send-all

Description Send all valid paths for a single NLRI to add-paths capable peers, subject to next-hop diversity. A path is advertised if it is valid (next-hop resolvable, not rejected by export policy) and has a unique next-hop relative to better-ranked paths. The number of paths advertised may exceed the platform multipath limit. Intended for use on route reflectors and route servers where maximum path visibility is required.

inter-as-vpn *boolean*

Description When set to true, received EVPN routes that are not imported by any network-instance are retained in the BGP RIB and considered 'used' so that they can be propagated to any EBGP or IBGP peer.

This command supersedes the effect of keep-all-routes.

Context network-instance name *string* protocols bgp afi-safi afi-safi-name *identityref* evpn inter-as-vpn *boolean*

Tree inter-as-vpn

Default false

Configurable True

Platforms Supported on all platforms

keep-all-routes *boolean*

Description When this is set to true all received EVPN routes are retained in the RIB-IN, even those not imported by any network-instance; these routes display as 'rejected' and cannot be propagated to other peers.

When this is false, EVPN routes that are not imported by any network-instance are dropped and not retained in the BGP RIB-IN; policy changes affecting received EVPN routes will trigger the sending of ROUTE_ REFRESH messages towards all EVPN family peers.

max-wait-to-advertise *number*

Description The maximum amount of time, in seconds, measured from the time when the first session (configured or dynamic) that supports the address family comes up after a BGP restart, until BGP is allowed to advertise any routes in that address family to any peer

The value of this leaf must always be greater than or equal to the operational value of min-wait-to-advertise. The default value is 3x the value of min-wait-to-advertise. A value of 0 means the feature is disabled and there is no additional delay before advertising routes of the address family.

receive-ipv6-next-hops *boolean*

Description	Enables the advertisement of the RFC 8950 capability to receive IPv4 routes with IPv6 next-hops When set to true, BGP advertises an extended NH encoding (RFC 8950) capability to its peers. This capability indicates that local router is prepared to accept BGP routes for the AFI/SAFI with IPv6 next-hops from peers in the scope of the command. When set to false, BGP handles received AFI/SAFI routes with IPv6 next-hops as an error and applies treat-as-withdraw.

max-wait-to-advertise *number*

Description	The maximum amount of time, in seconds, measured from the time when the first session (configured or dynamic) that supports the address family comes up after a BGP restart, until BGP is allowed to advertise any routes in that address family to any peer The value of this leaf must always be greater than or equal to the operational value of min-wait-to-advertise. The default value is 3x the value of min-wait-to-advertise. A value of 0 means the feature is disabled and there is no additional delay before advertising routes of the address family.

receive-ipv6-next-hops *boolean*

Description	Enables the advertisement of the RFC 8950 capability to receive IPv4 routes with IPv6 next-hops When set to true, BGP advertises an extended NH encoding (RFC 8950) capability to its peers. This capability indicates that local router is prepared to accept BGP routes for the AFI/SAFI with IPv6 next-hops from peers in the scope of the command. When set to false, BGP handles received AFI/SAFI routes with IPv6 next-hops as an error and applies treat-as-withdraw.

Tree convergence-state

Options

- waiting

  BGP has recently restarted and no sessions have re-established yet

- started

  BGP has recently restarted and at least one session has re-established with support of the address family

- partial

  BGP has recently restarted and at least one session has advertised an End-of-RIB marker for the address family.

- timeout

  BGP has recently restarted and not all non-slow peers advertised an End-of-RIB marker for the address family before the max-wait-to-advertise timer expired

- converged

  All non-slow peers that support the address family have have advertised the End-of-RIB marker for the address family

Configurable False

Platforms 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

max-wait-to-advertise *number*

Description The maximum amount of time, in seconds, measured from the time when the first session (configured or dynamic) that supports the address family comes up after a BGP restart, until BGP is allowed to advertise any routes in that address family to any peer

The value of this leaf must always be greater than or equal to the operational value of min-wait-to-advertise. The default value is 3x the value of min-wait-to-advertise. A value of 0 means the feature is disabled and there is no additional delay before advertising routes of the address family.

Context network-instance name *string* protocols bgp afi-safi afi-safi-name *identityref* l3vpn-ipv4-unicast convergence max-wait-to-advertise *number*

receive-ipv6-next-hops *boolean*

Description Enables the advertisement of the RFC 8950 capability to receive IPv4 routes with IPv6 next-hops

When set to true, BGP advertises an extended NH encoding (RFC 8950) capability to its peers. This capability indicates that local router is prepared to accept BGP routes for the AFI/SAFI with IPv6 next-hops from peers in the scope of the command. When set to false, BGP handles received AFI/SAFI routes with IPv6 next-hops as an error and applies treat-as-withdraw.

max-wait-to-advertise *number*

Description	The maximum amount of time, in seconds, measured from the time when the first session (configured or dynamic) that supports the address family comes up after a BGP restart, until BGP is allowed to advertise any routes in that address family to any peer The value of this leaf must always be greater than or equal to the operational value of min-wait-to-advertise. The default value is 3x the value of min-wait-to-advertise. A value of 0 means the feature is disabled and there is no additional delay before advertising routes of the address family.
Context	network-instance name *string* protocols bgp afi-safi afi-safi-name *identityref* l3vpn-ipv6-unicast convergence max-wait-to-advertise *number*

inter-as-vpn *boolean*

Description	When set to true, received VPN-IPv6 routes that are not imported by any network-instance are retained in the BGP RIB and considered 'used' so that they can be propagated to any EBGP or IBGP peer. This command supersedes the effect of keep-all-routes. This command triggers the programming of a VPN label swap operation for each received VPN-IPv6 route.
Context	network-instance name *string* protocols bgp afi-safi afi-safi-name *identityref* l3vpn-ipv6-unicast inter-as-vpn *boolean*

keep-all-routes *boolean*

Description When this is set to true all received VPN-IPv6 routes are retained in the RIB-IN, even those not imported by any network-instance; these routes display as 'rejected' and cannot be propagated to other peers

When this is false, VPN-IPv6 routes that are not imported by any network-instance are dropped and not retained in the BGP RIB-IN; policy changes affecting received VPN-IPv6 routes will trigger the sending of ROUTE_ REFRESH messages towards all VPN-IPv6 family peers.

Context network-instance name *string* protocols bgp afi-safi afi-safi-name *identityref* l3vpn-ipv6-unicast keep-all-routes *boolean*

admin-state *keyword*

Description Enable or disable origin validation for this AFI-SAFI at the BGP instance level

Enabling here does not automatically enable origin validation at the peer-group or neighbor level. Each scope requires explicit admin-state enable configuration. This is consistent with SR OS behavior and is an intentional deviation from the standard SR Linux configuration inheritance model.

Defaults to disable. Origin validation is explicitly opt-in per address family.

origin-invalid-unusable *boolean*

Description	Treat routes with invalid origin-validation-state as unusable When set to true, routes whose origin-validation-state is invalid are excluded from best path selection and are not used for forwarding. The routes remain in the RIB-IN for visibility but are marked unusable. This is the enforcement mode for RPKI origin validation. It is recommended to deploy with compare-origin-validation-state first in monitoring mode before enabling this knob.

transport-network-instance *reference*

Description	Network-instance used for TCP transport to the BMP collector. When configured, the TCP connection to the collector is established in this network-instance instead of the network-instance where BMP is configured. This enables out-of-band collector reachability via the management network-instance (e.g. mgmt). If not specified, the parent network-instance is used.

convergence

Description Enter the convergence context

Options for configuring address family independent BGP convergence parameters

Context network-instance name *string* protocols bgp convergence

Tree convergence

Configurable True

Platforms Supported on all platforms

min-wait-to-advertise *number*

Description The minimum amount of time, in seconds, measured from the moment when the first session (configured or dynamic) comes up after a BGP restart, until BGP is allowed to advertise any routes to any peer

The sessions that are established when this timer expires determines the set of peers from which EOR is expected in order to declare convergence for an address family. A value of 0 means the feature is disabled and all routes are advertised immediately.

Tree	accept
Configurable	True
Platforms	Supported on all platforms

match prefix *(ipv4-prefix | ipv6-prefix)*

Description	List of prefix and group-id combinations from which incoming TCP connections to port 179 will be accepted An incoming TCP connection to port 179 is matched to a list entry if: (a) the source IP does not match a configured BGP neighbor address (b) the list entry prefix is the longest prefix match of the source IP. (c) the source IP is not an IPv6 link-local address associated with an (unnumbered) interface configured for dynamic-neighbor sessions.

interface-name *string*

Description	Reference to a specific subinterface of the form <interface-name>.<subinterface-index>

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The referenced subinterface should be enabled for IPv6 and should be configured to accept and send IPv6 router advertisement messages. The referenced subinterface does not need any IPv4 addresses or global-unicast IPv6 addresses (i.e. it can be an unnumbered interface).

When a subinterface is present in this list, incoming TCP connections to the BGP well-known port that are received on this subinterface and sourced from an IPv6 link local address and destined for the IPv6 link local address of the subinterface are automatically accepted.

When a subinterface is present in this list, received IPv6 router advertisement messages on this subinterface automatically trigger BGP session setup towards the sender of these messages, if there is not already an established session.

Context network-instance name *string* protocols bgp dynamic-neighbors interface interface-name *string*

keep-withdrawn-routes

Description	Configure retention of malformed routes that have been treat-as-withdraw. Per RFC 7606 treat-as-withdraw semantics, when an UPDATE message contains a malformed route, the route is treated as if it had been withdrawn. When this container is present, such routes are retained in the peer for troubleshooting and post-mortem analysis instead of being discarded. The retained entries are accessible via state and do not influence route selection or advertisement.
Context	network-instance name *string* protocols bgp error-handling keep-withdrawn-routes
Tree	keep-withdrawn-routes
Configurable	True

send-all

Description Send all valid paths for a single NLRI to add-paths capable peers, subject to next-hop diversity. A path is advertised if it is valid (next-hop resolvable, not rejected by export policy) and has a unique next-hop relative to better-ranked paths. The number of paths advertised may exceed the platform multipath limit. Intended for use on route reflectors and route servers where maximum path visibility is required.

