# 1 About this guide

This document describes the configuration and state data models available for the Nokia Service Router Linux (SR Linux).

**Note:**

This guide generically covers the current release and may contain some content that will be released in later maintenance loads. See the *SR Linux Software Release Notes*, for information about features supported in each load.

Configuration and command outputs shown in this guide are examples only; actual displays may differ depending on supported functionality and user configuration.

For more information about accessing and using the interfaces that support these data models, see the *SR Linux System Management Guide*.

## 2 Overview

This overview describes the structure of the configuration and state data models available for the Nokia Service Router Linux (SR Linux). It includes an introduction to the tree hierarchy and details how to interpret field descriptions.

### 2.1 Tree hierarchy

The tree hierarchy consists of branches that show the fields and parameters that are available. [Figure 1: Tree hierarchy example](#) shows a tree hierarchy example.

*Figure 1: Tree hierarchy example*

```

bfd
- network-instance string
- peer number
  - active-receive-interval
  - active-transmit-interval
  - async

+ total_unmatched_bfd_packets

```

Each chapter of this guide describes a branch in the tree with field names linked to their corresponding descriptions. These descriptions indicate the required syntax for each field. See [Field descriptions](#) for more information.

*Italic names* after a field indicate the parameter type. Parameter types include (but are not limited to):

- Boolean (true and false values)
- keyword (enumerated values)

- string
- number
- IPv4 prefix
- IPv6 prefix
- IPv4 address
- IPv6 address
- MAC address

For more information about the input values, click the field or parameter name in the tree. The link will take you to the description where these values are defined.

A parameter type may also be a combination of different base types. These parameters are displayed in the tree with the individual parameter types enclosed in round brackets and separated by a pipe. For example: *(keyword | number)*

## 2.2 Transaction and report types

The following transaction and report types are used with the SR Linux:

- configuration transactions
- state transactions
- show reports

Configuration transactions allow you to modify a configuration while state transactions allow you to view the configuration and operational state.

In the tree hierarchy, configuration transactions are denoted with a plus sign (+). State transactions are denoted with a minus sign (-). See [Figure 2: Configuration/state in tree hierarchy](#).

Figure 2: Configuration/state in tree hierarchy

Each field description has a field called "Configurable". The field is set to either:

- true (for configuration transactions)
- false (for state transactions)

Show reports are Python plug-ins used to create custom output. A set of pre-defined show reports are provided and described in the *SR Linux System Management Guide*. These pre-defined reports can be used as examples for how to create additional custom reports.

## 2.3 Hardware platform designation

The platforms field is used to define the hardware platforms that are valid for a transaction. If a transaction is only valid on specific platforms, the designation is similar to the following:

*Figure 3: Platforms: applies to designated platforms only***name string**

<b>Description</b>	Enter the name context
<b>Context</b>	<a href="#">system mirroring mirroring-instance name string mirror-source interface name string</a>
<b>String Length</b>	3 to 20
<b>Configurable</b>	True
<b>Platforms</b>	7220 IXR-D3L, 7220 IXR-D3, 7220 IXR-D5, 7220 IXR-D2, 7220 IXR-D2L

If a transaction is valid on all platforms, the designation is the following:

*Figure 4: Platforms: applies to all platforms***acl**

<b>Description</b>	Top level enclosing container for ACL operational tools
<b>Context</b>	<a href="#">acl</a>
<b>Tree</b>	<a href="#">acl</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

## 2.4 Field descriptions

Syntax for each field is displayed in bold, followed by supported parameters and their type. In the example that follows, the **bfd network-instance** field shows that the parameter type is a string:

```
- bfd
  - network-instance string
```

[Table 1: Field descriptions](#) describes valid fields for commands. Not all fields are applicable for all commands.

*Table 1: Field descriptions*

Field	Description
Context	Configuration path to the command
Tree	Defines the commands location in the tree hierarchy
Description	Describes the command
Configurable	Indicates if the command can be configured (true) or if it is a view-only state command (false)
String Length	For a string, indicates a range (number of characters allowed)

---

Field	Description
Range	For a number, indicates the range of allowed values
Default	Default value
Units	Base unit type
Options	Enumerated values allowed
Reference	Reference to an instance in the configuration needed before the configuration is considered valid
Max Element	For lists and leaf-lists, the maximum number of elements
Platform	Defines the supported hardware platforms

### 2.4.1 References

A description of each parameter is also available from the online CLI help function. See the *SR Linux System Management Guide* for information on using the CLI help.

## 3.1 acl Descriptions

### acl

<b>Description</b>	Top level container for configuration and operational state related to access control lists (ACLs)
<b>Context</b>	<a href="#">acl</a>
<b>Tree</b>	<a href="#">acl</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

### acl-filter *name string type keyword*

<b>Description</b>	List of MAC, IPv4, IPv6 filter policies
<b>Context</b>	<a href="#">acl</a> <a href="#">acl-filter</a> <i>name string type keyword</i>
<b>Tree</b>	<a href="#">acl-filter</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

### name *string*

<b>Description</b>	ACL Filter policy name
<b>Context</b>	<a href="#">acl</a> <a href="#">acl-filter</a> <i>name string type keyword</i>
<b>String Length</b>	1 to 255
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

### type *keyword*

<b>Description</b>	Defines the type of ACL filter: ipv4: IPv4 ACL filter ipv6: IPv6 ACL filter mac: MAC ACL filter
<b>Context</b>	<a href="#">acl</a> <a href="#">acl-filter</a> <i>name string type keyword</i>
<b>Options</b>	<ul style="list-style-type: none"> <li>• ipv4</li> <li>• ipv6</li> <li>• mac</li> </ul>

<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**description** *string*

<b>Description</b>	Description string for the filter policy
<b>Context</b>	<a href="#">acl</a> <a href="#">acl-filter</a> <a href="#">name</a> <i>string</i> <a href="#">type</a> <a href="#">keyword</a> <a href="#">description</a> <i>string</i>

**entry** [sequence-id](#) *number*

<b>Description</b>	List of ACL entries comprising an ACL Filter
<b>Context</b>	<a href="#">acl</a> <a href="#">acl-filter</a> <a href="#">name</a> <i>string</i> <a href="#">type</a> <a href="#">keyword</a> <a href="#">entry</a> <a href="#">sequence-id</a> <i>number</i>
<b>Tree</b>	<a href="#">entry</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**sequence-id** *number*

<b>Description</b>	A number to indicate the relative evaluation order of the different entries; lower numbered entries are evaluated before higher numbered entries
<b>Context</b>	<a href="#">acl</a> <a href="#">acl-filter</a> <a href="#">name</a> <i>string</i> <a href="#">type</a> <a href="#">keyword</a> <a href="#">entry</a> <a href="#">sequence-id</a> <i>number</i>
<b>Range</b>	0 to 65535
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**action**

<b>Description</b>	Container for the actions to be applied to packets matching the filter entry.
<b>Context</b>	<a href="#">acl</a> <a href="#">acl-filter</a> <a href="#">name</a> <i>string</i> <a href="#">type</a> <a href="#">keyword</a> <a href="#">entry</a> <a href="#">sequence-id</a> <i>number</i> <a href="#">action</a>
<b>Tree</b>	<a href="#">action</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**accept**

