bfd-wait-for-up-timer *number*

Description	Specifies a wait-for-up timer value when seamless-bfd is enabled This timer takes effect if BFD does not come up, or BFD goes from up to down. The timer is started when BFD is first enabled on a segment-list or BFD transitions from up to down. When the timer expires if BFD is not yet come up, then the path is torn down by removing it from the TTM and the PI and the retry timer is started. The default is 3 seconds.
Context	network-instance name *string* traffic-engineering-policies policy-database sr-uncolored policy policy-name *string* protocol-origin *keyword* segment-list segment-list-index *number* bfd bfd-wait-for-up-timer *number*

hold-down-timer *number*

Description	Specifies a hold-down timer value when seamless-bfd is enabled The timer is started when the number of S-BFD sessions that are up drops below the threshold. The TE-policy path is not considered to be up again until the hold-down timer has expired and the number of S-BFD sessions that are up equals or exceeds the threshold. A grace preiod after session down such that sBFD session flaps does not impact active path. The default is 3 seconds.

Tree failed-reason

Options

- path-computation-request-timeout

  Path computation request timed out

- path-computation-no-route

  No valid route is returned for path computation request

- no-resources-available

  Required resources are depleted, not enough resources to estbalish the requested segment-list

- path-computation-bad-node

  Path computation failure due to a resolution issue of one or more of the hops

- path-computation-routing-loop

  Path computation failure due to routing loop

- unknown

  Segment-list is down due to unknown reason

- path-computation-no-route-owner

  Path computation failure as none of the IGP instances had a valid route to one of the hops

- path-computation-hop-limit-exceeded

  Path computation failure due to hop limit. No path within the hop limit constraint configured

- srlg-not-disjoint

  SRLG is shared with primary segment-list and there is no other viable path with dispersed SRLG

- srlg-not-computed-path

  SRLG is not applicable, as primary segment-list has no applicable SRLG for path computation

- srlg-primary-segment-list-down

  SRLG is not applicable, as primary segment-list is down

- unresolved-first-segment

  The router is unable to resolve the first SID (MPLS label value) into one or more outgoing interface(s) and next-hop(s)

- fib-add-pending

  Segment-list is kept down, when adding next-hop into the FIB

- fib-add-failed

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

FIB has failed to add the next-hop group. Next-hop group represents a group of next-hops for valid segment-lists under a TE-policy

- maximum-label-stack-depth-exceeded

  The resolution of the named path requires more labels than supported by the datapath.

- pce-update-with-empty-ero

  PCE update has empty Explicit Route Object (EROs)

- segment-list-admin-down

  Segment-list is administratively down

- ipv4-hops-in-ipv6-path

  IPv4 and IPv6 hops are mixed in explicit path

- ipv6-hops-in-ipv4-path

  IPv6 and IPv4 hops are mixed in explicit path

- sid-hops-in-ip-path

  SID (label-based) and IP hops are mixed in explicit path

- sid-hops-with-invalid-path-computation

  SID hops (labeled hops) with path computation local-cspf/pcep is not allowed

- invalid-path-computation

  Segment-list with unsupported path computation method

- policy-down

  Traffic engineering policy is down

- pce-association-conflict

  PCE-association conflict

- retry-on-config-change

  Segment-list retry attempted due to config change

- clear-command

  Segment-list retry attempted due to manual clear command

- secondary-segment-list

  Secondary type segment-list, Primary is always preferred when available

- bfd-down

  BFD is reported down

- te-rtr-id-not-configured

  TE router ID config is missing

- pce-down

  PCE is unavailable

- pcc-down

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

PCC is unavailable

- pce-error

  PCE response has error or timed-out

- pcc-error

  PCC responded with error

- delay-metric-limit-exceeded

  Segment-list delay metric limit exceeded

- invalid-protection-mode

  Invalid protection mode for the TE-policy type

- no-weight

  Segment-list with no weight

- exceeds-protection-mode-allowed

  More than the protection policy allows

- admin-group-missing

  Admin group info not available at TE database

Configurable False

ip-in-ip

Description	Enter the ip-in-ip context
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* ip-in-ip
Tree	ip-in-ip
Configurable	False
Platforms	Supported on all platforms

destination-address *(ipv4-address | ipv6-address)*

Description	The IP address that identifies the destination of the tunnel.
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* ip-in-ip destination-address *(ipv4-address | ipv6-address)*
Tree	destination-address
Configurable	False
Platforms	Supported on all platforms

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

source-address *(ipv4-address | ipv6-address)*

Description	The IP address that identifies the source of the tunnel.
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* ip-in-ip source-address *(ipv4-address | ipv6-address)*
Tree	source-address
Configurable	False
Platforms	Supported on all platforms

last-app-update *string*

Description	The date and time of the last update of this tunnel by the owning application or protocol.
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* last-app-update *string*
Tree	last-app-update
String Length	20 to 32
Configurable	False
Platforms	Supported on all platforms

metric *number*

Description	The metric of the tunnel.
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* metric *number*
Tree	metric
Configurable	False
Platforms	Supported on all platforms

next-hop-group *reference*

Description	Leaf reference to a next-hop-group that has the direct next-hops towards the tunnel far-end
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* next-hop-group *reference*
Tree	next-hop-group
Reference	network-instance name *string* route-table next-hop-group index *number*

Tree	destination-address
Configurable	False
Platforms	Supported on all platforms

destination-udp-port *number*

Description	Destination UDP port number in the added UDP header Usually this reflects the encoded payload type
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* udp destination-udp-port *number*
Tree	destination-udp-port
Range	0 to 65535
Configurable	False
Platforms	Supported on all platforms

in-profile-dscp *number*

Description	DSCP value in the outer IP header except when the packet is out of profile
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* udp in-profile-dscp *number*
Tree	in-profile-dscp
Range	0 to 63
Configurable	False
Platforms	Supported on all platforms

ip-ttl *number*

Description	IP TTL in the outer IP header added by GRE encapsulation
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* udp ip-ttl *number*
Tree	ip-ttl
Configurable	False
Platforms	Supported on all platforms

Use subject to Terms available at: www.nokia.com/terms.

out-profile-dscp *number*

Description	DSCP value in the outer IP header when the packet was policed as out of profile
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* udp out-profile-dscp *number*
Tree	out-profile-dscp
Range	0 to 63
Configurable	False
Platforms	Supported on all platforms

source-address *(ipv4-address | ipv6-address)*

Description	The source IP address in the outer IP header added by GRE encapsulation
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* udp source-address *(ipv4-address | ipv6-address)*
Tree	source-address
Configurable	False
Platforms	Supported on all platforms

vxlan

Description	Enter the vxlan context
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* vxlan
Tree	vxlan
Configurable	False
Platforms	Supported on all platforms

destination-address *(ipv4-address | ipv6-address)*

Description	The IP address that identifies the remote VXLAN Termination Endpoint (VTEP).
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* vxlan destination-address *(ipv4-address | ipv6-address)*
Tree	destination-address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Configurable	False
Platforms	Supported on all platforms

destination-udp-port *number*

Description	The destination UDP port number written into the outer IP/UDP header of VXLAN packets associated with this tunnel and originated by this router.
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* vxlan destination-udp-port *number*
Tree	destination-udp-port
Configurable	False
Platforms	Supported on all platforms

source-address *(ipv4-address | ipv6-address)*

Description	The IP address that identifies the local VXLAN Termination Endpoint (VTEP).
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* vxlan source-address *(ipv4-address | ipv6-address)*
Tree	source-address
Configurable	False
Platforms	Supported on all platforms

time-to-live *number*

Description	The Time To Live (TTL) value written into the outer IP header of VXLAN packets associated with this tunnel and originated by this router.
Context	network-instance name *string* tunnel-table ipv4 tunnel ipv4-prefix *string* type *identityref* owner *string* id *number* vxlan time-to-live *number*
Tree	time-to-live
Configurable	False
Platforms	Supported on all platforms

tunnel-summary

Description	Enter the tunnel-summary context Tunnel summary information
Context	network-instance name *string* tunnel-table ipv4 tunnel-summary

domain *number*

Description Domain of this vxlan-interface within the MAC-VRF

The default is 1. In a multi-instance MAC-VRF VXLAN-to-VXLAN deployment where the network-instance has two vxlan-interfaces, each vxlan-interface must be configured with a different domain (1 or 2). For example, if the first vxlan-interface uses domain 1, the second must use domain 2. Distinct domains ensure each vxlan-interface receives separate split-horizon group and multicast identifier (MCID) allocations, which is required for proper operation of the multi-instance MAC-VRF.

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable False

- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable False

clear

Description	Execute the clear action Clear the CSIG Statistics, which clears the accumulated stats. It will cause the stats counters to reset to zero and then increment again as new packets with CSIG headers ingress the system. This is useful for testing and debugging, but should be used with caution in production environments.

lowest-fault-priority-defect *keyword*

Description The lowest priority defect that will generate a Fault Alarm

When the lowest fault priority defect is reached or exceeded, a fault alarm will be generated. This also drives the ../ccm-local-fault-action for down MEPs. When the lowest priority fault priority defect is reached the ../ccm-local-fault with a value 'permit' will operationally affect the interface or subinterface on which it is attached.

when ../../link-loss-forwarding admin-state 'enable' is configured this leaf must be set to a minimum priority of 'remote-error-xcon' to disable the priority based fault generation for levels that indicate access interface failure faults from a peer.

sent-interface-status *keyword*

Description Latest interface-status TLV value sent to the peer in the CCM packet

Indicates the interface status TLV information included in the most recent Connectivity Check Message (CCM) transmission from the local MEP. If the local MEP CCM transmissions are not enabled, or if no interface status TLV was included in the most recent transmission, then ccm-tx-if-status will return a value of is-no-interface-status-tlv (0).

Context oam ethcfm domain domain-id *string* association association-id *string* mep mep-id *reference* continuity-check sent-interface-status *keyword*

Tree sent-interface-status

Options

- no-status-tlv

  Indicates either that no CCM has been received or that no interface status TLV was present in the last CCM received

- up

  The interface is ready to pass packets

- down

  The interface cannot pass packets

- testing

  The interface is in some test mode

- unknown

  The interface status cannot be determined for some reason

- dormant

  The interface is not in a state to pass packets but is in a pending state, waiting for some external event

- not-present

  Some component of the interface is missing

- lower-layer-down

  The interface is down due to state of the lower layer interface condition

Configurable False

Platforms 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

sent-port-status *keyword*

Description Latest port-status TLV value sent to the peer in the CCM packet

Indicates the port status TLV information included in the most recent Connectivity Check Message (CCM) transmission from the local MEP. If the local MEP CCM transmissions are not enabled, or if no port status TLV was included in the most recent transmission, then ccm-tx-port-status will return a value of ps-no-port-state-tlv (0).

Context oam ethcfm domain domain-id *string* association association-id *string* mep mep-id *reference* continuity-check sent-port-status *keyword*

Tree sent-port-status

Options

- no-status-tlv

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Indicates either that no CCM has been received or that no port status TLV was present in the last CCM received

- blocked

  Ordinary data cannot pass freely through the port on which the remote MEP resides

- up

  Ordinary data can pass freely through the port on which the remote MEP resides

Configurable False

Platforms 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

sent-remote-defect-indicator *boolean*

Description Latest remote defect indicator (rdi) value sent to the peer in the CCM packet

Indicates if the Remote Defect Indication (RDI) bit was set to on in the most recent Connectivity Check Message (CCM) transmission from the local MEP.

If the local MEP CCM transmissions are not enabled, or if the RDI bit was not set in the most recent transmission, then ccm-tx-rdi will return a value of 'false (2)'.

Options

- CHASSIS_COMPONENT

  Chassis identifier based on the value of entPhysicalAlias object defined in IETF RFC 2737

- INTERFACE_ALIAS

  Chassis identifier based on the value of ifAlias object defined in IETF RFC 2863

- PORT_COMPONENT

  Chassis identifier based on the value of entPhysicalAlias object defined in IETF RFC 2737 for a port or backplane component

- MAC_ADDRESS

  Chassis identifier based on the value of a unicast source address (encoded in network byte order and IEEE 802.3 canonical bit order), of a port on the containing chassis as defined in IEEE Std 802-2001

- NETWORK_ADDRESS

  Chassis identifier based on a network address, associated with a particular chassis. The encoded address is composed of two fields. The first field is a single octet, representing the IANA AddressFamilyNumbers value for the specific address type, and the second field is the network address value

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- INTERFACE_NAME

  Chassis identifier based on the name of the interface, e.g., the value of if Name object defined in IETF RFC 2863

- LOCAL

  Chassis identifier based on a locally defined value

Configurable False

Platforms 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

egress-action *keyword*

Description An enumerated value indicating the value returned n the Egress Action field

This leaf is not present if no value is returned in the LTR.

