Tree flags

Options

- backup

  Backup flag. When set, the END.X SID refers to an adjacency being protected (e.g.: using TILFA)

- set

  Set flag. When set, the S-Flag indicates that the END.X SID refers to a set of adjacencies

- persistent

  Set flag. When set, the S-Flag indicates that the END.X SID is persistently allocated, i.e., the SID value remains consistent across router restart and/or interface flap

bandwidth *number*

Description The bandwidth utilization on a link, forwarding adjacency, or bundled link with units of bytes per second. For a link or forwarding adjacency, bandwidth utilization represents the actual utilization of the link (i.e., as measured by the advertising node). For a bundled link, bandwidth utilization is defined to be the sum of the component link bandwidth utilizations.

flags *keyword*

Description Flags associated with Adj-Segment-ID.

Context network-instance name *string* protocols isis instance name *string* level level-number *number* link-state-database lsp lsp-id *string* tlvs tlv type *identityref* mt-isn neighbors neighbor mt-id *number* system-id *string* instances instance id *number* subtlvs subtlv type *identityref* adjacency-sids adjacency-sid value *number* flags *keyword*

Tree flags

Options

- address-family

  Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.

- backup

  Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).

- value

  Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.

- local

  Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.

- set

  Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

Configurable False

metric *number*

Description This metric is administratively assigned and can be used to present a differently weighted topology to traffic engineering SPF calculations. To preclude overflow within a traffic engineering SPF implementation, all metrics greater than or equal to MAX_PATH_METRIC SHALL be considered to have a metric of MAX_PATH_METRIC.

bandwidth *number*

Description The available bandwidth on a link, forwarding adjacency, or bundled link with units of bytes per second. For a link or forwarding adjacency, available bandwidth is defined to be residual bandwidth minus the measured bandwidth used for the actual forwarding of non-RSVP-TE label switched path packets. For a bundled link, available bandwidth is defined to be the sum of the component link available bandwidths minus the measured bandwidth used for the actual forwarding of non-RSVP-TE label switched path packets. For a bundled link, available bandwidth is defined to be the sum of the component link available bandwidths.

Tree flags

Options

- address-family

  Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.

- backup

  Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).

- value

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.

- local

  Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.

- set

  Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

link-loss *number*

Description Link packet loss as a percentage of the total traffic sent over a configurable interval. The basic unit is 0.000003%, where (2^24 - 2) is 50.331642%. This value s the highest packet-loss percentage that can be expressed (the assumption being that precision is more important on high-speed links than the ability to advertise loss rates greater than this, and that high- peed links with over 50% loss are unusable). Therefore, measured values that are larger than the field maximum SHOULD be encoded as the maximum value.

Context network-instance name *string* protocols isis instance name *string* level level-number *number* link-state-database lsp lsp-id *string* tlvs tlv type *identityref* mt-isn neighbors neighbor mt-id *number* system-id *string* instances instance id *number* subtlvs subtlv type *identityref* link-protection-type type *keyword*

Tree type

Options

- extra-traffic

  If set the link has extra traffic protection. If the link is of type Extra Traffic, it means that the link is protecting another link or links. The LSPs on a link of this type will be lost if any of the links it is protecting fail.

- unprotected

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If set, the link is unprotected. If the link is of type Unprotected, it means that there is no other link protecting this link. The LSPs on a link of this type will be lost if the link fails.

- shared

  If set, the link has shared protection. If the link is of type Shared, it means that there are one or more disjoint links of type Extra Traffic that are protecting this link. These Extra Traffic links are shared between one or more links of type Shared.

- one-one

  If set, the link has dedicated 1:1 protection. If the link is of type Dedicated 1:1, it means that there is one dedicated disjoint link of type Extra Traffic that is protecting this link.

- plus-one

  If set, the link has dedicated 1+1 protection. If the link is of type Dedicated 1+1, it means that a dedicated disjoint link is protecting this link. However, the protecting link is not advertised in the link state database and is therefore not available for the routing of LSPs.

- enhanced

  If set the link has enhanced protection. If the link is of type Enhanced, it means that a protection scheme that is more reliable than Dedicated 1+1, e.g., 4 fiber BLSR/MS-SPRING, is being used to protect this link.

Tree flags

Options

- backup

  Backup flag. When set, the END.X SID refers to an adjacency being protected (e.g.: using TILFA)

- set

  Set flag. When set, the S-Flag indicates that the END.X SID refers to a set of adjacencies

- persistent

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Persistent flag. When set, the S-Flag indicates that the END.X SID is persistently allocated, i.e., the SID value remains consistent across router restart and/or interface flap

Tree flags

Options

- backup

  Backup flag. When set, the END.X SID refers to an adjacency being protected (e.g.: using TILFA)

- set

  Set flag. When set, the S-Flag indicates that the END.X SID refers to a set of adjacencies

- persistent

  Set flag. When set, the S-Flag indicates that the END.X SID is persistently allocated, i.e., the SID value remains consistent across router restart and/or interface flap

bandwidth *number*

Description The bandwidth utilization on a link, forwarding adjacency, or bundled link with units of bytes per second. For a link or forwarding adjacency, bandwidth utilization represents the actual utilization of the link (i.e., as measured by the advertising node). For a bundled link, bandwidth utilization is defined to be the sum of the component link bandwidth utilizations.

Tree flags

Options

- flood

  When the S bit is set(1), the IS - IS Router CAPABILITY TLV MUST be flooded across the entire routing domain. When the S bit is not set(0), the TLV MUST NOT be leaked between levels . This bit MUST NOT be altered during the TLV leaking.

- down

  When the IS-IS Router CAPABILITY TLV is leaked from level - 2 to level-1, the Down bit MUST be set. Otherwise, this bit MUST be clear. IS - IS Router capability TLVs with the Down bit set MUST NOT be leaked from level - 1 to level-2. This is to prevent TLV looping.

Configurable False

Tree standard-algorithm

Options

- spf

  Shortest Path First (SPF) algorithm based on link metric. This is the well-known shortest path algorithm as computed by the IS-IS Decision process. Consistent with the deployed practice for link-state protocols, algorithm 0 permits any node to overwrite the SPF path with a different path based on local policy.

- strict-spf

  Strict Shortest Path First (SPF) algorithm based on link metric. The algorithm is identical to algorithm 0 but algorithm 1 requires that all nodes along the path will honor the SPF routing decision. Local policy MUST NOT alter the forwarding decision computed by algorithm 1 at the node claiming to support algorithm 1.

Tree flags

Options

- external-flag

  External prefix flag. Set if the prefix has been redistributed from another protocol. This includes the case where multiple virtual routers are supported and the source of the redistributed prefix is another IS-IS instance.

- readvertisement-flag

  Readvertisement flag. Set when the prefix has been leaked from one level to another (upwards or downwards).

- node-flag

  Node flag. Set when the prefix identifies the advertising router, i.e., the prefix is a host prefix advertising a globally reachable address typically associated with a loopback address.

- elc-flag

  Elc flag. Set for local host prefix of the originating node if it supports ELC on all interfaces

- anycast-flag

  Anycast flag. Set if the prefix is anycast

loopfree-alternate *boolean*

Description	Enables loopfree-alternate (LFA) protection for the IS-IS flexible algorithm. This setting allows the flex-algo to attempt to compute LFA backup paths. Enabling this does not guarantee LFA will be available. Note: LFA must also be enabled at the top-level IS-IS instance for this to be effective.

active *boolean*

Description	When false, the prefix SID is inactive. It could be inactive for any of these reasons:
Context	network-instance name *string* protocols isis instance name *string* segment-routing mpls sid-database prefix-sid prefix *(ipv4-prefix | ipv6-prefix)* sid-label-value *number* multi-topology-id *number* algorithm *number* active *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	active
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

prefix-conflict *boolean*

Description	Reads true when the prefix SID entry is involved in a prefix conflict within the scope of this IS-IS instance. This occurs when there are multiple entries for the same (prefix, multi-topology-id, algorithm). All the conflicting entries become inactive except for the one with the smallest sid-index.
Context	network-instance name *string* protocols isis instance name *string* segment-routing mpls sid-database prefix-sid prefix *(ipv4-prefix | ipv6-prefix)* sid-label-value *number* multi-topology-id *number* algorithm *number* prefix-conflict *boolean*
Tree	prefix-conflict
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

sid-conflict *boolean*

Description	Reads true when the prefix SID entry is involved in a SID conflict within the scope of this IS-IS instance. This occurs when the same SID has been assigned to different prefixes after first eliminating entries that have lost the prefix-conflict comparison. All entries involved in a SID conflict that do not have the absolute lowest 'preference' value become inactive. In the SRL implementation SID entries associated with interfaces of this IS-IS instance are considered to have a lower numerical preference than remote prefix-sid entries. If there are still SID conflicts then all the remaining conflicting entries become inactive except for the one with the smallest sid-index.
Context	network-instance name *string* protocols isis instance name *string* segment-routing mpls sid-database prefix-sid prefix *(ipv4-prefix | ipv6-prefix)* sid-label-value *number* multi-topology-id *number* algorithm *number* sid-conflict *boolean*

lsp-generation

Description Enter the lsp-generation context

Container with options for specifying LSP generation timer values

Context network-instance name *string* protocols isis instance name *string* timers lsp-generation

Tree lsp-generation

Configurable True

Platforms Supported on all platforms

initial-wait *number*

Description Time interval between the detection of topology change and when the new LSP is generated.

The timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms

Context network-instance name *string* protocols isis instance name *string* timers lsp-generation initial-wait *number*

Tree initial-wait

Range 10 to 100000

Default 10

Units milliseconds

Configurable True

Platforms Supported on all platforms

max-wait *number*

Description Specifies the maximum interval between two consecutive generations of an LSP.

The timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms

Context network-instance name *string* protocols isis instance name *string* timers lsp-generation max-wait *number*

Tree max-wait

Range 10 to 120000

Default 5000

Units	milliseconds
Configurable	True
Platforms	Supported on all platforms

second-wait *number*

Description	Time interval between the the first and second LSP generation. The timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms
Context	network-instance name *string* protocols isis instance name *string* timers lsp-generation second-wait *number*
Tree	second-wait
Range	10 to 100000
Default	1000
Units	milliseconds
Configurable	True
Platforms	Supported on all platforms

lsp-lifetime *number*

Description	Time interval in seconds that the LSPs originated by this IS (router) remain valid in the LSDB before they must be refreshed or else they are purged.
Context	network-instance name *string* protocols isis instance name *string* timers lsp-lifetime *number*
Tree	lsp-lifetime
Range	350 to 65535
Default	1200
Units	seconds
Configurable	True
Platforms	Supported on all platforms

lsp-refresh

Description	Enter the lsp-refresh context Configure LSP refresh timers.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	network-instance name *string* protocols isis instance name *string* timers lsp-refresh
Tree	lsp-refresh
Configurable	True
Platforms	Supported on all platforms

half-lifetime *boolean*

Description	When set to true, the LSP refresh interval is half the lsp-lifetime
Context	network-instance name *string* protocols isis instance name *string* timers lsp-refresh half-lifetime *boolean*
Tree	half-lifetime
Default	true
Configurable	True
Platforms	Supported on all platforms

interval *number*

Description	Time interval in seconds since the last advertisement of its LSP when the router attempts to refresh the LSP. Must not exceed 90% of the lsp-lifetime. This value is ignored when half-lifetime is set to true.
Context	network-instance name *string* protocols isis instance name *string* timers lsp-refresh interval *number*
Tree	interval
Range	150 to 65535
Default	600
Units	seconds
Configurable	True
Platforms	Supported on all platforms

spf

Description	Enter the spf context Container with options for specifying SPF timer values
Context	network-instance name *string* protocols isis instance name *string* timers spf
Tree	spf
Configurable	True

ipv4-te-router-id *string*

Description	A routable IPv4 address to identify the router uniquely in a TE domain. TLV = 134. The ipv4-te-router-id contains the 4-octet router ID of the router originating the LSP. The ipv4-te-router-id guarantees a single stable address that can always be referenced in a path that will be reachable from multiple hops away, regardless of the state of the node's interfaces. The configured ipv4-te-router-id address must be active and reachable within the routing instance and must be associated to either a system or loopback interface. The state value represents the operational advertised of ipv4-te-router-id

ipv6-te-router-id *string*

Description A routable IPv6 address to identify the router uniquely in a TE domain. TLV = 140.

The ipv6-te-router-id contains the 4-octet router ID of the router originating the LSP. The ipv6-te-router-id guarantees a single stable address that can always be referenced in a path that will be reachable from multiple hops away, regardless of the state of the node's interfaces.

The configured ipv6-te-router-id address must be active and reachable within the routing instance and must be associated to either a system or loopback interface. The state value represents the operational advertised of ipv6-te-router-id

admin-state *keyword*

Description Setting enable triggers weighted ECMP programming for all eligible multipath IS-IS routes associated with the instance

An IS-IS route is eligible for weighted ECMP if all the next-hop interfaces in the multipath set have a load-balancing-weight other than 'none'.

When weighted ECMP is disabled in an IS-IS instance all IS-IS multipath routes are programmed as normal ECMP, even if some or all of the next-hop

- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

last-oper-state-change *string*

Description The last time that the IPv6 oper-state changed

Context network-instance name *string* protocols ldp ipv6 last-oper-state-change *string*

Tree last-oper-state-change

String Length 20 to 32

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

lsr-id *string*

Description Returns the value that is being used as the LDP LSR ID

Context network-instance name *string* protocols ldp ipv6 lsr-id *string*

Tree lsr-id

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

oper-down-reason *keyword*

Description The reason for the LDP for IPv6 being operationally down

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context network-instance name *string* protocols ldp ipv6 oper-down-reason *keyword*

Tree oper-down-reason

Options

- ldp-admin-disabled
- mpls-admin-disabled
- no-system-ipv6-address

  System IPv6 address is used as the LSR ID. If this depedency is missing LDP is down
- net-instance-mgr-down
- label-block-unavailable
- no-resource

  Memory allocation failure
- unknown

  Other failure reason

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

oper-state *keyword*

Description The operational state of LDP for IPv6

Context network-instance name *string* protocols ldp ipv6 oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed

© 2026 Nokia.

- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable False

oper-state *keyword*

Description The operational state of the MLD interface. This simply tracks the operational state of the subinterface

Context network-instance name *string* protocols mld interface interface-name *string* oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable False

oper-state *keyword*

Description Used to report operational state of the MLD instance

Context network-instance name *string* protocols mld oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

query-interval *number*

Description	Interval at which the router sends the MLD membership queries
Context	network-instance name *string* protocols mld-snooping interface interface-name *string* query-interval *number*
Tree	query-interval
Range	2 to 1024
Default	125
Configurable	True
Platforms	7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7250 IXR-10e-gen2cp, 7250 IXR-6e-gen2cp, 7250 IXR-X1B, 7250 IXR-X3B

query-last-member-interval *number*

Description	Interval at which Group-Specific-Query packets are transmitted When used along with EVPN multi-homing, the result of this value multipled by the interface robust-count must be a value equal to or less than 25.5 seconds. This is due to the fact that the maximum response time field in the EVPN Multicast Leave Synch route has a limit of 255 units of 1/10 second, and this field encodes the result of [(query-last-member-interval* 10) * robust-count]. If the result of that operation is greater than 255, the maximum response time in the EVPN Multicast Leave Synch route is still 255.
Context	network-instance name *string* protocols mld-snooping interface interface-name *string* query-last-member-interval *number*
Tree	query-last-member-interval
Range	1 to 5
Default	1
Configurable	True

robust-count *number*

Description	Tune MLD robustness to allow for expected packet loss The robust-count variable allows tuning for the expected packet loss on a subnet. If a subnet anticipates losses, the robust-count variable can be increased. When used along with EVPN multi-homing, the result of this value multipled by the interface query-last-member-interval must be a value equal to or less than 25.5 seconds. This is due to the fact that the maximum response time field in the EVPN Multicast Leave Synch route has a limit of 255 units of 1/10 second, and this field encodes the result of [(query-last-member-interval* 10) * robust-count]. If the result of that operation is greater than 255, the maximum response time in the EVPN Multicast Leave Synch route is still 255.

- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

connection-retry *number*

Description	The number of peer connection retry attempts

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	network-instance name *string* protocols msdp peer ip-address *string* connection-retry *number*
Tree	connection-retry
Default	0
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

default-peer *boolean*

Description	Set the peer as a default MSDP peer
Context	network-instance name *string* protocols msdp peer ip-address *string* default-peer *boolean*
Tree	default-peer
Default	false
Configurable	True
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

last-active-source-limit *string*

Description	The time that the last active source limit was triggered
Context	network-instance name *string* protocols msdp peer ip-address *string* last-active-source-limit *string*
Tree	last-active-source-limit
String Length	20 to 32
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

last-peer-state-change *string*

Description	The time at which the most recent peer-state change occurred
Context	network-instance name *string* protocols msdp peer ip-address *string* last-peer-state-change *string*
Tree	last-peer-state-change

© 2026 Nokia.

duration *number*

Description	The length of time that the IGP interface has been in sync or out of sync
Context	network-instance name *string* protocols ospf instance name *string* area area-id interface interface-name *string* ldp-synchronization duration *number*
Tree	duration
Units	seconds
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

end-of-lib *boolean*

Description	When set to true, the IGP restores the normal metric for the IGP adjacency when learning from LDP that all label-FEC mappings have been received from the LDP peer, even if there is remaining time on the hold-down-timer. When set to false, the IGP always waits for the full duration of the hold-down-timer to restore the normal metric for the IGP adjacency. This overrides the global/instance level setting
Context	network-instance name *string* protocols ospf instance name *string* area area-id interface interface-name *string* ldp-synchronization end-of-lib *boolean*
Tree	end-of-lib
Configurable	True

sync-state *keyword*

Description The current state of the interface with respect to LDP-IGP sync

Context network-instance name *string* protocols ospf instance name *string* area area-id interface interface-name *string* ldp-synchronization sync-state *keyword*

Tree sync-state

Options

- wait-for-LDP-adjacency

  The IGP is waiting for the LDP adjacency to come up. The interface is being advertised with max-metric

- hold-down-timer-active

  The LDP adjacency has come up and the IGP has started the hold-down-timer, waiting for either end-of-lib or hold-down-timer expiry. The interface is being advertised with max-metric

- end-of-lib-received

  The IGP received end-of-lib and has switched to normal operation. The interface is being aadveertised with a normal metric

- hold-down-timer-expired

  The IGP did not receive end-of-lib (or was configured to ignore it) but hold-down-timer has expired and normal metric is restored

- manual-exit

  A tools command was performed to exit ldp-sync. Normal operation is resumed, max-metric is removed

- disabled

  ldp-sync is not applicable on this interface

Configurable False

type *identityref*

Description The type of LSA being described. The type of the LSA is expressed as a canonical name.

Context network-instance name *string* protocols ospf instance name *string* area area-id interface interface-name *string* lsdb lsa-types lsa-type type *identityref*

Options

- router-lsa

  Type 1 - router-lsa. An LSA originated by each router within the area describing the state and cost of the router's links in the area.

- network-lsa

  Type 2 - network-lsa. An LSA originated for each broadcast and non-broadcast multiple access (NBMA) in the area. This LSA is originated by the designated router.

