Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.

- backup

Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).

- value

Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.

- local

Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.

- set

Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

**link-loss** *number*

<b>Description</b>	Link packet loss as a percentage of the total traffic sent over a configurable interval. The basic unit is 0.000003%, where (2 <sup>24</sup> - 2) is 50.331642%. This value is the highest packet-loss percentage that can be expressed (the assumption being that precision is more important on high-speed links than the ability to advertise loss rates greater than this, and that high-speed links with over 50% loss are unusable). Therefore, measured values that are larger than the field maximum SHOULD be encoded as the maximum value.

**instance-id** *number*

<b>Description</b>	An Instance Identifier (IID) to uniquely identify an IS-IS instance. When the IID = 0, the list of supported ITIDs MUST NOT be present. An IID-TLV with IID = 0 MUST NOT appear in an SNP or LSP. When the TLV appears (with a non-zero IID) in an SNP or LSP, exactly one ITID. MUST be present indicating the topology with which the PDU is associated. If no ITIDs or multiple ITIDs are present or the IID is zero, then the PDU MUST be ignored.

### metric *number*

<b>Description</b>	<p>ISIS default metric value</p> <p>This is a metric understood by every Intermediate system in the domain. Each circuit shall have a positive integral value assigned for this metric. The value may be associated with any objective function of the circuit, but by convention is intended to measure the capacity of the circuit for handling traffic, for example, its throughput in bits-per-second. Higher values indicate a lower capacity.</p>

The up/down bit

Set if a prefix is advertised from a higher level to a lower level (e.g., level 2 to level 1), indicating that the prefix has traveled down the hierarchy. Prefixes that have the up/down bit set may only be advertised down the hierarchy, i.e., to lower levels. When a prefix is first injected into IS-IS, the bit is UNSET.

## metric *number*

<b>Description</b>	ISIS default metric value
--------------------	---------------------------

This is a metric understood by every Intermediate system in the domain. Each circuit shall have a positive integral value assigned for this metric. The value may be associated with any objective function of the circuit, but by convention is intended to measure the capacity of the circuit for handling traffic, for example, its throughput in bits-per-second. Higher values indicate a lower capacity.

## metric *number*

<b>Description</b>	ISIS expense metric value
--------------------	---------------------------

This metric measures the monetary cost of utilising the associated circuit. It is an optional metric, which if assigned to a circuit shall have a positive integral value<sup>1</sup>). Higher values indicate a larger monetary expense.

## up-down *boolean*

<b>Description</b>	The up/down bit  Set if a prefix is advertised from a higher level to a lower level (e.g., level 2 to level 1), indicating that the prefix has traveled down the hierarchy. Prefixes that have the up/down bit set may only be advertised down the hierarchy, i.e., to lower levels. When a prefix is first injected into IS-IS, the bit is UNSET.

<b>Tree</b>	<a href="#">flags</a>
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>address-family</b> Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.</li> <li>• <b>backup</b> Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).</li> <li>• <b>value</b> Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.</li> <li>• <b>local</b> Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.</li> <li>• <b>set</b></li> </ul>

Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

**bandwidth** *binary*

<b>Description</b>	The available bandwidth on a link, forwarding adjacency, or bundled link in IEEE floating-point format with units of bytes per second. For a link or forwarding adjacency, available bandwidth is defined to be residual bandwidth minus the measured bandwidth used for the actual forwarding of non-RSVP-TE label switched path packets. For a bundled link, available bandwidth is defined to be the sum of the component link available bandwidths minus the measured bandwidth used for the actual forwarding of non-RSVP-TE label switched path packets. For a bundled link,

**link-loss** *number*

<b>Description</b>	Link packet loss as a percentage of the total traffic sent over a configurable interval. The basic unit is 0.000003%, where $(2^{24} - 2)$ is 50.331642%. This value is the highest packet-loss percentage that can be expressed (the assumption being that precision is more important on high-speed links than the ability to advertise loss rates greater than this, and that high-speed links with over 50% loss are unusable). Therefore, measured values that are larger than the field maximum SHOULD be encoded as the maximum value.

If set, the link has shared protection. If the link is of type Shared, it means that there are one or more disjoint links of type Extra Traffic that are protecting this link. These Extra Traffic links are shared between one or more links of type Shared.

- one-one

If set, the link has dedicated 1:1 protection. If the link is of type Dedicated 1:1, it means that there is one dedicated disjoint link of type Extra Traffic that is protecting this link.

- plus-one

If set, the link has dedicated 1+1 protection. If the link is of type Dedicated 1+1, it means that a dedicated disjoint link is protecting this link. However, the protecting link is not advertised in the link state database and is therefore not available for the routing of LSPs.

- enhanced

If set the link has enhanced protection. If the link is of type Enhanced, it means that a protection scheme that is more reliable than Dedicated 1+1, e.g., 4 fiber BLSR/MS-SPRING, is being used to protect this link.

### Options

- readvertisement  
Readvertisement flag. When set, the prefix to which this Prefix-SID is attached, has been propagated by the router either from another level or from redistribution.
- node  
Node flag. When set, the Prefix-SID refers to the router identified by the prefix. Typically, the N-Flag is set on Prefix-SIDs attached to a router loopback address.
- no-php  
Penultimate-Hop-Popping flag. When set, then the penultimate hop MUST NOT pop the Prefix-SID before delivering the packet to the node that advertised the Prefix-SID.
- explicit-null  
Explicit-Null flag. When set, any upstream neighbor of the Prefix-SID originator MUST replace the Prefix-SID with a Prefix-SID having an Explicit-NULL value (0 for IPv4 and 2 for IPv6) before forwarding the packet.
- value  
Value flag. When set, the Prefix-SID carries a value (instead of an index). By default the flag is UNSET.
- local  
Local flag. When set, the value/index carried by the Prefix-SID has local significance. By default the flag is UNSET.

## up-down *boolean*

<b>Description</b>	The up/down bit. Set if a prefix is advertised from a higher level to a lower level (e.g., level 2 to level 1), indicating that the prefix has traveled down the hierarchy. Prefixes that have the up/down bit set may only be advertised down the hierarchy, i.e., to lower levels. When a prefix is first injected into IS-IS, the bit is UNSET.

### router-id *string*

<b>Description</b>	IPv4 Source router ID address. In cases where the advertisement is an identifier for the advertising router (e.g., with the N-flag set in the Prefix Attribute Flags sub-TLV), it may be useful for other routers to know the source of the advertisement. When reachability advertisement is leaked from one level to another, Router ID advertised is always the Router ID of the IS-IS instance that originated the advertisement. This would be true even if the prefix had been learned from another protocol.

<b>up-down</b> <i>boolean</i>	
<b>Description</b>	The up/down bit. Set if a prefix is advertised from a higher level to a lower level (e.g., level 2 to level 1), indicating that the prefix has traveled down the hierarchy. Prefixes that have the up/down bit set may only be advertised down the hierarchy, i.e., to lower levels. When a prefix is first injected into IS-IS, the bit is UNSET.

<b>link-loss</b> <i>number</i>	
<b>Description</b>	Link packet loss as a percentage of the total traffic sent over a configurable interval. The basic unit is 0.000003%, where $(2^{24} - 2)$ is 50.331642%. This value is the highest packet-loss percentage that can be expressed (the assumption being that precision is more important on high-speed links than the ability to advertise loss rates greater than this, and that high-speed links with over 50% loss are unusable). Therefore, measured values that are larger than the field maximum SHOULD be encoded as the maximum value.

