1 About this guide

This document describes the configuration and state data models available for the Nokia Service Router Linux (SR Linux).

Note:
This guide generically covers the current release and may contain some content that will be released in later maintenance loads. See the *SR Linux Software Release Notes*, for information about features supported in each load.

Configuration and command outputs shown in this guide are examples only; actual displays may differ depending on supported functionality and user configuration.

For more information about accessing and using the interfaces that support these data models, see the *SR Linux System Management Guide*.

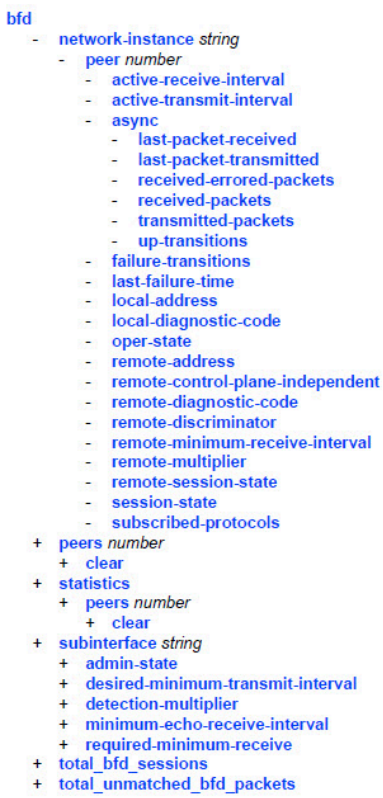
Use subject to Terms available at: www.nokia.com/terms.



2 Overview

This overview describes the structure of the configuration and state data models available for the Nokia Service Router Linux (SR Linux). It includes an introduction to the tree hierarchy and details how to interpret field descriptions.

2.1 Tree hierarchy

The tree hierarchy consists of branches that show the fields and parameters that are available. Figure 1: Tree hierarchy example shows a tree hierarchy example.

Figure 1: Tree hierarchy example

Each chapter of this guide describes a branch in the tree with field names linked to their corresponding descriptions. These descriptions indicate the required syntax for each field. See Field descriptions for more information.

Italic names after a field indicate the parameter type. Parameter types include (but are not limited to):

- Boolean (true and false values)
- keyword (enumerated values)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

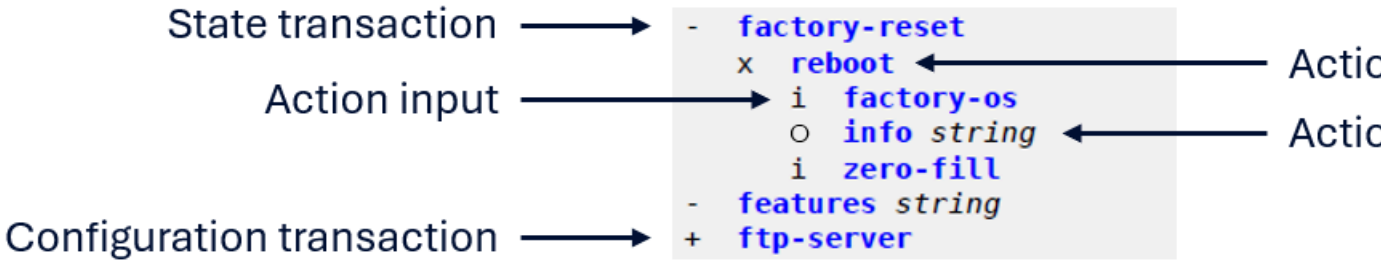
- string
- number
- IPv4 prefix
- IPv6 prefix
- IPv4 address
- IPv6 address
- MAC address

For more information about the input values, click the field or parameter name in the tree. The link will take you to the description where these values are defined.

A parameter type may also be a combination of different base types. These parameters are displayed in the tree with the individual parameter types enclosed in round brackets and separated by a pipe. For example: *(keyword* | *number)*

2.2 Transaction and report types

The following transaction, report types, and actions are used with the SR Linux:



- configuration transactions
- state transactions
- show reports
- action commands
- action inputs
- action outputs

In the tree hierarchy, elements are denoted with the following signs:

- Configuration transactions are denoted with a plus sign (+)
- State transactions are denoted with a minus sign (-)
- Action commands are denoted with the letter (x)
- Action inputs are denoted with the letter (i)
- Action outputs are denoted with the letter (o)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Figure 2: Element types in the tree hierarchy

Configuration and state transactions

Configuration transactions are used to create, modify, or delete configuration data (nodes under the configuration branch).

State transactions are used to view data. They can include both configuration and operational (state) information. State data is not modified through configuration transactions.

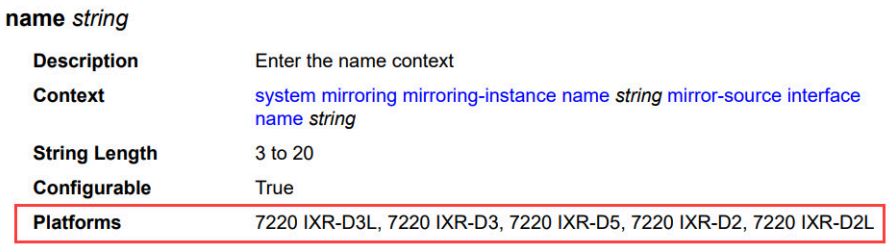
Show reports

Show reports are Python plug-ins used to create custom output. A set of pre-defined show reports are provided and described in the *SR Linux System Management Guide*. These pre-defined reports can be used as examples for how to create additional custom reports.

Actions

An action may have a Configurable value of True or False, depending on whether it is defined under a configuration branch or the state branch.

Actions are not configuration data. They cannot be added, changed, or removed through configuration transactions. An action is invoked as an operation on a specific action instance.



Action input and action output nodes are parameters and results of that invocation. They are not configuration data and are not committed to the configuration datastore, regardless of the Configurable field value shown in the schema tree context.

2.3 Hardware platform designation

The platforms field is used to define the hardware platforms that are valid for a transaction. If a transaction is only valid on specific platforms, the designation is similar to the following:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Figure 3: Platforms: applies to desiginated platforms only

If a transaction is valid on all platforms, the designation is the following:

Figure 4: Platforms: applies to all platforms

2.4 Field descriptions

Syntax for each field is displayed in bold, followed by supported parameters and their type. In the example that follows, the **bfd network-instance** element shows that the parameter type is a string:

```
- bfd
    - network-instance string
```

Table 1: Field descriptions describes valid fields for commands. Not all fields are applicable for all commands.

Table 1: Field descriptions

Field	Description
Context	Configuration path to the command
Tree	Defines the command location in the tree hierarchy
Description	Describes the command
Configurable	Indicates whether the element sits under a state branch (False) or a configurable branch (True). See Configurable field for more information.
String Length	For a string, indicates a range (number of characters allowed)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Field	Description
Range	For a number, indicates the range of allowed values
Default	Default value
Units	Base unit type
Options	Enumerated values allowed
Reference	Reference to an instance in the configuration needed before the configuration is considered valid
Max Element	For lists and leaf-lists, the maximum number of elements
Platforms	Defines the supported hardware platforms
Note	Indicates the kind of element as either an action command, action input, or an action output. See Note field for more information.

Configurable field

The Configurable field indicates whether a node in the model is configurable or whether it represents operational (state) data.

This field is set to either:

- **True**

  The node or at least one ancestor is configurable (no `config false` value applies to the node or any ancestor).

- **False**

  The node and its ancestors contain operational data and are not configurable (`config false` is present on the node or an ancestor).

Action elements may have a Configurable value of true or false depending on where the element sits in the tree hierarchy. Action elements themselves are not configurable.

Note field

This field indicates the kind of element as one of the following:

- Action command – the action operation defined in YANG
- Action input – a parameter supplied when the action is invoked (optional)
- Action output – a result returned when the action completes (optional)

For all other elements, this field is not shown.

For more information about actions, see Actions.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

2.4.1 References

A description of each parameter is also available from the online CLI help function. See the *SR Linux System Management Guide* for information on using the CLI help.

3.1 acl Descriptions

acl

Description	Enter the acl context Top level container for configuration and operational state related to access control lists (ACLs)
Context	acl
Tree	acl
Configurable	True
Platforms	Supported on all platforms

acl-filter name *string* type *keyword*

Description	List of MAC, IPv4, IPv6 filter policies
Context	acl acl-filter name *string* type *keyword*
Tree	acl-filter
Configurable	True
Platforms	Supported on all platforms

name *string*

Description	ACL Filter policy name
Context	acl acl-filter name *string* type *keyword*
String Length	1 to 255
Configurable	True
Platforms	Supported on all platforms

type *keyword*

Description	Defines the type of ACL filter: ipv4: IPv4 ACL filter ipv6: IPv6 ACL filter mac: MAC ACL filter mixed: mixed layer-2/layer-3 filter used for QoS handling of system generated traffic
Context	acl acl-filter name *string* type *keyword*
Options	• ipv4 • ipv6

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- mac
- mixed

  Mixed layer-2/layer-3 filter that combines protocol, transport-port and ethernet-type match criteria and is applied to system generated traffic via the system control-plane-traffic output context

Configurable True

Platforms Supported on all platforms

description *string*

Description Description string for the filter policy

Context acl acl-filter name *string* type *keyword* description *string*

Tree description

String Length 1 to 4096

Configurable True

Platforms Supported on all platforms

embedded-entries

Description Enter the embedded-entries context

Operational rows programmed from embed sources, separate from the static entry list

Context acl acl-filter name *string* type *keyword* embedded-entries

Tree embedded-entries

Configurable False

Platforms 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

entry sequence-id *number*

Description One dynamically programmed ACL row for this filter

Context acl acl-filter name *string* type *keyword* embedded-entries entry sequence-id *number*

Tree entry

Configurable False

Platforms 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

sequence-id *number*

Description Sequence-id of this embedded entry within the filter

Context acl acl-filter name *string* type *keyword* embedded-entries entry sequence-id *number*

Range 0 to 65535

Configurable False

Platforms 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

action

Description Enter the action context

Action programmed in hardware for this embedded entry

Context acl acl-filter name *string* type *keyword* embedded-entries entry sequence-id *number* action

Tree action

Configurable False

Platforms 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

accept

Description Enter the accept context

Accept matching packets and forward them towards their normal destination, optionally redirected

Context acl acl-filter name *string* type *keyword* embedded-entries entry sequence-id *number* action accept

Tree accept

Configurable False

Platforms 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

forward

Description Enter the forward context

Populated only when BGP requested redirection to a next hop or a routing context; omitted for a plain accept.

