-evpn vlan-aware-bundle)

Full Context

configure service vpls bgp-evpn vlan-aware-bundle

Description

This command configures a name that is used to group a bundle of VPLS services (Broadcast Domains) that are part of the same VLAN-aware bundle instance. This name is optional and allows the user to execute **show** commands that are relevant to all the Broadcast Domains in a VLAN-aware bundle service group.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The optional Ethernet Tag ID can be encoded in the EVPN routes for control-plane interoperability mode with VLAN-aware bundle services. The configuration of a non-default value requires the previous configuration of a VLAN-aware bundle name on the service.

When the Ethernet Tag ID is set to a non-zero value, the EVPN routes advertised for the VPLS service are advertised with this value into the Ethernet Tag ID field of the routes.

On reception of EVPN routes with non-zero Ethernet Tag ID, BGP imports the routes based on the import route target as usual. However, the system checks the received Ethernet Tag ID field and processes only routes whose Ethernet Tag ID matches the local VLAN-aware bundle Ethernet Tag value.

The **no** form of this command removes the configuration.

Parameters

name

Specifies the VLAN-aware bundle name, up to 32 characters.

value

Specifies the Ethernet Tag ID.

Values 1 to 16777215

Platforms

All

50.45 vlan-id

vlan-id

Syntax

vlan-id *service-port-vlan-id*

no vlan-id

Full Context

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range authentication vlan-mismatch-timeout

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range authentication vlan-mismatch-timeout

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the timeout value for the RADIUS proxy cache if a packet is received with a non-matching VLAN tag. The new timeout value is the lesser of the **vlan-mismatch-timeout** value and the currently remaining proxy cache timeout value.

The **no** form of this command disables the timeout behavior. The cache timeout value will remain unchanged.

Parameters

seconds

Specifies the timeout value for the RADIUS proxy cache, in seconds.

Values 5 to 60

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

50.47 vlan-range

vlan-range

Syntax

[**no**] **vlan-range** [*vlan-range*]

Context

[Tree] (config>service>vpls>stp>mst-instance vlan-range)

Full Context

configure service vpls stp mst-instance vlan-range

Description

This command specifies a range of VLANs associated with a certain mst-instance. This range applies to all SAPs of the M-VPLS.

Every VLAN range that is not assigned within any of the created **config>service>vpls>stp mst-instance** is automatically assigned to mst-instance 0. This instance is automatically maintained by the software and cannot be modified. Changing the VLAN range value can be performed only when the specified mst-instance is shutdown.

The **no** form of this command removes the **vlan-range** from the specified **config>service>vpls>stp mst-instance**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

vlan-range

The first VLAN range specifies the left-bound (i.e., minimum value) of a range of VLANs that are associated with the M-VPLS SAP. This value must be smaller than (or equal to) the second VLAN range value. The second VLAN range specifies the right-bound (i.e., maximum value) of a range of VLANs that are associated with the M-VPLS SAP.

Values 1 to 4094 to 1 to 4094

Platforms

All

vlan-range

Syntax

vlan-range *from* [**to** *to*]

no vlan-range *from*

Context

[Tree] (config>connection-profile-vlan vlan-range)

Full Context

configure connection-profile-vlan vlan-range

Description

This command allows the user to configure different ranges in the connection-profile-vlan. The ranges have the following characteristics:

- Ranges can contain a single VID or start-and-end values. When the *to-vid* is not specified, the end vid value is the same as the start vid value.
- On the fly addition/removal of ranges is allowed.
- When removing an entry, the **no vlan-range** *vid* **to** *vid* must be configured by the user.
- Multiple ranges are allowed under the same connection-profile-vlan. No VLAN values should overlap within the same connection-profile-vlan.
- The index for connection-profile and connection-profile-vlan must be unique between the two. For example, if **connection-profile 100** is present, then **connection-profile-vlan 100** is disallowed.

Each connection-profile-vlan must be explicitly configured.

Parameters

from

Specifies the beginning of the **vlan-range** associated to the **connection-profile-vlan**.

Values 1 to 4094

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

to

Specifies the end of the **vlan-range** associated to the **connection-profile-vlan**. If not specified, the **vlan-range** is comprised of only the *from* VLAN ID.

Values 1 to 4094

Platforms

[Tree] (config>service>epipe>sap>ingress vlan-translation)

Full Context

configure service vpls sap ingress vlan-translation

configure service epipe sap ingress vlan-translation

Description

This command configures ingress VLAN translation. If this command is enabled with an explicit VLAN value, the preserved VLAN ID is overwritten with this value. This setting is applicable to dot1q encapsulated ports. If enabled with the **copy-outer** keyword, the outer VLAN ID is copied to inner position on QinQ encapsulated ports. The feature is not supported on:

- dot1q SAPs
- QinQ saps with **qinq-vlan-translation** enabled
- connection profile VLAN SAPs if the **copy-outer** option is configured

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command disables VLAN translation.

Default

no vlan-translation

Parameters

vlan-id

Specifies the VLAN ID.

Values 0 to 4094

copy-outer

Keyword to specify to use the outer VLAN ID.

volume

Syntax

volume *credits* {**bytes** | **kilobytes** | **megabytes** | **gigabytes**}

no volume

Context

[Tree] (config>subscr-mgmt>diam-appl-plcy>gy>efh>interim-c volume)

Full Context

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit volume

Description

This command configures the default volume interim credit that is allocated to all rating groups of a Diameter Gy session when Extended Failure Handling (EFH) is active and for which no default credit is configured at the category map category level.

The **no** form of this command resets the value to the default value.

Default

volume 500 megabytes

Parameters

credits

Specifies the amount of volume credit that is allocated by default to all rating groups of a Diameter Gy session when EFH is active.

Values 1 to 4294967295

bytes | kilobytes | megabytes | gigabytes

Specifies whether credits are in bytes, kilobytes, megabytes, or gigabytes.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt volume-quota-direction

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt volume-quota-direction

Description

This command specifies whether volume quota is applied in the egress (downstream), ingress (upstream), or both directions. Configuration changes apply only to new DSM UEs and not to existing UEs.

Parameters

both

Enforces the volume quota on the packets ingressing and egressing the WLAN-GW combined.

ingress

Enforces the volume quota on packets ingressing the WLAN-GW from the UE (upstream).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

egress

Enforces the volume quota on packets egressing the WLAN-GW to the UE (downstream).

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

50.60 volume-stats-type

volume-stats-type

Syntax

volume-stats-type {**ip** | **default**}

no volume-stats-type

Context

[Tree] (config>subscr-mgmt>sub-prof volume-stats-type)

Full Context

configure subscriber-mgmt sub-profile volume-stats-type

Description

This command enables the reporting of Layer 3 (IP) based subscriber host volume accounting data.

By default, subscriber host volume accounting data includes Layer 2 header octets and can be configured to include a fixed packet byte offset or last-mile encapsulation overhead.

The **no** form of this command reverts to the default.

Default

volume-stats-type default

Parameters

default

Specifies that the subscriber host volume accounting data is reported including the Layer 2 header octets and optional delta's introduced by configuration (for example: packet byte offset, last mile aware shaping, and so on).

ip

Specifies that the subscriber host volume accounting data reporting is based on Layer 3 (IP) packet sizes. This includes subscriber host ingress/egress queue and policer stats in snmp, CLI show commands, RADIUS and XML accounting, and Diameter Gx usage monitoring. RADIUS and Diameter (DCCA) based credit control volume quota are interpreted as Layer 3 (IP).

50.61 vpls

vpls

Syntax

vpls *service-id* [**customer** *customer-id*] [**create**] [**vpn** *vpn-id*] [**m-vpls**] [**b-vpls** | **i-vpls**] [**etree**] [**name** *name*]

no vpls *service-id*

Context

[Tree] (config>service vpls)

Full Context

configure service vpls

Description

This command creates or edits a Virtual Private LAN Services (VPLS) instance. The **vpls** command is used to create or maintain a VPLS service. If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

A VPLS service connects multiple customer sites together acting like a zero-hop, Layer 2 switched domain. A VPLS is always a logical full mesh.

When a service is created, the **create** keyword must be specified if the **create** command is enabled in the **environment** context. When creating a service, you must enter the **customer** keyword and specify a *customer-id* to associate the service with a customer. The *customer-id* must already exist, having been created using the **customer** command in the **service** context. The *customer-id* must already exist having been created using the **customer** command in the service context. Once a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

To create a management VPLS on the 7450 ESS, the m-vpls keyword must be specified. See section **Hierarchical VPLS Redundancy** for an introduction to the concept of management VPLS.

Once a service is created, the use of the **customer** *customer-id* is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified will result in an error.

More than one VPLS service may be created for a single customer ID.

By default, no VPLS instances exist until they are explicitly created.

The **no** form of this command deletes the VPLS service instance with the specified *service-id*. The service cannot be deleted until all SAPs and SDPs defined within the service ID have been shut down and deleted, and the service has been shut down.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

service-id

Specifies unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: 64 characters maximum

customer *customer-id*

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

vpn vpn-id

Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN identification number

Values 1 to 2147483647

Default null (0)

create

Keyword used to create the service ID. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

m-vpls

Specifies a management VPLS

e-tree

Specifies a VPLS service as an E-Tree VPLS. E-Tree VPLS services have root and leaf attachment circuit (AC) and root leaf tag SAPs/SDP bindings for E-Tree interconnection. The access root AC SAP behaves as a SAP in non-E-tree VPLS services. The leaf AC SAP communicates only with root-connected services. Leaf and root AC SAPs behave externally the same as SAPs in non-E-Tree VPLS services.