### flags *keyword*

**Description** Flags associated with LAN-Adj-Segment-ID.

**Context** [network-instance name](#) *string* [protocols isis instance name](#) *string* [level level-number](#) *number* [link-state-database lsp lsp-id](#) *string* [tlvs tlv type identityref mt-isn neighbors neighbor mt-id](#) *number* [system-id](#) *string* [instances instance id](#) *number* [subtlvs subtlv type identityref lan-adjacency-sids lan-adjacency-sid](#) *value* *number* **flags** *keyword*

**Tree** [flags](#)

### Options

- address-family

Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.

- backup

Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).

- value

Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.

- local

Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.

- set

Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

**Configurable** False

<b>link-loss number</b>	
<b>Description</b>	Link packet loss as a percentage of the total traffic sent over a configurable interval. The basic unit is 0.000003%, where (2 <sup>24</sup> - 2) is 50.331642%. This value is the highest packet-loss percentage that can be expressed (the assumption being that precision is more important on high-speed links than the ability to advertise loss rates greater than this, and that high-speed links with over 50% loss are unusable). Therefore, measured values that are larger than the field maximum SHOULD be encoded as the maximum value.

- down  
Component or process is not operational
- empty  
Component slot is empty
- downloading  
Component is downloading image into memory
- booting  
Component is booting downloaded image
- starting  
Component image operational, application processes starting
- failed  
Component or process has failed
- synchronizing  
Component is currently being synchronized
- upgrading  
Component is currently being upgraded
- low-power  
Component is offline due to insufficient system power
- degraded  
Component or process is in a degraded state
- warm-reboot  
Component or process is currently warm rebooting  
This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting  
Component or process is currently waiting  
This state can be set by event handler when the `reinvoke-with-delay` action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

**sid-label-value** *number*

<b>Description</b>	The MPLS label value associated with the SID.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i>
<b>Range</b>	16 to 1048575
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**multi-topology-id** *number*

<b>Description</b>	The multi-topology ID that provided the prefix SID
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i>
<b>Range</b>	0 to 4095
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**algorithm** *number*

<b>Description</b>	Contains the identifier of the algorithm the router uses to compute the reachability of the prefix to which the Prefix-SID is associated
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**active** *boolean*

<b>Description</b>	When false, the prefix SID is inactive. It could be inactive for any of these reasons:
--------------------	-------------------------------------------------------------------------------------------

<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">active</a> <i>boolean</i>
<b>Tree</b>	<a href="#">active</a>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### **prefix-conflict** *boolean*

<b>Description</b>	Reads true when the prefix SID entry is involved in a prefix conflict within the scope of this IS-IS instance. This occurs when there are multiple entries for the same (prefix, multi-topology-id, algorithm). All the conflicting entries become inactive except for the one with the smallest sid-index.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">prefix-conflict</a> <i>boolean</i>
<b>Tree</b>	<a href="#">prefix-conflict</a>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### **sid-conflict** *boolean*

<b>Description</b>	Reads true when the prefix SID entry is involved in a SID conflict within the scope of this IS-IS instance. This occurs when the same SID has been assigned to different prefixes after first eliminating entries that have lost the prefix-conflict comparison. All entries involved in a SID conflict that do not have the absolute lowest 'preference' value become inactive. In the SRL implementation SID entries associated with interfaces of this IS-IS instance are considered to have a lower numerical preference than remote prefix-sid entries. If there are still SID conflicts then all the remaining conflicting entries become inactive except for the one with the smallest sid-index.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">sid-conflict</a> <i>boolean</i>
<b>Tree</b>	<a href="#">sid-conflict</a>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**sid-out-of-range** *boolean*

<b>Description</b>	Reads true when a received prefix SID from another router has a SID index or label value that is not within the locally defined SRGB range of the network instance; the prefix SID entry will be inactive.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">sid-out-of-range</a> <i>boolean</i>
<b>Tree</b>	<a href="#">sid-out-of-range</a>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**source-router** [system-id](#) *string* [level-number](#) *number*

<b>Description</b>	The ISIS routers that provided the prefix SID. (Multiple in the case of redistribution.)
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">source-router system-id</a> <i>string</i> <a href="#">level-number</a> <i>number</i>
<b>Tree</b>	<a href="#">source-router</a>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**system-id** *string*

<b>Description</b>	The system-id of an ISIS router that originated or redistributed the prefix SID
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">source-router system-id</a> <i>string</i> <a href="#">level-number</a> <i>number</i>
<b>String Length</b>	14
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**level-number** *number*

<b>Description</b>	The level of the LSP that advertises the prefix SID
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">source-router system-id</a> <i>string</i> <a href="#">level-number</a> <i>number</i>
<b>Range</b>	1 to 2
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**flags**

<b>Description</b>	Flags that characterize the prefix SID
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols isis instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">multi-topology-id</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">source-router system-id</a> <i>string</i> <a href="#">level-number</a> <i>number</i> <a href="#">flags</a>

Component or process is in a degraded state
- warm-reboot  
Component or process is currently warm rebooting  
This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting  
Component or process is currently waiting  
This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

### query-last-member-interval *number*

<b>Description</b>	Interval at which Group-Specific-Query packets are transmitted  When used along with EVPN multi-homing, the result of this value multiplied by the interface robust-count must be a value equal to or less than 25.5 seconds. This is due to the fact that the maximum response time field in the EVPN Multicast Leave Synch route has a limit of 255 units of 1/10 second, and this field encodes the result of [(query-last-member-interval * 10) * robust-count].  If the result of that operation is greater than 255, the maximum response time in the EVPN Multicast Leave Synch route is still 255.

**Options**

- up  
Component or process is operational
- down  
Component or process is not operational
- empty  
Component slot is empty
- downloading  
Component is downloading image into memory
- booting  
Component is booting downloaded image
- starting  
Component image operational, application processes starting
- failed  
Component or process has failed
- synchronizing  
Component is currently being synchronized
- upgrading  
Component is currently being upgraded
- low-power  
Component is offline due to insufficient system power
- degraded  
Component or process is in a degraded state
- warm-reboot  
Component or process is currently warm rebooting  
This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting  
Component or process is currently waiting  
This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

**ldp-synchronization**

<b>Description</b>	Container with configuration options and state that pertains to the operation of LDP-IGP synchronization on this interface
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">ldp-synchronization</a>
<b>Tree</b>	<a href="#">ldp-synchronization</a>
<b>Configurable</b>	True
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**disable**

<b>Description</b>	Disable LDP-IGP synchronization procedures on this interface, even if synchronization is enabled globally
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">ldp-synchronization disable</a>
<b>Tree</b>	<a href="#">disable</a>
<b>Configurable</b>	True
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**duration** *number*

<b>Description</b>	The length of time that the IGP interface has been in sync or out of sync
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">ldp-synchronization duration</a> <i>number</i>

<b>Tree</b>	<a href="#">duration</a>
<b>Units</b>	seconds
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### end-of-lib *boolean*

<b>Description</b>	<p>When set to true, the IGP restores the normal metric for the IGP adjacency when learning from LDP that all label-FEC mappings have been received from the LDP peer, even if there is remaining time on the hold-down-timer.</p> <p>When set to false, the IGP always waits for the full duration of the hold-down-timer to restore the normal metric for the IGP adjacency.</p> <p>This overrides the global/instance level setting</p>
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">ldp-synchronization end-of-lib</a> <i>boolean</i>
<b>Tree</b>	<a href="#">end-of-lib</a>
<b>Configurable</b>	True
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### hold-down-timer *number*