- summary-ip-network-lsa

  Type 3 - summary-ip-network-lsa. An LSA originated by area border routers describing inter-area destinations. This LSA type is used when the destination is an IP network

- summary-asbr-lsa

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Type 4 - summary-asbr-lsa. An LSA originated by an area border router describing inter-area destinations. This LSA type is used when the destination is an AS boundary router.

- as-external-lsa

  Type 5 - as-external-lsa. This LSA type is used to describe destinations external to the autonomous system, and is originated by an AS boundary router (ASBR).

- nssa-as-external-lsa

  Type 7 - nssa-as-external-lsa. This LSA type is used by systems within a not-so-stubby-area (NSSA) to inject external prefixes into the LSDB. They are translated to Type 5 LSAs at an ABR device.

- ospfv2-link-scope-opaque-lsa

  Type 9 - ospfv2-link-scope-opaque-lsa. This LSA type is used in OSPFv2 to distribute arbitrary information via the OSPF protocol. The contents is specific to the application defining the Opaque Type specified within the LSDB. LSAs with Type 9 have a scope of the link that they are being transmitted on (and the associated network or subnetwork).

- ospfv2-area-scope-opaque-lsa

  Type 10 - ospfv2-area-scope-opaque-lsa. This LSA type is used in OSPFv2 to distribute arbitrary information via the OSPF protocol. The contents is specific to the application defining the Opaque Type specified within the LSDB. LSAs with Type 10 have a scope of the area that they are transmitted within.

- ospfv2-as-scope-opaque-lsa

  Type 11 - ospfv2-as-scope-opaque-lsa. This LSA type is used in OSPFv2 to distribute arbitrary information via the OSPF protocol. The contents is specific to the application defining the Opaque Type specified within the LSDB. LSAs with Type 11 have a scope of the autonomous system that they are transmitted within.

Tree scope

Options

- LINK

  The scope of the LSA is the current link. The LSA is not flooded beyond the local network. This enumeration denotes a Type 9 LSA.

- AREA

  The scope of the LSA is the local area. The LSA is not flooded beyond the area of origin. This enumeration denotes a Type 10 LSA.

- AS

  The scope of the LSA is the local autonomous system (AS). The flooding domain is the same as a Type 5 LSA - it is not flooded into stub areas or NSSAs. This enumeration denotes a Type 11 LSA.

Configurable False

Platforms Supported on all platforms

type *identityref*

Description The Opaque Type of the LSA. This value is used to indicate the type of data carried by the opaque LSA

Context network-instance name *string* protocols ospf instance name *string* area area-id interface interface-name *string* lsdb lsa-types lsa-type type *identityref* lsas lsa advertising-router *string* link-state-id *string* opaque-lsa type *identityref*

Tree type

Options

- traffic-engineering

  The Traffic Engineering LSA. This type is used only with area-scope Opaque LSAs - and is used to describe routers, point-to-point links and connections to multi-access networks for traffic engineering purposes.

- grace-lsa

  Grace LSAs are announced by a system undergoing graceful-restart. A system that is attempting an OSPF graceful restart announces Grace-LSAs with a specified grace period, indicating the intention to have completed an restart within the specified period.

- router-information

  The Router Information LSA is used by an OSPFv2 system to announce optional capabilities of the local system, over and above those that are included within the OSPF hello message field. The flooding scope of the LSA can be link-, area-, or AS-wide (i.e., the LSA type can be 9, 10 or 11).

- ospfv2-extended-prefix

  The Extended Prefix LSA is used in OSPFv2 to carry a set of attributes that are to be associated with a prefix that is advertised in OSPF. The attributes are carried as one or more TLV tuples. The flooding scope of

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the LSA can be link-, area-, or AS-wide as specified by the advertising system. The flooding scope of the LSA may exceed the scope of the corresponding prefix.

- ospfv2-extended-link

  The Extended Link LSA is used in OSPFv2 to carry a set of attributes that are to be associated with a link that is advertised in OSPF. The link attributes are carried as one or more TLV tuples. The flooding scope of the link LSA is area-local - i.e., it is carried in a Type 10 opaque LSA.

prefix-options *identityref*

Description OSPFv3 prefix option flag list. This list will contain the identities for the OSPFv3 options that are set for the OSPFv3 prefix.

Context network-instance name *string* protocols ospf instance name *string* area area-id interface interface-name *string* lsdb lsa-types lsa-type type *identityref* lsas lsa advertising-router *string* link-state-id *string* ospfv3-link-lsa prefixes prefix *(ipv4-prefix | ipv6-prefix)* prefix-options prefix-options *identityref*

Tree prefix-options

Options

- ospfv3-prefix-nu-bit

  NU Bit, when set, the prefix should be excluded from IPv6 unicast calculations.

- ospfv3-prefix-la-bit

  LA bit, when set, the prefix is actually an IPv6 interface address of the Advertising Router.

- ospfv3-prefix-p-bit

  P bit, when set, the NSSA area prefix should be translated to an AS External LSA and advertised by the translating NSSA Border Router.

- ospfv3-prefix-dn-bit

  DN bit, when set, the inter-area-prefix LSA or AS-external LSA prefix has been advertised as an L3VPN prefix.

Configurable False

adjacency-state *identityref*

Description Current OSPF Neighbor state

Context network-instance name *string* protocols ospf instance name *string* area area-id interface interface-name *string* neighbor router-id adjacency-state *identityref*

Tree adjacency-state

Options

- down

  The initial state of a neighbor, indicating that no recent information has been received from the neighbor.

- attempt

  Utilised for neighbors that are attached to NBMA networks, it indicates that no information has been recently received from the neighbor but that Hello packets should be directly sent to that neighbor.

- init

  Indicates that a Hello packet has been received from the neighbor but bi-directional communication has not yet been established. That is to say that the local Router ID does not appear in the list of neighbors in the remote system's Hello packet.

- two-way

  Communication between the local and remote system is bi-directional such that the local system's Router ID is listed in the received remote system's Hello packet.

- exstart

  An adjacency with the remote system is being formed. The local system is currently transmitting empty database description packets in order to establish the primary/standby relationship for the adjacency.

- exchange

  The local and remote systems are currently exchanging database description packets in order to determine which elements of their local LSDBs are out of date.

- loading

  The local system is sending Link State Request packets to the remote system in order to receive the more recently LSAs that were discovered during the Exchange phase of the procedure establishing the adjacency.

- full

  The neighboring routers are fully adjacent such that both LSDBs are synchronized. The adjacency will appear in Router and Network LSAs

Tree	lsa-type
Configurable	False
Platforms	Supported on all platforms

type *identityref*

Description	The type of LSA being described. The type of the LSA is expressed as a canonical name.
Context	network-instance name *string* protocols ospf instance name *string* area area-id lsdb lsa-types lsa-type type *identityref*
Options	• router-lsa Type 1 - router-lsa. An LSA originated by each router within the area describing the state and cost of the router's links in the area. • network-lsa Type 2 - network-lsa. An LSA originated for each broadcast and non-broadcast multiple access (NBMA) in the area. This LSA is originated by the designated router. • summary-ip-network-lsa Type 3 - summary-ip-network-lsa. An LSA originated by area border routers describing inter-area destinations. This LSA type is used when the destination is an IP network • summary-asbr-lsa Type 4 - summary-asbr-lsa. An LSA originated by an area border router describing inter-area destinations. This LSA type is used when the destination is an AS boundary router. • as-external-lsa Type 5 - as-external-lsa. This LSA type is used to describe destinations external to the autonomous system, and is originated by an AS boundary router (ASBR). • nssa-as-external-lsa

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Type 7 - nssa-as-external-lsa. This LSA type is used by systems within a not-so-stubby-area (NSSA) to inject external prefixes into the LSDB. They are translated to Type 5 LSAs at an ABR device.

- ospfv2-link-scope-opaque-lsa

  Type 9 - ospfv2-link-scope-opaque-lsa. This LSA type is used in OSPFv2 to distribute arbitrary information via the OSPF protocol. The contents is specific to the application defining the Opaque Type specified within the LSDB. LSAs with Type 9 have a scope of the link that they are being transmitted on (and the associated network or subnetwork).

- ospfv2-area-scope-opaque-lsa

  Type 10 - ospfv2-area-scope-opaque-lsa. This LSA type is used in OSPFv2 to distribute arbitrary information via the OSPF protocol. The contents is specific to the application defining the Opaque Type specified within the LSDB. LSAs with Type 10 have a scope of the area that they are transmitted within.

- ospfv2-as-scope-opaque-lsa

  Type 11 - ospfv2-as-scope-opaque-lsa. This LSA type is used in OSPFv2 to distribute arbitrary information via the OSPF protocol. The contents is specific to the application defining the Opaque Type specified within the LSDB. LSAs with Type 11 have a scope of the autonomous system that they are transmitted within.

- ospfv3-lsa-type

scope *keyword*

Description The scope of the opaque LSA. The type of the LSA indicates its scope - the value of this leaf determines both the flooding domain, and the type of the LSA.

Context network-instance name *string* protocols ospf instance name *string* area area-id lsdb lsa-types lsa-type type *identityref* lsas lsa advertising-router *string* link-state-id *string* opaque-lsa scope *keyword*

Tree scope

Options

- LINK

  The scope of the LSA is the current link. The LSA is not flooded beyond the local network. This enumeration denotes a Type 9 LSA.

- AREA

  The scope of the LSA is the local area. The LSA is not flooded beyond the area of origin. This enumeration denotes a Type 10 LSA.

- AS

  The scope of the LSA is the local autonomous system (AS). The flooding domain is the same as a Type 5 LSA - it is not flooded into stub areas or NSSAs. This enumeration denotes a Type 11 LSA.