Platforms 7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7220 IXR-H5-32D, 7220 IXR-H5-64D, 7220 IXR-H5-64O, 7220 IXR-H5-64O-512, 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

default-export-policy *keyword*

Description Procesing to apply to BGP routes in the local RIB not matching any of the listed peer export policies

The default depends on context. For IBGP peers the default is `accept`. For EBGP peers the default depends on the setting for `export-reject-all`. Note that default-export-policy does not have any control over maintenance-mode policy results and it also does not apply to imported, non-BGP routes; to advertise imported routes they must be matched and accepted by a peer export policy.

advertise-ipv6-next-hops *boolean*

Description Enables advertisement of EVPN routes with IPv6 next-hops to peers in the peer-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If this is set to true and the local-address used towards the peer is an IPv6 address and BGP is supposed to apply next-hop-self then the route is advertised with the IPv6 local-address as the BGP next-hop. If this is set to false, then the EVPN route is advertised with an IPv4 next-hop.

Context network-instance name *string* protocols bgp group group-name *string* afi-safi afi-safi-name *identityref* evpn advertise-ipv6-next-hops *boolean*

Tree advertise-ipv6-next-hops

Configurable True

Platforms Supported on all platforms

default-received-encapsulation *keyword*

Description Indicates the encapsulation considered when the routes are received without BGP encapsulation extended community

Most EVPN routes are usually received with a BGP encapsulation extended community that indicates the encapsulation and therefore how to interpret the value in the received Label fields of the routes. If no encapsulation is received, BGP will validate the route as MPLS or VXLAN or SRv6 depending on how this command is configured.

receive-ipv6-next-hops *boolean*

Description	Enables the advertisement of the RFC 8950 capability to receive IPv4 routes with IPv6 next-hops When set to true, BGP advertises an extended NH encoding (RFC 8950) capability to its peers. This capability indicates that local router is prepared to accept BGP routes for the AFI/SAFI with IPv6 next-hops from peers in the scope of the command. When set to false, BGP handles received AFI/SAFI routes with IPv6 next-hops as an error and applies treat-as-withdraw.

add-next-hop-count-to-received-bgp-routes *(number | keyword)*

Description Determines the weight that is internally added to the received PE-CE BGP routes

The configured weight is added to all received BGP PE-CE routes for the purpose of EVPN unequal ECMP. This weight is internal and not added into any link-bandwidth extended community when readvertising the received routes to other ipv4 or ipv6 neighbors.

Context network-instance name *string* protocols bgp group group-name *string* afi-safi afi-safi-name *identityref* ipv4-unicast link-bandwidth add-next-hop-count-to-received-bgp-routes *(number | keyword)*

add-next-hop-count-to-received-bgp-routes *(number | keyword)*

Description Determines the weight that is internally added to the received PE-CE BGP routes

The configured weight is added to all received BGP PE-CE routes for the purpose of EVPN unequal ECMP. This weight is internal and not added into any link-bandwidth extended community when readvertising the received routes to other ipv4 or ipv6 neighbors.

Context network-instance name *string* protocols bgp group group-name *string* afi-safi afi-safi-name *identityref* ipv6-unicast link-bandwidth add-next-hop-count-to-received-bgp-routes *(number | keyword)*

receive-ipv6-next-hops *boolean*

Description Enables the advertisement of the RFC 8950 capability to receive IPv4 routes with IPv6 next-hops

When set to true, BGP advertises an extended NH encoding (RFC 8950) capability to its peers. This capability indicates that local router is prepared to accept BGP routes for the AFI/SAFI with IPv6 next-hops from peers in the scope of the command. When set to false, BGP handles received AFI/SAFI routes with IPv6 next-hops as an error and applies treat-as-withdraw.

admin-state *keyword*

Description

Enable or disable origin validation for this peer-group AFI-SAFI

When enabled, routes received from neighbors explicitly configured with origin validation enabled for this address family are validated against the local ROA database.

Enabling at the peer-group level does not automatically enable origin validation for member neighbors. Each neighbor requires explicit admin-state enable at the neighbor AFI-SAFI level. This is consistent with SR OS behavior.

Defaults to disable. Origin validation is explicitly opt-in per scope per address family.

keep-withdrawn-routes

Description Configure retention of malformed routes that have been treat-as-withdraw.

Per RFC 7606 treat-as-withdraw semantics, when an UPDATE message contains a malformed route, the route is treated as if it had been withdrawn. When this container is present, such routes are retained in the peer for troubleshooting and post-mortem analysis instead of being discarded.

The retained entries are accessible via state and do not influence route selection or advertisement.

max-entries-per-neighbor *number*

Description	Maximum number of malformed treat-as-withdraw entries retained per neighbor. Once this limit is reached, new arrivals are no longer retained. If the limit is later lowered below the current retained count, the oldest entries are evicted until the count fits within the new limit. An extra entry is created for every update message containing the malformed route.

local-address *(ipv4-address | ipv6-address | subinterface-all)*

Description	The local TCP endpoint of used for all BGP sessions in the group This also the source address for next-hop-self, if it applies. The local-address can be specified as an IP address that is resolvable to a local interface. This address must be the primary address of an interface, otherwise the session will not come up.
Context	network-instance name *string* protocols bgp group group-name *string* transport local-address *(ipv4-address | ipv6-address | subinterface-all)*
Tree	local-address
String Length	5 to 27
Configurable	True
Platforms	Supported on all platforms

mtu-discovery *boolean*

Description	Turns path mtu discovery for BGP TCP sessions on (true) or off (false)
Context	network-instance name *string* protocols bgp group group-name *string* transport mtu-discovery *boolean*

send-all

Description Send all valid paths for a single NLRI to add-paths capable peers, subject to next-hop diversity. A path is advertised if it is valid (next-hop resolvable, not rejected by export policy) and has a unique next-hop relative to better-ranked paths. The number of paths advertised may exceed the platform multipath limit. Intended for use on route reflectors and route servers where maximum path visibility is required.

default-export-policy *keyword*

Description Procesing to apply to BGP routes in the local RIB not matching any of the listed peer export policies

The default depends on context. For IBGP peers the default is `accept`. For EBGP peers the default depends on the setting for `export-reject-all`. Note that default-export-policy does not have any control over maintenance-mode policy results and it also does not apply to imported, non-BGP routes; to advertise imported routes they must be matched and accepted by a peer export policy.

receive-ipv6-next-hops *boolean*

Description	Enables the advertisement of the RFC 8950 capability to receive IPv4 routes with IPv6 next-hops When set to true, BGP advertises an extended NH encoding (RFC 8950) capability to its peers. This capability indicates that local router is prepared to accept BGP routes for the AFI/SAFI with IPv6 next-hops from peers in the scope of the command. When set to false, BGP handles received AFI/SAFI routes with IPv6 next-hops as an error and applies treat-as-withdraw.

Configurable	True
Platforms	Supported on all platforms

warning-threshold-pct *number*

Description	A percentage of the max-received-routes limit that sets the threshold when BGP raises a warning log event
Context	network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* afi-safi afi-safi-name *identityref* ipv4-unicast prefix-limit-received warning-threshold-pct *number*
Tree	warning-threshold-pct
Range	0 to 100
Configurable	True
Platforms	Supported on all platforms

receive-ipv6-next-hops *boolean*

Description	Enables the advertisement of the RFC 8950 capability to receive IPv4 routes with IPv6 next-hops When set to true, BGP advertises an extended NH encoding (RFC 8950) capability to its peers. This capability indicates that local router is prepared to accept BGP routes for the AFI/SAFI with IPv6 next-hops from peers in the scope of the command. When set to false, BGP handles received AFI/SAFI routes with IPv6 next-hops as an error and applies treat-as-withdraw.
Context	network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* afi-safi afi-safi-name *identityref* ipv4-unicast receive-ipv6-next-hops *boolean*

receive-ipv6-next-hops *boolean*

Description	Enables the advertisement of the RFC 8950 capability to receive IPv4 routes with IPv6 next-hops When set to true, BGP advertises an extended NH encoding (RFC 8950) capability to its peers. This capability indicates that local router is prepared to accept BGP routes for the AFI/SAFI with IPv6 next-hops from peers in the scope of the command. When set to false, BGP handles received AFI/SAFI routes with IPv6 next-hops as an error and applies treat-as-withdraw.

admin-state *keyword*

Description Enable or disable origin validation for this neighbor AFI-SAFI

When enabled, routes received from this neighbor for this address family are validated against the local ROA database and the origin-validation-state is set on each received route.

This leaf is independently evaluated and is not inherited from the peer-group or BGP instance level. Explicit configuration is required at this level regardless of peer-group settings. This is consistent with SR OS behavior.

Defaults to disable. Primarily intended for EBGP sessions; enablement on IBGP sessions is not blocked but is not the typical deployment model.

Context network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* afi-safi afi-safi-name *identityref* origin-validation admin-state *keyword*

remove-private-as

Description Container with options for removing private AS numbers (2-byte and 4-byte) from the advertised AS path towards all peers

Context network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* as-path-options remove-private-as

Tree remove-private-as

Configurable True

Platforms Supported on all platforms

ignore-peer-as *boolean*

Description If set to true then do not delete or replace a private AS number that is the same as the peer AS number

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* as-path-options remove-private-as ignore-peer-as *boolean*
Tree	ignore-peer-as
Default	false
Configurable	True
Platforms	Supported on all platforms

leading-only *boolean*

Description	If set to true then only delete or replace private AS numbers that appear before the first occurrence of a non-private ASN in the sequence of most recent ASNs in the AS path
Context	network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* as-path-options remove-private-as leading-only *boolean*
Tree	leading-only
Default	false
Configurable	True
Platforms	Supported on all platforms

mode *keyword*

Description	The method by which private AS numbers are removed from the advertised AS_PATH attribute
Context	network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* as-path-options remove-private-as mode *keyword*
Tree	mode
Options	• disabled Do not strip or replace any private AS numbers • delete Delete private AS numbers, shortening the AS path • replace Replace private AS numbers with the local AS number used towards the peer, maintaining the AS path length
Configurable	True
Platforms	Supported on all platforms

keep-withdrawn-routes

Description	Configure retention of malformed routes that have been treat-as-withdraw. Per RFC 7606 treat-as-withdraw semantics, when an UPDATE message contains a malformed route, the route is treated as if it had been withdrawn. When this container is present, such routes are retained in the peer for troubleshooting and post-mortem analysis instead of being discarded. The retained entries are accessible via state and do not influence route selection or advertisement.
Context	network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* error-handling keep-withdrawn-routes
Tree	keep-withdrawn-routes
Configurable	True

max-entries-per-neighbor *number*

Description	Maximum number of malformed treat-as-withdraw entries retained per neighbor. Once this limit is reached, new arrivals are no longer retained. If the limit is later lowered below the current retained count, the oldest entries are evicted until the count fits within the new limit. An extra entry is created for every update message containing the malformed route.
Context	network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* error-handling keep-withdrawn-routes max-entries-per-neighbor *number*