Context oam ethcfm domain domain-id *string* association association-id *string* mep mep-id *reference* linktrace latest-run reply reply-order *number* egress-action *keyword*

Options

- INTERFACE_ALIAS

  Chassis identifier based on the value of ifAlias object defined in IETF RFC 2863

- PORT_COMPONENT

  Port identifier based on the value of entPhysicalAlias object defined in IETF RFC 2737 for a port component

- MAC_ADDRESS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Port identifier based on the value of a unicast source address (encoded in network byte order and IEEE 802.3 canonical bit order) associated with a port

- NETWORK_ADDRESS

  Port identifier based on a network address, associated with a particular port

- INTERFACE_NAME

  Port identifier based on the name of the interface, e.g., the value of if Name object defined in IETF RFC 2863

- AGENT_CIRCUIT_ID

  Port identifer based on the circuit id in the DHCP relay agent information option as defined in IETF RFC 3046

- LOCAL

  Port identifier based on a locally defined alphanumeric string

test-status *keyword*

Description The status of the last test that was executed

A value of 'completed' means the test has run and ended without intervention, to completion. A value of 'terminated-incomplete' indicates the test started but conditions existed that caused if to terminate before the natural completion. A value 'in-progress' means the test is currently executing. A value of 'failed-to-start' meant a requirement to start the test was not met and the test had failed to start. When this value is set the statistics from a prior latest-run are deleted.

Options

- CHASSIS_COMPONENT

  Chassis identifier based on the value of entPhysicalAlias object defined in IETF RFC 2737

- INTERFACE_ALIAS

  Chassis identifier based on the value of ifAlias object defined in IETF RFC 2863

- PORT_COMPONENT

  Chassis identifier based on the value of entPhysicalAlias object defined in IETF RFC 2737 for a port or backplane component

- MAC_ADDRESS

  Chassis identifier based on the value of a unicast source address (encoded in network byte order and IEEE 802.3 canonical bit order), of a port on the containing chassis as defined in IEEE Std 802-2001

- NETWORK_ADDRESS

  Chassis identifier based on a network address, associated with a particular chassis. The encoded address is composed of two fields. The first field is a single octet, representing the IANA AddressFamilyNumbers value for the specific address type, and the second field is the network address value

- INTERFACE_NAME

  Chassis identifier based on the name of the interface, e.g., the value of if Name object defined in IETF RFC 2863

- LOCAL

  Chassis identifier based on a locally defined value

Configurable False

Platforms 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

remote-mep-failed-ok-time *number*

Description The time at which the Remote MEP state machine last entered either the RMEP_FAILED or RMEP_OK state

This type is based on the timeticks type defined in RFC 6991, but with 64-bit width. It represents the time, modulo 2^64, in hundredths of a second between two epochs.

Options

- idle

  Indicates momentary state during reset

- start

  Indicates the timer has not expired since the state machine was reset, and no valid CCM has yet been received

- failed

  Indicates the timer has expired, both since the state machine was reset and since a valid CCM was received.

- ok

  Indicates the timer has not expired since a valid CCM was received.

admin-state *keyword*

Description Enable the ability to auto-discover remote MEPs within the Maintenance Association

When the admins-state is 'enable' unknown remote MEP peers which have the same Maintenance Association information will be automatically added to the remote-mep database and these unknown peer MEPS will not raise the defect error-ccm. When the admin-state is 'disable' unknown remote MEP peers will not automatically be added to the remote-mep database. Unknown MEPs will cause the defect error-ccm to be raised.

If the admin-state value is changed from 'enable' to 'disable' all previously learned MEPs for the Maintenance Association will be removed from the remote-mep database and auto-discovery will be disabled.

aging-timer *(number | keyword)*

Description Optional time in seconds the peer MEP remains in the remote-mep database after defect remote-ccm

Peer MEPs added to the remote-mep database do not age out unless the optional aging-timer is configured. The aging-timer value is the additional time the remote peer MEP remains in the database since the recognition of the defect remote-ccm (peer timeout where no packets have arrived from the peer in 3.5 times the ccm-interval). A value of 'none' disables aging.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

subinterface *string*

Description	Egress router sub-interface used with the path destination
Context	oam lsp-trace ldp fec prefix *(ipv4-prefix | ipv6-prefix)* session-id id *number* path-destination subinterface *string*
Tree	subinterface
String Length	5 to 27
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

test-active *boolean*

Description	Indicates if the test is still running (true) or not (false)
Context	oam lsp-trace ldp fec prefix *(ipv4-prefix | ipv6-prefix)* session-id id *number* test-active *boolean*
Tree	test-active
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

rsvp-te

Description	Enter the rsvp-te context Container of LSP trace results for different RSVP-TE tunnels

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	oam lsp-trace rsvp-te
Tree	rsvp-te
Configurable	False
Platforms	mpls-oam-rsvp-te

tunnel tunnel-name *string*

Description	Enter the tunnel list instance
Context	oam lsp-trace rsvp-te tunnel tunnel-name *string*
Tree	tunnel
Configurable	False
Platforms	mpls-oam-rsvp-te

tunnel-name *string*

Description	The RSVP-TE tunnel name This is the tunnel that was traced.
Context	oam lsp-trace rsvp-te tunnel tunnel-name *string*
String Length	1 to 64
Configurable	False
Platforms	mpls-oam-rsvp-te

session-id id *number*

Description	List of recent sessions (up to 10) with saved LSP trace results for the prefix
Context	oam lsp-trace rsvp-te tunnel tunnel-name *string* session-id id *number*
Tree	session-id
Configurable	False
Platforms	mpls-oam-rsvp-te
Max. Elements	10

id *number*

Description	The system-assigned session ID
Context	oam lsp-trace rsvp-te tunnel tunnel-name *string* session-id id *number*
Configurable	False

bin-group-name *string*

Description The name of the bin group

Each performance monitoring session requires a bin-group references. The bin-group includes information on how the delay information is binned and any threshold or exclusion functions. Each performance monitoring session references the bin-group 'default'. The 'default' bin-group is created by the system. Its purpose is to reduce the configuration when the binning of information is not a key requirement for the performance monitoring session. It contains basic values. The bin-type parameters cannot be modified. The following bin-type and lower-bound values are assigned to the bin-group 'default'. These values are microseconds.

bin-type fd bin 0 { lower-bound 0 } bin 1 { lower-bound 5000 } bin 2 { lower-bound 10000 } bin-type fdr bin 0 { lower-bound 0 } bin 1 { lower-bound 5000 } bin-type ifdv bin 0 { lower-bound 0 } bin 1 { lower-bound 5000 }

The bin-group 'default' can be entered in the configuration. It must include the admin-state 'enable'. If entered in the configuration it cannot be deleted if any performance monitoring session is referencing it. The information for the bin-group 'default' is available in state.

bin-number *number*

Description	The number of the bin

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The bin values must be contiguous. Space cannot be left between numerical values. If no lower-bound is configured for a bin the default lower-bound will be 1000 microseconds multiplied by the bin number. If this value conflicts with a lower bin number lower-bound value the configuration of an appropriate lower-bound number for the bin must be configured in the same transaction as the addition of the bin to the bin-group.

lower-bound *number*

Description Lower bound for the bin

The lower-bound value between two adjacent bins represents the range of results that will be mapped to the bin. The lower-bound value for the bin represents the smallest value in the range. The lower-bound value of the adjacent higher bin represents the smallest value in its range.

Bin 0 must have a lower-bound value of '0'. Bin numbers must not have conflicting lower-bound values. Higher bin numbers must not have lower-bound values less than any lower bin number.

clear-threshold *number*

Description The not be exceeded value used to clear a previously triggered threshold crossing alarm

Two type of threshold crossing alarms; Stateless and Stateful. When the clear-threshold is not specified the type = stateless. Stateless alarms are not maintained across measurement interval boundaries. Each measurement interval is self-contained. When a clear-threshold is configured the type = stateful. Stateful alarms are maintained across measurement interval boundaries and cleared when a subsequent measurement interval completes and meets the clear threshold criteria.

A value '0' means a subsequent measurement interval must have no results in the bins counted against the threshold.

A value 'active' means the bin-group being referenced by the test session has an admin-state 'enable'. A value 'inactive' means the bin-group being referenced by the test session has an admin-state 'disable'. When the value is 'inactive' test packets are being transmitted but there is no bin-group to bin the result and the delay results are discarded.

oper-state *keyword*

Description Operational state of the Threshold Crossing Alerts (TCAs)

The conditions are evaluated in the order shown.

The value 'pending' is returned if the threshold configuration for the specified indices changed during the current measurement interval. The threshold configuration is evaluated in the next full measurement interval after the new configuration.

The value 'active' is returned if the specified indices have a no clear threshold configured (stateless), and the current measurement interval has generated a Raise TCA. The value is also returned if the specified indices have a clear threshold configured (stateful), and the most recent TCA generated was a Raise.

The value 'not-active' is returned for all other conditions (e.g., thresholding is not configured for the specified indices).

suspect-status *boolean*

Description	Whether the Measurement Interval has been marked as suspect The object is to be set to 'false' at the start of a measurement interval. It is set to 'true' when there is a discontinuity in the performance measurements during the Measurement Interval. This flag is used to warn operators if the result count in the measurement interval is suboptimal for considering the results valid. Results are still collected, computed, and stored regardless of this flag. This is meant as a post processing notification to an external system. Conditions for a discontinuity include, but are not limited to the following: 1 - The local time-of-day clock is adjusted by at least 10 seconds 2 - The test is halted before the current Measurement Interval is completed 3 - A local test failure, or reconfiguration that disrupts testing

Max. Elements	5

mi-duration *keyword*

Description	Configure the measurement interval duration The measurement interval duration defines the length of the sample window over which the statistics are collected, computed, and stored. The system automatically instantiates a 'raw' measurement interval for each defined test session. The 'raw' measurement interval is unbounded and continually accumulates measurements while the test session admin-state has value 'enable'. The 'raw' measurement interval can have result cleared to flush restart the accumulation of statistics.
Context	oam performance-monitoring ethcfm session session-name *string* measurement-interval mi-duration *keyword*

bin-group-name *string*

Description	The name of the bin group Each performance monitoring session requires a bin-group references. The bin-group includes information on how the delay information is binned and any threshold or exclusion functions. Each performance monitoring session references the bin-group 'default'. The 'default' bin-group is created by the system. Its purpose is to reduce the configuration when the binning of information is not a key requirement for the performance monitoring session. It contains basic values. The bin-type parameters cannot be modified. The following bin-type and lower-bound values are assigned to the bin-group 'default'. These values are microseconds. bin-type fd bin 0 { lower-bound 0 } bin 1 { lower-bound 5000 } bin 2 { lower-bound 10000 } bin-type fdr bin 0 { lower-bound 0 } bin 1 { lower-bound 5000 } bin-type ifdv bin 0 { lower-bound 0 } bin 1 { lower-bound 5000 } The bin-group 'default' can be entered in the configuration. It must include the admin-state 'enable'. If entered in the configuration it cannot be deleted if any performance monitoring session is referencing it. The information for the bin-group 'default' is available in state.

bin-number *number*

Description	The number of the bin The bin values must be contiguous. Space cannot be left between numerical values. If no lower-bound is configured for a bin the default lower-bound will be 1000 microseconds multiplied by the bin number. If this value conflicts with a lower bin number lower-bound value the configuration of an appropriate lower-bound number for the bin must be configured in the same transaction as the addition of the bin to the bin-group.

lower-bound *number*

Description	Lower bound for the bin The lower-bound value between two adjacent bins represents the range of results that will be mapped to the bin. The lower-bound value for the bin represents the smallest value in the range. The lower-bound value of the adjacent higher bin represents the smallest value in its range. Bin 0 must have a lower-bound value of '0'. Bin numbers must not have conflicting lower-bound values. Higher bin numbers must not have lower-bound values less than any lower bin number.

clear-threshold *number*

Description	The not be exceeded value used to clear a previously triggered threshold crossing alarm Two type of threshold crossing alarms; Stateless and Stateful. When the clear-threshold is not specified the type = stateless. Stateless alarms are not maintained across measurement interval boundaries. Each measurement interval is self-contained. When a clear-threshold is configured the type = stateful. Stateful alarms are maintained across measurement

direction *keyword*

Description The direction of the measurement of interest

A value 'forward' is the measurement from source to reflector. A value 'backward' is the measurement from reflector to source. A value 'aggregate' sums the forward and backward counts into an aggregate.

Context oam performance-monitoring ip loss loss-events-template loss-events-template-name *string* chli-event direction *keyword*

clear-threshold *number*

Description The value used to clear a previously triggered alarm for the metric of interest

Two type of threshold crossing alarms; Stateless and Stateful. When the clear-threshold is not specified the type = stateless. Stateless alarms are not maintained across measurement interval boundaries. Each measurement interval is self-contained. When a clear-threshold is configured the type = stateful. Stateful alarms are maintained across measurement interval boundaries and cleared when a subsequent measurement interval completes and meets the clear threshold criteria.