<b>Description</b>	Accept matching packets and forward them towards their normal destination
<b>Context</b>	<a href="#">acl</a> <a href="#">acl-filter name</a> <i>string</i> <a href="#">type</a> <a href="#">keyword</a> <a href="#">entry</a> <a href="#">sequence-id</a> <a href="#">number</a> <a href="#">action</a> <a href="#">accept</a>
<b>Tree</b>	<a href="#">accept</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**forward**

<b>Description</b>	Enable the next-hop context
<b>Context</b>	<a href="#">acl</a> <a href="#">acl-filter name</a> <i>string</i> <a href="#">type</a> <a href="#">keyword</a> <a href="#">entry</a> <a href="#">sequence-id</a> <a href="#">number</a> <a href="#">action</a> <a href="#">accept</a> <a href="#">forward</a>
<b>Tree</b>	<a href="#">forward</a>
<b>Configurable</b>	True
<b>Platforms</b>	7730 SXR-1d-32D, 7730 SXR-1x-44S

**next-hop**

<b>Description</b>	Enter the next-hop context
<b>Context</b>	<a href="#">acl</a> <a href="#">acl-filter name</a> <i>string</i> <a href="#">type</a> <a href="#">keyword</a> <a href="#">entry</a> <a href="#">sequence-id</a> <a href="#">number</a> <a href="#">action</a> <a href="#">accept</a> <a href="#">forward</a> <a href="#">next-hop</a>

**source-port****Description**

A packet matches this condition if its source TCP or UDP port number matches the value or range that is specified

The rule should also have a condition that the IP protocol equals 6 (TCP) or 17 (UDP) in order for this to be interpreted correctly.

<b>Context</b>	<a href="#">acl policers system-cpu-policer name</a> <i>string</i>
<b>String Length</b>	1 to 255
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**entry-specific** *boolean*

<b>Description</b>	If set to false, only one policer instance is created from this template and it is shared by all entries of all cpm-filter ACLs that refer to this policer.  If set to true, multiple policer instances are created from this template, one for each cpm-filter entry that refers to the policer template.
<b>Context</b>	<a href="#">acl policers system-cpu-policer name</a> <i>string</i> <a href="#">entry-specific</a> <i>boolean</i>
<b>Tree</b>	<a href="#">entry-specific</a>
<b>Default</b>	false
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**maximum-burst-packet** *number*

<b>Description</b>	The maximum depth of the policer bucket in number of packets
<b>Context</b>	<a href="#">acl policers system-cpu-policer name</a> <i>string</i> <a href="#">maximum-burst-packet</a> <i>number</i>
<b>Tree</b>	<a href="#">maximum-burst-packet</a>

## 4.1 bfd Descriptions

### bfd

<b>Description</b>	Context to configure BFD parameters and report BFD sessions state
<b>Context</b>	<a href="#">bfd</a>
<b>Tree</b>	<a href="#">bfd</a>
<b>Configurable</b>	True
<b>Platforms</b>	7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### micro-bfd-sessions

<b>Description</b>	Context to configure micro-BFD session parameters and report sessions state
<b>Context</b>	<a href="#">bfd micro-bfd-sessions</a>
<b>Tree</b>	<a href="#">micro-bfd-sessions</a>
<b>Configurable</b>	True
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### lag-interface [name reference](#)

<b>Description</b>	List of interface references to associate a micro-BFD session config and state
<b>Context</b>	<a href="#">bfd micro-bfd-sessions lag-interface name reference</a>
<b>Tree</b>	<a href="#">lag-interface</a>
<b>Configurable</b>	True
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**name** *reference*

<b>Description</b>	Reference ID for associated lag interface Example: lag1 (Reference Interface lag1).
<b>Context</b>	<a href="#">bfd micro-bfd-sessions lag-interface name</a> <i>reference</i>
<b>Reference</b>	<a href="#">interface name</a> <i>string</i>
<b>Configurable</b>	True
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**admin-state** *keyword*

<b>Description</b>	Administratively enable or disable BFD for this subinterface
<b>Context</b>	<a href="#">bfd micro-bfd-sessions lag-interface name</a> <i>reference</i> <a href="#">admin-state</a> <i>keyword</i>
<b>Tree</b>	<a href="#">admin-state</a>
<b>Default</b>	disable
<b>Options</b>	<ul style="list-style-type: none"> <li>• enable</li> <li>• disable</li> </ul>
<b>Configurable</b>	True
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**desired-minimum-transmit-interval** *number*

<b>Description</b>	<p>The minimum interval between transmission of BFD control packets</p> <p>This value is advertised to the peer, however the actual interval used is specified by taking the maximum of desired-minimum-transmit-interval and the value of the remote required-minimum-receive interval value. This value is specified as an integer number of microseconds.</p>
<b>Context</b>	<a href="#">bfd micro-bfd-sessions lag-interface name</a> <i>reference</i> <a href="#">desired-minimum-transmit-interval</a> <i>number</i>
<b>Tree</b>	<a href="#">desired-minimum-transmit-interval</a>
<b>Range</b>	10000 to 100000000

<b>Default</b>	1000000
<b>Units</b>	microseconds
<b>Configurable</b>	True
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### detection-multiplier *number*

<b>Description</b>	The number of packets that must be missed to declare this session as down The detection interval for the BFD session is calculated by multiplying the value of the negotiated transmission interval by this value.
<b>Context</b>	<a href="#">bfd micro-bfd-sessions lag-interface name</a> <i>reference</i> <a href="#">detection-multiplier number</a>
<b>Tree</b>	<a href="#">detection-multiplier</a>
<b>Range</b>	3 to 20
<b>Default</b>	3
<b>Configurable</b>	True
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

### local-address (*ipv4-address* | *ipv6-address*)

<b>Description</b>	IP address to be used as source address in BFD packets
<b>Context</b>	<a href="#">bfd micro-bfd-sessions lag-interface name</a> <i>reference</i> <a href="#">local-address (ipv4-address   ipv6-address)</a>
<b>Tree</b>	<a href="#">local-address</a>
<b>Configurable</b>	True
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**member-interface** *name string*

<b>Description</b>	List of interface references to associate a micro-BFD session config and state
<b>Context</b>	<a href="#">bfd micro-bfd-sessions lag-interface name</a> <i>reference</i> <a href="#">member-interface name</a> <i>string</i>
<b>Tree</b>	<a href="#">member-interface</a>
<b>Configurable</b>	False
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**name** *string*

<b>Description</b>	Reference ID for associated interface Example: ethernet-2/1 (Reference Interface ethernet-2/1).
<b>Context</b>	<a href="#">bfd micro-bfd-sessions lag-interface name</a> <i>reference</i> <a href="#">member-interface name</a> <i>string</i>
<b>Configurable</b>	False
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**active-receive-interval** *number*

<b>Description</b>	The receive interval currently being used by this BFD session This is the amount of time the BFD state machine expects between receiving BFD messages from the remote peer.
<b>Context</b>	<a href="#">bfd micro-bfd-sessions lag-interface name</a> <i>reference</i> <a href="#">member-interface name</a> <i>string</i> <a href="#">active-receive-interval</a> <i>number</i>
<b>Tree</b>	<a href="#">active-receive-interval</a>
<b>Configurable</b>	False
<b>Platforms</b>	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**active-transmit-interval** *number*