Tree	input-total
Configurable	False
Platforms	Supported on all platforms

output-total *number*

Description	The number of TCAM entries required to implement this entry on all subinterfaces of this complex where the filter is applied to egress traffic. For example, if a single-instance of the entry takes 2 TCAM entries and the filter is an output-only subinterface-specific filter and the filter is applied to 5 subinterfaces on output and to 5 subinterfaces on input then output-total= 10. If the entry is not applied to egress traffic on any subinterfaces of this complex then output-total=0.
Context	acl acl-filter name *string* type *keyword* embedded-entries entry sequence-id *number* tcam-entries forwarding-complex complex-identifier *string* output-total *number*
Tree	output-total

single-instance *number*

Description The number of TCAM entries required to implement this entry if it is applied to only one subinterface and one traffic direction specific to this slot.

This is non-zero even if the filter is not applied to any subinterfaces of this complex. It captures the effect of TCAM entry expansion to deal with L4 port or VLAN ranges, for example.

Context acl acl-filter name *string* type *keyword* embedded-entries entry sequence-id *number* tcam-entries forwarding-complex complex-identifier *string* single-instance *number*

Tree single-instance

Configurable False

Platforms 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

embedding index *number*

Description Per-source embed configuration

Multiple embedding instances are allowed. Non-overlapping offset and range vs static entries and other embed instances is enforced by the ACL manager.

Context acl acl-filter name *string* type *keyword* embedding index *number*

Tree embedding

Configurable True

Platforms 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

index *number*

Description Distinguishes this embed source among up to fifteen bindings on the filter

Context acl acl-filter name *string* type *keyword* embedding index *number*

Range 1 to 15

Configurable True

Configurable False

Platforms 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

offset *number*

Description Base sequence-id where embedded entries for this source start

Context acl acl-filter name *string* type *keyword* embedding index *number* offset *number*

Tree offset

Range 0 to 65535

Configurable True

Platforms 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

oper-state *keyword*

Description Operational state of this embed source on the filter

up when every candidate entry is programmed and the filter is applied. degraded when programmed is greater than zero and the candidate set is not fully programmed (TCAM and/or range). down when programmed is zero, the filter is not applied, or the embed source is unavailable. oper-state-reasons is present when down or degraded.

Context acl acl-filter name *string* type *keyword* embedding index *number* oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable False

Platforms 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

oper-state-reasons *keyword*

Description Reasons this embed source is down or degraded

Absent when oper-state is up. Multiple values may be present together.

Context acl acl-filter name *string* type *keyword* embedding index *number* oper-state-reasons *keyword*

Configurable True

Platforms Supported on all platforms

source-port

Description Enter the source-port context

A packet matches this condition if its source TCP or UDP port number matches the value or range or within the port-lists that is specified

The rule should also have a condition that the IP protocol equals 6 (TCP) or 17 (UDP) in order for this to be interpreted correctly.

statistics

Description	Enter the statistics context Container for per-entry statistics
Context	acl acl-filter name *string* type *keyword* entry sequence-id *number* statistics
Tree	statistics
Configurable	False
Platforms	Supported on all platforms

incomplete *boolean*

Description	Returns true when at least one linecard had insufficient stats resources to ensure an accurate set of values for the number of matched packets, or when not all forwarding complexes reported their counts after control plane switchover.
Context	acl acl-filter name *string* type *keyword* entry sequence-id *number* statistics incomplete *boolean*
Tree	incomplete
Configurable	False
Platforms	Supported on all platforms

last-clear *string*

Description	Time of the last clear command performed by the user at this level or a higher level
Context	acl acl-filter name *string* type *keyword* entry sequence-id *number* statistics last-clear *string*
Tree	last-clear
String Length	20 to 32
Configurable	False
Platforms	Supported on all platforms

last-match *string*

Description	The elapsed time since a packet last matched the entry, considering the mgmt0 subinterface and all subinterfaces of all linecard ports that use the ACL as an input ACL

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	acl acl-filter name *string* type *keyword* entry sequence-id *number* statistics last-match *string*
Tree	last-match
String Length	20 to 32
Configurable	False
Platforms	Supported on all platforms

matched-packets *number*

Description	The number of packets matching the entry since it was programmed or since the last clear, considering the mgmt0 subinterface and all subinterfaces of all linecard ports that use the ACL as an input ACL
Context	acl acl-filter name *string* type *keyword* entry sequence-id *number* statistics matched-packets *number*
Tree	matched-packets
Default	0
Configurable	False
Platforms	Supported on all platforms

policer

Description	Enter the policer context Policer stats for traffic matching the entry: Statistics for policer configured with scope=global and entry-specific=true, and acl configured with subinterface-specific=false.
Context	acl acl-filter name *string* type *keyword* entry sequence-id *number* statistics policer
Tree	policer
Configurable	False
Platforms	Supported on all platforms

conforming-octets *number*

Description	The number of bytes that were considered conforming by the policer. The byte count includes 18 bytes of Ethernet overhead for every IP packet.
Context	acl acl-filter name *string* type *keyword* entry sequence-id *number* statistics policer conforming-octets *number*
Tree	conforming-octets

ipv4-tcam-action-profile *keyword*

Description	This profile selects between IPv4 ACL log and reject actions and BGP Flow Spec redirect programming in hardware
Context	acl ipv4-tcam-action-profile *keyword*
Tree	ipv4-tcam-action-profile
Default	acl-log-reject
Options	• acl-log-reject IPv4 ACL filter entries may use the log and reject actions BGP FlowSpec redirect actions are not programmed in hardware; BGP marks affected routes flowspec-unsupported-action • bgp-flowspec-redirect Hardware TCAM action encoding is repurposed so BGP FlowSpec redirect actions are programmed In this mode IPv4 ACL filter entries cannot use the log or reject actions. No user-configurable redirect action is added to ACLs; redirect is driven only by BGP FlowSpec
Configurable	True
Platforms	7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen3, 7250 IXR-X4, 7250 IXR-X4-OSFP

aggregate

Description Enter the aggregate context

None of these statistics are populated if the policer is configured as entry-specific=true.

If entry-specific=false and subinterface-specific=true, this is sum of all the entries and all the policer templates instantiated for all subintrefaces.

If entry-specific=false and subinterface-specific=false, this is sum of all the entries using this policer template.

desired-minimum-transmit-interval *number*

Description The minimum interval between transmission of BFD control packets

This value is advertised to the peer, however the actual interval used is specified by taking the maximum of desired-minimum-transmit-interval and the value of the remote required-minimum-receive interval value. This value is specified as an integer number of microseconds. [Note: On vSRL instances this must be set to a value of 1000000 or greater]

Context bfd micro-bfd-sessions lag-interface name *reference* desired-minimum-transmit-interval *number*

local-diagnostic-code *keyword*

Description The local BFD diagnostic code indicating the most recent reason for failure of this BFD session

Context bfd micro-bfd-sessions lag-interface name *reference* member-interface name *string* local-diagnostic-code *keyword*

Tree local-diagnostic-code

Options

- NO_DIAGNOSTIC

  No diagnostic code was specified, or the session has not changed state

- DETECTION_TIMEOUT

  The control detection time expired: no BFD packet was received within the required period

- ECHO_FAILED

  The BFD echo function failed - echo packets have not been received for the required period of time

- NEIGHBOR_SIGNALED_DOWN

  The neighbor signaled session down

- FORWARDING_RESET

  The forwarding plane in the local system was reset

  The remote system cannot rely on the forwarding state of the device specifying this error code.

- PATH_DOWN

  Signalling outside of BFD specified that the path underlying this session has failed

- CONCATENATED_PATH_DOWN

  A segment on the path between source and destination has failed

  When a BFD session runs over a series of path segments, this error code indicates that a subsequent path segment (i.e., one in the transmit path between the source and destination of the session) has failed.

- ADMIN_DOWN

  The BFD session has been administratively disabled by the peer

- REVERSE_CONCATENATED_PATH_DOWN

  A segment on the reverse path between destination and source has failed

  In the case that a BFD session is running over a series of path segments, this error code indicates that a path segment on the reverse path (i.e., in the transmit direction from the destination to the source of the session) has failed.

required-minimum-receive *number*

Description The minimum interval between received BFD control packets that this system should support

This value is advertised to the remote peer to indicate the maximum frequency (i.e., minimum inter-packet interval) between BFD control packets that is acceptable to the local system. This value is specified as an integer number of microseconds. [Note: On vSRL instances this must be set to a value of 1000000 or greater]

local-diagnostic-code *keyword*

Description Local BFD diagnostic code indicating the most recent reason for failure of this BFD session

Context bfd network-instance name *string* peer local-discriminator *number* local-diagnostic-code *keyword*

Tree local-diagnostic-code

Options

- NO_DIAGNOSTIC

  No diagnostic code was specified or the session has not changed state

- DETECTION_TIMEOUT

  Control detection time expired: no BFD packet was received within the required period

- ECHO_FAILED

  BFD echo function failed and echo packets were not received for the required period of time

- NEIGHBOR_SIGNALED_DOWN

  Neighbor signaled session down

- FORWARDING_RESET

  Forwarding plane in the local system was reset

  The remote system cannot rely on the forwarding state of the device specifying this error code.

- PATH_DOWN

  Signalling outside of BFD specifies that the path underlying this session has failed

- CONCATENATED_PATH_DOWN

  Segment on the path between source and destination has failed

  When a BFD session runs over a series of path segments, this error code indicates that a subsequent path segment (i.e., one in the transmit path between the source and destination of the session) has failed.

- ADMIN_DOWN

  BFD session has been administratively disabled by the peer

- REVERSE_CONCATENATED_PATH_DOWN

  Segment on the reverse path between destination and source has failed

  In the case that a BFD session is running over a series of path segments, this error code indicates that a path segment on the reverse path (i.e., in the transmit direction from the destination to the source of the session) has failed.