Max. Elements	5

mi-duration *keyword*

Description	Configure the measurement interval duration The measurement interval duration defines the length of the sample window over which the statistics are collected, computed, and stored. The system automatically instantiates a 'raw' measurement interval for each defined test session. The 'raw' measurement interval is unbounded and continually accumulates measurements while the test session admin-state has value 'enable'. The 'raw' measurement interval can have result cleared to flush restart the accumulation of statistics.

source-udp-port *number*

Description Automatically allocate or statically configure the source UDP port for oam pm ip

The value 0 will automatically select an available source UDP port from the dynamic range. When selecting a source UDP port from the from the reserved STAMP pool [64374..64383] that port must be administratively assigned to the STAMP application attempting to use it. Once a UDP port in this range is assigned to one application it cannot be used by the other application. When a test has been configured to use one of UDP ports from the reserved STAMP pool the application-assignment of that UDP port cannot be modified.

Allocation of these UDP ports can be found at srl_nokia-udp-source-pool.yang model (path oam ippm source-udp-pools).

suspect-status *boolean*

Description	Whether the Measurement Interval has been marked as suspect The object is to be set to 'false' at the start of a measurement interval. It is set to 'true' when there is a discontinuity in the performance measurements during the Measurement Interval. This flag is used to warn operators if the result count in the measurement interval is suboptimal for considering the results valid. Results are still collected, computed, and stored regardless of this flag. This is meant as a post processing notification to an external system. Conditions for a discontinuity include, but are not limited to the following: 1 - The local time-of-day clock is adjusted by at least 10 seconds 2 - The test is halted before the current Measurement Interval is completed 3 - A local test failure, or reconfiguration that disrupts testing

detected-tx-error *keyword*

Description Reason for the specified test session's current inability (if any) to launch request frames

For example, 'eth-parent-admin-down(4)' could be returned for a test if the MEP to be tested is associated with a subinterface which is administratively down.

Not all request frame transmit failures are detected by this mechanism. It is possible that the value 'none' will be returned when the test is unable to transmit frames during undetectable transmission errors.

undetermined-available *number*

Description	Number of availability indicators evaluated as Available for the specified direction and measurement interval, based on extrapolation Undetermined counters are incremented when there is no explicit understanding why a response packet was not received. This will occur during a complete failure where no responses are received on the source and the source must time out those missing responses. This counter will increment when the availability window has been reached plus an additional five second timeout. Previous state must be maintained but the appropriate undetermined counter will increment by the equal value. This value should be used to adjust the availability counter if the reason was packet loss and not an administrative function that caused the condition.

undetermined-available *number*

Description	Number of availability indicators evaluated as Available for the specified direction and measurement interval, based on extrapolation Undetermined counters are incremented when there is no explicit understanding why a response packet was not received. This will occur during a complete failure where no responses are received on the source and the source must time out those missing responses. This counter will increment when the availability window has been reached plus an additional five second timeout. Previous state must be maintained but the appropriate undetermined counter will increment by the equal value. This value should be used to adjust the availability counter if the reason was packet loss and not an administrative function that caused the condition.

suspect-status *boolean*

Description	Whether the Measurement Interval has been marked as suspect The object is to be set to 'false' at the start of a measurement interval. It is set to 'true' when there is a discontinuity in the performance measurements during the Measurement Interval. This flag is used to warn operators if the result count in the measurement interval is suboptimal for considering the results valid. Results are still collected, computed, and stored regardless of this flag. This is meant as a post processing notification to an external system. Conditions for a discontinuity include, but are not limited to the following: 1 - The local time-of-day clock is adjusted by at least 10 seconds 2 - The test is halted before the current Measurement Interval is completed 3 - A local test failure, or reconfiguration that disrupts testing

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

selected-mode *keyword*

Description The TWAMP Mode chosen in the Mode field of the TWAMP Set-Up-Response message

Context oam twamp server network-instance name *reference* control-connection client-ip *(ipv4-address | ipv6-address)* client-tcp-port *number* server-ip *(ipv4-address | ipv6-address)* server-tcp-port *number* selected-mode *keyword*

Tree selected-mode

Options

- unauthenticated

  No encryption or authentication is applied in TWAMP-Control and TWAMP-Test
- authenticated

  Control-Client and Server pass a shared secret for authentication
- encrypted

  Additional level of protection using encryption
- unauth-test-encrypt-control

  Mixed Security Mode, the TWAMP-Test uses unauthenticated mode and TWAMP-Control uses encrypted mode
- individual-session-control

  Individual TWAMP-Test sessions start and stop using individual session identifiers

  This allows TWAMP-Test sessions using the same control channel to be started individually instead of using the bulk all sessions start.
- reflect-octets

  Reflect octets capability

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- symmetrical-size

  Symmetrical size for test packets between Session-Sender and Session-Reflector

Configurable False

Platforms 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

state *keyword*

Description Indicates the Server TWAMP-Control connection state

Context oam twamp server network-instance name *reference* control-connection client-ip *(ipv4-address | ipv6-address)* client-tcp-port *number* server-ip *(ipv4-address | ipv6-address)* server-tcp-port *number* state *keyword*

Tree state

Options

- active

  TWAMP-Control connection between the Server and the Control-Client is active

  Packets are arriving on the TWAMP-Control channel or there are active TWAMP-Test sessions on the TWAMP-Control channel.

- servwait

  TWAMP-Control connection between the Server and the Control-Client is in SERVWAIT

  This state is entered when no there are no TWAMP-Control messages between the Control-Client and Server and all test sessions on the TWAMP-Control channel have been stopped, and the REFWAIT (timeout following test session stop) has expired.

Configurable False

enforce-test-session-start-time *boolean*

Description Discard or process TWAMP-Test packets arriving before the negotiated session start time

A Request-TW-Session includes a start-time value for the test session. A value 'true' enforces the server check that will drop the TWAMP-Test packets if the test session start-time is before the Server time of day. In environments where the TWAMP Client and TWAMP Servers are not synchronized the value 'false' can be used to skip this validation check and process TWAMP test packets that arrive before their indicated start time.

arrived-before-start-time *number*

Description	Test packets dropped because they arrived before start time The TWAMP-Test packets arrived on the Session-Reflector before the indicated start-time in the Request-TW-Session. This is likely caused by a difference in Time of Day (ToD) clocks used for timestaming the TWAMP-Test packet. This may occur when the Server/Session-Reflector clock is ahead of the ToD clock of the Control-Client/Session-Sender.
Context	oam twamp statistics dropped-test-packet arrived-before-start-time *number*

healthz

Description	Enter the healthz context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The health of the component

The paramaters within this container indicate the status of the component beyond whether it is operationally up or down. When a signal is received that a component is in an unhealthy state the gNOI.Healthz service can be used to retrieve further diagnostic information relating to the component. The contents of this directory relate only to the specific component that it is associated with.

Context platform chassis healthz

Tree healthz

Configurable False

oper-state *keyword*

Description The operational state of this component

Context platform chassis oper-state *keyword*

Tree oper-state

Options

- up
  Component or process is operational
- down
  Component or process is not operational
- empty
  Component slot is empty
- downloading
  Component is downloading image into memory
- booting
  Component is booting downloaded image
- starting
  Component image operational, application processes starting
- failed
  Component or process has failed
- synchronizing
  Component is currently being synchronized

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

manufactured-date *string*

Description The date this component was manufactured

Context platform fabric slot *number* manufactured-date *string*

Tree manufactured-date

String Length 20 to 32

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3

oper-state *keyword*

Description The operational state of this component

Context platform fabric slot *number* oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Locator LED is currently inactive

Configurable False

Platforms Supported on all platforms

manufactured-date *string*

Description The date this component was manufactured

Context platform fan-tray id *number* manufactured-date *string*

Tree manufactured-date

String Length 20 to 32

Configurable False

Platforms Supported on all platforms

oper-reason *keyword*

Description Indicates the reason for the current state of this fan tray

Context platform fan-tray id *number* oper-reason *keyword*

Tree oper-reason

Options

- fault

  Hardware fault detected
- eeprom-invalid

  EEPROM of this fan tray is either invalid or corrupt
- airflow-mismatch

  The detected airflow of this fan tray does not match the system-calculated airflow direction

  The logic for determining the system-calculated direction is: - Majority wins between present fan trays - In the case where there are equal F2B or B2F fan trays, PSUs are used as a tie break (PSUs only are counted in the event a tie breaker is needed) - F2B wins if no tie break can be used

Configurable False

Options

- ip-lpm-ipv4-routes

  IPv4 longest prefix match route resources

  7220 D1/D2/D3: Reports the number of IPv4 entries in the hardware LPM table. In non-ALPM mode, free entries is the remaining number of half-wide entries in all partitions (i.e. it assumes no IPv6 routes consume those entries). In ALPM mode, free entries is the Minimum Guaranteed Capacity returned by the BCM SDK.

  7220 D4/D5 and 7220 H2/H3/H4: Reports the number of IPv4 routes installed in the FIB. Free entries is the Minimum Guaranteed Capacity returned by the BCM SDK.

- ip-lpm-ipv6-routes

  IPv6 longest prefix match route resources

  Reports the number of IPv6 routes installed in the FIB. Free entries is the Minimum Guaranteed Capacity returned by the BCM SDK.

- ip-lpm-ipv6-shorter-routes

  IPv6 longest prefix match route resources when the prefix length is less than or equal to 64

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

7220 D1/D2/D3: Reports the number of IPv6 entries with prefix length less than 65 bits in the hardware LPM table. In non-ALPM mode, free entries is the remaining number of single-wide + double-wide entries (i.e. it assumes no other types of routes consume those entries). In ALPM mode, free entries is based on the Minimum Guaranteed Capacity returned by the BCM SDK.

7220 H2/H3: Reports the number of IPv6 entries with prefix length less than 65 bits installed in the FIB. Free entries is based on the Minimum Guaranteed Capacity returned by the BCM SDK.

- ip-lpm-ipv6-longer-routes

  IPv6 longest prefix match route resources when the prefix length is greater than 64

  7220 D1/D2/D3: Reports the number of IPv6 entries with prefix length greater than 64 bits in the hardware LPM table. In non-ALPM mode, free entries is the remaining number of double-wide entries (i.e. it assumes no other types of routes consume those entries). In ALPM mode, free entries is based on the Minimum Guaranteed Capacity returned by the BCM SDK.

  7220 H2/H3: Reports the number of IPv6 entries with prefix length greater than 64 bits installed in the FIB. Free entries is based on the Minimum Guaranteed Capacity returned by the BCM SDK.

- exact-match-entries

  Exact match lookup table resources

  Counts 30-bit entries. On 7250 IXR Gen3 systems, this captures total usage across both the main and secondary table.

- exact-match-entries-1

  Exact match lookup table resources, main table

  Counts 30-bit entries

- exact-match-entries-2

  Exact match lookup table resources, secondary table

  Counts 30-bit entries

- exact-match-entries-mac-da

  Exact match lookup table resources used for MAC destination address FDB lookup

  Counts 30-bit entries

- exact-match-entries-mac-sa

  Exact match lookup table resources used for MAC source address FDB lookup

  Counts 30-bit entries

- exact-match-entries-mpls-label

  Exact match lookup table resources used for MPLS incoming label lookup

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Counts 30-bit entries

- exact-match-entries-ipv4-route

  Exact match lookup table resources used for IPv4 compressed route lookup

  Counts 30-bit entries

- exact-match-entries-ipv6-route

  Exact match lookup table resources used for IPv6 compressed route lookup

  Counts 30-bit entries

- exact-match-entries-next-hop

  Exact match lookup table resources used for compressed route next-hop lookup

  Counts 30-bit entries

- ip-tunnel-source-ipv4-addresses

  IP tunnel source IPv4 address resources

  Each IPinIP and GRE tunnel with a different source IPv4 address uses one of these resources.

- ip-tunnel-source-ipv6-addresses

  IP tunnel source IPv6 address resources

  Each IPinIP and GRE tunnel with a different source IPv6 address uses one of these resources.

- underlay-ecmp-groups

  Underlay ECMP group resources

  ECMP groups are partitioned into overlay and underlay groups. The underlay partition is further subdivided into groups used for underlay ECMP and groups used for VP LAGs (EVPN M-H - if supported). This counts the utilization of the sub-resource used for ECMP.

- dynamic-load-balancing-ecmp-groups

  Dynamic load-balancing ECMP groups

  A DLB ECMP group can support per-packet load-balancing or it can support assignment of flows to ECMP members based on interface load metrics

- vp-lag-groups

  VP LAG group resources

  ECMP groups are partitioned into overlay and underlay groups. The underlay partition is further subdivided into groups used for underlay ECMP and groups used for VP LAGs (EVPN M-H). This counts the utilization of the sub-resource used for VP LAGs.

- overlay-ecmp-groups

  Overlay ECMP group resources

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ECMP groups are partitioned into overlay and underlay groups. This counts the utilization of the overlay ECMP partition.

- underlay-ecmp-members

  Underlay ECMP member resources

  ECMP members are partitioned into overlay and underlay. This counts the utilization of the partition used for underlay.

- overlay-ecmp-members

  Overlay ECMP member resources

  ECMP members are partitioned into overlay and underlay. This counts the utilization of the partition used for overlay.