  Start event on the passive peering side (incoming connection)
- parseError
  Failed to parse a received BGP protocol message
- outOfMemory

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

BGP processing failed due to insufficient memory

- rtmLimitExceed

  Route or prefix limit enforced by the routing table manager was exceeded

- outOfProtNHIndex

  No protected next-hop index available for BGP route installation

- outOfNHIndex

  No next-hop index available for BGP route installation

- labelAllocFailed

  MPLS label allocation failed for BGP-learnt routes

- lspIdAllocFailed

  LSP identifier allocation failed for BGP-learnt routes

- collisionResolution

  BGP connection collision resolution terminated this session

- adminShutdown

  Administrative shutdown of the BGP session (for example cease/ administrative shutdown)

- adminReset

  Administrative reset of the BGP session

- configChange

  Configuration change required the BGP session to be re-established

- maxPrefixExceed

  Configured maximum-prefix threshold for the peer was exceeded

- maxPfxExcdLog

  Maximum-prefix threshold exceeded and logged without necessarily resetting the session

- trackingPolMismatch

  Peer was disabled due to a peer-tracking policy mismatch

- receivedMalformedAttr

  A received BGP path attribute was malformed

- adminResetHard

  Hard administrative reset of the BGP session

- peerDamping

  Peer temporarily placed in idle hold due to flap damping (RFC 4271)

- trackingDown

  BGP session ended because peer tracking detected a reachability failure

- bfdDown

  BGP session ended because the associated BFD session went down

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- fibResourceFail

  BGP session ended because a route could not be installed (for example FIB or RTM resource failure)
- bfdUp

  BFD session associated with the BGP peer transitioned to the up state

Configurable False

Platforms Supported on all platforms

last-established *string*

Description The time when the session last transitioned into or out of the established state

Uptime or downtime of the session can be calculated from this state.

prefix *(ipv4-prefix | ipv6-prefix)*

Description Prefix carried by this NLRI, when BGP was able to parse it and the address family maps onto a plain IP prefix (ipv4-unicast, ipv6-unicast and the labeled variants). Absent for UPDATE-level malformations, for AFI/SAFIs whose NLRI is opaque from the IP-prefix point of view (evpn, mvpn, flowspec, link-state, l2vpn, mdt, srte, vpn-ipv*, route-target-constrain, mcast-* and multi-segment pseudowire - those entries carry their wire NLRI via nlri-length / nlri-hex instead), and for entries whose AFI/SAFI could not be resolved.

Context network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* malformed-updates entry afi-safi *keyword* sequence-number *number* entry-id *number* prefix *(ipv4-prefix | ipv6-prefix)*

raw-update-hex *string*

Description Copy of the raw UPDATE bytes, rendered as plain (no-separator) lowercase hex chunks. The total byte stream is split into chunks of up to 128 bytes (256 hex characters) each; the full UPDATE can be reconstructed by concatenating the chunks in list order, and its total length is reported via raw-update-length. The list caps at 32 elements (4096 source bytes).

- disable

Configurable True

Platforms Supported on all platforms

maximum-hops *number*

Description This sets the maximum number of routing hops towards the peer. It determines the IP TTL value in originated BGP TCP/IP packets. By default the TTL is set to 1 towards an EBGP peer and 64 towards an IBGP peer.

This overrides the group setting for maximum-hops.

Context network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* multihop maximum-hops *number*

Tree maximum-hops

Range 1 to 255

Configurable True

Platforms Supported on all platforms

next-hop-self *boolean*

Description When set to true, the next-hop in all IPv4-unicast, IPv6-unicast and EVPN BGP routes advertised to the peer, if IBGP, is set equal to the local-address used on this session (or to the router ID if the NLRI is IPv6 and there is no IPv6 local address to use). This is independent of the route origin (EBGP, IBGP-client, IBGP-non-client or redistributed direct/static/aggregate route).

When set to false, normal BGP rules from RFC 4271 apply.

Context network-instance name *string* protocols bgp neighbor peer-address *(ipv4-address-with-zone | ipv6-address-with-zone)* next-hop-self *boolean*

rpki

Description	RPKI configuration for BGP origin validation

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Contains RPKI-RTR cache server session management and statically configured ROA entries. RPKI is only supported in the default network-instance.

The ROA database and origin-validation operational state are maintained under BGP (not inside this container) since BGP is the consumer of the database for validation decisions. See srl_nokia-bgp-origin-validation.yang for those elements.

roa-entries

Description Enter the roa-entries context

Aggregate ROA database view for this network-instance's RPKI configuration.

Contains one entry per (prefix, origin-as, max-prefix-length, source) tuple across all active RPKI-RTR cache-server sessions AND the statically configured static-roa entries. Walk order mirrors the panos merged ROA database: prefix key order across all sources.

Split by address family into ipv4 and ipv6 sub-containers so a query for one AFI never enumerates entries of the other, matching the ipv4/ipv6 split already used under .../session/<name>/roa-entries.

Per-session views remain available at .../session/<name>/roa-entries/{ipv4,ipv6}/roa-entry for gNMI subscribers that want per-session feeds; the aggregate view is what the operator-facing 'show ... rpki roa-database ipv{4,6}' command consumes.

session *string*

Description Session that provided this ROA entry, or the reserved sentinel '--' when the entry came from the static-roa configuration list. Static entries have no owning session; the '--' sentinel makes each combination of (prefix, origin-as, max-prefix-length, source) a distinct list key. Session names that would collide with the sentinel are rejected at configuration time by a must-constraint on rpki-session-config/name.

session name *string*

Description RPKI-RTR cache server sessions

Up to 4 concurrent RPKI-RTR sessions are supported per network-instance. All established sessions contribute concurrently to the merged ROA database; there is no session preference or tie-break mechanism in this release.

The unique constraint on [cache-server network-instance] prevents configuring two sessions that reach the same cache server via the same network-instance, since such sessions would be functionally redundant and could double-count or conflict over the same ROA feed.

Context network-instance name *string* protocols bgp rpki session name *string*

admin-state *keyword*

Description Administrative state of this RPKI-RTR session

When set to disable, the TCP connection is torn down and no new connection attempts are made. The session enters the cleanup state and all ROA entries received from this cache server are immediately purged from the ROA database. The session transitions to idle once cleanup completes.

This differs from a session clear tools command, which also purges entries immediately but does not enter the cleanup state and triggers an automatic reconnect attempt.

network-instance *reference*

Description Network-instance used to route the TCP connection to the cache server

Allows the cache server TCP connection to be established via a different network-instance than the one where BGP is running. A common deployment is to reach the RPKI cache server via the management network-instance (type ip-vrf) while BGP runs in the default network-instance.

Only network-instances of type default or ip-vrf are permitted.

Defaults to 'default' so the [cache-server network-instance] uniqueness constraint on the session list is well-defined even when this leaf is left unconfigured.

roa-entries

Description	Enter the roa-entries context Per-session ROA entry table for this RPKI-RTR cache server Contains the authoritative per-session view of ROA records received from this cache server. This container is a sibling of the session state leaves, not a child of a state container. This separation ensures that queries for session

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

summary state do not enumerate potentially hundreds of thousands of ROA entries inline, consistent with the BGP per-peer rib pattern.

The container is split by address family into ipv4 and ipv6 sub-containers. Each sub-container holds only the entries of its family and uses an AFI-specific prefix key type, so a query targeting one family never traverses entries of the other. This mirrors the ipv4-unicast / ipv6-unicast split used in the IP route tables.

Static ROA entries are not present in this container; they are visible in the static-roa configuration list. A consolidated view of the full ROA database is obtained by reading the static-roa configuration list first, followed by the ipv4 and ipv6 roa-entry lists under each session sequentially. This reflects the internal per-session storage architecture and is consistent with SR OS.

stale-time *number*

Description

Duration that ROA entries remain valid after the session goes down

When the RPKI-RTR session is lost, all ROA entries received from this cache server are marked stale. If the session is not re-established before stale-time expires, the stale entries are purged from the ROA database and affected BGP routes are re-evaluated.

The extended upper range of 262144 seconds (approximately 3 days) provides resilience during prolonged cache server outages, preventing premature removal of ROA data that would cause valid routes to transition to not-found.

last-update-time *string*

Description Time elapsed since the last ROA database update was received from this cache server

Updated on receipt of every End-of-Data PDU from the cache server, including responses to periodic serial queries that contain no data changes. This means the timestamp advances even when no ROA entries were added or deleted, reflecting that the cache server has confirmed the local database is current as of that serial number.

Not present if no End-of-Data PDU has been received in the current session lifetime.

roa-entries-active *number*

Description	Number of ROA entries from this cache server currently present in the session's entry table, including stale entries whose stale-time has not yet expired This counter remains non-zero while a session is down but entries have not been purged. It reaches zero only after stale-time expires and all entries are removed, or after an explicit tools roa-database clear-by-session operation. When compared with roa-entries-received, a value of roa-entries-active greater than roa-entries-received indicates entries being held stale pending session re-establishment. Under normal operation with a healthy synchronized session the two values are equal.
Context	network-instance name *string* protocols bgp rpki session name *string* state roa-entries-active *number*
Tree	roa-entries-active
Configurable	False
Platforms	7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7220 IXR-H5-32D, 7220 IXR-H5-64D, 7220 IXR-H5-64O, 7220 IXR-H5-64O-512, 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

roa-entries-received *number*

Description	Net number of ROA entries asserted by this cache server at the time the session connection was last lost Incremented as IPv4 Prefix and IPv6 Prefix PDUs with flag announce are processed. Decremented when delete announcements are processed during the session lifetime. Reset to zero when the session connection goes down. This gives the counter diagnostic value: while the session is down, roa-entries-active remains non-zero (showing stale entries still held) while roa-entries-received is zero, making the difference immediately visible as the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

stale entry count. When the session is established and synchronized, both counters are equal.

Provides per-cache accountability for telemetry without requiring enumeration of the full ROA database in YANG state.

session-state *keyword*

Description Current operational state of the RPKI-RTR session

Reflects the state machine defined in RFC 6810: idle (no connection), connect (TCP in progress), up (session established and exchanging data), error (protocol error encountered).

Context network-instance name *string* protocols bgp rpki session name *string* state session-state *keyword*

Tree session-state

Options

- idle

  Session is not established and no connection attempt is in progress
- connect

  Session is attempting to establish a TCP connection to the cache server
- up

  Session is established and exchanging data with the cache server
- error

  Session has encountered a protocol error
- cleanup

  Session is administratively disabled and stale entries are being purged from the ROA database.