<b>Description</b>	The transmit interval currently being used by this BFD session This is the amount of time the local BFD agent will wait between the sending of BFD messages to the remote peer
<b>Context</b>	<a href="#">bfd micro-bfd-sessions lag-interface name</a> <i>reference</i> <a href="#">member-interface name</a> <i>string</i> <a href="#">active-transmit-interval</a> <i>number</i>
<b>Tree</b>	<a href="#">active-transmit-interval</a>

- **CONCATENATED\_PATH\_DOWN**  
A segment on the path between source and destination has failed  
When a BFD session runs over a series of path segments, this error code indicates that a subsequent path segment (i.e., one in the transmit path between the source and destination of the session) has failed.
- **ADMIN\_DOWN**  
The BFD session has been administratively disabled by the peer
- **REVERSE\_CONCATENATED\_PATH\_DOWN**  
A segment on the reverse path between destination and source has failed  
In the case that a BFD session is running over a series of path segments, this error code indicates that a path segment on the reverse path (i.e., in the transmit direction from the destination to the source of the session) has failed.

### **local-diagnostic-code** *keyword*

<b>Description</b>	The local BFD diagnostic code indicating the most recent reason for failure of this BFD session
<b>Context</b>	<a href="#">bfd network-instance name</a> <i>string</i> <a href="#">peer local-discriminator number</a> <a href="#">local-diagnostic-code</a> <i>keyword</i>
<b>Tree</b>	<a href="#">local-diagnostic-code</a>

**Options**

- **NO\_DIAGNOSTIC**  
No diagnostic code was specified, or the session has not changed state
- **DETECTION\_TIMEOUT**  
The control detection time expired: no BFD packet was received within the required period
- **ECHO\_FAILED**  
The BFD echo function failed - echo packets have not been received for the required period of time
- **NEIGHBOR\_SIGNALED\_DOWN**  
The neighbor signaled session down
- **FORWARDING\_RESET**  
The forwarding plane in the local system was reset  
The remote system cannot rely on the forwarding state of the device specifying this error code.
- **PATH\_DOWN**  
Signalling outside of BFD specified that the path underlying this session has failed
- **CONCATENATED\_PATH\_DOWN**  
A segment on the path between source and destination has failed  
When a BFD session runs over a series of path segments, this error code indicates that a subsequent path segment (i.e., one in the transmit path between the source and destination of the session) has failed.
- **ADMIN\_DOWN**  
The BFD session has been administratively disabled by the peer
- **REVERSE\_CONCATENATED\_PATH\_DOWN**  
A segment on the reverse path between destination and source has failed  
In the case that a BFD session is running over a series of path segments, this error code indicates that a path segment on the reverse path (i.e., in the transmit direction from the destination to the source of the session) has failed.

- CONCATENATED\_PATH\_DOWN

A segment on the path between source and destination has failed

When a BFD session runs over a series of path segments, this error code indicates that a subsequent path segment (i.e., one in the transmit path between the source and destination of the session) has failed.

- ADMIN\_DOWN

The BFD session has been administratively disabled by the peer

- REVERSE\_CONCATENATED\_PATH\_DOWN

A segment on the reverse path between destination and source has failed

In the case that a BFD session is running over a series of path segments, this error code indicates that a path segment on the reverse path (i.e., in the transmit direction from the destination to the source of the session) has failed.

both ports are configured, then the lower numbered port takes precedence and the higher numbered port shall be operationally down with reason unsupported-breakout-port. Groupings are (8,9), (11,12), (14,15), (17,18), (20,21), (23,24), (44, 45), (47,48).

Note 3: Breakout and 40G is only supported on odd numbered ports. For the QSFP28 four port groupings [1-4], [5-8], [9-12], [13-16], [21-24], [25-28], and [29-32] if either of the odd numbered ports within a group is configured for 40G, 4x10G, or 4x25G, then the other odd numbered port in the same group may only be configured if it is configured for one of 40G, 4x10G, or 4x25G (can differ between the odd ports) and neither of the two even numbered ports within the same group can be configured.

Note 4: For the QSFP28 ports, the following port groups exist [n, n+1, n+2, n+3] for n = 1, 5, 9, 13, 17, 21. Breakout for 4x25G or 4x10G is only supported on ports n+1 and n+3. When initially configuring a port with a breakout configuration or port speed that does not already exist on another configured port within the same group, then a link flap and traffic hit may occur on other ports within the same group. When the breakout configuration or port speed is changed for a port in a group, then a link flap and traffic hit may occur on other ports within the same group. If port n+1 within the group is configured for breakout, then port n cannot be configured. In addition if port n+1 is configured for breakout and port n+3 is configured without breakout, then port n+2 may only be configured with the same speed as port n+3. If port n+3 within the group is configured for breakout, then port n+2 cannot be configured. In addition if port n+3 is configured for breakout and port n+1 is configured without breakout, then port n may only be configured with the same speed as port n+1.

Port Groups and auto-configuration of port speed: Manually configured breakout-mode takes precedence over the auto-configured port-speed. This means that configuring a port within a port-group can have a side effect to take down an operational port that had its speed set based on the auto configuration feature. If there is risk of mixing transceiver types within a port group, then it is recommended to always manually configure the ports

## fec-option *keyword*

**Description** The forward error correction algorithm requested for the interface

The same FEC algorithm must be used at both ends of a link. This leaf should be only be configured for 25G and 100G interfaces; it can cause the port to remain operationally down for other interface speeds. 1G, 10G, and 40G interfaces do not use FEC 50G and interfaces with speeds higher than 100G have well defined FEC settings in IEEE 802.3 that must be used and so configuration is not needed.

For 100G interfaces, if the specific transceiver inserted uses PAM4 encoding, then the system shall always enable clause 91 RS(544,514) FEC and so this leaf should be left unconfigured. For 100G interfaces, if the specific transceiver inserted uses NRZ encoding, then it may require rs-528 to be enabled. This is dependent on the specific PMD and also whether the installed transceiver includes the FEC functionality inside the transceiver. Refer to Nokia support for the correct setting for the specific transceiver.

If this leaf is configured and the setting is incompatible with the installed transceiver, the interface shall be kept down with a reason of unsupported-fec.

25G interfaces support disabled, base-r, and rs-528. The FEC requirement for a 25G interface depends on the cable type. A CA-N DAC cable has a loss specification that requires no FEC. A CA-S DAC cable requires FEC, rs-528 recommended. A CA-L DAC cable requires the stronger rs-528 FEC.

**Options**

- disabled
- base-r

An early form of FEC used with 25G interfaces

Defined in clause 74 of IEEE 802.3. This FEC has poor performance compared to clause 108 (rs-528). base-r should only be used if the far end doesn't support rs-528

This type of FEC is only supported for 25G interfaces.