- underlay-egress-next-hops

  Underlay egress next-hop resources

  Egress next-hops are partitioned into overlay and underlay. This counts the utilization of the partition used for underlay.

- overlay-egress-next-hops

  Overlay egress next-hop resources

  Egress next-hops are partitioned into overlay and underlay. This counts the utilization of the partition used for overlay.

- dgpp-module-ids

  DGPP module ID resources

  DGPPs are an aggregate id consisting of a module_id and a port_id. There are 64 modules and 120 ports per module. Each 'network' ARP entry (IP next-hop) needs a DGPP - the module_id is allocated against the network interface (port) and a port_id is allocated from within the module. A module_id will only be allocated when the first ArpEntry is added (freed when last is removed) but is owned exclusively by that network interface. A network interface may require more than one module_id - i.e. if there are 245 ArpEntries on ethernet-1/1 (possibly spread across multiple network-instance interfaces) then 3 module_ids are required.

- egress-vlan-translate-egress-vnis

  EGR_VLAN_XLATE_1 resources

  Corresponds to the 'EGR_VLAN_XLATE_1' HW table (8K entries on Dx). These entries are used for finding the egress VNI to be used for VXLAN packets.

- egress-vlan-translate-local-bias-pairs

  EGR_VLAN_XLATE_2 resources

  Corresponds to the 'EGR_VLAN_XLATE_2' HW table (24K entries). These entries are used for local bias (ES pruning).

- level-1-ecmp-groups

  Level 1 (top level) ECMP group resources.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- level-2-ecmp-groups

  Level 2 (middle level) ECMP group resources.
- level-3-ecmp-groups

  Level 3 (bottom level) ECMP group resources.
- level-1-ecmp-members

  Level 1 (top level) ECMP member resources.
- level-2-ecmp-members

  Level 2 (middle level) ECMP member resources.
- level-3-ecmp-members

  Level 3 (bottom level) ECMP member resources.
- level-1-non-ecmp-fecs

  Level 1 (top level) non-ECMP FEC resources.
- level-2-non-ecmp-fecs

  Level 2 (middle level) non-ECMP FEC resources.
- level-3-non-ecmp-fecs

  Level 3 (bottom level) non-ECMP FEC resources.
- ip-tunnel-statistics

  Statistics resources for counting packets matching an IP tunnel entry

  One resource is one packet/octet counter pair that is allocated to counting: (a) packets that match an IP tunnel termination entry for purposes of per-prefix transit traffic statistics (b) packets that match IP tunnel termination entries programmed to decapsulate and redirect traffic to another network-instance (c) packets that match IP tunnel termination entries programmed to decapsulate and re-tunnel traffic to a new endpoint address (1 counter pair per new endpoint address)
- subinterface-basic-stats-counters

  Stats resources used by bridged and routed (non-IRB) subinterfaces that do not provide a breakdown by protocol family
- subinterface-detailed-stats-counters

  Stats resources used by routed (non-IRB) subinterfaces that provide a breakdown by protocol family
- subinterface-irb-stats-counters

  Stats resources used by routed IRB subinterfaces
- kaps-public

  The public KAPS hardware table
- kaps-private

  The private KAPS hardware table
- phase-2-type-1-eedb-entries

  Phase-2 (EEDB) Egress Encapsulation resources

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Required by various applications such as EVPN BUM label and sflow

- phase-2-type-2-eedb-entries

  Phase-2 (EEDB) Egress Encapsulation resources

  Required by various applications such as EVPN Unicast label, IP-VPN/ IFL label, IRB ARP entries and vlan loopbacks

- phase-3-type-1-eedb-entries

  Phase-3 (EEDB) Egress Encapsulation resources

  Required by various applications such as MPLS and sflow. When used by SR/MPLS, one resource is used at every stage while pushing tunnel labels. Up to two labels can be referenced via a single EEDB entry.

- phase-3-type-2-eedb-entries

  Phase-3 (EEDB) Egress Encapsulation resources

  Required by various applications such as BGP Labeled Unicast and IP-in-IP tunnels

- phase-4-type-1-eedb-entries

  Phase-4 (EEDB) Egress Encapsulation resources

  Required by various applications such as MPLS, GREv4 and GREv6 tunnels, sflow for UDP tunnels. When used by SR/MPLS, one resource is used at every stage while pushing tunnel labels. Up to two labels can be referenced via a single EEDB entry.

- phase-4-type-2-eedb-entries

  Phase-4 (EEDB) Egress Encapsulation resources

  Required by various applications such as TE-Policy extended label stack, three or more labels. Requires phase-3 type-1 bank for first and second label. On IXR Gen 3, can push multiple labels starting with TE-Policy label position 3

- phase-5-type-1-eedb-entries

  Phase-5 (EEDB) Egress Encapsulation resources

  Required by various applications such as MPLS and GREv6 tunnels. When used by SR/MPLS, one resource is used at every stage while pushing tunnel labels. Up to two labels can be referenced via a single EEDB entry.

- phase-6-type-1-eedb-entries

  Phase-6 (EEDB) Egress Encapsulation resources

  Required by various applications such as MPLS tunnels and ti-LFA. When used by SR/MPLS, one resource is used at every stage while pushing tunnel labels. Up to two labels can be referenced via a single EEDB entry.

- phase-7-type-1-eedb-entries

  Phase-7 (EEDB) Egress Encapsulation resources

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Required by various applications such as MPLS tunnels including LDP and SR-ISIS. When used by SR/MPLS, one resource is used at every stage while pushing tunnel labels. Up to two labels can be referenced via a single EEDB entry.

- type-1-esem-entries

  Type-1 (ESEM) Egress Exact Match resources

  Required by various applications such as Egress VNIs for VXLAN tunnels

- type-2-esem-entries

  Type-2 (ESEM) Egress Exact Match resources

  Required by various applications such as EVPN-MPLS Multi-Homing ESI label forwarding to ES peers

- es-prune-entries

  Ethernet Segment Prune resources

  Required by various applications, including EVPN-MPLS and EVPN-VXLAN Multi-Homing, to enforce split-horizon filtering at the egress Ethernet Segment interface. For EVPN-MPLS Multi-Homing, one entry is maintained per Ethernet Segment interface. For EVPN-VXLAN Multi-Homing, one entry is maintained per Ethernet Segment interface and remote peer that shares the same Ethernet Segment with the system.

Options

- arp-nd-entries

  IPv4 ARP and IPv6 neighbor discovery resources

  Each IPv4 ARP and each IPv6 neighbor entry counts as 1 used resource against a total that is platform dependent.

- ip-hosts

  IP host route resources

  7215 IXS-A1: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address requires 1 entry. Every local host /128 route, and ND entry requires 2 entries.

  7220 D1/D2/D3: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address requires 1 entry. Every IPv4 multicast snoop entry requires 2 entries. In non-ALPM operation every remote /32 route also requires 1 entry. Every local host /128 route, and ND entry requires 2 entries. Every IPv6 multicast snoop entry requires 4 entries. In non-ALPM operation every remote /128 route also requires 2 entries. Free entries reflects the total number of entries remaining in shared + dedicated UFT banks.

  7220 D4/D5: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address requires 1 entry. Every local host /128 route, and ND entry requires 2 entries. Every (*, G) IPv4 multicast snoop entry requires 1 entry. Every (S, G) IPv4 multicast snoop entry requires 2 entries. Every (*, G) IPv6 multicast snoop entry requires 2 entries. Every (S, G) IPv6 multicast snoop entry requires 4 entries.

  7220 H2/H3/H4/H5/H6: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address requires 1 entry. Every local host /128 route, and ND entry requires 2 entries.

- ip-lpm-routes

  IP longest prefix match route resources

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

7250 IXR/IXRe: Every installed IPv4 and IPv6 route counts as one used route.

7220 D1/D2/D3: In ALPM-disabled mode: Reports the number of half-wide entries. An IPv4 route requires a half-wide entry. An IPv6 route that is /64 or less requires a single-wide entry (2 half-wide entries). An IPv6 route that is more than /64 requires a double-wide entry (4 half-wide entries). In ALPM mode: Every IPv4 route counts as 1 used route and every IPv6 route (regardless of prefix length) counts as 2 used routes.

7220 D4/D5: Every IPv4 route counts as 1 used route and every IPv6 route (regardless of prefix length) counts as 4 used routes.

- mac-addresses

  MAC lookup table resources

  Reports the number of entries used in the MAC lookup table. On 7220 D1/D2/D3/D4/D5, free entries reflects the total number of entries remaining in shared + dedicated UFT banks

- mac-next-hops

  Direct MAC next-hop resources

  A resource that is consumed by each next-hop of a gRIBI route or an EVPN IFF unnumbered route, where the next-hop is specified as an interface name combined with a MAC address

- direct-ip-next-hops

  Direct IP next-hop resources

  Reports the number of entries, where 1 entry is used for every next-hop of an IP route or MPLS route/tunnel that is resolved directly to a local interface.

- indirect-ip-next-hops

  Indirect IP next-hop resources

  Reports the number of entries, where 1 entry is used for every next-hop of an IP route that requires resolution by a non-local route. This does not consider underlying ASIC resources.

- multicast-route

  multicast route resources

  7250 X3b/X1b/IXR/IXRe: Reports the number of entries used in the multicast route table.

- tunnel-next-hops

  Tunnel next-hop resources

  Reports the number of tunnel next-hop entries. 1 tunnel next-hop is required every time an indirect next-hop (e.g. a BGP next-hop) is resolved by a tunnel (BGP-LU, LDP, SR-ISIS or VXLAN)

- ecmp-groups

  ECMP group resources

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

7250 IXR/IXRe: Reports the used number of ECMP FECs, adding L1 ECMP FECs, L2 ECMP FECs and L3 ECMP FECs.

7220 D1/D2/D3/D4/D5: Reports the used number of ECMP groups, adding overlay and underlay ECMP groups (if applicable).

7220 H2/H3/H4: Reports used number of ECMP groups.

- ecmp-members

  ECMP member resources

  7250 IXR/IXRe: Reports the used number of ECMP member FECs, adding L1 ECMP member FECs, L2 ECMP member FECs and L3 ECMP member FECs.

  7220 D1/D2/D3/D4/D5: Reports the used number of ECMP members, adding overlay and underlay ECMP members (if applicable).

  7220 H2/H3/H4: Reports used number of ECMP members.

- egress-next-hops

  Egress next-hop resources

  7215 IXS-A1: Reports the number of entries used in the egress next-hop table. 1 entry = 1 IPv4 next-hop address or 1 IPv6 next-hop address.

  7220 D2/D3/D4/D5: Reports the number of entries used in the egress next-hop table, counting entries in the overlay partition and entries in the underlay partition. 1 entry = 1 IPv4 next-hop address or 1 IPv6 next-hop address.

  7220 H2/H3/H4/H5/H6: Reports the number of entries used in the egress next-hop table. 1 entry = 1 IPv4 next-hop address or 1 IPv6 next-hop address.

- lag-groups

  LAG group resources

  Reports the number of LAG resources used, including DGPP LAGs.

- lag-members

  LAG member resources

  Reports the number of LAG member resources used, including DGPP LAG members.

- subinterfaces

  Subinterface resources

  There are a maximum of 127 subinterfaces per TH3 pipeline (limited by VFP/EFP TCAM resources). This counts the utilization of those resources.

- mpls-next-hops

  MPLS next-hop (NHLFE) resources

  One resource is used for every next-hop that pushes an MPLS label in every next-hop-group that is tied to an ILM entry that performs a 'swap'.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

One additional resource is used for every next-hop that pushes an MPLS label in every next-hop-group that is tied to an MPLS tunnel.

- mpls-incoming-labels

  MPLS label lookup (ILM) resources

  One resource is used for every MPLS ILM entry that performs either a 'swap' or a 'pop' operation.

- originating-tunnels

  Originating tunnel resources

  One resource is used for every VXLAN, LDP, SR-ISIS or IPinIP tunnel originating on this node as head-end. On TD and TD4 systems this equates to a DVP resource.

- terminating-tunnels

  Terminating tunnel resources

  One resource is used for every IPinIP tunnel terminating entry on this node.

adverse-aggregate *number*

Description	Aggregation of all counters incremented when packets are dropped unexpectedly This leaf counts packet discarded as result of corrupted programming state or data structures in the forwarding-complex integrated circuit.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note: corrupted packets received on ingress interfaces are not counted in this leaf. This is because incoming corrupted packets are not a signal of adverse state within the integrated circuit, but rather of an adjacent entity, such as a cable or transceiver.

congestion-aggregate *number*

Description Aggregation of all counters incremented when packets are dropped due to an excess of traffic, i.e. some queue or FIFO is getting overloaded. Many of these drops are also counted in the qos/interface hierarchy

This is derived by summing all port-level in-discarded-packets counters, which count drops due to ASIC forwarding-rate over-subscription. Those counters also include some drops not due to oversubscription, such as Ethernet frames smaller than 64 bytes or frames with a bad CRC

Also included: * packets deleted from egress queues when port TX is disabled * packets tail-dropped by VOQs due to insufficient credits * packets aged out of VOQs after being queued for over 500ms

no-route *number*

Description Aggregation of all counters incremented when packets are dropped due to no FIB entry for an IPv4 or IPv6 packet

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This counter and the packet-processing-aggregate counter should be incremented for each no-route packet drop. MPLS packets, and Ethernet packets switched at Layer 2 through the MAC FDB, are not considered.