  The session remains in cleanup until all ROA entries received from this cache server have been removed. A subsequent admin-state enable will not initiate a new connection attempt until cleanup completes. If the same cache-server and network-instance combination is assigned to another session, that session waits for this cleanup to finish before attempting its first connection.

errors *number*

Description Total RPKI-RTR error PDUs encountered on this session

Includes error PDUs received from the cache server and error PDUs generated locally due to protocol violations detected on this router.

Certain error PDU types mandate session teardown per RFC 8210 section 10. An increment of this counter may therefore be correlated with a session-state transition to error or cleanup.

TCP-level connection failures are not reflected in this counter; those are captured in connection-attempts.

trace-options

Description Per-session debug trace options for RPKI-RTR PDU processing on this cache-server session

Configure either the aggregate 'all' leaf or one or more of the per-PDU 'flag' entries. The two forms are mutually exclusive at the schema level. Traced PDUs are logged at debug severity under the rpki logging subsystem identity; the rpki subsystem must separately be enabled at debug severity in /system/logging for traces to appear in a log file.

static-roa prefix *(ipv4-prefix | ipv6-prefix)* origin-as *number* max-prefix-length *number*

Description Statically configured ROA entries

Static entries are evaluated alongside dynamic entries received from RPKI-RTR cache servers. When a static entry and a dynamic entry exist for the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

same prefix and origin AS, the static entry takes precedence. Static entries are not subject to stale-time and are never automatically purged.

The composite key [prefix origin-as max-prefix-length] permits multiple static ROA entries for the same prefix provided they differ in origin-as or max-prefix-length. This supports multi-origin anycast and route transfer scenarios where a single prefix may be legitimately originated by more than one AS.

max-prefix-length is mandatory as a list key. A value equal to the prefix-length of the prefix leaf expresses a no-deaggregation ROA (exact-length match only).

mtu-discovery *boolean*

Description Turns path mtu discovery for BGP TCP sessions on (true) or off (false)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If this is unconfigured then the setting comes from network-instance/mtu/path-mtu-discovery.

Changing the value of network-instance/mtu/path-mtu-discovery takes effect only for new connections established after the change

Context network-instance name *string* protocols bgp transport mtu-discovery *boolean*

Tree mtu-discovery

Configurable True

Platforms 7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7220 IXR-H5-32D, 7220 IXR-H5-64D, 7220 IXR-H5-64O, 7220 IXR-H5-64O-512, 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

single-hop-connected-check *boolean*

Description Control whether a single-hop BGP session should be allowed to setup if its 'related interface' is down.

If single-hop-connected-check is false, a single-hop BGP session (EBGP or IBGP) to any IPv4 or IPv6 neighbor address is permitted to establish if there is ANY valid (IPv6 global unicast, IPv4 link-local, or IPv4 global) route to that neighbor address, regardless of whether the 'related interface' is up or down.

If single-hop-connected-check is true (default value), a single-hop BGP session (EBGP or IBGP) to any IPv4 or IPv6 neighbor address is only permitted to transition from idle to a higher state if the 'related interface' is up.

The 'related interface' of a single hop peer is the subinterface associated with the IPv6 link local neighbor address or else the subinterface with a primary or secondary IP address and prefix-length that covers the neighbor address.

ignore-mtu-mismatch *boolean*

Description	Configures whether MTU mismatches between received values on IMET routes and the local MAC-VRF MTU are ignored When set to true, the Layer-2 MTU carried in the Layer-2 Attributes extended community on IMET routes is not compared against the local MAC-VRF MTU. When set to false, an IMET route whose Layer-2 Attributes extended community reports an MTU that differs from the local MAC-VRF service MTU causes the EVPN destination toward that peer to be treated as non-viable. The inclusive multicast destination is not installed, unicast MACs learned from that peer are programmed as blackhole, and the evpnNetworkInstance MtuMismatch event is raised. This leaf has no effect when the Layer-2 Attributes extended community is not advertised or processed for this bgp-instance.

flow-label *boolean*

Description	Configures the use of flow-label for EVPN MPLS packets When set to true, the router signals the use of the Flow Aware Transport (FAT) label in the F flag of the Layer 2 attributes extended community sent

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

along with the EVPN routes (AD per EVI for VPWS or Inclusive Multicast Ethernet Tag route for MAC-VRF). For EVPN VPWS network instances, if the local and remote flags are set to 1 and match, the flow label is pushed at the bottom of the stack. On reception, the flow label is also expected and packets without it are dropped. If there is a mismatch between the local and remote F flags, the EVPN destination is removed.

On a mac-vrf, flow-label can only be enabled when advertise-l2-attributes-extended-community is true under routes/bridge-table/inclusive-mcast.

advertise-l2-attributes-extended-community *boolean*

Description Enables advertisement and processing of the Layer-2 Attributes extended community on IMET routes

When set to true, EVPN Inclusive Multicast Ethernet Tag (IMET) routes advertised by this MAC-VRF BGP-EVPN instance include the Layer-2 Attributes extended community. On reception of IMET routes that carry this extended community, BGP imports the routes based on the import route-target as usual. The system then compares the received Layer-2 Attributes extended community against the locally configured values and processes only matching routes.

vlan-aware-bundle-eth-tag *number*

Description Configures the Ethernet Tag ID to be encoded in the EVPN routes for control-plane interoperability mode with VLAN-aware bundle services.

When set to a non-zero value, all the EVPN routes advertised for the MAC-VRF will be advertised with this value into the ethernet-tag-id field of the routes.

On reception of EVPN routes with non-zero ethernet-tag-id, BGP will import the routes based on the import route-target as usual. However, the system checks the received ethernet-tag-id field and will process only those routes whose ethernet-tag-id match the local vlan-aware-bundle-eth-tag value.

admin-state *keyword*

Description Enable triggers the resolution of EVPN IFL routes GW-IP to EVPN-IFL-HOST routes

When set to enable, the router processes the GW-IP field in the EVPN-IFL routes, and tries to resolve the GW-IP to the next hops of the received EVPN-IFL-HOST (MAC/IP Advertisement routes with layer 3 information) routes that contain the GW-IP. If more than one EVPN-IFL-HOST route resolves the GW-IP of the EVPN-IFL route, the EVPN-IFL route is programmed with a next hop group that contains all the next hops of the EVPN-IFL-HOST routes. Weights are used to influence the load balancing when multiple EVPN-IFL-HOST routes resolving the IP Prefix come from the same next-hop.

admin-state *keyword*

Description Setting enable triggers weighted ECMP programming for all elegible multipath EVPN IFL routes

When set to enable, the router processes the evpn-link-bandwidth extended community when installing an ECMP set for an EVPN IP-Prefix route in the ip-vrf route table. Flows to an IP Prefix received with a weight and a zero-ESI are sprayed based on the weight. If the EVPN IP Prefix route received with the weight has a non-zero ESI, the weight is divided into the number of PEs attached to the Ethernet Segment (and rounded up if the result is not an integer). The command also enables the weighted ECMP functionality for BGP CEs that are configured with the parameter evpn-link-bandwidth add-weight-to-received-bgp-routes <weight>.

oper-state *keyword*

Description This leaf contains the operational state of bgp-instance.

Context network-instance name *string* protocols bgp-ipvpn bgp-instance id *reference* oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

  Component is offline due to insufficient system power
- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

allow-export

Description Allow re-export of EVPN IFL or VPN-IP routes

When this feature is enabled, received EVPN IFL routes or VPN-IP routes are re-exported to the configured BGP peers. In IP-VRF network instances that contain both a bgp-evpn and a bgp-ipvpn instance, EVPN IFL routes are automatically re-exported to the BGP-IPVPN instance without requiring this command. Similarly, IPVPN routes are automatically re-exported to the BGP-EVPN instance.

combined-ecmp

Description Combine BGP owners into the same ECMP set

When enabled, candidate BGP PE-CE routes and BGP VPN routes (EVPN IFL or VPN-IP) to the same prefix are combined into a single ECMP set. A single route with a combined next hop group is installed in the route table. If different BGP owners are combined and have different configured ecmp maximum values, the minimum of the maximum configured values is considered for the combined ECMP set.

admin-state *keyword*

Description Administratively enable or disable gRIBI support.

The enable setting only has an effect when the network-instance type is ip-vrf or default.

When this is set to disable all IP entries and next-hop-groups associated with the network-instance are deleted from the gRIBI server database and the recovery of this state depends on the gRIBI clients to re-signal all of the deleted entries. While in a disabled state, no entries are accepted for this network-instance. (This is the same behavior when the network-instance does not exist at all.)

Component is currently being synchronized

- upgrading

  Component is currently being upgraded

- low-power

  Component is offline due to insufficient system power

- degraded

  Component or process is in a degraded state

- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Component or process has failed

- synchronizing

  Component is currently being synchronized

- upgrading

  Component is currently being upgraded

- low-power

  Component is offline due to insufficient system power

- degraded

  Component or process is in a degraded state

- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

oper-state *keyword*

Description Used to report operational state of the IGMP instance

Context network-instance name *string* protocols igmp oper-state *keyword*

Tree oper-state

Options

- up

  Component or process is operational
- down

  Component or process is not operational
- empty

  Component slot is empty
- downloading

  Component is downloading image into memory
- booting

  Component is booting downloaded image
- starting

  Component image operational, application processes starting
- failed

  Component or process has failed
- synchronizing

  Component is currently being synchronized
- upgrading

  Component is currently being upgraded
- low-power

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Component is offline due to insufficient system power

- degraded

  Component or process is in a degraded state

- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.

- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

Configurable False

query-last-member-interval *number*

Description	Interval at which Group-Specific-Query packets are transmitted When used along with EVPN multi-homing, the result of this value multipled by the interface robust-count must be a value equal to or less than 25.5 seconds. This is due to the fact that the maximum response time field in the EVPN Multicast Leave Synch route has a limit of 255 units of 1/10 second, and this field encodes the result of [(query-last-member-interval* 10) * robust-count]. If the result of that operation is greater than 255, the maximum response time in the EVPN Multicast Leave Synch route is still 255.

robust-count *number*

Description	Tune IGMP robustness to allow for expected packet loss The robust-count variable allows tuning for the expected packet loss on a subnet. If a subnet anticipates losses, the robust-count variable can be increased. When used along with EVPN multi-homing, the result of this value multipled by the interface query-last-member-interval must be a value equal to or less than 25.5 seconds. This is due to the fact that the maximum response time field in the EVPN Multicast Leave Synch route has a limit of 255 units of 1/10 second, and this field encodes the result of [(query-last-member-interval* 10) * robust-count]. If the result of that operation is greater than 255, the maximum response time in the EVPN Multicast Leave Synch route is still 255.
Context	network-instance name *string* protocols igmp-snooping interface interface-name *string* robust-count *number*
Tree	robust-count
Range	2 to 10
Default	2
Configurable	True
Platforms	7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7250 IXR-10e-gen2cp, 7250 IXR-6e-gen2cp, 7250 IXR-X1B, 7250 IXR-X3B

router-alert-check *boolean*

Description	Enable or disable router alert checking for IGMP messages received on this interface

version *number*

Description The version of the protocol that is sent by this multicast router

Context network-instance name *string* protocols igmp-snooping multicast-routers address *string* version *number*

Tree version

Range 1 to 3

Configurable False

Platforms 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7250 IXR-10e-gen2cp, 7250 IXR-6e-gen2cp, 7250 IXR-X1B, 7250 IXR-X3B

oper-state *keyword*

Description Used to report operational state of the IGMP instance.

Context network-instance name *string* protocols igmp-snooping oper-state *keyword*

Tree oper-state

Options

- up
  Component or process is operational
- down
  Component or process is not operational
- empty
  Component slot is empty
- downloading
  Component is downloading image into memory
- booting
  Component is booting downloaded image
- starting
  Component image operational, application processes starting
- failed
  Component or process has failed
- synchronizing
  Component is currently being synchronized
- upgrading
  Component is currently being upgraded
- low-power
  Component is offline due to insufficient system power

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- degraded

  Component or process is in a degraded state
- warm-reboot

  Component or process is currently warm rebooting

  This state is set during a warm reboot immediately following initiation of the reboot, continuing after startup until the system has completed audit. In this state the system will not accept configuration changes.
- waiting

  Component or process is currently waiting

  This state can be set by event handler when the reinvoke-with-delay action is used, and indicates that the event handler is waiting for the provided delay before reinvoking the instance.

reference-bandwidth *number*

Description	Configures the reference bandwidth that provides the basis for interface metrics based on link bandwidth. If the reference bandwidth is defined, then the cost is calculated using the following formula: cost = reference-bandwidth / bandwidth When a large reference-bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, IS-IS automatically reverts to the maximum configurable cost metric. If the reference bandwidth is not configured then all interfaces have a default metric of 10. Note: To use metrics in excess of 63, wide metrics must be deployed
Context	network-instance name *string* protocols isis instance name *string* auto-cost reference-bandwidth *number*
Tree	reference-bandwidth
Range	1 to 8000000000
Units	kbps
Configurable	True
Platforms	Supported on all platforms

enable-csnp-on-p2p-links *boolean*

Description	Enable/disable the transmission of periodic CSNP PDUs on point-to-point interfaces When this is set to false, CSNP PDUs will only be sent on a P2P interface when the adjacency is initialized. This setting has no effect on broadcast interfaces.
Context	network-instance name *string* protocols isis instance name *string* enable-csnp-on-p2p-links *boolean*

hello-padding *keyword*

Description Specifies the use of IS-IS Hello PDU padding all interfaces

This can be overridden by interface configuration.

Context network-instance name *string* protocols isis instance name *string* hello-padding *keyword*

Tree hello-padding

Default disable

Options

- strict

  Strict padding option. Hello padding is done continuously, regardless of adjacency state or interface type.

- loose

  Loose padding option. On p2p interfaces hello PDUs are padded from the initial detection of a new neighbor until the adjacency transitions to the INIT state. On broadcast interfaces hello padding is done until there is at least one UP adjacency on the interface.

- adaptive

  Adaptive padding option. On p2p interfaces hello PDUs are padded until the sender declares the adjacency to be UP (based on 3-way handshake or the classic algorithm described in ISO 10589. If the p2p neighbor does not support the adjacency state TLV, then padding continues. On broadcast interfaces hello padding is done until there is at least one UP adjacency on the interface.

- disable

  This enum disables hello PDU padding

key

Description Enter the key context

Container to specify the secret key and crypto algorithm to use for the authentication of Hello PDUs on this interface

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	network-instance name *string* protocols isis instance name *string* interface interface-name *string* authentication key
Tree	key
Configurable	True
Platforms	Supported on all platforms

auth-password *string*

Description	The secret key to use for authentication of Hello PDUs
Context	network-instance name *string* protocols isis instance name *string* interface interface-name *string* authentication key auth-password *string*
Tree	auth-password
Configurable	True
Platforms	Supported on all platforms

crypto-algorithm *keyword*

Description	The cryptographic algorithm used with the keying material to secure the messages.
Context	network-instance name *string* protocols isis instance name *string* interface interface-name *string* authentication key crypto-algorithm *keyword*
Tree	crypto-algorithm
Options	• cleartext The authentication-key is encoded in plaintext. • hmac-md5 The authentication-key is used to generate a 16-byte (128 bit) MD5 digest using the HMAC algorithm (RFC 2104). • hmac-sha-256 The authentication-key is used to generate a SHA2 digest using the HMAC algorithm (RFC 2104).The SHA-256 variant of SHA2 produces an output of 32 bytes (256 bits).
Configurable	True
Platforms	Supported on all platforms

keychain *reference*

Description	Specifies a keychain to use for the authentication of Hello PDUs on this interface.

Tree	unidirectional-minimum-link-delay
Range	1 to 4294967295
Units	microseconds
Options	• none
Configurable	False
Platforms	7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

hello-padding *keyword*

Description	Specifies the use of IS-IS Hello PDU padding on the interface
Context	network-instance name *string* protocols isis instance name *string* interface interface-name *string* hello-padding *keyword*
Tree	hello-padding
Options	• strict Strict padding option. Hello padding is done continuously, regardless of adjacency state or interface type. • loose Loose padding option. On p2p interfaces hello PDUs are padded from the initial detection of a new neighbor until the adjacency transitions to the INIT state. On broadcast interfaces hello padding is done until there is at least one UP adjacency on the interface. • adaptive Adaptive padding option. On p2p interfaces hello PDUs are padded until the sender declares the adjacency to be UP (based on 3-way handshake or the classic algorithm described in ISO 10589. If the p2p neighbor does not support the adjacency state TLV, then padding continues. On broadcast interfaces hello padding is done until there is at least one UP adjacency on the interface. • disable This enum disables hello PDU padding
Configurable	True

sync-state *keyword*

Description The current state of the interface with respect to LDP-IGP sync

Context network-instance name *string* protocols isis instance name *string* interface interface-name *string* ldp-synchronization sync-state *keyword*

Tree sync-state

Options

- wait-for-LDP-adjacency

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The IGP is waiting for the LDP adjacency to come up. The interface is being advertised with max-metric

- hold-down-timer-active

  The LDP adjacency has come up and the IGP has started the hold-down-timer, waiting for either end-of-lib or hold-down-timer expiry. The interface is being advertised with max-metric

- end-of-lib-received

  The IGP received end-of-lib and has switched to normal operation. The interface is being aadveertised with a normal metric

- hold-down-timer-expired

  The IGP did not receive end-of-lib (or was configured to ignore it) but hold-down-timer has expired and normal metric is restored

- manual-exit

  A tools command was performed to exit ldp-sync. Normal operation is resumed, max-metric is removed

- disabled

  ldp-sync is not applicable on this interface

Configurable False

Tree hello-authentication

Configurable True

Platforms Supported on all platforms

check-received *keyword*

Description Specifies the type of authentication checks done for received PDUs of the specified type.

Context network-instance name *string* protocols isis instance name *string* interface interface-name *string* level level-number *number* authentication hello-authentication check-received *keyword*

Tree check-received

Options

- strict

  Strict authentication option. Reject all packets that do not have an authentication TLV or that do have an authentication TLV that cannot be validated.

- loose

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Loose authentication option. Accept packets received without an authentication TLV; validate packets received with an authentication TLV and reject those packets that cannot be validated.

- disable

  This enum disables athentication checks. Do not check authentication TLV (if any) of received PDUs; authentication TLV may still be added self-generated PDUs

Configurable True

Platforms Supported on all platforms

generate *boolean*

Description When set to true, IS-IS is instructed to add an authentication TLV to every transmitted PDU of the specified type

Context network-instance name *string* protocols isis instance name *string* interface interface-name *string* level level-number *number* authentication hello-authentication generate *boolean*

lsp-pacing-interval *number*

Description

Controls the interval between (bursts of) LSPs sent from the interface. The interval applies to all LSPs: LSPs generated by the router, and LSPs received from other routers and re-flooded.

The burst interval is 100 ms if the lsp-pacing-interval < 100 ms and otherwise it is 1 second. For example, if the lsp-pacing-interval is 2 ms, at most 50 LSPs are sent every 100 ms. On the other hand, if the lsp-pacing-interval is 100 ms, at most 10 LSPs are sent every 1 second.

If a value of 0 is configured, no LSPs are sent from the interface.

The default pacing interval of 100 milliseconds means that a maximum of 10 LSPs are sent in a burst every second.

type *identityref*

Description	The type of TLV being described. The type of TLV is expressed as a canonical name.
Context	network-instance name *string* protocols isis instance name *string* level level-number *number* link-state-database lsp lsp-id *string* tlvs tlv type *identityref*
Options	• area-addresses ISIS TLV 1 • iis-neighbors ISIS TLV 2 • instance-id ISIS TLV 7 An Instance Identifier (IID) to uniquely identify an IS-IS instance. When the IID = 0, the list of supported ITIDs MUST NOT be present. An IID-TLV with IID = 0 MUST NOT appear in an SNP or LSP. When the TLV appears (with a non-zero IID) in an SNP or LSP, exactly one ITID. MUST be present indicating the topology with which the PDU is associated. If no ITIDs or multiple ITIDs are present or the IID is zero, then the PDU MUST be ignored • authentication ISIS TLV 10 • purge-oi ISIS TLV 13 If an IS generates a purge, it SHOULD include this TLV in the purge with its own system ID. If an IS receives a purge that does not include this TLV, then it SHOULD add this TLV with both its own system ID and the system ID of the IS from which it received the purge. This allows ISs receiving purges to log the system ID of the originator, or the upstream source of the purge. • lsp-buffer-size

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ISIS TLV 14. The maximum MTU that the advertising system can receive, expressed in bytes.