The root AC SDP bind behaves as an SDP bind in non-E-tree VPLS services. The leaf AC SDP bind communicates only with root-connected services.

In the E-Tree VPLS, the root AC SAP/SDP bindings can communicate with other root and leaf AC SAP/SDP bind services locally and remotely. Root-originated traffic is marked internally with a root indication and the root is tagged externally on tag SAP/SDP binds. The leaf AC SAP/SDP bindings can communicate with other root SAP/SDP bindings locally and remotely. Leaf-originated traffic is marked internally with a leaf indication and tagged externally on leaf tag SAP/SDP bindings.

Any number of root or leaf AC SAPs can be used, up to the configured SAP limits in the E-Tree VPLS.

Network-side root leaf tag SAPs use additional SAP resources. These tag SAPs used two tags; one for root and one for leaf. Network-side tag SDPs use a hard coded tag of 1 for

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

root and 2 for leaf. AC SDP bindings are designated as root or leaf SDP bindings but carry no tags marking traffic on the egress frames.

The E-Tree SAP type must be specified when the SAP is created. To change the SAP type, the SAP must be removed and recreated.

b-vpls | i-vpls

Creates a backbone-vpls or ISID-vpls

name name

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Platforms

All

vpls

Syntax

vpls *service-name*

no vpls

Context

[Tree] (config>service>ies>if vpls)

Full Context

configure service ies interface vpls

Description

The **vpls** command, within the IP interface context, is used to bind the IP interface to the specified service name (VPLS or I-VPLS).

The system does not attempt to resolve the service name provided until the IP interface is placed into the administratively up state (**no shutdown**). Once the IP interface is administratively up, the system will scan the available VPLS services that have the **allow-ip-int-bind** flag set for a VPLS service associated with the name. If the service name is bound to the service name when the IP interface is already in the administratively up state, the system will immediately attempt to resolve the given name.

If a VPLS service is found associated with the name and with the **allow-ip-int-bind** flag set, the IP interface is attached to the VPLS service allowing routing to and from the service virtual ports once the IP interface is operational.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A VPLS service associated with the specified name that does not have the **allow-ip-int-bind** flag set or a non-VPLS service associated with the name is ignored and will not be attached to the IP interface.

If the service name is applied to a VPLS service after the service name is bound to an IP interface and the VPLS service **allow-ip-int-bind** flag is set at the time the name is applied, the VPLS service is automatically resolved to the IP interface if the interface is administratively up or when the interface is placed in the administratively up state.

If the service name is applied to a VPLS service without the **allow-ip-int-bind** flag set, the system will not attempt to resolve the applied service name to an existing IP interface bound to the name. To rectify this condition, the flag must first be set and then the IP interface must enter or reenter the administratively up state.

While the specified service name may be assigned to only one service context in the system, it is possible to bind the same service name to more than one IP interface. If two or more IP interfaces are bound to the same service name, the first IP interface to enter the administratively up state (if currently administratively down) or to reenter the administratively up state (if currently administratively up) when a VPLS service is configured with the name and has the **allow-ip-int-bind** flag set is attached to the VPLS service. Only one IP interface is allowed to attach to a VPLS service context. No error is generated for the remaining non-attached IP interfaces using the service name.

Once an IP interface is attached to a VPLS service, the name associated with the service cannot be removed or changed until the IP interface name binding is removed. Also, the **allow-ip-int-bind** flag cannot be removed until the attached IP interface is unbound from the service name.

Unbinding the service name from the IP interface causes the IP interface to detach from the VPLS service context. The IP interface may then be bound to another service name or a SAP or SDP binding may be created for the interface using the **sap** or **spoke-sdp** commands on the interface.

IP Interface MTU and Fragmentation

A VPLS service is affected by two MTU values; port MTUs and the VPLS service MTU. The MTU on each physical port defines the largest Layer 2 packet (including all DLC headers and CRC) that may be transmitted out a port. The VPLS itself has a service level MTU that defines the largest packet supported by the service. This MTU does not include the local encapsulation overhead for each port (QinQ, Dot1Q, TopQ or SDP service delineation fields and headers) but does include the remainder of the packet. As virtual ports are created in the system, the virtual port cannot become operational unless the configured port MTU minus the virtual port service delineation overhead is greater than or equal to the configured VPLS service MTU. Thus, an operational virtual port is ensured to support the largest packet traversing the VPLS service. The service delineation overhead on each Layer 2 packet is removed before forwarding into a VPLS service. VPLS services do not support fragmentation and must discard any Layer 2 packet larger than the service MTU after the service delineation overhead is removed.

IP interfaces have a configurable up MTU that defines the largest packet that may egress the IP interface without being fragmented. This MTU encompasses the IP portion of the packet and does not include any of the egress DLC header or CRC. This MTU does not affect the size of the largest ingress packet on the IP interface. If the egress IP portion of the packet is larger than the IP interface MTU and the IP header do not fragment flag is not set, the packet is fragmented into smaller packets that will not exceed the configured MTU size. If the do not fragment bit is set, the packet is silently discarded at egress when it exceeds the IP MTU.

When the IP interface is bound to a VPLS service, the IP MTU must be at least 18 bytes less than the VPLS service MTU. This allows for the addition of the minimal Ethernet encapsulation overhead; 6 bytes for the DA, 6 bytes for the SA, 2 bytes for the Etype and 4 bytes for the trailing CRC. Any remaining egress virtual port overhead (Dot1P, Dot1Q, QinQ, TopQ or SDP) required above the minimum is known to be less than the egress ports MTU since the virtual port would not be operational otherwise.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the IP interface IP MTU value is too large based on the VPLS service MTU, the IP interface will enter the operationally down state until either the IP MTU is adequately lowered or the VPLS service MTU is sufficiently increased.

The **no** form of this command on the IP interface is used to remove the service name binding from the IP interface. If the service name has been resolved to a VPLS service context and the IP interface has been attached to the VPLS service, the IP interface will also be detached from the VPLS service.

Parameters

service-name

The service-name parameter is required when using the IP interface vpls command and specifies the service name that the system will attempt to resolve to an **allow-ip-int-bind** enabled VPLS service associated with the name. The specified name is expressed as an ASCII string comprised of up to 32 characters. It does not need to already be associated with a service and the system does not check to ensure that multiple IP interfaces are not bound to the same name.

no vpn-family-policy

Context

[Tree] (config>router>bgp>next-hop-resolution vpn-family-policy)

Full Context

configure router bgp next-hop-resolution vpn-family-policy

Description

This command specifies the VPN family policy that is applied when filtering routes for consideration for next-hop resolution process for EVPN and IP-VPN families.

This policy is supported by the following families:

- VPN-IPv4 and VPN-IPv6
- EVPN (all routes types 1-6, although AD per-ES and AD per-EVI routes are always shown as resolved)
- MCAST-VPN-IPv4 and MCAST-VPN-IPv6

In a VPN family policy:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- only prefix-lists are used to match the next hop of a resolving route. No other policy qualifiers are supported.
- the route resolving the next hop is accepted or rejected

  In other words, if an imported route's next hop is resolved by route N (N is the preferred entry in tunnel-table for MPLS or the longest prefix match in the route-table for VXLAN), and route N is rejected by vpn-family-policy, then the route next hop is unresolved. This is irrespective of the existence of a route M that could potentially resolve the next hop in the tunnel-table or route-table.

The **no** form of this command removes the VPN family policy.

Default

no vpn-family-policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

configure service system vpn-gre-source-ip

Description

This command configures a single system-wide alternate source IPv4 address of the GRE tunnels in all VPRN services using the **auto-bind-tunnel** or an explicit SDP binding (**config**>**service**>**vprn**>**spoke-sdp**) with a tunnel of encapsulation GRE.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A change to the value of the **vpn-gre-source-ip** parameter can be performed without disabling the service. Once the new value is configured, the system address is not used in services which bind to the GRE tunnel.

The primary IPv4 address of any local network IP interface, loopback or otherwise, may be used.

The address of the following interfaces are not supported, and the configuration is rejected:

- unnumbered network IP interface
- IES interface
- VPRN interface
- CSC VPRN interface

The **vpn-gre-source-ip** parameter value adheres to the following rules:

- This single source address counts towards the maximum of 15 distinct address values per system that are used by all GRE SDPs under the **config**>**service**>**sdp**>**local-end** context and all L2oGRE SDPs under the **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** context.
- The same source address can be used in both **vpn-gre-source-ip** and **config**>**service**>**sdp**>**local-end** contexts.
- The same source address cannot be used in both **vpn-gre-source-ip** and **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** contexts because an address configured for a L2oGRE SDP matches an internally created interface which is not available to other applications.
- The **vpn-gre-source-ip** address, when different from system, need not match the primary address of an interface which has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

The **no** form of the command reverts to the default value.