This is derived from the forward and drop counters of the VOQ associated with the no-route extraction reason.

packet-processing-aggregate *number*

Description Aggregation of all counters incremented when packets are dropped due to a packet characteristic (e.g. size, header fields) or due to policy / specific programming

This is derived by summing: * subinterface-level in-discarded counters (operator preference / control / policy: FIB lookup failures / no-route, ACL drop or reject, CPM filter drops, blackhole next-hop, uRPF, and similar) * subinterface-level out-error counters (packets dropped due to IP MTU exceeded) * port-level out-error counters (packets dropped due to port MTU exceeded) * port-level in-error counters (packets dropped due to MRU exceeded or packet CRC error) * subinterface-level in-error counters (header field errors, including TTL/HopLimit expiry) * subinterface-level out-discarded counters

Context platform linecard slot *number* forwarding-complex name *keyword* fib-table next-hop-group index *number* next-hop id *number* oper-state *keyword*

Tree oper-state

Options

- up

  The NHG or NH is fully resolved and operational

- down

  The NHG or NH is unresolved and not viable for carrying traffic

- failed

  The NHG or NH is not operational because of an underlying hardware resource issue

- up-unused

  The NH is up and resolved but not used for carrying traffic, possibly because of resilient-hash-prefix configuration

- down-vni-conflict

  The NH is down because of a VNI conflict

  If a network-instance receives multiple EVPN-VXLAN routes from the same VTEP but with different VNI values, only the next-hop

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

corresponding to the lowest VNI value is used for forwarding. The other next-hops are marked as down-vni-conflict.

- down-tcam-resources

  The NHG is down because of an underlying TCAM resource issue

  In NHGs where data path egress filtering for combined ECMP relies on ACLs to override the ECMP group ID obtained from route lookup with an alternate ECMP group containing only access next hops, exhaustion of TCAM resources for those ACLs causes the NHG to be marked as down-tcam-resources.

- down-domain-id-conflict

  The NHG is down because of a domain-id conflict

  If a network-instance receives multiple EVPN-VXLAN routes from the same VTEP but with different domain ID values, only the next-hop corresponding to the lowest domain ID value is used for forwarding. The other next-hops are marked as down-domain-id-conflict.

healthz

Description Enter the healthz context

The health of the component

The paramaters within this container indicate the status of the component beyond whether it is operationally up or down. When a signal is received that a component is in an unhealthy state the gNOI.Healthz service can be used to retrieve further diagnostic information relating to the component. The contents of this directory relate only to the specific component that it is associated with.

oper-state *keyword*

Description The operational state of this component

Context platform linecard slot *number* forwarding-complex name *keyword* oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable False

Options

- arp-nd-entries

  IPv4 ARP and IPv6 neighbor discovery resources

  Each IPv4 ARP and each IPv6 neighbor entry counts as 1 used resource against a total that is platform dependent.

- ip-hosts

  IP host route resources

  7215 IXS-A1: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address requires 1 entry. Every local host /128 route, and ND entry requires 2 entries.

  7220 D1/D2/D3: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address requires 1 entry. Every IPv4 multicast snoop entry requires 2 entries. In non-ALPM operation every remote /32 route also requires 1 entry. Every local host /128 route, and ND entry requires 2 entries. Every IPv6 multicast snoop entry requires 4 entries. In non-ALPM operation every remote /128 route also requires 2 entries. Free entries reflects the total number of entries remaining in shared + dedicated UFT banks.

  7220 D4/D5: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

requires 1 entry. Every local host /128 route, and ND entry requires 2 entries. Every (*, G) IPv4 multicast snoop entry requires 1 entry. Every (S, G) IPv4 multicast snoop entry requires 2 entries. Every (*, G) IPv6 multicast snoop entry requires 2 entries. Every (S, G) IPv6 multicast snoop entry requires 4 entries.

7220 H2/H3/H4/H5/H6: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address requires 1 entry. Every local host /128 route, and ND entry requires 2 entries.

- ip-lpm-routes

  IP longest prefix match route resources

  7250 IXR/IXRe: Every installed IPv4 and IPv6 route counts as one used route.

  7220 D1/D2/D3: In ALPM-disabled mode: Reports the number of half-wide entries. An IPv4 route requires a half-wide entry. An IPv6 route that is /64 or less requires a single-wide entry (2 half-wide entries). An IPv6 route that is more than /64 requires a double-wide entry (4 half-wide entries). In ALPM mode: Every IPv4 route counts as 1 used route and every IPv6 route (regardless of prefix length) counts as 2 used routes.

  7220 D4/D5: Every IPv4 route counts as 1 used route and every IPv6 route (regardless of prefix length) counts as 4 used routes.

- mac-addresses

  MAC lookup table resources

  Reports the number of entries used in the MAC lookup table. On 7220 D1/D2/D3/D4/D5, free entries reflects the total number of entries remaining in shared + dedicated UFT banks

- mac-next-hops

  Direct MAC next-hop resources

  A resource that is consumed by each next-hop of a gRIBI route or an EVPN IFF unnumbered route, where the next-hop is specified as an interface name combined with a MAC address

- direct-ip-next-hops

  Direct IP next-hop resources

  Reports the number of entries, where 1 entry is used for every next-hop of an IP route or MPLS route/tunnel that is resolved directly to a local interface.

- indirect-ip-next-hops

  Indirect IP next-hop resources

  Reports the number of entries, where 1 entry is used for every next-hop of an IP route that requires resolution by a non-local route. This does not consider underlying ASIC resources.

- multicast-route

  multicast route resources

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

7250 X3b/X1b/IXR/IXRe: Reports the number of entries used in the multicast route table.

- tunnel-next-hops

  Tunnel next-hop resources

  Reports the number of tunnel next-hop entries. 1 tunnel next-hop is required every time an indirect next-hop (e.g. a BGP next-hop) is resolved by a tunnel (BGP-LU, LDP, SR-ISIS or VXLAN)

- ecmp-groups

  ECMP group resources

  7250 IXR/IXRe: Reports the used number of ECMP FECs, adding L1 ECMP FECs, L2 ECMP FECs and L3 ECMP FECs.

  7220 D1/D2/D3/D4/D5: Reports the used number of ECMP groups, adding overlay and underlay ECMP groups (if applicable).

  7220 H2/H3/H4: Reports used number of ECMP groups.

- ecmp-members

  ECMP member resources

  7250 IXR/IXRe: Reports the used number of ECMP member FECs, adding L1 ECMP member FECs, L2 ECMP member FECs and L3 ECMP member FECs.

  7220 D1/D2/D3/D4/D5: Reports the used number of ECMP members, adding overlay and underlay ECMP members (if applicable).

  7220 H2/H3/H4: Reports used number of ECMP members.

- egress-next-hops

  Egress next-hop resources

  7215 IXS-A1: Reports the number of entries used in the egress next-hop table. 1 entry = 1 IPv4 next-hop address or 1 IPv6 next-hop address.

  7220 D2/D3/D4/D5: Reports the number of entries used in the egress next-hop table, counting entries in the overlay partition and entries in the underlay partition. 1 entry = 1 IPv4 next-hop address or 1 IPv6 next-hop address.

  7220 H2/H3/H4/H5/H6: Reports the number of entries used in the egress next-hop table. 1 entry = 1 IPv4 next-hop address or 1 IPv6 next-hop address.

- lag-groups

  LAG group resources

  Reports the number of LAG resources used, including DGPP LAGs.

- lag-members

  LAG member resources

  Reports the number of LAG member resources used, including DGPP LAG members.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- subinterfaces

  Subinterface resources

  There are a maximum of 127 subinterfaces per TH3 pipeline (limited by VFP/EFP TCAM resources). This counts the utilization of those resources.

- mpls-next-hops

  MPLS next-hop (NHLFE) resources

  One resource is used for every next-hop that pushes an MPLS label in every next-hop-group that is tied to an ILM entry that performs a 'swap'. One additional resource is used for every next-hop that pushes an MPLS label in every next-hop-group that is tied to an MPLS tunnel.

- mpls-incoming-labels

  MPLS label lookup (ILM) resources

  One resource is used for every MPLS ILM entry that performs either a 'swap' or a 'pop' operation.

- originating-tunnels

  Originating tunnel resources

  One resource is used for every VXLAN, LDP, SR-ISIS or IPinIP tunnel originating on this node as head-end. On TD and TD4 systems this equates to a DVP resource.

- terminating-tunnels

  Terminating tunnel resources

  One resource is used for every IPinIP tunnel terminating entry on this node.

Context

platform linecard slot *number* forwarding-complex name *keyword* pipeline index *(number | keyword)* pipeline-counters host-interface-block packet-extraction extraction-reason reason *identityref*

Options

- ipv4-header-options

  IPv4 header options are present in the packet.
- ipv6-hop-by-hop-option

  IPv6 packet with topmost next-header value of zero.
- icmp

  ICMPv4 packets with this router as destination.
- icmp6

  ICMPv6 packets including neighbor-solicitation and neighbor-advertisement messages.
- icmp-redirect

  Received IPv4 and IPv6 packets that should cause an ICMP redirect to be generated.
- bfd

  BFD and micro-BFD packets with this router as destination.
- bgp

  BGP packets; TCP port 179.
- grpc

  GRPC packets; TCP port 57400
- ike

  IKE (IPsec Internet Key Exchange) packets; UDP port 500
- ospf

  OSPF packets; IP protocol 89
- vrrp

  VRRP packets; IP protocol 112
- ldp

  LDP packets; UDP port 646
- dhcp

  DHCP packets; UDP ports 67,68
- ip-other-terminating

  Any other IP packets that are locally destined
- ip-blackhole-icmp

  Traffic matched a blackhole route with generate-icmp=true
- ipv6-multicast

  IPv6 DA = FF01:0:0:0:0:0:0:1 or IPv6 DA = FF01:0:0:0:0:0:0:2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- ipv6-link-local

  IPv6 DA = FE80::/10 address
- ipv4-broadcast

  IPv4 packets were received with a subnet broadcast address or a limited broadcast and not recognized as another type
- ip-no-route

  IPv4 and IPv6 packets for which there was no route to the destination
- ip-header-errors

  IP version error, IP header checksum error, IP header length error, IP header total length error, IPv6 next-header is null, IPv6 SA is link-local while IPv6 DA is global
- ip-ttl-expired

  The IP packet is not destined for this router and it was received with TTL 0 or TTL 1
- mpls-ttl-expired

  The MPLS packet was received with MPLS label stack TTL 0 or TTL 1
- ip-arp-miss

  The IP DA itself or the next-hop of the route used to forward the packet has no ARP/IPv6 neighbor entry
- ip-arp

  The received frame is an ARP packet recognized by ethertype 0x0806
- lldp

  The received frame is an LLDP packet recognized by ethertype 0x88cc
- isis

  The received frame is an ISIS packet
- lacp

  The received frame is an LACP packet
- google-discovery

  The received frame is a GDP packet recognized by ethertype 0x6007
- capture-filter-copy

  Packets matching a capture-filter copy rule
- cpm-filter-log

  Packets matching a CPM-filter rule with log action
- ingress-acl-log

  Packets matching an interface IP filter rule with log action
- ingress-acl-reject

  Packets matching an interface IP filter rule with reject action
- egress-acl-log

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Packet matched an egress ACL rule with log action.

- ip-mpls-mtu-exceeded

  The egress subinterface IP MTU or MPLS MTU (as applicable) is less than the size of the IP or MPLS packet that needs to be transmitted.

Options

- classifier-profiles

  A classifier-profile resource is used every time a different combination of IPv4 DSCP classifier and IPv6 DSCP classifier is applied to an ingress subinterface. One is always used by the combination of the default IPv4 DSCP classifier and the default IPv6 DSCP classifier.

- rewrite-profiles

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A rewrite-profile resource is used every time a different combination of IPv4 DSCP rewrite-rule and IPv6 DSCP rewrite-rule is applied to an egress subinterface.

- dscp-classifier-policies

  Every user-defined DSCP classifier policy that is configured uses one of these resources

- dscp-mpls-rewrite-policies

  A rewrite-policy resource is used every time a different DSCP or MPLS traffic-class rewrite-rule policy is applied to an egress subinterface.

- mpls-classifier-policies

  Every user-defined mpls traffic class classifier policy that is configured uses one of these resources

- mpls-rewrite-policies

  An mpls-rewrite-policy resource is used every time a different MPLS traffic-class rewrite-rule policy is applied to at least one egress subinterface on this forwarding-complex.

- dscp-rewrite-policies

  Every user-defined dscp rewrite policy that is configured uses one of these resources.