<b>Description</b>	<p>The maximum amount of time that the IGP advertises a maximum metric for an interface, measured from the time that the LDP adjacency is re-established after going down.</p> <p>This overrides the global/instance level setting</p>
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">ldp-synchronization hold-down-timer</a> <i>number</i>
<b>Tree</b>	<a href="#">hold-down-timer</a>
<b>Range</b>	1 to 1800
<b>Units</b>	seconds
<b>Configurable</b>	True
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**sync-state** *keyword*

<b>Description</b>	The current state of the interface with respect to LDP-IGP sync
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">ldp-synchronization sync-state</a> <i>keyword</i>
<b>Tree</b>	<a href="#">sync-state</a>
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>wait-for-LDP-adjacency</b> The IGP is waiting for the LDP adjacency to come up. The interface is being advertised with max-metric</li> <li>• <b>hold-down-timer-active</b> The LDP adjacency has come up and the IGP has started the hold-down-timer, waiting for either end-of-lib or hold-down-timer expiry. The interface is being advertised with max-metric</li> <li>• <b>end-of-lib-received</b> The IGP received end-of-lib and has switched to normal operation. The interface is being advertised with a normal metric</li> <li>• <b>hold-down-timer-expired</b> The IGP did not receive end-of-lib (or was configured to ignore it) but hold-down-timer has expired and normal metric is restored</li> <li>• <b>manual-exit</b> A tools command was performed to exit ldp-sync. Normal operation is resumed, max-metric is removed</li> <li>• <b>disabled</b> ldp-sync is not applicable on this interface</li> </ul>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**link-lsa-cksum-sum** *string*

<b>Description</b>	the value of link-lsa-cksum-sum indicates the 32-bit unsigned sum of the link-scope link-state advertisements' LS checksums contained in this link's link-state database. the sum can be used to determine if there has been a change in a router's link-state database, and to compare the link state database of two routers.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">link-lsa-cksum-sum</a> <i>string</i>
<b>Tree</b>	<a href="#">link-lsa-cksum-sum</a>
<b>Configurable</b>	False

**Platforms** Supported on all platforms

## link-lsa-count

**Description** the value of link-lsa-count indicates the total number of link-scope link-state advertisements in this link's link-state database.

**Context** [network-instance name](#) *string* [protocols ospf instance name](#) *string* [area area-id](#) [interface interface-name](#) *string* [link-lsa-count](#)

**Tree** [link-lsa-count](#)

**Configurable** False

**Platforms** Supported on all platforms

## local-ip-address (*ipv4-address* | *ipv6-address*)

**Description** the value of local-ip-address indicates the IP address of this OSPF interface.

**Context** [network-instance name](#) *string* [protocols ospf instance name](#) *string* [area area-id](#) [interface interface-name](#) *string* [local-ip-address](#) (*ipv4-address* | *ipv6-address*)

**Configurable** False

**Platforms** Supported on all platforms

## lsa-filter-out *keyword*

**Description** LSA flooding reduction

**Context** [network-instance name](#) *string* [protocols ospf instance name](#) *string* [area area-id](#) [interface interface-name](#) *string* [lsa-filter-out](#) *keyword*

**Tree** [lsa-filter-out](#)

**Default** none

**Options**

- none
- all
- except-own-rtrlsa
- except-own-rtrlsa-and-defaults

**Configurable** True

**Platforms** Supported on all platforms

## lsa-totals

<b>Description</b>	The number of LSAs of each type in this interface's database
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">lsa-totals</a>
<b>Tree</b>	<a href="#">lsa-totals</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## e-link-lsa

<b>Description</b>	The number of extended link LSAs in this interface's database.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">lsa-totals e-link-lsa</a>
<b>Tree</b>	<a href="#">e-link-lsa</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## link-lsa

<b>Description</b>	The number of link LSAs in this interface's database.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">lsa-totals link-lsa</a>
<b>Tree</b>	<a href="#">link-lsa</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## link-opaque-lsa

<b>Description</b>	The number of link opaque LSAs in this interface's database.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">lsa-totals link-opaque-lsa</a>
<b>Tree</b>	<a href="#">link-opaque-lsa</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**router-info-lsa**

<b>Description</b>	The number of link scoped router information LSAs in this interface's AS database.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">lsa-totals router-info-lsa</a>
<b>Tree</b>	<a href="#">router-info-lsa</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**metric** *number*

<b>Description</b>	Explicit route cost metric that is applied to the interface. Setting the value to 0 or removing the metric will cause the metric to be derived from the link bandwidth and the reference-bandwidth
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">metric</a> <i>number</i>
<b>Tree</b>	<a href="#">metric</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**mtu** *number*

<b>Description</b>	MTU for the OSPF to use on the interface. For OSPFv3 this must be minimum 1280. If the MTU defined here exceeds the actual IP-MTU of the interface, then the IP-MTU of the interface is used.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">mtu</a> <i>number</i>
<b>Tree</b>	<a href="#">mtu</a>
<b>Range</b>	512 to 9486
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**neighbor** [router-id](#)

<b>Description</b>	List of neighbors associated with this OSPF interface
--------------------	-------------------------------------------------------

<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">neighbor router-id</a>
<b>Tree</b>	<a href="#">neighbor</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## router-id

<b>Description</b>	The router-id advertised by the neighbor
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">neighbor router-id</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## address (*ipv4-address-with-zone* | *ipv6-address-with-zone*)

<b>Description</b>	the value of address indicates the IP address of the neighbor associated with the local link.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">neighbor router-id</a> <a href="#">address</a> ( <i>ipv4-address-with-zone</i>   <i>ipv6-address-with-zone</i> )
<b>Tree</b>	<a href="#">address</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## adjacency-state *identityref*

<b>Description</b>	Current OSPF Neighbor state
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">neighbor router-id</a> <a href="#">adjacency-state identityref</a>
<b>Tree</b>	<a href="#">adjacency-state</a>
<b>Options</b>	<ul style="list-style-type: none"> <li>down           <p>The initial state of a neighbor, indicating that no recent information has been received from the neighbor.</p> </li> <li>attempt           <p>Utilised for neighbors that are attached to NBMA networks, it indicates that no information has been recently received from the neighbor but that Hello packets should be directly sent to that neighbor.</p> </li> </ul>

- **init**  
Indicates that a Hello packet has been received from the neighbor but bi-directional communication has not yet been established. That is to say that the local Router ID does not appear in the list of neighbors in the remote system's Hello packet.
- **two-way**  
Communication between the local and remote system is bi-directional such that the local system's Router ID is listed in the received remote system's Hello packet.
- **exstart**  
An adjacency with the remote system is being formed. The local system is currently transmitting empty database description packets in order to establish the primary/standby relationship for the adjacency.
- **exchange**  
The local and remote systems are currently exchanging database description packets in order to determine which elements of their local LSDBs are out of date.
- **loading**  
The local system is sending Link State Request packets to the remote system in order to receive the more recently LSAs that were discovered during the Exchange phase of the procedure establishing the adjacency.
- **full**  
The neighboring routers are fully adjacent such that both LSDBs are synchronized. The adjacency will appear in Router and Network LSAs

## last-established-time *string*

<b>Description</b>	Time then OSPF neighbor was last established
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id interface interface-name</a> <i>string</i> <a href="#">neighbor router-id last-established-time</a> <i>string</i>
<b>Tree</b>	<a href="#">last-established-time</a>
<b>String Length</b>	20 to 32
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## last-event-time *string*

<b>Description</b>	the value of last-event-time indicates the value of sys-up-time when the last event occurred that affected the adjacency to the neighbour.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id interface interface-name</a> <i>string</i> <a href="#">neighbor router-id last-event-time</a> <i>string</i>
<b>Tree</b>	<a href="#">last-event-time</a>
<b>String Length</b>	20 to 32
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**last-restart-time** *string*

<b>Description</b>	the value of last-restart-time indicates the last time the neighbor attempted restart.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">protocols ospf instance name</a> <i>string</i> <a href="#">area area-id</a> <a href="#">interface interface-name</a> <i>string</i> <a href="#">neighbor router-id</a> <a href="#">last-restart-time</a> <i>string</i>

## nssa

**Description** This command creates the context to configure the associated OSPF or OSPF3 area as Not So Stubby Area (NSSA).  
NSSAs are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is an NSSA has the capability to flood external routes that it learns throughout its area and via an ABR to the entire OSPF or OSPF3 domain.