Default

vpn-gre-source-ip ip-address (System interface primary IPv4 address)

Parameters

ip-address

Specifies the IPv4 address (a.b.c.d).

Platforms

All

50.73 vpn-ipv4

Full Context

configure router bgp group neighbor add-paths vpn-ipv4

configure router bgp add-paths vpn-ipv4

configure router bgp group add-paths vpn-ipv4

Description

This command configures the add-paths capability for VPN-IPv4 routes. By default, add-paths is not enabled for VPN-IPv4 routes.

The maximum number of paths per VPN-IPv4 NLRI to send is the configured send-limit, which is a mandatory parameter. The capability to receive multiple paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for VPN-IPv4 routes, causing sessions established using add-paths for VPN-IPv4 to go down and come back up without the add-paths capability.

Default

no vpn-ipv4

Parameters

send-limit

Specifies the maximum number of paths per VPN-IPv4 NLRI that are allowed to be advertised to add-paths peers (the actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules). If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each VPN-IPv4 NLRI if the peer has signaled support for receiving multiple add paths. If the router has not installed any of the routes in its FIB then all BGP add-paths qualify for advertisement.

Values 1 to 16, none, multipaths

receive

Specifies that the router negotiates the add-paths receive capability for VPN-IPv4 routes with its peers.

none

Specifies that the router does not negotiate the add-paths receive capability for VPN-IPv4 routes with its peers.

Use subject to Terms available at: www.nokia.com/terms.

Default

no vpn-ipv4

Parameters

max-paths

Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

ebgp-max-paths

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

restrict same-neighbor-as

Keyword that specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

restrict exact-as-path

Keyword that specifies that the non-best path must have the same AS path as the best path.

unequal-cost

Keyword that instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

50.76 vport

vport

Syntax

vport *name* [**create**]

no vport *name*

Context

[Tree] (config>port>ethernet>access>egress vport)

Full Context

configure port ethernet access egress vport

Description

This command configures a scheduling node, referred to as virtual port, within the context of an egress Ethernet port. The Vport scheduler operates either like a port scheduler with the difference that multiple Vport objects can be configured on the egress context of an Ethernet port, or it can be an aggregate rate when an egress port-scheduler policy is applied to the port.

The Vport is always configured at the port level even when a port is a member of a LAG.

When a port scheduler policy is applied to a Vport the following command is used:

```
config>port>ethernet>access>egress>vport>port-scheduler-policy
port-scheduler-policy-name
```

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The CLI will not allow the user to apply a port scheduler policy to a Vport if one has been applied to the port. Conversely, the CLI will not allow the user to apply a port scheduler policy to the egress of an Ethernet port if one has been applied to any Vport defined on the access egress context of this port. The **agg-rate**, along with an egress port-scheduler, can be used to ensure that a given Vport does not oversubscribe the port's rate.

SAP and subscriber host queues can be port-parented to a Vport scheduler in a similar way they port-parent to a port scheduler or can be port-parented directly to the egress port-scheduler if the **agg-rate** is used.

When the Vport uses an aggregate rate, the following command is used:

configure>port>ethernet>access>egress>vport>agg-rate-limit

The **no** form of this command removes the Vport name from the configuration.

Parameters

name

Specifies the name of the Vport scheduling node and can be up to 32 ASCII characters. This does not need to be unique within the system but is unique within the port or a LAG.

Platforms

All

50.78 vprn

vprn

Syntax

vprn *service-id* [**name** *name*] [**customer** *customer-id*] [**create**]

no vprn *service-id*

Context

[Tree] (config>service vprn)

Full Context

configure service vprn

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates or edits a Virtual Private Routed Network (VPRN) service instance.

If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

VPRN services allow the creation of customer-facing IP interfaces in the same routing instance used for service network core routing connectivity. VPRN services require that the IP addressing scheme used by the subscriber must be unique between it and other addressing schemes used by the provider and potentially the entire Internet.

IP interfaces defined within the context of an VPRN service ID must have a SAP created as the access point to the subscriber network.

When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

When a service is created, the use of the **customer** *customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error.

Multiple VPRN services are created to separate customer-owned IP interfaces. More than one VPRN service can be created for a single customer ID. More than one IP interface can be created within a single VPRN service ID. All IP interfaces created within an VPRN service ID belongs to the same customer.

The **no** form of this command deletes the VPRN service instance with the specified *service-id*. The service cannot be deleted until all the IP interfaces and all routing protocol configurations defined within the service ID have been shut down and deleted.

Parameters

service-id

Specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every 7750 SR on which this service is defined.

Values

service-id:	1 to 2147483648
svc-name:	64 characters maximum

customer-id

Specifies an existing customer identification number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

name name

This parameter configures an optional VPRN name, up to 64 characters, which adds a name identifier to a given vprn to then use that vprn name in configuration references as well as display and use vprn names in show commands throughout the system. This helps the service provider/administrator to identify and manage vprn within the SR OS platforms.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

All services are required to assign a service ID to initially create a service. However, either the service ID or the service name can be used to identify and reference a given service once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the service-id as the name.

Service names may not begin with an integer (0 to 9).

create

Keyword used to create a service ID. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

All

configure cflowd collector export-filter interface-list service vprn

Description

This command configures the VPRN service interfaces flow data sent to this collector.

The **no** form of the command removes the values from the configuration.

Parameters

service-id

Specifies the unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every SR OS on which this service is defined.

Values *service-id*: 1 to 2147483647

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

svc-name: 64 characters maximum

interface *ip-int-name*

Specifies the name of an IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters and must start with a letter. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

network-interface *ip-int-name*

Specifies the name of a network interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes and must start with a letter.

subscriber-interface *ip-int-name*

Specifies an interface name of a subscriber interface. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes and must start with a letter.

group-interface *ip-int-name*

Specifies an interface name of a group interface. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes and must start with a letter.

ingress

Keyword to specify that ingress flows are sent to the associated Cflowd Collector.

Default both

egress

Keyword to specify that egress flows are sent to the associated Cflowd Collector.

Default both

both

Keyword to specify that both ingress and egress flows are sent to the associated Cflowd Collector.

configure router mpls lsp-template vprn-auto-bind

configure router mpls lsp vprn-auto-bind

Description

This command determines whether the associated names LSP can be used or not as part of the auto-bind feature for VPRN services. By default, a names LSP is available for inclusion to be used for the auto-bind feature.

By configuring the command vprn-auto-bind exclude, the associated LSP will not be used by the auto-bind feature within VPRN services.

The **no** form of this command resets the flag back to the default value.

Default

vprn-auto-bind include

Parameters

include

Allows an associated LSP to be used by auto-bin for vprn services

exclude

Disables the use of the associated LSP to be used with the auto-bind feature for VPRN services.

50.81 vprn-local

vprn-local

Syntax

vprn-local [{**none** | **all** | **vc-only**}]

Context

[Tree] (config>router>ttl-propagate vprn-local)

Full Context

configure router ttl-propagate vprn-local

Description

This command configures the TTL propagation for locally generated packets which are forwarded over a MPLS LSPs in all VPRN service contexts.

For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP traceroute in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance.

Default

vprn-local vc-only

Parameters

none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

[Tree] (config>system>security vprn-network-exceptions)

Full Context

configure system security vprn-network-exceptions

Description

This command configures the rate to limit the processing of packets with label TTL expiry received within an LSP shortcut, or within all VPRN instances in the system, and from all network IP interfaces. This includes labeled user and control plane packets, ping and traceroute packets within GRT and VPRN, and ICMP replies. Packets over the configured rate are dropped.

This feature does not rate limit MPLS and service OAM packets (vprn-ping, vprn-trace, lsp-ping, lsp-trace, vccv-ping, and vccv-trace).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command disables the rate limiting of the reply to these packets.

Parameters

number

Specifies the number limit of MPLS exception messages.

Values 10 to 10,000

seconds

Specifies the rate limit of MPLS exception messages, in seconds.

Values 1 to 60

Full Context

configure service system bgp-evpn ethernet-segment vprn-next-hop

Description

This command configuresthe IPv4 or IPv6 address associated with an Ethernet Segment (ES). A virtual ES using this VPRN next-hop association represents a Layer 3 ES as described in *draft-sajassi-bess-evpn-ip-aliasing*. This IP address must be installed in the route table of the VPRN service identified by the EVI so that the Auto-Discovery per-ES or EVI routes for the ES are advertised. Only one VPRN next hop is supported per ES.

The **no** form of this command removes the IPv4 or IPv6 address association.

Default

no vprn-next-hop

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-address

Specifies the IPv4 or IPv6 address associated with an Ethernet Segment.

Values ipv4-address - a.b.c.d

ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0..FFFF]H

d - [0..255]D

Platforms

[Tree] (oam vprn-ping)

Full Context

configure saa test type vprn-ping

oam vprn-ping

Description

This command performs a VPRN ping and applies only to the 7750 SR and 7950 XRS.

Parameters

service-id

Specifies the VPRN service ID to diagnose or manage.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **configure saa test type vprn-ping service** *service-name* variant can be used in all configuration modes.