Configurable False

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

3x100G (Note 1), 2x100G, 1x100G (Note 1), 4x25G 7250 IXR-6e/10e/18e 36p OSFP IMM all ports: 2x400G, 4x200G, 8x100G, 1x400G (Note 1) 7250 IXR-X1b QSFP28 ports 1-24: 4x25G, and 4x10G (Note 4) 7250 IXR-X1b QSFPDD ports 25-30: 2x200G, 4x100G, 3x100G (Note 1), 2x100G, 1x100G (Note 1), 4x25G, and 4x10G 7250 IXR-X1b QSFPDD ports 31-36: 2x200G, 4x100G, 3x100G (Note 1), 2x100G, 1x100G (Note 1), 8x50G, 4x25G, and 4x10G 7250 IXR-X3b QSFPDD ports 1-6,13-24,31-36: 2x200G, 4x100G, 3x100G (Note 1), 2x100G, 1x100G (Note 1), 8x10G, 8x50G, 4x25G, and 4x10G 7250 IXR-X3b QSFPDD ports 7-12,25-30: 2x200G, 4x100G, 3x100G (Note 1), 2x100G, 1x100G (Note 1), 4x25G, and 4x10G 7250 IXR-X4 QSFP112-DD all ports: 2x400G, 1x400G (Note 1), 8x100G, 4x100G, 3x100G (Note 1), 2x100G, 1x100G (Note 1), 8x50G, 4x25G 7250 IXR-X4-OSFP all ports: 2x400G, 4x200G, 8x100G, 1x400G

Note 1: Only supported for Digital Coherent Optic transceivers

Note 2: For the following port groupings only the higher numbered port supports breakout-mode. If the higher numbered port is to be configured for breakout-mode, then the lower numbered port should not be configured. If both ports are configured, then the lower numbered port takes precedence and the higher numbered port shall be operationally down with reason unsupported-breakout-port. Groupings are (8,9), (11,12), (14,15), (17,18), (20,21), (23,24), (44, 45), (47,48).

Note 3: Breakout and 40G is only supported on odd numbered ports. For the QSFP28 four port groupings [1-4], [5-8], [9-12], [13-16], [21-24], [25-28], and [29-32] if either of the odd numbered ports within a group is configured for 40G, 4x10G, or 4x25G, then the other odd numbered port in the same group may only be configured if it is configured for one of 40G, 4x10G, or 4x25G (can differ between the odd ports) and neither of the two even numbered ports within the same group can be configured.

Note 4: For the QSFP28 ports, the following port groups exist [n, n+1, n+2, n +3] for n = 1, 5, 9, 13, 17, 21. Breakout for 4x25G or 4x10G is only supported on ports n+1 and n+3. When initially configuring a port with a breakout configuration or port speed that does not already exist on another configured port within the same group, then a link flap and traffic hit may occur on other ports within the same group. When the breakout configuration or port speed is changed for a port in a group, then a link flap and traffic hit may occur on other ports within the same group. If port n+1 within the group is configured for breakout, then port n cannot be configured. In addition if port n+1 is configured for breakout and port n+3 is configured without breakout, then port n+2 may only be configured with the same speed as port n+3. If port n+3 within the group is configured for breakout, then port n+2 cannot be configured. In addition if port n+3 is configured for breakout and port n+1 is configured without breakout, then port n may only be configured with the same speed as port n+1.

Note 5: QSFP28 port 2 is disabled if port 1 is configured with breakout-mode or port-speed 40G; QSFP28 port 4 is disabled if port 3 is configured with breakout-mode or port-speed 40G.

Note 6: On IXR-H5-32D, IXR-H5-64D, and IXR-H5-64O, any port may use num-breakout-ports 2, 4, or 8 for any supported breakout mode listed above, as long as the total number of breakout ports in a port pair does not exceed

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

10. The paired ports are: IXR-H5-64D and IXR-H5-64O: (1,34), (2,33), (3,36), (4,35), (5,38), (6,37), (7,40), (8,39), (9,42), (10,41), (11,44), (12,43), (13,46), (14,45), (15,48), (16,47), (17,50), (18,49), (19,52), (20,51), (21,54), (22,53), (23,56), (24,55), (25,58), (26,57), (27,60), (28,59), (29,62), (30,61), (31,64), (32,63) IXR-H5-32D: (1,2), (3,4), (5,6), ..., (31,32)

Port Groups and auto-configuration of port speed: Manually configured breakout-mode takes precedence over the auto-configured port-speed. This means that configuring a port within a port-group can have a side effect to take down an operational port that had its speed set based on the auto configuration feature. If there is risk of mixing transceiver types within a port group, then it is recommended to always manually configure the ports

num-physical-channels *number*

Description Sets the number of lanes or physical channels assigned to the set of interfaces within this breakout group

This leaf can be used to distinguish between transceivers that provide the same breakout-configuration but using different PMAs. For example, a transceiver that provides a breakout of 4 ports of 100G using 4 x 100GAUI2 would set this leaf to 8 but a transceiver using 4 x 100GAUI-1 would have this leaf set to 4. An 800G transceiver that provides a breakout of 1 port of 400G using 1x400GAUI-8 would set this leaf to 8 or if using 1x400GAUI-4 would set this leaf to 4.

If not set, then the default shall be as follows: 4 is used for 4x10G, 2x50G, 4x25G, 1x100G 6 is used for 3x100G (digital coherent optics) 8 is used for 2x100G, 8x50G, 1x400G, 4x100G, 2x400G

If num-physical-channels has been configured at the interface level, it cannot be configured within the breakout group.

retention-refresh *keyword*

Description	Controls whether ingress or egress subinterface counter changes refresh the retention timer for active VLANs When ingress-and-egress-stats is configured, any change to ingress or egress subinterface counters refreshes the retention timer. When ingress-stats is configured, only ingress subinterface counter changes refresh the retention timer; egress BUM traffic does not prevent VLAN aging.
Context	interface name *string* dynamic-subinterfaces retention-refresh *keyword*
Tree	retention-refresh
Default	ingress-and-egress-stats
Options	• ingress-stats Refresh the retention timer only when ingress subinterface counters change Egress traffic on the dynamic subinterface, including BUM frames from other hosts in the same bridge domain, does not keep the VLAN in active-vlans. • ingress-and-egress-stats Refresh the retention timer when ingress or egress subinterface counters change This behavior supports silent hosts that receive little ingress traffic but still have egress activity.
Configurable	True

fec-option *keyword*

Description The forward error correction algorithm requested for the interface

The same FEC algorithm must be used at both ends of a link. This leaf should be only be configured for 25G and 100G interfaces; it can cause the port to remain operationally down for other interface speeds. 1G, 10G, and 40G interfaces do not use FEC 50G and interfaces with speeds higher than 100G have well defined FEC settings in IEEE 802.3 that must be used and so configuration is not needed.

For 100G interfaces, if the specific transceiver inserted uses PAM4 encoding, then the system shall always enable clause 91 RS(544,514) FEC and so this leaf should be left unconfigured. For 100G interfaces, if the specific transceiver inserted uses NRZ encoding, then it may require rs-528 to be enabled. This is dependent on the specific PMD and also whether the installed transceiver includes the FEC functionality inside the transceiver. Refer to Nokia support for the correct setting for the specific transceiver.

If this leaf is configured and the setting is incompatible with the installed transceiver, the interface shall be kept down with a reason of unsupported-fec.

25G interfaces support disabled, base-r, and rs-528. The FEC requirement for a 25G interface depends on the cable type. A CA-N DAC cable has a loss specification that requires no FEC. A CA-S DAC cable requires FEC, rs-528 recommended. A CA-L DAC cable requires the stronger rs-528 FEC.

Context interface name *string* ethernet forward-error-correction fec-option *keyword*

Tree fec-option

Options

- disabled
- base-r

  An early form of FEC used with 25G interfaces

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Defined in clause 74 of IEEE 802.3. This FEC has poor performance compared to clause 108 (rs-528). base-r should only be used if the far end doesn't support rs-528

This type of FEC is only supported for 25G interfaces.

- rs-528

  Reed-Solomon RS(528,514) code FEC

  For 25G interfaces, this is IEEE 802.3 Clause 108 using RS(528,514) For 100G interfaces, this is IEEE 802.3 Clause 91 using RS(528,514)

Configurable True

operational-host-if-fec *keyword*

Description The forward error correction algorithm in use to use at the host interface and potentially the media interface

The same FEC algorithm must be used at both ends of a link.

Context interface name *string* ethernet forward-error-correction operational-host-if-fec *keyword*

Tree operational-host-if-fec

Options

- disabled

  No FEC is active on the host interface

- cl74-baser

  An early form of FEC used with 25G interfaces

  Not very strong performance - cl108-rs528 is preferred. cl74-baser should only be used if the far end doesn't support cl108-rs528

- cl108-rs528

  IEEE 802.3 Clause 108 using RS(528,514)

  IEEE defines this as mandatory for 25G interfaces

- cl91-rs528

  IEEE 802.3 Clause 91 using RS(528,514)

  IEEE defines this as an option for 100G interfaces using NRZ

- cl91-rs544

  IEEE 802.3 Clause 91 using RS(544,514)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

IEEE defines this as mandatory for 100G interfaces using PAM4

- cl119-rs544

  IEEE 802.3 Clause 119 using RS(544,514)

  IEEE defines this as mandatory for 200G and 400G interfaces

- cl134-rs544

  IEEE 802.3 Clause 134 using RS(544,514)

  IEEE defines this as mandatory for 50G interfaces

- cl172-rs544

  IEEE 802.3 Clause 172 using RS(544,514)

  IEEE defines this as mandatory for 800G interfaces

- cl175-rs544

  IEEE 802.3 Clause 175 using RS(544,514)

  IEEE defines this as mandatory for 1.6T interfaces

forwarding-viable *boolean*

Description If true: this LAG member link should be used for the transmission of traffic if all other LAG/port attributes allow it.

If false: this LAG member link should not be used for the transmission of traffic.