- rs-528

Reed-Solomon RS(528,514) code FEC

For 25G interfaces, this is IEEE 802.3 Clause 108 using RS(528,514) For 100G interfaces, this is IEEE 802.3 Clause 91 using RS(528,514)

## forwarding-viable *boolean*

**Description**

If true: this LAG member link should be used for the transmission of traffic if all other LAG/port attributes allow it.

If false: this LAG member link should not be used for the transmission of traffic.

In all cases: This LAG member link should process any received frames when it is an active member link. L2 protocols such as LLDP, LACP and micro-BFD should continue to be sent and processed.

**down number**

<b>Description</b>	<p>Holds link down events for the configured time</p> <p>The hold-time down behavior is triggered with events that try to bring the ethernet interface down and can change quickly. It is not triggered with an admin-state disable event or interface disable due to other internal reasons (such as fabric unavailability). When running, the interface will not be brought down till the timer expires. The typical use of the hold-time down is to provide stability and avoid the protocols to advertise/withdraw messages if there are flapping optics. The hold-time down is aborted if the user does admin-state disable or if the interface is disabled due to other internal reasons that prevent the traffic to be forwarded on the interface.</p>

### **link-loss-forwarding** *boolean*

<b>Description</b>	Indicates whether link-loss-forwarding is enabled in the interface  When enabled, faults can be propagated to the devices connected to this interface. It is supported on interfaces with a single non-tagged subinterface that is associated to a network-instance of type vpws. On VPWS services, the propagation of faults from a connection-point to the opposite connection-point is known as Link Loss Forwarding and requires setting this command to true and the standby-signaling command to the type of propagation signaling to be used with the connected Customer Equipment.

Note 1: Note reserved for future use.

Note 2: On 7220-D2: if one port in each consecutive group of 4 ports (1-4, 5-8, .. , 45-48) is enabled and has a configured speed of 25G then the other 3 ports may only be enabled if they also have a configured speed of 25G or no speed configured; if one port in each consecutive group of 4 ports (1-4, 5-8, .. , 45-48) is enabled and has a configured speed of 1G or 10G the other 3 ports may only be enabled if they also have a configured speed of 1G or 10G or no speed configured. On 7220-D2L: if one port in each port group of 4 ports ({1, 2, 3, 6}, {4, 5, 7, 9}, {8, 10, 11, 12}, {13, 14, 15, 18}, {16, 17, 19, 21}, {20, 22, 23, 24}, {25, 26, 27, 30}, {28, 29, 31, 33}, {32, 34, 35, 36}, {37, 38, 39, 42}, {40, 41, 43, 45}, {44, 46, 47, 48}) is enabled and has a configured speed of 25G the other 3 ports may only be enabled if they also have a configured speed of 25G or no speed configured; if one port in each port group of 4 ports is enabled and has a configured speed of 1G or 10G the other 3 ports may only be enabled if they also have a configured speed of 1G or 10G or no speed configured.

Note 3: Breakout and 40G is only supported on odd numbered ports. For the QSFP28 four port groupings [1-4], [5-8], [9-12], [13-16], [21-24], [25-28], and [29-32] if either of the odd numbered ports within a group is configured for 40G, 4x10G, or 4x25G, then the other odd numbered port in the same group may only be configured if it is configured for one of 40G, 4x10G, or 4x25G (can differ between the odd ports) and neither of the two even numbered ports within the same group can be configured.

Note 4: For the QSFP28 ports, the following port groups exist [n, n+1, n+2, n+3] for n = 1, 5, 9, 13, 17, 21. Breakout for 4x25G or 4x10G is only supported on ports n+1 and n+3. When initially configuring a port with a breakout configuration or port speed that does not already exist on another configured port within the same group, then a link flap and traffic hit may occur on other ports within the same group. When the breakout configuration or port speed is changed for a port in a group, then a link flap and traffic hit may occur on other ports within the same group. If port n+1 within the group is configured for breakout, then port n cannot be configured. In addition if port n+1 is configured for breakout and port n+3 is configured without breakout, then port n+2 may only be configured with the same speed as port n+3. If port n+3 within the group is configured for breakout, then port n+2 cannot be configured. In addition if port n+3 is configured for breakout and port n+1 is configured without breakout, then port n may only be configured with the same speed as port n+1.

7250 IXR details: If the interface corresponds to a connector that has no installed transceiver then the value is accepted without any checking or restriction, and info from state will display the configured value. Otherwise if the configured port-speed is NOT supported by the installed transceiver the port is forced operationally down.

Port Groups and auto-configuration: Manually configured and enabled port-speed (and breakout-modes) take precedence over the auto-configured port-speed. This means that configuring and enabling a port within a port-group can have a side effect to take down an operational port that had its speed set based on the auto-configuration feature. If there is risk of mixing transceiver types within a port group, then it is recommended to always manually configure the speed for enabled ports

<b>Description</b>	Disables timestamping of PTP over IP messages on this port  For platforms supporting PTP functionality, any transiting PTP over IP packets are timestamped in hardware by default, regardless of whether PTP is enabled on the system. To avoid unwanted correction-field updates of PTP transit packets on ports (ports involved in PTP packet transit only), this command can be used to disabled the timestamping.

**mtu** *number*

<b>Description</b>	Port MTU in bytes including ethernet overhead but excluding 4-bytes FCS
--------------------	-------------------------------------------------------------------------

If a transmitted packet exceeds this size it is dropped. The default value for ethernet-x interfaces is taken from /system/mtu/default-port-mtu. For the mgmt0 and mgmt0-standby interfaces the default is 1514 bytes, but the value can be changed for each interface individually. Port MTU is not configurable for loopback interfaces or irb interfaces. For irb interfaces, if the size of the ip packets to be routed to a mac-vrf has to be restricted, the subinterface.ip-mtu should be configured instead. The max mtu for the mgmt0 and mgmt0-standby interfaces is 9216. The 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D3, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, and 7220 IXR-H4 systems support a maximum port MTU of 9412 bytes and minimum of 1500 bytes. The 7730 SXR systems support a maximum port MTU of 9408 bytes and minimum of 1500 bytes. All other systems support a maximum port MTU of 9500 and minimum of 1500 bytes. Each 7250 IXR IMM supports a maximum of 8 different port MTU values. 7220 IXR systems do not have any limit on the maximum number of different port MTU values.