Values 1 to 2147483647

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

service-name

Specifies the VPRN service name to diagnose or manage, up to 64 characters.

source *ip-address*

Specifies an unused IP address in the same network that is associated with the VPRN.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

destination *ip-address*

Specifies the IP address to be used as the destination for performing a VPRN ping operation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

fc-name

Specifies the forwarding class of the MPLS echo request encapsulation.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

Default out

size

Specifies the OAM request packet size in bytes, expressed as a decimal integer.

Values 1 to 9786

Default 72

vc-label-ttl

Specifies the TTL value in the VC label for the OAM request, expressed as a decimal integer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 255

Default 255

send-count

Specifies the number of messages to send. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

Values 1 to 100

Default 1

return-control

Specifies the response to come on the control plane.

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response was not received. Any response received after the request times out is silently discarded.

Values 1 to 100

Default 5

interval

Specifies the interval time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

[Tree] (oam vprn-trace)

Full Context

configure saa test type vprn-trace

oam vprn-trace

Description

This command is used to perform a VPRN trace.

Parameters

service-id

Specifies the VPRN service ID to diagnose or manage.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **configure saa test type vprn-trace service** *service-name* variant can be used in all configuration modes.

Values 1 to 2147483647

service-name

Specifies the VPRN service name to diagnose or manage, up to 64 characters.

source *ip-address*

Specifies the IP address for the source IP address in dotted decimal notation.

Values ipv4-address: a.b.c.d

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

destination *ip-address*

Specifies the IP address to be used as the destination for performing an vprn-trace operation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

fc-name

Specifies the forwarding class of the MPLS echo request encapsulation.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the MPLS echo request encapsulation.

Default out

size

Specifies the OAM request packet size in bytes.

Values 1 to 9786

Default 1

min-vc-label-ttl

Specifies the minimum TTL value in the VC label for the trace test.

Values 1 to 255

Default 1

max-vc-label-ttl

Specifies the maximum TTL value in the VC label for the trace test.

Values 1 to 255

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default 4

send-count

Specifies the number of OAM requests sent for a TTL value.

Values 1 to 10

Default 1

return-control

Specifies the OAM reply to a data plane OAM request be sent using the control plane instead of the data plane.

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response was not received. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 3

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

50.86 vprn-transit

vprn-transit

Syntax

vprn-transit [{**none** | **all** | **vc-only**}]

Context

[Tree] (config>router>ttl-propagate vprn-transit)

Full Context

configure router ttl-propagate vprn-transit

Description

This command configures the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in all VPRN service contexts. For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP trace-route in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The user can override the global configuration within each VPRN service instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance

Default

vprn-transit vc-only

Parameters

none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

configure service vprn bgp-evpn mpls vrf-export

configure service vprn bgp-ipvpn mpls vrf-export

configure service vprn bgp-ipvpn segment-routing-v6 vrf-export

Description

This command configures route policies that control how routes are exported from the local VRF to other VRFs on the same or remote PE routers (using MP-BGP). Route policies are configured in the **configure router policy-options** context.

The **vrf-export** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route.

Only one of the 15 objects referenced by the **vrf-export** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-export** commands are issued, the last command entered overrides the previous command.

Aggregate routes are not advertised using MP-BGP protocols to the other MP-BGP peers.

The **no** form of this command removes all route policy names from the **vrf-export** list.

Default

no vrf-export

Parameters

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Up to 14 policies may be entered.

Description

This command configures route policies that control how VPN-IP and EVPN-IFL routes exported by other VRFs, on the same or remote PEs, are imported into the local VRF. Route policies are configured in the **configure router policy-options** context.

The **vrf-import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route

Only one of the 15 objects referenced by the **vrf-import** command is allowed to be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-import** commands are issued, the last command entered overrides the previous command.

The **no** form of this command removes all route policy names from the import list

Note:
Unless the preference value is changed by the policy, BGP-VPN and EVPN-IFL routes imported with a **vrf-import** policy have the preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs on the same router.

Default

no vrf-import

Parameters

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

configure service vprn bgp-evpn vxlan vrf-target

Description

This command provides a simplified method to configure the route target added to advertised routes or compared against received routes from other VRFs on the same or remote PE routers (using MP-BGP).

BGP-VPN and EVPN-IFL routes imported with a VRF target policy use the BGP preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs in the same router.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Specified VRF import or VRF export policies override the VRF target policy.

The **no** form of this command removes the VRF target policy.

Default

no vrf-target

Parameters

ext-comm

Specifies an extended BGP community in the *type:x:y* format. The value *x* can be an integer or IP address. The *type* can be the target or origin. *y* can be 16-bit integers.

Values

<ext-community>	: target:{<ip-addr:comm-val> | <2byte-asnumber:ext-comm-val> | <4byte-asnumber:comm-val>}	
	ip-addr:	a.b.c.d
	comm-val:	[0 to 65535]
	2byte-asnumber:	[0 to 65535]
	ext-comm-val:	[0 to 4294967295]
	4byte-asnumber:	[0 to 4294967295]

import *ext-community*

Specifies communities allowed to be received from remote PE neighbors.

export *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

Description

This command specifies the route target to be added to the advertised routes or compared against the received routes from other VRFs on the same or remote PE routers. vrf-import or vrf-export policies override the vrf-target policy.

The **no** form of this command removes the vrf-target.

Default

no vrf-target

Parameters

unicast

Specifies to use unicast vrf-target ext-community for the multicast VPN.

ext-comm

An extended BGP community in the **type**:**x**:**y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers.

Values target:{*ip-address*:*comm-val* | *2byte-asnumber:ext-comm-val* | 4byte-asnumber:comm-val}

ip-address:	a.b.c.d
comm-val:	0 to 65535
2byte-asnumber:	1 to 65535
4byte-asnumber	0 to 4294967295

import *ext-community*

Specifies communities allowed to be accepted from remote PE neighbors.

export *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

Full Context

configure service ies interface vrrp

configure service ies interface ipv6 vrrp

Description

This command configures the router to create or edit a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. The **vrrp** *virtual-router-id* command is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shutdown to remove the virtual router instance.

Parameters

virtual-router-id

Specifies a virtual router ID or an ID that can be modified on the IP interface.

Values 1 to 255

owner

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

passive

Keyword used to identify this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

[Tree] (config>router>if>ipv6 vrrp)

[Tree] (config>router>if vrrp)

Full Context

configure router interface ipv6 vrrp

configure router interface vrrp

Description

This command creates the context to configure a VRRP virtual router instance. A virtual router is defined by its virtual router identifier (VRID) and a set of IP addresses.

The optional **owner** keyword indicates that the **owner** controls the IP address of the virtual router and is responsible for forwarding packets sent to this IP address. The **owner** assumes the role of the master virtual router.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

All other virtual router instances participating in this message domain must have the same *vrid* configured and cannot be configured as **owner**. Once created, the **owner** keyword is optional when entering the *vrid* for configuration purposes.

A *vrid* is internally associated with the IP interface. This allows the *vrid* to be used on multiple IP interfaces while representing different virtual router instances.

For IPv4, up to four VRRP VRID nodes can be configured on a router interface. Each virtual router instance can manage up to 16 backup IP addresses. For IPv6, only one VRID can be configured on a router interface.

The optional **passive** keyword indicates that a *vrid* can be configured as **passive**, in which case, the VRRP advertisement messages are suppressed on transmission and reception, and all routers configured with the same *vrid* become master. Passive *VRIDs* can exceed the limit of four VRRP VRID nodes on a router interface.

The **no** form of the command removes the specified *vrid* from the IP interface. This terminates VRRP participation and deletes all references to the *vrid* in conjunction with the IP interface. The *vrid* does not need to be shut down to remove the virtual router instance.

Default

no vrrp — No VRRP virtual router instance is associated with the IP interface.

Parameters

virtual-router-id

The virtual router ID for the IP interface expressed as a decimal integer.

Values 1 to 255

owner

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Keyword used to identify this virtual router instance as **passive**, therefore owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove the parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command informs the system about the cross-connect type that is required for non-system IPv4 and IPv6 VXLAN termination. Internally, it triggers the automatic creation of two internal IP interfaces in the PXC ports and enables those internal interfaces to process and terminate VXLAN.

If no parameters are used, the VXLAN termination occurs in the base router; however, when the FPE is used for static VXLAN termination (no BGP-EVPN services), non-system IPv4 and IPv6 VXLAN can be terminated in a VPRN service. In this case, the VPRN router instance or service name must be configured with the **vxlan-termination** command.

The **no** form of this command disables the cross-connect type from the configuration.

Default

no vxlan-termination

Parameters

router-name

Specifies the router instance for VXLAN termination.

Values *router-name*: *router-name* or *vprn-svc-id*

router-name	"Base"
vprn-svc-id	1 to 2147483647

Default Base

service-name

Specifies the service name that identifies the VPRN for VXLAN termination, up to 64 characters.

Context

[Tree] (config>service>vpls>allow-ip-int-bind vxlan-ipv4-tep-ecmp)

Full Context

configure service vpls allow-ip-int-bind vxlan-ipv4-tep-ecmp

Description

This command enables and disables ECMP on VXLAN IPv4 destinations for R-VPLS services. When this command is enabled, packets entering a VPRN connected to an R-VPLS that is terminating on a VXLAN IPv4 destination are looked up in the routing table. If the next hop is a VXLAN IPv4 TEP, the packets are distributed based on per-flow load-balancing.