**Context** `network-instance name string protocols ospf instance name string area area-id nssa`

**Tree** `nssa`

**Configurable** True

**Range** 1 to 255

**Default** 10

**Configurable** True

**Platforms** Supported on all platforms

### reference-bandwidth *number*

**Description** Configures the reference bandwidth that provides the basis for interface metrics based on link Bandwidth

If the reference bandwidth is defined, then the cost is calculated using the following formula:  $\text{cost} = \text{reference-bandwidth} / \text{bandwidth}$

When a large reference-bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, OSPF automatically reverts to the maximum configurable cost metric.

**Context** [network-instance name string protocols ospf instance name string reference-bandwidth number](#)

**Tree** [reference-bandwidth](#)

**Range** 1 to 8000000000

**Default** 400000000

**Units** kbps

**Configurable** True

**Platforms** Supported on all platforms

### router-id

**Description** Enter the router-id context

**Context** [network-instance name string protocols ospf instance name string router-id](#)

**Tree** [router-id](#)

**Configurable** True

### holding-priority *number*

**Description** The priority of the TE LSP with respect to holding resources  
The value of 0 represents highest priority. The holding priority indicates whether this session can be preempted by another session. It is the LSPA object used in PCReq message.

**Context** [network-instance name](#) *string* [protocols pcep pcc path-request request-id number](#) [holding-priority number](#)

**Tree** [holding-priority](#)

**Range** 0 to 7

**Configurable** False

**Platforms** 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### hop-count *number*

**Description** The number of hops that are traversed via the TE tunnel  
It is the METRIC object in PCReq message.

**Context** [network-instance name](#) *string* [protocols pcep pcc path-request request-id number](#) [hop-count number](#)

**Tree** [hop-count](#)

**Configurable** False

**Platforms** 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### igp-metric *number*

**Description** The Interior Gateway Protocol (IGP) metric that must be optimized by the path computation algorithm for providing the cost of computed path  
It is the METRIC object used in PCReq message.

**Context** [network-instance name](#) *string* [protocols pcep pcc path-request request-id number](#) [igp-metric number](#)

**Tree** [igp-metric](#)

**Configurable** False

**Platforms** 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### **include-all** *number*

**Description** Set of attribute filters associated with a tunnel, all of which must be present for a link to be acceptable  
It is the LSPA object used in PCReq message.

**Context** [network-instance name](#) *string* [protocols pcep pcc path-request request-id number](#) [include-all number](#)

**Tree** [include-all](#)

**Configurable** False

**Platforms** 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### **include-any** *number*

**Description** Set of attribute filters associated with a tunnel, any of which renders a link acceptable  
It is the LSPA object used in PCReq message.

**Context** [network-instance name](#) *string* [protocols pcep pcc path-request request-id number](#) [include-any number](#)

**Tree** [include-any](#)

**Configurable** False

**Platforms** 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### **local-protection-desired** *boolean*

**Description** Indicates whether local protection is desired or not  
It is the LSPA (LSP Attribute) object used in PCReq message. When the value of this object is set to 'true', it indicates that the computed path must include links protected with Fast Reroute as defined in the maximum number of hops to be transversed that must not be exceeded to consider computed path as acceptable.

**Context** [network-instance name](#) *string* [protocols pcep pcc path-request request-id number](#) [local-protection-desired boolean](#)

**Tree** [local-protection-desired](#)

**Configurable** False

**Platforms** 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### loose-path-acceptable *boolean*

**Description** Indicates whether a loose path is acceptable (true) or not (false)  
It is the RP object used in PCReq message.  
When the value of this object is set to 'true', it indicates that a loose path is acceptable. When the value of this object is set to 'false', it indicates that a path exclusively made of strict hops is required.

**Context** [network-instance name](#) *string* [protocols pcep pcc path-request request-id number](#) [loose-path-acceptable](#) *boolean*

**Tree** [loose-path-acceptable](#)

**Configurable** False

**Platforms** 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### lsp-bandwidth *number*

**Description** The bandwidth that is being requested by the LSP.

**Context** [network-instance name](#) *string* [protocols pcep pcc path-request request-id number](#) [lsp-bandwidth](#) *number*

**Tree** [lsp-bandwidth](#)

**Units** Mbps

**Configurable** False

**Platforms** 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### lsp-id *number*

**Description** The unique identifier for the LSP

**Context** [network-instance name](#) *string* [protocols pcep pcc path-request request-id number](#) [lsp-id](#) *number*

**Tree** [lsp-id](#)

- degraded  
Component or process is in a degraded state
- warm-reboot  
Component or process is currently warm rebooting  
This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting  
Component or process is currently waiting  
This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

### source-flags *bits*

**Description** spt-bit and PruneDesired state of the entry

This object is applicable only for (S,G) entries, i.e., when source-type is 'sg'. The (S,G) 'spt-bit' is used to distinguish whether to forward on (\*,\*,RP) or (\*,G) or on (S,G) state. It is updated when the (S,G) data comes on the RPF interface towards the source. 'rpt-prune-desired' is set according to the PruneDesired(S,G,rpt) algorithm.

**upstream-rpt-override-timer** *number*

<b>Description</b>	Delay to triggered Join(S,G,rpt) messages to prevent implosions of triggered messages  If non-zero, it means that the router was in 'not-pruned' state and it saw a Prune(S,G,rpt) message being sent to RPF'(S,G,rpt). If the router sees a Join(S,G,rpt) override message being sent by some other router on the LAN while the timer is still non-zero, it simply cancels the override timer. If it does not see a Join(S,G,rpt) message, then on expiry of the override timer, it sends it's own Join(S,G,rpt) message to RPF'(S,G,rpt). A similar scenario exists when RPF'(S,G,rpt) changes to become equal to RPF'(*,G).

**ecmp-balance** *boolean*

<b>Description</b>	Enables hashing balance for multicast streams
--------------------	-----------------------------------------------

This command enables multicast balancing of traffic over ECMP links based on the number of (S, G) distributed over each link. When enabled, each new multicast stream that needs to be forwarded over an ECMP link is compared to the count of (S, G) already using each link, so that the link with the fewest (S, G) is chosen.

<b>Context</b>	<code>network-instance name string protocols pim ecmp-balance boolean</code>

<b>Configurable</b>	True
<b>Platforms</b>	7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### **ecmp-balance-hold *number***

<b>Description</b>	Hold period for ecmp balancing  This command defines a hold period that applies after an interface has been added to the ECMP link. It is also used periodically to rebalance if channels have been removed from the ECMP link. If the ECMP interface has not changed in the hold period and if no multicast streams have been removed, then no action is taken when the timer triggers. This parameter should be used to avoid excessive changes to the multicast distribution.