### **num-physical-channels** *number*

<b>Description</b>	<p>Sets the number of lanes or physical channels assigned to this interface or to the set of interfaces within this breakout group</p> <p>This leaf can be used to distinguish between transceivers that provide the same port-speed or breakout-configuration but using different PMAs. For example, if a port supports two transceivers providing 100G optical signal but one uses CAUI4 and the other uses 100GAUI-2, then this leaf can be set to 4 for the CAUI4 transceiver and 2 for the 100GAUI-2 transceiver. Similarly, a transceiver that provides a breakout of 4 ports of 100G using 4 x 100GAUI2 would set this leaf to 8 but a transceiver using 4 x 100GAUI-1 would have this leaf set to 4.</p> <p>If not set, then the default shall be as follows: 1 is used for 10G, 25G 2 is used for 50G 4 is used for 40G, 100G, 2x50G, 1x100G, 4x10G, 4x25G 6 is used for 3x100G (digital coherent optics) 8 is used for 200G, 400G, 800G, 2x100G, 4x100G, 8x50G</p>

Component is offline due to insufficient system power

- degraded

Component or process is in a degraded state

- warm-reboot

Component or process is currently warm rebooting

This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

Component or process is currently waiting

This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

### ip-mtu *number*

<b>Description</b>	<p>IP MTU of the subinterface in bytes.</p> <p>Includes the IP header but excludes Ethernet encapsulation.</p> <p>IP MTU specifies the maximum sized IPv4 or IPv6 packet that can be transmitted on the subinterface. If an IPv4 or IPv6 packet exceeds this size it is dropped and this may result in the generation of an ICMP error message back to the source.</p> <p>The default IP MTU for a subinterface is taken from <code>/system/mtu/default-ip-mtu</code>. For the <code>mgmt0</code> and <code>mgmt0-standby</code> subinterfaces the default is the associated interface MTU minus the Ethernet encapsulation overhead.</p> <p>The IP MTU is not configurable for subinterfaces of loopback interfaces.</p> <p>The 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D3, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, and 7220 IXR-H4 systems support a maximum IP MTU of 9398 bytes.</p>
--------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The 7730 SXR systems support a maximum IP MTU of 9394 bytes.

Each 7250 IXR IMM supports a maximum of 4 different IP MTU values. 7220 IXR systems do not have any limit on the maximum number of different IP MTU values.

## [ip-prefix](#) *string*

<b>Description</b>	<p>The IPv4 address and prefix length in CIDR notation</p> <p>Subnets on the same subinterface are allowed to overlap as long as the host bits are different. When a locally originated unicast packet is destined to a host covered by multiple subnets associated with a subinterface, the source address is chosen to be the numerically lowest IP address among all these subnets. For example, if the addresses 172.16.1.1/12, 172.16.1.2/12, and 172.16.1.3/12 are configured on the same interface, 172.16.1.1 would be used as a local address when you issue a ping 172.16.1.5 command</p>

### **primary**

<b>Description</b>	One of the IPv4 prefixes assigned to the subinterface can be explicitly configured as primary by setting this leaf to true. This designates the associated IPv4 address as a primary IPv4 address of the subinterface. By default, the numerically lowest value IPv4 address is selected as the primary address.
--------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The primary address is used as the source address for locally originated broadcast and multicast packets sent out the subinterface.

### probe-interval *number*

<b>Description</b>	Configure the ARP probe interval at which the system sends an ARP request for the virtual IPv4 address.  The default value of zero determines that the system sends an ARP Request for the virtual IPv4 only when the address is configured. The creation of the ARP entry for the virtual IPv4 address will in this case rely on the server sending a Gratuitous ARP for the virtual IPv4 address. When the value is set to a non-zero interval, the system sends a periodic ARP Request at the configured interval and irrespective of the ARP entry being already created.

**ipv6**

<b>Description</b>	IPv6 configuration and state for the subinterface
<b>Context</b>	<a href="#">interface name</a> <i>string</i> <a href="#">subinterface</a> <i>index</i> <i>number</i> <a href="#">ipv6</a>
<b>Tree</b>	<a href="#">ipv6</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**address ip-prefix string**

<b>Description</b>	The list of IPv6 addresses assigned to the subinterface.
<b>Context</b>	<a href="#">interface name string subinterface index number ipv6 address ip-prefix string</a>
<b>Tree</b>	<a href="#">address</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms
<b>Max. Elements</b>	18

**ip-prefix string**

<b>Description</b>	The IPv6 address and prefix-length in CIDR notation  Up to 16 global unicast IPv6 addresses can be assigned to each subinterface. Global unicast IPv6 address subnets on the same subinterface are allowed to overlap as long as the host bits are different. When a locally originated unicast packet is destined to a host covered by multiple subnets associated with a subinterface, the source address is chosen to be the numerically lowest IP address among all these subnets.
<b>Context</b>	<a href="#">interface name string subinterface index number ipv6 address ip-prefix string</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**anycast-gw boolean**

<b>Description</b>	This designates the associated IPv6 address as an anycast-gateway IPv6 address of the subinterface.  When this parameter is set to true:
<b>Context</b>	<a href="#">interface name string subinterface index number ipv6 address ip-prefix string anycast-gw boolean</a>
<b>Tree</b>	<a href="#">anycast-gw</a>
<b>Configurable</b>	True
<b>Platforms</b>	7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7250 IXR-10, 7250 IXR-10e, 7250 IXR-6, 7250 IXR-6e, 7250 IXR-X1b, 7250 IXR-X3b, 7730 SXR-1d-32D, 7730 SXR-1x-44S

**origin keyword**

<b>Description</b>	The origin of the IPv6 address
--------------------	--------------------------------

<b>Context</b>	<a href="#">interface name</a> <i>string</i> <a href="#">subinterface index</a> <i>number</i> <a href="#">ipv6 address ip-prefix</a> <i>string</i> <a href="#">origin</a> <i>keyword</i>
<b>Tree</b>	<a href="#">origin</a>
<b>Options</b>	<ul style="list-style-type: none"> <li>• other</li> <li>• static</li> <li>• dhcp</li> <li>• link-layer</li> <li>• random</li> </ul>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## primary

<b>Description</b>	<p>One of the IPv6 prefixes assigned to the subinterface can be explicitly configured as primary by setting this leaf to true. This designates the associated IPv6 address as a primary IPv6 address of the subinterface. By default, the numerically lowest value IPv6 address is selected as the primary address.</p> <p>The primary address is used as the source address for locally originated broadcast and multicast packets sent out the subinterface.</p>
<b>Context</b>	<a href="#">interface name</a> <i>string</i> <a href="#">subinterface index</a> <i>number</i> <a href="#">ipv6 address ip-prefix</a> <i>string</i> <a href="#">primary</a>
<b>Tree</b>	<a href="#">primary</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

## status *keyword*

<b>Description</b>	The status of an IPv6 address
<b>Context</b>	<a href="#">interface name</a> <i>string</i> <a href="#">subinterface index</a> <i>number</i> <a href="#">ipv6 address ip-prefix</a> <i>string</i> <a href="#">status</a> <i>keyword</i>
<b>Tree</b>	<a href="#">status</a>
<b>Options</b>	<ul style="list-style-type: none"> <li>• preferred</li> <li>• deprecated</li> <li>• invalid</li> <li>• inaccessible</li> <li>• unknown</li> <li>• tentative</li> </ul>

	<ul style="list-style-type: none"> <li>• duplicate</li> <li>• optimistic</li> </ul>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**type keyword**

<b>Description</b>	<p>Specifies the explicit type of the IPv6 address being assigned to the subinterface</p> <p>By default, addresses are assumed to be global unicast. Where a link-local address is to be explicitly configured, this leaf should be set to link-local.</p>
<b>Context</b>	<a href="#">interface name</a> <i>string</i> <a href="#">subinterface index</a> <i>number</i> <a href="#">ipv6 address ip-prefix</a> <i>string</i> <a href="#">type keyword</a>
<b>Tree</b>	<a href="#">type</a>
<b>Default</b>	global-unicast
<b>Options</b>	<ul style="list-style-type: none"> <li>• global-unicast           <p>The IPv6 address is a global unicast address type and must be in the format defined in RFC 4291 section 2.4.</p> </li> <li>• link-local-unicast           <p>The IPv6 address is a Link-Local unicast address type and must be in the format defined in RFC 4291 section 2.4.</p> </li> </ul>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