This command can only be used in FP3- (or higher) routers. R-VPLS per-flow load-balancing for VXLAN IPv6 destinations works by default without this command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** version of this command reverts the process to the default behavior of per-remote VTEP load-balancing.

oam vxlan-ping

Description

Operational command used to validate the VXLAN Tunnel Endpoint (VXLAN) connectivity between peers.

Parameters

test-id

Specifies a value to identify the originator handle of the specific request. Each active test requires a unique test identifier.

Values 1 to 2147483647

vpls-service-id

Specifies the VPLS service used to launch the request and by extension pick up the source VNI information.

Values

service-id: 1 to 2147483647

svc-name: up to 64 characters

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vxlan-network-id

Specifies the target Vxlan network identifier on the terminating VTEP.

Values 1 to 16777215

outer-ip-destination *ipv4-address*

Specifies the IPv4 address of the terminating VTEP.

Values a.b.c.d

udp-port-number

Optional outer source UDP port number.

Values 1 to 65535

Default System-generated UDP port number

time-to-live

Specifies the optional outer time to live.

Values 1 to 255

Default 255

inner-l2 *ieee-address*

Specifies the destination MAC address used in the inner VXLAN header.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Default 00:00:00:00:00:00

inner-ip-source *ipv4-address*

Specifies the inner source IPv4 address.

Values a.b.c.d

Default System IPv4 Address

inner-ip-destination *ipv4-address*

Specifies the inner destination IPv4 address. Must be in the range 127/8.

Values 127.0.0.0 to 127.0.0.8

Default 127.0.0.1

i-flag-on

Sets the VNI Validation bit to 1, indicating that the OAMPDU contains a valid VNI.

Default i-flag set to "0” which prevents the OAMPDU form being forwarded beyond the terminating VTEP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

end-system *ieee-address*

Optional command to include the sub TLV to validate an end system MAC address in the FDB. Only one MAC address may be included.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Default 00:00:00:00:00:00

packets

Specifies the number of VXLAN ping requests to transmit.

Values 1 to 1024

Default 1

interval-time

Specifies the probe interval, in seconds.

Values 0.1, 1 to 10

Default 1

timeout-time

Specifies the packet time out value, in seconds.

Values 1 to 10

Default 5

tlv-size

Specifies whether to include the Pad TLV and specifies the number of octets that defines the entire size of the pad TLV, including the type (2B), the length field (2B), the padding (variable).

Values 0, 5 to 2000

Default 0

reflect-pad

Instructs the responder to include the pad-tlv in the echo response. This option is not supported when the reply mode is "UDP”.

fc-name

Indicates the forwarding class that is exposed to the QoS policy as input into generating the outer CoS.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

profile {in | out}

Defines the frame's disposition that is exposed to the QoS policy as input into generating the outer CoS.

Default in

reply-mode {overlay | udp}

Instructs the responder how to route the VXLAN response.

Values **udp**: responds using UDP over the IP network. The default must be changed if the VTEP uses anything other than an IPv4 System Address as the source.

overlay: responds using the VXLAN overlay for the service

Default udp

Context

[Tree] (config>service>system>bgp-evpn>ip-prefix-routes>ifl vxlan-router-mac)

Full Context

configure service system bgp-evpn ip-prefix-routes interface-less vxlan-router-mac

Description

This command configures the router MAC address of the VXLAN instance in the VPRN. This MAC address is encoded in the router MAC extended community that is advertised with the IP prefix routes with VXLAN encapsulation. The MAC address is configured at the system level and used by all the VPRN services configured with VXLAN instances.

When unconfigured, the chassis base MAC is used as the inner source MAC in the originated packets for all the EVPN IFL VXLAN instances, as well as in the MAC extended community of the router.

The **no** form of this command removes the router MAC address configuration.

Default

no vxlan-router-mac

Parameters

ieee-address

Specifies the router MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure qos sap-ingress ipv6-criteria entry match vxlan-vni

configure qos sap-ingress ip-criteria entry match vxlan-vni

Description

This command configures a VXLAN or VXLAN GPE VNI to be used as a SAP QoS policy match criterion. A range of VNIs to be matched can be specified by including the keyword **range** with a *start* and *end* VNI. This command requires the **type** to be set to **vxlan-vni** in the related **ip-criteria** or **ipv6-criteria** context.

See Virtual Network Identifier (VNI) Classification for the list of restrictions for this command.

Default

no vxlan-vni

Parameters

eq *vxlan-vni-id*

Specifies the VXLAN or VXLAN GPE VNI to be matched in the SAP ingress QoS classification. The VNI can be specified in any of the available formats but is always shown in decimal.

Values 1 to 16777215 (Decimal)

0x1 to 0xFFFFFF (Hexadecimal)

[0b1 to 0b111111111111111111111111] (Binary)

range *startend*

Identifies a range of VNIs to be used as matching criteria. The *start* value must be lower than the *end* value. The VNI can be specified in any of the available formats but is always shown in decimal.

Values 1 to 16777215 (Decimal)

0x1 to 0xFFFFFF (Hexadecimal)

Full Context

configure router isa-service-chaining vxlan-vtep-range

Description

This command specifies the address range to be used as the local VXLAN VTEP on the ISA for service chaining. The system allocates one address for each ISA in the NAT group out of the specified range. The allocated address appears as /32 or /128 routes in the global routing table with the route type **nat**.

The **no** form of this command removes the IP or IPv6 addresses from the configuration.

Parameters

start

Specifies the start address of the VXLAN VTEP range.

end

Specifies the end address of the VXLAN VTEP range.

ip-address

Specifies an IPv4 address start and end range.

Values ipv4-address - a.b.c.d

ipv6-address

Specifies an IPv6 address start and end range

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

Full Context

configure isa application-assurance-group qos egress to-subscriber wa-shared-high-wmark

configure isa application-assurance-group qos egress from-subscriber wa-shared-high-wmark

Description

This command configures the high watermark for the weighted average utilization of the shared buffer space in the **from-subscriber** buffer pool for each ISA. When a buffer pool is not in the overload state and the wa-shared buffer utilization for an ISA crosses above the high watermark value in the ISA **from-subscriber** buffer pool enters an overload state and an overload notification is raised.

The **no** form of this command reverts to the default.

Default

wa-shared-high-wmark max

Parameters

percent

Specifies the weighted average shared buffer utilization high watermark.

Values 1 to 100, **max** percent (disabled)

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

51.3 wait

wait

Syntax

wait *seconds*

Context

[Tree] (bof wait)

Full Context

bof wait

Description

This command configures a pause, in seconds, at the start of the boot process which allows system initialization to be interrupted at the console.

When system initialization is interrupted the operator is allowed to manually override the parameters defined in the boot option file (BOF).

Only one **wait** command can be defined in the BOF.

Default

wait 3

Parameters

seconds

Specifies the time to pause at the start of the boot process, in seconds.

Values 1 to10

Platforms

All

51.4 wait-for-up-timer

wait-for-up-timer

configure router mpls lsp primary bfd wait-for-up-timer

configure router mpls lsp-template bfd wait-for-up-timer

configure router mpls lsp bfd wait-for-up-timer

Description

This command configures the time to wait for a BFD to come up in seconds. This timer is applicable to SR-TE LSPs, including auto-LSPs and PCE-initiated LSPs, as well as RSVP-TE LSPs. In case of SR-TE LSPs, this timer takes effect if BFD does not come up, or BFD goes from up to down. The timer is started when BFD is first enabled on a path or BFD transitions from up to down. When the timer expires if BFD is not yet come up, then the path is torn down by removing it from the TTM and the IOM and the retry timer is started.

In case of RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up on the original path
- the initial administrative enable of an LSP
- signaling retry of non-standby secondary paths

The **no** form of this command sets the timer to its default value.

Default

no wait-for-up-timer

Parameters

seconds

Specifies the BFD wait for up timer in seconds.

Values 0 to 60

Default 4

Platforms

All

- configure router mpls lsp bfd wait-for-up-timer

configure service epipe spoke-sdp bfd wait-for-up-timer

configure service vprn interface spoke-sdp bfd wait-for-up-timer

configure service vpls spoke-sdp bfd wait-for-up-timer

Description

This command configures the time interval, in seconds, that is used to wait for a BFD session to come up.

This command is triggered when a spoke-SDP is first administratively enabled and a VCCV BFD session transitions from up to down. The command is required to allow time for BFD sessions to come up, and for BFD to settle before selecting the active spoke-SDP to use in a redundant set. In the case where a VCCV BFD session is bouncing, the timer prevents excessive flapping of the operational state of a spoke-SDP.

The **no** form of this command disables the timer.

Default

no wait-for-up-timer

Parameters

seconds

Specifies the wait interval, in seconds, for the BFD up timer.

Values 1 to 60

Platforms

All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

51.5 wait-to-restore

wait-to-restore

Syntax

wait-to-restore *interval*

no wait-to-restore

Context

[Tree] (config>router>mpls>mpls-tp>protection-template wait-to-restore)

Full Context

configure router mpls mpls-tp protection-template wait-to-restore

Description

This command configures the WTR timer. It determines how long to wait until the active path of an MPLS-TP LSP is restored to the working path following the clearing of a defect on the working path. It is applicable to revertive mode, only.