In all cases: This LAG member link should process any received frames when it is an active member link. L2 protocols such as LLDP, LACP and micro-BFD should continue to be sent and processed.

hold-time

Description Enter the hold-time context

Configure interface hold timers for Ethernet interfaces

Context interface name *string* ethernet hold-time

Tree hold-time

Configurable True

Platforms Supported on all platforms

down *number*

Description Holds link down events for the configured time

The hold-time down behavior is triggered with events that try to bring the ethernet interface down and can change quickly. It is not triggered with an admin-state disable event or interface disable due to other internal reasons (such as fabric unavailability). When running, the interface will not be brought down till the timer expires. The typical use of the hold-time down is to provide stability and avoid the protocols to advertise/withdraw messages if there are flapping optics. The hold-time down is aborted if the user does admin-state disable or if the interface is disabled due to other internal reasons that prevent the traffic to be forwarded on the interface.

link-loss-forwarding *boolean*

Description Indicates whether link-loss-forwarding is enabled in the interface

When enabled, faults can be propagated to the devices connected to this interface. It is supported on interfaces with a single non-tagged subinterface that is associated to a network-instance of type vpws. On VPWS services, the propagation of faults from a connection-point to the opposite connection-point is known as Link Loss Forwarding and requires setting this command to true and the standby-signaling command to the type of propagation signaling to be used with the connected Customer Equipment.

Tree	physical-medium
Options	• 1000BASE-T
Configurable	False
Platforms	Supported on all platforms

port-speed *keyword*

Description

The speed of the port or channel

If this parameter is configured, then the configured value will be applied. If it is not configured, then there are two mechanisms that will set a speed for the port.

Some platforms support a mechanism to automatically set the port-speed based on the form factor of the inserted transceiver. form-factor speed QSFP28 100G SFP112 100G SFP56-DD 100G SFP 1G SFP+ 10G QSFP56-DD 400G QSFP56 200G QSFP28-DD 200G SFP28 25G QSFP112 400G QSFP+ 40G QSFP28-50G 50G SFP56 50G QSFP112-DD 800G CFP2-DCO 400G OSFP800 800G

When the auto-configuration of speed based on form factor is not supported and the speed is not configured, then the default speed of a port (when auto-negotiation is disabled or unsupported) depends on the platform and port/connector number as follows:

mgmt0 and mgmt0-standby ports: 1G 7250 IXR-6/10 IMM ports 1-32: 100G 7250 IXR-6/10 IMM ports 33-36: 100G 7215 IXS-A1 ports 1-48: 1G 7215 IXS-A1 ports 49-52: 10G 7220-D1 ports 1-48: 1G 7220-D1 ports 49-52: 10G 7220-D2/D2L ports 1-48: 25G 7220-D2/D2L ports 49-56: 100G 7220-D2L ports 57-58: 10G 7220-D3 ports 1-2: 10G 7220-D3 ports 3-34: 100G 7220-D3L ports 1-32: 100G 7220-D3L ports 33-34: 10G 7220-D4 ports 1-28: 100G 7220-D4 ports 29-36: 400G 7220-D5 ports 1-32: 400G 7220-D5 ports 33-38: 10G 7220-H2 ports 1-128: 100G 7220-H3 ports 1-2: 10G 7220-H3 ports 3-34: 400G 7220-H4 ports 1-64: 400G 7220-H4 ports 65-66: 10G 7220-H4-32D ports 1-32: 400G 7220-H4-32D ports 33: 10G 7220-H5-32D ports 1-32: 800G 7220-H5-32D ports 33-34: 10G 7220-H5-64D ports 1-64: 800G 7220-H5-64D ports 65-66: 10G 7220-H5-64O ports 1-64: 800G 7220-H5-64O ports 65-66: 10G 7220-H6-64 ports 1-64: 1.6T 7220-H6-64 ports 65-66: 25G 7250 IXR-6e/10e 60p QSFP28 IMM all ports: 100G 7250 IXR-6e/10e 36p QSFPDD-400 IMM all ports: 400G 7250 IXR-6e/10e/18e 36p QSFP112-DD IMM all ports: 800G 7250 IXR-6e/10e/18e 36p OSFP IMM all ports: 800G 7250 IXR-X1b QSFP28 ports 1-24: 100G 7250 IXR-X1b QSFPDD ports 25-36: 400G 7250 IXR-X3b QSFPDD all ports: 400G 7250 IXR-X4 QSFP112-DD all ports: 800G 7250 IXR-X4-OSFP all ports:

Note 1: Use of 100G with fec enabled is supported on every port. Use of 100G with no FEC and 40G are only supported on odd numbered ports If port 11 is used with 100G with no FEC or 40G, then port 10 shall be disabled.

Note 2: On 7220-D2: if one port in each consecutive group of 4 ports (1-4, 5-8, .. , 45-48) is enabled and has a configured speed of 25G then the other 3 ports may only be enabled if they also have a configured speed of 25G or no speed configured; if one port in each consecutive group of 4 ports (1-4, 5-8, .. , 45-48) is enabled and has a configured speed of 1G or 10G the other 3 ports may only be enabled if they also have a configured speed of 1G or 10G or no speed configured. On 7220-D2L: if one port in each port group of 4 ports ({1, 2, 3, 6}, {4, 5, 7, 9}, {8, 10, 11, 12}, {13, 14, 15, 18}, {16, 17, 19, 21}, {20, 22, 23, 24}, {25, 26, 27, 30}, {28, 29, 31, 33}, {32, 34, 35, 36}, {37, 38, 39, 42}, {40, 41, 43, 45}, {44, 46, 47, 48}) is enabled and has a configured speed of 25G the other 3 ports may only be enabled if they also have a configured speed of 25G or no speed configured; if one port in each port group of 4 ports is enabled and has a configured speed of 1G or 10G the other 3 ports may only be enabled if they also have a configured speed of 1G or 10G or no speed configured.

Note 3: Breakout and 40G is only supported on odd numbered ports. For the QSFP28 four port groupings [1-4], [5-8], [9-12], [13-16], [21-24], [25-28], and [29-32] if either of the odd numbered ports within a group is configured for 40G, 4x10G, or 4x25G, then the other odd numbered port in the same group may only be configured if it is configured for one of 40G, 4x10G, or 4x25G (can differ between the odd ports) and neither of the two even numbered ports within the same group can be configured.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note 4: For the QSFP28 ports, the following port groups exist [n, n+1, n+2, n+3] for n = 1, 5, 9, 13, 17, 21. 4x25G or 4x10G breakout, and 10G, are only supported on ports n+1 and n+3. When initially configuring a port with a breakout configuration or port speed that does not already exist on another configured port within the same group, then a link flap and traffic hit may occur on other ports within the same group. When the breakout configuration or port speed is changed for a port in a group, then a link flap and traffic hit may occur on other ports within the same group. If port n+1 within the group is configured for breakout, then port n cannot be configured. In addition if port n+1 is configured for breakout and port n+3 is configured without breakout, then port n+2 may only be configured with the same speed as port n+3. If port n+3 within the group is configured for breakout, then port n+2 cannot be configured. In addition if port n+3 is configured for breakout and port n+1 is configured without breakout, then port n may only be configured with the same speed as port n+1.

Note 5: QSFP28 port 2 is disabled if port 1 is configured with breakout-mode or port-speed 40G; QSFP28 port 4 is disabled if port 3 is configured with breakout-mode or port-speed 40G.

7250 IXR details: If the interface corresponds to a connector that has no installed transceiver then the value is accepted without any checking or restriction, and info from state will display the configured value. Otherwise if the configured port-speed is NOT supported by the installed transceiver the port is forced operationally down.

Port Groups and auto-configuration: Manually configured and enabled port-speed (and breakout-modes) take precedence over the auto-configured port-speed. This means that configuring and enabling a port within a port-group can have a side effect to take down an operational port that had its speed set based on the auto-configuration feature. If there is risk of mixing transceiver types within a port group, then it is recommended to always manually configure the speed for enabled ports

Configurable True

Platforms Supported on 7220 IXR-D5, 7250 IXR-X3b

disable-ip-timestamping *boolean*

Description Disables timestamping of PTP over IP messages on this port

For platforms supporting PTP functionality, any transiting PTP over IP packets are timestamped in hardware by default, regardless of whether PTP is enabled on the system. To avoid unwanted correction-field updates of PTP transit packets on ports (ports involved in PTP packet transit only), this command can be used to disabled the timestamping.

reload-delay *number*

Description	Configure reload-delay timer for Ethernet interfaces. The reload-delay timer starts when the associated XDP interface state is learned. While the timer is running, the interface transceiver laser is disabled to avoid attracting traffic from the connected device at the other end of the interface. The reload-delay timer should be used in multi-homing interfaces and be set to a value long enough to allow the system to recover all the network protocols upon reboot, before start attracting traffic from the multi-homed device.

oper-state *keyword*

Description Operational state for the associated LAG

Context interface name *string* lag member name *reference* oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

mtu *number*

Description	Port MTU in bytes including ethernet overhead but excluding 4-bytes FCS If a transmitted packet exceeds this size it is dropped. The default value for ethernet-x interfaces is taken from /system/mtu/default-port-mtu. For the mgmt0 and mgmt0-standby interfaces the default is 1514 bytes, but the value can be changed for each interface individually. For the mgmtA and mgmtB interfaces the default value is derived from mgmt0 or mgmt0-standby configuration. Port MTU is not configurable for loopback interfaces or irb interfaces. For irb interfaces, if the size of the ip packets to be routed to a mac-vrf has to be restricted, the subinterface.ip-mtu should be configured instead. The max mtu for the mgmt0, mgmt0-standby, mgmtA and mgmtB interfaces is 9216. The 7220 IXR systems support a maximum port MTU of 9412 bytes and minimum of 1500 bytes. The VSRL system supports a maximum port MTU of 9500 and minimum of 1450 bytes. All systems support a maximum port MTU of 9500 and minimum of 1500 bytes. Each 7250 IXR IMM supports a maximum of 8 different port MTU values. 7220 IXR systems do not have any limit on the maximum number of different port MTU values.
Context	interface name *string* mtu *number*
Tree	mtu
Range	1450 to 9500
Units	bytes
Configurable	True
Platforms	Supported on all platforms

num-physical-channels *number*

Description	Sets the number of lanes or physical channels assigned to this interface or to the set of interfaces within this breakout group This leaf can be used to distinguish between transceivers that provide the same port-speed or breakout-configuration but using different PMAs. For example, if a port supports two transceivers providing 100G optical signal but one uses CAUI4 and the other uses 100GAUI-2, then this leaf can be set to 4 for the CAUI4 transceiver and 2 for the 100GAUI-2 transceiver. Similarly, a transceiver that provides a breakout of 4 ports of 100G using 4 x 100GAUI2 would set this leaf to 8 but a transceiver using 4 x 100GAUI-1 would have this leaf set to 4. An 800G transceiver that provides a breakout of 1 port of

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

400G using 1x400GAUI-8 would set this leaf to 8 or if using 1x400GAUI-4 would set this leaf to 4.