Configurable False

Platforms Supported on all platforms

type *identityref*

Description The Opaque Type of the LSA. This value is used to indicate the type of data carried by the opaque LSA

Context network-instance name *string* protocols ospf instance name *string* area area-id lsdb lsa-types lsa-type type *identityref* lsas lsa advertising-router *string* link-state-id *string* opaque-lsa type *identityref*

Tree type

Options

- traffic-engineering

  The Traffic Engineering LSA. This type is used only with area-scope Opaque LSAs - and is used to describe routers, point-to-point links and connections to multi-access networks for traffic engineering purposes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- grace-lsa

  Grace LSAs are announced by a system undergoing graceful-restart. A system that is attempting an OSPF graceful restart announces Grace-LSAs with a specified grace period, indicating the intention to have completed an restart within the specified period.

- router-information

  The Router Information LSA is used by an OSPFv2 system to announce optional capabilities of the local system, over and above those that are included within the OSPF hello message field. The flooding scope of the LSA can be link-, area-, or AS-wide (i.e., the LSA type can be 9, 10 or 11).

- ospfv2-extended-prefix

  The Extended Prefix LSA is used in OSPFv2 to carry a set of attributes that are to be associated with a prefix that is advertised in OSPF. The attributes are carried as one or more TLV tuples. The flooding scope of the LSA can be link-, area-, or AS-wide as specified by the advertising system. The flooding scope of the LSA may exceed the scope of the corresponding prefix.

- ospfv2-extended-link

  The Extended Link LSA is used in OSPFv2 to carry a set of attributes that are to be associated with a link that is advertised in OSPF. The link attributes are carried as one or more TLV tuples. The flooding scope of the link LSA is area-local - i.e., it is carried in a Type 10 opaque LSA.

Configurable False

Platforms Supported on all platforms

nssa

Description This command creates the context to configure the associated OSPF or OSPF3 area as Not So Stubby Area (NSSA).

NSSAs are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is an NSSA has the capability to flood external routes that it learns throughout its area and via an ABR to the entire OSPF or OSPF3 domain.

Context network-instance name *string* protocols ospf instance name *string* area area-id nssa

helper-mode *boolean*

Description	Enable or disable the OSPF graceful restart helper function When this leaf is set, the local system supports retaining forwarding information during a neighbor router's restart.
Context	network-instance name *string* protocols ospf instance name *string* graceful-restart helper-mode *boolean*
Tree	helper-mode
Default	false
Configurable	True
Platforms	Supported on all platforms

strict-lsa-checking *boolean*

Description	Enter the strict-lsa-checking context
Context	network-instance name *string* protocols ospf instance name *string* graceful-restart strict-lsa-checking *boolean*
Tree	strict-lsa-checking
Default	false
Configurable	True
Platforms	Supported on all platforms

ignore-dn-bit *boolean*

Description	In an ip-vrf (VPRN), when true, this OSPF instance ignores the Down (DN) bit on received LSAs when installing or using routes. Applies to both OSPFv2 (Type 3 summary, Type 5 / Type 7 external LSA options DN bit, RFC 4576) and OSPFv3 (prefix-options DN bit on inter-area-prefix and AS-external LSAs, RFC 6565); the SR Linux model intentionally exposes a single version-agnostic knob because the underlying behaviour is identical at the redistribute / SPF boundary. In the default network-instance, the DN bit is not used by the protocol stack for PE-CE loop prevention, so this leaf is a no-op there and is constrained to false by a must statement.
Context	network-instance name *string* protocols ospf instance name *string* ignore-dn-bit *boolean*
Tree	ignore-dn-bit

type *identityref*

Description The type of LSA being described. The type of the LSA is expressed as a canonical name.

Context network-instance name *string* protocols ospf instance name *string* lsdb lsa-types lsa-type type *identityref*

Options

- router-lsa

  Type 1 - router-lsa. An LSA originated by each router within the area describing the state and cost of the router's links in the area.

- network-lsa

  Type 2 - network-lsa. An LSA originated for each broadcast and non-broadcast multiple access (NBMA) in the area. This LSA is originated by the designated router.

- summary-ip-network-lsa

  Type 3 - summary-ip-network-lsa. An LSA originated by area border routers describing inter-area destinations. This LSA type is used when the destination is an IP network

- summary-asbr-lsa

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Type 4 - summary-asbr-lsa. An LSA originated by an area border router describing inter-area destinations. This LSA type is used when the destination is an AS boundary router.

- as-external-lsa

  Type 5 - as-external-lsa. This LSA type is used to describe destinations external to the autonomous system, and is originated by an AS boundary router (ASBR).

- nssa-as-external-lsa

  Type 7 - nssa-as-external-lsa. This LSA type is used by systems within a not-so-stubby-area (NSSA) to inject external prefixes into the LSDB. They are translated to Type 5 LSAs at an ABR device.

- ospfv2-link-scope-opaque-lsa

  Type 9 - ospfv2-link-scope-opaque-lsa. This LSA type is used in OSPFv2 to distribute arbitrary information via the OSPF protocol. The contents is specific to the application defining the Opaque Type specified within the LSDB. LSAs with Type 9 have a scope of the link that they are being transmitted on (and the associated network or subnetwork).

- ospfv2-area-scope-opaque-lsa

  Type 10 - ospfv2-area-scope-opaque-lsa. This LSA type is used in OSPFv2 to distribute arbitrary information via the OSPF protocol. The contents is specific to the application defining the Opaque Type specified within the LSDB. LSAs with Type 10 have a scope of the area that they are transmitted within.

- ospfv2-as-scope-opaque-lsa

  Type 11 - ospfv2-as-scope-opaque-lsa. This LSA type is used in OSPFv2 to distribute arbitrary information via the OSPF protocol. The contents is specific to the application defining the Opaque Type specified within the LSDB. LSAs with Type 11 have a scope of the autonomous system that they are transmitted within.

scope *keyword*

Description The scope of the opaque LSA. The type of the LSA indicates its scope - the value of this leaf determines both the flooding domain, and the type of the LSA.

Context network-instance name *string* protocols ospf instance name *string* lsdb lsa-types lsa-type type *identityref* lsas lsa advertising-router *string* link-state-id *string* opaque-lsa scope *keyword*

Tree scope

Options

- LINK

  The scope of the LSA is the current link. The LSA is not flooded beyond the local network. This enumeration denotes a Type 9 LSA.

- AREA

  The scope of the LSA is the local area. The LSA is not flooded beyond the area of origin. This enumeration denotes a Type 10 LSA.

- AS

  The scope of the LSA is the local autonomous system (AS). The flooding domain is the same as a Type 5 LSA - it is not flooded into stub areas or NSSAs. This enumeration denotes a Type 11 LSA.

Configurable False

Platforms Supported on all platforms

type *identityref*

Description The Opaque Type of the LSA. This value is used to indicate the type of data carried by the opaque LSA

Context network-instance name *string* protocols ospf instance name *string* lsdb lsa-types lsa-type type *identityref* lsas lsa advertising-router *string* link-state-id *string* opaque-lsa type *identityref*

Tree type

Options

- traffic-engineering

  The Traffic Engineering LSA. This type is used only with area-scope Opaque LSAs - and is used to describe routers, point-to-point links and connections to multi-access networks for traffic engineering purposes.

- grace-lsa

  Grace LSAs are announced by a system undergoing graceful-restart. A system that is attempting an OSPF graceful restart announces Grace-

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

LSAs with a specified grace period, indicating the intention to have completed an restart within the specified period.

- router-information

  The Router Information LSA is used by an OSPFv2 system to announce optional capabilities of the local system, over and above those that are included within the OSPF hello message field. The flooding scope of the LSA can be link-, area-, or AS-wide (i.e., the LSA type can be 9, 10 or 11).

- ospfv2-extended-prefix

  The Extended Prefix LSA is used in OSPFv2 to carry a set of attributes that are to be associated with a prefix that is advertised in OSPF. The attributes are carried as one or more TLV tuples. The flooding scope of the LSA can be link-, area-, or AS-wide as specified by the advertising system. The flooding scope of the LSA may exceed the scope of the corresponding prefix.

- ospfv2-extended-link

  The Extended Link LSA is used in OSPFv2 to carry a set of attributes that are to be associated with a link that is advertised in OSPF. The link attributes are carried as one or more TLV tuples. The flooding scope of the link LSA is area-local - i.e., it is carried in a Type 10 opaque LSA.

Configurable False

new-lsas-originated

Description	The number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA.
Context	network-instance name *string* protocols ospf instance name *string* new-lsas-originated
Tree	new-lsas-originated
Configurable	False
Platforms	Supported on all platforms

new-lsas-received

Description	The number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements.
Context	network-instance name *string* protocols ospf instance name *string* new-lsas-received
Tree	new-lsas-received
Configurable	False
Platforms	Supported on all platforms

opaque-lsa-support *boolean*

Description	the value of opaque-lsa-support indicates the router's support for opaque LSA types. this object is valid only when version is 'version2'.
Context	network-instance name *string* protocols ospf instance name *string* opaque-lsa-support *boolean*
Tree	opaque-lsa-support
Configurable	False
Platforms	Supported on all platforms

oper-state *keyword*

Description	Used to report operational state of the OSPF instance
Context	network-instance name *string* protocols ospf instance name *string* oper-state *keyword*

Use subject to Terms available at: www.nokia.com/terms.