- dot1p-classifier-policies

  Every user-defined dot1p classifier policy that is configured uses one of these resources

- dot1p-rewrite-policies

  Every user-defined dot1p rewrite policy that is configured uses one of these resources

- input-policers

  Every input-policer that is allocated to the configured subinterfaces based on input-class-map

- output-class-maps

  Every output class map that is applied to at least one egress subinterface on this forwarding-complex, uses one of these resources.

- slope-policies

  Every user-defined qos buffer management slope policy that is configured uses one of these resources

- input-class-maps

  Every qos input class map that is applied to at least one qos subinterface input on this forwarding-complex, uses one of these resources.

- dscp-reclassify-policies

  Every user-defined dscp reclassify policy that is configured uses one of these resources

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- ip-rewrite-policies

  Every user-defined ip rewrite policy that is configured uses one of these resources

- if-output-mac

  Resource pool of TCAM entries used by MAC egress ACLs

- if-output-cpm-mac

  Resource pool of TCAM entries used by MAC egress ACLs and MAC cpm-filter ACLs

- policy-forwarding-vrf-selection-ipv4

  Resource pool of TCAM entries used by IPv4 policy-forwarding entries that redirect flows to a different network-instance

- policy-forwarding-vrf-selection-ipv6

  Resource pool of TCAM entries used by IPv6 policy-forwarding entries that redirect flows to a different network-instance

- policy-forwarding-vrf-selection-ipv4-and-gre-udp-decap

  Resource pool of TCAM entries used by IPv4 policy-forwarding entries that redirect flows to a different network-instance and IPv4/IPv6 global-decap policy rules that perform GRE, MPLSoUDP and IPoGUE decapsulation

- policy-forwarding-nhg-ipv4

  Resource pool of TCAM entries used by IPv4 policy-forwarding entries that redirect flows to a NHG of IP next-hops or tunnels

  On TD4 systems IPv6 policy-forwarding entries share this resource with IPv4 entries.

- policy-forwarding-nhg-ipv6

  Resource pool of TCAM entries used by IPv6 policy-forwarding entries that redirect flows to a NHG of IP next-hops or tunnels

- policy-forwarding-selective-load-balancing

  Resource pool of TCAM entries used by the selective-DLB match that enables/disables dynamic-load-balancing for a subset of traffic

- if-input-policer

  Resource pool of TCAM entries used by ingress subinterface policer templates

- if-input-ipv4-qos

  Resource pool of TCAM entries associated with IPv4 multi-field QoS classification entries, when applied to subinterface input

- if-input-ipv6-qos

  Resource pool of TCAM entries associated with IPv6 multi-field QoS classification entries, when applied to subinterface input

- mrouter-mfib-redirect

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Resource pool of TCAM entries used by multicast snooping protocols in MAC-VRF network-instances

One TCAM entry is used per multicast snooping protocol enabled in a MAC-VRF. For instance, if igmp-snooping and mld-snooping are enabled on a MAC-VRF, two entries are used. If only igmp-snooping is enabled, only one entry is used.

- tunnel-decap-ipv4-ipv6

  Resource pool of TCAM entries used for IPv4 and IPv6 tunnel-decapsulation groups

  Only applicable to Gen2c+

- if-output-evpn-mh-multicast-non-df

  Resource pool of TCAM entries used by egress filtering of IP multicast traffic to non-Designated Forwarder subinterfaces

  One TCAM entry is used when multicast snooping protocols are enabled on at least one MAC-VRF that has one or more subinterfaces associated with Ethernet Segments.

- dot1x-multi-host-authentication-guard

  Resource pool of TCAM entries used for dot1x multi host authentication

  This is used for any protocol that uses multi host including dot1x or MBA.

- input-first-hop-security-ip-source-guard

  Resource pool of TCAM entries used for IP source guard.

- input-first-hop-security-ipv4-source-guard

  Resource pool of TCAM entries used for IPv4 source guard entries.

- input-first-hop-security-ipv6-source-guard

  Resource pool of TCAM entries used for IPv6 source guard entries.

- gbp-ingress

  Resource pool of TCAM entries used for Group Based Policy entries.

- combined-ecmp-redirect

  Resource pool of TCAM entries used for combined ECMP and gateway-IP load balancing with data path egress filtering

  One TCAM entry is used per NHG for combined ECMP and gateway-IP load balancing with data path egress filtering. The TCAM entry is used to override the ECMP group ID obtained from route lookup with an alternate ECMP group containing only access next hops.

Configurable False

healthz

Description Enter the healthz context

The health of the component

The paramaters within this container indicate the status of the component beyond whether it is operationally up or down. When a signal is received that a component is in an unhealthy state the gNOI.Healthz service can be used to retrieve further diagnostic information relating to the component. The contents of this directory relate only to the specific component that it is associated with.

oper-state *keyword*

Description The operational state of this component

Context platform power-supply id *number* oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Platforms	7220 IXR-D2L, 7220 IXR-D3L

ipv6-128bit-lpm-entries *number*

Description	Sets the value for num_ipv6_lpm_128b_entries, which affects IP FIB scale. H2/H3 range: 0-1024 D1 range: 0-4096 D2/D3 range: 0-8192
Context	platform resource-management unified-forwarding-resources ipv6-128bit-lpm-entries *number*
Tree	ipv6-128bit-lpm-entries
Range	0 to 8192
Configurable	True
Platforms	7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-H2, 7220 IXR-H3

requested-extra-ip-host-entries *number*

Description	The extra number of host entries that are desired. The number of UFT shared banks that are reserved for IPv4 and IPv6 host entries is given by: min(N//X,P-A) where: N = configured value of requested-extra-ip-host-entries X = the size of each shared bank, which is platform specific P-A = platform-specific number of shared banks, subtracting the ALPM banks requested-extra-ip-host-entries is interpreted in terms of IPv4 hosts (single-wide entries). IPv6 host entries are double-wide so 1 IPv4 host entry + 1 IPv6 host-entry counts as 3 entries. All UFT shared banks that are not reserved by ALPM and not reserved for extra IP host entries are used for extra MAC entries. On D1 the default value is 48K entries, which provides 3 shared banks, max is 96K. On D2/D3 the default value is 128K entries, which provides 4 shared banks, max is 256K.

Options

- ip-lpm-ipv4-routes

  IPv4 longest prefix match route resources

  7220 D1/D2/D3: Reports the number of IPv4 entries in the hardware LPM table. In non-ALPM mode, free entries is the remaining number of half-wide entries in all partitions (i.e. it assumes no IPv6 routes consume those entries). In ALPM mode, free entries is the Minimum Guaranteed Capacity returned by the BCM SDK.

  7220 D4/D5 and 7220 H2/H3/H4: Reports the number of IPv4 routes installed in the FIB. Free entries is the Minimum Guaranteed Capacity returned by the BCM SDK.

- ip-lpm-ipv6-routes

  IPv6 longest prefix match route resources

  Reports the number of IPv6 routes installed in the FIB. Free entries is the Minimum Guaranteed Capacity returned by the BCM SDK.

- ip-lpm-ipv6-shorter-routes

  IPv6 longest prefix match route resources when the prefix length is less than or equal to 64

  7220 D1/D2/D3: Reports the number of IPv6 entries with prefix length less than 65 bits in the hardware LPM table. In non-ALPM mode, free entries is the remaining number of single-wide + double-wide entries (i.e. it assumes no other types of routes consume those entries). In ALPM mode, free entries is based on the Minimum Guaranteed Capacity returned by the BCM SDK.

  7220 H2/H3: Reports the number of IPv6 entries with prefix length less than 65 bits installed in the FIB. Free entries is based on the Minimum Guaranteed Capacity returned by the BCM SDK.

- ip-lpm-ipv6-longer-routes

  IPv6 longest prefix match route resources when the prefix length is greater than 64

  7220 D1/D2/D3: Reports the number of IPv6 entries with prefix length greater than 64 bits in the hardware LPM table. In non-ALPM mode, free entries is the remaining number of double-wide entries (i.e. it assumes no other types of routes consume those entries). In ALPM mode, free entries is based on the Minimum Guaranteed Capacity returned by the BCM SDK.

7220 H2/H3: Reports the number of IPv6 entries with prefix length greater than 64 bits installed in the FIB. Free entries is based on the Minimum Guaranteed Capacity returned by the BCM SDK.

- exact-match-entries

  Exact match lookup table resources

  Counts 30-bit entries. On 7250 IXR Gen3 systems, this captures total usage across both the main and secondary table.

- exact-match-entries-1

  Exact match lookup table resources, main table

  Counts 30-bit entries

- exact-match-entries-2

  Exact match lookup table resources, secondary table

  Counts 30-bit entries

- exact-match-entries-mac-da

  Exact match lookup table resources used for MAC destination address FDB lookup

  Counts 30-bit entries

- exact-match-entries-mac-sa

  Exact match lookup table resources used for MAC source address FDB lookup

  Counts 30-bit entries

- exact-match-entries-mpls-label

  Exact match lookup table resources used for MPLS incoming label lookup

  Counts 30-bit entries

- exact-match-entries-ipv4-route

  Exact match lookup table resources used for IPv4 compressed route lookup

  Counts 30-bit entries

- exact-match-entries-ipv6-route

  Exact match lookup table resources used for IPv6 compressed route lookup

  Counts 30-bit entries

- exact-match-entries-next-hop

  Exact match lookup table resources used for compressed route next-hop lookup

  Counts 30-bit entries

- ip-tunnel-source-ipv4-addresses

  IP tunnel source IPv4 address resources

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Each IPinIP and GRE tunnel with a different source IPv4 address uses one of these resources.

- ip-tunnel-source-ipv6-addresses

  IP tunnel source IPv6 address resources

  Each IPinIP and GRE tunnel with a different source IPv6 address uses one of these resources.

- underlay-ecmp-groups

  Underlay ECMP group resources

  ECMP groups are partitioned into overlay and underlay groups. The underlay partition is further subdivided into groups used for underlay ECMP and groups used for VP LAGs (EVPN M-H - if supported). This counts the utilization of the sub-resource used for ECMP.

- dynamic-load-balancing-ecmp-groups

  Dynamic load-balancing ECMP groups

  A DLB ECMP group can support per-packet load-balancing or it can support assignment of flows to ECMP members based on interface load metrics

- vp-lag-groups

  VP LAG group resources

  ECMP groups are partitioned into overlay and underlay groups. The underlay partition is further subdivided into groups used for underlay ECMP and groups used for VP LAGs (EVPN M-H). This counts the utilization of the sub-resource used for VP LAGs.

- overlay-ecmp-groups

  Overlay ECMP group resources

  ECMP groups are partitioned into overlay and underlay groups. This counts the utilization of the overlay ECMP partition.

- underlay-ecmp-members

  Underlay ECMP member resources

  ECMP members are partitioned into overlay and underlay. This counts the utilization of the partition used for underlay.

- overlay-ecmp-members

  Overlay ECMP member resources

  ECMP members are partitioned into overlay and underlay. This counts the utilization of the partition used for overlay.

- underlay-egress-next-hops

  Underlay egress next-hop resources

  Egress next-hops are partitioned into overlay and underlay. This counts the utilization of the partition used for underlay.

- overlay-egress-next-hops

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Overlay egress next-hop resources

Egress next-hops are partitioned into overlay and underlay. This counts the utilization of the partition used for overlay.

- dgpp-module-ids

  DGPP module ID resources

  DGPPs are an aggregate id consisting of a module_id and a port_id. There are 64 modules and 120 ports per module. Each 'network' ARP entry (IP next-hop) needs a DGPP - the module_id is allocated against the network interface (port) and a port_id is allocated from within the module. A module_id will only be allocated when the first ArpEntry is added (freed when last is removed) but is owned exclusively by that network interface. A network interface may require more than one module_id - i.e. if there are 245 ArpEntries on ethernet-1/1 (possibly spread across multiple network-instance interfaces) then 3 module_ids are required.

- egress-vlan-translate-egress-vnis

  EGR_VLAN_XLATE_1 resources

  Corresponds to the 'EGR_VLAN_XLATE_1' HW table (8K entries on Dx). These entries are used for finding the egress VNI to be used for VXLAN packets.

- egress-vlan-translate-local-bias-pairs

  EGR_VLAN_XLATE_2 resources

  Corresponds to the 'EGR_VLAN_XLATE_2' HW table (24K entries). These entries are used for local bias (ES pruning).

- level-1-ecmp-groups

  Level 1 (top level) ECMP group resources.

- level-2-ecmp-groups

  Level 2 (middle level) ECMP group resources.

- level-3-ecmp-groups

  Level 3 (bottom level) ECMP group resources.

- level-1-ecmp-members

  Level 1 (top level) ECMP member resources.

- level-2-ecmp-members

  Level 2 (middle level) ECMP member resources.

- level-3-ecmp-members

  Level 3 (bottom level) ECMP member resources.

- level-1-non-ecmp-fecs

  Level 1 (top level) non-ECMP FEC resources.

- level-2-non-ecmp-fecs

  Level 2 (middle level) non-ECMP FEC resources.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- level-3-non-ecmp-fecs

  Level 3 (bottom level) non-ECMP FEC resources.