- extended-is-reachability

  ISIS TLV 22. An extended IS reachability TLV that has a different data structure to TLV 2 that introduces the use of sub-TLV object-group.

- is-neighbor-attribute

  ISIS TLV 23. Identical in format to TLV 22 and included in Original LSPs or Extended LSPs. Regardless of the type of LSP in which the TLVs appear, the information pertains to the neighbor relationship between the Originating System and the IS identified in the TLV

- isis-alias-id

  ISIS TLV 24. IS-Alias TLV which extension-capable ISs to recognize the Originating System of an Extended LSP set. It identifies the Normal system-id of the Originating System

- ipv4-internal-reachability

  ISIS TLV 128. TLV defines IP addresses within the routing domain reachable directly via one or more interfaces on this Intermediate system

- nlpid

  ISIS TLV 129. TLV defines the set Network Layer Protocol Identifiers for Network Layer protocols that this Intermediate System is capable of relaying

- ipv4-external-reachability

  ISIS TLV 130. TLV defines IP addresses outside the routing domain reachable via interfaces on this Intermediate system. This is permitted to appear multiple times, and in an LSP with any LSP number. However, this field must not appear in pseudonode LSPs

- ipv4-interface-addresses

  ISIS TLV 132. The IP address of one or more interfaces corresponding to the SNPAs enabled on this Intermediate system (i.e., one or more IP addresses of this router). This is permitted to appear multiple times, and in an LSP with any LSP number.

- ipv4-te-router-id

  ISIS TLV 134. Traffic Engineering router ID TLV that contains the 4-octet router ID of the router originating the LSP

- extended-ipv4-reachability

  ISIS TLV 135. Extended IP reachability TLV that provides for a 32-bit metric and adds one bit to indicate that a prefix has been redistributed _ down_ in the hierarchy

- dynamic-name

  ISIS TLV 137. The Dynamic hostname TLV is optional. This TLV may be present in any fragment of a non-pseudonode LSP. The value field identifies the symbolic name of the router originating the LSP. This

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

symbolic name can be the FQDN for the router, it can be a subset of the FQDN, or it can be any string operators want to use for the router.

- ipv4-srlg

  ISIS TLV 138. IPv4 Shared Risk Link Group TLV

- ipv6-srlg

  ISIS TLV 139. IPv6 Shared Risk Link Group

- ipv6-te-router-id

  ISIS TLV 140. The IPv6 TE Router ID TLV contains a 16-octet IPv6 address. A stable global IPv6 address MUST be used, so that the router ID provides a routable address, regardless of the state of a node's interfaces. If a router does not implement traffic engineering, it MAY include or omit the IPv6 TE Router ID TLV. If a router implements traffic engineering for IPv6, it MUST include this TLV in its LSP. This TLV MUST NOT be included more than once in an LSP.

- mt-isn

  ISIS TLV 222. TLV is aligned with extended IS reachability TLV type 22 beside an additional two bytes in front at the beginning of the TLV that. indicate MT membership.

- mt-is-neighbor-attribute

  ISIS TLV 223. It is identical in format to TLV 222. In the event that there is a need to advertise in Extended LSPs such information associated with neighbors of the Originating System, it is necessary to define new TLVs to carry the sub-TLV information.

- multi-topology

  ISIS TLV 229. This MT TLV can advertise up to 127 MTs. It is announced in IIHs and LSP fragment 0, and can occur multiple times. The resulting MT set SHOULD be the union of all the MT TLV occurrences in the packet. Any other IS-IS PDU occurrence of this TLV MUST be ignored. Lack of MT TLV in hellos and fragment zero LSPs MUST be interpreted as participation of the advertising interface or router in MT ID #0 only. If a router advertises MT TLV, it has to advertise all the MTs it participates in, specifically including topology ID #0 also.

- ipv6-interface-addresses

  ISIS TLV 232. IPv6 Interface Address TLV that maps directly to the IP Interface Address TLV in [RFC1195]. We necessarily modify the contents to be 0-15 16-octet IPv6 interface addresses instead of 0-63 4-octet IPv4 interface addresses

- mt-ipv4-reachability

  ISIS TLV 235. TLV is aligned with extended IP reachability TLV type 135 beside an additional two bytes in front to indicate MT membership

- ipv6-reachability

  ISIS TLV 236. The IPv6 Reachability TLV describes network reachability through the specification of a routing prefix, metric information, a bit to indicate if the prefix is being advertised down from a higher level, a bit to

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

indicate if the prefix is being distributed from another routing protocol, and OPTIONALLY the existence of Sub-TLVs to allow for later extension.

- mt-ipv6-reachability

  ISIS TLV 237. TLV is aligned with IPv6 Reachability TLV type 236 beside an additional two bytes in front to indicate MT membership.

- router-capability

  ISIS TLV 242. IS-IS TLV named CAPABILITY, formed of multiple sub-TLVs, which allows a router to announce its capabilities within an IS-IS level or the entire routing domain.

- srv6-locator

  ISIS TLV 27. A locator is a covering prefix for all SIDs provisioned on that node that have the matching topology/algorithm

Tree flags

Options

- external-flag

  External prefix flag. Set if the prefix has been redistributed from another protocol. This includes the case where multiple virtual routers are supported and the source of the redistributed prefix is another IS-IS instance.

- readvertisement-flag

  Readvertisement flag. Set when the prefix has been leaked from one level to another (upwards or downwards).

- node-flag

  Node flag. Set when the prefix identifies the advertising router, i.e., the prefix is a host prefix advertising a globally reachable address typically associated with a loopback address.

- elc-flag

  Elc flag. Set for local host prefix of the originating node if it supports ELC on all interfaces

- anycast-flag

  Anycast flag. Set if the prefix is anycast

router-id *string*

Description IPv4 Source router ID address. In cases where the advertisement is an identifier for the advertising router (e.g., with the N-flag set in the Prefix Attribute Flags sub-TLV), it may be useful for other routers to know the source of the advertisement. When reachability advertisement is leaked from one level to another, Router ID advertised is always the Router ID of the IS-IS instance that originated the advertisement. This would be true even if the prefix had been learned from another protocol.

router-id *string*

Description IPv6 Source router ID address.

In cases where the advertisement is an identifier for the advertising router (e.g., with the N-flag set in the Prefix Attribute Flags sub-TLV), it may be useful for other routers to know the source of the advertisement. When reachability advertisement is leaked from one level to another, Router ID advertised is always the Router ID of the IS-IS instance that originated the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

advertisement. This would be true even if the prefix had been learned from another protocol.

Tree flags

Options

- readvertisement

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Readvertisment flag. When set, the prefix to which this Prefix-SID is attached, has been propagated by the router either from another level or from redistribution.

- node

  Node flag. When set, the Prefix-SID refers to the router identified by the prefix. Typically, the N-Flag is set on Prefix-SIDs attached to a router loopback address.

- no-php

  Penultimate-Hop-Popping flag. When set, then the penultimate hop MUST NOT pop the Prefix-SID before delivering the packet to the node that advertised the Prefix-SID.

- explicit-null

  Explicit-Null flag. When set, any upstream neighbor of the Prefix-SID originator MUST replace the Prefix-SID with a Prefix-SID having an Explicit-NULL value (0 for IPv4 and 2 for IPv6) before forwarding the packet.

- value

  Value flag. When set, the Prefix-SID carries a value (instead of an index). By default the flag is UNSET.

- local

  Local flag. When set, the value/index carried by the Prefix-SID has local significance. By default the flag is UNSET.

up-down *boolean*

Description The up/down bit. Set if a prefix is advertised from a higher level to a lower level (e.g., level 2 to level 1), indicating that the prefix has traveled down the hierarchy. Prefixes that have the up/down bit set may only be advertised down the hierarchy, i.e., to lower levels. When a prefix is first injected into IS-IS, the bit is UNSET.

Tree flags

Options

- address-family

  Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.

- backup

  Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).

- value

  Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.

- local

  Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.

- set

  Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

metric *number*

Description This metric is administratively assigned and can be used to present a differently weighted topology to traffic engineering SPF calculations. To preclude overflow within a traffic engineering SPF implementation, all metrics greater than or equal to MAX_PATH_METRIC SHALL be considered to have a metric of MAX_PATH_METRIC.

bandwidth *number*

Description The available bandwidth on a link, forwarding adjacency, or bundled link with units of bytes per second. For a link or forwarding adjacency, available bandwidth is defined to be residual bandwidth minus the measured bandwidth used for the actual forwarding of non-RSVP-TE label switched path packets. For a bundled link, available bandwidth is defined to be the sum of the component link available bandwidths minus the measured bandwidth used for the actual forwarding of non-RSVP-TE label switched path packets. For a bundled link, available bandwidth is defined to be the sum of the component link available bandwidths.

flags *keyword*

Description Flags associated with LAN-Adj-Segment-ID.

Context network-instance name *string* protocols isis instance name *string* level level-number *number* link-state-database lsp lsp-id *string* tlvs tlv type *identityref* extended-is-reachability neighbors neighbor system-id *string* instances instance id *number* subtlvs subtlv type *identityref* lan-adjacency-sids lan-adjacency-sid value *number* flags *keyword*

Tree flags

Options

- address-family

  Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.

- backup

  Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).

- value

  Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.

- local

  Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.

- set

  Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

Configurable False

Platforms 7215 IXS-A1, 7220 IXR-D1, 7220 IXR-D2, 7220 IXR-D2L, 7220 IXR-D3, 7220 IXR-D3L, 7220 IXR-D4, 7220 IXR-D5, 7220 IXR-H2, 7220 IXR-H3, 7220 IXR-H4, 7220 IXR-H4-32D, 7220 IXR-H5-32D, 7220 IXR-H5-64D, 7220 IXR-H5-64O, 7220 IXR-H5-64O-512, 7220 IXR-H6-64, 7250 IXR-10, 7250 IXR-10e-gen2cp, 7250 IXR-10e-gen2cp-3, 7250 IXR-10e-gen3, 7250 IXR-18e-gen3, 7250 IXR-6, 7250 IXR-6e-gen2cp, 7250 IXR-6e-gen2cp-3, 7250 IXR-6e-gen3, 7250 IXR-X1B, 7250 IXR-X3B, 7250 IXR-X4, 7250 IXR-X4-OSFP

link-loss *number*

Description Link packet loss as a percentage of the total traffic sent over a configurable interval. The basic unit is 0.000003%, where (2^24 - 2) is 50.331642%. This value s the highest packet-loss percentage that can be expressed (the assumption being that precision is more important on high-speed links than the ability to advertise loss rates greater than this, and that high- peed links with over 50% loss are unusable). Therefore, measured values that are larger than the field maximum SHOULD be encoded as the maximum value.