Tree	max-lsa-count
Range	1 to 4294967295
Configurable	True
Platforms	Supported on all platforms

overload-timeout *number*

Description	Enter the overload-timeout context
Context	network-instance name *string* protocols ospf instance name *string* overload rtr-adv-lsa-limit overload-timeout *number*
Tree	overload-timeout
Range	1 to 1800
Configurable	True
Platforms	Supported on all platforms

warning-threshold *number*

Description	Enter the warning-threshold context
Context	network-instance name *string* protocols ospf instance name *string* overload rtr-adv-lsa-limit warning-threshold *number*
Tree	warning-threshold
Range	0 to 100
Default	0
Configurable	True
Platforms	Supported on all platforms

overload-rem-interval *number*

Description	the value of overload-rem-interval indicates the time for which the system will be in overload state if OSPF is in overload state. the value of 0 implies that the system is indefinitely in overload state.
Context	network-instance name *string* protocols ospf instance name *string* overload-rem-interval *number*
Tree	overload-rem-interval
Range	0 to 65535
Units	seconds
Configurable	False

Platforms	Supported on all platforms

overload-state *keyword*

Description	the value of overload-oper-state indicates whether or not the OSPF application is presently in overload state or not.
Context	network-instance name *string* protocols ospf instance name *string* overload-state *keyword*
Tree	overload-state
Options	• overload • no-overload
Configurable	False
Platforms	Supported on all platforms

ovld-lsa-limit-rem-interval *number*

Description	the value of ovld-lsa-limit-rem-interval indicates the remaining time in seconds for which the system will be in overload state due to advertising router LSA limit exceeded. the value of 0 implies that the system is either not in overload or indefinitely in overload state.
Context	network-instance name *string* protocols ospf instance name *string* ovld-lsa-limit-rem-interval *number*
Tree	ovld-lsa-limit-rem-interval
Range	0 to 65535
Units	seconds
Configurable	False
Platforms	Supported on all platforms

preference *number*

Description	Sets the route prefence for OSPF sourced routes
Context	network-instance name *string* protocols ospf instance name *string* preference *number*
Tree	preference
Range	1 to 255
Default	10
Configurable	True

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	Supported on all platforms

reference-bandwidth *number*

Description	Configures the reference bandwidth that provides the basis for interface metrics based on link Bandwidth If the reference bandwidth is defined, then the cost is calculated using the following formula: cost = reference-bandwidth / bandwidth When a large reference-bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, OSPF automatically reverts to the maximum configurable cost metric.
Context	network-instance name *string* protocols ospf instance name *string* reference-bandwidth *number*
Tree	reference-bandwidth
Range	1 to 8000000000
Default	400000000
Units	kbps
Configurable	True
Platforms	Supported on all platforms

router-id

Description	Enter the router-id context
Context	network-instance name *string* protocols ospf instance name *string* router-id
Tree	router-id
Configurable	True
Platforms	Supported on all platforms

routes-submitted

Description	the value of routes-submitted indicates the number of routes submitted to the route table manager (RTM) by this instance of OSPF.
Context	network-instance name *string* protocols ospf instance name *string* routes-submitted
Tree	routes-submitted
Configurable	False
Platforms	Supported on all platforms

spf

Description Enter the spf context

SPF related information

Context network-instance name *string* protocols ospf instance name *string* spf

Tree spf

Configurable False

Platforms Supported on all platforms

avg-spf-run-interval *number*

Description the value of avg-spf-run-interval indicates the average time, in hundredths of seconds, of all the total SPF calculations performed by this OSPF router.

Context network-instance name *string* protocols ospf instance name *string* spf avg-spf-run-interval *number*

Tree avg-spf-run-interval

Range 0 to 2147483647

Units centiseconds

Configurable False

Platforms Supported on all platforms

ext-spf-runs

Description The total number of times that only the external portion of the SPF has been run since OSPF was last enabled.

Context network-instance name *string* protocols ospf instance name *string* spf ext-spf-runs

Tree ext-spf-runs

Configurable False

Platforms Supported on all platforms

full-spf-runs

Description The total number of times that complete SPF has been run on the router since OSPF was last enabled.

Context network-instance name *string* protocols ospf instance name *string* spf full-spf-runs

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	full-spf-runs
Configurable	False
Platforms	Supported on all platforms

incremental-ext-spf-runs

Description	The total number of incremental SPF runs triggered by new or updated external LS-as.
Context	network-instance name *string* protocols ospf instance name *string* spf incremental-ext-spf-runs
Tree	incremental-ext-spf-runs
Configurable	False
Platforms	Supported on all platforms

incremental-inter-spf-runs

Description	The total number of incremental SPF runs triggered by new or updated inter-area prefix or inter-area router LS-as.
Context	network-instance name *string* protocols ospf instance name *string* spf incremental-inter-spf-runs
Tree	incremental-inter-spf-runs
Configurable	False
Platforms	Supported on all platforms

last-ext-spf

Description	Enter the last-ext-spf context Information about the last external SPF run
Context	network-instance name *string* protocols ospf instance name *string* spf last-ext-spf
Tree	last-ext-spf
Configurable	False
Platforms	Supported on all platforms

Units	centiseconds
Configurable	False
Platforms	Supported on all platforms

min-spf-run-interval *number*

Description	the value of min-spf-run-interval indicates the minimum time, in hundredths of seconds, used to perform a total SPF calculation.
Context	network-instance name *string* protocols ospf instance name *string* spf min-spf-run-interval *number*
Tree	min-spf-run-interval
Range	0 to 2147483647
Units	centiseconds
Configurable	False
Platforms	Supported on all platforms

spf-attempts-failed

Description	The number of times an attempt to run SPF has failed because SPF runs have been stopped as a result of insufficient memory resources.
Context	network-instance name *string* protocols ospf instance name *string* spf spf-attempts-failed
Tree	spf-attempts-failed
Configurable	False
Platforms	Supported on all platforms

suppress-dn-bit *boolean*

Description	In an ip-vrf (VPRN), when true, this OSPF instance does not set the Down (DN) bit on originated LSAs. Applies to both OSPFv2 (Type 3 summary, Type 5 / Type 7 external LSAs, RFC 4576) and OSPFv3 (inter-area-prefix and AS-external LSA prefix-options, RFC 6565); the SR Linux model intentionally exposes a single version-agnostic knob because the underlying behaviour is identical at the LSA origination boundary. In the default network-instance, originated LSAs do not carry the DN bit for PE-CE loop prevention, so this leaf is a no-op there and is constrained to false by a must statement.
Context	network-instance name *string* protocols ospf instance name *string* suppress-dn-bit *boolean*

  Component or process is in a degraded state

- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable False

source-flags *bits*

Description spt-bit and PruneDesired state of the entry

This object is applicable only for (S,G) entries,i.e., when source-type is 'sg'. The (S,G) 'spt-bit' is used to distinguish whether to forward on (*,*,RP) or (*,G) or on (S,G) state. It is updated when the (S,G) data comes on the RPF interface towards the source. 'rpt-prune-desired' is set according to the PruneDesired(S,G,rpt) algorithm.

upstream-rpt-override-timer *number*

Description	Delay to triggered Join(S,G,rpt) messages to prevent implosions of triggered messages If non-zero, it means that the router was in 'not-pruned' state and it saw a Prune(S,G,rpt) message being sent to RPF'(S,G,rpt). If the router sees a Join(S,G,rpt) override message being sent by some other router on the LAN while the timer is still non-zero, it simply cancels the override timer. If it does not see a Join(S,G,rpt) message, then on expiry of the override timer, it sends it's own Join(S,G,rpt) message to RPF'(S,G,rpt). A similar scenario exists when RPF'(S,G,rpt) changes to become equal to RPF'(*,G).

ecmp-balance *boolean*

Description	Enables hashing balance for multicast streams This command enables multicast balancing of traffic over ECMP links based on the number of (S, G) distributed over each link. When enabled, each new multicast stream that needs to be forwarded over an ECMP link is compared to the count of (S, G) already using each link, so that the link with the fewest (S, G) is chosen.

ecmp-balance-hold *number*

Description Hold period for ecmp balancing

This command defines a hold period that applies after an interface has been added to the ECMP link. It is also used periodically to rebalance if channels have been removed from the ECMP link. If the ECMP interface has not changed in the hold period and if no multicast streams have been removed, then no action is taken when the timer triggers. This parameter should be used to avoid excessive changes to the multicast distribution.

ecmp-hashing

Description Enables hashing for multicast streams

This command enables hash-based multicast balancing of traffic over ECMP links and causes PIM joins to be distributed over the multiple ECMP paths based on a hash of S and G (and possibly next-hop IP address). When a link in the ECMP set is removed, the multicast flows that were using that link are redistributed over the remaining ECMP links using the same hash algorithm. When a link is added to the ECMP set new joins may be allocated to the new link based on the hash algorithm, but existing.

assert-state *keyword*

Description The ASSERT state for this entry

Where multiple PIM routers peer over a shared LAN it possible for more than one upstream router to have valid forwarding state for a packet, which can lead to packet duplication. PIM does not attempt to prevent this from occurring. Instead it detects when this has happened and elects a single forwarder amongst the upstream routers to prevent further duplication. This election is performed using PIM Assert messages. Assert messages are also received by downstream routers on the LAN, and these cause subsequent Join or Prune messages to be sent to the upstream router that won the Assert.

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Component slot is empty

- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

oper-state *keyword*

Description Operational state of PTP within the network instance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This is dependent on the administrative state of the ptp instance, the administrative state of the this network-instance under ptp, and the operational state of the network-instance itself.