**vrrp**

<b>Description</b>	VRRP Configuration and State under a IPv6 context of a sub-interface
<b>Context</b>	<a href="#">interface name</a> <i>string</i> <a href="#">subinterface index</a> <i>number</i> <a href="#">ipv6 address ip-prefix</a> <i>string</i> <a href="#">vrrp</a>
<b>Tree</b>	<a href="#">vrrp</a>

### I2-mtu *number*

<b>Description</b>	Layer-2 MTU of the subinterface in bytes. Includes the Ethernet header and VLAN tags, and excludes 4-bytes FCS.
--------------------	--------------------------------------------------------------------------------------------------------------------

L2 MTU specifies the maximum sized Ethernet frame that can be transmitted on the subinterface. If a frame exceeds this size it is discarded. If the l2-mtu of the subinterface exceeds the port-mtu of the associated interface, the subinterface will remain operationally down.

The default value for a subinterface is taken from /system/mtu/default-l2-mtu. The L2 MTU is only configurable for bridged subinterfaces.

The 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D3, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, and 7220 IXR-H4 systems support a maximum L2 MTU of 9412 bytes and minimum of 1500 bytes.

The 7730 SXR systems support a maximum L2 MTU of 9408 bytes.

All other systems support a maximum L2 MTU of 9500 and minimum of 1500 bytes.

- warm-reboot  
Component or process is currently warm rebooting  
This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting  
Component or process is currently waiting  
This state can be set by event handler when the `reinvoke-with-delay` action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

**mpls-mtu** *number*

<b>Description</b>	MPLS MTU of the subinterface in bytes, including the transmitted label stack.  MPLS MTU specifies the maximum sized MPLS packet that can be transmitted on the subinterface. If an MPLS packet containing any payload exceeds this size then it is dropped. If the payload of the dropped packet is IPv4 or IPv6 then this may also result in the generation of an ICMP error message that is either tunneled or sent back to the source.  The default MPLS MTU for a subinterface is taken from /system/mtu/default-mpls-mtu.  The MPLS MTU is not configurable for subinterfaces of loopback interfaces.  The 7730 SXR systems support a maximum MPLS MTU of 9404 bytes.  Each 7250 IXR IMM supports a maximum of 4 different MPLS MTU values.

- TPID\_0X9100  
Alternate TPID value
- TPID\_0X9200  
Alternate TPID value
- TPID\_ANY  
A wildcard that matches any of the generally used TPID values for singly- or multiply-tagged VLANs Equivalent to matching any of TPID\_0X8100, TPID\_0X88A8, TPID\_0X9100 and TPID\_0x9200. This value is only applicable where the TPID of a packet is being matched.

**forward-error-correction** *keyword***Description**

The forward error correction algorithm to use on the optical channel

The same FEC algorithm must be used at both ends of a link.

25G interfaces support disabled, base-r, rs-108 and rs-528; configuring other (incompatible) options will bring the port down. The FEC requirement for a 25G interface depends on the cable type. A CA-N DAC cable has a loss specification that requires no FEC. A CA-S DAC cable requires base-r FEC at a minimum. A CA-L DAC cable requires the stronger rs-108 Reed Solomon FEC.

100G interfaces support disabled and rs-528; configuring other (incompatible) options will bring the port down.

400G interfaces require rs-544; configuring other (unsupported) options will bring the port down.

**vendor-part-number** *string*

<b>Description</b>	Vendor's part number for the transceiver This is the information as read from the EEPROM of the part.
<b>Context</b>	<a href="#">interface name</a> <i>string</i> <a href="#">transceiver</a> <a href="#">vendor-part-number</a> <i>string</i>
<b>Tree</b>	<a href="#">vendor-part-number</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**vendor-revision** *string*

<b>Description</b>	Vendor's revision number for the transceiver This is the information as read from the EEPROM of the part.
<b>Context</b>	<a href="#">interface name</a> <i>string</i> <a href="#">transceiver</a> <a href="#">vendor-revision</a> <i>string</i>
<b>Tree</b>	<a href="#">vendor-revision</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**voltage**

<b>Description</b>	Enter the voltage context
<b>Context</b>	<a href="#">interface name</a> <i>string</i> <a href="#">transceiver</a> <a href="#">voltage</a>
<b>Tree</b>	<a href="#">voltage</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**high-alarm-condition** *boolean*

<b>Description</b>	High alarm threshold condition. Set to true whenever the module voltage is above the high-alarm-threshold and set to false whenever the module voltage is below the high-alarm-threshold
<b>Context</b>	<a href="#">interface name</a> <i>string</i> <a href="#">transceiver</a> <a href="#">voltage</a> <a href="#">high-alarm-condition</a> <i>boolean</i>
<b>Tree</b>	<a href="#">high-alarm-condition</a>

## 6.1 network-instance Descriptions

### network-instance *name string*

<b>Description</b>	Network instances configured on the local system
<b>Context</b>	<a href="#">network-instance name string</a>
<b>Tree</b>	<a href="#">network-instance</a>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

### name *string*

<b>Description</b>	A unique name identifying the network instance
<b>Context</b>	<a href="#">network-instance name string</a>
<b>String Length</b>	1 to 247
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

### admin-state *keyword*

<b>Description</b>	This leaf contains the configured, desired state of the network instance.
<b>Context</b>	<a href="#">network-instance name string admin-state keyword</a>
<b>Tree</b>	<a href="#">admin-state</a>
<b>Default</b>	enable
<b>Options</b>	<ul style="list-style-type: none"> <li>• enable</li> <li>• disable</li> </ul>
<b>Configurable</b>	True
<b>Platforms</b>	Supported on all platforms

### afts

<b>Description</b>	The abstract forwarding tables (AFTs) that are associated with the network instance
<b>Context</b>	<a href="#">network-instance name string afts</a>
<b>Tree</b>	<a href="#">afts</a>

<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## ipv4-unicast

<b>Description</b>	The abstract forwarding table for IPv4 unicast Entries within this table are uniquely keyed on the IPv4 unicast destination prefix which is matched by ingress packets. The data set represented by the IPv4 Unicast AFT is the set of entries from the IPv4 unicast RIB that have been selected for installation into the FIB of the device exporting the data structure.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">afts ipv4-unicast</a>
<b>Tree</b>	<a href="#">ipv4-unicast</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## ipv4-entry [prefix](#) *string*

<b>Description</b>	List of the IPv4 unicast entries within the abstract forwarding table
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">afts ipv4-unicast</a> <a href="#">ipv4-entry</a> <a href="#">prefix</a> <i>string</i>
<b>Tree</b>	<a href="#">ipv4-entry</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## [prefix](#) *string*

<b>Description</b>	The IPv4 destination prefix that should be matched to utilise the AFT entry
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">afts ipv4-unicast</a> <a href="#">ipv4-entry</a> <a href="#">prefix</a> <i>string</i>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