Tree type

Options

- extra-traffic

  If set the link has extra traffic protection. If the link is of type Extra Traffic, it means that the link is protecting another link or links. The LSPs on a link of this type will be lost if any of the links it is protecting fail.

- unprotected

  If set, the link is unprotected. If the link is of type Unprotected, it means that there is no other link protecting this link. The LSPs on a link of this type will be lost if the link fails.

- shared

  If set, the link has shared protection. If the link is of type Shared, it means that there are one or more disjoint links of type Extra Traffic that are protecting this link. These Extra Traffic links are shared between one or more links of type Shared.

- one-one

  If set, the link has dedicated 1:1 protection. If the link is of type Dedicated 1:1, it means that there is one dedicated disjoint link of type Extra Traffic that is protecting this link.

- plus-one

  If set, the link has dedicated 1+1 protection. If the link is of type Dedicated 1+1, it means that a dedicated disjoint link is protecting this link. However, the protecting link is not advertised in the link state database and is therefore not available for the routing of LSPs.

- enhanced

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If set the link has enhanced protection. If the link is of type Enhanced, it means that a protection scheme that is more reliable than Dedicated 1+1, e.g., 4 fiber BLSR/MS-SPRING, is being used to protect this link.

bandwidth *number*

Description Residual bandwidth on a link,forwarding adjacency [RFC4206], or bundled link with units of bytes per second. For a link or forwarding adjacency, residual bandwidth is defined to be the Maximum Bandwidth [RFC5305] minus the bandwidth currently allocated to RSVP-TE label switched paths. For a bundled link, residual bandwidth is defined to be the sum of the component link residual bandwidths.

Tree flags

Options

- backup

  Backup flag. When set, the END.X SID refers to an adjacency being protected (e.g.: using TILFA)

- set

  Set flag. When set, the S-Flag indicates that the END.X SID refers to a set of adjacencies

- persistent

  Persistent flag. When set, the S-Flag indicates that the END.X SID is persistently allocated, i.e., the SID value remains consistent across router restart and/or interface flap

Tree flags

Options

- backup

  Backup flag. When set, the END.X SID refers to an adjacency being protected (e.g.: using TILFA)

- set

  Set flag. When set, the S-Flag indicates that the END.X SID refers to a set of adjacencies

- persistent

  Set flag. When set, the S-Flag indicates that the END.X SID is persistently allocated, i.e., the SID value remains consistent across router restart and/or interface flap

bandwidth *number*

Description The bandwidth utilization on a link, forwarding adjacency, or bundled link with units of bytes per second. For a link or forwarding adjacency, bandwidth utilization represents the actual utilization of the link (i.e., as measured by the advertising node). For a bundled link, bandwidth utilization is defined to be the sum of the component link bandwidth utilizations.

instance-id *number*

Description	An Instance Identifier (IID) to uniquely identify an IS-IS instance. When the IID = 0, the list of supported ITIDs MUST NOT be present. An IID-TLV with IID = 0 MUST NOT appear in an SNP or LSP. When the TLV appears (with a non-zero IID) in an SNP or LSP, exactly one ITID. MUST be present indicating the topology with which the PDU is associated. If no ITIDs or multiple ITIDs are present or the IID is zero, then the PDU MUST be ignored.

metric *number*

Description ISIS default metric value

This is a metric understood by every Intermediate system in the domain. Each circuit shall have a positive integral value assigned for this metric. The value may be associated with any objective function of the circuit, but by convention is intended to measure the capacity of the circuit for handling traffic, for example, its throughput in bits-per-second. Higher values indicate a lower capacity.

up-down *boolean*

Description The up/down bit

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Set if a prefix is advertised from a higher level to a lower level (e.g., level 2 to level 1), indicating that the prefix has traveled down the hierarchy. Prefixes that have the up/down bit set may only be advertised down the hierarchy, i.e., to lower levels. When a prefix is first injected into IS-IS, the bit is UNSET.

metric *number*

Description ISIS default metric value

This is a metric understood by every Intermediate system in the domain. Each circuit shall have a positive integral value assigned for this metric. The value may be associated with any objective function of the circuit, but by convention is intended to measure the capacity of the circuit for handling traffic, for example, its throughput in bits-per-second. Higher values indicate a lower capacity.

metric *number*

Description ISIS expense metric value

This metric measures the monetary cost of utilising the associated circuit. It is an optional metric, which if assigned to a circuit shall have a positive integral value1). Higher values indicate a larger monetary expense.

up-down *boolean*

Description The up/down bit

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Set if a prefix is advertised from a higher level to a lower level (e.g., level 2 to level 1), indicating that the prefix has traveled down the hierarchy. Prefixes that have the up/down bit set may only be advertised down the hierarchy, i.e., to lower levels. When a prefix is first injected into IS-IS, the bit is UNSET.

Tree flags

Options

- external-flag

  External prefix flag. Set if the prefix has been redistributed from another protocol. This includes the case where multiple virtual routers are supported and the source of the redistributed prefix is another IS-IS instance.

- readvertisement-flag

  Readvertisement flag. Set when the prefix has been leaked from one level to another (upwards or downwards).

- node-flag

  Node flag. Set when the prefix identifies the advertising router, i.e., the prefix is a host prefix advertising a globally reachable address typically associated with a loopback address.

- elc-flag

  Elc flag. Set for local host prefix of the originating node if it supports ELC on all interfaces

- anycast-flag

  Anycast flag. Set if the prefix is anycast

Configurable False

router-id *string*

Description IPv4 Source router ID address. In cases where the advertisement is an identifier for the advertising router (e.g., with the N-flag set in the Prefix Attribute Flags sub-TLV), it may be useful for other routers to know the source of the advertisement. When reachability advertisement is leaked from one level to another, Router ID advertised is always the Router ID of the IS-IS instance that originated the advertisement. This would be true even if the prefix had been learned from another protocol.

flags *keyword*

Description Flags associated with Prefix Segment-ID.

Context network-instance name *string* protocols isis instance name *string* level level-number *number* link-state-database lsp lsp-id *string* tlvs tlv type *identityref* ipv6-reachability prefixes prefix prefix *string* subtlvs subtlv type *identityref* prefix-sids prefix-sid value *number* flags *keyword*

Tree flags

Options

- readvertisement

  Readvertisment flag. When set, the prefix to which this Prefix-SID is attached, has been propagated by the router either from another level or from redistribution.

- node

  Node flag. When set, the Prefix-SID refers to the router identified by the prefix. Typically, the N-Flag is set on Prefix-SIDs attached to a router loopback address.

- no-php

  Penultimate-Hop-Popping flag. When set, then the penultimate hop MUST NOT pop the Prefix-SID before delivering the packet to the node that advertised the Prefix-SID.

- explicit-null

  Explicit-Null flag. When set, any upstream neighbor of the Prefix-SID originator MUST replace the Prefix-SID with a Prefix-SID having an Explicit-NULL value (0 for IPv4 and 2 for IPv6) before forwarding the packet.

- value

  Value flag. When set, the Prefix-SID carries a value (instead of an index). By default the flag is UNSET.

- local

  Local flag. When set, the value/index carried by the Prefix-SID has local significance. By default the flag is UNSET.

Configurable False

up-down *boolean*

Description The up/down bit. Set if a prefix is advertised from a higher level to a lower level (e.g., level 2 to level 1), indicating that the prefix has traveled down the hierarchy. Prefixes that have the up/down bit set may only be advertised down the hierarchy, i.e., to lower levels. When a prefix is first injected into IS-IS, the bit is UNSET.

This is a metric understood by every Intermediate system in the domain. Each circuit shall have a positive integral value assigned for this metric. The value may be associated with any objective function of the circuit, but by convention is intended to measure the capacity of the circuit for handling traffic, for example, its throughput in bits-per-second. Higher values indicate a lower capacity.

Tree flags

Options

- address-family

  Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.

- backup

  Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).

- value

  Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.

- local

  Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.

- set

  Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

bandwidth *binary*

Description The available bandwidth on a link, forwarding adjacency, or bundled link in IEEE floating-point format with units of bytes per second. For a link or forwarding adjacency, available bandwidth is defined to be residual bandwidth minus the measured bandwidth used for the actual forwarding of non-RSVP-TE label switched path packets. For a bundled link, available bandwidth is defined to be the sum of the component link available bandwidths minus the measured bandwidth used for the actual forwarding of non-RSVP-TE label switched path packets. For a bundled link, available bandwidth is defined to be the sum of the component link available bandwidths.

Tree flags

Options

- address-family

  Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.

- backup

  Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).

- value

  Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.

- local

  Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- set

  Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

link-loss *number*

Description Link packet loss as a percentage of the total traffic sent over a configurable interval. The basic unit is 0.000003%, where (2^24 - 2) is 50.331642%. This value s the highest packet-loss percentage that can be expressed (the assumption being that precision is more important on high-speed links than the ability to advertise loss rates greater than this, and that high- peed links with over 50% loss are unusable). Therefore, measured values that are larger than the field maximum SHOULD be encoded as the maximum value.

Tree type

Options

- extra-traffic

  If set the link has extra traffic protection. If the link is of type Extra Traffic, it means that the link is protecting another link or links. The LSPs on a link of this type will be lost if any of the links it is protecting fail.

- unprotected

  If set, the link is unprotected. If the link is of type Unprotected, it means that there is no other link protecting this link. The LSPs on a link of this type will be lost if the link fails.

- shared

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If set, the link has shared protection. If the link is of type Shared, it means that there are one or more disjoint links of type Extra Traffic that are protecting this link. These Extra Traffic links are shared between one or more links of type Shared.

- one-one

  If set, the link has dedicated 1:1 protection. If the link is of type Dedicated 1:1, it means that there is one dedicated disjoint link of type Extra Traffic that is protecting this link.

- plus-one

  If set, the link has dedicated 1+1 protection. If the link is of type Dedicated 1+1, it means that a dedicated disjoint link is protecting this link. However, the protecting link is not advertised in the link state database and is therefore not available for the routing of LSPs.

- enhanced

  If set the link has enhanced protection. If the link is of type Enhanced, it means that a protection scheme that is more reliable than Dedicated 1+1, e.g., 4 fiber BLSR/MS-SPRING, is being used to protect this link.

bandwidth *binary*

Description The maximum amount of bandwidth that can be reserved in this direction on this link. Note that for oversubscription purposes, this can be greater than the bandwidth of the link. It is encoded in 32 bits in IEEE floating point format. The units are bytes (not bits!) per second.