Context network-instance name *string* protocols ptp oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable False

Platforms 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5

root-cost *number*

Description The cost of the path to the root as seen from this bridge

Context network-instance name *string* route-table ipv4-unicast route ipv4-prefix *string* route-type *identityref* route-owner *string* id *number* origin-network-instance *reference*

Options

- aggregate

  Locally configured aggregate route
- arp-nd

  IP route added by ARP ND.
- bgp

  Border Gateway Protocol version 4
- bgp-evpn

  BGP Ethernet VPN (EVPN) Interface-less
- bgp-evpn-iff

  BGP Ethernet VPN (EVPN) Interface-ful
- bgp-evpn-ifl-host

  BGP Ethernet VPN (EVPN) Interface-less Host
- bgp-ipvpn

  BGP IP VPN
- bgp-label

  BGP labeled-unicast
- dhcp

  IP (default) route added by DHCP.
- gribi

  A gRIBI route
- host

  A host route
- isis

  IS-IS
- local

  A directly connected route
- linux

  IP route added by the linux kernel.
- ndk1

  Route added by an agent application using the NDK
- ndk2

  Route added by an agent application using the NDK
- ospfv2

  OSPFv2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- ospfv3

  OSPFv3
- sr-submgmt

  Subscriber-management route
- srv6

  Segment routing using IPv6 dataplane, SRv6, programmed by srv6 manager.
- static

  Locally configured static route

Configurable False

Platforms Supported on all platforms

route-owner *string*

Description The application name of the owner of the IP route

Context network-instance name *string* route-table ipv4-unicast route ipv4-prefix *string* route-type *identityref* route-owner *string* id *number* origin-network-instance *reference*

Configurable False

Platforms Supported on all platforms

id *number*

Description An owner-assigned index value that is unique for each of the routes for a given prefix.

Context network-instance name *string* route-table ipv4-unicast route ipv4-prefix *string* route-type *identityref* route-owner *string* id *number* origin-network-instance *reference*

Configurable False

Platforms Supported on all platforms

origin-network-instance *reference*

Description Origin network instance of the route (where it was originally learned or configured)

If the route was leaked from another network instance, the value of this leaf reflects the network-instance from which it was learned. If it was not leaked the value is the same as the parent network-instance.

Platforms	Supported on all platforms

resource-allocation-failed *boolean*

Description	True when an available statistics resource was not available for this forwarding object
Context	network-instance name *string* route-table ipv4-unicast route ipv4-prefix *string* route-type *identityref* route-owner *string* id *number* origin-network-instance *reference* counters resource-allocation-failed *boolean*
Tree	resource-allocation-failed
Configurable	False
Platforms	Supported on all platforms

resource-allocation-failed-locations *string*

Description	List of forwarding complexes that reported a stat resource allocation failure. They appear in the format (slot-number,complex-number).
Context	network-instance name *string* route-table ipv4-unicast route ipv4-prefix *string* route-type *identityref* route-owner *string* id *number* origin-network-instance *reference* counters resource-allocation-failed-locations *string*
Tree	resource-allocation-failed-locations
Configurable	False
Platforms	Supported on all platforms

dynamic-load-balancing *boolean*

Description	Set to true if the route is covered by a dynamic-load-balancing prefix configured in this network-instance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

True does not guarantee that the route is programmed for DLB. This information is found in the NHG used by the route

Context network-instance name *string* route-table ipv4-unicast route ipv4-prefix *string* route-type *identityref* route-owner *string* id *number* origin-network-instance *reference* dynamic-load-balancing *boolean*

Tree dynamic-load-balancing

Configurable False

Platforms Supported on all platforms

fib-programming

Description Enter the fib-programming context

Container for state related to the FIB programming of the object

Context network-instance name *string* route-table ipv4-unicast route ipv4-prefix *string* route-type *identityref* route-owner *string* id *number* origin-network-instance *reference* fib-programming

Tree fib-programming

Configurable False

Platforms Supported on all platforms

last-failed-locations *string*

Description List of forwarding complexes that reported a failure for the last operation. They appear in the format (slot-number,complex-number).

Context network-instance name *string* route-table ipv4-unicast route ipv4-prefix *string* route-type *identityref* route-owner *string* id *number* origin-network-instance *reference* fib-programming last-failed-locations *string*

Tree last-failed-locations

Configurable False

Platforms Supported on all platforms

last-failed-operation-type *keyword*

Description The last operation type that failed.

Context network-instance name *string* route-table ipv4-unicast route ipv4-prefix *string* route-type *identityref* route-owner *string* id *number* origin-network-instance *reference* fib-programming last-failed-operation-type *keyword*

Tree last-failed-operation-type

Options

- add

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The current or last operation was an attempt to create a new entry.

- delete

  The current or last operation was an attempt to delete an existing entry.

- modify

  The current or last operation was an attempt to modify an existing entry.

- none

  There was no prior operation for this entry or there is no current operation that is in process

Configurable False

Platforms Supported on all platforms

last-successful-operation-timestamp *string*

Description The date and time of the last operation to complete successfully, if the entry was not suppressed.

A delete operation is immediately timestamped by FIB manager on the assumption that it will ultimately be successful on all complexes. For other operations the timestamp is generated when the last complex that was expected to respond has responded with a success acknowledgement.

Context network-instance name *string* route-table ipv4-unicast route ipv4-prefix *string* route-type *identityref* route-owner *string* id *number* origin-network-instance *reference* fib-programming last-successful-operation-timestamp *string*

Tree last-successful-operation-timestamp

String Length 20 to 32

Configurable False

next-hop index *number*

Description	Enter the next-hop list instance
Context	network-instance name *string* route-table next-hop index *number*
Tree	next-hop
Configurable	False
Platforms	Supported on all platforms

index *number*

Description	A system-wide unique identifier of a next-hop object (system allocated).
Context	network-instance name *string* route-table next-hop index *number*
Configurable	False
Platforms	Supported on all platforms

counters

Description	Enter the counters context Packet forwarding counters for this next-hop
Context	network-instance name *string* route-table next-hop index *number* counters
Tree	counters
Configurable	False
Platforms	Supported on all platforms

clear

Description	Execute the clear action Clear next-hop forwarding counters Resets the packets-forwarded and octets-forwarded counters for this next-hop to zero.
Context	network-instance name *string* route-table next-hop index *number* counters clear
Tree	clear
Configurable	False
Note	This is an action command
Platforms	Supported on all platforms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

octets-forwarded *number*

Description	The number of octets in the packets that were forwarded
Context	network-instance name *string* route-table next-hop index *number* counters octets-forwarded *number*
Tree	octets-forwarded
Default	0
Configurable	False
Platforms	Supported on all platforms

packets-forwarded *number*

Description	The number of packets forwarded
Context	network-instance name *string* route-table next-hop index *number* counters packets-forwarded *number*
Tree	packets-forwarded
Default	0
Configurable	False
Platforms	Supported on all platforms

resource-allocation-failed *boolean*

Description	True when an available statistics resource was not available for this forwarding object
Context	network-instance name *string* route-table next-hop index *number* counters resource-allocation-failed *boolean*
Tree	resource-allocation-failed
Configurable	False
Platforms	Supported on all platforms

resource-allocation-failed-locations *string*

Description	List of forwarding complexes that reported a stat resource allocation failure. They appear in the format (slot-number,complex-number).
Context	network-instance name *string* route-table next-hop index *number* counters resource-allocation-failed-locations *string*
Tree	resource-allocation-failed-locations

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Configurable False

Platforms Supported on all platforms

decapsulate-header *keyword*

Description Packets matching this next-hop are decapsulated by removing the specified header.

Context network-instance name *string* route-table next-hop index *number* decapsulate-header *keyword*

Tree decapsulate-header

Options

- none

  There is no encapsulation header
- gre

  The encapsulation header is a Generic Routing Encapsulation header
- ipv4

  The encapsulation header is an IPv4 packet header
- ipv6

  The encapsulation header is an IPv6 packet header
- mpls

  The encapsulation header is one or more MPLS labels
- vxlan

  The encapsulation header is a VXLAN packet header
- udp-v4

  The encapsulation header is a UDP + IPv4 header
- udp-v6

  The encapsulation header is a UDP + IPv6 header

Configurable False

Platforms Supported on all platforms

indirect

Description Enter the indirect context

State that applies to an indirect next-hop

Context network-instance name *string* route-table next-hop index *number* indirect

Tree indirect

Configurable False

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	Supported on all platforms

resolved *boolean*

Description	Indicates whether the next-hop is reachable and has been resolved
Context	network-instance name *string* route-table next-hop index *number* indirect resolved *boolean*
Tree	resolved
Configurable	False
Platforms	Supported on all platforms

resolving-route

Description	Enter the resolving-route context
Context	network-instance name *string* route-table next-hop index *number* indirect resolving-route
Tree	resolving-route
Configurable	False
Platforms	Supported on all platforms

ip-prefix *(ipv4-prefix | ipv6-prefix)*

Description	The prefix of the resolving route
Context	network-instance name *string* route-table next-hop index *number* indirect resolving-route ip-prefix *(ipv4-prefix | ipv6-prefix)*
Tree	ip-prefix
Configurable	False
Platforms	Supported on all platforms

next-hop-group *reference*

Description	Reference to the next-hop-group used by the route that resolves this next-hop
Context	network-instance name *string* route-table next-hop index *number* indirect resolving-route next-hop-group *reference*
Tree	next-hop-group
Reference	network-instance name *string* route-table next-hop-group index *number*

A gRIBI route

- host

  A host route

- isis

  IS-IS

- local

  A directly connected route

- linux

  IP route added by the linux kernel.

- ndk1

  Route added by an agent application using the NDK

- ndk2

  Route added by an agent application using the NDK

- ospfv2

  OSPFv2

- ospfv3

  OSPFv3

- sr-submgmt

  Subscriber-management route

- srv6

  Segment routing using IPv6 dataplane, SRv6, programmed by srv6 manager.

- static

  Locally configured static route

Configurable False

type *identityref*

Description The next-hop type used by the datapath.