If not set, then the default shall be as follows: 1 is used for 10G, 25G 2 is used for 50G 4 is used for 40G, 100G, 200G, 4x10G, 2x50G, 4x25G, 1x100G 6 is used for 3x100G (digital coherent optics) 8 is used for 400G, 800G, 2x100G, 8x50G, 1x400G, 4x100G, 2x400G

If num-physical-channels has been configured within the breakout group, it cannot be configured at the interface level.

Options

- LISTENING

  Listening port indicates port that is processing BPDUs and building active toplogy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- LEARNING

  Learning port indicates port that is building bridging tables; no forwarding of data
- BLOCKING

  Blocking port indicates port that would cause a loop if it were sending data. It only receivs BPDUs, until a topology change removes the possibliity of a loop
- FORWARDING

  Forwarding port indicates port that is operating normally, sending and receiving data
- DISCARDING

  Discarding port indicates port that is receiving and discarding data
- DISABLED

  Disabled Port is the port that is isolated from network, either administratively down or failed

Configurable False

- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

  Listening port indicates port that is processing BPDUs and building active toplogy

- LEARNING

  Learning port indicates port that is building bridging tables; no forwarding of data

- BLOCKING

  Blocking port indicates port that would cause a loop if it were sending data. It only receivs BPDUs, until a topology change removes the possibliity of a loop

- FORWARDING

  Forwarding port indicates port that is operating normally, sending and receiving data

- DISCARDING

  Discarding port indicates port that is receiving and discarding data

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- DISABLED

  Disabled Port is the port that is isolated from network, either administratively down or failed

Configurable False

Context	interface name *string* subinterface index *number* ifindex *number*
Tree	ifindex
Configurable	False
Platforms	Supported on all platforms

ip-mtu *number*

Description	IP MTU of the subinterface in bytes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Includes the IP header but excludes Ethernet encapsulation.

IP MTU specifies the maximum sized IPv4 or IPv6 packet that can be transmitted on the subinterface. If an IPv4 or IPv6 packet exceeds this size it is dropped and this may result in the generation of an ICMP error message back to the source.

The default IP MTU for a subinterface is taken from /system/mtu/default-ip-mtu. For the mgmt0 and mgmt0-standby subinterfaces the default is the associated interface MTU minus the Ethernet encapsulation overhead.

The IP MTU is not configurable for subinterfaces of loopback interfaces.

The 7220 IXR systems support a maximum IP MTU of 9398 bytes.

Each 7250 IXR IMM supports a maximum of 4 different IP MTU values. 7220 IXR systems do not have any limit on the maximum number of different IP MTU values.

Max. Elements 512

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ip-prefix *string*

Description The IPv4 address and prefix length in CIDR notation

Subnets on the same subinterface are allowed to overlap as long as the host bits are different. When a locally originated unicast packet is destined to a host covered by multiple subnets associated with a subinterface, the source address is chosen to be the numerically lowest IP address among all these subnets. For example, if the addresses 172.16.1.1/12, 172.16.1.2/12, and 172.16.1.3/12 are configured on the same interface, 172.16.1.1 would be used as a local address when you issue a ping 172.16.1.5 command

Context interface name *string* subinterface index *number* ipv4 address ip-prefix *string*

Configurable True

Platforms Supported on all platforms

anycast-gw *boolean*

Description This designates the associated IPv4 address as an anycast-gateway IPv4 address of the subinterface.

When this parameter is set to true:

Context interface name *string* subinterface index *number* ipv4 address ip-prefix *string* anycast-gw *boolean*

Tree anycast-gw

Configurable True

allow-directed-broadcast *boolean*

Description	When this is set to true the software is allowed to re-broadcast targeted broadcast IPv4 packets on this subinterface Detailed handling of subnet broadcast is as follows: If a targeted broadcast packet is received on subinterface X that has the matching subnet then it is delivered to the CPM and CPM will reply to an ICMP echo.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If a targeted broadcast packet is received on subinterface X but the matching subnet is associated with subinterface Y, and subinterface Y is configured with allow-directed-broadcasts=false then it is delivered to the CPM and CPM replies to an ICMP echo per above, but it does not re-broadcast the packet on subinterface Y.

If a targeted broadcast packet is received on subinterface X but the matching subnet is associated with subinterface Y, and subinterface Y is configured with allow-directed-broadcasts=true then it is delivered to the CPM and CPM replies to an ICMP echo per above, and CPM also re-broadcasts the packet on subinterface Y.

entry-type *keyword*

Description Controls how evpn-derived ARP/ND entries are programmed

When set to evpn, the received EVPN MAC/IP Advertisement routes matching a local ethernet segment create an ARP/ND entry of type evpn. When set to evpn-local-es, the ARP/ND corresponding entries are of type evpn-local-es. The evpn-local-es ARP/ND entries then trigger the local router to advertise corresponding MAC/IP Advertisement routes with the proxy bit set if the advertise evpn-local-es command is configured. The evpn-local-es entries are subject to the retention-timer when the evpn route that created the entry is withdrawn.

retention-timer *number*

Description	The retention timer in seconds for evpn-local-es entries This timer begins when the EVPN MAC/IP Advertisement route that originated the evpn-local-es route is withdrawn and defines how long the evpn-local-es entry is retained. While the timer is active, the router sends ARP Requests or Neighbor Solicitations for the entry to the local ethernet segment. The entry is converted into a dynamic entry if a response is received. This timer can only be configured when entry-type is evpn-local-es.

Max. Elements 10

probe-interval *number*

Description Configure the ARP probe interval at which the system sends an ARP request for the virtual IPv4 address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The default value of zero determines that the system sends an ARP Request for the virtual IPv4 only when the address is configured. The creation of the ARP entry for the virtual IPv4 address will in this case rely on the server sending a Gratuitous ARP for the virtual IPv4 address. When the value is set to a non-zero interval, the system sends a periodic ARP Request at the configured interval and irrespective of the ARP entry being already created.

- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

in-forwarded-packets *number*

Description	The number of packets received on this subinterface for which the router was not the final destination and for which the router attempted to find a route to forward them to that final destination Includes non-terminating IPv4 packets with options, non-terminating IPv6 packets with Routing, Destination Options or Fragment headers, packets that trigger ICMP/ICMPv6 redirect messages, and packets extracted to the CPM for ARP/ND resolution of a next-hop or locally connected host. On 7250 IXR systems a transit IPv6 packet whose first Next Header is Hop-by-Hop Options is extracted for option inspection and counted in in-terminated-packets instead.

in-terminated-packets *number*

Description The total number of input packets extracted to the control plane after CPM filter accept

Locally destined (terminating) packets are counted here. Transit IPv4 packets with options are forwarded without extraction and counted in in-forwarded-packets, as are transit IPv6 packets with Routing, Destination Options or Fragment headers. On 7250 IXR systems a transit IPv6 packet whose first Next Header is Hop-by-Hop Options is extracted so that the options can be inspected, is counted here, and is forwarded by the control plane when the options are valid.

A packet counted here stays on this counter even when the control plane subsequently discards it; the count is never moved to in-discarded-packets or in-error-packets. Such control plane discards include:

out-discarded-packets *number*

Description	The total number of packets, originating and transit, that should have been sent out this subinterface but were dropped This includes IP packets dropped by egress interface ACL drop action. On 7220 platforms, which do not support out-error-packets, this also includes IP and MPLS packets dropped because the egress IP MTU or MPLS MTU was exceeded. Those MTU-exceeded drops are not counted on 7215 IXS-A1.

out-error-packets *number*

Description	The number of packets, originating and transit, for which this router was successful in finding a path to their final destination through this subinterface but an error prevented their transmission On 7250 IXR systems this is incremented when the IPv4 packet size exceeds the IP MTU and fragmentation was not allowed or not supported. It is also incremented when the MPLS packet size exceeds the MPLS MTU of the subinterface. On platforms that do not support this counter the same MTU-exceeded drops are counted in out-discarded-packets.

origin *keyword*

Description	The origin of the IPv6 address
Context	interface name *string* subinterface index *number* ipv6 address ip-prefix *string* origin *keyword*
Tree	origin
Options	• other • static • dhcp • link-layer • random
Configurable	False
Platforms	Supported on all platforms

primary

Description	One of the IPv6 prefixes assigned to the subinterface can be explicitly configured as primary by setting this leaf to true. This designates the associated IPv6 address as a primary IPv6 address of the subinterface. By default, the numerically lowest value IPv6 address is selected as the primary address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The primary address is used as the source address for locally originated broadcast and multicast packets sent out the subinterface.

Context interface name *string* subinterface index *number* ipv6 address ip-prefix *string* primary

Tree primary

Configurable True

Platforms Supported on all platforms

status *keyword*

Description The status of an IPv6 address

Context interface name *string* subinterface index *number* ipv6 address ip-prefix *string* status *keyword*

Tree status

Options

- preferred
- deprecated
- invalid
- inaccessible
- unknown
- tentative
- duplicate
- optimistic

Configurable False

Platforms Supported on all platforms

type *keyword*

Description Specifies the explicit type of the IPv6 address being assigned to the subinterface

By default, addresses are assumed to be global unicast. Where a link-local address is to be explicitly configured, this leaf should be set to link-local.

Context interface name *string* subinterface index *number* ipv6 address ip-prefix *string* type *keyword*

Tree type

Default global-unicast

Options

- global-unicast

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The IPv6 address is a global unicast address type and must be in the format defined in RFC 4291 section 2.4.

- link-local-unicast

  The IPv6 address is a Link-Local unicast address type and must be in the format defined in RFC 4291 section 2.4.