### **ecmp-hashing**

<b>Description</b>	Enables hashing for multicast streams  This command enables hash-based multicast balancing of traffic over ECMP links and causes PIM joins to be distributed over the multiple ECMP paths based on a hash of S and G (and possibly next-hop IP address). When a link in the ECMP set is removed, the multicast flows that were using that link are redistributed over the remaining ECMP links using the same hash algorithm. When a link is added to the ECMP set new joins may be allocated to the new link based on the hash algorithm, but existing.

### **assert-state** *keyword*

<b>Description</b>	<p>The ASSERT state for this entry</p> <p>Where multiple PIM routers peer over a shared LAN it possible for more than one upstream router to have valid forwarding state for a packet, which can lead to packet duplication. PIM does not attempt to prevent this from occurring. Instead it detects when this has happened and elects a single forwarder amongst the upstream routers to prevent further duplication. This election is performed using PIM Assert messages. Assert messages are also received by downstream routers on the LAN, and these cause subsequent Join or Prune messages to be sent to the upstream router that won the Assert.</p>

- synchronizing  
Component is currently being synchronized
- upgrading  
Component is currently being upgraded
- low-power  
Component is offline due to insufficient system power
- degraded  
Component or process is in a degraded state
- warm-reboot  
Component or process is currently warm rebooting  
This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting  
Component or process is currently waiting  
This state can be set by event handler when the `reinvoke-with-delay` action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

- booting  
Component is booting downloaded image
- starting  
Component image operational, application processes starting
- failed  
Component or process has failed
- synchronizing  
Component is currently being synchronized
- upgrading  
Component is currently being upgraded
- low-power  
Component is offline due to insufficient system power
- degraded  
Component or process is in a degraded state
- warm-reboot  
Component or process is currently warm rebooting  
This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting  
Component or process is currently waiting  
This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

Component or process is currently waiting

This state can be set by event handler when the `reinvoke-with-delay` action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

- delete  
The current or last operation was an attempt to delete an existing entry.
- modify  
The current or last operation was an attempt to modify an existing entry.
- none  
There was no prior operation for this entry or there is no current operation that is in process

**Configurable** False

**Platforms** Supported on all platforms

### **last-successful-operation-timestamp** *string*

**Description** The date and time of the last operation to complete successfully, if the entry was not suppressed.

A delete operation is immediately timestamped by FIB manager on the assumption that it will ultimately be successful on all complexes. For other

operations the timestamp is generated when the last complex that was expected to respond has responded with a success acknowledgement.

- ospfv3

OSPFv3

- sr-submgmt

Subscriber-management route

- static

Locally configured static route

**Configurable**

False

**Platforms**

Supported on all platforms

### **active-routes** *number*

**Description**

Total number of prefixes associated with this route type that were submitted to fib-mgr and that fib-mgr successfully installed as active routes

**Context**

[network-instance name](#) *string* [route-table ipv4-unicast](#) [route-summary route-type ip-route-type-name](#) *identityref* [active-routes](#) *number*

**Configurable**

False

**Platforms**

Supported on all platforms

**origin-network-instance** *reference*

<b>Description</b>	Origin network instance of the route (where it was originally learned or configured)  If the route was leaked from another network instance, the value of this leaf reflects the network-instance from which it was learned. If it was not leaked the value is the same as the parent network-instance.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id number</a> <a href="#">origin-network-instance reference</a>
<b>Reference</b>	<a href="#">network-instance name</a> <i>string</i>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**active** *boolean*

<b>Description</b>	If set to true then the route is installed as the active route for the IP prefix in the FIB. A route can be inactive because there is a more preferred route for the same prefix or else its next-hops are unresolved.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id number</a> <a href="#">origin-network-instance reference</a> <a href="#">active</a> <i>boolean</i>
<b>Tree</b>	<a href="#">active</a>

<b>Platforms</b>	Supported on all platforms

**counters**

<b>Description</b>	Packet forwarding counters
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id number</a> <a href="#">origin-network-instance reference</a> <a href="#">counters</a>
<b>Tree</b>	<a href="#">counters</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**octets-forwarded** *number*

<b>Description</b>	The number of octets in the packets that were forwarded
--------------------	---------------------------------------------------------

<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id number</a> <a href="#">origin-network-instance reference</a> <a href="#">counters octets-forwarded</a> <i>number</i>
<b>Tree</b>	<a href="#">octets-forwarded</a>
<b>Default</b>	0
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **packets-forwarded** *number*

<b>Description</b>	The number of packets forwarded
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id number</a> <a href="#">origin-network-instance reference</a> <a href="#">counters packets-forwarded</a> <i>number</i>
<b>Tree</b>	<a href="#">packets-forwarded</a>
<b>Default</b>	0
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **resource-allocation-failed** *boolean*

<b>Description</b>	True when an available statistics resource was not available for this forwarding object
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id number</a> <a href="#">origin-network-instance reference</a> <a href="#">counters resource-allocation-failed</a> <i>boolean</i>
<b>Tree</b>	<a href="#">resource-allocation-failed</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **fib-programming**

<b>Description</b>	Container for state related to the FIB programming of the object
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id number</a> <a href="#">origin-network-instance reference</a> <a href="#">fib-programming</a>
<b>Tree</b>	<a href="#">fib-programming</a>
<b>Configurable</b>	False

**Platforms** Supported on all platforms

### **last-failed-locations** *string*

**Description** List of forwarding complexes that reported a failure for the last operation. They appear in the format (slot-number,complex-number).

**Context** [network-instance name](#) *string* [route-table ipv6-unicast route ipv6-prefix](#) *string* [route-type identityref route-owner](#) *string* [id number](#) [origin-network-instance reference fib-programming last-failed-locations](#) *string*

**Tree** [last-failed-locations](#)

**Configurable** False

**Platforms** Supported on all platforms

### **last-failed-operation-type** *keyword*

**Description** The last operation type that failed.

**Context** [network-instance name](#) *string* [route-table ipv6-unicast route ipv6-prefix](#) *string* [route-type identityref route-owner](#) *string* [id number](#) [origin-network-instance reference fib-programming last-failed-operation-type](#) *keyword*

**Tree** [last-failed-operation-type](#)

**Options**

- add  
The current or last operation was an attempt to create a new entry.
- delete  
The current or last operation was an attempt to delete an existing entry.
- modify  
The current or last operation was an attempt to modify an existing entry.
- none  
There was no prior operation for this entry or there is no current operation that is in process

**Configurable** False

**Platforms** Supported on all platforms

### **last-successful-operation-timestamp** *string*

**Description** The date and time of the last operation to complete successfully, if the entry was not suppressed.

A delete operation is immediately timestamped by FIB manager on the assumption that it will ultimately be successful on all complexes. For other

operations the timestamp is generated when the last complex that was expected to respond has responded with a success acknowledgement.