Context network-instance name *string* route-table next-hop index *number* type *identityref*

Tree type

Options

- extract

  Next-hop will cause matching packets to be delivered to the CPM.
- direct

  Next-hop was resolved by a local route - i.e. it is an address on a connected subnet.
- discard

  Next-hop will cause matching packets to be dropped without ICMP generation.
- reject

  Next-hop will cause matching packets to be dropped with ICMP generation.
- indirect

  Next-hop was resolved by a non-local route - i.e. it is not an address on a connected subnet.
- mpls

  An MPLS label will be pushed when forwarding to this next-hop.
- tunnel

  Next-hop is a tunnel.
- broadcast

  Next-hop will cause matching subnet-bradcast packets to be delivered to the control plane.
- redirect

  Next-hop will redirect to another network-instance.
- interface-with-mac

  Next-hop is associated with an outbound interface plus MAC address
- srv6

  Packets forwarded to this next-hop have one or more SRv6 SIDs added
- srv6-endpoint

  Packets forwarded to this next-hop have an associated SRv6 endpoint behavior

weight *number*

Description	The configured/programmed weight assigned to the next-hop within the group This may be different from the actual weight used by the datapath, which changes depending on the next-hops that are up/down in the group. Traffic is balanced across the next-hops within the group in proportion of the actual weight.
Context	network-instance name *string* route-table next-hop-group index *number* next-hop id *number* weight *number*
Tree	weight
Configurable	False
Platforms	Supported on all platforms

programmed-index *number*

Description	The index assigned to the next-hop-group by the gRIBI client
Context	network-instance name *string* route-table next-hop-group index *number* programmed-index *number*
Tree	programmed-index
Configurable	False
Platforms	Supported on all platforms

nh-counters

Description	Enter the nh-counters context Operational commands for next-hop forwarding counters in this route table
Context	network-instance name *string* route-table nh-counters
Tree	nh-counters

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Configurable	False
Platforms	Supported on all platforms

clear

Description	Execute the clear action Clear all next-hop forwarding counters Resets the packets-forwarded and octets-forwarded counters to zero for every next-hop in this route table.
Context	network-instance name *string* route-table nh-counters clear
Tree	clear
Configurable	False
Note	This is an action command
Platforms	Supported on all platforms

router-id *string*

Description	A identifier for the local network instance - typically used within associated routing protocols or signalling routing information in another network instance
Context	network-instance name *string* router-id *string*
Tree	router-id
Configurable	True
Platforms	Supported on all platforms

segment-routing

Description	Enter the segment-routing context Container with segment routing configuration options
Context	network-instance name *string* segment-routing
Tree	segment-routing
Configurable	True
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mpls

Description	Adding this container activates datapath support for SR-MPLS
Context	network-instance name *string* segment-routing mpls
Tree	mpls
Configurable	True
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

global-block

Description	Enter the global-block context Container with SRGB configuration that is applicable to all IGP protocol instances
Context	network-instance name *string* segment-routing mpls global-block
Tree	global-block
Configurable	True
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

label-range *reference*

Description	Reference to a static label range
Context	network-instance name *string* segment-routing mpls global-block label-range *reference*
Tree	label-range
Reference	system mpls label-ranges static name *string*
Configurable	True
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

label-range-status *keyword*

Description	Status of the label block. The label block may show as unavailable if there is pending cleanup.

active *boolean*

Description When false, the prefix SID is inactive.

It could be inactive because it is involved in a prefix or SID conflict that occurred between different protocol-instance. It could also be inactive because datapath programming failed.

Context network-instance name *string* segment-routing mpls sid-database prefix-sid prefix *(ipv4-prefix | ipv6-prefix)* sid-label-value *number* protocol *keyword* protocol-instance *number* protocol-multi-topology *number* algorithm *number* active *boolean*

Tree active

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

prefix-conflict *boolean*

Description Reads true when the prefix SID entry is involved in a prefix conflict that has occurred between protocols. This occurs when there are multiple entries in the SID database for the same prefix. All the conflicting entries become inactive except for the one with the smallest sid-index.

Context network-instance name *string* segment-routing mpls sid-database prefix-sid prefix *(ipv4-prefix | ipv6-prefix)* sid-label-value *number* protocol *keyword* protocol-instance *number* protocol-multi-topology *number* algorithm *number* prefix-conflict *boolean*

Tree prefix-conflict

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

sid-conflict *boolean*

Description Reads true when the prefix SID entry is involved in a SID conflict that has occurred between protocols (after first removing inter-protocol prefix conflict entries). All entries involved in a SID conflict that do not have the absolute lowest 'preference' value become inactive. In the SRL implementation local-prefix-sid entries are considered to have a lower numerical preference than remote prefix-sid entries. If there are still SID conflicts then all the remaining conflicting entries become inactive except for the one with the smallest sid-index.

admin-state *keyword*

Description Enable/disable table connections in the network instance

When set to disable, configuration of table-connection list entries is blocked. For protocol B to advertise active routes of protocol A, it is sufficient for protocol B to be configured with an export-policy that accepts routes of protocol A.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When admin-state is set to enable, protocol B cannot advertise an active route of protocol A unless there is an A->B table connection that causes the route to be accepted. When a route of protocol A is redistributed to protocol B, it is added to the RIB of protocol B and as such it is advertisable to peers of protocol B without any export policy. However if protocol B does have an export policy, this policy (or list of policies) has final control over the advertisement of the redistributed route.

tcp

Description Enter the tcp context

State for TCP connections that have been established or could be established using the route tables of this network instance.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	network-instance name *string* tcp
Tree	tcp
Configurable	False
Platforms	Supported on all platforms

connection local-address *(ipv4-address | ipv6-address)* local-port *number* remote-address *(ipv4-address | ipv6-address)* remote-port *number*

Description	List of TCP connections that are established or that are in the process of being established – i.e. excluding those in the LISTEN state. An entry in this list is transient in that it ceases to exist when (or soon after) the connection makes the transition to the CLOSED state.
Context	network-instance name *string* tcp connection local-address *(ipv4-address | ipv6-address)* local-port *number* remote-address *(ipv4-address | ipv6-address)* remote-port *number*
Tree	connection
Configurable	False
Platforms	Supported on all platforms

local-address *(ipv4-address | ipv6-address)*

Description	The local IP address for this TCP connection.
Context	network-instance name *string* tcp connection local-address *(ipv4-address | ipv6-address)* local-port *number* remote-address *(ipv4-address | ipv6-address)* remote-port *number*
Configurable	False
Platforms	Supported on all platforms

local-port *number*

Description	The local port number for this TCP connection.
Context	network-instance name *string* tcp connection local-address *(ipv4-address | ipv6-address)* local-port *number* remote-address *(ipv4-address | ipv6-address)* remote-port *number*
Range	0 to 65535
Configurable	False
Platforms	Supported on all platforms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

remote-address *(ipv4-address | ipv6-address)*

Description	The remote IP address for this TCP connection.
Context	network-instance name *string* tcp connection local-address *(ipv4-address | ipv6-address)* local-port *number* remote-address *(ipv4-address | ipv6-address)* remote-port *number*
Configurable	False
Platforms	Supported on all platforms

remote-port *number*

Description	The remote port number for this TCP connection.
Context	network-instance name *string* tcp connection local-address *(ipv4-address | ipv6-address)* local-port *number* remote-address *(ipv4-address | ipv6-address)* remote-port *number*
Range	0 to 65535
Configurable	False
Platforms	Supported on all platforms

process-id *number*

Description	The process ID of the application that owns the socket.
Context	network-instance name *string* tcp connection local-address *(ipv4-address | ipv6-address)* local-port *number* remote-address *(ipv4-address | ipv6-address)* remote-port *number* process-id *number*
Tree	process-id
Configurable	False
Platforms	Supported on all platforms

session-state *keyword*

Description	The state of this TCP connection.
Context	network-instance name *string* tcp connection local-address *(ipv4-address | ipv6-address)* local-port *number* remote-address *(ipv4-address | ipv6-address)* remote-port *number* session-state *keyword*
Tree	session-state

Configurable	False
Platforms	Supported on all platforms

process-id *number*

Description	The process ID of the application that owns the socket.
Context	network-instance name *string* tcp listening-application local-address *(ipv4-address | ipv6-address)* local-port *number* process-id *number*
Tree	process-id
Configurable	False
Platforms	Supported on all platforms

statistics

Description	Enter the statistics context
Context	network-instance name *string* tcp statistics
Tree	statistics
Configurable	False
Platforms	Supported on all platforms

active-opens *number*

Description	The total number of times that TCP connections have made a direct transition to the SYN-SENT state from the CLOSED state.
Context	network-instance name *string* tcp statistics active-opens *number*
Tree	active-opens
Default	0
Configurable	False
Platforms	Supported on all platforms

attempt-fails *number*

Description	The total number of times that TCP connections have made a direct transition to the CLOSED state from either the SYN-SENT state or the SYN-RCVD state, plus the number of times that TCP connections have made a direct transition to the LISTEN state from the SYN-RCVD state.
Context	network-instance name *string* tcp statistics attempt-fails *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	attempt-fails
Default	0
Configurable	False
Platforms	Supported on all platforms

established-resets *number*

Description	The total number of times that TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.
Context	network-instance name *string* tcp statistics established-resets *number*
Tree	established-resets
Default	0
Configurable	False
Platforms	Supported on all platforms

in-checksum-errors *number*

Description	The total number of segments that are received as bad TCP checksum errors.
Context	network-instance name *string* tcp statistics in-checksum-errors *number*
Tree	in-checksum-errors
Default	0
Configurable	False
Platforms	Supported on all platforms

in-error-segments *number*

Description	The total number of segments received in error (e.g., bad TCP checksums).
Context	network-instance name *string* tcp statistics in-error-segments *number*
Tree	in-error-segments
Default	0
Configurable	False
Platforms	Supported on all platforms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

in-segments *number*

Description	The total number of segments received, including those received in error. This count includes segments received on currently established connections.
Context	network-instance name *string* tcp statistics in-segments *number*
Tree	in-segments
Default	0
Configurable	False
Platforms	Supported on all platforms

out-rst-segments *number*

Description	The total number of TCP segments sent containing the RST flag.
Context	network-instance name *string* tcp statistics out-rst-segments *number*
Tree	out-rst-segments
Default	0
Configurable	False
Platforms	Supported on all platforms

out-segments *number*

Description	The total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
Context	network-instance name *string* tcp statistics out-segments *number*
Tree	out-segments
Default	0
Configurable	False
Platforms	Supported on all platforms

passive-opens *number*

Description	The total number of times TCP connections have made a direct transition to the SYN-RCVD state from the LISTEN state.
Context	network-instance name *string* tcp statistics passive-opens *number*
Tree	passive-opens
Default	0

© 2026 Nokia.