Configurable True

Platforms Supported on all platforms

oper-state *keyword*

Description The operational state of the dhcp relay agent

Context interface name *string* subinterface index *number* ipv6 dhcp-relay oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Component is downloading image into memory

- booting

  Component is booting downloaded image

- starting

  Component image operational, application processes starting

- failed

  Component or process has failed

- synchronizing

  Component is currently being synchronized

- upgrading

  Component is currently being upgraded

- low-power

  Component is offline due to insufficient system power

- degraded

  Component or process is in a degraded state

- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

entry-type *keyword*

Description Controls how evpn-derived ARP/ND entries are programmed

When set to evpn, the received EVPN MAC/IP Advertisement routes matching a local ethernet segment create an ARP/ND entry of type evpn. When set to evpn-local-es, the ARP/ND corresponding entries are of type evpn-local-es. The evpn-local-es ARP/ND entries then trigger the local router to advertise corresponding MAC/IP Advertisement routes with the proxy bit set if the advertise evpn-local-es command is configured. The evpn-local-es entries are subject to the retention-timer when the evpn route that created the entry is withdrawn.

retention-timer *number*

Description	The retention timer in seconds for evpn-local-es entries This timer begins when the EVPN MAC/IP Advertisement route that originated the evpn-local-es route is withdrawn and defines how long the evpn-local-es entry is retained. While the timer is active, the router sends ARP Requests or Neighbor Solicitations for the entry to the local ethernet segment. The entry is converted into a dynamic entry if a response is received. This timer can only be configured when entry-type is evpn-local-es.

Max. Elements	10

probe-interval *number*

Description	Configure the probe interval at which the system sends a Neighbor Solicitation (NS) for the virtual IPv6 address. The default value of zero determines that the system sends a NS for the virtual IPv6 only when the address is configured. The creation of the Neighbor entry for the virtual IPv6 address will in this case rely on the server sending an unsolicited Neighbor Advertisement for the virtual IPv6 address. When the value is set to a non-zero interval, the system sends a periodic NS at the configured interval and irrespective of the Neighbor entry being already created.

Platforms	Supported on all platforms

max-advertisement-interval *number*

Description	The maximum time between sending router advertisement messages to the all-nodes multicast address. Each subinterface has its own timer. Whenever the timer fires the message is sent and then the timer is reset to a uniformly distributed random value between min-advertisement-interval and max-advertisement-interval. The RA message can be sent before timer expiry in response to a RS message.
Context	interface name *string* subinterface index *number* ipv6 router-advertisement router-role max-advertisement-interval *number*
Tree	max-advertisement-interval
Range	4 to 1800
Default	600
Units	seconds
Configurable	True
Platforms	Supported on all platforms

min-advertisement-interval *number*

Description	The minimum time between sending router advertisement messages to the all-nodes multicast address. Each subinterface has its own timer. Whenever the timer fires the message is sent and then the timer is reset to a uniformly distributed random value between min-advertisement-interval and max-advertisement-interval. The RA message can be sent before timer expiry in response to a RS message.

in-error-packets *number*

Description The total number of input packets discarded due to header field errors, counting transit and terminating traffic

Includes hop-count/TTL/HopLimit exceeded on transit, bad version, IHL/length/checksum, address errors (including IPv4 Class E destination 240.0.0.0/4), truncated packets, and IPv6 Beyond Scope drops for transit packets with a link-local source.

Only errors detected in the forwarding pipeline are counted here. Header field errors that the control plane detects in a packet it has already accepted, such as an unsupported IPv4 option or an invalid IPv6 extension header, option or fragment, are counted in in-terminated-packets.

A Next Header value of 59 (No Next Header) is not an error.

In an MPLS context, the total number of MPLS packets that were dropped because:

in-forwarded-packets *number*

Description The number of packets received on this subinterface for which the router was not the final destination and for which the router attempted to find a route to forward them to that final destination

Includes non-terminating IPv4 packets with options, non-terminating IPv6 packets with Routing, Destination Options or Fragment headers, packets that trigger ICMP/ICMPv6 redirect messages, and packets extracted to the CPM for ARP/ND resolution of a next-hop or locally connected host.

On 7250 IXR systems a transit IPv6 packet whose first Next Header is Hop-by-Hop Options is extracted for option inspection and counted in in-terminated-packets instead.

in-terminated-packets *number*

Description The total number of input packets extracted to the control plane after CPM filter accept

Locally destined (terminating) packets are counted here. Transit IPv4 packets with options are forwarded without extraction and counted in in-forwarded-packets, as are transit IPv6 packets with Routing, Destination Options or Fragment headers. On 7250 IXR systems a transit IPv6 packet whose first Next Header is Hop-by-Hop Options is extracted so that the options can be inspected, is counted here, and is forwarded by the control plane when the options are valid.

A packet counted here stays on this counter even when the control plane subsequently discards it; the count is never moved to in-discarded-packets or in-error-packets. Such control plane discards include:

Context interface name *string* subinterface index *number* ipv6 statistics in-terminated-packets *number*

out-discarded-packets *number*

Description The total number of packets, originating and transit, that should have been sent out this subinterface but were dropped

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This includes IP packets dropped by egress interface ACL drop action.

On 7220 platforms, which do not support out-error-packets, this also includes IP and MPLS packets dropped because the egress IP MTU or MPLS MTU was exceeded. Those MTU-exceeded drops are not counted on 7215 IXS-A1.

out-error-packets *number*

Description The number of packets, originating and transit, for which this router was successful in finding a path to their final destination through this subinterface but an error prevented their transmission

On 7250 IXR systems this is incremented when the IPv4 packet size exceeds the IP MTU and fragmentation was not allowed or not supported. It is also incremented when the MPLS packet size exceeds the MPLS MTU of the subinterface. On platforms that do not support this counter the same MTU-exceeded drops are counted in out-discarded-packets.

l2-mtu *number*

Description	Layer-2 MTU of the subinterface in bytes. Includes the Ethernet header and VLAN tags, and excludes 4-bytes FCS. L2 MTU specifies the maximum sized Ethernet frame that can be transmitted on the subinterface. If a frame exceeds this size it is discarded. If the l2-mtu of the subinterface exceeds the port-mtu of the associated interface, the subinterface will remain operationally down. The default value for a subinterface is taken from /system/mtu/default-l2-mtu. The L2 MTU is only configurable for bridged and capture subinterfaces. The 7220 IXR systems support a maximum L2 MTU of 9412 bytes and minimum of 1500 bytes. The VSRL system supports a maximum L2 MTU of 9500 and minimum of 1450 bytes. All other systems support a maximum L2 MTU of 9500 and minimum of 1500 bytes.

  Component is currently being synchronized

- upgrading

  Component is currently being upgraded

- low-power

  Component is offline due to insufficient system power

- degraded

  Component or process is in a degraded state

- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

in-terminated-packets *number*

Description The total number of input packets extracted to the control plane after CPM filter accept

Locally destined (terminating) packets are counted here. Transit IPv4 packets with options are forwarded without extraction and counted in in-forwarded-packets, as are transit IPv6 packets with Routing, Destination Options or Fragment headers. On 7250 IXR systems a transit IPv6 packet whose first Next Header is Hop-by-Hop Options is extracted so that the options can be inspected, is counted here, and is forwarded by the control plane when the options are valid.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A packet counted here stays on this counter even when the control plane subsequently discards it; the count is never moved to in-discarded-packets or in-error-packets. Such control plane discards include:

out-discarded-packets *number*

Description The total number of packets, originating and transit, that should have been sent out this subinterface but were dropped

This includes IP packets dropped by egress interface ACL drop action.

On 7220 platforms, which do not support out-error-packets, this also includes IP and MPLS packets dropped because the egress IP MTU or MPLS MTU was exceeded. Those MTU-exceeded drops are not counted on 7215 IXS-A1.

out-error-packets *number*

Description	The number of packets, originating and transit, for which this router was successful in finding a path to their final destination through this subinterface but an error prevented their transmission On 7250 IXR systems this is incremented when the IPv4 packet size exceeds the IP MTU and fragmentation was not allowed or not supported. It is also incremented when the MPLS packet size exceeds the MPLS MTU of the subinterface. On platforms that do not support this counter the same MTU-exceeded drops are counted in out-discarded-packets.

mpls-mtu *number*

Description	MPLS MTU of the subinterface in bytes, including the transmitted label stack. MPLS MTU specifies the maximum sized MPLS packet that can be transmitted on the subinterface. If an MPLS packet containing any payload exceeds this size then it is dropped. If the payload of the dropped packet is IPv4 or IPv6 then this may also result in the generation of an ICMP error message that is either tunneled or sent back to the source. The default MPLS MTU for a subinterface is taken from /system/mtu/default-mpls-mtu. The MPLS MTU is not configurable for subinterfaces of loopback interfaces. Each 7250 IXR IMM supports a maximum of 4 different MPLS MTU values.

Platforms	Supported on all platforms

in-error-packets *number*

Description	The total number of input packets discarded due to header field errors, counting transit and terminating traffic Includes hop-count/TTL/HopLimit exceeded on transit, bad version, IHL/length/checksum, address errors (including IPv4 Class E destination 240.0.0.0/4), truncated packets, and IPv6 Beyond Scope drops for transit packets with a link-local source. Only errors detected in the forwarding pipeline are counted here. Header field errors that the control plane detects in a packet it has already accepted, such as an unsupported IPv4 option or an invalid IPv6 extension header, option or fragment, are counted in in-terminated-packets. A Next Header value of 59 (No Next Header) is not an error. In an MPLS context, the total number of MPLS packets that were dropped because:

in-forwarded-packets *number*

Description	The number of packets received on this subinterface for which the router was not the final destination and for which the router attempted to find a route to forward them to that final destination Includes non-terminating IPv4 packets with options, non-terminating IPv6 packets with Routing, Destination Options or Fragment headers, packets that trigger ICMP/ICMPv6 redirect messages, and packets extracted to the CPM for ARP/ND resolution of a next-hop or locally connected host. On 7250 IXR systems a transit IPv6 packet whose first Next Header is Hop-by-Hop Options is extracted for option inspection and counted in in-terminated-packets instead.

in-terminated-packets *number*

Description	The total number of input packets extracted to the control plane after CPM filter accept Locally destined (terminating) packets are counted here. Transit IPv4 packets with options are forwarded without extraction and counted in in-forwarded-packets, as are transit IPv6 packets with Routing, Destination Options or Fragment headers. On 7250 IXR systems a transit IPv6 packet whose first Next Header is Hop-by-Hop Options is extracted so that the options can be inspected, is counted here, and is forwarded by the control plane when the options are valid. A packet counted here stays on this counter even when the control plane subsequently discards it; the count is never moved to in-discarded-packets or in-error-packets. Such control plane discards include:

out-error-packets *number*

Description	The number of packets, originating and transit, for which this router was successful in finding a path to their final destination through this subinterface but an error prevented their transmission On 7250 IXR systems this is incremented when the IPv4 packet size exceeds the IP MTU and fragmentation was not allowed or not supported. It is also incremented when the MPLS packet size exceeds the MPLS MTU of the subinterface. On platforms that do not support this counter the same MTU-exceeded drops are counted in out-discarded-packets.

ingress-mapping

Description Enter the ingress-mapping context

Context interface name *string* subinterface index *number* vlan ingress-mapping

Tree ingress-mapping

Configurable True

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

inner-tpid *identityref*

Description Optionally override the inner tag protocol identifier field (TPID)

The configured tpid is used by the action configured by 'vlan-stack-action' when modifying the VLAN stack.