Default

wait-to-restore 300

Parameters

interval

Specifies the WTR timer interval in 1 second increments.

Values 0 to 720 seconds

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

51.7 warm-standby

warm-standby

Syntax

warm-standby

Context

[Tree] (config>redundancy>multi-chassis>peer warm-standby)

Full Context

configure redundancy multi-chassis peer warm-standby

Description

This command enables Oversubscribed Multi-Chassis Redundancy (OMCR) model where subscriber hosts are synchronized between the two chassis only in the control plane and are kept there (as part of the Multi-Chassis Synchronization (MCS) state) until the switchover occurs. Link or nodal failure will trigger the switchover at which point the subscriber hosts are being fully instantiated in the control and the forwarding plane. This approach allows oversubscription of the resources in the central standby (or protecting) node that is backing-up several active nodes. The total number of protected subscribers in the OMCR cluster exceeds the forwarding capacity of the protecting node. This is achievable by not fully occupying the resources for the subscriber hosts until the failure occurs.

The restoration times depend on the amount of the subscriber hosts that are affected by the switchover and it is related to the time needed for the full instantiation of the subscribers in the forwarding plane.

Although this command is configured on a peer level, the warm-standby property is a nodal characteristic. In other words, mixing of N:1 and 1:1 (hot standby) mode in the central standby node is not supported. Consequently all peers on the central standby node must be configured for warm-standby (N:1), or all peers must be configured for hot-standby (1:1) by omitting the warm-standby keyword from the configuration.

The peer of the central backup node is not aware of the redundancy model supported. In in other words, the peer of the central-backup node does not know whether it peers with a warm-standby peer or host-standby-peer.

51.9 watchdog-timer

watchdog-timer

Syntax

watchdog-timer *seconds*

no watchdog-timer

Context

[Tree] (config>aaa>diam>node>peer watchdog-timer)

Full Context

configure aaa diameter node peer watchdog-timer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

Watchdog messages are used to verify liveliness of a Diameter peer. A single watchdog message is sent to a peer in case that no traffic is received from it within a configured watchdog-timer. This watchdog request message solicits a watchdog answer message from the peer. If no traffic (watchdog answer or otherwise) is received from the peer in response to watchdog request while the watchdog timer is running, the peer ise put in suspicious state and a peer failover routine is triggered.

The peer closes after it has been in suspicious mode for the duration of one more watchdog-timer interval without receiving any traffic from it.

After the peer is recovered, it takes three successful exchanges of diameter watchdog messages (DWR/DWA) for the peer to become used again in Diameter forwarding. This behavior is described in RFC 3539, §3.4.1, *Authentication, Authorization and Accounting (AAA) Transport Profile*).

This command is not applicable to legacy implementations of Diameter base in the SR OS.

The **no** form of this command removes the watchdog timer value from the configuration.

Default

watchdog-timer 30

Parameters

seconds

Specifies the device watchdog timer, in seconds, used on all connections by this peer.

Values 1 to 1000

[Tree] (config>router>nat>outside>pool watermarks)

Full Context

configure service vprn nat outside pool watermarks

configure router nat outside pool watermarks

Description

This command configures the watermarks for ports or port-block utilization in a NAT pool.

For CGN and L2-aware NAT, the port and port-block watermarks are used to monitor ports or port-block utilization in a NAT pool. High and low thresholds are configured in percentages of total available port-blocks or ports per protocol in a pool.

For LSN44 pools with flexible port allocation, the watermarks represent the port utilization per outside IP address if paired address pooling is enabled. If an arbitrary address pooling is enabled, then the watermarks represent the port utilization per pool.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For port-block based pools where flexible port allocation is disabled, the watermarks represent port-block occupancy per pool. These watermarks cover combined initial and extended port-blocks in a NAT pool. If the extended port blocks are not enabled in L2-aware NAT, then the L2-aware pool contains only the initial port-blocks.

For the system to generate those events, the NAT event ID is configured as follows:

- 2001 is enabled for L2-aware pools which do not use l2-aware port-block-extensions
- 2003 is enabled for port-blocks based LSN pools
- 2044 is enabled for L2-aware pools which use l2aware port-block-extension
- 2046 is enabled for port based LSN pools for flexible-port-allocation

Event IDs are enabled via log event control configuration.

no watermarks

Context

[Tree] (config>service>nat>up-nat-policy>port-block-extensions watermarks)

Full Context

configure service nat up-nat-policy port-block-extensions watermarks

Description

This command configures the extended port block watermarks used to monitor utilization of the port block space per outside IP in a NAT pool reserved for extended port blocks. Configure extended port blocks in addition to the initial port blocks optionally allocated to each NAT subscriber.

The high and low thresholds are configured in percentages of the total extended port blocks per outside IP in a NAT pool. Both values represent extended port-block utilization or occupancy per outside IP in a NAT pool.

Note: For the system to generate these events, you must enable the NAT event ID 2045 using the configuration in the log event-control.

The **no** form of this command reverts the watermarks to the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no watermarks

Parameters

high-percentage

Specifies the high threshold value in the percentages of the total extended port-block space per outside IP in a NAT pool .

Values 1 to 100

low-percentage

Specifies the low threshold value in the percentage of the total extended port-block space per outside IP in a NAT pool.

Values 0 to 99

no weekday

Context

[Tree] (config>system>cron>sched weekday)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure system cron schedule weekday

Description

This command specifies which days of the week that the schedule will fire on. Multiple days of the week can be specified. When multiple days are configured, each of them will cause the schedule to occur. If a weekday is configured without configuring the month, weekday, day-of-month, and minute, the event will not execute.

Using the **weekday** command as well as the **day-of month** command will cause the script to run twice. For example, consider that today is Monday January 1. If Tuesday January 5 is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified weekday from the configuration.

Default

no weekday

Parameters

weekday-number

Specifies a weekday number.

Values 1 to 7 (maximum 7 weekday-numbers)

day-name

Specifies a day by name.

Values sunday, monday, tuesday, wednesday, thursday, friday, saturday (maximum 7 weekday names)

all

Specifies all days of the week.

Platforms

All

no weight

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>seg-list weight)

Full Context

configure router segment-routing sr-policies static-policy segment-list weight

Description

This command associates a weight value with a segment list of a statically-defined segment routing policy to achieve weighted ECMP behavior. Weight is an optional parameter.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When any segment-list in the active policy has a weight greater than 1, traffic matching the policy is load-balanced across the segment lists according to their relative weight values.

The **no** form of this command reverts to the default value.

Default

weight 1

Parameters

weight

Specifies the weight value.

Values 1 to 4294967295

Platforms

All

51.16 weight-down

weight-down

Syntax

[**no**] **weight-down** *lag-ports-down-weight*

Context

[Tree] (config>vrrp>policy>priority-event>lag-port-down weight-down)

Full Context

configure vrrp policy priority-event lag-port-down weight-down

Description

This command creates a context to configure an event set threshold within a lag-port-down priority control event. The weight-down command defines a sub-node within the lag-port-down event and is uniquely identified with the lag-ports-down-weight parameter. Each weight-down node within the same lag-port-down event node must have a unique lag-ports-down-weight value. Each weight-down node has its own priority command that takes effect whenever that node represents the current threshold. A single LAG can use either weight-based (**weight-down**) or port-based (**number-down**) thresholds. The weight-based thresholds are required for correct operation on mixed port-speed LAGs, but can be used for non mixed port-speed LAGs as well. The weights for the **weight-down** node are normalized from the **hash-weight** values of the LAG member ports to fit a 1 to 64 range for 64-link capable LAGs and a 1 to 32 range for other LAGs.

The total number of sub-nodes (uniquely identified by the lag-ports-down-weight parameter) allowed in the system is 2048.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A **weight-down** node is not required for each possible number of ports that could be down. The active threshold is always the closest lower threshold.

The **no** form of the command deletes the event set threshold. The threshold may be removed at any time. If the removed threshold is the current active threshold, the event set thresholds must be re-evaluated after removal.

Default

no weight-down

Parameters

lag-ports-down-weight

The total weight of LAG ports down to create a set event threshold. This is the active threshold when the weight of down ports in the LAG equals or exceeds *lag-ports-down-weight*, but does not equal or exceed the next highest configured *lag-ports-down-weight*.

Values 1 to 64 (for 64-link capable LAGs)

1 to 32 (for other LAGs)

configure service vpls bgp-evpn ip-route-link-bandwidth weighted-ecmp

configure service vprn bgp-evpn vxlan evpn-link-bandwidth weighted-ecmp

Description

This command enables the processing of the EVPN link bandwidth extended community when installing an ECMP set for an EVPN IP prefix route in the VPRN route table.

Flows to an IP prefix received with a weight and a zero ESI value are sprayed according to the weight. If the EVPN IP prefix route received with the weight has a non-zero ESI, the weight is divided into the number of PEs attached to the Ethernet Segment (and rounded up if the result is not an integer).

This command also enables the weighted ECMP functionality for BGP CEs where the weight is configured with the **evpn-link-bandwidth add-to-received-bgp** command.