## counters

<b>Description</b>	Packet forwarding counters
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">afts ipv4-unicast</a> <a href="#">ipv4-entry</a> <a href="#">prefix</a> <i>string</i> <a href="#">counters</a>
<b>Tree</b>	<a href="#">counters</a>

<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**octets-forwarded** *number*

<b>Description</b>	The number of octets in the packets that were forwarded
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">afts ipv4-unicast ipv4-entry prefix</a> <i>string</i> <a href="#">counters octets-forwarded</a> <i>number</i>
<b>Tree</b>	<a href="#">octets-forwarded</a>
<b>Default</b>	0
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**packets-forwarded** *number*

<b>Description</b>	The number of packets forwarded
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">afts ipv4-unicast ipv4-entry prefix</a> <i>string</i> <a href="#">counters packets-forwarded</a> <i>number</i>
<b>Tree</b>	<a href="#">packets-forwarded</a>
<b>Default</b>	0
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**resource-allocation-failed** *boolean*

<b>Description</b>	True when an available statistics resource was not available for this forwarding object
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">afts ipv4-unicast ipv4-entry prefix</a> <i>string</i> <a href="#">counters resource-allocation-failed</a> <i>boolean</i>
<b>Tree</b>	<a href="#">resource-allocation-failed</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

**entry-metadata** *binary*

<b>Description</b>	Metadata persistently stored with the entry
--------------------	---------------------------------------------

<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">afts</a> <a href="#">ipv4-unicast</a> <a href="#">ipv4-entry</a> <a href="#">prefix</a> <i>string</i> <a href="#">entry-metadata</a> <i>binary</i>
<b>Tree</b>	<a href="#">entry-metadata</a>
<b>String Length</b>	0 to 8
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **next-hop-group** *reference*

<b>Description</b>	A reference to the next-hop-group that is used for the entry
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">afts</a> <a href="#">ipv4-unicast</a> <a href="#">ipv4-entry</a> <a href="#">prefix</a> <i>string</i> <a href="#">next-hop-group</a> <i>reference</i>

<b>Tree</b>	<a href="#">label-allocation-failed</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **next-hop-unresolved** *boolean*

<b>Description</b>	Indicates true if the BGP route has a BGP next-hop that cannot be resolved to an outgoing interface.
<b>Context</b>	<a href="#">network-instance</a> <i>name</i> <i>string</i> <a href="#">bgp-rib</a> <a href="#">afi-safi</a> <a href="#">afi-safi-name</a> <a href="#">identityref</a> <a href="#">evpn</a> <a href="#">local-rib</a> <a href="#">imet-route</a> <a href="#">route-distinguisher</a> ( <a href="#">route-distinguisher-type-0</a>   <a href="#">route-distinguisher-type-1</a>   <a href="#">route-distinguisher-type-2</a>   <a href="#">route-distinguisher-type-2b</a> ) <a href="#">originating-router</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">ethernet-tag-id</a> <i>number</i> <a href="#">neighbor</a> ( <a href="#">ipv4-address-with-zone</a>   <a href="#">ipv6-address-with-zone</a> ) <a href="#">path-id</a> <i>number</i> <a href="#">invalid-reason</a> <a href="#">next-hop-unresolved</a> <i>boolean</i>
<b>Tree</b>	<a href="#">next-hop-unresolved</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **rejected-route** *boolean*

<b>Description</b>	Indicates true if the route was rejected by an import policy.
<b>Context</b>	<a href="#">network-instance</a> <i>name</i> <i>string</i> <a href="#">bgp-rib</a> <a href="#">afi-safi</a> <a href="#">afi-safi-name</a> <a href="#">identityref</a> <a href="#">evpn</a> <a href="#">local-rib</a> <a href="#">imet-route</a> <a href="#">route-distinguisher</a> ( <a href="#">route-distinguisher-type-0</a>   <a href="#">route-distinguisher-type-1</a>   <a href="#">route-distinguisher-type-2</a>   <a href="#">route-distinguisher-type-2b</a> ) <a href="#">originating-router</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">ethernet-tag-id</a> <i>number</i> <a href="#">neighbor</a> ( <a href="#">ipv4-address-with-zone</a>   <a href="#">ipv6-address-with-zone</a> ) <a href="#">path-id</a> <i>number</i> <a href="#">invalid-reason</a> <a href="#">rejected-route</a> <i>boolean</i>
<b>Tree</b>	<a href="#">rejected-route</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **last-modified** *string*

<b>Description</b>	Time of the last modification of the route stored in the BGP RIB. For a route learned from a BGP neighbor the initial value is the same as <code>last-updatereceived</code> . If an import policy later changed some attribute of the route <code>last-modified</code> would be updated to reflect the time of this change.
--------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">bgp-rib</a> <a href="#">afi-safi</a> <a href="#">afi-safi-name</a> <a href="#">identityref</a> <a href="#">evpn</a> <a href="#">local-rib</a> <a href="#">imet-route</a> <a href="#">route-distinguisher</a> ( <a href="#">route-distinguisher-type-0</a>   <a href="#">route-distinguisher-type-1</a>   <a href="#">route-distinguisher-type-2</a>   <a href="#">route-distinguisher-type-2b</a> ) <a href="#">originating-router</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">ethernet-tag-id</a> <i>number</i> <a href="#">neighbor</a> ( <a href="#">ipv4-address-with-zone</a>   <a href="#">ipv6-address-with-zone</a> ) <a href="#">path-id</a> <i>number</i> <a href="#">last-modified</a> <i>string</i>
<b>Tree</b>	<a href="#">last-modified</a>

### **last-modified** *string*

<b>Description</b>	Time of the last modification of the route stored in the BGP RIB. For a route learned from a BGP neighbor the initial value is the same as last-updatereceived. If an import policy later changed some attribute of the route last-modified would be updated to reflect the time of this change.

<b>Platforms</b>	Supported on all platforms

### **label-allocation-failed** *boolean*

<b>Description</b>	Indicates true if dynamic-label-block has no more free labels
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">bgp-rib</a> <a href="#">afi-safi</a> <a href="#">afi-safi-name</a> <a href="#">identityref</a> <a href="#">evpn</a> <a href="#">local-rib</a> <a href="#">smet-route</a> <a href="#">route-distinguisher</a> ( <a href="#">route-distinguisher-type-0</a>   <a href="#">route-distinguisher-type-1</a>   <a href="#">route-distinguisher-type-2</a>   <a href="#">route-distinguisher-type-2b</a> ) <a href="#">ethernet-tag-id</a> <i>number</i> <a href="#">multicast-source-length</a> <i>number</i> <a href="#">multicast-source-address</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">multicast-group-length</a> <i>number</i> <a href="#">multicast-group-address</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">originating-router</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">neighbor</a> ( <a href="#">ipv4-address-with-zone</a>   <a href="#">ipv6-address-with-zone</a> ) <a href="#">path-id</a> <i>number</i> <a href="#">invalid-reason</a> <a href="#">label-allocation-failed</a> <i>boolean</i>
<b>Tree</b>	<a href="#">label-allocation-failed</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **next-hop-unresolved** *boolean*