Context interface name *string* subinterface index *number* vlan ingress-mapping inner-tpid *identityref*

Tree inner-tpid

Options

- TPID_0X8100

  Default TPID value for 802.1q single-tagged VLANs
- TPID_0X88A8

  TPID value for 802.1ad provider bridging, QinQ or stacked VLANs
- TPID_0X9100

  Alternate TPID value

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- TPID_0X9200

  Alternate TPID value

- TPID_ANY

  A wildcard that matches any of the generally used TPID values for singly- or multiply-tagged VLANs Equivalent to matching any of TPID_0X8100, TPID_0X88A8, TPID_0X9100 and TPID_0x9200. This value is only applicable where the TPID of a packet is being matched.

Configurable True

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

inner-vlan-id *number*

Description Optionally specifies the inner VLAN tag identifier

The vlan-id is used by the action configured in 'vlan-stack-action'. For example, if the action is 'PUSH-PUSH' then this VLAN identifier is added to the stack as inner vlan-id. This value must be non-zero if the 'vlan-stack-action' is one 'PUSH-PUSH' or 'POP-SWAP'.

laser-tunability *keyword*

Description Tunability of the optical interface.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Value 'unequipped' indicates the optical interface is not equipped with a laser.

Context interface name *string* transceiver optical-channel index *number* laser-tunability *keyword*

Tree laser-tunability

Options

- unequipped

  The optical interface is not equipped with a laser.
- not-tunable

  The optical interface is not tunable.
- fully-tunable

  The optical interface is tunable on the 100GHz and 50 GHz grids.
- tunable-100g

  The optical interface is tunable on the 100GHz grid.
- flex-tunable

  The optical interface is FlexGrid tunable.

Configurable False

Platforms 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

logical-channel *reference*

Description Logical channel associated to this optical channel

This is used to assist with the openconfig management of DCO using logical channels

Context interface name *string* transceiver optical-channel index *number* logical-channel *reference*

Tree logical-channel

Reference *number*

Configurable False

rx-optical-snr-y-polarization *decimal-number*

Description	Indicates the network received estimated optical SNR (Signal-to-Noise Ratio) of Y polarization.
Context	interface name *string* transceiver optical-channel index *number* rx-optical-snr-y-polarization *decimal-number*
Tree	rx-optical-snr-y-polarization
Units	decibels
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

rx-quality-margin *decimal-number*

Description	Indicates the received quality margin.
Context	interface name *string* transceiver optical-channel index *number* rx-quality-margin *decimal-number*
Tree	rx-quality-margin
Units	decibels
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

statistics

Description	Enter the statistics context interface/statistics/last-clear indicates when these statistics were last cleared.
Context	interface name *string* transceiver optical-channel index *number* statistics
Tree	statistics
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

current *decimal-number*

Description	Current SNR received on the optical channel
Context	interface name *string* transceiver optical-channel index *number* statistics received optical-signal-to-noise-ratio current *decimal-number*
Tree	current
Units	decibels
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

maximum *decimal-number*

Description	Maximum SNR received on the optical channel
Context	interface name *string* transceiver optical-channel index *number* statistics received optical-signal-to-noise-ratio maximum *decimal-number*
Tree	maximum
Units	decibels
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

minimum *decimal-number*

Description	Minimum SNR received on the optical channel
Context	interface name *string* transceiver optical-channel index *number* statistics received optical-signal-to-noise-ratio minimum *decimal-number*
Tree	minimum
Units	decibels
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

polarization-dependent-loss

Description	Enter the polarization-dependent-loss context
Context	interface name *string* transceiver optical-channel index *number* statistics received polarization-dependent-loss
Tree	polarization-dependent-loss
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

average *decimal-number*

Description	Indicates the average Polarization Dependent Loss received on the optical channel
Context	interface name *string* transceiver optical-channel index *number* statistics received polarization-dependent-loss average *decimal-number*
Tree	average
Units	decibels
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

current *decimal-number*

Description	Indicates the current Polarization Dependent Loss received on the optical channel
Context	interface name *string* transceiver optical-channel index *number* statistics received polarization-dependent-loss current *decimal-number*
Tree	current
Units	decibels
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

© 2026 Nokia.

latest-value *decimal-number*

Description	The current value of the ingress amplifier output power
Context	interface name *string* transceiver optical-line-system digital-diagnostic-monitoring ingress-amplifier-output-power latest-value *decimal-number*
Tree	latest-value
Units	decibel-milliwatts
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4

low-alarm-condition *boolean*

Description	Low alarm threshold condition. Set to true whenever the ingress amplifier output power is below the low-alarm-threshold and set to false whenever the value is above the low-alarm-threshold
Context	interface name *string* transceiver optical-line-system digital-diagnostic-monitoring ingress-amplifier-output-power low-alarm-condition *boolean*
Tree	low-alarm-condition
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4

low-alarm-threshold *decimal-number*

Description	Low alarm threshold condition. Read from the installed transceiver
Context	interface name *string* transceiver optical-line-system digital-diagnostic-monitoring ingress-amplifier-output-power low-alarm-threshold *decimal-number*
Tree	low-alarm-threshold
Units	decibel-milliwatts
Configurable	False
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4

egress-amplifier-gain *decimal-number*

Description	Gain for the egress amplifier
Context	interface name *string* transceiver optical-line-system egress-amplifier-gain *decimal-number*
Tree	egress-amplifier-gain
Range	0.00 to 25.00
Default	25.00
Units	decibels
Configurable	True
Platforms	7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4

reset

Description	Execute the reset action Reset the transceiver
Context	interface name *string* transceiver reset
Tree	reset
Configurable	True
Note	This is an action command
Platforms	Supported on IXR Gen 2c+, IXR Gen 3, IXR mixed Gen 2c+/Gen 3

info *string*

Description	Info message returned by the reset operation
Context	interface name *string* transceiver reset info *string*
Tree	info
Configurable	True
Note	This is an action output
Platforms	Supported on IXR Gen 2c+, IXR Gen 3, IXR mixed Gen 2c+/Gen 3

serial-number *string*

Description	Transceiver serial number This is the information as read from the EEPROM of the part.

high-warning-threshold *decimal-number*

Description	High warning threshold. Read from the installed transceiver
Context	interface name *string* transceiver voltage high-warning-threshold *decimal-number*
Tree	high-warning-threshold
Configurable	False
Platforms	Supported on all platforms

© 2026 Nokia.

latest-value *decimal-number*

Description	The current voltage reading of the transceiver module (in Volts)
Context	interface name *string* transceiver voltage latest-value *decimal-number*
Tree	latest-value
Configurable	False
Platforms	Supported on all platforms

low-alarm-condition *boolean*

Description	Low alarm threshold condition. Set to true whenever the module voltage is below the low-alarm-threshold and set to false whenever the module voltage is above the low-alarm-threshold
Context	interface name *string* transceiver voltage low-alarm-condition *boolean*
Tree	low-alarm-condition
Configurable	False
Platforms	Supported on all platforms

low-alarm-threshold *decimal-number*

Description	Low alarm threshold. Read from the installed transceiver
Context	interface name *string* transceiver voltage low-alarm-threshold *decimal-number*
Tree	low-alarm-threshold
Configurable	False
Platforms	Supported on all platforms

low-warning-condition *boolean*

Description	Low warning threshold condition. Set to true whenever the module voltage is below the low-warning-threshold and set to false whenever the module voltage is above the low-warning-threshold
Context	interface name *string* transceiver voltage low-warning-condition *boolean*
Tree	low-warning-condition