The **no** form of this command disables EVPN link bandwidth extended community.

Default

no weighted-ecmp

Platforms

All

weighted-ecmp

Syntax

weighted-ecmp [**strict**]

no weighted-ecmp

Context

[Tree] (config>router weighted-ecmp)

Full Context

configure router weighted-ecmp

Description

This command enables the weighted load-balancing, or weighted ECMP, over MPLS LSP.

When this command is enabled, packets of IGP, BGP, and static route prefixes resolved to a set of ECMP tunnel next-hops are sprayed proportionally to the weights configured for each MPLS LSP in the ECMP set.

Weighted load-balancing over MPLS LSP is supported in the following forwarding contexts:

- IGP prefix resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- BGP prefix with the BGP next-hop resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- Static route prefix resolved to an indirect next-hop, which itself is resolved to a set of equal-metric MPLS LSPs in TTM. The user can allow automatic selection or specify the names of the equal-metric MPLS LSPs in TTM to be used in the ECMP set.
- Static route prefix resolved to an indirect next-hop, which is resolved to IGP shortcuts in RTM.
- BGP prefix with a BGP next-hop resolved to a static route, which resolves to a set of tunnel next-hops toward an indirect next-hop in RTM or TTM.
- BGP prefix resolving to another BGP prefix, whose next-hop is resolved to a set of ECMP tunnel next-hops with a static route in RTM or TTM or to IGP shortcuts in RTM.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

IGP computes the normalized weight for each prefix tunnel next-hop. IGP updates the route in RTM with the set of tunnel next-hops and normalized weights. RTM downloads the information to IOM for inclusion in the FIB.

If one or more LSPs in the ECMP set of a prefix do not have a weight configured, the regular ECMP spraying for the prefix will be performed.

The weight assigned to an LSP impacts only the forwarding decision, not the routing decision. In other words, it does not change the selection of the set of ECMP tunnel next-hops of a prefix when more next-hops exist than the value of the router **ecmp** option. Once the set of tunnel next-hops is selected, the LSP weight is used to modulate the amount of packets forwarded over each next-hop. It also does not change the hash routine, but only the spraying of the flows over the tunnel next-hops is modified to reflect the normalized weight of each tunnel next-hop.

The **no** form of this command resumes regular ECMP spraying of packets of IGP, BGP, and static route prefixes over MPLS LSP.

Default

no weighted-ecmp

Parameters

strict

Enables strict enforcement for a load balancing weight to be configured on each interface withing a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

51.18 wide-metrics-only

wide-metrics-only

Syntax

[**no**] **wide-metrics-only**

Context

[Tree] (config>service>vprn>isis>level wide-metrics-only)

Full Context

configure service vprn isis level wide-metrics-only

Description

This command enables the exclusive use of wide metrics in the LSPs for the level number. Narrow metrics can have values between 1 and 63. IS-IS can generate two TLVs, one for the adjacency and one for the IP prefix. In order to support traffic engineering, wider metrics are required. When wide metrics are used, a second pair of TLVs are added, again, one for the adjacency and one for the IP prefix.

By default, both sets of TLVs are generated. When wide-metrics-only is configured, IS-IS only generates the pair of TLVs with wide metrics for that level.

The **no** form of this command reverts to the default value.

configure port ethernet efm-oam link-monitoring errored-frame-period window

Description

This command defines the size of the window based on a packet receive rate. The minimum serviceable rate is the number of minimum size packets that can be received in one second. The window receive count value will be polled at a minimum one second intervals to see if the window size has been reached. Errors are accumulated until the end of the window. At the end of the window the actual errors are compared to the thresholds to determine if a threshold has been crossed. There is no mid-window threshold checking. The window represents a unique non-overlapping period of time.

Parameters

packets

Specifies the number of received packets in one second.

Values 1 to 4294967295

Default 1488095

Platforms

All

window

Syntax

window *deciseconds*

Context

[Tree] (config>port>ethernet>efm-oam>link-mon>errored-frame-seconds window)

Full Context

configure port ethernet efm-oam link-monitoring errored-frame-seconds window

Description

This command defines the size of the window using a 100ms base *deciseconds*. Errored seconds are accumulated until the end of the window. At the end of the window, the actual errors are compared to the thresholds to determine if a threshold has been crossed. There is no mid-window threshold checking. The window represents a unique non-overlapping period of time.

Parameters

deciseconds

Specifies the number of 100 ms increments. Must be specified in increments of 10 (full seconds).

Values 100 to 9000

Default 600

Platforms

All

window

Syntax

window *deciseconds*

Context

[Tree] (config>port>ethernet>efm-oam>link-mon>errored-symbols window)

Full Context

configure port ethernet efm-oam link-monitoring errored-symbols window

Description

This command defines the size of the window using a 100ms base *deciseconds*. The time value is converted to a number of symbols for the underlying medium. Errors are accumulated until the end of the window. At the end of the window, the actual errors are compared to the thresholds to determine if a threshold has been crossed. There is no mid-window threshold checking. The window represents a unique non-overlapping period of time.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

deciseconds

Specifies the number of 100ms increments in increments of 10 (full seconds).

Values 10 to 600

Default 10

Platforms

All

51.25 window-integrity

window-integrity

Syntax

window-integrity *percentage*

no window-integrity

Context

[Tree] (config>oam-pm>streaming>delay-template window-integrity)

Full Context

configure oam-pm streaming delay-template window-integrity

Description

This command specifies the integrity of the sample window. A percentage value that suggests the measurement has enough samples (integrity) to be considered representative for that sample window. The configured percentage considers the interval of the test PDUs, and the length of the sample window to determine the number of packets required in the sample.

(((window-integrity %) x (sample-window length (s) x pps per test (interval)).

Ensure that the percentage and the combination of sample window and packet per second per test interval produces the desired results.

If the number of samples in the sample window are equal to or greater than the computed number of required samples, then the value has integrity and the suspect flag is set to false for that streamed result.

If the count is less than the computed number of required samples, then the suspect flag is set to true for that streamed result.

Regardless of the integrity, the average values are streamed. It is up to the higher level systems to interrogate the suspect flag and determine if the value that is set should be used, discarded, or reported separately.

The **no** form of this command reverts to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

window-integrity 50

Parameters

percentage

Specifies the window integrity percentage.

Values 1 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

window-integrity

Syntax

window-integrity *percent*

no window-integrity

Context

[Tree] (config>test-oam>link-meas>template>asw window-integrity)

Full Context

configure test-oam link-measurement measurement-template aggregate-sample-window window-integrity

Description

This command determines whether the aggregate sample window is integral based on the number of samples received from the sample window, comparing the number of samples to the percentage configured.

The configured percentage translates to a required sample window count that must be included in the aggregate sample window. The range is from 0 to 100. The number of samples is computed as follows:

(window-integrity (%)) x (((aggregate-sample-window length (s)) / (sample-window length (s)))

For an aggregate sample window that does not reach the integrity, the value is not considered as representative and is used for threshold comparison.

If the number of samples in the aggregate sample window are equal to or greater than the computed number of required samples, the sample window has integrity and the aggregate sample window result is compared to configured sample window thresholds.

If the count is less than the computed number of required samples, the aggregate sample window does not have integrity and the aggregate sample window results are compared to configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

The **no** form of this command disables integrity checking.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

window-integrity 0

Parameters

percent

Specifies the percentage of successful sent and received request-response pairs.

Zero indicates any amount of integrity is acceptable for report to the routing engine.

Values 0 to 100

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

window-integrity

Syntax

window-integrity *percent*

no window-integrity

Context

[Tree] (config>test-oam>link-meas>template>sw window-integrity)

Full Context

configure test-oam link-measurement measurement-template sample-window window-integrity

Description

This command specifies the integrity of the sample window. A percentage value indicates when the sample window has enough samples to be considered representative for that window (integrity). The configured percentage considers the interval of probes and the length of the sample window to determine the number of packets required in the sample:

(window-integrity (%)) x (((sample-window length (s)) / pps per test (interval)))

Ensure that the percentage and the combination of sample window and the packet-per- second per test interval produces the desired results.

If the number of samples in the sample window are equal to or greater than the computed number of required samples, the sample window has integrity and the sample window result is compared to the configured sample window thresholds.

If the count is less than the computed number of required samples, the sample window does not have integrity and the sample window results are not compared to configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

The **no** form of this command disables integrity checking.

Context

[Tree] (config>isa wlan-gw-group)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure isa wlan-gw-group

Description

This command creates a WLAN GW group that contains a set of ISAs to be used in WLAN-GW functionality. A WLAN-GW group can also be used where a NAT group is expected. The WLAN-GW group ID shares the same number space with the NAT group.

At most, one WLAN-GW group may be configured.

The optional redundancy parameter determines the provisioning and redundancy mode.

- IOM mode

  A whole IOM is added to the group. The IOM must be fully provisioned with BB ISA modules. In IOM mode, when a single ISA fails, the entire IOM is considered to have failed and all subscribers are recovered on a backup IOM.

- ISA mode

  BB ISA modules are added separately with no restriction put on other MDAs in the IOM. When a single ISA fails, a backup ISA will try to recover as many subscribers as possible but may run out of resources (for example, queues, policers, host entries) during the recovery process. It is recommended to pair ISAs with MDAs and services that do not consume many IOM resources.