- ip-tunnel-statistics

  Statistics resources for counting packets matching an IP tunnel entry

  One resource is one packet/octet counter pair that is allocated to counting: (a) packets that match an IP tunnel termination entry for purposes of per-prefix transit traffic statistics (b) packets that match IP tunnel termination entries programmed to decapsulate and redirect traffic to another network-instance (c) packets that match IP tunnel termination entries programmed to decapsulate and re-tunnel traffic to a new endpoint address (1 counter pair per new endpoint address)

- subinterface-basic-stats-counters

  Stats resources used by bridged and routed (non-IRB) subinterfaces that do not provide a breakdown by protocol family

- subinterface-detailed-stats-counters

  Stats resources used by routed (non-IRB) subinterfaces that provide a breakdown by protocol family

- subinterface-irb-stats-counters

  Stats resources used by routed IRB subinterfaces

- kaps-public

  The public KAPS hardware table

- kaps-private

  The private KAPS hardware table

- phase-2-type-1-eedb-entries

  Phase-2 (EEDB) Egress Encapsulation resources

  Required by various applications such as EVPN BUM label and sflow

- phase-2-type-2-eedb-entries

  Phase-2 (EEDB) Egress Encapsulation resources

  Required by various applications such as EVPN Unicast label, IP-VPN/ IFL label, IRB ARP entries and vlan loopbacks

- phase-3-type-1-eedb-entries

  Phase-3 (EEDB) Egress Encapsulation resources

  Required by various applications such as MPLS and sflow. When used by SR/MPLS, one resource is used at every stage while pushing tunnel labels. Up to two labels can be referenced via a single EEDB entry.

- phase-3-type-2-eedb-entries

  Phase-3 (EEDB) Egress Encapsulation resources

  Required by various applications such as BGP Labeled Unicast and IP-in-IP tunnels

- phase-4-type-1-eedb-entries

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Phase-4 (EEDB) Egress Encapsulation resources

Required by various applications such as MPLS, GREv4 and GREv6 tunnels, sflow for UDP tunnels. When used by SR/MPLS, one resource is used at every stage while pushing tunnel labels. Up to two labels can be referenced via a single EEDB entry.

- phase-4-type-2-eedb-entries

  Phase-4 (EEDB) Egress Encapsulation resources

  Required by various applications such as TE-Policy extended label stack, three or more labels. Requires phase-3 type-1 bank for first and second label. On IXR Gen 3, can push multiple labels starting with TE-Policy label position 3

- phase-5-type-1-eedb-entries

  Phase-5 (EEDB) Egress Encapsulation resources

  Required by various applications such as MPLS and GREv6 tunnels. When used by SR/MPLS, one resource is used at every stage while pushing tunnel labels. Up to two labels can be referenced via a single EEDB entry.

- phase-6-type-1-eedb-entries

  Phase-6 (EEDB) Egress Encapsulation resources

  Required by various applications such as MPLS tunnels and ti-LFA. When used by SR/MPLS, one resource is used at every stage while pushing tunnel labels. Up to two labels can be referenced via a single EEDB entry.

- phase-7-type-1-eedb-entries

  Phase-7 (EEDB) Egress Encapsulation resources

  Required by various applications such as MPLS tunnels including LDP and SR-ISIS. When used by SR/MPLS, one resource is used at every stage while pushing tunnel labels. Up to two labels can be referenced via a single EEDB entry.

- type-1-esem-entries

  Type-1 (ESEM) Egress Exact Match resources

  Required by various applications such as Egress VNIs for VXLAN tunnels

- type-2-esem-entries

  Type-2 (ESEM) Egress Exact Match resources

  Required by various applications such as EVPN-MPLS Multi-Homing ESI label forwarding to ES peers

- es-prune-entries

  Ethernet Segment Prune resources

  Required by various applications, including EVPN-MPLS and EVPN-VXLAN Multi-Homing, to enforce split-horizon filtering at the egress Ethernet Segment interface. For EVPN-MPLS Multi-Homing, one entry is maintained per Ethernet Segment interface. For EVPN-VXLAN Multi-

name *identityref*

Description

The name of the XDP datapath resource.

Some of these resources may be software only (i.e. no correspondence to a hardware table).

Some of these resources may depend on multiple HW tables and when the utilization is reported it represents an aggregated or summarized view.

Context platform resource-monitoring datapath xdp resource name *identityref*

Options

- arp-nd-entries

  IPv4 ARP and IPv6 neighbor discovery resources

  Each IPv4 ARP and each IPv6 neighbor entry counts as 1 used resource against a total that is platform dependent.

- ip-hosts

  IP host route resources

  7215 IXS-A1: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address requires 1 entry. Every local host /128 route, and ND entry requires 2 entries.

  7220 D1/D2/D3: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address requires 1 entry. Every IPv4 multicast snoop entry requires 2 entries. In non-ALPM operation every remote /32 route also requires 1 entry. Every local host /128 route, and ND entry requires 2 entries. Every IPv6 multicast snoop entry requires 4 entries. In non-ALPM operation every remote /128 route also requires 2 entries. Free entries reflects the total number of entries remaining in shared + dedicated UFT banks.

  7220 D4/D5: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

requires 1 entry. Every local host /128 route, and ND entry requires 2 entries. Every (*, G) IPv4 multicast snoop entry requires 1 entry. Every (S, G) IPv4 multicast snoop entry requires 2 entries. Every (*, G) IPv6 multicast snoop entry requires 2 entries. Every (S, G) IPv6 multicast snoop entry requires 4 entries.

7220 H2/H3/H4/H5/H6: Reports the number of entries used in the IP host table. Every local host /32 route, ARP entry and IPv4 subnet broadcast address requires 1 entry. Every local host /128 route, and ND entry requires 2 entries.

- ip-lpm-routes

  IP longest prefix match route resources

  7250 IXR/IXRe: Every installed IPv4 and IPv6 route counts as one used route.

  7220 D1/D2/D3: In ALPM-disabled mode: Reports the number of half-wide entries. An IPv4 route requires a half-wide entry. An IPv6 route that is /64 or less requires a single-wide entry (2 half-wide entries). An IPv6 route that is more than /64 requires a double-wide entry (4 half-wide entries). In ALPM mode: Every IPv4 route counts as 1 used route and every IPv6 route (regardless of prefix length) counts as 2 used routes.

  7220 D4/D5: Every IPv4 route counts as 1 used route and every IPv6 route (regardless of prefix length) counts as 4 used routes.

- mac-addresses

  MAC lookup table resources

  Reports the number of entries used in the MAC lookup table. On 7220 D1/D2/D3/D4/D5, free entries reflects the total number of entries remaining in shared + dedicated UFT banks

- mac-next-hops

  Direct MAC next-hop resources

  A resource that is consumed by each next-hop of a gRIBI route or an EVPN IFF unnumbered route, where the next-hop is specified as an interface name combined with a MAC address

- direct-ip-next-hops

  Direct IP next-hop resources

  Reports the number of entries, where 1 entry is used for every next-hop of an IP route or MPLS route/tunnel that is resolved directly to a local interface.

- indirect-ip-next-hops

  Indirect IP next-hop resources

  Reports the number of entries, where 1 entry is used for every next-hop of an IP route that requires resolution by a non-local route. This does not consider underlying ASIC resources.

- multicast-route

  multicast route resources

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

7250 X3b/X1b/IXR/IXRe: Reports the number of entries used in the multicast route table.

- tunnel-next-hops

  Tunnel next-hop resources

  Reports the number of tunnel next-hop entries. 1 tunnel next-hop is required every time an indirect next-hop (e.g. a BGP next-hop) is resolved by a tunnel (BGP-LU, LDP, SR-ISIS or VXLAN)

- ecmp-groups

  ECMP group resources

  7250 IXR/IXRe: Reports the used number of ECMP FECs, adding L1 ECMP FECs, L2 ECMP FECs and L3 ECMP FECs.

  7220 D1/D2/D3/D4/D5: Reports the used number of ECMP groups, adding overlay and underlay ECMP groups (if applicable).

  7220 H2/H3/H4: Reports used number of ECMP groups.

- ecmp-members

  ECMP member resources

  7250 IXR/IXRe: Reports the used number of ECMP member FECs, adding L1 ECMP member FECs, L2 ECMP member FECs and L3 ECMP member FECs.

  7220 D1/D2/D3/D4/D5: Reports the used number of ECMP members, adding overlay and underlay ECMP members (if applicable).

  7220 H2/H3/H4: Reports used number of ECMP members.

- egress-next-hops

  Egress next-hop resources

  7215 IXS-A1: Reports the number of entries used in the egress next-hop table. 1 entry = 1 IPv4 next-hop address or 1 IPv6 next-hop address.

  7220 D2/D3/D4/D5: Reports the number of entries used in the egress next-hop table, counting entries in the overlay partition and entries in the underlay partition. 1 entry = 1 IPv4 next-hop address or 1 IPv6 next-hop address.

  7220 H2/H3/H4/H5/H6: Reports the number of entries used in the egress next-hop table. 1 entry = 1 IPv4 next-hop address or 1 IPv6 next-hop address.

- lag-groups

  LAG group resources

  Reports the number of LAG resources used, including DGPP LAGs.

- lag-members

  LAG member resources

  Reports the number of LAG member resources used, including DGPP LAG members.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- subinterfaces

  Subinterface resources

  There are a maximum of 127 subinterfaces per TH3 pipeline (limited by VFP/EFP TCAM resources). This counts the utilization of those resources.

- mpls-next-hops

  MPLS next-hop (NHLFE) resources

  One resource is used for every next-hop that pushes an MPLS label in every next-hop-group that is tied to an ILM entry that performs a 'swap'. One additional resource is used for every next-hop that pushes an MPLS label in every next-hop-group that is tied to an MPLS tunnel.

- mpls-incoming-labels

  MPLS label lookup (ILM) resources

  One resource is used for every MPLS ILM entry that performs either a 'swap' or a 'pop' operation.

- originating-tunnels

  Originating tunnel resources

  One resource is used for every VXLAN, LDP, SR-ISIS or IPinIP tunnel originating on this node as head-end. On TD and TD4 systems this equates to a DVP resource.

- terminating-tunnels

  Terminating tunnel resources

  One resource is used for every IPinIP tunnel terminating entry on this node.

Options

- classifier-profiles

  A classifier-profile resource is used every time a different combination of IPv4 DSCP classifier and IPv6 DSCP classifier is applied to an ingress subinterface. One is always used by the combination of the default IPv4 DSCP classifier and the default IPv6 DSCP classifier.

- rewrite-profiles

  A rewrite-profile resource is used every time a different combination of IPv4 DSCP rewrite-rule and IPv6 DSCP rewrite-rule is applied to an egress subinterface.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- dscp-classifier-policies

  Every user-defined DSCP classifier policy that is configured uses one of these resources

- dscp-mpls-rewrite-policies

  A rewrite-policy resource is used every time a different DSCP or MPLS traffic-class rewrite-rule policy is applied to an egress subinterface.

- mpls-classifier-policies

  Every user-defined mpls traffic class classifier policy that is configured uses one of these resources

- mpls-rewrite-policies

  An mpls-rewrite-policy resource is used every time a different MPLS traffic-class rewrite-rule policy is applied to at least one egress subinterface on this forwarding-complex.

- dscp-rewrite-policies

  Every user-defined dscp rewrite policy that is configured uses one of these resources.

- dot1p-classifier-policies

  Every user-defined dot1p classifier policy that is configured uses one of these resources

- dot1p-rewrite-policies

  Every user-defined dot1p rewrite policy that is configured uses one of these resources

- input-policers

  Every input-policer that is allocated to the configured subinterfaces based on input-class-map

- output-class-maps

  Every output class map that is applied to at least one egress subinterface on this forwarding-complex, uses one of these resources.

- slope-policies

  Every user-defined qos buffer management slope policy that is configured uses one of these resources

- input-class-maps

  Every qos input class map that is applied to at least one qos subinterface input on this forwarding-complex, uses one of these resources.

- dscp-reclassify-policies

  Every user-defined dscp reclassify policy that is configured uses one of these resources

- ip-rewrite-policies

  Every user-defined ip rewrite policy that is configured uses one of these resources

  Resource pool of TCAM entries used by MAC egress ACLs

- if-output-cpm-mac

  Resource pool of TCAM entries used by MAC egress ACLs and MAC cpm-filter ACLs

- policy-forwarding-vrf-selection-ipv4

  Resource pool of TCAM entries used by IPv4 policy-forwarding entries that redirect flows to a different network-instance

- policy-forwarding-vrf-selection-ipv6

  Resource pool of TCAM entries used by IPv6 policy-forwarding entries that redirect flows to a different network-instance

- policy-forwarding-vrf-selection-ipv4-and-gre-udp-decap

  Resource pool of TCAM entries used by IPv4 policy-forwarding entries that redirect flows to a different network-instance and IPv4/IPv6 global-decap policy rules that perform GRE, MPLSoUDP and IPoGUE decapsulation

- policy-forwarding-nhg-ipv4

  Resource pool of TCAM entries used by IPv4 policy-forwarding entries that redirect flows to a NHG of IP next-hops or tunnels

  On TD4 systems IPv6 policy-forwarding entries share this resource with IPv4 entries.