Configurable	False
Platforms	Supported on all platforms

low-warning-threshold *decimal-number*

Description	Low warning threshold. Read from the installed transceiver
Context	interface name *string* transceiver voltage low-warning-threshold *decimal-number*
Tree	low-warning-threshold
Configurable	False
Platforms	Supported on all platforms

wavelength *decimal-number*

Description	Wavelength of the transmitting laser in nanometers
Context	interface name *string* transceiver wavelength *decimal-number*
Tree	wavelength
Configurable	False
Platforms	Supported on all platforms

uuid *string*

Description	The system-generated or user-configured UUID for the interface
Context	interface name *string* uuid *string*
Tree	uuid
Configurable	True
Platforms	vsrl and future-0-0

vlan-tagging *boolean*

Description	When set to true the interface is allowed to accept frames with one or more VLAN tags
Context	interface name *string* vlan-tagging *boolean*
Tree	vlan-tagging
Configurable	True

mac-address *string*

Description	The MAC address of the next-hop if programmed explicitly
Context	network-instance name *string* afts next-hop index *number* mac-address *string*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	mac-address
Configurable	False
Platforms	Supported on all platforms

network-instance *reference*

Description	A network instance targeted for redirection
Context	network-instance name *string* afts next-hop index *number* network-instance *reference*
Tree	network-instance
Reference	network-instance name *string*
Configurable	False
Platforms	Supported on all platforms

programmed-index *number*

Description	The configured or client-supplied index of the next-hop
Context	network-instance name *string* afts next-hop index *number* programmed-index *number*
Tree	programmed-index
Configurable	False
Platforms	Supported on all platforms

next-hop-group id *number*

Description	An individual set of next-hops grouped into a common group Each entry within an abstract forwarding table points to a next-hop-group. Traffic is forwarded to the next-hops in the next-hop-group according to the weights specified.
Context	network-instance name *string* afts next-hop-group id *number*
Tree	next-hop-group
Configurable	False
Platforms	Supported on all platforms

id *number*

Description	A unique identifier for the next-hop-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	This index is not expected to be consistent across reboots, or reprogramming of the next-hop-group.
Context	network-instance name *string* afts next-hop-group id *number*
Configurable	False
Platforms	Supported on all platforms

backup-active *boolean*

Description	When true, this NHG is not being used to forward traffic and its backup NHG is being relied upon to provide reachability
Context	network-instance name *string* afts next-hop-group id *number* backup-active *boolean*
Tree	backup-active
Configurable	False
Platforms	Supported on all platforms

backup-next-hop-group *reference*

Description	The backup next-hop-group for the current group
Context	network-instance name *string* afts next-hop-group id *number* backup-next-hop-group *reference*
Tree	backup-next-hop-group
Reference	network-instance name *string* route-table next-hop-group index *number*
Configurable	False
Platforms	Supported on all platforms

next-hop index *reference*

Description	An individual next-hop within the next-hop-group Each next-hop is a reference to an entry within the next-hop list.
Context	network-instance name *string* afts next-hop-group id *number* next-hop index *reference*
Tree	next-hop
Configurable	False
Platforms	Supported on all platforms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

index *reference*

Description	A reference to the identifier for the next-hop to which the entry in the next-hop group corresponds
Context	network-instance name *string* afts next-hop-group id *number* next-hop index *reference*
Reference	network-instance name *string* afts next-hop index *number*
Configurable	False
Platforms	Supported on all platforms

weight *number*

Description	The weight applied to the next-hop within the group
Context	network-instance name *string* afts next-hop-group id *number* next-hop index *reference* weight *number*
Tree	weight
Configurable	False
Platforms	Supported on all platforms

programmed-id *number*

Description	The ID of the next-hop group as provided by the original programming mechanism (for example gRIBI)
Context	network-instance name *string* afts next-hop-group id *number* programmed-id *number*
Tree	programmed-id
Configurable	False
Platforms	Supported on all platforms

aggregate-routes

Description	Enable the aggregate-routes context
Context	network-instance name *string* aggregate-routes
Tree	aggregate-routes
Configurable	True
Platforms	Supported on all platforms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

instance-name *string*

Description	The name of the aggregate routing instance (optional)
Context	network-instance name *string* aggregate-routes instance-name *string*
Tree	instance-name
String Length	1 to 255
Configurable	True
Platforms	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7220 IXR-H5-32D, 7220 IXR-H5-64D, 7220 IXR-H5-64O, 7220 IXR-H5-64O-512, 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

route prefix *(ipv4-prefix | ipv6-prefix)*

Description	Enter the route list instance
Context	network-instance name *string* aggregate-routes route prefix *(ipv4-prefix | ipv6-prefix)*
Tree	route

communities

Description Enter the communities context

Context network-instance name *string* aggregate-routes route prefix *(ipv4-prefix | ipv6-prefix)* communities

Tree communities

Configurable True

Platforms Supported on all platforms

add *(bgp-std-community-type | identityref | bgp-large-community-type)*

Description Enter the add context

Context network-instance name *string* aggregate-routes route prefix *(ipv4-prefix | ipv6-prefix)* communities add *(bgp-std-community-type | identityref | bgp-large-community-type)*

Tree add

Options

- no-export

  Do not export NLRI received carrying this community outside the bounds of this autonomous system, or this confederation if the local autonomous system is a confederation member AS. This community has a value of 0xFFFFFF01.

- no-advertise

  All NLRI received carrying this community must not be advertised to other BGP peers. This community has a value of 0xFFFFFF02.

- no-export-subconfed

  All NLRI received carrying this community must not be advertised to external BGP peers - including over confederation sub-AS boundaries. This community has a value of 0xFFFFFF03.

Configurable True

Platforms Supported on all platforms

Max. Elements 12

generate-icmp *boolean*

Description When set to true the router generares ICMP unreachable messages for packets matching the aggregate route (and not a more specific route).

Context network-instance name *string* aggregate-routes route prefix *(ipv4-prefix | ipv6-prefix)* generate-icmp *boolean*

Tree generate-icmp

label

Description	Enter the label context The encoded label value and type in the EVPN NLRI

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context network-instance name *string* bgp-rib afi-safi afi-safi-name *identityref* evpn local-rib ethernet-ad-route route-distinguisher *(route-distinguisher-type-0 | route-distinguisher-type-1 | route-distinguisher-type-2 | route-distinguisher-type-2b)* esi *string* ethernet-tag-id *number* neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* path-id *number* label

Tree label

Configurable False

Platforms Supported on all platforms

value *number*

Description The value of the label field

If the route is an EVPN MPLS route, the mpls-label is read out of the 20-bit high order value. If the route is an EVPN VXLAN route, the vni is read out of the 24-bit value. If the route is an EVPN SRv6 route, this field is set to zero if no transposition is used and set to a non-zero value if transposition is used. For all the cases, if this is an Auto-Discovery per ES route, this leaf is set to zero.

Context network-instance name *string* bgp-rib afi-safi afi-safi-name *identityref* evpn local-rib ethernet-ad-route route-distinguisher *(route-distinguisher-type-0 | route-distinguisher-type-1 | route-distinguisher-type-2 | route-distinguisher-type-2b)* esi *string* ethernet-tag-id *number* neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* path-id *number* label value *number*

Tree value

Range 0 to 16777215

Configurable False

Platforms Supported on all platforms

value-type *keyword*

Description Whether the encoded label value is an mpls-label, a vni or a transposed function or argument

Context network-instance name *string* bgp-rib afi-safi afi-safi-name *identityref* evpn local-rib ethernet-ad-route route-distinguisher *(route-distinguisher-type-0 | route-distinguisher-type-1 | route-distinguisher-type-2 | route-distinguisher-type-2b)* esi *string* ethernet-tag-id *number* neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* path-id *number* label value-type *keyword*

label

Description Enter the label context

The encoded label value and type in the EVPN NLRI

Context network-instance name *string* bgp-rib afi-safi afi-safi-name *identityref* evpn local-rib ip-prefix-route route-distinguisher *(route-distinguisher-type-0* | *route-distinguisher-type-1* | *route-distinguisher-type-2* | *route-distinguisher-type-2b)* ethernet-tag-id *number* ip-prefix-length *number* ip-prefix *(ipv4-prefix* | *ipv6-prefix)* neighbor *(ipv4-address-with-zone* | *ipv6-address-with-zone)* path-id *number* label

Tree label

Configurable False

Platforms Supported on all platforms

value *number*

Description The value of the label field

If the route is an EVPN MPLS route, the mpls-label is read out of the 20-bit high order value. If the route is an EVPN VXLAN route, the vni is read out of the 24-bit value. If the route is an EVPN SRv6 route, this field is set to zero if no transposition is used and set to a non-zero value if transposition is used.

Context network-instance name *string* bgp-rib afi-safi afi-safi-name *identityref* evpn local-rib ip-prefix-route route-distinguisher *(route-distinguisher-type-0* | *route-distinguisher-type-1* | *route-distinguisher-type-2* | *route-distinguisher-type-2b)* ethernet-tag-id *number* ip-prefix-length *number* ip-prefix *(ipv4-prefix* | *ipv6-prefix)* neighbor *(ipv4-address-with-zone* | *ipv6-address-with-zone)* path-id *number* label value *number*

value *number*

Description The value of the label field

If the route is an EVPN MPLS route, the mpls-label is read out of the 20-bit high order value. If the route is an EVPN VXLAN route, the vni is read out of the 24-bit value. If the route is an EVPN SRv6 route, this field is set to zero if no transposition is used and set to a non-zero value if transposition is used.

last-modified *string*

Description	Time of the last modification of the route stored in the BGP RIB. For a route learned from a BGP neighbor the initial value is the same as last-update received. If an import policy later changed some attribute of the route last-modified would be updated to reflect the time of this change.
Context	network-instance name *string* bgp-rib afi-safi afi-safi-name *identityref* evpn local-rib multicast-membership-report-synch-route route-distinguisher *(route-distinguisher-type-0 | route-distinguisher-type-1 | route-distinguisher-type-2 | route-distinguisher-type-2b)* esi *string* ethernet-tag-id *number* multicast-source-length *number* multicast-source-address *(ipv4-address | ipv6-address)* multicast-group-length *number* multicast-group-address *(ipv4-address | ipv6-address)* originating-router *(ipv4-address | ipv6-address)* neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* path-id *number* last-modified *string*

label

Description Enter the label context

The encoded label value and type in the EVPN NLRI

Context network-instance name *string* bgp-rib afi-safi afi-safi-name *identityref* evpn rib-in-out rib-in-post ethernet-ad-route route-distinguisher *(route-distinguisher-type-0 | route-distinguisher-type-1 | route-distinguisher-type-2 | route-distinguisher-type-2b)* esi *string* ethernet-tag-id *number* neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* path-id *number* label

Tree label

Configurable False

Platforms Supported on all platforms

value *number*

Description The value of the label field

If the route is an EVPN MPLS route, the mpls-label is read out of the 20-bit high order value. If the route is an EVPN VXLAN route, the vni is read out of the 24-bit value. If the route is an EVPN SRv6 route, this field is set to zero if no transposition is used and set to a non-zero value if transposition is used. For all the cases, if this is an Auto-Discovery per ES route, this leaf is set to zero.

Context network-instance name *string* bgp-rib afi-safi afi-safi-name *identityref* evpn rib-in-out rib-in-post ethernet-ad-route route-distinguisher *(route-distinguisher-type-0 | route-distinguisher-type-1 | route-distinguisher-type-2 | route-distinguisher-type-2b)* esi *string* ethernet-tag-id *number* neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* path-id *number* label value *number*