<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table</a> <a href="#">ipv6-unicast route</a> <a href="#">ipv6-prefix</a> <i>string</i> <a href="#">route-type</a> <a href="#">identityref</a> <a href="#">route-owner</a> <i>string</i> <a href="#">id</a> <i>number</i> <a href="#">origin-network-instance</a> <a href="#">reference</a> <a href="#">fib-programming</a> <a href="#">last-successful-operation-timestamp</a> <i>string</i>
<b>Tree</b>	<a href="#">last-successful-operation-timestamp</a>
<b>String Length</b>	20 to 32
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **last-successful-operation-type** *keyword*

<b>Description</b>	The last operation type that completed successfully, if the entry was not suppressed.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table</a> <a href="#">ipv6-unicast route</a> <a href="#">ipv6-prefix</a> <i>string</i> <a href="#">route-type</a> <a href="#">identityref</a> <a href="#">route-owner</a> <i>string</i> <a href="#">id</a> <i>number</i> <a href="#">origin-network-instance</a> <a href="#">reference</a> <a href="#">fib-programming</a> <a href="#">last-successful-operation-type</a> <i>keyword</i>
<b>Tree</b>	<a href="#">last-successful-operation-type</a>
<b>Options</b>	<ul style="list-style-type: none"> <li>• <code>add</code> The current or last operation was an attempt to create a new entry.</li> <li>• <code>delete</code> The current or last operation was an attempt to delete an existing entry.</li> <li>• <code>modify</code> The current or last operation was an attempt to modify an existing entry.</li> <li>• <code>none</code> There was no prior operation for this entry or there is no current operation that is in process</li> </ul>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **pending-operation-type** *keyword*

<b>Description</b>	The current operation type that is in progress because not all complexes have responded.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table</a> <a href="#">ipv6-unicast route</a> <a href="#">ipv6-prefix</a> <i>string</i> <a href="#">route-type</a> <a href="#">identityref</a> <a href="#">route-owner</a> <i>string</i> <a href="#">id</a> <i>number</i> <a href="#">origin-network-instance</a> <a href="#">reference</a> <a href="#">fib-programming</a> <a href="#">pending-operation-type</a> <i>keyword</i>
<b>Tree</b>	<a href="#">pending-operation-type</a>

<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>add</b> The current or last operation was an attempt to create a new entry.</li> <li>• <b>delete</b> The current or last operation was an attempt to delete an existing entry.</li> <li>• <b>modify</b> The current or last operation was an attempt to modify an existing entry.</li> <li>• <b>none</b> There was no prior operation for this entry or there is no current operation that is in process</li> </ul>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **suppressed** *boolean*

<b>Description</b>	When true, FIB programming for this entry has been suppressed and it is only installed in the control plane route table
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id number origin-network-instance reference fib-programming suppressed</a> <i>boolean</i>
<b>Tree</b>	<a href="#">suppressed</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **gribi-metadata** *binary*

<b>Description</b>	Metadata persistently stored with the entry.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id number origin-network-instance reference gribi-metadata</a> <i>binary</i>
<b>Tree</b>	<a href="#">gribi-metadata</a>
<b>String Length</b>	0 to 8
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **internal-tags** *string*

<b>Description</b>	Internal route tag written in the route/tunnel tables or BGP rib
--------------------	------------------------------------------------------------------

The internal-tag value is shown with the format 'type-string = hex-value-string'. For example:

<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string id number</i> <a href="#">origin-network-instance reference</a> <a href="#">internal-tags</a> <i>string</i>

<b>Max. Elements</b>	2

### **last-app-update** *string*

<b>Description</b>	The date and time of the last update of this route by the owning application or protocol.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string id number</i> <a href="#">origin-network-instance reference</a> <a href="#">last-app-update</a> <i>string</i>
<b>Tree</b>	<a href="#">last-app-update</a>
<b>String Length</b>	20 to 32
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **leakable** *boolean*

<b>Description</b>	Reads true when the route was matched and accepted by the route-leaking inter-instance export-policy
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string id number</i> <a href="#">origin-network-instance reference</a> <a href="#">leakable</a> <i>boolean</i>
<b>Tree</b>	<a href="#">leakable</a>
<b>Configurable</b>	False
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**metric** *number*

<b>Description</b>	The metric of the IP route. In general, when comparing two routes with the same owner and preference, the route with the lower metric is the one that is activated and used for forwarding.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id</a> <i>number</i> <a href="#">origin-network-instance reference</a> <a href="#">metric</a> <i>number</i>
<b>Tree</b>	<a href="#">metric</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**next-hop-group** *reference*

<b>Description</b>	The next-hop-group indirection object used by this route.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id</a> <i>number</i> <a href="#">origin-network-instance reference</a> <a href="#">next-hop-group</a> <i>reference</i>
<b>Tree</b>	<a href="#">next-hop-group</a>
<b>Reference</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table next-hop-group index</a> <i>number</i>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**next-hop-group-network-instance** *reference*

<b>Description</b>	The network instance where the next-hop-group can be found. If unspecified, the next hop group is in the local network instance.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table ipv6-unicast route ipv6-prefix</a> <i>string</i> <a href="#">route-type identityref route-owner</a> <i>string</i> <a href="#">id</a> <i>number</i> <a href="#">origin-network-instance reference</a> <a href="#">next-hop-group-network-instance</a> <i>reference</i>
<b>Tree</b>	<a href="#">next-hop-group-network-instance</a>
<b>Reference</b>	<a href="#">network-instance name</a> <i>string</i>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**preference** *number*

<b>Description</b>	The IP route table preference. This is sometimes called the administrative distance of the route. In general, when comparing any two routes, the route with the lower preference is the one that is activated and used for forwarding.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table</a> <a href="#">ipv6-unicast route</a> <a href="#">ipv6-prefix</a> <i>string</i> <a href="#">route-type</a> <a href="#">identityref</a> <a href="#">route-owner</a> <i>string</i> <a href="#">id</a> <i>number</i> <a href="#">origin-network-instance</a> <a href="#">reference</a> <a href="#">preference</a> <i>number</i>
<b>Tree</b>	<a href="#">preference</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**resilient-hash** *boolean*

<b>Description</b>	Set to true if the route is covered by a resilient-hash-prefix entry
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table</a> <a href="#">ipv6-unicast route</a> <a href="#">ipv6-prefix</a> <i>string</i> <a href="#">route-type</a> <a href="#">identityref</a> <a href="#">route-owner</a> <i>string</i> <a href="#">id</a> <i>number</i> <a href="#">origin-network-instance</a> <a href="#">reference</a> <a href="#">resilient-hash</a> <i>boolean</i>
<b>Tree</b>	<a href="#">resilient-hash</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**target-network-instances** *reference*

<b>Description</b>	List of network-instances that have imported this route as a result of matching and accepting it in their inter-instance import-policy
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table</a> <a href="#">ipv6-unicast route</a> <a href="#">ipv6-prefix</a> <i>string</i> <a href="#">route-type</a> <a href="#">identityref</a> <a href="#">route-owner</a> <i>string</i> <a href="#">id</a> <i>number</i> <a href="#">origin-network-instance</a> <a href="#">reference</a> <a href="#">target-network-instances</a> <a href="#">reference</a>
<b>Tree</b>	<a href="#">target-network-instances</a>
<b>Reference</b>	<a href="#">network-instance name</a> <i>string</i>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**route-summary**

<b>Description</b>	Route summary information
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">route-table</a> <a href="#">ipv6-unicast route-summary</a>

<b>Tree</b>	<a href="#">route-summary</a>

A host route

- isis

IS-IS

- local

A directly connected route

- linux

IP route added by the linux kernel.