Description Enter the hop-type context

Context network-instance name *string* traffic-engineering-policies explicit-paths path explicit-path-name *string* hop index *number* ip hop-type *keyword*

Tree hop-type

Default loose

Options

- strict

  A strict hop is always one hop away from the previous hop (or from the head-end in the case of the first hop). TE DB translates each strict hop into an adjacency-SID label. To be resolved to an adjacency SID, a strict hop must be a non-local IP address on a connected subnet (representing the neighbor's interface address on this subnet) or it must be a loopback or system address of the directly-connected neighbor.

- loose

  A loose hop can be any number of hops away from the previous hop (or from the head-end in the case of the first hop). TE DB translates each loose hop into a node-SID label. A loose hop can be any IP address of the remote router associated with the node SID, not just the IP address associated with the node SID itself. Note that the endpoint of the policy is implicitly considered to be a final loose hop. If the final configured hop (previous hop of this implicit loose hop) is unnecessary TEDB indicates this to SR policy manager and the adjacency SID or node SID of the final confgired hop is omitted from the datapath programming.

Configurable True

hold-down-timer *number*

Description	Specifies a hold-down timer value when seamless-bfd is enabled The timer is started when the number of S-BFD sessions that are up drops below the threshold. The TE-policy path is not considered to be up again until the hold-down timer has expired and the number of S-BFD sessions that are up equals or exceeds the threshold. A grace preiod after session down such that sBFD session flaps does not impact active path.

bfd-wait-for-up-timer *number*

Description

Specifies a wait-for-up timer value when seamless-bfd is enabled

This timer takes effect if BFD does not come up, or BFD goes from up to down. The timer is started when BFD is first enabled on a segment-list or BFD transitions from up to down. When the timer expires if BFD is not yet come up, then the path is torn down by removing it from the TTM and the PI and the retry timer is started.

The default is 3 seconds.

Context

network-instance name *string* traffic-engineering-policies policy-database sr-colored policy color *number* endpoint *(ipv4-address-unicast | ipv6-address-unicast-without-local)* candidate-path protocol-origin *keyword* discriminator *number* originator-asn *number* originator-address *(ipv4-address | ipv6-address)* segment-list segment-list-index *number* bfd bfd-wait-for-up-timer *number*

hold-down-timer *number*

Description

Specifies a hold-down timer value when seamless-bfd is enabled

The timer is started when the number of S-BFD sessions that are up drops below the threshold. The TE-policy path is not considered to be up again until the hold-down timer has expired and the number of S-BFD sessions that are up equals or exceeds the threshold. A grace preiod after session down such that sBFD session flaps does not impact active path.

The default is 3 seconds.

Tree explicit-path

String Length 1 to 255

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

failed-reason *identityref*

Description The reason why the segment list is invalid.

One of the following values:

Context network-instance name *string* traffic-engineering-policies policy-database sr-colored policy color *number* endpoint *(ipv4-address-unicast | ipv6-address-unicast-without-local)* candidate-path protocol-origin *keyword* discriminator *number* originator-asn *number* originator-address *(ipv4-address | ipv6-address)* segment-list segment-list-index *number* failed-reason *identityref*

Tree failed-reason

Options

- path-computation-request-timeout

  Path computation request timed out

- path-computation-no-route

  No valid route is returned for path computation request

- no-resources-available

  Required resources are depleted, not enough resources to estbalish the requested segment-list

- path-computation-bad-node

  Path computation failure due to a resolution issue of one or more of the hops

- path-computation-routing-loop

  Path computation failure due to routing loop

- unknown

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Segment-list is down due to unknown reason

- path-computation-no-route-owner

  Path computation failure as none of the IGP instances had a valid route to one of the hops

- path-computation-hop-limit-exceeded

  Path computation failure due to hop limit. No path within the hop limit constraint configured

- srlg-not-disjoint

  SRLG is shared with primary segment-list and there is no other viable path with dispersed SRLG

- srlg-not-computed-path

  SRLG is not applicable, as primary segment-list has no applicable SRLG for path computation

- srlg-primary-segment-list-down

  SRLG is not applicable, as primary segment-list is down

- unresolved-first-segment

  The router is unable to resolve the first SID (MPLS label value) into one or more outgoing interface(s) and next-hop(s)

- fib-add-pending

  Segment-list is kept down, when adding next-hop into the FIB

- fib-add-failed

  FIB has failed to add the next-hop group. Next-hop group represents a group of next-hops for valid segment-lists under a TE-policy

- maximum-label-stack-depth-exceeded

  The resolution of the named path requires more labels than supported by the datapath.

- pce-update-with-empty-ero

  PCE update has empty Explicit Route Object (EROs)

- segment-list-admin-down

  Segment-list is administratively down

- ipv4-hops-in-ipv6-path

  IPv4 and IPv6 hops are mixed in explicit path

- ipv6-hops-in-ipv4-path

  IPv6 and IPv4 hops are mixed in explicit path

- sid-hops-in-ip-path

  SID (label-based) and IP hops are mixed in explicit path

- sid-hops-with-invalid-path-computation

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

SID hops (labeled hops) with path computation local-cspf/pcep is not allowed

- invalid-path-computation

  Segment-list with unsupported path computation method
- policy-down

  Traffic engineering policy is down
- pce-association-conflict

  PCE-association conflict
- retry-on-config-change

  Segment-list retry attempted due to config change
- clear-command

  Segment-list retry attempted due to manual clear command
- secondary-segment-list

  Secondary type segment-list, Primary is always preferred when available
- bfd-down

  BFD is reported down
- te-rtr-id-not-configured

  TE router ID config is missing
- pce-down

  PCE is unavailable
- pcc-down

  PCC is unavailable
- pce-error

  PCE response has error or timed-out
- pcc-error

  PCC responded with error
- delay-metric-limit-exceeded

  Segment-list delay metric limit exceeded
- invalid-protection-mode

Path computation request timed out

- path-computation-no-route

  No valid route is returned for path computation request

- no-resources-available

  Required resources are depleted, not enough resources to estbalish the requested segment-list

- path-computation-bad-node

  Path computation failure due to a resolution issue of one or more of the hops

- path-computation-routing-loop

  Path computation failure due to routing loop

- unknown

  Segment-list is down due to unknown reason

- path-computation-no-route-owner

  Path computation failure as none of the IGP instances had a valid route to one of the hops

- path-computation-hop-limit-exceeded

  Path computation failure due to hop limit. No path within the hop limit constraint configured

- srlg-not-disjoint

  SRLG is shared with primary segment-list and there is no other viable path with dispersed SRLG

- srlg-not-computed-path

  SRLG is not applicable, as primary segment-list has no applicable SRLG for path computation

- srlg-primary-segment-list-down

  SRLG is not applicable, as primary segment-list is down

- unresolved-first-segment

  The router is unable to resolve the first SID (MPLS label value) into one or more outgoing interface(s) and next-hop(s)

- fib-add-pending

  Segment-list is kept down, when adding next-hop into the FIB

- fib-add-failed

  FIB has failed to add the next-hop group. Next-hop group represents a group of next-hops for valid segment-lists under a TE-policy

- maximum-label-stack-depth-exceeded

  The resolution of the named path requires more labels than supported by the datapath.

Options
- up
- down

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

oper-state-change-count *number*

Description Traffic Engineering Policy operational state change count Operational status trnasition from up to down, down to up, etc all accounted under this counter

Context network-instance name *string* traffic-engineering-policies policy-database sr-colored policy color *number* endpoint *(ipv4-address-unicast | ipv6-address-unicast-without-local)* oper-state-change-count *number*

Tree oper-state-change-count

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

policy-type *keyword*

Description Colored Traffic Engineering Policy type

Context network-instance name *string* traffic-engineering-policies policy-database sr-colored policy color *number* endpoint *(ipv4-address-unicast | ipv6-address-unicast-without-local)* policy-type *keyword*

Tree policy-type

Options
- sr-mpls-colored
- sr-mpls-uncolored

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

protection

Description Enter the protection context

Protection context for TE Policy, hold and wait timers, sBFD, revertive behavior and alike available under this context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	network-instance name *string* traffic-engineering-policies policy-database sr-colored policy color *number* endpoint *(ipv4-address-unicast | ipv6-address-unicast-without-local)* protection
Tree	protection
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

protection-policy *string*

Description	The protection policy to use with the TE policy
Context	network-instance name *string* traffic-engineering-policies policy-database sr-colored policy color *number* endpoint *(ipv4-address-unicast | ipv6-address-unicast-without-local)* protection protection-policy *string*
Tree	protection-policy
String Length	1 to 255
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

return-path

Description	Enter the return-path context Context for defining return path identifier
Context	network-instance name *string* traffic-engineering-policies policy-database sr-colored policy color *number* endpoint *(ipv4-address-unicast | ipv6-address-unicast-without-local)* protection return-path
Tree	return-path
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

mpls-label *number*

Description	MPLS label that is used by reflector while responding to the sBFD request. Assigned value should uniquely identify the sender. Binding-SID or a Node-SID are commonly used options