Context network-instance name *string* protocols isis instance name *string* level level-number *number* link-state-database lsp lsp-id *string* tlvs tlv type *identityref* isis-neighbor-attribute neighbors neighbor system-id *string* instances instance id *number* subtlvs subtlv type *identityref* max-reservable-link-bandwidth bandwidth *binary*

flags *keyword*

Description Flags associated with LAN-Adj-Segment-ID

Context network-instance name *string* protocols isis instance name *string* level level-number *number* link-state-database lsp lsp-id *string* tlvs tlv type *identityref* isis-neighbor-attribute neighbors neighbor system-id *string* instances instance id *number* subtlvs subtlv type *identityref* srv6-lan-adjacency-sids srv6-lan-adjacency-sid address *string* flags *keyword*

Tree flags

Options

- backup

  Backup flag. When set, the END.X SID refers to an adjacency being protected (e.g.: using TILFA)

- set

  Set flag. When set, the S-Flag indicates that the END.X SID refers to a set of adjacencies

- persistent

  Set flag. When set, the S-Flag indicates that the END.X SID is persistently allocated, i.e., the SID value remains consistent across router restart and/or interface flap

bandwidth *binary*

Description The amount of bandwidth reservable in this direction on this link. Note that for oversubscription purposes, this can be greater than the bandwidth of the link. It contains eight 32-bit IEEE floating point numbers(one for each priority). The units are bytes (not bits!) per second. The values correspond to the bandwidth that can be reserved with a setup priority of 0 through 7, arranged in increasing order with priority 0 occurring at the start of the sub-TLV, and priority 7 at the end of the sub-TLV.

bandwidth *binary*

Description The bandwidth utilization on a link, forwarding adjacency, or bundled link in IEEE floating-point format with units of bytes per second. For a link or forwarding adjacency, bandwidth utilization represents the actual utilization of the link (i.e., as measured by the advertising node). For a bundled link, bandwidth utilization is defined to be the sum of the component link bandwidth utilizations.

Tree flags

Options

- external-flag

  External prefix flag. Set if the prefix has been redistributed from another protocol. This includes the case where multiple virtual routers are supported and the source of the redistributed prefix is another IS-IS instance.

- readvertisement-flag

  Readvertisement flag. Set when the prefix has been leaked from one level to another (upwards or downwards).

- node-flag

  Node flag. Set when the prefix identifies the advertising router, i.e., the prefix is a host prefix advertising a globally reachable address typically associated with a loopback address.

- elc-flag

  Elc flag. Set for local host prefix of the originating node if it supports ELC on all interfaces

- anycast-flag

  Anycast flag. Set if the prefix is anycast

Configurable False

router-id *string*

Description IPv4 Source router ID address. In cases where the advertisement is an identifier for the advertising router (e.g., with the N-flag set in the Prefix Attribute Flags sub-TLV), it may be useful for other routers to know the source of the advertisement. When reachability advertisement is leaked from one level to another, Router ID advertised is always the Router ID of the IS-IS instance that originated the advertisement. This would be true even if the prefix had been learned from another protocol.

flags *keyword*

Description Flags associated with Prefix Segment-ID.

Context network-instance name *string* protocols isis instance name *string* level level-number *number* link-state-database lsp lsp-id *string* tlvs tlv type *identityref* mt-ipv4-reachability prefixes prefix prefix *string* mt-id *number* subtlvs subtlv type *identityref* prefix-sids prefix-sid value *number* flags *keyword*

Tree flags

Options

- readvertisement

  Readvertisment flag. When set, the prefix to which this Prefix-SID is attached, has been propagated by the router either from another level or from redistribution.

- node

  Node flag. When set, the Prefix-SID refers to the router identified by the prefix. Typically, the N-Flag is set on Prefix-SIDs attached to a router loopback address.

- no-php

  Penultimate-Hop-Popping flag. When set, then the penultimate hop MUST NOT pop the Prefix-SID before delivering the packet to the node that advertised the Prefix-SID.

- explicit-null

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Explicit-Null flag. When set, any upstream neighbor of the Prefix-SID originator MUST replace the Prefix-SID with a Prefix-SID having an Explicit-NULL value (0 for IPv4 and 2 for IPv6) before forwarding the packet.

- value

  Value flag. When set, the Prefix-SID carries a value (instead of an index). By default the flag is UNSET.

- local

  Local flag. When set, the value/index carried by the Prefix-SID has local significance. By default the flag is UNSET.

up-down *boolean*

Description The up/down bit. Set if a prefix is advertised from a higher level to a lower level (e.g., level 2 to level 1), indicating that the prefix has traveled down the hierarchy. Prefixes that have the up/down bit set may only be advertised down the hierarchy, i.e., to lower levels. When a prefix is first injected into IS-IS, the bit is UNSET.

Tree flags

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Options

- external-flag

  External prefix flag. Set if the prefix has been redistributed from another protocol. This includes the case where multiple virtual routers are supported and the source of the redistributed prefix is another IS-IS instance.

- readvertisement-flag

  Readvertisement flag. Set when the prefix has been leaked from one level to another (upwards or downwards).

- node-flag

  Node flag. Set when the prefix identifies the advertising router, i.e., the prefix is a host prefix advertising a globally reachable address typically associated with a loopback address.

- elc-flag

  Elc flag. Set for local host prefix of the originating node if it supports ELC on all interfaces

- anycast-flag

  Anycast flag. Set if the prefix is anycast

Configurable False

Tree flags

Options

- readvertisement

  Readvertisment flag. When set, the prefix to which this Prefix-SID is attached, has been propagated by the router either from another level or from redistribution.

- node

  Node flag. When set, the Prefix-SID refers to the router identified by the prefix. Typically, the N-Flag is set on Prefix-SIDs attached to a router loopback address.

- no-php

  Penultimate-Hop-Popping flag. When set, then the penultimate hop MUST NOT pop the Prefix-SID before delivering the packet to the node that advertised the Prefix-SID.

- explicit-null

  Explicit-Null flag. When set, any upstream neighbor of the Prefix-SID originator MUST replace the Prefix-SID with a Prefix-SID having an Explicit-NULL value (0 for IPv4 and 2 for IPv6) before forwarding the packet.

- value

  Value flag. When set, the Prefix-SID carries a value (instead of an index). By default the flag is UNSET.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- local

  Local flag. When set, the value/index carried by the Prefix-SID has local significance. By default the flag is UNSET.

up-down *boolean*

Description The up/down bit. Set if a prefix is advertised from a higher level to a lower level (e.g., level 2 to level 1), indicating that the prefix has traveled down the hierarchy. Prefixes that have the up/down bit set may only be advertised down the hierarchy, i.e., to lower levels. When a prefix is first injected into IS-IS, the bit is UNSET.

Tree flags

Options

- address-family

  Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- backup

  Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).

- value

  Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.

- local

  Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.

- set

  Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

Configurable False

bandwidth *number*

Description The available bandwidth on a link, forwarding adjacency, or bundled link with units of bytes per second. For a link or forwarding adjacency, available bandwidth is defined to be residual bandwidth minus the measured bandwidth used for the actual forwarding of non-RSVP-TE label switched path packets. For a bundled link, available bandwidth is defined to be the sum of the component link available bandwidths minus the measured bandwidth used for the actual forwarding of non-RSVP-TE label switched path packets. For a bundled link, available bandwidth is defined to be the sum of the component link available bandwidths.

Tree flags

Options

- address-family

  Address-family flag. When unset, the Adj-SID refers to an adjacency with outgoing IPv4 encapsulation. If set then the Adj-SID refers to an adjacency with outgoing IPv6 encapsulation.

- backup

  Backup flag. When set, the Adj-SID refers to an adjacency being protected (e.g.: using IPFRR or MPLS-FRR).

- value

  Value flag. When set, the SID carries a value (instead of an index). By default the flag is SET.

- local

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Local flag. When set, the value/index carried by the SID has local significance. By default the flag is SET.

- set

  Set flag. When set, the S-Flag indicates that the Adj-SID refers to a set of adjacencies.

Configurable False

link-loss *number*

Description Link packet loss as a percentage of the total traffic sent over a configurable interval. The basic unit is 0.000003%, where (2^24 - 2) is 50.331642%. This value s the highest packet-loss percentage that can be expressed (the assumption being that precision is more important on high-speed links than the ability to advertise loss rates greater than this, and that high- peed links with over 50% loss are unusable). Therefore, measured values that are larger than the field maximum SHOULD be encoded as the maximum value.

Tree type

Options

- extra-traffic

  If set the link has extra traffic protection. If the link is of type Extra Traffic, it means that the link is protecting another link or links. The LSPs on a link of this type will be lost if any of the links it is protecting fail.

- unprotected

  If set, the link is unprotected. If the link is of type Unprotected, it means that there is no other link protecting this link. The LSPs on a link of this type will be lost if the link fails.

- shared

  If set, the link has shared protection. If the link is of type Shared, it means that there are one or more disjoint links of type Extra Traffic that are protecting this link. These Extra Traffic links are shared between one or more links of type Shared.

- one-one

  If set, the link has dedicated 1:1 protection. If the link is of type Dedicated 1:1, it means that there is one dedicated disjoint link of type Extra Traffic that is protecting this link.

- plus-one

  If set, the link has dedicated 1+1 protection. If the link is of type Dedicated 1+1, it means that a dedicated disjoint link is protecting this link. However, the protecting link is not advertised in the link state database and is therefore not available for the routing of LSPs.

- enhanced

  If set the link has enhanced protection. If the link is of type Enhanced, it means that a protection scheme that is more reliable than Dedicated 1+1, e.g., 4 fiber BLSR/MS-SPRING, is being used to protect this link.

bandwidth *number*

Description Residual bandwidth on a link,forwarding adjacency [RFC4206], or bundled link with units of bytes per second. For a link or forwarding adjacency, residual bandwidth is defined to be the Maximum Bandwidth [RFC5305] minus the bandwidth currently allocated to RSVP-TE label switched paths. For a bundled link, residual bandwidth is defined to be the sum of the component link residual bandwidths.

Tree flags

Options

- backup

  Backup flag. When set, the END.X SID refers to an adjacency being protected (e.g.: using TILFA)

- set

  Set flag. When set, the S-Flag indicates that the END.X SID refers to a set of adjacencies

- persistent

  Persistent flag. When set, the S-Flag indicates that the END.X SID is persistently allocated, i.e., the SID value remains consistent across router restart and/or interface flap