- ndk1

Route added by an agent application using the NDK

- ndk2

Route added by an agent application using the NDK

- ospfv2

OSPFv2

- ospfv3

OSPFv3

- sr-submgmt

Subscriber-management route

- static

Locally configured static route

- extract  
Next-hop will cause matching packets to be delivered to the CPM.
- direct  
Next-hop was resolved by a local route - i.e. it is an address on a connected subnet.
- discard  
Next-hop will cause matching packets to be dropped without ICMP generation.
- reject  
Next-hop will cause matching packets to be dropped with ICMP generation.
- indirect

Next-hop was resolved by a non-local route - i.e. it is not an address on a connected subnet.

- mpls

An MPLS label will be pushed when forwarding to this next-hop.

- tunnel

Next-hop is a tunnel.

- broadcast

Next-hop will cause matching subnet-broadcast packets to be delivered to the control plane.

- redirect

Next-hop will redirect to another network-instance.

- interface-with-mac

Next-hop is associated with an outbound interface plus MAC address

### **protocol** *keyword*

<b>Description</b>	The protocol that provided the prefix SID
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix   ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">protocol keyword</a> <a href="#">protocol-instance</a> <i>number</i> <a href="#">protocol-multi-topology</a> <i>number</i> <a href="#">algorithm</a> <i>number</i>
<b>Options</b>	<ul style="list-style-type: none"> <li>• isis</li> <li>• direct</li> </ul>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### **protocol-instance** *number*

<b>Description</b>	The instance ID that provided the prefix SID
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix   ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">protocol keyword</a> <a href="#">protocol-instance</a> <i>number</i> <a href="#">protocol-multi-topology</a> <i>number</i> <a href="#">algorithm</a> <i>number</i>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**protocol-multi-topology** *number*

<b>Description</b>	The multi-topology ID that provided the prefix SID
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">protocol keyword</a> <a href="#">protocol-instance</a> <i>number</i> <a href="#">protocol-multi-topology</a> <i>number</i> <a href="#">algorithm</a> <i>number</i>
<b>Range</b>	0 to 4095
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**algorithm** *number*

<b>Description</b>	Contains the identifier of the algorithm the router uses to compute the reachability of the prefix to which the Prefix-SID is associated
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">protocol keyword</a> <a href="#">protocol-instance</a> <i>number</i> <a href="#">protocol-multi-topology</a> <i>number</i> <a href="#">algorithm</a> <i>number</i>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**active** *boolean*

<b>Description</b>	When false, the prefix SID is inactive.  It could be inactive because it is involved in a prefix or SID conflict that occurred between different protocol-instance. It could also be inactive because datapath programming failed.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">protocol keyword</a> <a href="#">protocol-instance</a> <i>number</i> <a href="#">protocol-multi-topology</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">active</a> <i>boolean</i>
<b>Tree</b>	<a href="#">active</a>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**prefix-conflict** *boolean*

<b>Description</b>	Reads true when the prefix SID entry is involved in a prefix conflict that has occurred between protocols. This occurs when there are multiple entries in the SID database for the same prefix. All the conflicting entries become inactive except for the one with the smallest sid-index.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">protocol keyword</a> <a href="#">protocol-instance</a> <i>number</i> <a href="#">protocol-multi-topology</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">prefix-conflict</a> <i>boolean</i>
<b>Tree</b>	<a href="#">prefix-conflict</a>
<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**sid-conflict** *boolean*

<b>Description</b>	Reads true when the prefix SID entry is involved in a SID conflict that has occurred between protocols (after first removing inter-protocol prefix conflict entries). All entries involved in a SID conflict that do not have the absolute lowest 'preference' value become inactive. In the SRL implementation local-prefix-sid entries are considered to have a lower numerical preference than remote prefix-sid entries. If there are still SID conflicts then all the remaining conflicting entries become inactive except for the one with the smallest sid-index.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">segment-routing mpls sid-database prefix-sid prefix</a> ( <i>ipv4-prefix</i>   <i>ipv6-prefix</i> ) <a href="#">sid-label-value</a> <i>number</i> <a href="#">protocol keyword</a> <a href="#">protocol-instance</a> <i>number</i> <a href="#">protocol-multi-topology</a> <i>number</i> <a href="#">algorithm</a> <i>number</i> <a href="#">sid-conflict</a> <i>boolean</i>
<b>Tree</b>	<a href="#">sid-conflict</a>

## admin-state *keyword*

<b>Description</b>	<p>Enable/disable table connections in the network instance</p> <p>When set to disable, configuration of table-connection list entries is blocked. For protocol B to advertise active routes of protocol A, it is sufficient for protocol B to be configured with an export-policy that accepts routes of protocol A.</p> <p>When admin-state is set to enable, protocol B cannot advertise an active route of protocol A unless there is an A-&gt;B table connection that causes the route to be accepted. When a route of protocol A is redistributed to protocol B, it is added to the RIB of protocol B and as such it is advertisable to peers of protocol B without any export policy. However if protocol B does have an export policy, this policy (or list of policies) has final control over the advertisement of the redistributed route.</p>

**Tree** [bfd](#)

**Configurable** False

**Platforms** 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

## hold-down-timer *number*

**Description** Specifies a hold-down timer value when seamless-bfd is enabled

The timer is started when the number of S-BFD sessions that are up drops below the threshold. The TE-policy path is not considered to be up again until the hold-down timer has expired and the number of S-BFD sessions that are up equals or exceeds the threshold. A grace period after session down such that sBFD session flaps does not impact active path.

The default is 3 seconds.

**Context** [network-instance name](#) *string* [traffic-engineering-policies policy-database sr-colored policy color](#) *number* [endpoint \(ipv4-address-unicast | ipv6-address-unicast-without-local\)](#) [candidate-path protocol-origin keyword discriminator](#) *number* [originator-asn](#) *number* [originator-address \(ipv4-address | ipv6-address\)](#) **bfd hold-down-timer** *number*

**bfd-wait-for-up-timer** *number*

<b>Description</b>	<p>Specifies a wait-for-up timer value when seamless-bfd is enabled</p> <p>This timer takes effect if BFD does not come up, or BFD goes from up to down. The timer is started when BFD is first enabled on a segment-list or BFD transitions from up to down. When the timer expires if BFD is not yet come up, then the path is torn down by removing it from the TTM and the PI and the retry timer is started.</p> <p>The default is 3 seconds.</p>

- fib-add-failed  
FIB has failed to add the next-hop group. Next-hop group represents a group of next-hops for valid segment-lists under a TE-policy
- maximum-label-stack-depth-exceeded  
The resolution of the named path requires more labels than supported by the datapath.
- pce-update-with-empty-ero  
PCE update has empty Explicit Route Object (EROs)
- segment-list-admin-down  
Segment-list is administratively down
- ipv4-hops-in-ipv6-path  
IPv4 and IPv6 hops are mixed in explicit path
- ipv6-hops-in-ipv4-path  
IPv6 and IPv4 hops are mixed in explicit path
- sid-hops-in-ip-path  
SID (label-based) and IP hops are mixed in explicit path
- sid-hops-with-invalid-path-computation  
SID hops (labeled hops) with path computation local-cspf/pcep is not allowed
- invalid-path-computation  
Segment-list with unsupported path computation method
- policy-down  
Traffic engineering policy is down
- pce-association-conflict  
PCE-association conflict
- retry-on-config-change  
Segment-list retry attempted due to config change
- clear-command  
Segment-list retry attempted due to manual clear command
- secondary-segment-list  
Secondary type segment-list, Primary is always preferred when available
- bfd-down  
BFD is reported down