<b>Description</b>	Indicates true if the BGP route has a BGP next-hop that cannot be resolved to an outgoing interface.
--------------------	------------------------------------------------------------------------------------------------------

<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">bgp-rib</a> <a href="#">afi-safi</a> <a href="#">afi-safi-name</a> <a href="#">identityref</a> <a href="#">evpn</a> <a href="#">local-rib</a> <a href="#">smet-route</a> <a href="#">route-distinguisher</a> ( <a href="#">route-distinguisher-type-0</a>   <a href="#">route-distinguisher-type-1</a>   <a href="#">route-distinguisher-type-2</a>   <a href="#">route-distinguisher-type-2b</a> ) <a href="#">ethernet-tag-id</a> <i>number</i> <a href="#">multicast-source-length</a> <i>number</i> <a href="#">multicast-source-address</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">multicast-group-length</a> <i>number</i> <a href="#">multicast-group-address</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">originating-router</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">neighbor</a> ( <a href="#">ipv4-address-with-zone</a>   <a href="#">ipv6-address-with-zone</a> ) <a href="#">path-id</a> <i>number</i> <a href="#">invalid-reason</a> <a href="#">next-hop-unresolved</a> <i>boolean</i>
<b>Tree</b>	<a href="#">next-hop-unresolved</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **rejected-route** *boolean*

<b>Description</b>	Indicates true if the route was rejected by an import policy.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">bgp-rib</a> <a href="#">afi-safi</a> <a href="#">afi-safi-name</a> <a href="#">identityref</a> <a href="#">evpn</a> <a href="#">local-rib</a> <a href="#">smet-route</a> <a href="#">route-distinguisher</a> ( <a href="#">route-distinguisher-type-0</a>   <a href="#">route-distinguisher-type-1</a>   <a href="#">route-distinguisher-type-2</a>   <a href="#">route-distinguisher-type-2b</a> ) <a href="#">ethernet-tag-id</a> <i>number</i> <a href="#">multicast-source-length</a> <i>number</i> <a href="#">multicast-source-address</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">multicast-group-length</a> <i>number</i> <a href="#">multicast-group-address</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">originating-router</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">neighbor</a> ( <a href="#">ipv4-address-with-zone</a>   <a href="#">ipv6-address-with-zone</a> ) <a href="#">path-id</a> <i>number</i> <a href="#">invalid-reason</a> <a href="#">rejected-route</a> <i>boolean</i>
<b>Tree</b>	<a href="#">rejected-route</a>
<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### **last-modified** *string*

<b>Description</b>	Time of the last modification of the route stored in the BGP RIB. For a route learned from a BGP neighbor the initial value is the same as last-updatereceived. If an import policy later changed some attribute of the route last-modified would be updated to reflect the time of this change.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">bgp-rib</a> <a href="#">afi-safi</a> <a href="#">afi-safi-name</a> <a href="#">identityref</a> <a href="#">evpn</a> <a href="#">local-rib</a> <a href="#">smet-route</a> <a href="#">route-distinguisher</a> ( <a href="#">route-distinguisher-type-0</a>   <a href="#">route-distinguisher-type-1</a>   <a href="#">route-distinguisher-type-2</a>   <a href="#">route-distinguisher-type-2b</a> ) <a href="#">ethernet-tag-id</a> <i>number</i> <a href="#">multicast-source-length</a> <i>number</i> <a href="#">multicast-source-address</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">multicast-group-length</a> <i>number</i> <a href="#">multicast-group-address</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">originating-router</a> ( <a href="#">ipv4-address</a>   <a href="#">ipv6-address</a> ) <a href="#">neighbor</a> ( <a href="#">ipv4-address-with-zone</a>   <a href="#">ipv6-address-with-zone</a> ) <a href="#">path-id</a> <i>number</i> <a href="#">last-modified</a> <i>string</i>

### **value** *number*

<b>Description</b>	The value of the label field
--------------------	------------------------------

If the route is an EVPN MPLS route, the mpls-label is read out of the 20-bit high order value. If the route is an EVPN VXLAN route, the vni is read out of the 24-bit value. If the route is an EVPN SRv6 route, this field is set to zero if no transposition is used and set to a non-zero value if transposition is used.

<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">bgp-rib</a> <a href="#">afi-safi</a> <a href="#">afi-safi-name</a> <a href="#">identityref</a> <a href="#">evpn</a> <a href="#">rib-in-out</a> <a href="#">rib-in-post</a> <a href="#">ip-prefix-route</a> <a href="#">route-distinguisher</a> ( <a href="#">route-distinguisher-type-0</a>   <a href="#">route-distinguisher-type-1</a>   <a href="#">route-distinguisher-type-2</a>   <a href="#">route-distinguisher-type-2b</a> ) <a href="#">ethernet-tag-id</a> <i>number</i> <a href="#">ip-prefix-length</a> <i>number</i> <a href="#">ip-prefix</a> ( <a href="#">ipv4-prefix</a>   <a href="#">ipv6-prefix</a> ) <a href="#">neighbor</a> ( <a href="#">ipv4-address-with-zone</a>   <a href="#">ipv6-address-with-zone</a> ) <a href="#">path-id</a> <i>number</i> <a href="#">label</a> <a href="#">value</a> <i>number</i>

<b>Configurable</b>	False
<b>Platforms</b>	Supported on all platforms

### last-modified *string*

<b>Description</b>	Time of the last modification of the route stored in the BGP RIB. For a route learned from a BGP neighbor the initial value is the same as last-updatereceived. If an import policy later changed some attribute of the route last-modified would be updated to reflect the time of this change.
<b>Context</b>	<a href="#">network-instance name</a> <i>string</i> <a href="#">bgp-rib</a> <a href="#">afi-safi</a> <a href="#">afi-safi-name</a> <a href="#">identityref</a> <a href="#">evpn</a> <a href="#">rib-in-out</a> <a href="#">rib-in-post</a> <a href="#">ip-prefix-route</a> <a href="#">route-distinguisher</a> ( <a href="#">route-distinguisher-type-0</a>   <a href="#">route-distinguisher-type-1</a>   <a href="#">route-distinguisher-type-2</a>   <a href="#">route-distinguisher-type-2b</a> ) <a href="#">ethernet-tag-id</a> <i>number</i> <a href="#">ip-prefix-length</a> <i>number</i> <a href="#">ip-</a>

## value *number*

<b>Description</b>	The value of the label field  If the route is an EVPN MPLS route, the <i>mpls-label</i> is read out of the 20-bit high order value. If the route is an EVPN VXLAN route, the <i>vni</i> is read out of the 24-bit value. If the route is an EVPN SRv6 route, this field is set to zero if no transposition is used and set to a non-zero value if transposition is used. For all the cases, if this is an Auto-Discovery per ES route, this leaf is set to zero.

**value number**

<b>Description</b>	The value of the label field
--------------------	------------------------------

If the route is an EVPN MPLS route, the mpls-label is read out of the 20-bit high order value. If the route is an EVPN VXLAN route, the vni is read out of the 24-bit value. If the route is an EVPN SRv6 route, this field is set to zero if no transposition is used and set to a non-zero value if transposition is used. For all the cases, if this is an Auto-Discovery per ES route, this leaf is set to zero.