The **no** form of this command removes the group.

Parameters

group-id

Specifies WLAN Gateway Integrated Service Adaptor (ISA) Groups.

Values 1 to 4

unit

Specifies the provisioning and redundancy mode.

Values mda or iom

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

51.34 wred-queue

wred-queue

Syntax

wred-queue [**policy** *slope-policy-name*] [**mode** *mode*] [**slope-usage** *slope-usage*]

no wred-queue

Context

[Tree] (config>qos>sap-egress>queue wred-queue)

Full Context

configure qos sap-egress queue wred-queue

Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

  This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out-of-profile and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus-profile and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When **native** mode is enabled for a queue, the **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

This is only supported on FP3 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's MBS parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's CBS parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shutdown (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue is automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used. If the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for a SAP egress queue, the queue **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the WRED queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default

no wred-queue

Parameters

slope-policy-name

Specifies an existing slope policy that is used to override the default WRED slope policy.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mode

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** — uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue — each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This is supported on both FP2- and higher-based hardware and requires **slope-usage default**.

Default native

slope-usage

Specifies congestion control to be used.

Values **default** — maps the inplus, in, out, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low — maps the out and exceed-profile traffic to the low and exceed WRED slopes with the inplus and in-profile traffic using the MBS drop tail. This is only supported for **native** mode.

Default exceed-low

no wred-queue

Context

[Tree] (config>qos>qgrps>egr>qgrp>queue wred-queue)

Full Context

configure qos queue-group-templates egress queue-group queue wred-queue

Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

Native hardware WRED is supported on FP3- and higher-based hardware and is ignored on FP2 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's **mbs** parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's **cbs** parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shut down (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue will be automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used, and if the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for an egress queue group queue, the queue pool and drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The resource usage for the wred-queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default

no wred-queue

Parameters

slope-policy-name

Specifies an existing slope policy that is used to override the default WRED slope policy.

mode {native | pool-per-queue}

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** - Each queue uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue - Each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This requires **slope-usage default**.

Default native

slope-usage {default | exceed-low}

Specifies the type of congestion control to be used.

Values **default** - Maps the inplus-profile, in-profile, out-of-profile, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low - Maps the out-of-profile and exceed-profile traffic to the low and exceed WRED slopes, with the inplus-profile and in-profile traffic using the MBS drop tail. This option is only supported for **native** mode.

51.38 wrr-group

wrr-group

Syntax

wrr-group *group-id* **sched-class** *class-id*

wrr-group *group-id* **unattached**

no wrr-group *group-id*

Context

[Tree] (config>qos>hs-attachment-policy wrr-group)

Full Context

configure qos hs-attachment-policy wrr-group

Description

This command defines how the specified group ID is attached to the scheduler. A WRR group may have one of two attachment states:

- directly attached to a scheduler class
- unattached

A WRR group provides a weighted scheduling context for its member queues, collapsing the queues into a single scheduling class.

The following WRR membership restrictions apply:

- Two groups are supported: WRR-group 1 and WRR-group 2.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Up to six of the eight queues can become members of WRR groups (the sum of the membership of both groups cannot exceed six queues). All six queues can be placed in a single WRR group or they can be spread between the two groups.
- All queues within a group must have contiguous queue IDs.
- When both groups are configured to have queue members, the queue IDs in group 1 must be lower than the queue IDs in group 2.

The **queue** *queue-id* attachment command is used to define WRR group membership.

The **no** form of the command reverts to the default unattached attachment state for the group ID.

Default

wrr-group group-id unattached

Parameters

group-id

Specifies the WRR group identifier. The *group-id* parameter is required when executing the **wrr-group** attachment command.

Values 1, 2

sched-class

Specifies a direct attachment between the WRR group and one of the six scheduling classes. The **sched-class** and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **wrr-group** attachment command is executed.

class-id

Specifies the scheduling class associated with this WRR group. The **sched-class** keyword specifies the attachment between the group ID and one of the six scheduling classes. A value of 1 through 6 must accompany the **sched-class** keyword representing the WRR group's attached scheduling class. Only one queue or WRR group can be attached to a given scheduling class. If another queue or a WRR group is currently attached to the specified scheduling class, the **wrr-group** attachment command fails and the current attachment for the *group-id* is unchanged.

Values 1 to 6

unattached

Indicates that the group ID is not attached to any scheduling class or WRR group. Queues that are members of the unattached WRR group do not forward any packets. The **sched-class** and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **wrr-group** attachment command is executed.

configure card xiom

Description

This command configures an XIOM in one of the slots of an XCM. An XIOM can be used instead of an XMA and operates as a carrier module to support MDA-s modules.

Parameters

xiom-slot

Specifies the XIOM identifier.

Values x1 or x2

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

52.15 xiom-type

xiom-type

Syntax

xiom-type *xiom-type* [**level** *xiom-level*]

no xiom-type

Context

[Tree] (config>card>xiom xiom-type)

Full Context

configure card xiom xiom-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command adds an XIOM to the device configuration for the slot. The XIOM type can be preprovisioned, which means that the XIOM does not have to be installed in the chassis.

An XIOM must be provisioned before an MDA-s, connector, or port can be configured.

An XIOM can only be provisioned in a slot that is vacant. No other XIOM or XMA can be provisioned (configured) for that particular slot. To reconfigure a slot position, use the **no** form of this command to remove the current information.

An XIOM can only be provisioned in a slot if the XIOM type is allowed in the slot. An error message is generated if an attempt is made to provision an XIOM type that is not allowed.

If an XIOM is inserted that does not match the configured XIOM type for the slot, then a log event and a facility alarm are raised. The alarm is cleared when the correct XIOM type is installed or the configuration is modified.

A log event and a facility alarm are raised if an administratively enabled XIOM is removed from the chassis. The alarm is cleared when the correct XIOM type is installed or the configuration is modified. A log event is issued when a XIOM is removed that is administratively disabled.

XIOMs are controlled by hardware and software licensing. For these cards, the license level must be provisioned in addition to the XIOM type. An XIOM cannot become operational unless the provisioned license level matches the license level of the card installed into the slot. The set of license levels varies by XIOM type.

The provisioned license level controls aspects related to connector provisioning and the consumption of hardware egress queues and egress policers. Changes to the provisioned license level may be blocked if a configuration exists that would not be permitted with the new target license level.

If the license level is not specified, the level is set to the highest license level for that XIOM.

The **no** form of this command removes the XIOM from the configuration.

Parameters

xiom-type

Specifies the type of XIOM to be configured and installed in the slot. Values for this attribute vary by platform and release. The release notes include a listing of all supported xiom-types and their CLI strings. In addition, the command can be queried to check which xiom-types are relevant for the active platform type.

xiom-level

Specifies the license level of the XIOM, up to 32 characters. Possible values vary by XIOM type.

54 z Commands

54.1 zone

zone

Syntax

zone {*std-zone-name* | *non-std-zone-name*} [*hh* [*:mm*]]

no zone

Context

[Tree] (config>system>time zone)

Full Context

configure system time zone

Description

This command sets the time zone and/or time zone offset for the device.

The 7450 ESS, 7750 SR, 7950 XRS, and VSR router OS supports system-defined and user-defined time zones. The system-defined time zones are listed in the Time Zones section.

For user-defined time zones, the zone and the UTC offset must be specified.

The **no** form of the command reverts to the default of Coordinated Universal Time (UTC). If the time zone in use was a user-defined time zone, the time zone will be deleted. If a **dst-zone** command has been configured that references the zone, the summer commands must be deleted before the zone can be reset to UTC.

Default

zone UTC 00

Parameters

std-zone-name

Specifies the standard time zone name. The standard name must be a system-defined zone in the Time Zones section. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining **start-date**, **end-date** and **offset** parameters do not need to be provided unless it is necessary to override the system defaults for the time zone.

For system-defined time zones, a different offset cannot be specified. If a new time zone is needed with a different offset, the user must create a new time zone. Note that some system-defined time zones have implicit summer time settings which causes the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

switchover to summer time to occur automatically; configuring the **config>system>time dst-zone** command is not required.

A user-defined time zone name is case-sensitive and can be up to 5 characters in length.

Values A user-defined value can be up to 5 characters or one of the following values: GMT, WET, CET, EET, EEST, MSK, MSD, AST, NST, EST, CST, MST, PST, HST, AKST, AWST, ACST, AEST, NZST, UTC

non-std-zone-name

Specifies the non-standard time zone name. The name can be up to 5 characters.

hh [:mm]

Specifies the hours and minutes offset from UTC time, expressed as integers. Some time zones do not have an offset that is an integral number of hours. In these instances, the *minutes-offset* must be specified. For example, the time zone in Pirlanngimpi, Australia UTC + 9.5 hours.

Values hours: -11 to 12 minutes: 0 to 59

Default hours: 0 minutes: 0

Full Context

configure service vprn video-interface channel zone-channel

configure service ies video-interface channel zone-channel

Description

This command configures zone-channel parameters or ad insertion. The channel configuration along with the zone-channel configuration associates a network channel to a zone-channel and builds the store and forward relationship.