### Options

#### [failed-reason](#)

- [path-computation-request-timeout](#)  
Path computation request timed out
- [path-computation-no-route](#)  
No valid route is returned for path computation request
- [no-resources-available](#)  
Required resources are depleted, not enough resources to establish the requested segment-list
- [path-computation-bad-node](#)  
Path computation failure due to a resolution issue of one or more of the hops
- [path-computation-routing-loop](#)  
Path computation failure due to routing loop
- [unknown](#)  
Segment-list is down due to unknown reason
- [path-computation-no-route-owner](#)  
Path computation failure as none of the IGP instances had a valid route to one of the hops
- [path-computation-hop-limit-exceeded](#)  
Path computation failure due to hop limit. No path within the hop limit constraint configured
- [srlg-not-disjoint](#)  
SRLG is shared with primary segment-list and there is no other viable path with dispersed SRLG
- [srlg-not-computed-path](#)  
SRLG is not applicable, as primary segment-list has no applicable SRLG for path computation
- [srlg-primary-segment-list-down](#)  
SRLG is not applicable, as primary segment-list is down
- [unresolved-first-segment](#)  
The router is unable to resolve the first SID (MPLS label value) into one or more outgoing interface(s) and next-hop(s)
- [fib-add-pending](#)  
Segment-list is kept down, when adding next-hop into the FIB
- [fib-add-failed](#)  
FIB has failed to add the next-hop group. Next-hop group represents a group of next-hops for valid segment-lists under a TE-policy

- maximum-label-stack-depth-exceeded  
The resolution of the named path requires more labels than supported by the datapath.
- pce-update-with-empty-ero  
PCE update has empty Explicit Route Object (EROs)
- segment-list-admin-down  
Segment-list is administratively down
- ipv4-hops-in-ipv6-path  
IPv4 and IPv6 hops are mixed in explicit path
- ipv6-hops-in-ipv4-path  
IPv6 and IPv4 hops are mixed in explicit path
- sid-hops-in-ip-path  
SID (label-based) and IP hops are mixed in explicit path
- sid-hops-with-invalid-path-computation  
SID hops (labeled hops) with path computation local-cspf/pcep is not allowed
- invalid-path-computation  
Segment-list with unsupported path computation method
- policy-down  
Traffic engineering policy is down
- pce-association-conflict  
PCE-association conflict
- retry-on-config-change  
Segment-list retry attempted due to config change
- clear-command  
Segment-list retry attempted due to manual clear command
- secondary-segment-list  
Secondary type segment-list, Primary is always preferred when available
- bfd-down  
BFD is reported down
- te-rtr-id-not-configured  
TE router ID config is missing
- pce-down  
PCE is unavailable
- pcc-down  
PCC is unavailable
- pce-error

PCE response has error or timed-out

- pcc-error

PCC responded with error

- delay-metric-limit-exceeded

Segment-list delay metric limit exceeded

- invalid-protection-mode

Invalid protection mode for the TE-policy type

- no-weight

Segment-list with no weight

### **hold-down-timer** *number*

<b>Description</b>	<p>Specifies a hold-down timer value when seamless-bfd is enabled</p> <p>The timer is started when the number of S-BFD sessions that are up drops below the threshold. The TE-policy path is not considered to be up again until the hold-down timer has expired and the number of S-BFD sessions that are up equals or exceeds the threshold. A grace period after session down such that sBFD session flaps does not impact active path.</p> <p>The default is 3 seconds.</p>

- path-computation-bad-node  
Path computation failure due to a resolution issue of one or more of the hops
- path-computation-routing-loop  
Path computation failure due to routing loop
- unknown  
Segment-list is down due to unknown reason
- path-computation-no-route-owner  
Path computation failure as none of the IGP instances had a valid route to one of the hops
- path-computation-hop-limit-exceeded  
Path computation failure due to hop limit. No path within the hop limit constraint configured
- srlg-not-disjoint  
SRLG is shared with primary segment-list and there is no other viable path with dispersed SRLG
- srlg-not-computed-path  
SRLG is not applicable, as primary segment-list has no applicable SRLG for path computation
- srlg-primary-segment-list-down  
SRLG is not applicable, as primary segment-list is down
- unresolved-first-segment  
The router is unable to resolve the first SID (MPLS label value) into one or more outgoing interface(s) and next-hop(s)
- fib-add-pending  
Segment-list is kept down, when adding next-hop into the FIB
- fib-add-failed  
FIB has failed to add the next-hop group. Next-hop group represents a group of next-hops for valid segment-lists under a TE-policy
- maximum-label-stack-depth-exceeded  
The resolution of the named path requires more labels than supported by the datapath.
- pce-update-with-empty-ero  
PCE update has empty Explicit Route Object (EROs)
- segment-list-admin-down  
Segment-list is administratively down
- ipv4-hops-in-ipv6-path  
IPv4 and IPv6 hops are mixed in explicit path
- ipv6-hops-in-ipv4-path

- IPv6 and IPv4 hops are mixed in explicit path
- sid-hops-in-ip-path  
SID (label-based) and IP hops are mixed in explicit path
- sid-hops-with-invalid-path-computation  
SID hops (labeled hops) with path computation local-cspf/pcep is not allowed
- invalid-path-computation  
Segment-list with unsupported path computation method
- policy-down  
Traffic engineering policy is down
- pce-association-conflict  
PCE-association conflict
- retry-on-config-change  
Segment-list retry attempted due to config change
- clear-command  
Segment-list retry attempted due to manual clear command
- secondary-segment-list  
Secondary type segment-list, Primary is always preferred when available
- bfd-down  
BFD is reported down
- te-rtr-id-not-configured  
TE router ID config is missing
- pce-down  
PCE is unavailable
- pcc-down  
PCC is unavailable
- pce-error  
PCE response has error or timed-out
- pcc-error  
PCC responded with error
- delay-metric-limit-exceeded  
Segment-list delay metric limit exceeded
- invalid-protection-mode  
Invalid protection mode for the TE-policy type
- no-weight  
Segment-list with no weight

<b>Configurable</b>	False
<b>Platforms</b>	7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### forwarding-state *keyword*

<b>Description</b>	Forwarding state of the segment-list, tells about the activeness of segment-list in the data-path. active - programmed in data path and enabled for forwarding traffic backup - Programmed in data path for uniform fail-over and forwarding sBFD / OAM packets, inactive - Programmed in data path as standby and forwarding sBFD / OAM packets.

### **admin-state** *keyword*

<b>Description</b>	<p>Enable the ability to auto-discover remote MEPs within the Maintenance Association</p> <p>When the admin-state is 'enable' unknown remote MEP peers which have the same Maintenance Association information will be automatically added to the remote-mep database and these unknown peer MEPS will not raise the defect error-ccm. When the admin-state is 'disable' unknown remote MEP peers will not automatically be added to the remote-mep database. Unknown MEPs will cause the defect error-ccm to be raised.</p> <p>If the admin-state value is changed from 'enable' to 'disable' all previously learned MEPs for the Maintenance Association will be removed from the remote-mep database and auto-discovery will be disabled.</p>

### aging-timer (*number | keyword*)

<b>Description</b>	<p>Optional time in seconds the peer MEP remains in the remote-mep database after defect remote-ccm</p> <p>Peer MEPs added to the remote-mep database do not age out unless the optional aging-timer is configured. The aging-timer value is the additional time the remote peer MEP remains in the database since the recognition of the defect remote-ccm (peer timeout where no packets have arrived from the peer in 3.5 times the ccm-interval). A value of 'none' disables aging.</p>