- policy-forwarding-nhg-ipv6

  Resource pool of TCAM entries used by IPv6 policy-forwarding entries that redirect flows to a NHG of IP next-hops or tunnels

- policy-forwarding-selective-load-balancing

  Resource pool of TCAM entries used by the selective-DLB match that enables/disables dynamic-load-balancing for a subset of traffic

- if-input-policer

  Resource pool of TCAM entries used by ingress subinterface policer templates

- if-input-ipv4-qos

  Resource pool of TCAM entries associated with IPv4 multi-field QoS classification entries, when applied to subinterface input

- if-input-ipv6-qos

  Resource pool of TCAM entries associated with IPv6 multi-field QoS classification entries, when applied to subinterface input

- mrouter-mfib-redirect

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Resource pool of TCAM entries used by multicast snooping protocols in MAC-VRF network-instances

One TCAM entry is used per multicast snooping protocol enabled in a MAC-VRF. For instance, if igmp-snooping and mld-snooping are enabled on a MAC-VRF, two entries are used. If only igmp-snooping is enabled, only one entry is used.

- tunnel-decap-ipv4-ipv6

  Resource pool of TCAM entries used for IPv4 and IPv6 tunnel-decapsulation groups

  Only applicable to Gen2c+

- if-output-evpn-mh-multicast-non-df

  Resource pool of TCAM entries used by egress filtering of IP multicast traffic to non-Designated Forwarder subinterfaces

  One TCAM entry is used when multicast snooping protocols are enabled on at least one MAC-VRF that has one or more subinterfaces associated with Ethernet Segments.

- dot1x-multi-host-authentication-guard

  Resource pool of TCAM entries used for dot1x multi host authentication

  This is used for any protocol that uses multi host including dot1x or MBA.

- input-first-hop-security-ip-source-guard

  Resource pool of TCAM entries used for IP source guard.

- input-first-hop-security-ipv4-source-guard

  Resource pool of TCAM entries used for IPv4 source guard entries.

- input-first-hop-security-ipv6-source-guard

  Resource pool of TCAM entries used for IPv6 source guard entries.

- gbp-ingress

  Resource pool of TCAM entries used for Group Based Policy entries.

- combined-ecmp-redirect

  Resource pool of TCAM entries used for combined ECMP and gateway-IP load balancing with data path egress filtering

  One TCAM entry is used per NHG for combined ECMP and gateway-IP load balancing with data path egress filtering. The TCAM entry is used to override the ECMP group ID obtained from route lookup with an alternate ECMP group containing only access next hops.

high-threshold-bytes *number*

Description	The queue depth that, when crossed in a rising direction, signals a potential start of congestion On IXR-6/10 this parameter applies to all VOQs associated with the egress queue. On 7220-D2/D3/H2/H3 this parameter applies to the unicast queue only; the configuration of this leaf is ignored when the queue-template is attached to a queue with queue-type other than unicast. The actions that follow the start of congestion depend on whether queue-depth-sampling is true or false. If queue-depth-sampling is false, the system time is recorded and no further actions are taken. If queue-depth sampling is true, the system starts a rapid queue-depth polling process that profiles the entire duration of congestion. On 7220-D2/D3 the threshold is rounded up the nearest multiple of 2048 bytes. On IXR-6e/10e the threshold is rounded up to the nearest multiple of 4096 bytes. On 7220-H2/H3 the threshold is rounded up to the nearest multiple of 254 bytes. The default value of 0 disables the functionality.

low-threshold-bytes *number*

Description	The queue depth that, when crossed in a falling direction, signals a potential end of congestion When queue-depth-sampling is enabled and a VOQ associated with the egress queue is in a congested state the periodic pollling of that VOQ's depth ends when there have been low-threshold-count samples recording a depth below the low-threshold-bytes.

maximum-burst-size *number*

Description	Maximum amount of shared buffer memory available to the queue. On IXR-6/10 this parameter applies to a set of VOQs. If the configured value is 0 or no value is configured the limit is 256 MB (268435456 bytes), however the use of 'alpha' may limit the effective value to less than 256 MB. A configured non-zero value sets a static limit without 'alpha'. On 7220-D2/D3/D5/H2/H3 this parameter applies to an egress queue and the default value of zero instructs the forwarding chip to apply its own limit based on 'alpha'. A non-zero value disables 'alpha'. The alpha value is 5 (0.25 multiplier of shared buffer space) for unicast queues and 4 (0.125 multiplier of shared buffer space) for multicast queues. Must be non-zero/non-default in order to add the active-queue-management presence container

maximum-burst-size-delay *number*

Description	Maximum amount of shared buffer memory available to the queue, expressed as a function of time-delay. The number of bytes is calculated by multiplying maximum-burst-size-delay by interface speed the queue is attached to. Must be non-zero/non-default in order to take effect, and when so, the bytes based maximum-burst-size leaf is meaningless.

queue-depth-sampling *boolean*

Description	True setting enables triggered queue-depth sampling When this setting is enabled and the queue depth of any VOQ associated with the egress queue exceeds the high-threshold, the system records the congestion start-time and begins collecting regular samples of the VOQ's depth. The periodic sampling continues until the low-threshold conditions are met.

destination-port

Description Enter the destination-port context

A packet matches this condition if its destination TCP or UDP port number matches the value or range or within the port-lists that is specified

The rule should also have a condition that the IP protocol equals 6 (TCP) or 17 (UDP) in order for this to be interpreted correctly.

Context qos classifiers multifield-classifier name *string* entry sequence-id *number* match transport destination-port

source-port

Description Enter the source-port context

A packet matches this condition if its source TCP or UDP port number matches the value or range or within the port-lists that is specified

The rule should also have a condition that the IP protocol equals 6 (TCP) or 17 (UDP) in order for this to be interpreted correctly.

Use subject to Terms available at: www.nokia.com/terms.

single-instance *number*

Description The number of TCAM entries required to implement this entry if it is applied to only one subinterface and one traffic direction specific to this slot.

This is non-zero even if the filter is not applied to any subinterfaces of this complex. It captures the effect of TCAM entry expansion to deal with L4 port or VLAN ranges, for example.

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable

Use subject to Terms available at: www.nokia.com/terms.

Component or process is currently warm rebooting

This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable False

Tree	forwarding-type
Options	• unicast A packet is 'unicast' if the destination address is unicast and it matches an entry in the FIB • unknown-unicast A packet is 'unknown-unicast' if the destination address is unicast but it doesn't match any entry in the FIB and is therefore conventionally flooded • multicast A packet is 'multicast' if the destination address is a multicast address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

On TD3 systems this includes multicast packets with a known destination/group address and multicast packets with an unknown destination/group address. On TD4 systems this only includes known multicast packets

- unknown-multicast

  Multicast packets with an unknown destination/group address

- broadcast

  A packet is 'broadcast' if the destination address is a broadcast address

Reference	qos buffer-management buffer-allocation-profile name *string*
Configurable	True
Platforms	7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7220 IXR-H5-32D, 7220 IXR-H5-64D, 7220 IXR-H5-64O, 7220 IXR-H5-64O-512, 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

lag-bundle-pending *boolean*

Description	True when the LAG bundle-id for this LAG sub-interface has not yet been allocated. A LAG bundle-id is a precondition for allocating voq-set and voq-connector-set on a LAG sub-interface; while this leaf reads true, voq-set-pending will also be empty because the downstream voq-set allocation is intentionally not attempted. Only meaningful on LAG sub-interfaces with per-subinterface queueing QoS configured; reads false on all other sub-interfaces.
Context	qos interfaces interface interface-id *string* output lag-bundle-pending *boolean*
Tree	lag-bundle-pending
Default	false
Configurable	False
Platforms	7250 IXR-X4, 7250 IXR-X4-OSFP

lag-system-port-pending *reference*

Description	List of member interfaces, related to this LAG sub-interface, where the LAG system-port resource has not yet been allocated. A LAG system-port is a precondition for allocating voq-set and voq-connector-set on a LAG sub-interface member; while a member appears here it will not appear in voq-set-pending because the downstream voq-set allocation is intentionally not attempted.
Context	qos interfaces interface interface-id *string* output lag-system-port-pending *reference*
Tree	lag-system-port-pending
Reference	interface name *string*
Configurable	False
Platforms	7250 IXR-X4, 7250 IXR-X4-OSFP

traffic-type *keyword*

Description The traffic type to which the WRED slope applies

Context qos interfaces interface interface-id *string* output queues queue queue-name *reference* active-queue-management wred-slope traffic-type *keyword* drop-probability *keyword* enable-ecn *boolean*

Options

- tcp

  Refers to IPv4/IPv6 packets with a protocol/next-header indicating a value of 6

- non-tcp

  Refers to all packets that are not IPv4/IPv6 packets with a protocol/next-header indicating a value of 6

- all

  Refers to all traffic, whether it is TCP or non-TCP

Configurable False

Platforms 7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7220 IXR-H5-32D, 7220 IXR-H5-64D, 7220 IXR-H5-64O, 7220 IXR-H5-64O-512, 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

drop-probability *keyword*

Description The drop probability to which the WRED slope applies

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context qos interfaces interface interface-id *string* output queues queue queue-name *reference* active-queue-management wred-slope traffic-type *keyword* drop-probability *keyword* enable-ecn *boolean*

Options

- low

  Traffic that should be dropped last when there is congestion. Internally this is traffic that is colored green

- medium

  Traffic that should be dropped before green traffic but after red traffic when there is congestion. Internally this is traffic that is colored yellow

- high

  Traffic that should be dropped first when there is congestion. Internally this is traffic that is colored red

- all

  All traffic, consisting of traffic marked low, medium and high drop-probability

Configurable False

Context qos policer-templates policer-template name *string* policer sequence-id *number* forwarding-class fc *reference* forwarding-type *keyword*

Tree forwarding-type

Options

- unicast

  A packet is 'unicast' if the destination address is unicast and it matches an entry in the FIB

- unknown-unicast

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A packet is 'unknown-unicast' if the destination address is unicast but it doesn't match any entry in the FIB and is therefore conventionally flooded

- multicast

  A packet is 'multicast' if the destination address is a multicast address

  On TD3 systems this includes multicast packets with a known destination/group address and multicast packets with an unknown destination/group address. On TD4 systems this only includes known multicast packets

- unknown-multicast

  Multicast packets with an unknown destination/group address

- broadcast

  A packet is 'broadcast' if the destination address is a broadcast address

Description Enter the policers context

Configuration and state for global policers

A global policer is single-rate or dual-rate traffic meter that can be used to rate limit traffic by discarding or remarking non-compliant traffic. An instance of each global policer exists on every forwarding-complex and core of the system, whether traffic is directed to each instance or not.

Description A drop probability level within the FC for which a different remarking is desired

Context qos rewrite-rules mpls-traffic-class-policy name *string* map forwarding-class *reference* drop-probability drop-probability *keyword*

Options

- low

  Traffic that should be dropped last when there is congestion. Internally this is traffic that is colored green.

- medium

  Traffic that should be dropped before green traffic but after red traffic when there is congestion. Internally this is traffic that is colored yellow.

- high

  Traffic that should be dropped first when there is congestion. Internally this is traffic that is colored red.

Max. Elements	32

regex-mode *keyword*

Description	Mode used to parse the regular expression in every as-path-set-member of the as-path-set In ASN mode the AS path is converted to a string and the string is matched one complete AS number at a time. In character mode the AS path is converted to a string and the string is matched one character at a time.
Context	routing-policy as-path-set name *string* regex-mode *keyword*
Tree	regex-mode
Default	asn
Options	• asn ASN mode regular expression parsing • character Character mode regular expression parsing
Configurable	True
Platforms	Supported on all platforms

community-set name *string*

Description	List of BGP community sets containing standard, extended and large BGP communities
Context	routing-policy community-set name *string*
Tree	community-set
Configurable	True
Platforms	Supported on all platforms

name *string*

Description	A name used to identify the community set

Tree member

Options

- no-export

  Do not export NLRI received carrying this community outside the bounds of this autonomous system, or this confederation if the local autonomous system is a confederation member AS. This community has a value of 0xFFFFFF01.

- no-advertise

  All NLRI received carrying this community must not be advertised to other BGP peers. This community has a value of 0xFFFFFF02.

- no-export-subconfed

  All NLRI received carrying this community must not be advertised to external BGP peers - including over confederation sub-AS boundaries. This community has a value of 0xFFFFFF03.

Configurable True

Platforms Supported on all platforms

operation *keyword*

Description The type of operation for modifying the community attribute with the specified values

Context routing-policy policy name *string* default-action bgp standard-community operation *keyword*

Tree operation

Options

- add

  Add the specified communities to the existing community attribute

- remove

  Remove the specified communities from the existing community attribute

- replace

  Replace the existing community attribute with the specified communities

  If an empty set is specified, this removes the community attribute from the route.
